Timber365 - Our innovative solution for the timber trade market.

The timber and the building materials markets are evolving. Established traditional companies meet new competitors on the Internet. But customers don't just use the Web to compare prices and performance; they expect the same smooth processes of private online shopping for business processes as well. Can you process quotes and orders quickly? How long do your customers have to wait for a quote and how long for their timber or building materials? In addition to increasing competitive pressure, there is also a growing shortage of skilled workers. Are you using the capacities of your employees effectively or are you losing time with cumbersome workflows? What does this have to do with IT? The right business software supports your ongoing operations smoothly. But not only that. It offers answers to all these challenges. And to many more. Completely according to your requirements.

For about 40 years, acadon AG has made it its business to provide IT-based support to companies in the timber industry, both in their daily work and in long-term strategic developments. For this purpose we have developed the customized business software Timber365. A software for all business areas and for all challenges of the timber industry.

Our business software Timber365 is tailored to the needs of the timber and building materials market.

Some special highlights of our solution:

- Clever item handling through various item types such as variant items, catalog items, accessory items, miscellaneous items and more

- Consistent industry-specific dimensional conversions (such as exact determination of dimensional gains/losses)

- Package/batch and measurement management

- Variable packaging and quantity units

- Support of certification systems (FSC, PEFC etc.)
