**vSignify**

Sign on the Digital Dotted Line: **Experience Seamless eSignature Solutions"**

An vSignify, or electronic signature, is a digital representation of a person's signature that is used to sign electronic documents and agreements, indicating a person's intent to agree to the terms of the document or contract.

## Extensive File Type Support

vSignify supports virtually any type of document file type from most applications – like Microsoft Word, Excel, and PowerPoint – to ensure all your important documents can be sent for signature. Supported file formats include .doc, .docx, .pdf, .xls, .xlsx, .txt and many others.

## Signature Drawing

The Drawing field enables both signers and senders to upload images and signers can leave free-form markups directly on those images.

## Comments

Comments enable the sender and recipients of an envelope to exchange feedback in the context of a document directly within the vSignify web and mobile signing.

## Signing Workflow

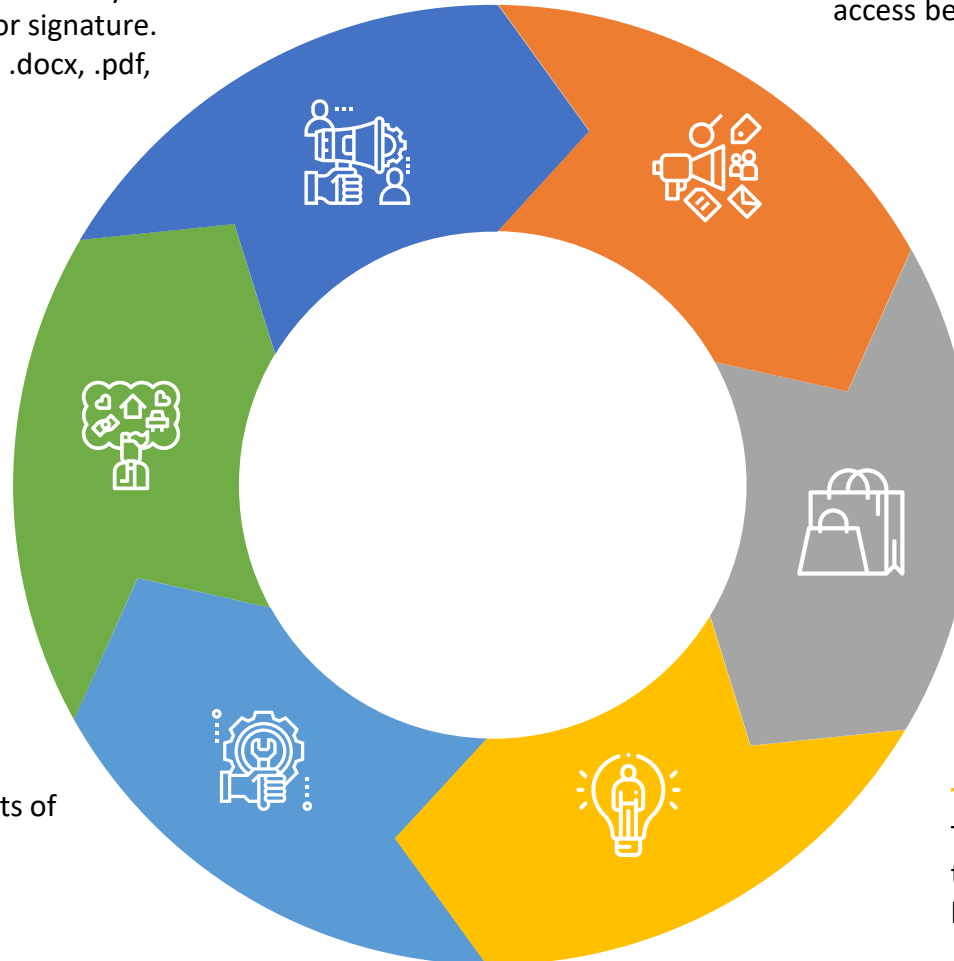

vSignify lets you specify and order any number of signers. Assign recipients different roles and access beyond signing permissions.

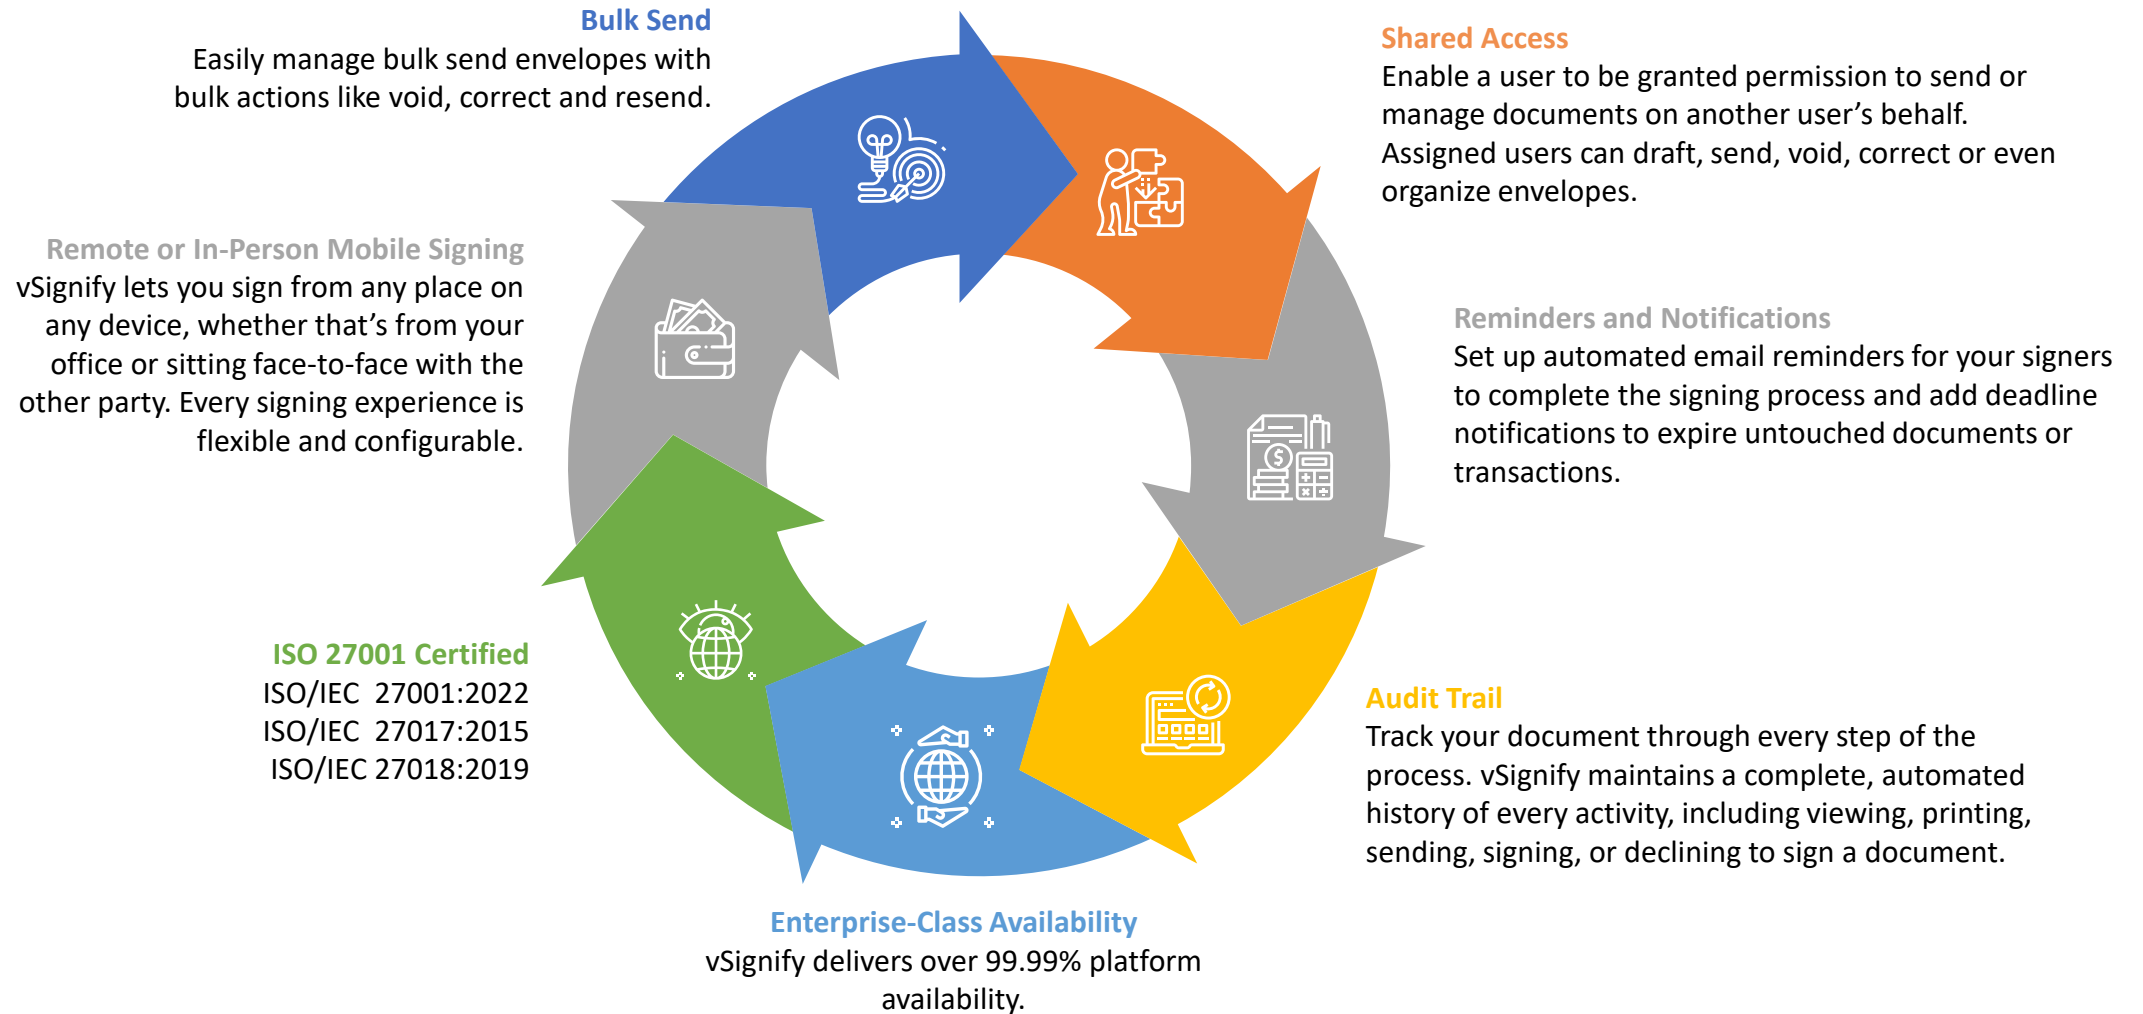

## Serial, Parallel and Mixed Routing

Route documents to multiple users in serial, parallel and mixed sequencing to fit your ideal process. Require users to sign one by one or allow them all to sign at the same time.

## Templates

Templates standardize processes, reduce preparation time, and enable end-to-end automation of your business.

## Add-on Services

Take advantage of optional add-on services from vSignify and our industry-leading partners to address specific transaction requirements like content discovery and analysis, payment processing, document retention, notary, and more.

## Payment Processing

Collect credit card and debit card information from a document and process it through a payment gateway such as Stripe. And with vSignify Payments, you can set up documents so that customers sign, pay, and complete business transactions all in one step, using credit cards, Apple Pay or Android Pay.

## Real-Time Status

vSignify tracks your transactions in real-time — every signature, approval and related recipient actions are logged and viewable.

## Document, Recipient and Account Reports

Easily customize, run, export, and print reports for your account. vSignify reports on documents, recipients, and overall account activity.

## Certification of Completion

Every signed vSignify document comes with a certificate of completion that provides proof of the signing process to all parties of the transaction.

## REST/SOAP API and IODocs

vSignify publishes both its REST and SOAP APIs. They are easily accessible to developers looking to integrate. Explore vSignify's extensive API with our interactive IODocs.

### Email-Based Authentication

vSignify's built-in form of authentication is email authentication. This ensures the only people signing are those invited by you to sign and have access to the email account.

### Access Code Authentication

Requires signers to provide a sender-generated code to open and sign their documents.

### SMS Authentication

Via SMS text messaging, send a one-time passcode that your recipients must enter to access documents.

### Federated Identity Authentication

vSignify accepts and records authentication by other systems integrated with vSignify via industry-standard protocols. As an option, Single Sign-On detects email domains at login and redirects to your domain's Identity Provider for authentication.

### OAuth2 Support

vSignify supports an OAuth2-based tokening system as an additional API authorization option for companies requiring an increased layer of security to custom integrations

### Document Encryption

vSignify uses AES 128-bit encryption and SSL 256-bit encryption to ensure documents in the system are always encrypted. Any unauthorized changes in the underlying document will be detected and identified as evidence of tampering.

### Aadhaar eSign

Verify with OTP or biometrics via UIDAI integration.

### Automated Identity Verification Solutions

Deliver seamless, secure, and scalable 24/7 customer experiences with our comprehensive identity verification services.

### DSC Signature

Sign PDFs securely using cryptographic algorithms and private keys.

### Remote Online Notarization (RON)

Complete notarization remotely with secure audio-visual and e-signature technologies, eliminating the need for physical presence in USA.

### Video Verification

Expert-led, face-to-face identity checks with anti-fraud safeguards and KYC customization.

### In-Person Verification

Instantly verify identities at POS locations or public sites across USA.

### Evidence Creation

Ensure secure digital documentation through authenticated eSigning processes

**Document Custody Management**

vSignify can automatically reassign your document to a different user after a document has been signed, giving that user ownership, and removing access from the original sender.

**Document Retention Policies**

Control the life of your documents and enforce company policy related to document retention. Automatically purge documents after a specified period and notify users in advance of purging.

**Tamper-Sealed Documents**

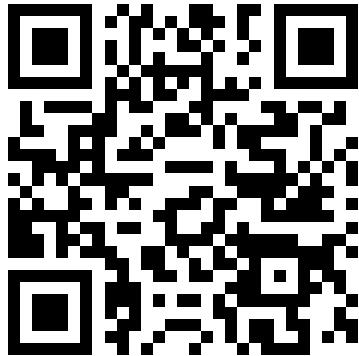

All documents are digitally sealed with the industry-standard technology, Public Key Infrastructure (PKI). This Tamper Seal indicates the electronic signature is valid and that the document has not been tampered with after it was downloaded from vSignify.
