

How to use: Kernel Excel Splitter Tool?

Here is the detailed step-by-step procedure to split single/multiple Excel files based on different parameters, such as by rows, sheets and size using this excellent Excel Split tool:

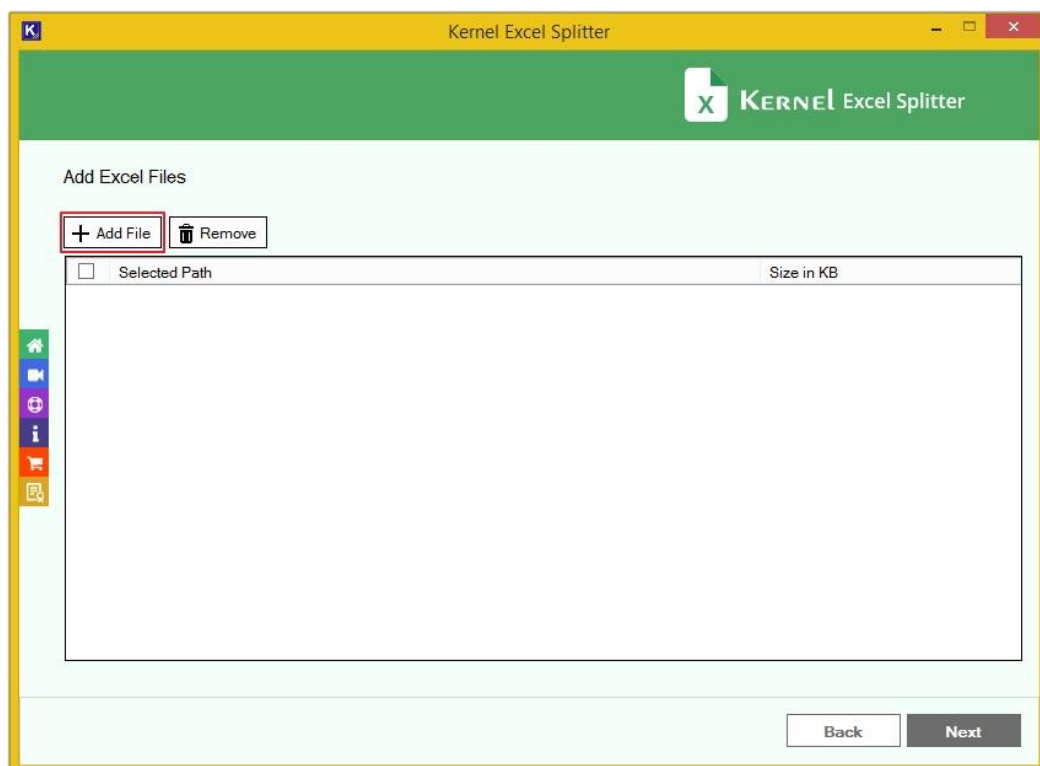

Step 1. The home screen of the **Kernel Excel Splitter** Tool.

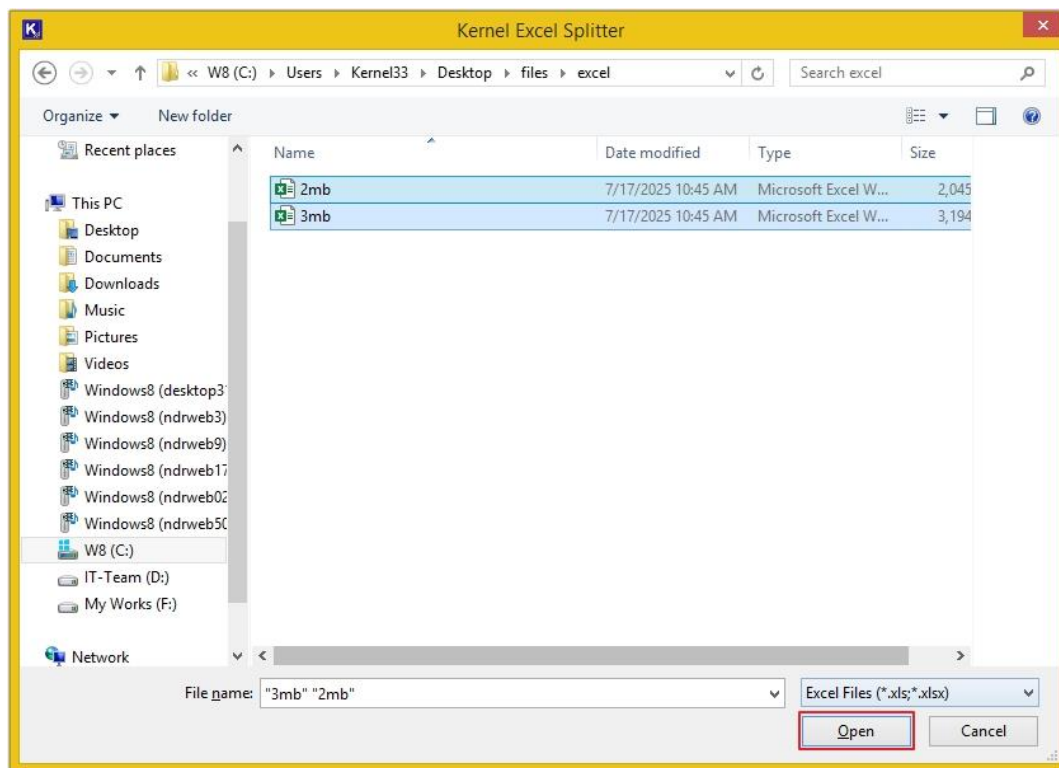

Step 2. Click on the **Split** option under **Split Excel Files**.

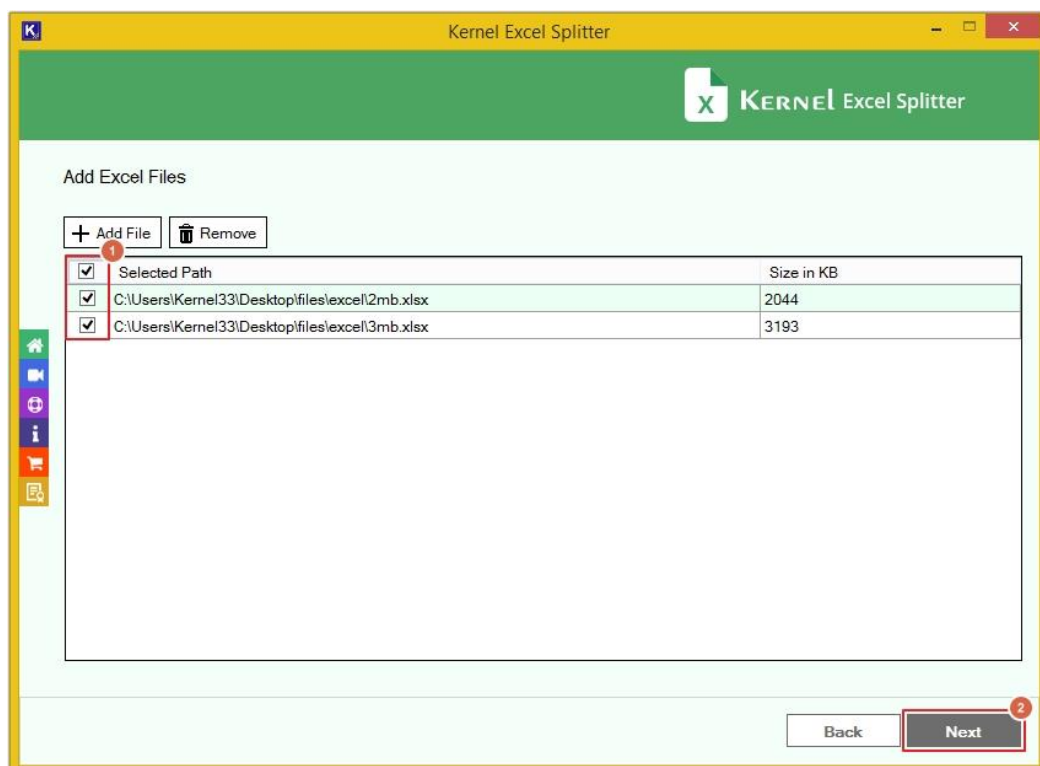

Step 3. Click **Add File** to upload Excel file(s).

Step 4. Select Excel files and click **Open**.

Step 5. Checkmark Excel files and click **Next**.

Select Split options

Here you'll get three options to split Excel files. Select any as per requirements:

Split by Row

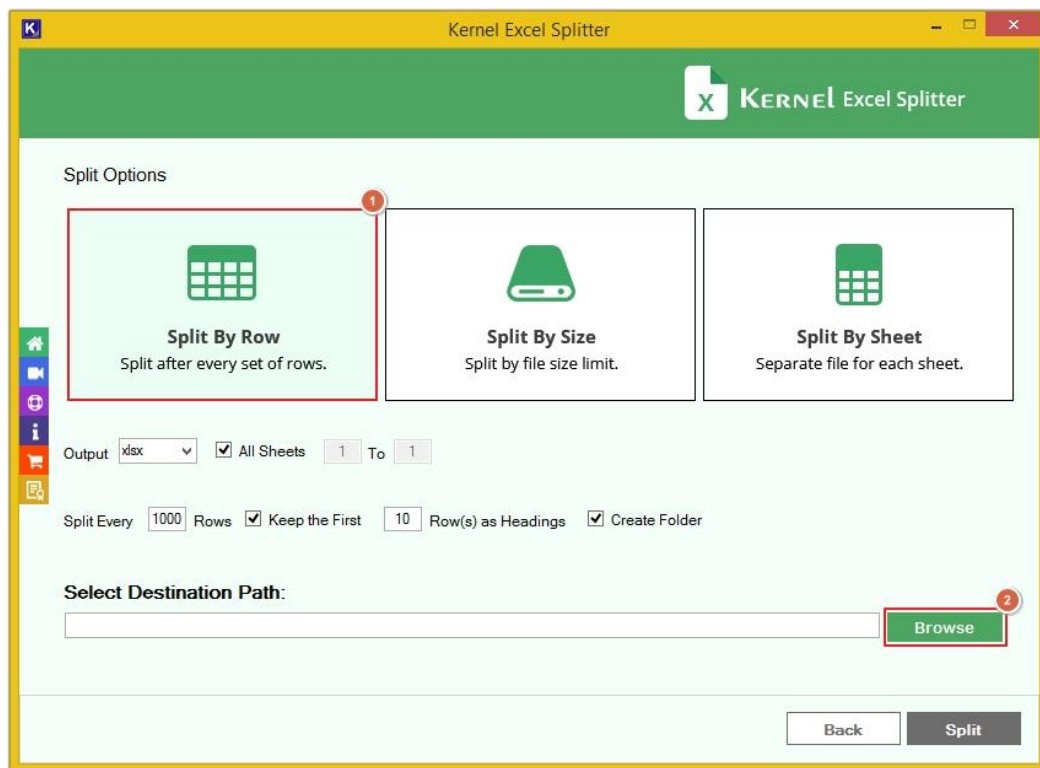

Split Excel files by Rows

With this option, your Excel sheets will get split after every set of a selected number of rows.

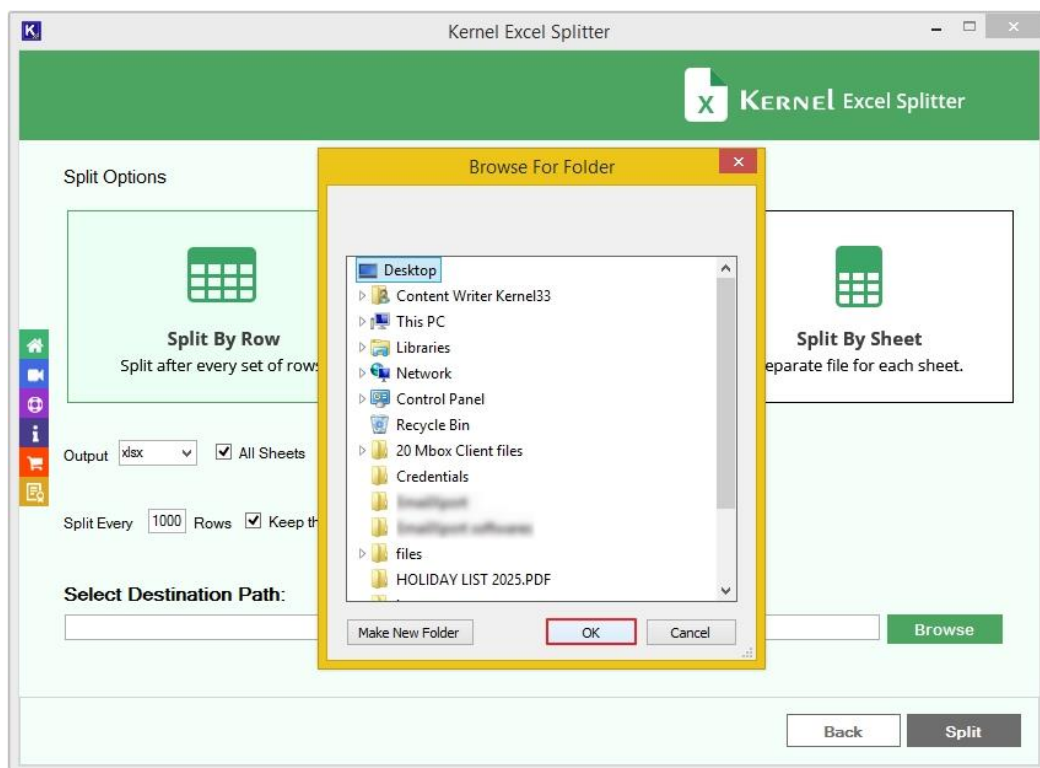

Step 1. Select **Split By Row** and apply filters, then click **Browse** to provide a saving path.

Note: Following is the explanation of all filter options:

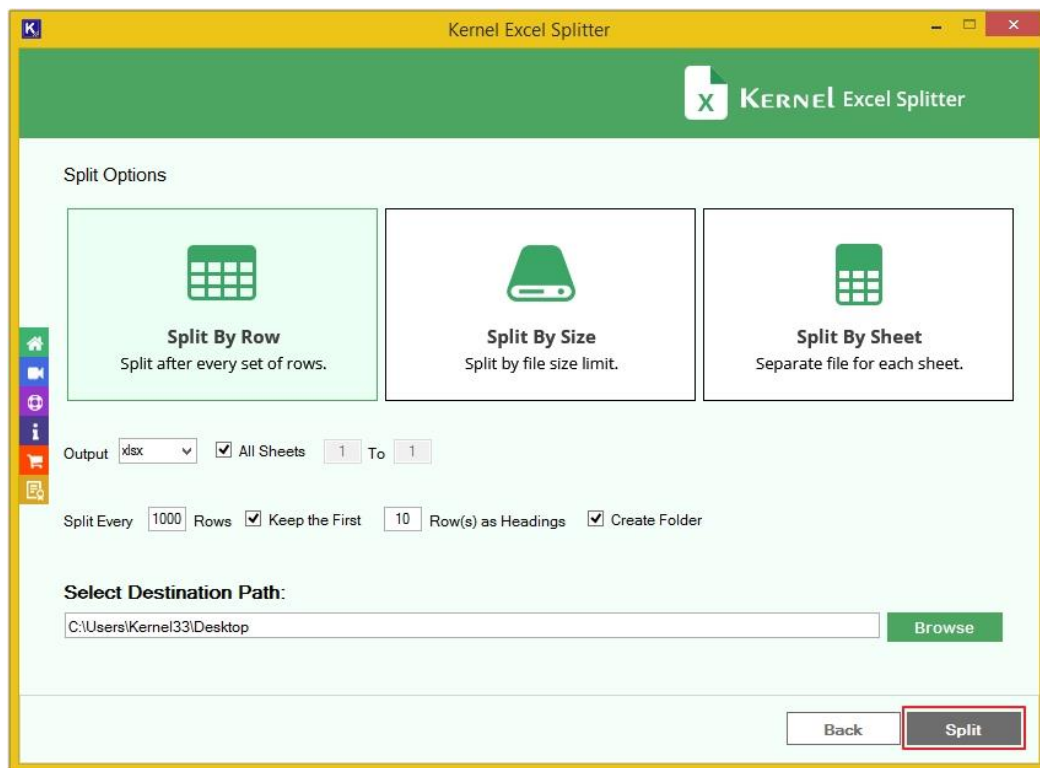

- **Output:** Select the desired format to save the file, such as XLSX, XLS, CSV, XML, ODS.
- **All Sheets:** Select from which sheet to which sheets you want to split your Excel files.
- **Split Every [X] Rows:** Choose after how many rows you want to split your Excel files.
- **Keep the First [X] Row(s) as Headings:** Set the first [X] rows as headings according to requirements.
- **Create Folder:** Uncheck this option to save the file by its original name, and select this option to save the file with the software name.

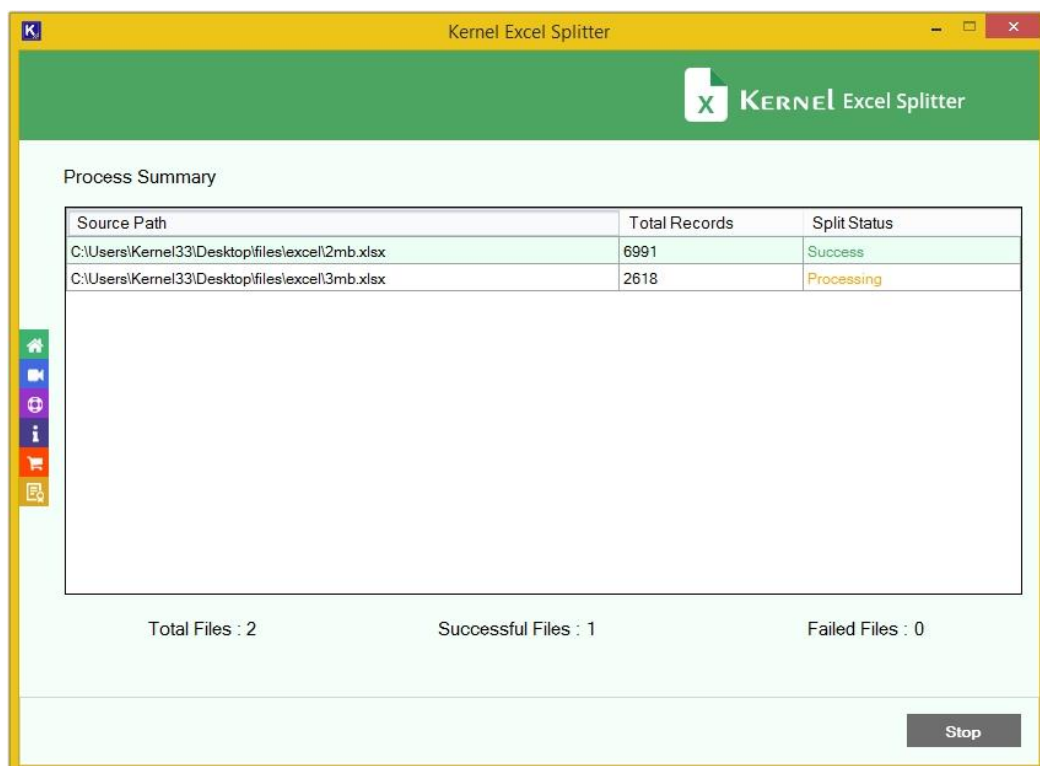

Step 2. Provide saving location or make a new folder, then click **OK**.

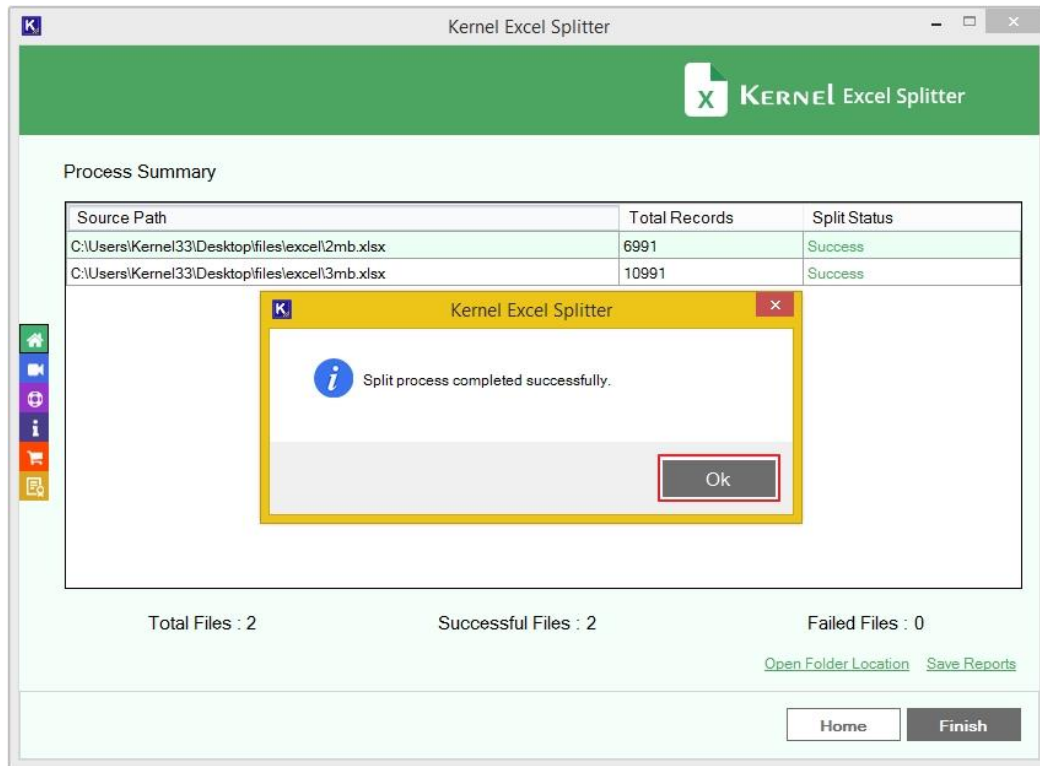

Step 3. Click on the **Split** button.

Step 4. The tool will start splitting Excel files.

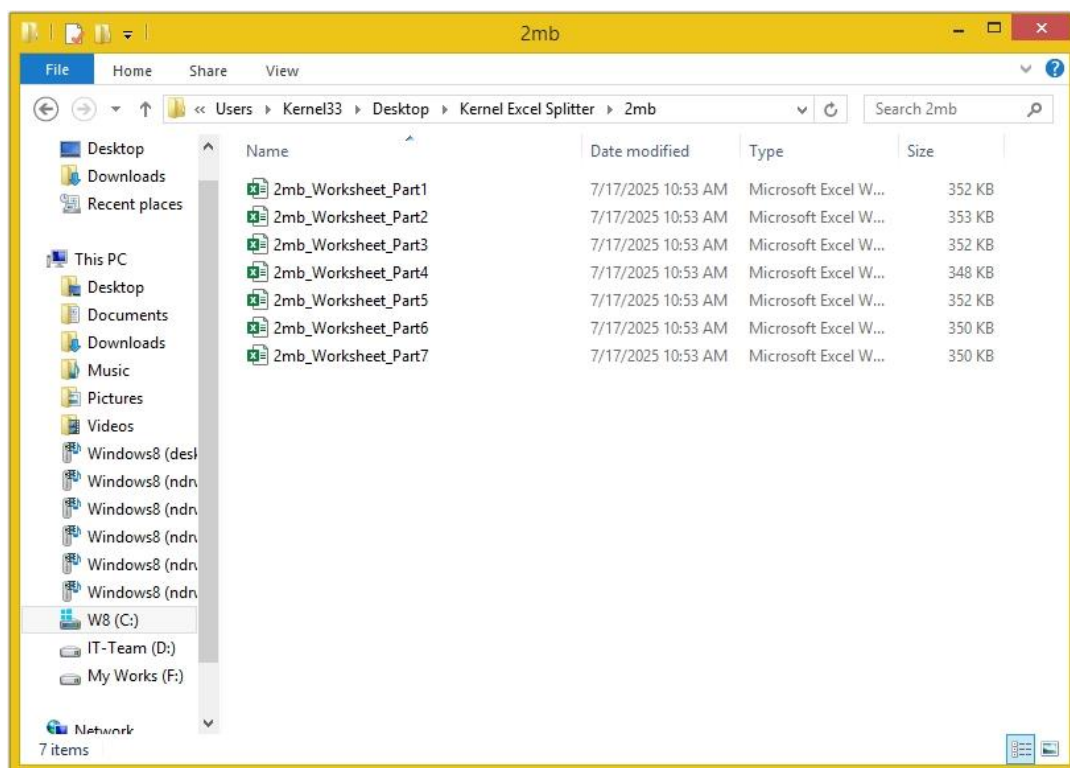

Step 5. Upon completion, you'll receive the **Split process completed successfully** message, click **OK**.

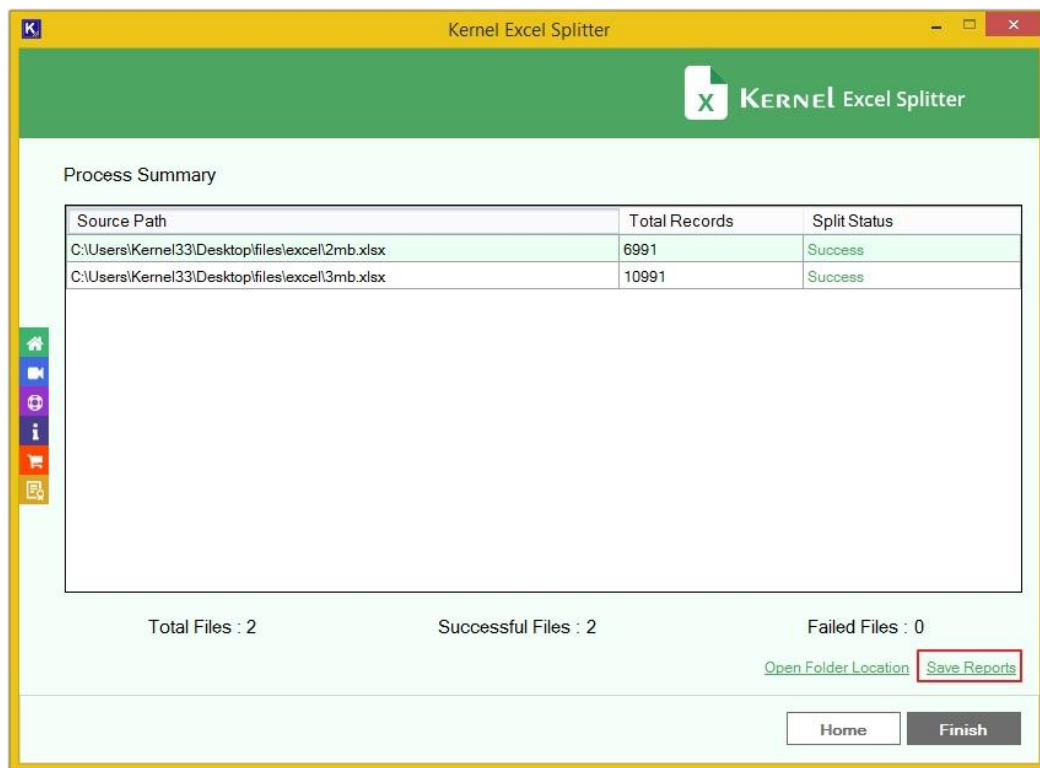

Step 6. Click **Open Folder Location** to access saved files directly.

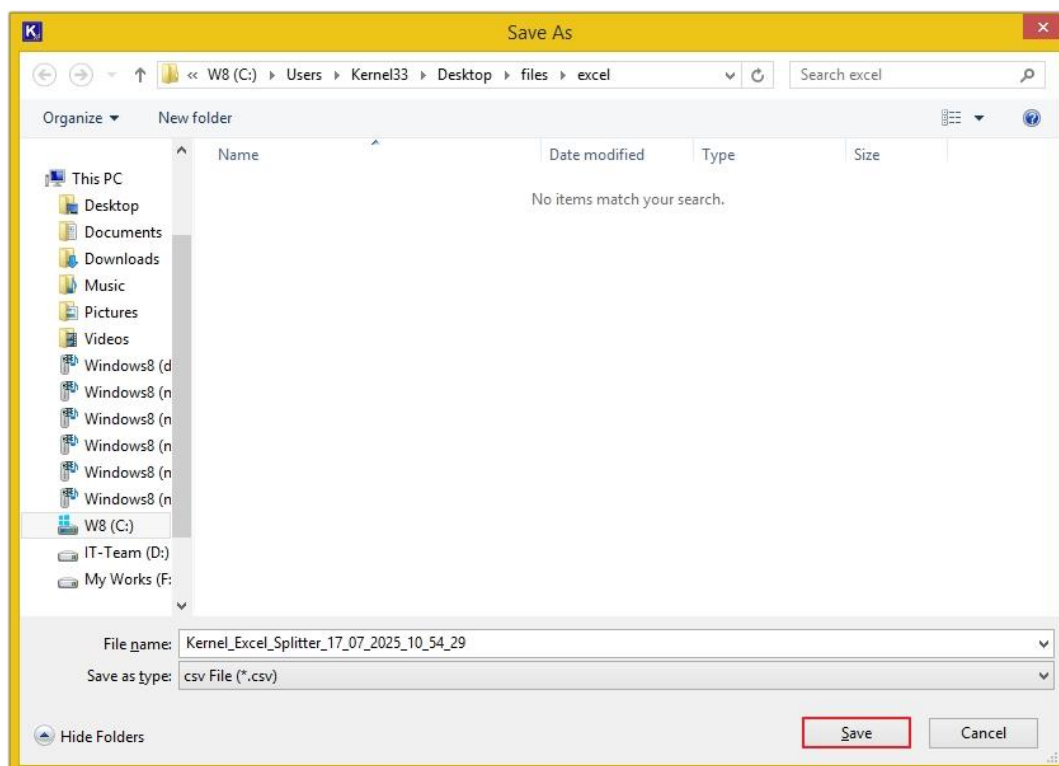

Step 7. Click on any sheet to view its content.

Step 8. To save the split summary in a CSV file, click the **Save Reports** option.

Step 9. Provide the location and click **Save**.

Split by Size

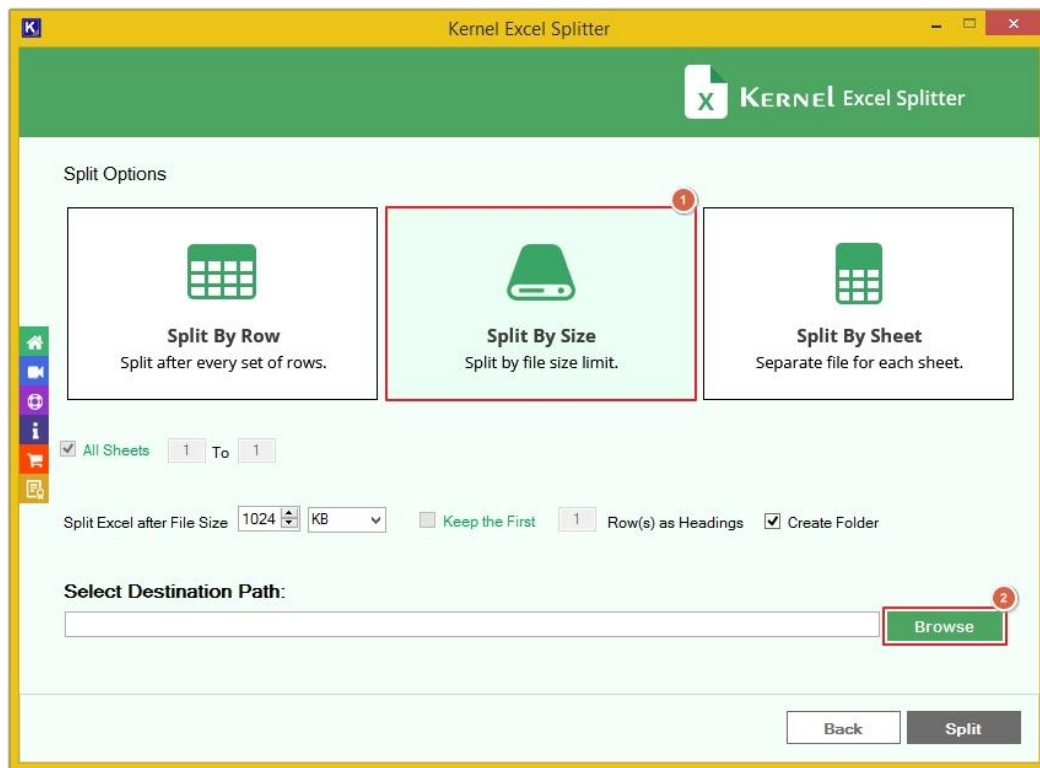

Split Excel files by Size

With this option, your Excel sheets will get split based on different file sizes.

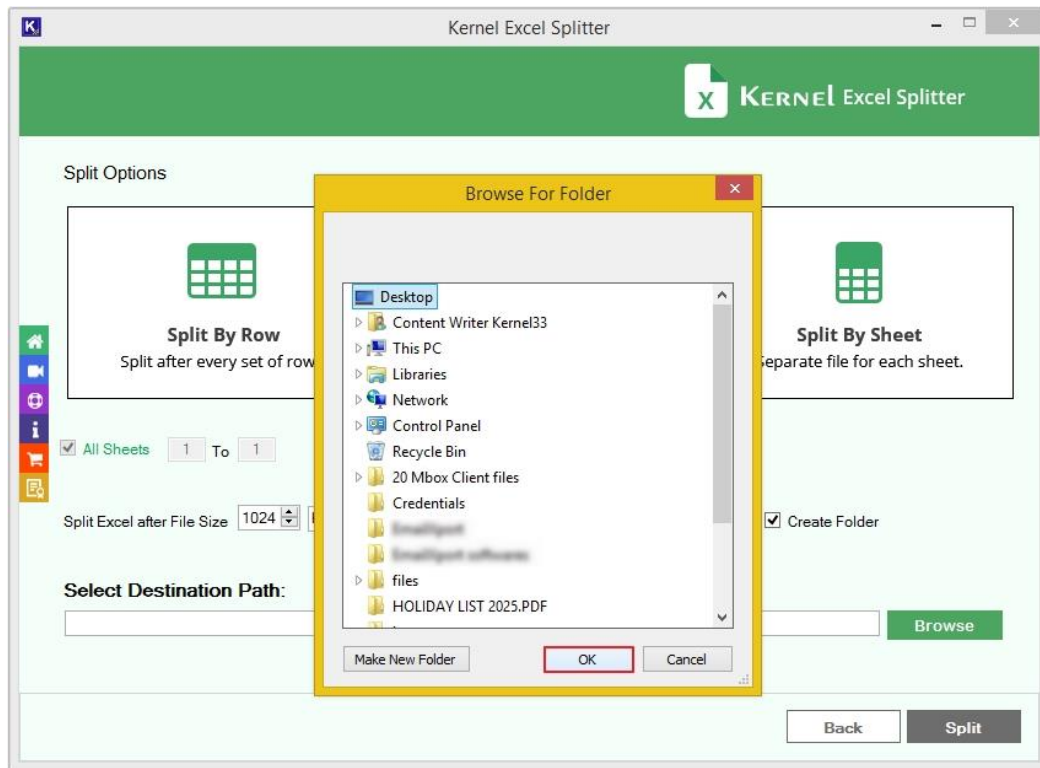

Step 1. Select **Split By Size** and apply filters, then click **Browse** to provide a saving path.

Note: Following is the explanation of all the filter options:

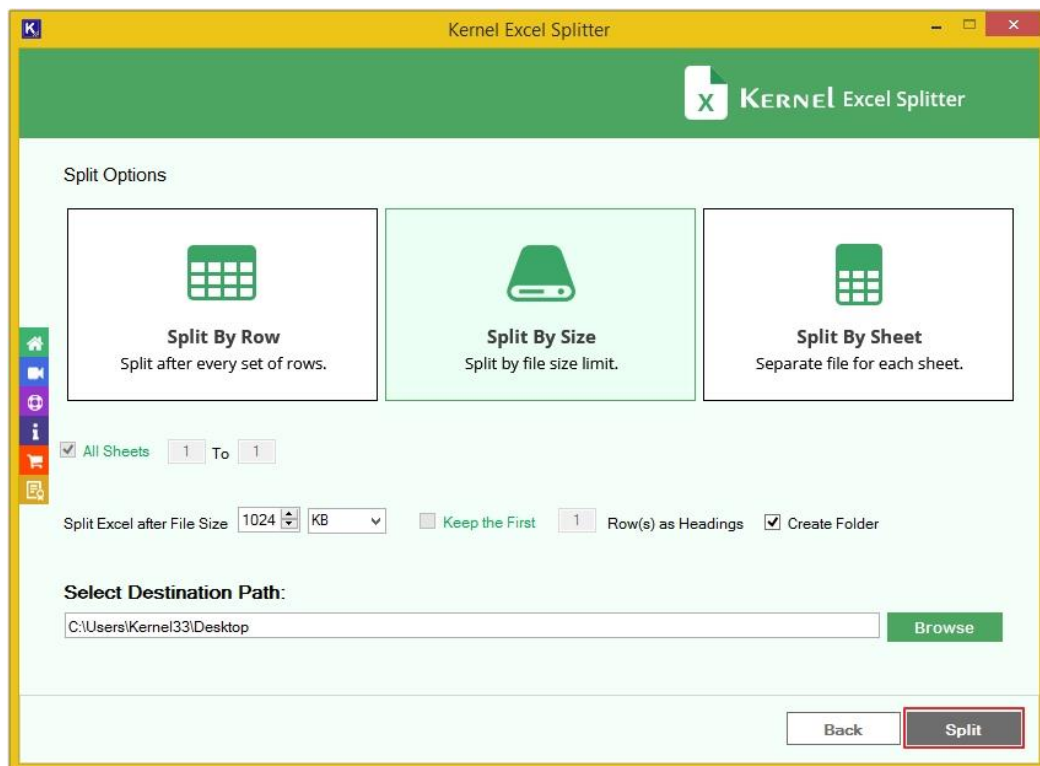

- **Split Excel after File Size:** Define the file size to split large Excel files based on KB, MB, and GB.
- **Create Folder:** Uncheck this option to save Excel sheets by original name, and select this option to save Excel sheets with the software name.

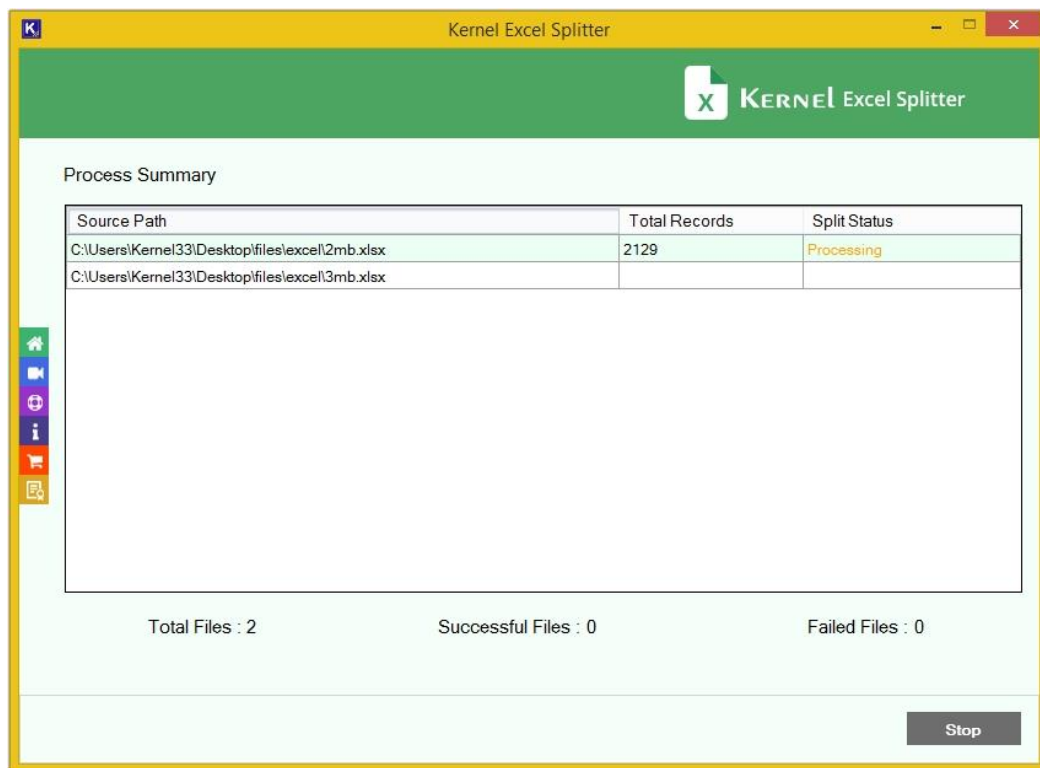

Step 2. Choose saving location or make new folder, then click **OK**.

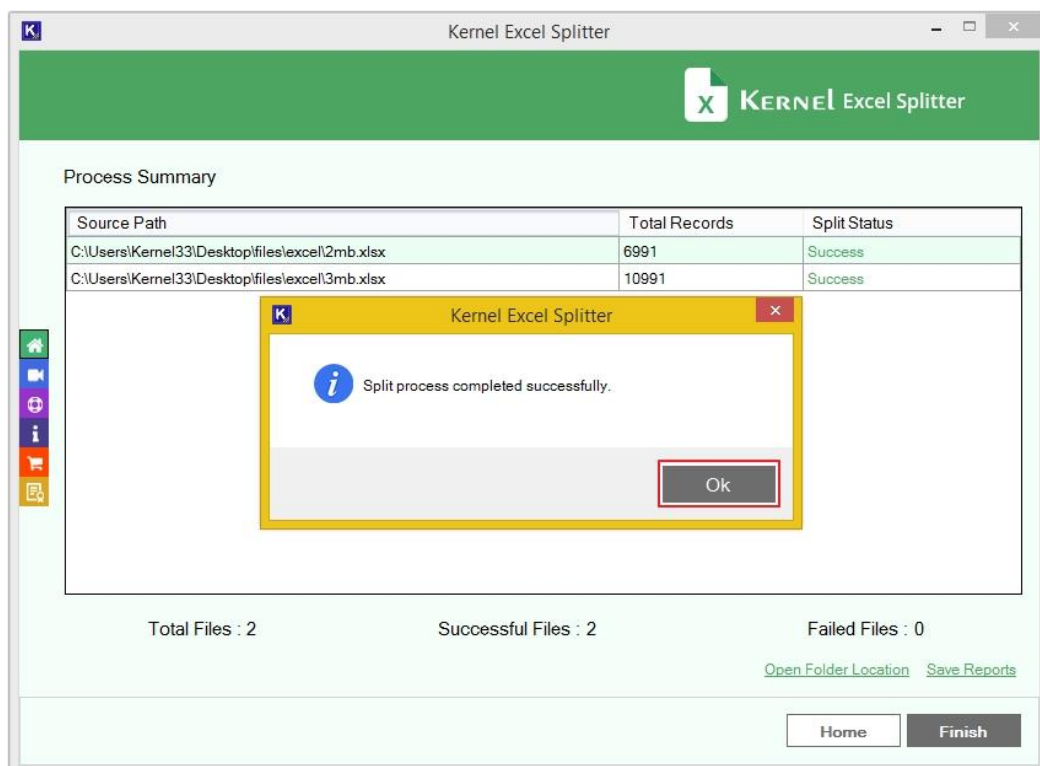

Step 3. Click **Split**.

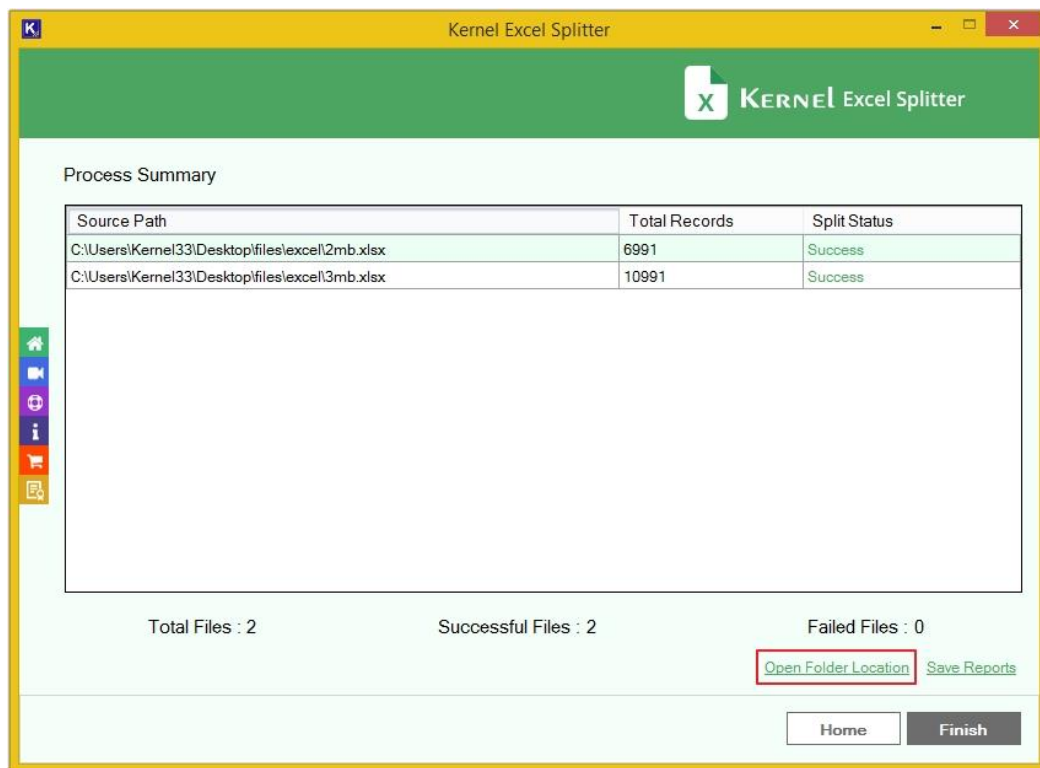

Step 4. The tool will begin the split process.

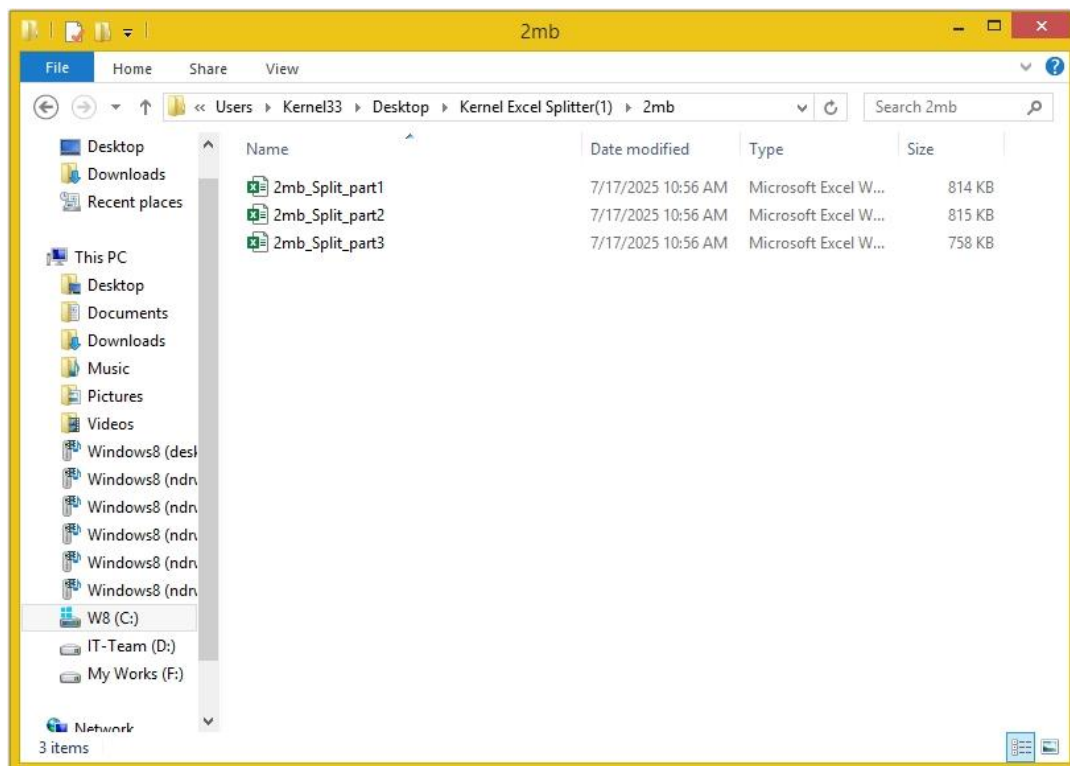

Step 5. You'll receive a success message. Click **OK**.

Step 6. Click on **Open File Location** to check saved files.

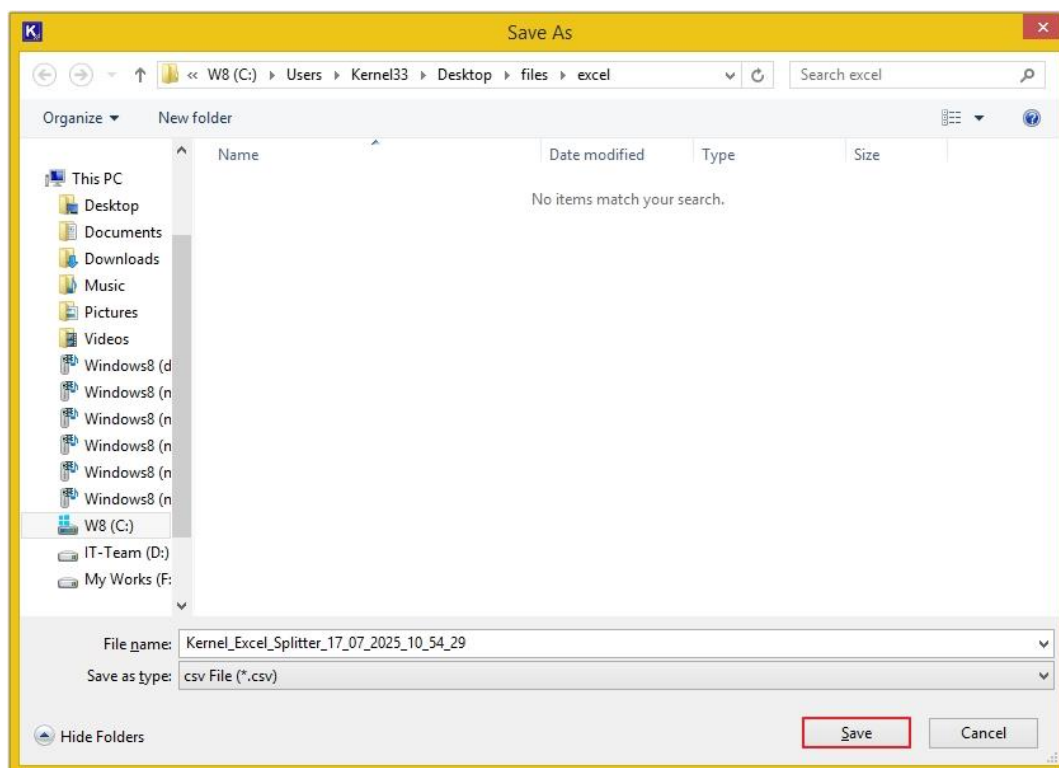

Step 7. View files content by clicking on it.

Step 8. Click **Save Reports** to keep the split summary in a CSV file.

Step 9. Define location, then click **Save**.

Split by Sheets

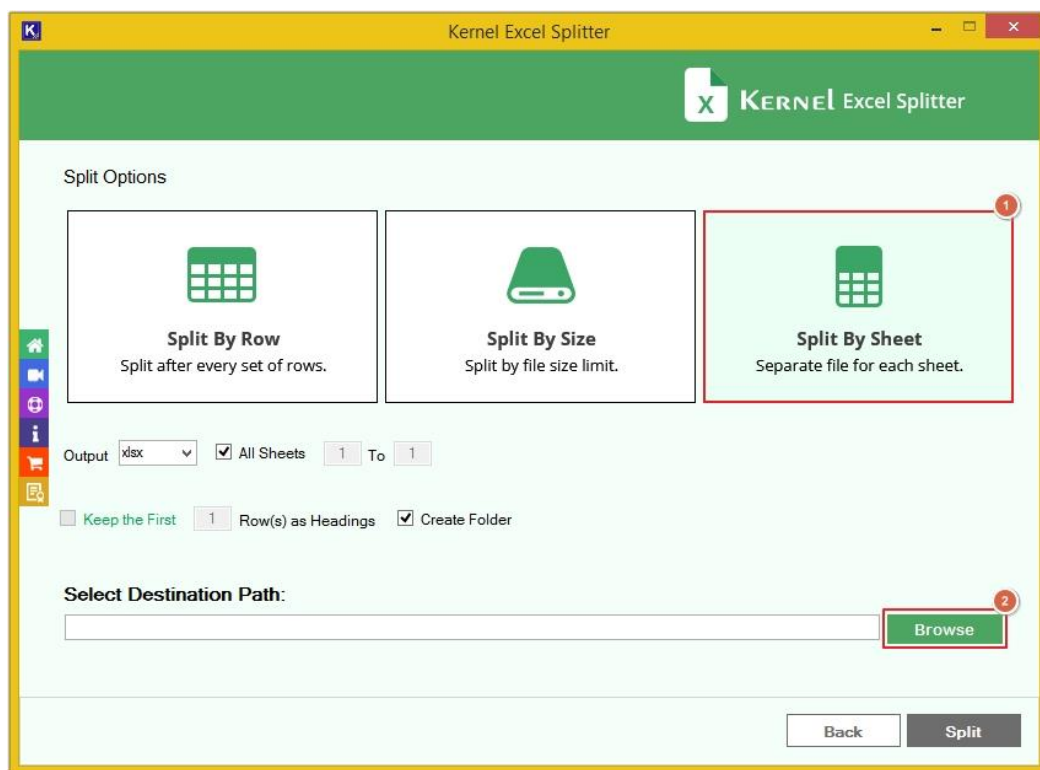

Split Excel files by Sheets

With this option, your Excel sheets will get split by sheets.

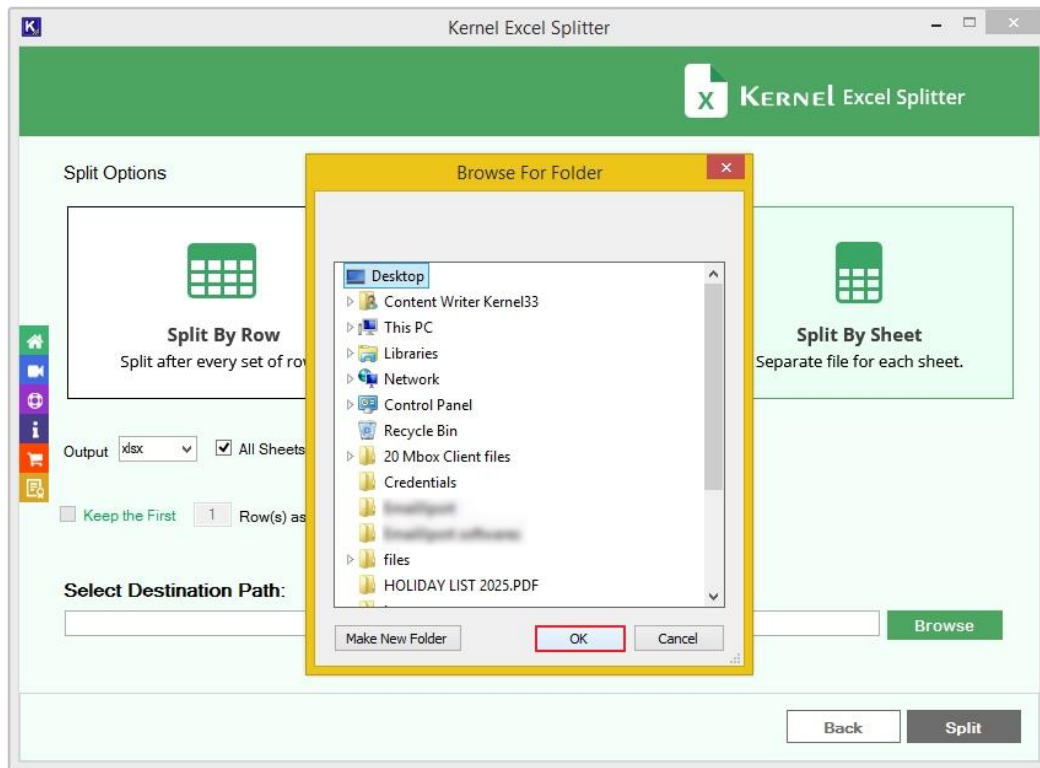

Step 1. Click on **Split By Sheets** and apply the required filters, then click **Browse**.

Note: Following is the explanation of all filter options:

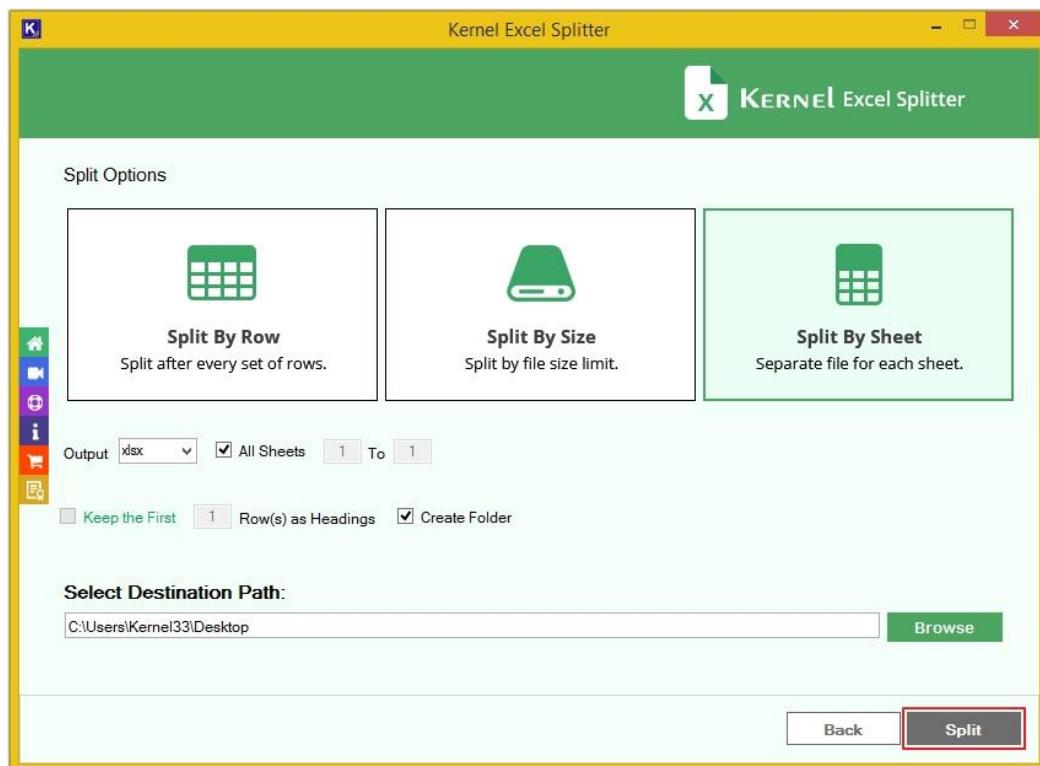

- **Output:** Select the required output format to save the file, such as XLSX, XLS, XML, CSV, or ODS.
- **All Sheets:** Choose from which Excel sheets to which Excel sheets you want to split your files.
- **Create Folder:** Uncheck this option to save the Excel file by its original name and choose this option to save the Excel file with the software name.

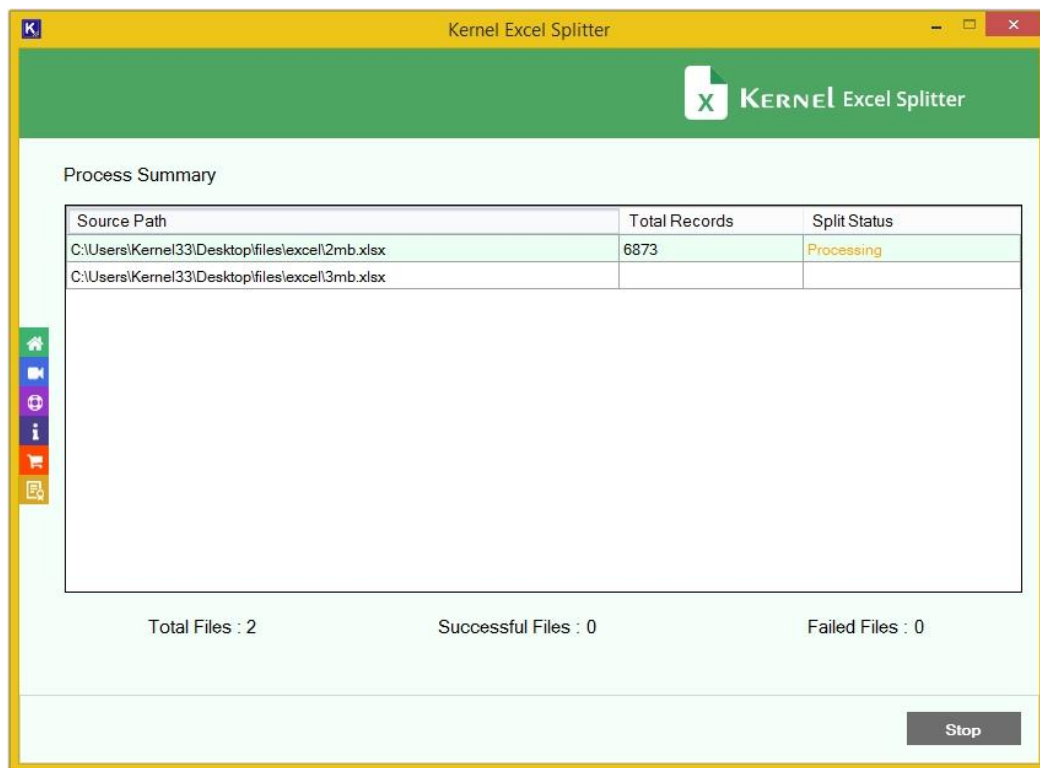

Step 2. Define a saving path or make a new folder, then click **OK**.

Step 3. Click on the **Split** option.

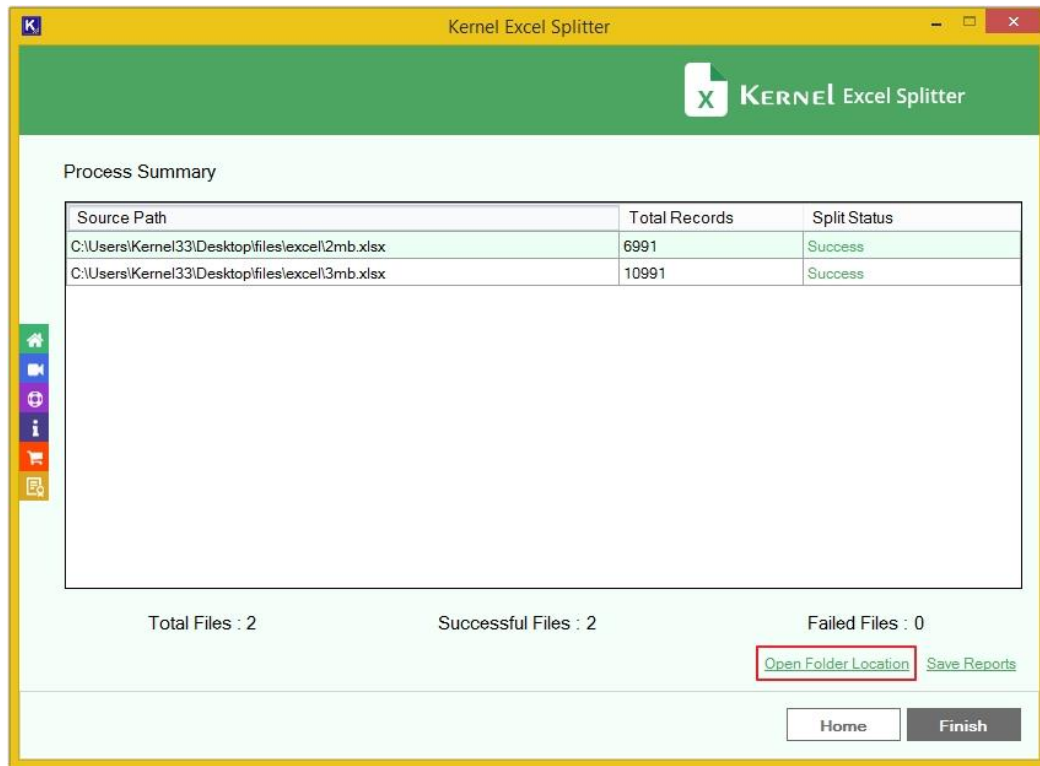

Step 4. The software will begin splitting Excel sheets.

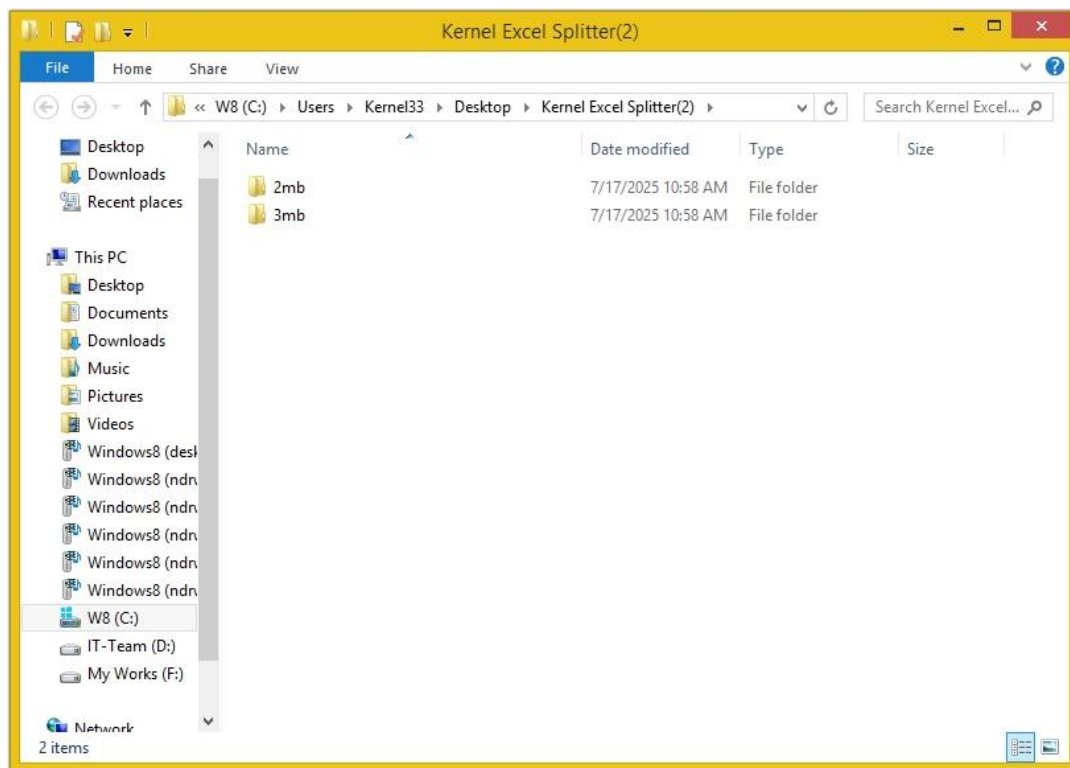

Step 5. Once the process is completed, click **OK**.

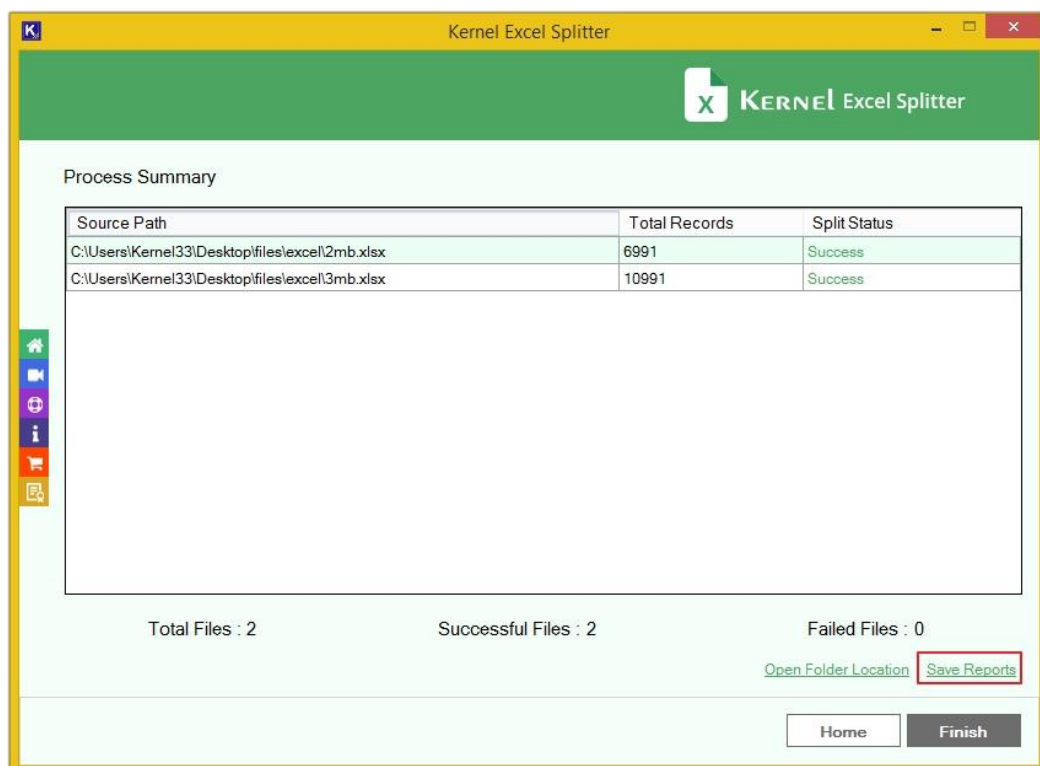

Step 6. Click on the **Open Folder Location** to directly navigate to the saving location of Excel sheets.

Step 7. Click any sheet to get a preview.

Step 8. Click on **Save Reports** to keep the summary in CSV format.

Step 9. Provide the location and click **Save**.
