

Gartenbau-Versicherung partners with CAIRO and B+B

Gartenbau-Versicherung was founded in 1847 by horticulturists for horticulturists and traded as Deutsche Hagel-Versicherungs-Gesellschaft a. G. für Gärtnereien usw. zu Berlin. Its essential task and objective was to guarantee nurseries the best possible

insurance cover at the most favourable conditions. Guided by this task, Gartenbau-Versicherung has been a successful special insurer for the horticultural sector since its establishment.

Customer Size:

Country: Germany, Hessen

Industry: Insurance

Products and Services: Microsoft Azure

Gartenbau-Versicherung, CAIRO & B+B

Customer challenges

Gartenbau-Versicherung runs a wide variety of applications, providing functions such as insurance administration, risk calculation, processing new business, and claims management. In total, over 1,000 individual applications are in use across the organization. With different development strategies used within the company, it was difficult to consistently maintain or enhance these applications and services - and there was no transparency between application environments.

CAIRO & B+B Solution

With the usage of RaCE and StART technology along with CAIRO and B+B expertise Gartenbau-Versicherung was able to modernize legacy applications, such as implementing SOA concepts and flexible web-technologies. C-routines have been migrated to OO-COBOL, procedural COBOL ran natively in multi-language environments. Different codes were easily to maintain through the standardized IDE.

Customer Benefits

Rollout of modernized applications allowed Sales Reps new possibilities supporting their clients with online access on individual agreements and generated additional business impacts.

The use of the RaCE tool will bring qualified results within 4 to 6 weeks and has a minimal impact on the customer's team resources thanks to the high level of automation and our years of experience.

In a 1 to 2 days Discovery Workshop we aim to understand your business and IT strategy in order to identify architecture and system relevant indicators.

The RaCE tool evaluation enables decision makers to estimate the cost and the complexity of any kind of transformation.
