  
- **Automatically**: When a conversation (work item) is assigned to you, Omnichannel for Customer Service sets your presence status based on your capacity as follows:
  - When your capacity is fully utilized, then Omnichannel for Customer Service sets your presence to **Do not disturb**.

- When your capacity is partially utilized, then Omnichannel for Customer Service sets your presence to **Busy**.
- When your capacity isn't utilized, then Omnichannel for Customer Service sets your presence to **Available**.
- If you already have 10 sessions open, which is the maximum multisession limit, and a new work item comes in, then Omnichannel for Customer Service changes your presence to **Do not disturb**.
- When you miss a notification and the missed notifications setting is enabled, then the presence changes to **Inactive**.
- When you reject a work notification and the agent reject notification setting is enabled, then the presence changes to **Do not disturb**.

Presence status conditions

Your presence status pertains to the following conditions:

- Omnichannel for Customer Service determines your presence based on your used or released capacity. The presence changes from **Available** to **Busy**, **Busy** to **Do not disturb**, **Do not disturb** to **Busy**, or **Busy** to **Available**.
- If your presence is **Away** or **Offline**, then Omnichannel for Customer Service doesn't update the presence. But, you can manually change it.
- If you change your presence to **Do not disturb**, then Omnichannel for Customer Service doesn't update the presence. But, you can manually change it.
- If you are inactive or signed out due to any reason, the system will clear your presence status and recalculate a fresh status when you resume your work or sign in again.

The system waits for 2.5 minutes, after which the agent is considered as inactive and is marked as offline when the agent does any of the following actions:

- Closes the browser
- Signs out of Customer Service workspace
- Closes or signs out of the device
- Experiences disruption to internet
- Leaves the browser open without any activity

More information: FAQ on agent presence

Presence status scenarios

The following scenarios describe how your presence status can change while you work with your customers.

- **Reconnect**: When the connection is lost because of network issues, or when you refresh the browser and connect back, then Omnichannel for Customer Service picks up your last known presence.
- **Sign in**: When you sign in, your presence is set to the default presence if no work items have been assigned to you. If work items have been assigned, then your presence is automatically determined. However, if your default presence status is Away or Offline, then Omnichannel for Customer Service doesn't change your presence.
- **Accept work items**: When you accept a work item or it's assigned automatically, then Omnichannel for Customer Service determines your presence based on your work capacity. But if your presence status is Away or Offline, or if you've manually changed your presence to Do not disturb, then Omnichannel for Customer Service doesn't change your presence.
- **Close work items**: When you close a session, or resolve, cancel, or reroute a case, then Omnichannel for Customer Service determines your presence based on your work capacity. But, if your presence status Away or Offline, or if you've manually changed your presence to Do not disturb, then Omnichannel for Customer Service doesn't change your presence.
- **Reset agent presence**: When your presence is based on the missed notification or the agent reject notification, then Omnichannel for Customer Service determines your presence based on your work capacity.

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

As an agent, you communicate with customers to resolve issues. All those conversations are stored as transcripts in Omnichannel for Customer Service app. When you want to find any details from the transcripts, you can search for them.

Search details in transcripts

1. Sign in to Omnichannel for Customer Service.
2. Select **Search** in the nav bar. The **Search** tab opens in the application tab panel.
3. Type a phrase in the search box, and then select the search icon. The results appears as a list.
4. Select a result. The **Conversation Form** opens in the application tab panel.

You can now view the details in the **Transcript** section.

> **Note**
>
> Users with the System Administrator role can access conversations that are handled by other agents.

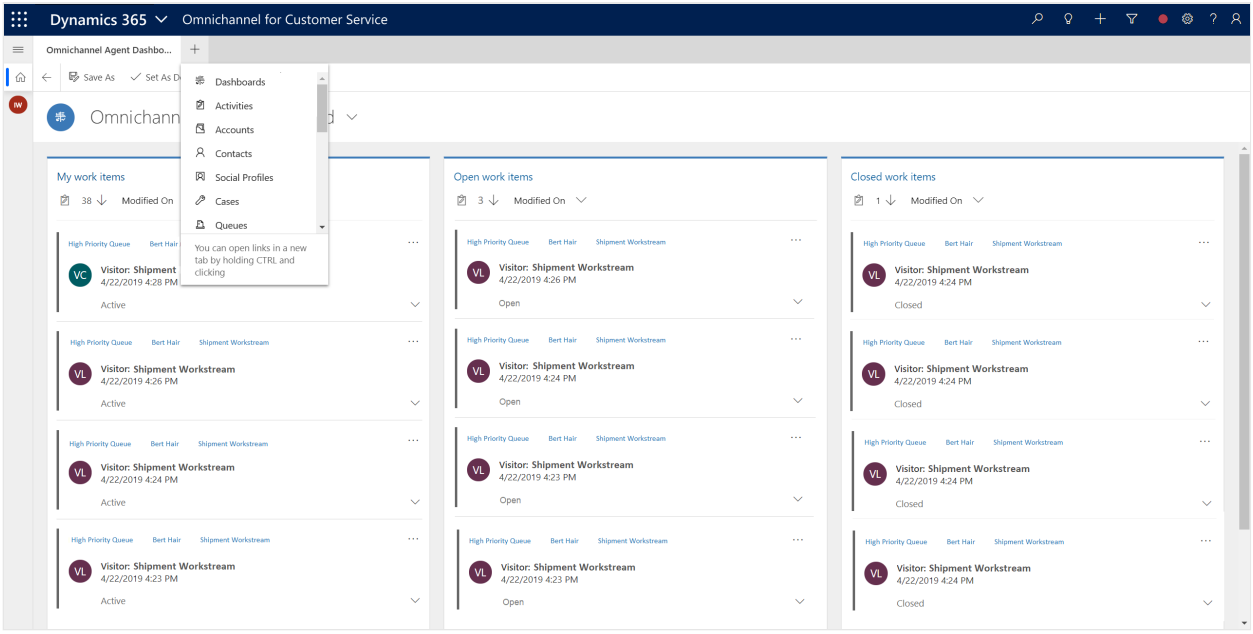
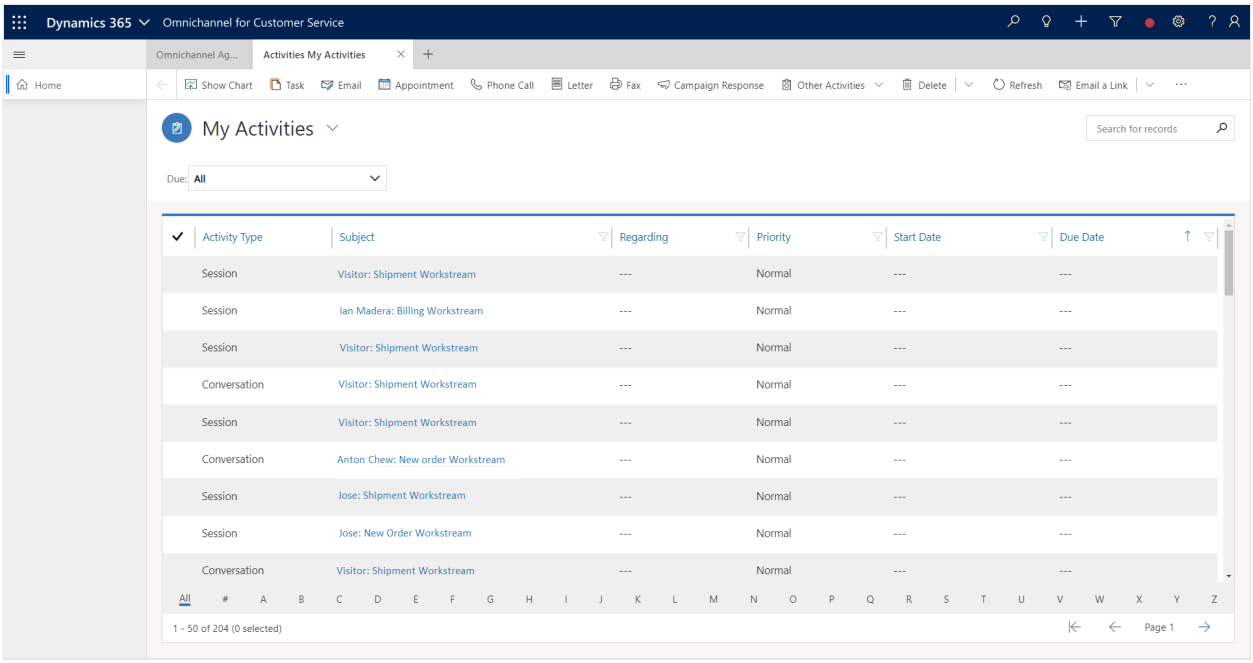
Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Your organization might have a classification where certain agents work in the contact center, which uses Omnichannel for Customer Service on the web and certain agents work in another contact center, which uses model-driven app such as Customer Service Hub. In this case, if you are an agent who works on the model-driven app, and you need to analyze the conversation request from Omnichannel for Customer Service, you can find the information through **Activities** in the model-driven app.

Select the plus icon in the application tab to view the site map and select **Activities**.

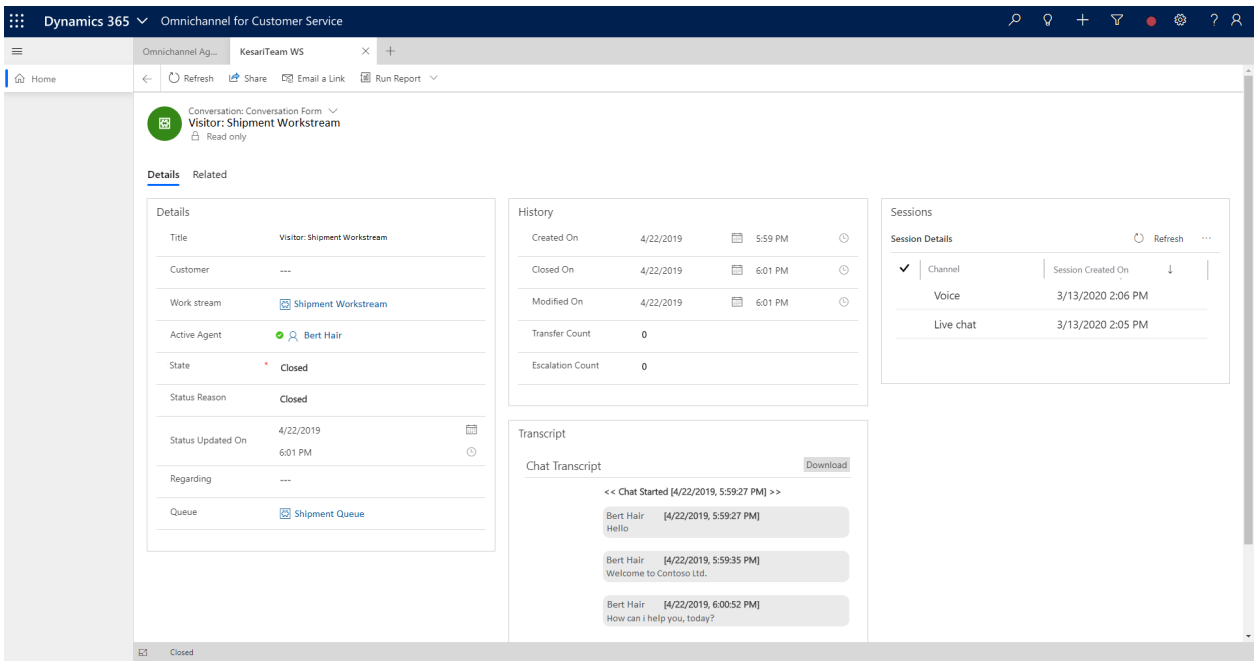


There'll be many activity types, and you need to look for **Conversation** and **Session** types.



Conversation activity type

The Conversation activity type displays information about a conversation request.



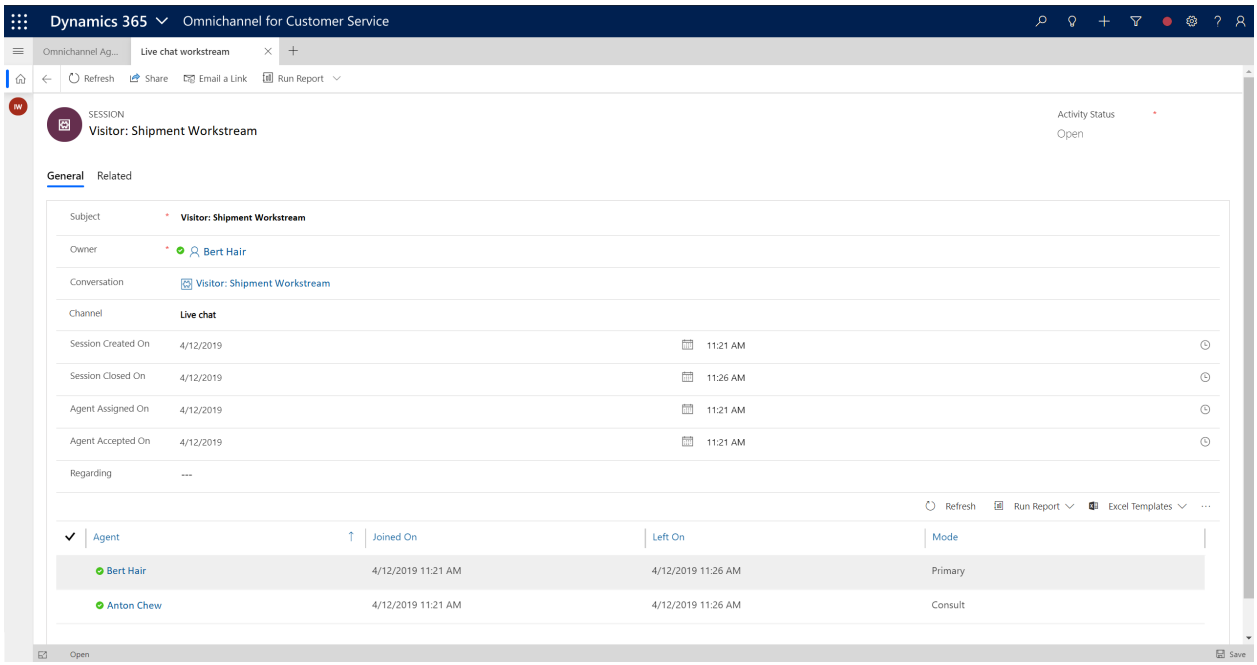
> **Note**
>
> The fields listed in the following table only are supported for the Conversation activity type.

Tab	Section	Fields

Tab	Section	Fields
Details	Details	• Title • Customer • Work stream • Active agent • Activity status • Status reason • Status updated on • Regarding • Queue
Details	History	• Created on • Closed on • Modified on • Transfer count • Escalation count
Details	Session Details	• Channel • Date created • Subject • Date created
Details	Chat Transcript	• Download

Session activity type

The session activity type displays information about a individual session in a conversation request.



> **Note**
>
> The fields listed in the following table only are supported for the Session activity type.

Tab	Section	Field
General	Header	• Activity Status
General	General	• Subject • Owner • Conversation • Channel • Session Created On • Session Closed On • Agent Assigned On • Agent Accepted On • Regarding • Name • Created on
General	Session Participants	• Agents • Joined On • Left On • Mode

The Session Participants section lets you add a participant related to the session or add a session participant that already exists for the record you are working with.

> **Important**
>
> This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making, and should not be used to make, decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using Dynamics 365 Customer Service, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

When language translation is enabled for conversations that are exchanged between the agent and customer or among agents internally, agents can view the conversation in the language that's set as the default for them. The customer receives the agent's messages in the language they used for initiating the chat. This feature removes the necessity of routing conversations only to agents who know the language being used by the customer.

How language translation of conversations works

When a customer initiates a chat conversation on the portal, irrespective of the language used by the customer, the assigned agent receives the chat text in the language that's set as the default. The language translation happens in real time. For example, if a customer initiates a chat in Spanish, the message text appears to an English-speaking agent in Spanish along with the translated English version. The agent has the option to view and respond to the chat in the customer's language or the agent's default language.

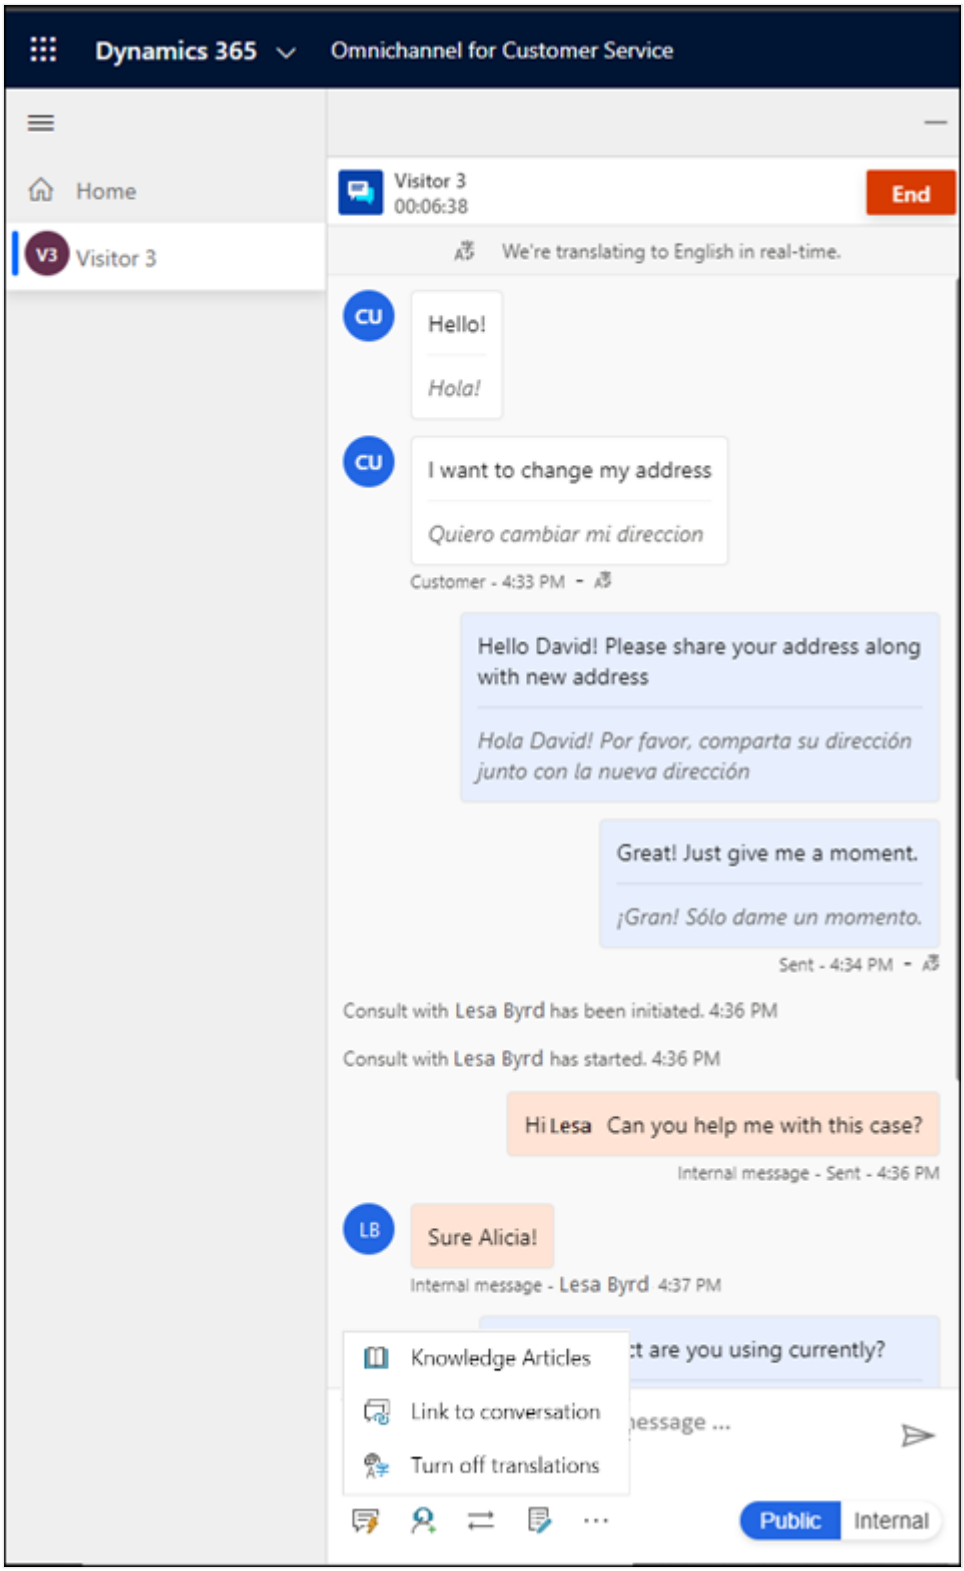
If the agent has to consult a peer or supervisor, it can be done in the language preferred between the agent and peer or agent and supervisor, which can be different from the language used between the agent and customer. The chat transcripts are saved in the languages used in the conversation.

The agent can see the following details pertaining to the feature:

- Information about the language in which the agent receives the chat content is displayed at the top of the chat window.
- The chat content is displayed in the customer's language and translated language.

The agents can turn on or turn off the translation for each conversation by using the **More commands** button on the chat window.

The following image shows a sample screenshot of the agent experience.



The following image shows a sample screenshot of the customer experience.

Markdown formats for agents

Article • 06/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

In Omnichannel for Customer Service, you can use Markdown to format messages when you interact with customers over chat and social channels.

> **Note**
>
> You can use Markdown in chat and social channels only if your administrator has enabled the Markdown settings under **Agent experience** in the Customer Service admin center or Omnichannel admin center app. More information: **Enable formatted messages**

Markdown formats for chat messages

The following table lists the Markdown formats that you can use for your chat messages in Omnichannel for Customer Service.

Text style	You type...	The text displays as...
bold	**bold text** or *bold text*	**bold text**
italics	_italic text_	*italic text*
strikethrough	~strikethrough text~	~~strikethrough text~~
blockquote	> blockquote text	> blockquote text
header (levels 1–4)	### Header3 text	**Header 3 text**
hyperlink	`https://www.microsoft.com`	https://www.microsoft.com

Text style	You type...	The text displays as...
hyperlink with text	[Hyperlink with text] (https://www.microsoft.com)	Microsoft website
monospace	``` monospace text ```	`monospace text`
numbered list	<number> Item one	1. Item one 2. Item two
unordered list	* Item one or - Item one	* Item one * Item two
new line	Paragraph 1 Paragraph 2 </br>	Paragraph 1 Paragraph 2

> **Note**
>
> Currently, we don't support the **<Shift + Enter>** key combination to add multiple line breaks.

Formatted messages are supported in channels such as Microsoft Teams, WhatsApp, Facebook, Telegram, and custom channels that use Direct Line.

Develop a custom live chat widget

Article • 04/25/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Microsoft provides an option to create a custom live chat widget that you can attach to your Dynamics 365 Customer Service account. Each component of the custom live chat widget can be customized for both functionality and user interface.

Depending on your requirement and outcome, you can customize the chat widget using one of the following options:

- Use customizable live chat widget 2.0
- Develop your own widget

Use customizable live chat widget 2.0

The customizable live chat widget 2.0 lets you edit all elements of the widget, such as font, colors, and styling so that you can match the widget with your brand image. The customized widget helps you cultivate trust and credibility, distinguish your brand, foster positive emotional connections, and increase the value that customers attribute to your product.

The new live chat widget 2.0 is built upon Omnichannel Chat SDK and Live Chat Widget UI Component Library.

Portal Developer—Customize out-of-the-box script-based UI

The portal developer option lets you personalize the UI of the chat widget but doesn't modify the out-of-the-box functionality settings in Customer Service admin center. To customize, you can use the "data-customization-callback" script that connects the out-of-the-box widget to a JavaScript function. The function can contain CSS styling customizations to the chat components with the same precedents as the Omnichannel Live Chat Widget UI Components library.

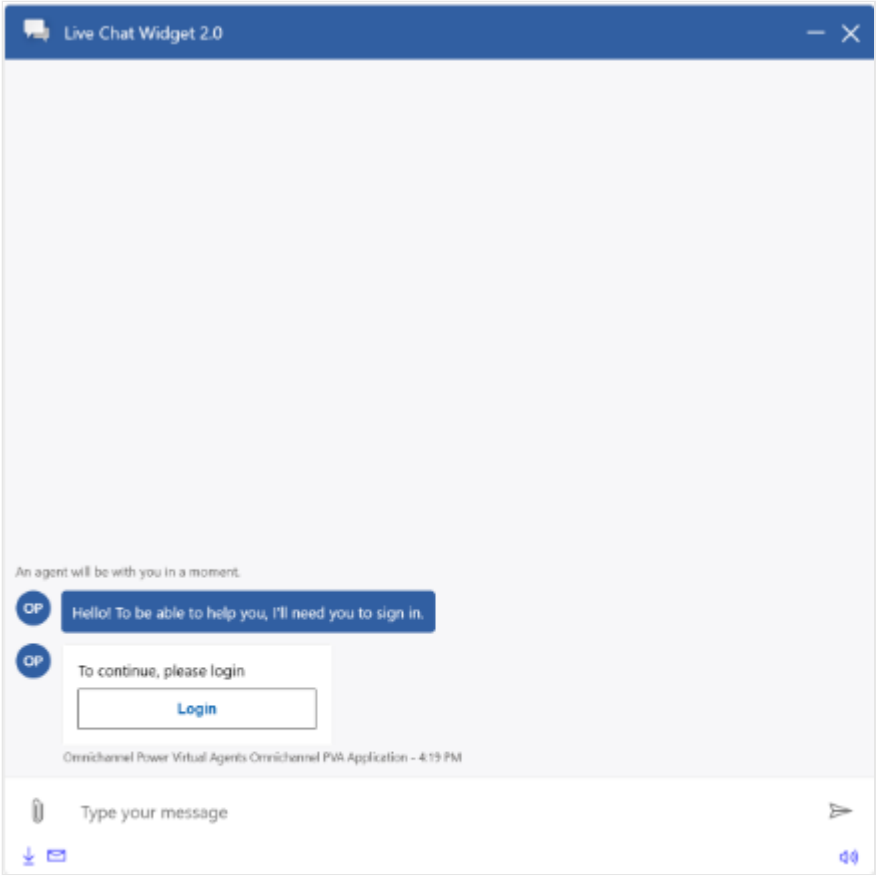
Edit live chat widget script to enable live chat widget 2.0

To use the live chat widget 2.0 and script-based customization, modify the code snippet of the out-of-the-box live chat widget 2.0 as follows.

1. In Customer Service admin center, open the chat workstream, and select **Copy Live Chat Widget 2.0 Script** to copy the code snippet.
2. Create a new JavaScript function with all component styling. More information: Omnichannel chat widget
3. Add "v2" after the script attribute.
4. Add "data-customization-callback" and reference the JavaScript function.

The updated code snippet will look as follows.

An example screenshot of a chat widget 2.0 that's customized to increase its size is as follows.



Watch the walkthrough video of the live chat widget set up.

Develop your own widget

Use the information in the following sections to build your own widget.

Omnichannel Live Chat Widget UI Components library

The Omnichannel Live Chat Widget UI Components library provides a framework of reusable React components. The components are built using the Fluent UI library. Learn more about the Omnichannel Live Chat Widget UI Components library.

Omnichannel Chat SDK

The Omnichannel Chat SDK is an open-source package that provides chat methods and features to add functionality to a live chat widget. Learn more about the Omnichannel Chat SDK.

Customize your live chat widget

After you install the latest version of the Omnichannel Chat SDK, customize your live chat widget using Omnichannel Chat SDK methods and by editing the basic CSS styles

of Omnichannel Live Chat Widget UI Components.

> **Note**
>
> The Omnichannel Chat SDK is a prerequisite for installing the Omnichannel Live Chat Widget UI Components library.

Customize live chat widgets using data tags

Article • 02/01/2023

> **ⓘ Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

You can customize live chat widgets by using data tags in the widget script. You can use the following tags in the chat widget script that you copy from your admin app such as Customer Service admin center or Omnichannel admin center. More information: Embed chat widget in your website or portal

Attribute name	Description	Example
`data-hide-chat-button`	When you implement your chat widget, you can add a chat button that aligns with your mobile app experience instead of using the default chat button. In such cases, use this data tag to hide the default open chat button that's available in the live chat widget.	`<script id="Microsoft_Omnichannel_LCWidget" src="<valid-src>" data-app-id="<valid-app-id>" data-org-id="<valid-org-id>" data-org-url="<valid-org-url>" data-hide-chat-button="true"></script>`
`data-disable-telemetry`	By default, telemetry data collection is turned on for all widgets. Set the value of this data tag to `true` if you want to disable telemetry data collection. More information: Live chat widget telemetry	`<script id="Microsoft_Omnichannel_LCWidget" src="<valid-src>" data-app-id="<valid-app-id>" data-org-id="<valid-org-id>" data-org-url="<valid-org-url>" data-disable-telemetry="true"></script>`
`data-render-mobile`	Open the chat widget in mobile mode. The chat widget doesn't have a header when used on a mobile device. More information: Customize live chat widget for mobile apps	`<script id="Microsoft_Omnichannel_LCWidget" src="<valid-src>" data-app-id="<valid-app-id>" data-org-id="<valid-org-id>" data-org-url="<valid-org-url>" data-render-mobile="true" ></script>`

Attribute name	Description	Example
`data-color-override`	Use this data tag to override the default chat widget theme color. This override will take priority over any color theme settings on the admin app.	Here's an example, where the widget theme color is changed to blue. `<script id="Microsoft_Omnichannel_LCWidget" src="<valid-src>" data-app-id="<valid-app-id>" data-org-id="<valid-org-id>" data-org-url="<valid-org-url>" data-color-override="#0000FF"></script>`
`data-font-family-override`	The default font family is "Segoe UI". Use this data tag to override the default font family with another native supported font.	**Example 1**: To override the default Segoe UI font and set the font family to Arial: `<script id="Microsoft_Omnichannel_LCWidget" src="<valid-src>" data-app-id="<valid-app-id>" data-org-id="<valid-org-id>" data-org-url="<valid-org-url>" data-font-family-override="Arial; Segoe UI"></script>` **Example 2**: To add a custom font family like Monotype Corsiva: `<script id="Microsoft_Omnichannel_LCWidget" src="<valid-src>" data-app-id="<valid-app-id>" data-org-id="<valid-org-id>" data-org-url="<valid-org-url>" data-font-family-override="Monotype Corsiva"></script>`
`data-open-in-window`	Use this data tag to open the chat widget in a new window. You can set this tag to `true` or `false` (default value). By default, the chat widget will open in the same browser window. If set to `true`, the chat widget will open in a new browser window when selected.	`<script id="Microsoft_Omnichannel_LCWidget" src="<valid-src>" data-app-id="<valid-app-id>" data-org-id="<valid-org-id>" data-org-url="<valid-org-url>" data-open-in-window="true"></script>`

Attribute name	Description	Example
`data-suggested-action-layout`	Use this data tag to display the suggested actions vertically. By default, the suggested actions are displayed horizontally. To display the suggested actions vertically, set the value of this data tag as `stacked`.	`<script id="Microsoft_Omnichannel_LCWidget" src="<valid-src>" data-app-id="<valid-app-id>" data-org-id="<valid-org-id>" data-org-url="<valid-org-url>" data-suggested-action-layout="stacked"></script>`
`data-enable-lcw-autofill`	Use this data tag to enable the chat widget to autofill the browser window in embedded mode.	`<script id="Microsoft_Omnichannel_LCWidget" src="<valid-src>" data-app-id="<valid-app-id>" data-org-id="<valid-org-id>" data-org-url="<valid-org-url>" data-enable-lcw-autofill="true"></script>`
`data-custom-close-button-text`	Use this data tag to customize the close button of the chat widget. The input is a text string that will appear in place of the default 'X' close button.	`<script id="Microsoft_Omnichannel_LCWidget" src="<valid-src>" data-app-id="<valid-app-id>" data-org-id="<valid-org-id>" data-org-url="<valid-org-url>" data-custom-close-button-text="End Chat"></script>`
`data-enable-sso-magic-code`	Use this data tag to automatically send a magic code to the user after sign-in, either in the chat or silently through the client. This is similar to multifactor authentication and helps prevent phishing attacks. You can set this tag to `true` (default value) or `false`. If set to `false`, the code is automatically sent through the client silently, after sign-in. If set to `true`, a magic code is displayed to the user to manually enter into the chat, after sign-in.	In this example, the magic code is automatically passed through the client after sign-in, without needing user input. `<script id="Microsoft_Omnichannel_LCWidget" src="<valid-src>" data-app-id="<valid-app-id>" data-org-id="<valid-org-id>" data-org-url="<valid-org-url>" data-enable-sso-magic-code="false"></script>`

Article • 03/17/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

If the live chat SDK does not meet your requirements, then you can embed a widget code in your mobile app. However, embedding a chat widget code has many limitations such as reduced performance, limited mobile usability, and unavailable features.

> **Note**
>
> Live chat widget features—escalating to voice and video, and downloading the chat transcript—aren't supported on mobile apps.

Render the live chat widget using embedded code

A `WebView` is an embedded browser that enables a native application to display web content. Use the `WebView` component of your mobile operating system language to enable rendering of the web version of the chat widget on mobile devices. The WebView capability is offered on both Android and iOS.

The following sample code renders the chat widget in a mobile application.

Kotlin

```
var html: String = """
        <html>
            <head>
                <meta http-equiv="no-cache">
                <meta http-equiv="Expires" content="-1">
                <meta http-equiv="Cache-Control" content="no-cache">
                <script
                    type="text/javascript"
                    src = "Use src from widget code snippet"
```

```
                    id = Microsoft_Omnichannel_LCWidget
                    data-app-id = "Use data-app-Id from widget code snippet"
                    data-org-id = "Use data-org-Id from widget code snippet"
                    data-org-url = "Use data-org-url from widget code
snippet"
                    data-render-mobile = "true"
                    data-hide-chat-button = "true"
                    data-color-override = "desired color code eg. #008577">
                </script>
            </head>
            <body>
            </body>
        </html>
    """.trimIndent()
    var baseUrl: String = "Get baseUrl from data-org-url eg. https://oc-cdn-
ocprod.azureedge.net"
    chatWebView.loadDataWithBaseURL(baseUrl,html, "text/html", null,
baseUrl)
```

You can optimize the rendering of the chat widget for mobile web experience by using data tags such as `data-hide-chat-button` and `data-render-mobile`, along with a few APIs and events provided by the live chat widget client SDK. More information: Customize a chat widget using data tags

To open a chat session, you can call the startChat method when the new chat button is selected.

JavaScript

```
chatWebView.evaluateJavascript(
    "Microsoft.Omnichannel.LiveChatWidget.SDK.closeChat();",
    null
)
```

You can use the `data-render-mobile` data tag to optimize the rendering of the live chat widget on mobile. For example, it hides the header of the chat widget. Along with the header, the **Close (X)** button also goes away. To close the chat, you have to create an "end chat" button in the mobile app and call the closeChat method on the click event.

JavaScript

```
chatWebView.evaluateJavascript(
    "Microsoft.Omnichannel.LiveChatWidget.SDK.closeChat();", null)
```

The preceding code covers the scenario where the user of the mobile app ends the chat. However, in another scenario, where an agent ends the conversation, you can listen for

the lcw:threadUpdate event and call the closeChat method to end the conversation from the client side, as shown in the following code.

JavaScript

```
chatWebView.evaluateJavascript(
    "window.addEventListener(\"lcw:threadUpdate\", function()
{Microsoft.Omnichannel.LiveChatWidget.SDK.closeChat();})", null)
```

When the chat is closed, the live chat widget triggers the lcw:closeChat event. You can listen for this event, and perform any post-chat steps if required.

Download Omnichannel for Customer Service transcripts in bulk

Article • 02/17/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Omnichannel for Customer Service transcripts are stored in base64 encoded format in the annotations table in Microsoft Dataverse. Attachments are stored as separate records in the annotations table. If a conversation has two files exchanged between the agent and the customer, a total of three records are created related to this conversation. Any conversation always has n+1 records stored for it in the annotations table, where n is the number of attachments in the conversation. Attachments are also base64 encoded before being saved.

The option to download transcripts in bulk is not available out of the box. You can use the following Web API requests to retrieve all the transcripts and attachments exchanged in the past one month.

The following Web API request retrieves all the textual transcripts:

HTTP

```
GET [Organization URI]/api/data/v9.1/annotations?$filter=objecttypecode eq
'msdyn_transcript'
Accept: application/json
OData-MaxVersion: 4.0
OData-Version: 4.0
```

The following Web API request retrieves all the file attachment annotations:

HTTP

```
GET [Organization URI]/api/data/v9.1/annotations?$filter=objecttypecode eq
'msdyn_ocliveworkitem'
Accept: application/json
OData-MaxVersion: 4.0
OData-Version: 4.0
```

The `documentBody` attribute in the response obtained from each of the web API requests contains the base64 encoded transcript or attachment.

You can call the APIs using C# code and then iterate over each of the returned records, access the `documentBody` attribute, and process it to get the whole transcripts.

Structure of the JSON transcript

The transcripts you see in the link can contain different types of messages:

- Control messages
- System messages
- Text messages (for example, Hi, Hello, and How are you)
- File attachment metadata

On each of these types of messages, you can see a `createdDateTime` field that denotes the exact time at which this message was posted or created.

A control message is of no visual value and indicates an event like agent joined or left the conversation. It usually has a flag called `isControlMessage` set to `true`.

HTTP

```

},
```

A system message is a special type of message that's shown to the customer regarding events during the conversations. For example, when an agent joins, when an agent disconnects, and when a new agent joins.

HTTP

```
{
    "content": "Alan Steiner has left the conversation.",
    "contentType": "text",
    "createdDateTime": "2020-05-19T04:43:12.976+00:00",
    "from": {
        "application": {
            "displayName": "DynamicsBot",
            "id": "bc81db89-c4d7-4763-91fe-086fcc2e6daf"
        },
        "user": null,
        "phone": null,
        "guest": null,
        "encrypted": null,
        "onPremises": null,
        "azureApplicationInstance": null,
        "applicationInstance": null,
        "device": null
    },
    "likes": [],
    "attachments": [],
    "id": "1589863392976",
    "created": "2020-05-19T04:43:12.976Z",
    "culture": null,
    "deleted": null,
    "important": null,
    "modified": null,
    "modifiedDateTime": null,
    "tags": "system"
},
```

Text messages exchanged during the chat between agent and customer appear as follows:

HTTP

```
{
    "content": "I am using product A",
    "contentType": "text",
    "createdDateTime": "2020-05-19T04:43:03.979+00:00",
    "from": {
        "user": {
            "displayName": "Customer",
            "id": "04fd615d-586d-4866-9791-b24c5f7a9e78"
        },
        "phone": null,
        "guest": null,
        "encrypted": null,
        "onPremises": null,
        "azureApplicationInstance": null,
        "applicationInstance": null,
        "application": null,
        "device": null
    },
    "likes": [],
    "attachments": [],
    "id": "1589863384036",
    "created": "2020-05-19T04:43:03.979Z",
    "culture": null,
    "deleted": null,
    "important": null,
    "modified": null,
    "modifiedDateTime": null,
    "tags": "private,parentID-5493180821148088016",
    "deliveryMode": "unbridged"
},
```

As seen in the preceding code, messages sent by the customer have a display name "Customer" in case of an unidentified customer or their actual name if they're known to Omnichannel for Customer Service.

For the message that's sent by an agent to a customer, there are tags denoting that it's a “public” message sent by the agent. If the tags contain “private”, then they're internal messages exchanged between two agents and are not visible to the customer.

HTTP

```
{
    "content": "Great! Just give me a moment. \\nWhich product are you using
currently?",
    "contentType": "text",
    "createdDateTime": "2020-05-19T04:42:44.202+00:00",
    "from": {
        "user": {
            "displayName": "Alan Steiner",
            "id": "04fd615d-586d-4866-9791-b24c5f7a9e78"
        },
```

```
        "phone": null,
        "guest": null,
        "encrypted": null,
        "onPremises": null,
        "azureApplicationInstance": null,
        "applicationInstance": null,
        "application": null,
        "device": null
    },
    "likes": [],
    "attachments": [],
    "id": "1589863364220",
    "created": "2020-05-19T04:42:44.202Z",
    "culture": null,
    "deleted": null,
    "important": null,
    "modified": null,
    "modifiedDateTime": null,
    "tags": "public,messageId-1589863364202,RTT-C1",
    "deliveryMode": "unbridged"
},
```

A `FileAttachment` message looks like the following snippet in the JSON:

HTTP

```
{
    "content": "",
    "contentType": "text",
    "createdDateTime": "2020-05-06T21:31:37.316+00:00",
    "from": {
      "application": {
        "displayName": "Customer",
        "id": "6cc05310-05d9-4ce5-8fc0-d606c478f896"
      },
      "user": null,
      "phone": null,
      "guest": null,
      "encrypted": null,
      "onPremises": null,
      "azureApplicationInstance": null,
      "applicationInstance": null,
      "device": null
    },
    "likes": [
    ],
    "attachments": [
      {
        "id": "0-wus-d3-37f4fa3cd63945c526799ae5b4e009f5",
        "index": 0,
        "fileType": "docx",
        "name": "mr Hand goes to the moon, By contoso.docx",
        "sourceUrl": "https://us-api.asm.contoso.com/v1/objects/0-wus-d3-
```

```
37f4fa3cd63945c526799ae5b4e009f5/",
        "annotationid": "cfb551a8-ef4f-431a-871f-9b027ff940e3"
      }
    ],
    "id": "1588800697316",
    "created": "2020-05-06T21:31:37.316Z",
    "culture": null,
    "deleted": null,
    "important": null,
    "modified": null,
    "modifiedDateTime": null,
    "deliveryMode": "bridged"
  },
```

It usually has metadata related to the attachments exchanged during the chat. The `annotationid` is the key to the base64 encoded record in Annotations table for that file attachment. You can retrieve the record using the following Web API request. The Web API request gives you the base64 encoded attachment that you can decode and use the way you want.

HTTP

```
GET [Organization URI]/api/data/v9.1/annotations(<annotationid>)
Accept: application/json
OData-MaxVersion: 4.0
OData-Version: 4.0
```

Add a web resource for real-time translation

Article • 03/08/2023

You can use a web resource to implement the logic for enabling real-time translation of messages exchanged in conversations between the customer and the agent.

To add a web resource:

1. Download the sample web resource (webResourceV2.js) file that you can use to implement the logic for enabling real-time translation of the conversation message, which are exchanged between the customer and the agent. More information: Web resources in model-driven apps.

2. Customize the settings, such as define the translation provider, language of the agent, when to turn on translation, and when to turn it off. More information: initializeNewConversation method and translateMessage method.

3. Upload the web resource file in your environment.

Upload the web resource file

Perform the following steps to upload the web resource file for real-time translation:

1. In Dynamics 365, on the top right of the Customer Service admin center page, select **Settings**, and select **Advanced Settings**.

2. On the page that appears on a new tab, select **Settings**, and then select **Solutions**.

3. In **All Solutions**, select **New**, and do the following:
   a. In the General section of the **Solution: New Solution** page, enter the details for the mandatory fields.
   b. Save the solution and close the form.

4. For the added solution, in the left pane, select **Web Resources** under **Components**.

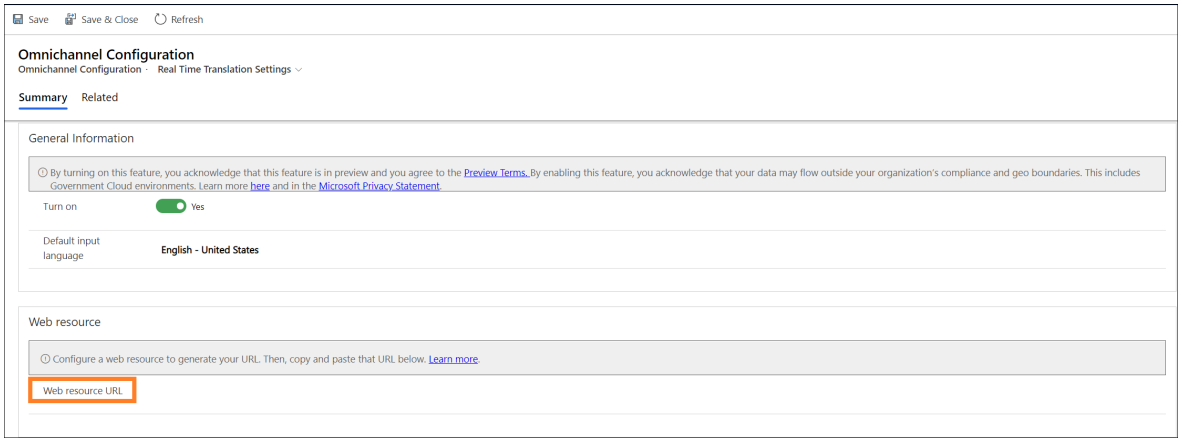
5. Select **New**, and perform the following steps:
   a. In the **General** section, enter a name for the web resource.
   b. In the **Content** section, select Script (JScript) for **Type**.
   c. For **Upload File**, select **Choose File** to upload the JavaScript file that you customized.
   d. Save the form, select the option to publish all customizations.

e. Copy the link in the **URL** field. You'll provide this link in the administrator settings in Customer Service admin center or Omnichannel admin center app for configuring real-time translation.
f. Select the option to publish all customizations on the **Solution** page, and close the form.

6. In the site map of Customer Service admin center app, select **Productivity** under Agent experience, then select **Manage** next to **Real-time translation**.

   If you're using Omnichannel admin center, then in the site map, select **Agent experience** under **Advanced settings**, and then select **Manage** next to **Real-time translation**.

7. In the **Web resource URL** field, paste the link that you had copied, and save the changes.



8. Select **Save**.

Enable third-party co-browse and screen sharing

Article • 03/17/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Introduction

Co-browse and screen sharing are escalation channels in the Chat channel of Microsoft Dynamics 365. A co-browse or screen sharing escalation channel allows your organization's agents to start a co-browse or screen sharing session with customers. Using co-browse, agents can see and interact with a customer's web browser. Using screen sharing, agents can see and interact with the customer's current screen. This provides customers with an extra option to connect to an agent who can efficiently troubleshoot issues in real time.

Co-browse and screen sharing can be enabled in the Omnichannel for Customer Service chat channel by integrating with third-party solutions. Extensibility is provided to enable any providers to onboard their co-browse and screen sharing solution to Omnichannel for Customer Service.

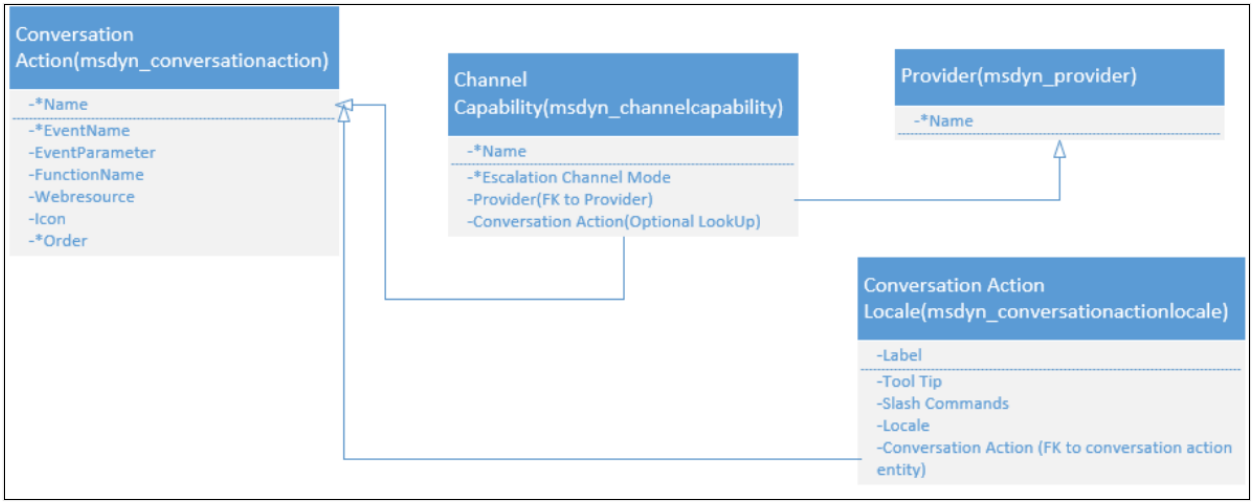
> **Note**
>
> Third-party co-browse and screen sharing features are not available in Unified Service Desk.

Prerequisites

- An active digital messaging or chat subscription.
- Updated Omnichannel base and Omnichannel chat solution with third-party co-browse externalities enabled.

Third-party co-browse and screen sharing extensibility framework

To enable third-party co-browse and screen sharing, the Omnichannel for Customer Service application has added an extensibility system to support this feature. In this system, a few entities have been added to the Omnichannel for Customer Service solution, and third-party co-browse and screen sharing providers should use these entities to enable their co-browse and screen sharing feature in the Omnichannel for Customer Service framework. The following graph explains the basic entity relationships that support the third-party co-browse and screen sharing feature.



Not all the above fields are required to be filled in for third-party co-browse and screen sharing providers. For version 1.0, ISVs are supported to bring their co-browse and screen sharing feature into Omnichannel for Customer Service by enabling a button in the agent's chat widget. When a user selects this button, it opens an app tab within Omnichannel for Customer Service with the ISV's application website. To enable this button, ISVs need to bring the required data with their co-browse and screen sharing solutions.

The following section lists the required entity data needed to support this feature.

- **Conversation Actions entity (msdyn_conversationaction)**

  The action that can be performed in the conversation.

  Fields:
  - Name (This is an identifier name for your button.)
  - Event Name (Option set: Open App Tab Template, Send message, Customer Defined function. For third-party co-browse/screen sharing feature, input **Open App Tab Template**.)

- Event Parameter (For the third-party co-browse/screen sharing button, put the App Tab Template name here.)
- Order (Used to determine the positions for conversation actions. Admin can edit. Smallest number comes first.)
- Icon (A web resource URL that links to the button icon.)

Fields classification and usage:

- This is the entity to store the action button metadata that is visible on the conversation control.
- Localized fields from relationships to Locale entity (label, tooltip, slash command) will be a subgrid in this conversation action form.
- Label, Order, Tooltip, Icon are used for rendering the button in the UI. Slash commands are used by agents to trigger conversation actions by typing the slash command in the chat box.
- Event Name, Web Resource, Event Parameter, and Function Name are used for handling the onButtonClick action.

- **Conversation Action Locale entity (msdyn_conversationactionlocale)**

  Localization information associated with the conversation action.

  Fields:

  - Label (The label of the button showing to users in conversation control.)
  - Tooltip (Tooltip for that button.)
  - Locale (Language key for that button.)
  - Conversation Action (FK to conversation action entity.)

- **Provider entity (msdyn_provider)**

  A list of third-party providers that bring capabilities into the application.

  Fields: Name (ISV name)

- **Channel Capability entity (msdyn_channelcapability)**

  The capability that a channel can enable, such as co-browse and screen sharing.

  Fields:

  - Name (provider_channelcapability relationship name)
  - Escalation Channel Mode (Co-browse, Screen Sharing, Audio, Video, or None. For third-party co-browse and screen sharing providers, use “Co-browse” or “Screen Sharing”.)
  - Provider (FK to Provider entity)

- Conversation Actions (A lookup field for conversation actions. If there is no button created for a certain capability, then it can be empty. For the third-party co-browse and screen sharing feature, link the channel capability to a conversation action record.

Fields classification and usage

The Escalation Channel Mode attribute will tell what this button can do. For example, co-browse, audio, video. When users select a certain Escalation Channel Mode for a conversation action—for example, "co-browse"—Omnichannel for Customer Service will handle this co-browse event and trigger a list of internal events like "create new session for secondary channel," "send system messages," and "update presence," which should be implemented in the Omnichannel for Customer Service code base.

One provider can bring several channel capabilities, but for one Conversation Action and one Provider, the capability should be unique. This is handled by using the Channel Capability entity, as shown in the following schema.

Channel Capability	Provider	Escalation Channel Mode	Conversation Action
ISV_screensharing	ISV	Screen sharing	CA1
ISV_cobrowse	ISV	Co-browse	CA2

UI rendering for the third-party co-browse and screen sharing button

Label, Order, Tooltip, and Icon are used for rendering a button in the UI. Users also can provide a slash command key for their button, but the slash command needs to be unique in the system. Users need to input this data when bringing in their button.

Name	Label	Order	Tooltip	Slash command	Icon
ISVCobrowse	ISV Co-browse	0	Start a Co-browse session provided by ISV	/cb	/webresource/.../...svg

Event handlers for third-party co-browse and screen sharing

For third-party co-browse, ISVs need to input the conversation action data for triggering the Open App Tab Template event. The Event Names are option sets. It can be a predefined omnichannel event that can be used for most cases, like Open App Tab Template or Send message. In a third-party co-browse case, it will use the Open App Tab Template as Event Name and the Event Parameter can be the App Tab Template name. There will be no Web Resources data for this event because the App Tab Template framework will handle the web resource.

Name	Event Name	Event Parameter	Capability
ISVCobrowse	Open App Tab Template	ISVAppTabTemplate	Co-browse

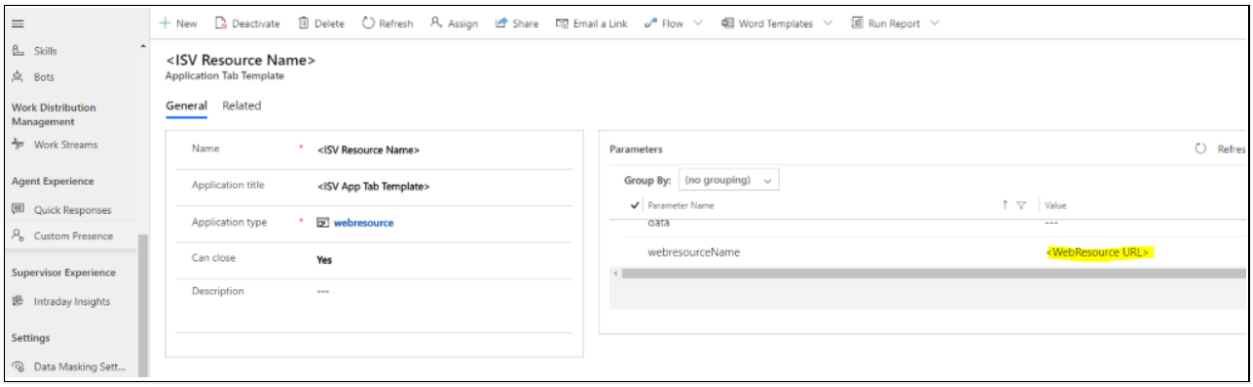
App Tab Template for third-party co-browse and screen sharing

We encourage our integrated third-party co-browse providers to make their co-browse and screen sharing applications inside of an Omnichannel for Customer Service tab. When the agent selects the **Co-browse** button in the chat widget, it will open this tab. Inside of this tab, the agent can start and end the co-browse sessions and share the session invitations with customers. You can include the data in this form inside of your solution. Follow these steps to create the App Tab Template:

1. Sign in to Power Apps and select **Apps**.
2. Select the ellipsis next to Omnichannel for Customer Service and select **App profile manager**.
3. Select **App profiles**.
4. Expand **Omnichannel for Customer Service**.
5. Under **Templates**, select **Application tabs**.
6. Select **New** to create a channel application tab.

   See Manage application tab templates for more information about completing this form.
7. In the Application type field, select **webresource**.
8. In the Parameters section, add the web resource URL and query parameters that are required for ISVs to open their web resources.

   webresourcename: `<URL path to the web resource>`



You'll find a single URL parameter called `data` that'll contain a JSON object. This object when decoded and parsed will contain the `conversationId` field. This ID can be used to attach any data back to a conversation.

Create the third-party co-browse and screen sharing solution with the required data

ISVs should bring in all the required data as specified in the Third-party co-browse extensibility framework section and the App Tab Template for third-party co-browse section to make this framework work.

The data input requirements for third-party providers are as follows:

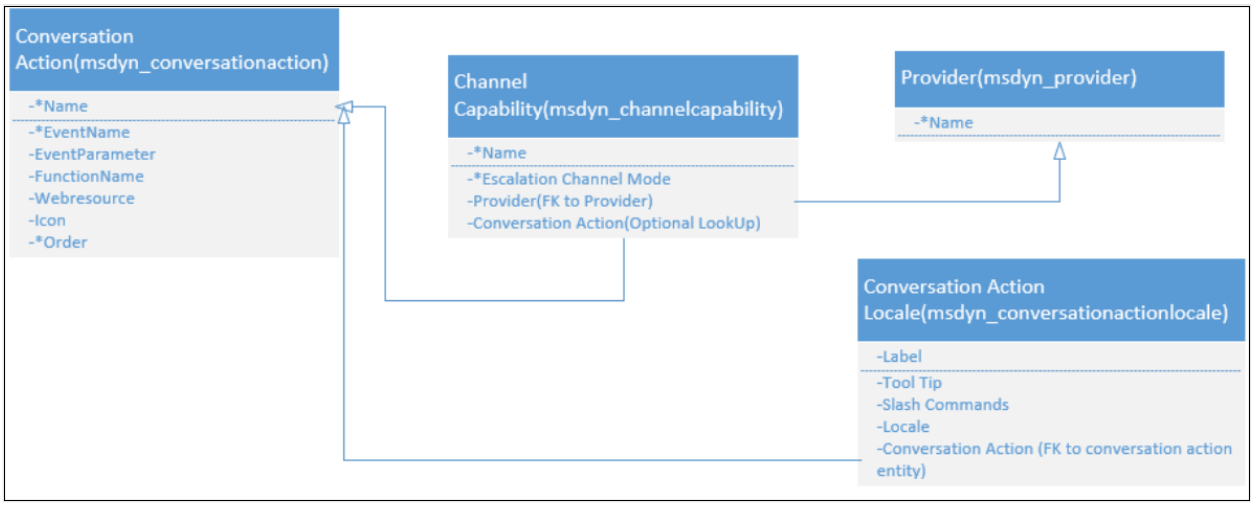
- App Tab Template record.
- Conversation Action record. (If you have both co-browse and screen sharing options, you can create two records, one for each.)
- Conversation Action Locale record. (For each conversation action you created, you should have at least one Conversation Action Locale record. The basic language we support is English.)
- Provider record.
- Channel Capability record. (If you have both co-browse and screen sharing options, you can create two records, one for each.)

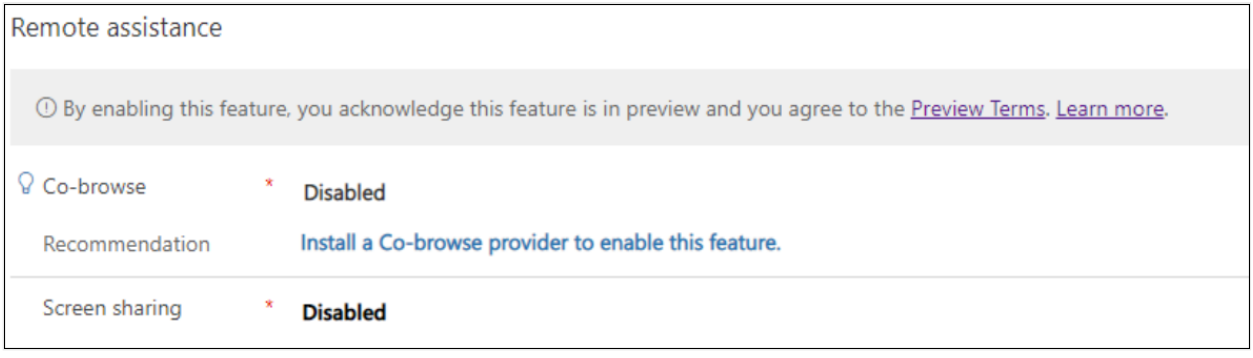
These records (Conversation Action records, Conversation Action Locale records, Channel Capability records, Provider record, and Application Tab Template records) should be included as part of the solution you create as a third-party provider so that the end user doesn't need to create them manually.

Omnichannel administration experience for third-party co-browse and screen sharing

> **Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

In the **Conversation Options** tab of the chat widget, in the **Remote assistance** section, the Omnichannel administrator can choose to enable or disable the third-party co-browse and screen sharing options per chat widget. If there are no co-browse and screen sharing providers installed in this organization, these two options are disabled as shown here.

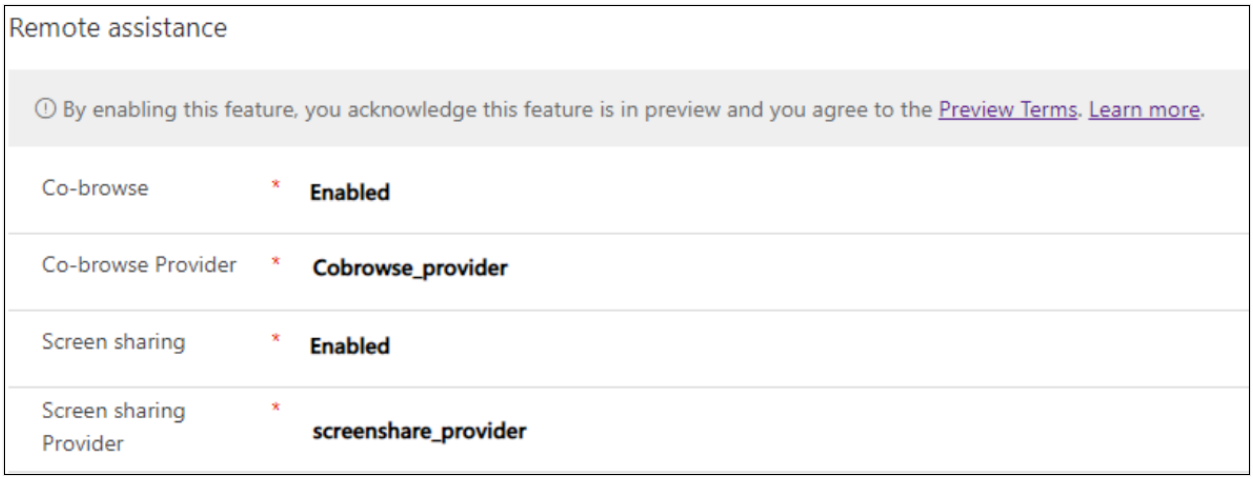




> **Note**
>
> The co-browse provider and screen sharing provider are controlled separately. You can install a co-browse provider by creating a co-browse channel capability record

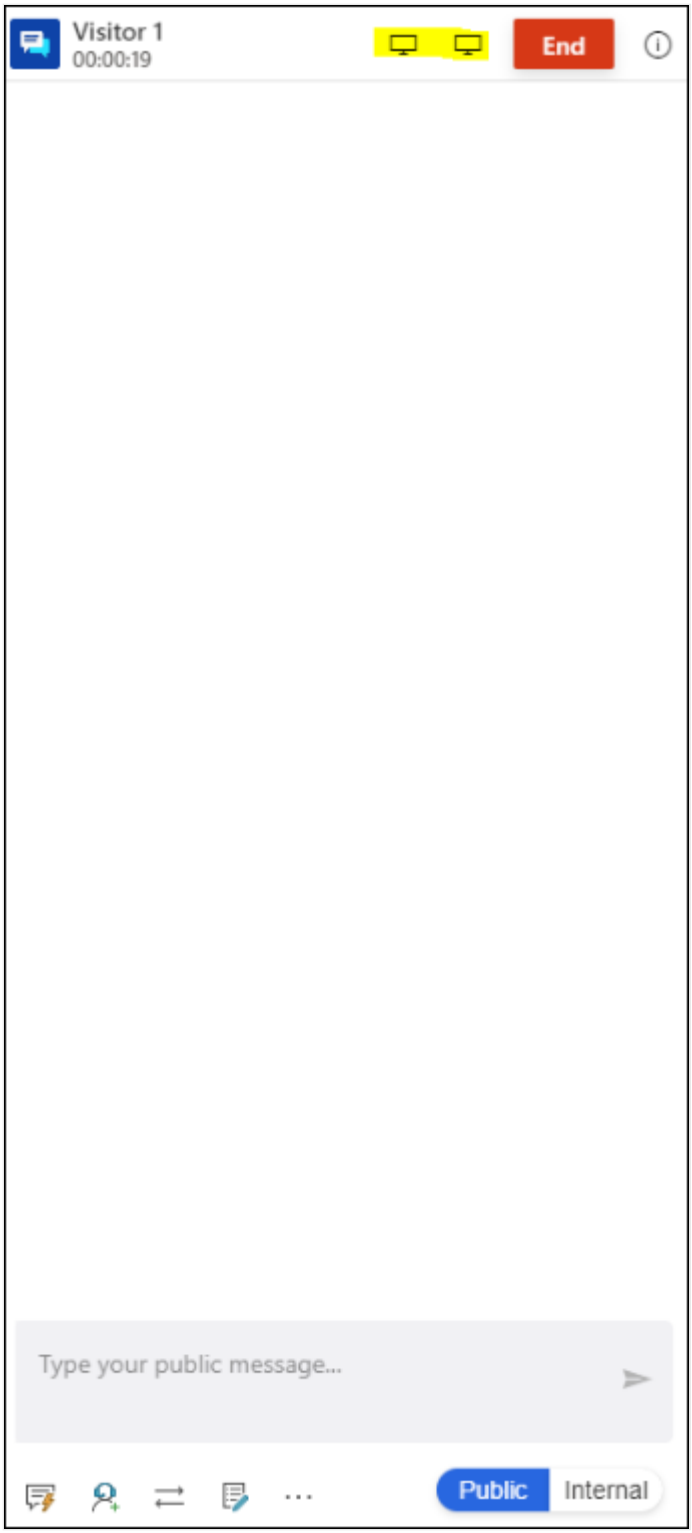
with required provider and conversation action data, the same as the screen sharing provider.

When the organization has been provisioned with both options—that is, when it has two different channel capabilities installed—the admin can choose which third-party co-browse provider to use. Also, it's the admin's choice whether to disable or enable these options. Here is the screenshot for admin enabled both options and selected the both providers.



Co-browse and screen sharing button rendering in the agent chat widget

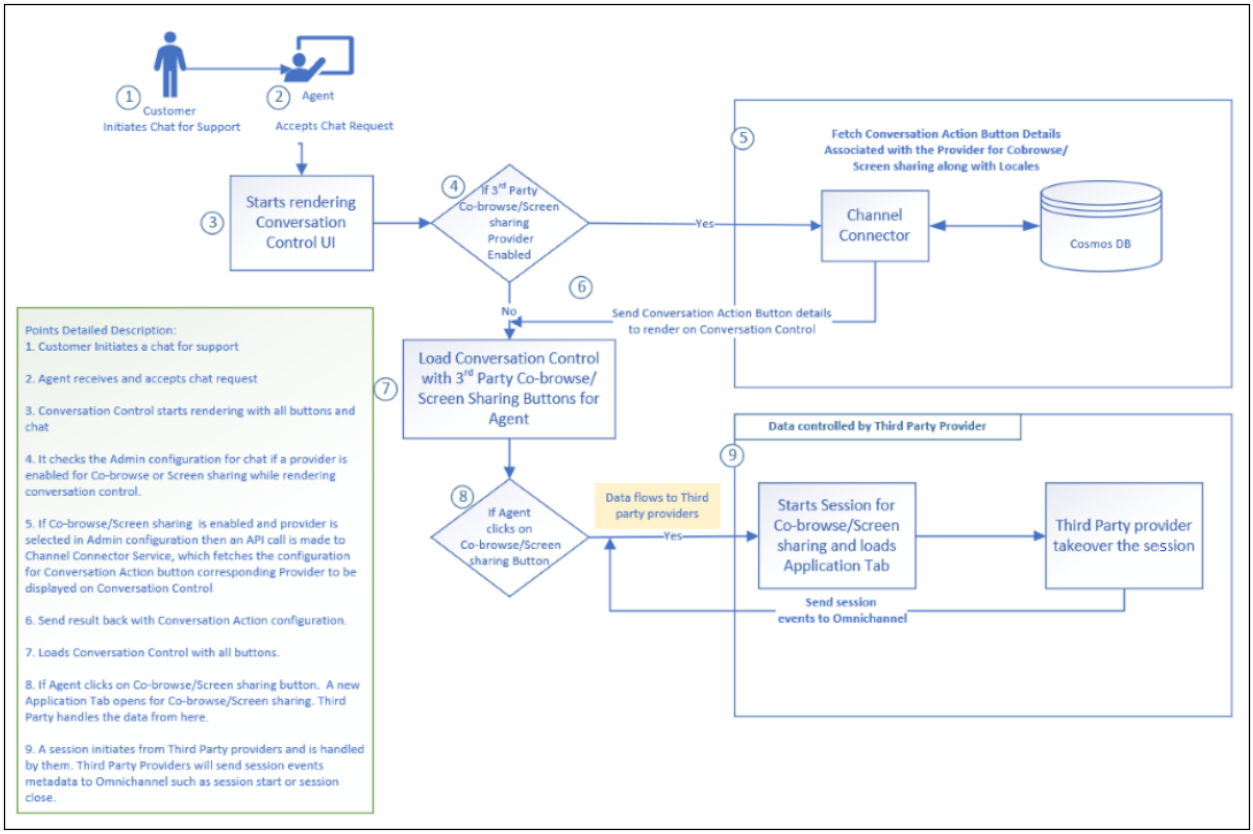
When a co-browse and screen sharing button is defined, it will be rendered at the top of the conversation control as shown here.



Omnichannel session services and data flow for third-party co-browse and screen sharing

When an agent selects the button for co-browse or screen sharing, it triggers the application tab inside of the Omnichannel service. Omnichannel for Customer Service will handle the events as escalation channels event type. Omnichannel for Customer Service internal services will update the status for current session events.

After the third-party applications take over, all data will be handled by a third-party application server. See the following graph for the integration data flow.



Some important events, such as starting or ending session events, should be reported to the Omnichannel service, so the overall service knows the status of the current agent. We provide third-party providers with this framework. It is the third-party providers' responsibility to implement it in their codebase. The next section provides details on how to implement it.

Events expected from the third-party application

The third-party application is expected to send events notifying Omnichannel for Customer Service of different milestones in the co-browse and screen sharing session. Currently, these events are as follows:

- CobrowseConnectedEvent (on connection of the co-browse session)
- CobrowseEndedEvent (on end of the co-browse session)
- ScreenShareConnectedEvent (on connection of the screen sharing session)
- ScreenShareEndedEvent (on end of the screen sharing session)

The events must be dispatched within the third-party web resource to the `window.top` element.

JavaScript

```
function triggerCobrowseStart() {
  if(document.createEvent) {
    let params = {};

    let evt = new CustomEvent('CobrowseConnectedEvent', {detail: params});
    window.top.dispatchEvent(evt);
  }
}
```

The `CobrowseEndedEvent` and `ScreenShareEndedEvent` should be added to the `onbeforeunload` property of the web resource so that the session is ended if the agent closes out of the tab within Omnichannel for Customer Service.

HTML

```
<script>
function triggerCobrowseStop() {
  if(document.createEvent){

    let params = {};

    let evt= new CustomEvent('CobrowseEndedEvent', {detail:params});
    window.top.dispatchEvent(evt);
  }
}

</script>
</head>
<body onbeforeunload="return triggerCobrowseStop()">
</body>
```

Provisioning and deprovisioning requirements

To provision the third-party co-browse and screen sharing solution for our customers, ISVs should provide a solution with the required data. When customers install the solution, minimal or no manual steps are required of them to enable the co-browse and screen sharing feature. We require ISVs to be responsible for the data they created and to follow our guidance as required.

To deprovision the third-party co-browse and screen sharing solution for our customers, ISVs should remove the solution along with the data created with this framework. There shouldn't be any existing legacy data or code remaining in that org after deprovisioning.

Publishing strategy

The following are links for publishing the application to AppSource:

Third-party providers responsibility and data disclaimer

Be sure to publish the privacy policy link to AppSource for security and privacy protection of the personal information that would be processed, and provide a compliant approach to data protection.

Live chat widget telemetry

Article • 06/17/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

The live chat widget in Chat for Dynamics 365 collects telemetry data from end users to improve the feature's capabilities, reliability, and performance over time by helping Microsoft understand usage patterns, plan new features, and troubleshoot and fix problem areas.

Some of the data collected by the live chat widget include the following.

Field	Sample value
OrganizationId	`8e9071c2-4415-47aa-b1cb-693631e7fafb`
Chat Widget Version	`prod`
BrowserName	`Edge`
OSName	`Windows`
Anonymized IP Address (last octet redacted)	`19.207.000.000`

> **ⓘ Important**
>
> No personal data is contained in the live chat widget telemetry.

If your organization is concerned about the data collected by this service, you can turn off automatic data collection by adding an HTML attribute to the chat widget script.

HTML

```
data-disable-telemetry = "true"
```

Configure relevance search for transcripts

Article • 01/29/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

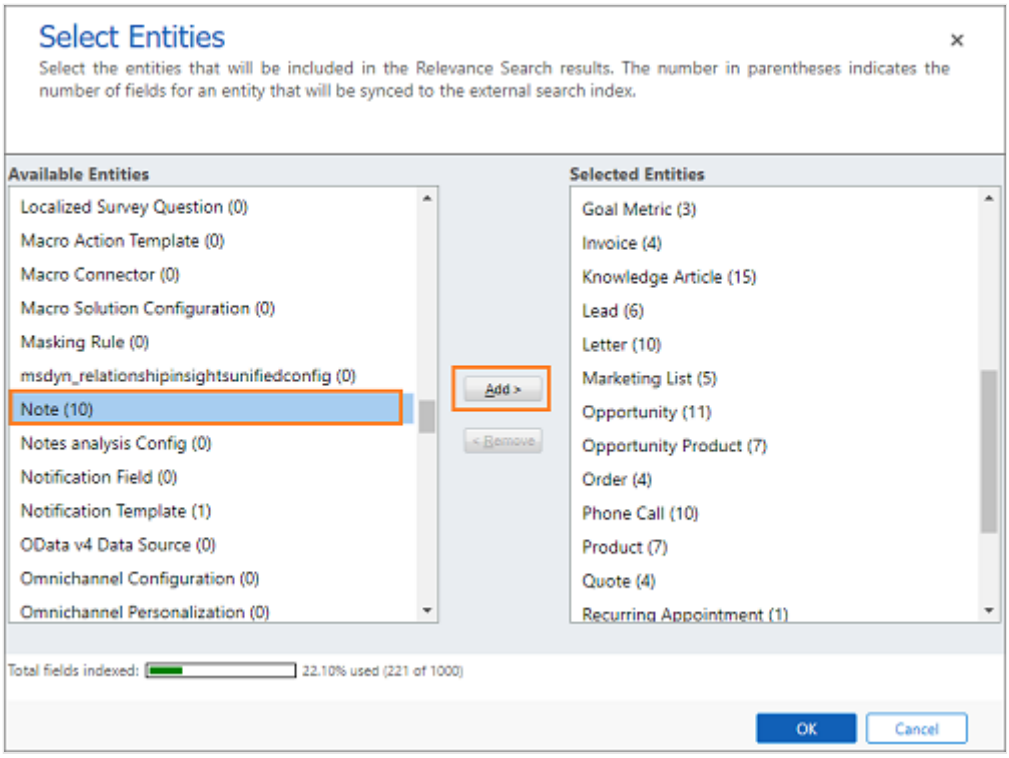
In Omnichannel for Customer Service, agents can search for details in transcripts. To enable agents to search in transcripts, you as a system customizer need to configure relevance search for the Note entity and then add the entity to Omnichannel for Customer Service.

Prerequisites

Ensure that relevance search is enabled in your environment. To learn more, see Enable relevance search.

Configure relevance search for the Note entity

1. Sign in to Dynamics 365.
2. Select **Settings** > **Customizations** > **Customize the System**. The **Solution: Default Solution - Microsoft Dynamics 365** window appears.
3. Under **Components**, select **Entities**.
4. Select **Configure Relevance Search**. The **Select Entities** dialog appears.
5. In the **Available Entities** box, select **Note**, select **Add**, and then select **OK**.



6. Select **Save**.

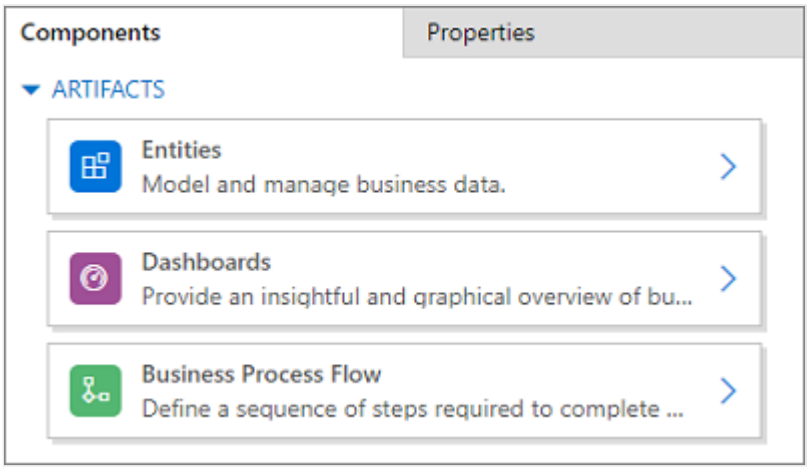
7. Select **Publish All Customizations**.

Add the Note entity to Omnichannel for Customer Service

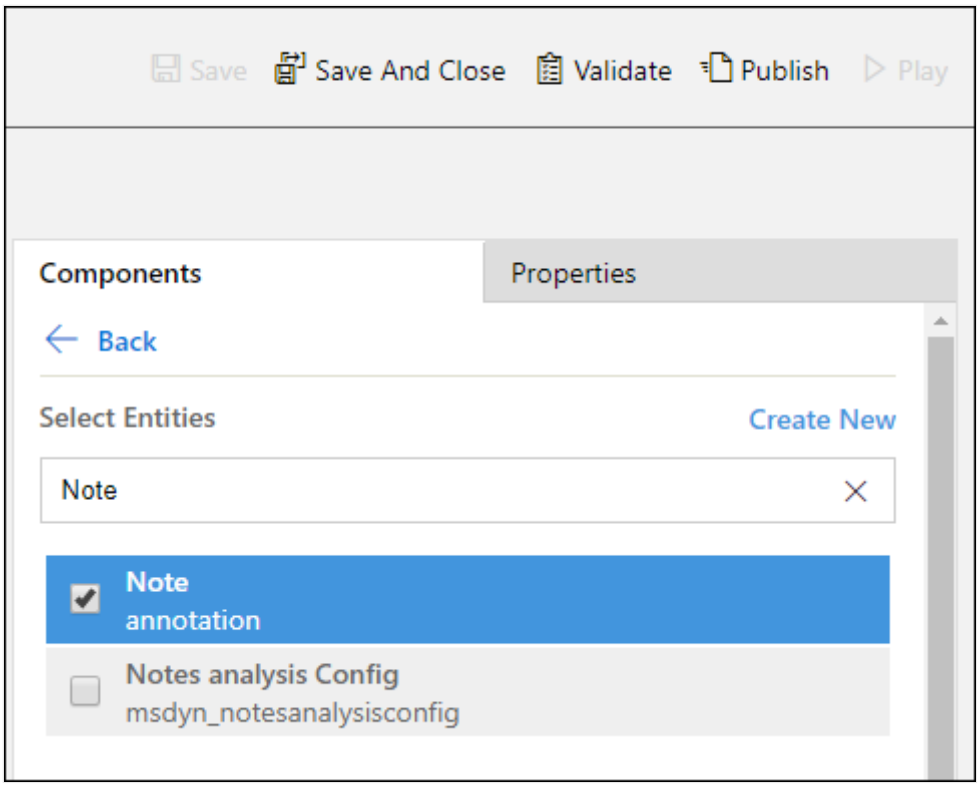
1. Sign in to `https://<org>.dynamics.com/apps`.

2. Select **More Options** (...) in the **Omnichannel for Customer Service** app tile, and then select **OPEN IN APP DESIGNER**. The **App Designer** opens in a new browser tab.

3. On the **Components** tab, under **ARTIFACTS**, select **Entities**.



4. Type **Note** in the search box, and then select the check box next to **Note** in the search results.



5. Select **Save**, and then select **Publish**.

Search for transcripts

Configure Link to conversation button in model-driven app entity form

Article • 08/19/2021

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

This topic describes how you, as a system customizer, can configure the **Link to conversation** button in the model-driven app entity form for agents using Omnichannel for Customer Service app.

When an agent accepts a conversation request, and there is no record in Omnichannel for Customer Service linked to this conversation, the agent wants to search for a contact or account record and link the record to the conversation. As a system customizer, you need to configure the **Link to conversation** button in the model-driven app entity (contact, account or case) form so agents can link a record to the current conversation. After you link a record to the conversation, the **Active Conversation** page loads and displays the record that you linked.

> **Note**
>
> The Link to conversation button appears only in a session (context of a conversation) and not on the main forms.

To add the **Link to conversation** button in the model-driven app entity form, as a system customizer, you need to customize the ribbon (`<RibbonDiffXml>`) definition. The customization change definitions that you specify are applied at runtime when the ribbon is displayed in the application.

With latest release of Omnichannel for Customer Service base solutions, you get the web resources to add the **Link to conversation** button.

Customize the entity ribbon to add Link to conversation button

To add the **Link to conversation** button, you need to customize the ribbon (`<RibbonDiffXml>`) of the entity. To do so, you will edit the ribbon in the **Form context** of the entity.

Name of the web resource: `msdyn_OmnichannelLinkCommand.js`

Step 1: Export and edit the XML

Step 2: Add command and define ribbon actions

Step 3: Enable display rules

Step 4: Import the ribbon

Step 1: Export and edit the XML

In this step, you need to export the ribbon and edit the `<RibbonDiffXml>`.

To learn more, see Export, prepare to edit, and import the ribbon.

Step 2: Add command and define ribbon actions

Edit the XML to provide values for the parameters such as:

- Library
- FunctionName
- StringParameter Value
- Button

Parameter name	Value	Comment
`Library`	`$webresource:msdyn_OmnichannelLinkCommand.js`

      </Titles>
```

```
    </LocLabel>
  </LocLabels>
</RibbonDiffXml>
```

To learn more, see Define ribbon actions.

Step 3: Enable display rules

Enable display rule for an entity, and add custom rule within the enable rule tag.

The `<CustomRule>` element calls a function in a JavaScript library that returns a Promise.

Parameter name	Value	Comment
`EnableRuleId`	`msdyn.account.EnableInConversationContext.EnableRule`	
`Library`	`$webresource:msdyn_OmnichannelLinkCommand.js`	In the `<CustomRule>` element
`FunctionName`	`OmniChannelPackage.OmnichannelLinkCommand.shouldDisplayLinkCommand`	In the `<CustomRule>` element

Sample XML to enable display rules

XML

```
<CommandDefinitions>
    <CommandDefinition Id="msdyn.account.LinkToConversation.Command">
      <EnableRules>
        <EnableRule Id="msdyn.account.EnableInConversationContext.EnableRule"
/>
      </EnableRules>
      <DisplayRules />
      <Actions>
        <JavaScriptFunction
FunctionName="OmniChannelPackage.OmnichannelLinkCommand.linkRecordToConversat
ion" Library="$webresource:msdyn_OmnichannelLinkCommand.js">
          <StringParameter
Value="msdyn_account_msdyn_ocliveworkitem_Customer" />
        </JavaScriptFunction>
      </Actions>
    </CommandDefinition>
  </CommandDefinitions>
  <RuleDefinitions>
```

```
    <TabDisplayRules />
    <DisplayRules />
    <EnableRules>
      <EnableRule Id="msdyn.account.EnableInConversationContext.EnableRule">
        <CustomRule
FunctionName="OmniChannelPackage.OmnichannelLinkCommand.shouldDisplayLinkComm
and" Library="$webresource:msdyn_OmnichannelLinkCommand.js" Default="false"
/>
      </EnableRule>
    </EnableRules>
```

To learn more, see Define ribbon display rules

Step 4: Import the ribbon

In this step you need to import the customized ribbon.

To learn more, see Import the ribbon.

Start a chat

Article • 02/17/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Follow these steps to start a chat:

1. Listen to the **lcw:ready** event raised by a live chat to start using the live chat SDK methods. The live chat methods should be invoked after the **lcw:ready** event is raised. You can listen for this event by adding your own event listener on the window object.

2. After the **lcw:ready** event is raised, call the startChat method to start a chat.

   To authenticate a customer when you start a chat, see Send authentication token.

   To start a chat proactively depending on various customer scenarios in your organization, see Start a chat proactively.

Sample code

JavaScript

```
window.addEventListener("lcw:ready", function handleLivechatReadyEvent(){
    // Handle LiveChat SDK ready event
    // SDK methods are ready for use now
    // Initiate a chat using startChat SDK
    Microsoft.Omnichannel.LiveChatWidget.SDK.startChat();
});

window.addEventListener("lcw:error", function
handleLivechatErrorEvent(errorEvent){
    // Handle LiveChat error event
    console.log(errorEvent);
});
```

Consider a scenario where the customer is on your portal page, and you want to start a chat after the customer has spent some time on the page. You can programmatically open the chat widget after the specified time has elapsed.

The following sample code shows how you can start a chat after the customer has been waiting for 5 minutes:

JavaScript

```
window.addEventListener("lcw:ready", function handleLivechatReadyEvent(){
    // Open chat widget proactively after customer has been waiting for 5
minutes
    setTimeout(function startProactiveChat() {
        Microsoft.Omnichannel.LiveChatWidget.SDK.startChat();
    }, 300000);
});
```

Use custom chat button

To use a custom chat button instead of the out-of-the-box chat button, add the attribute `data-hide-chat-button` in the widget snippet and set its value to `true`. Invoke the startChat method on click of the custom UI component to start the chat.

Sample code snippet to hide the standard chat button

`<script id="Microsoft_Omnichannel_LCWidget" src="<valid-src>" data-app-id="<valid-app-id>" data-org-id="<valid-org-id>" data-org-url="<valid-org-url>" data-hide-chat-button="true"></script>`

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

You can help improve customer satisfaction by anticipating areas where customers need help, and then engaging them through chat when they've been browsing your website for some time.

Consider the following scenarios for proactively starting a chat.

> **Note**
>
> The code samples listed in the following scenarios use the **setContextProvider API** that can be used for unauthenticated chat only. For authenticated chat, you must use the JSON Web Token (JWT). More information: **Send authentication tokens**

Scenario 1: Customer wait time

Amy has accidentally damaged a Surface Book and is on the product knowledge base trying to seek answers for about 20 seconds. A proactive chat request is triggered based on the product page that Amy was browsing and the time spent on the page.

```
Hi! Just checking in to see if I can help answer any questions you may have.
```

Amy can accept the chat offer and start the conversation to sort out the issue.

Sample code

HTML

```
<!-- Code to show proactive chat invite after visitor has spend given time
on the webpage -->
<script id="Proactivechattrigger">
    // Wait for Chat widget to load completely
```

```
    window.addEventListener("lcw:ready", function handleLivechatReadyEvent()
{
        var timeToWaitBeforeOfferingProactiveChatInMilliseconds =
20000;//time to wait before Offering proactive chat to webpage visitor
        // Setting context variables
        Microsoft.Omnichannel.LiveChatWidget.SDK.setContextProvider(function
contextProvider(){
            return {
                'Proactive Chat':{'value':'True','isDisplayable':true},
                'Time On Page':{'value':
timeToWaitBeforeOfferingProactiveChatInMilliseconds ,'isDisplayable':true},
                'Page URL':{'value':
window.location.href,'isDisplayable':true},
            };
        });

        //Display proactive chat invite after
'timeToWaitBeforeOfferingProactiveChatInMilliseconds' milliseconds
        setTimeout(function(){

Microsoft.Omnichannel.LiveChatWidget.SDK.startProactiveChat({message: "Hi!
Just checking in to see if I can help answer any questions you may have."},
false)
        },timeToWaitBeforeOfferingProactiveChatInMilliseconds);
    });
</script>
```

Scenario 2: Customer visits a webpage multiple times

Thomas is browsing through the Microsoft Surface community webpage and is looking for information on Microsoft Surface device. Thomas has visited a webpage multiple times but is not able to find the answers.

Realizing this scenario, the organization offers a chat request to the customer with the following message.

```
Hi! Do you have a question on Surface device ? I am here to help.
```

Sample code

HTML

```
<!-- Code to show proactive chat invite(after given time) after visitor
visits the webpage given number of time -->
```

```
<!-- Operations on cookies like creating cookies, deleting cookies etc.. -->
<script>
var expdate = new Date ();
expdate.setTime (expdate.getTime() + (24 * 60 * 60 * 1000*365)); // 1 yr
from now
/* ######################## start set cookie  ######################## */
function setCookie(name, value, expires, path, domain, secure) {
  var thisCookie = name + "=" + escape(value) +
      ((expires) ? "; expires=" + expires.toGMTString() : "") +
      ((path) ? "; path=" + path : "") +
      ((domain) ? "; domain=" + domain : "") +
      ((secure) ? "; secure" : "");
  document.cookie = thisCookie;
}

/* ######################## start get cookie value ######################## */
function getCookieVal (offset) {
  var endstr = document.cookie.indexOf (";", offset);
  if (endstr == -1)
    endstr = document.cookie.length;
  return unescape(document.cookie.substring(offset, endstr));
/* ######################## end get cookie value ######################## */
}

/* ######################## start get cookie (name) ########################
*/
function GetCookie (name) {
  var arg = name + "=";
  var alen = arg.length;
  var clen = document.cookie.length;
  var i = 0;
  while (i < clen) {
    var j = i + alen;
    if (document.cookie.substring(i, j) == arg)
      return getCookieVal (j);
    i = document.cookie.indexOf(" ", i) + 1;
    if (i == 0) break;
  }
  return null;
}
/* ######################## End get cookie (name) ######################## */

/* ######################## Start delete cookie ######################## */
function DeleteCookie (name,path,domain) {
  if (GetCookie(name)) {
    document.cookie = name + "=" +
      ((path) ? "; path=" + path : "") +
      ((domain) ? "; domain=" + domain : "") +
      "; expires=Thu, 01-Jan-70 00:00:01 GMT";
  }
}
/* ######################## End of delete cookie ######################## */

/* ######################## Count number of visits to current webpage
######################## */
```

```
function VisitCounter(){
var visits = GetCookie("timesPageVisited");
if (!visits) { visits = 1;
document.write("Select a Conversation Space");
}
else {
visits = parseInt(visits) + 1;document.write("Select a Conversation
Space.");}
setCookie("timesPageVisited", visits,expdate);
}
/* ######################## End of count number of visits to current webpage
######################## */
</script>

<!-- Count number of visits to current webpage -->
<script>
VisitCounter();
</script>

<script id="Proactivechattrigger">
    // Wait for Chat widget to load completely
    window.addEventListener("lcw:ready", function handleLivechatReadyEvent()
{
        // setting Context variables
        Microsoft.Omnichannel.LiveChatWidget.SDK.setContextProvider(function
contextProvider(){
            return {
                'Proactive Chat':{'value':'True','isDisplayable':true},
                'No. of visits':{'value':'2','isDisplayable':true},
                'Forums':{'value':'Surface Devices','isDisplayable':true},
            };
        });

        setTimeout(function(){
            var timeToWaitBeforeOfferingProactiveChatInMilliseconds =
5000;//Time to wait before offering proactive chat to webpage visitor
            var visits = GetCookie("timesPageVisited");
            //Check if webpage has been visited 2 or more times by the user.
            if (visits > 2) {
                //Display proactive chat invite

Microsoft.Omnichannel.LiveChatWidget.SDK.startProactiveChat({message: "Hi!
Do you have a question on Surface device? I am here to help."}, false);
                DeleteCookie("timesPageVisited");//Delete the cookie to
reset the counter
            }
        },timeToWaitBeforeOfferingProactiveChatInMilliseconds);
    });
</script>
```

Scenario 3: Customer checks status of open support case

Jacob is browsing through the support page for Microsoft Surface devices to find more information regarding the open support case. Jacob has been on the page for 10 seconds, and is then offered a proactive chat with the following message.

```
Hi! How are you doing today? The status of the case:<caseid> is in progress. Would you like to get more details?
```

Sample code

HTML

```
<!--Code to show proactive chat invite after visitor has spend given time on the webpage, with relevant details about user.-->
<script id="Proactivechattrigger">
    // Wait for Chat widget to load completely
    window.addEventListener("lcw:ready", function handleLivechatReadyEvent()
{
        var timeToWaitBeforeOfferingProactiveChatInMilliseconds =
10000;//Time to wait before offering proactive chat to webpage visitor
        var caseId = '< your case id relevant to the user.>';//Set case id
relevant to the user.
        // setting Context variables
        Microsoft.Omnichannel.LiveChatWidget.SDK.setContextProvider(function
contextProvider(){
            return {
                'Proactive Chat':{'value':'True','isDisplayable':true},
                'Case Id':{'value':caseId,'isDisplayable':true}
            };
        });

        //Show proactive chat invite after
'timeToWaitBeforeOfferingProactiveChatInMilliseconds' milliseconds
        setTimeout(function(){

Microsoft.Omnichannel.LiveChatWidget.SDK.startProactiveChat({message: "Hi!
How are you doing today? The status of the case: " + caseId + " is in
progress. Would you like to get more details?"}, false)
        },timeToWaitBeforeOfferingProactiveChatInMilliseconds);
    });
</script>
```

Scenario 4: Customer tries to leave a webpage after spending some time on it

Amy has been browsing a webpage for 15 seconds and is not satisfied with the available information. When Amy is about to switch tabs on the web browser, a proactive chat request with the following message is sent to Amy.

```
Hi! Just checking in to see if I can help answer any questions you may have.
```

Sample code

JavaScript

```
//Code to show proactive chat invite when visitor tries to leave page after spending given time (15 seconds in this case) on the webpage. This invite is offered once and only for the first time. All subsequent tries to leave page are ignored and proactive chat is not offered in them.
<script id="Proactivechattrigger">
    //Track if proactive chat has been already offered to the visitor
    var hasProactiveChatBeenOffered = false;
    //Wait for Chat widget to load completely
    window.addEventListener("lcw:ready", function handleLivechatReadyEvent()
{
        var
timeToWaitBeforeEnablingOfferingProactiveChatInMillisecondsOnLeaving =
15000; //Time to wait before Offering proactive chat to webpage visitor

        //Enable showing proactive chat invite on leaving page after
browsing page for
'timeToWaitBeforeEnablingOfferingProactiveChatInMillisecondsOnLeaving'
milliseconds
        setTimeout(function(){
            //Show proactive chat invite on leaving page
            window.document.body.onmouseleave = function(){
                //Offer proactive chat if it has not been offered earlier
during this visit
                if( hasProactiveChatBeenOffered == false )
                {
                    // Set this to true as proactive chat has been almost
offered.
                    hasProactiveChatBeenOffered = true;
                    //Setting Context variables

Microsoft.Omnichannel.LiveChatWidget.SDK.setContextProvider(function
contextProvider(){
                        return {
                            'Proactive Chat':
{'value':'True','isDisplayable':true},
```

```
                            'Page URL':{'value':
window.location.href,'isDisplayable':true},
                        };
                    });
                    //Offer proactive chat

Microsoft.Omnichannel.LiveChatWidget.SDK.startProactiveChat({message: "Hi!
Just checking in to see if I can help answer any questions you may have."},
false);
                }
            };

},timeToWaitBeforeEnablingOfferingProactiveChatInMillisecondsOnLeaving);
    });
</script>
```

Scenario 5: Customer browsed another webpage and then spends time on the current webpage

Amy has browsed the FAQ's document of the product and is currently on the Knowledge Base page for more than 15 seconds. Amy is proactively offered a chat session with the following message.

```
Hi! Just checking in to see if I can help answer any questions you may have.
```

Sample code

JavaScript

```
//Code to show proactive chat invite when visitor spends given time on
current page, after coming from given last visited page
<script id="Proactivechattrigger">
    var lastVisitedPage = "www.contoso.com/FAQ";// last visited page. A
visitor coming form this page will be shown proactive chat invite after
given time on current page
    // Wait for Chat widget to load completely
    window.addEventListener("lcw:ready", function handleLivechatReadyEvent()
{
        var timeToWaitBeforeOfferingProactiveChat = 15000;//Time to wait
before Offering proactive chat to webpage visitor
        //Check if referrer page( read:
https://www.w3schools.com/jsref/prop_doc_referrer.asp ) is same as last
Visited page
        if( window.document.referrer == lastVisitedPage) )
```

```
        {
            //Show proactive chat invite after browsing page for
'timeToWaitBeforeOfferingProactiveChat' milliseconds
            setTimeout(function(){
                //Setting Context variables

Microsoft.Omnichannel.LiveChatWidget.SDK.setContextProvider(function
contextProvider(){
                return {
                            'Proactive Chat':
{'value':'True','isDisplayable':true},
                            'Page URL':{'value':
window.location.href,'isDisplayable':true},
                            'Last Page URL':{'value':
window.document.referrer,'isDisplayable':true}
                        };
                });
                //Offer proactive chat

Microsoft.Omnichannel.LiveChatWidget.SDK.startProactiveChat({message: "Hi!
Just checking in to see if I can help answer any questions you may have."},
false);
            },timeToWaitBeforeOfferingProactiveChat);
        }
    });
</script>
```

Scenario 6: Customer signs in from a specific geographic region

Klarissa logs in to your website from Ruritania where your company is running a special discount on products. You can set up a trigger for customers coming from a particular location that proactively starts a chat session. Klarissa is prompted to chat with the following message.

```
Hi! Just checking in to see if I can help answer any questions you may have.
```

Sample code

This sample code shows how you can use Bing's Geolocation APIs to know the geographic region of the customer and offer chat request based on that. More information about Bing's location APIs: Bing Maps Locations API.

JavaScript

```
//Code to show proactive chat invite if visitor is visiting the page in a
particular country or region
<script id="Proactivechattrigger">
    // Wait for Chat widget to load completely
    window.addEventListener("lcw:ready", function handleLivechatReadyEvent()
{
        var countryNameWhereProactiveChatInviteShouldBeOffered =
'Ruritania';//Country name where proactive chat invite should be offered, if
user is visiting webpage from this country

        // Get Country name using Bing Geolocation API and proactively offer
chat if visitor's country matches with given country name
        function
GetCountryUsingBingGeoLocationAPIAndOfferProactiveChatIfVisitorCountryMatche
sWithGivenCountry( latitude, longitude, bingMapApiKey, countryToMatch) {
            var xhttp = new XMLHttpRequest();
            xhttp.onreadystatechange = function() {
            if (this.readyState == 4)
                if(this.status == 200) {
                    console.log(this.responseText);
                    var currentCountryName =
JSON.parse(this.responseText).resourceSets[0].resources[0].address.countryRe
gion;
                    //Check if visitor's country matches with given Country
name
                    if( currentCountryName == countryToMatch){
                        alert(currentCountryName);
                        // setting Context variables

Microsoft.Omnichannel.LiveChatWidget.SDK.setContextProvider(function
contextProvider(){
                            return {
                                'Proactive Chat':
{'value':'True','isDisplayable':true},
                                'Country':{'value': currentCountryName
,'isDisplayable':true},
                                'Page URL':{'value':
window.location.href,'isDisplayable':true},
                            };
                        });
                        //Show proactive chat invite

Microsoft.Omnichannel.LiveChatWidget.SDK.startProactiveChat({message: "Hi!
Just checking in to see if I can help answer any questions you may have."},
false);
                    }
                }
                else{
                    console.log("Bing Geolocation API call has failed and
returned error: " + this.statusText);
                }
            };
            xhttp.open("GET",
'https://dev.virtualearth.net/REST/v1/Locations/'+ latitude +','+ longitude
```

```
+'?key='+ bingMapApiKey, true);
            xhttp.setRequestHeader("Content-type", "application/json");
            xhttp.send();
        }

        //fetching latitude and longitude is success
        function successGetlatLong(position) {
            var latitude = position.coords.latitude;
            var longitude = position.coords.longitude;
            console.log('Your latitude is :'+latitude+' and longitude is
'+longitude);
            //convert current loaction to a country/ region via Bing
Geolocation APIs
            var bingMapApiKey = 'Enter your Bing Map API key';// Get Bing
Map API key here : https://learn.microsoft.com/bingmaps/getting-
started/bing-maps-dev-center-help/getting-a-bing-maps-key

GetCountryUsingBingGeoLocationAPIAndOfferProactiveChatIfVisitorCountryMatche
sWithGivenCountry( latitude, longitude, bingMapApiKey,
countryNameWhereProactiveChatInviteShouldBeOffered);// get Country name
using Bing Geolocation API and offer proctiveChat if visitor's country
matches with Country name where proactive chat invite should be offered
        }

        //fetching latitude and longitude has failed
        function errorGetlatLong() {
            console.log('It seems browser was not allowed to access
location. Please allow browser to access location.');
        }

        //fetch latitude and longitude via browser
        if (navigator.geolocation) {
            navigator.geolocation.getCurrentPosition(successGetlatLong,
errorGetlatLong);
        } else {
            console.log('It seems like Geolocation, which is required for
this page, is not enabled in your browser. Please use a browser which
supports it.');
        }
    });
</script>
```

Scenario 7: Proactively offer chat to customers within a certain time period

Suppose your organization is running a festive season sale between certain dates, and you want to proactively offer chat requests to customers to see if they have any questions.

Sample code

The following sample code shows how you can proactively offer chat invites to customers when they visit your website in a time period.

JavaScript

```
//Code to show proactive chat invite if visitor visits webpage between given time period
<script id="Proactivechattrigger">
    // Wait for Chat widget to load completely
    window.addEventListener("load", function handleLivechatReadyEvent() {//lcw:ready
        var startTimeOfTimePeriod = new Date('01 Jan 2019 00:00:00 GMT');//start time of time period in which proactive chat will be shown to webpage visitor
        var endTimeOfTimePeriod = new Date('01 Jan 2100 00:00:00 GMT');//end time of time period in which proactive chat will be shown to webpage visitor
        var currentDateTime = new Date();//current date and time

        //Make sure that endTimeOfTimePeriod is always greater and equal to startTimeOfTimePeriod
        if( endTimeOfTimePeriod < startTimeOfTimePeriod)
        {
            console.log("The time period given for proactive chat has start time: " + startTimeOfTimePeriod.toGMTString() + " more that the end time: " + endTimeOfTimePeriod.toGMTString() + " of time period. So, proactive chat will not be offered.");
            return;
        }

        //Check if current date time is between given time period
        if( startTimeOfTimePeriod < currentDateTime && endTimeOfTimePeriod > currentDateTime){
            // setting Context variables

Microsoft.Omnichannel.LiveChatWidget.SDK.setContextProvider(function contextProvider(){
                return {
                    'Proactive Chat':{'value':'True','isDisplayable':true},
                    'Page URL':{'value': window.location.href,'isDisplayable':true},
                };
            });
            //Show proactive chat invite

Microsoft.Omnichannel.LiveChatWidget.SDK.startProactiveChat({message: "Hi! Just checking in to see if I can help answer any questions you may have."}, false);
        }
    });
</script>
```

Scenario 8: Proactively offer chat with pre-survey to customers

Suppose your organization wants consent authorization to start a chat with a customer or wants to ask about the topics related to the customer's enquiry before routing the session to the appropriate agent.

Sample code

The following sample code shows how you can proactively offer chat with a pre-survey question to your customers.

JavaScript

```
window.addEventListener("lcw:ready", function handleLivechatReadyEvent(){
 Microsoft.Omnichannel.LiveChatWidget.SDK.startProactiveChat(
 "Hi! How are you doing today? Do you wish to start a chat?",
 true);
 });
```

Send authentication token

Article • 02/17/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

To authenticate a customer when they start a chat, pass an authentication token to Omnichannel for Customer Service. This token is used to validate a signed-in customer from a domain, and to extract information based on the context variables that are defined. Custom authentication is optional and is relevant only when the chat widget is hosted outside Power Apps portals.

> **Important**
>
> - In the payload of the JSON Web Token (JWT), the value provided for the `lwicontexts` key should be the serialized custom context.
> - The custom context is a collection of key/value pairs. Only primitive values are allowed for any key.
> - The keys of custom context must correspond to context variables that are created for the associated workstream in Omnichannel for Customer Service.
> - The authentication token provider would be invoked by live chat widget when starting a new chat.

The SDKs related to authentication token provider are applicable only if authentication is enabled for the widget. To enable authentication for your widget, see Create chat authentication settings.

Follow these steps to send an authentication token when you start a chat:

1. Generate a valid JWT from the JSON payload. More information: setAuthTokenProvider
2. The live chat methods should be invoked after the lcw:ready event is raised. You can listen for this event by adding your own event listener on the window object.

3. After the `lcw:ready` event is raised, register an authentication token provider with live chat by using the setAuthTokenProvider method.

> **Note**
>
> To avoid timeout, the **authTokenProvider** function in the **setAuthTokenProvider** method must respond within 10 seconds.

4. Use the startChat method to start the chat.

Sample code

JavaScript

```
let payloadToEncrypt = {
    "sub" : "87b4d06c-abc2-e811-a9b0-000d3a10e09e",
    "lwicontexts" :"{\"msdyn_cartvalue\":\"10000\",
\"msdyn_isvip\":\"false\"}",
    "iat" : 1542622071,
    "iss" : "contosohelp.com",
    "exp" : 1542625672,
    "nbf" : 1542622072
};

function convertToJwtToken(payloadToEncrypt){
  // Ideally, you should call your service to convert the payload to a valid
JWT token
  return
Promise.resolve("eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.eyJzdWIiOiI4N2I0ZDA2Yy

QyNjIyMDcyfQ.r37z1M5rMyRYMOJ-rhyTRYFOgvl9N7KvTMueSFPkiuM");
}

function authTokenProvider(callback){
    convertToJwtToken(payloadToEncrypt).then(function (jwtToken){
    // Calling the callback with the valid JWT token
   callback(jwtToken);
   });
}

window.addEventListener("lcw:ready", function handleLivechatReadyEvent(){
    // Handle live chat ready event
    // Can use the SDK methods now
    // Setting authentication token provider to be used for the chat

Microsoft.Omnichannel.LiveChatWidget.SDK.setAuthTokenProvider(authTokenProvi
der);
```

```
   // Starting a new chat
   Microsoft.Omnichannel.LiveChatWidget.SDK.startChat();
});

window.addEventListener("lcw:error", function
handleLivechatErrorEvent(errorEvent){
  // Handle livechat error event
   console.log(errorEvent);
});

Configure automatic closure of conversations using web API

Article • 09/29/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

This article demonstrates how you can configure the auto-close duration of a conversation using the Web API.

> **Important**
>
> Duration-based automatic closure of conversations isn't supported for records that're configured for unified routing. When you delete a routed record, the associated queue item is deleted. The live work item or conversation will also be deleted as part of the clean-up process.

Use the following `GET` request to fetch all the configuration records that have been defined out of the box.

Request

```HTTP
GET [Organization URI]/api/data/v9.1/msdyn_occhannelstateconfigurations
Accept: application/json
OData-MaxVersion: 4.0
OData-Version: 4.0
If-None-Match: null
```

Response

```HTTP
{
   "@odata.context":"[Organization
URI]/api/data/v9.1/$metadata#msdyn_occhannelstateconfigurations",
   "value":[
```

```
      {
         "@odata.etag":"W/\"1379367\"",
         "_organizationid_value":"758f70a9-7aba-4764-bdda-fcc0023a702f",
         "msdyn_name":"Live Chat - Open",
         "statecode":0,
         "statuscode":1,
         "_msdyn_occhannelconfigurationid_value":"836717fd-5578-e911-8196-
000d3af7d71e",
         "msdyn_autocloseliveworkitemafter":20,
         "modifiedon":"2019-10-01T13:41:51Z",
         "_modifiedby_value":"d6e088ce-8866-4b3d-8ea2-150ad72e2b79",
         "msdyn_ocliveworkitemstate":0,
         "msdyn_showconfirmationonsessionclose":false,
         "versionnumber":1379367,
         "msdyn_occhannelstateconfigurationid":"6283ab63-5778-e911-8196-
000d3af7d71e",
         "createdon":"2019-10-01T13:41:51Z",
         "_createdby_value":"d6e088ce-8866-4b3d-8ea2-150ad72e2b79",
         "_modifiedonbehalfby_value":null,

         "overriddencreatedon":null,
         "_createdonbehalfby_value":null,
         "utcconversiontimezonecode":null,
         "timezoneruleversionnumber":null
      },
      {
         "@odata.etag":"W/\"1379368\"",
         "_organizationid_value":"758f70a9-7aba-4764-bdda-fcc0023a702f",
         "msdyn_name":"Live Chat - Active",
         "statecode":0,
         "statuscode":1,
         "_msdyn_occhannelconfigurationid_value":"836717fd-5578-e911-8196-
000d3af7d71e",
         "msdyn_autocloseliveworkitemafter":null,
         "modifiedon":"2019-10-01T13:41:51Z",
         "_modifiedby_value":"d6e088ce-8866-4b3d-8ea2-150ad72e2b79",
         "msdyn_ocliveworkitemstate":1,
         "msdyn_showconfirmationonsessionclose":true,
         "versionnumber":1379368,
         "msdyn_occhannelstateconfigurationid":"e2737c9a-5778-e911-8196-
000d3af7d71e",
         "createdon":"2019-10-01T13:41:51Z",
         "_createdby_value":"d6e088ce-8866-4b3d-8ea2-150ad72e2b79",
         "_modifiedonbehalfby_value":null,
         "importsequencenumber":null,
         "overriddencreatedon":null,
         "_createdonbehalfby_value":null,
         "utcconversiontimezonecode":null,
         "timezoneruleversionnumber":null
      },
   ]
}
```

The `msdyn_name` attribute in the `msdyn_occhannelstateconfiguration` entity mentions the channel and state of the conversation. For more information about conversation states, see Understand conversation states in Omnichannel for Customer Service.

You can make a `GET` request to the `msdyn_occhannelconfiguration` entity to fetch all the existing channel records. For each of these channels, you can see its state when you query the `msdyn_occhannelstateconfiguration` entity.

Make a `PATCH` request to the `msdyn_occhannelstateconfiguration` entity record and update the value of the `msdyn_autocloseliveworkitemafter` attribute.

HTTP

```
PATCH [Organization
URI]/api/data/v9.1/msdyn_occhannelstateconfigurations(6283ab63-5778-e911-
8196-000d3af7d71e)
Accept: application/json
OData-MaxVersion: 4.0
OData-Version: 4.0
If-None-Match: null

{
    "msdyn_autocloseliveworkitemafter":5
}
```

Here's a sample code for updating existing records in the `msdyn_occhannelstateconfigurations` entity:

JavaScript

```
var data =
    {
        "msdyn_autocloseliveworkitemafter": 2
    }
// update the record
Xrm.WebApi.updateRecord("msdyn_occhannelstateconfiguration", "6283ab63-5778-
e911-8196-000d3af7d71e", data).then(
    function success(result) {
        console.log("Auto close time updated");
    },
    function (error) {
        console.log(error.message);
    }
);
```

> **Note**

The value for the `msdyn_autocloseliveworkitemafter` attribute is in minutes. If you want to provide a value that is in days, you'll have to convert it into minutes. For example, 1 day will be 24 x 60 = 1,440 minutes.

The conversation closes automatically if the value of the `msdyn_autocloseliveworkitemafter` attribute is greater than the value of the `createdon` attribute.

If the conversation is in the wrap-up state—that is, the agent has resolved the issue and can now perform some post-conversation steps to close the conversation—then the conversation is closed if the value of the `msdyn_autocloseliveworkitemafter` attribute is greater than the value of the `wrapupinitiatedon` attribute.

> **Important**
>
> The decision to close a conversation based on the values of the `msdyn_autocloseliveworkitemafter` and `createdon` attributes is made when a scheduled job runs, and not when the `PATCH` Web API request is run.

Configure automatic closure of Wrap-up state for live chat

The default time for automatically closing a live chat that's in **Wrap-up** state is 15 minutes. The value is defined in the `msdyn_autocloseliveworkitemafter` attribute and can be programmatically changed to suit your business needs.

The value defined for the **Block capacity for wrap-up** field in the workstream overrides the value specified in the `msdyn_autocloseliveworkitemafter` attribute, if it is more than the value for the `msdyn_autocloseliveworkitemafter` attribute. For example, if you have set the value for blocking agent's capacity as 15 minutes and the `msdyn_autocloseliveworkitemafter` attribute as 10 minutes, a conversation in **Wrap-up** state will occupy capacity for 15 minutes and will be eligible for automatic closure only after 15 minutes.

Send custom context

Article • 08/30/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

The custom context is a collection of key or value pairs. Only primitive values are allowed for any key. The keys must correspond to context variables that are created for the associated workstream. If no context variables have been created under live workstream with a matching logical name, variables are created at runtime assuming the type as String. The custom context provider would be invoked by the live chat widget when a new chat is started. Because the values are case-sensitive, use exact match to pass them to the context variables. More information: Considerations for context variables

> **Important**
>
> - The **setContextProvider** is supported only for unauthenticated chat. For authenticated chat, you must use the JSON Web Token (JWT). More information: **Send authentication tokens**
> - You can pass only 100 custom context variables during each chat session.

When a customer starts a chat from the portal, you can pass custom context to Omnichannel for Customer Service. This custom context can be used to display information on the user interface and to create routing rules that eventually determine the queue to which you must route the chats.

Follow these steps to send custom context when you start a chat:

1. The live chat SDK methods should be invoked after the lcw:ready event event is raised. You can listen for this event by adding your own event listener on the window object.
2. After the `lcw:ready` event is raised, register a custom context provider with live chat using the setContextProvider method.
3. Start the chat using the startChat method.

Sample code

JavaScript

```
function contextProvider(){
    //Here it is assumed that the corresponding work stream would have
context variables with logical name of 'contextKey1', 'contextKey2',
'contextKey3'. If no context variable exists with a matching logical name,
items are created assuming Type:string
    return {
            'contextKey1': 'contextValue1', // string value
            'contextKey2': 12.34, // number value
            'contextKey3': true // boolean value
    };
}

window.addEventListener("lcw:ready", function handleLivechatReadyEvent(){
    // Handle LiveChat Ready event

Article • 03/20/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

The data type of the context variables is a JSON object with two properties—`isDisplayable` and `Value`. The JSON object has the following schema.

JavaScript

```
{
            "type": "object",
             "properties": {
                    "isDisplayable": {
                        " description": " Context variable should display in
agent UI or not",
                        "type": "boolean"
                    },
                    "Value": {
                         " description": " Context variable value pass
through bot , this can be string Boolean or number",
                        "type": "string or Boolean or Number"
                    }
                },
                "required": [ "isDisplayable", "Value" ]
        }
```

The input value for `isDisplayable` is **Boolean** (true or false). The input value for `Value` can be **Boolean**, **String**, or **Number**.

To display the context variables in the Conversation Summary Control of conversations for Power Virtual Agents and Azure bots, use the `isDisplayable` property in the body of setContextProvider method.

Here's an example: `{\"isDisplayable\":\"true\"," +"\"Value\":\"context variable value as string\"}`

The `isDisplayable` property, when set to `true`, will display the context variables on the third tab of the Conversation Summary Control for a conversation. The `Value` property

of the JSON object includes the user response or any other information in string, Boolean, or number format.

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Overview

Every organization has a unique way of working. Some organizations have well-defined business processes, and some don't. As a system customizer, you can customize the forms for your agents and supervisors to cater to your business process and workflow requirements.

In this section

Use the resources in the following sections to learn how to use Omnichannel for Customer Service for system customizer:

- Customize Active Conversation form
- Customize the session form
- Customize quick view forms

Customize the Active Conversation form

Article • 08/08/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> The **Customer Summary** form is renamed as **Active Conversation** form.

You can customize the following for the **Active Conversation** page:

- Add or remove custom controls
- Add a web resource or iFrame to the form
- Customize the layout
- Add custom fields if the **Customise active conversation form** in Customer Service admin center is enabled.
- Embed canvas apps

> **Note**
>
> - For a conversation entity, you can't add custom forms.
> - We recommend that you don't:
>   - Change the Conversation form or the order in which it's displayed, as it's the default form.
>   - Modify the out-of-the-box JavaScript handlers and web resource used in the Active Conversation form.
>   - Remove the form initiator control from the **Search customer** and **Search issue** lookup controls.

By default, the **Active Conversation** page displays the sections that are listed in this article. For information on how to customize these sections, see Customize quick view forms.

Customer profile

The **Customer profile** section provides details about the customer or account. These details include the name of the customer or account, category or job, title, relationship type, city, and the preferred channel of engagement. You can modify the quick view forms in this section by navigating to the respective entity forms.

Conversation summary

The **Conversation summary** section fetches details based on the context of the incoming conversation request.

This section includes **Pre-chat survey** and **Visitor details**. The details on these tabs help you to understand contextual channel-specific information about the conversation with the customer. The **Pre-chat survey** tab shows responses from the customer on the pre-chat questions.

The **Visitor details** tab provides some information such as the customer is authenticated or not, browser used by the customer for contacting support, an operating system used by the customer, location of the customer, interacting language of the customer, and so on. In addition, conversation and transfer details.

If the customer signs in to the portal to initiate a chat with the support, then as an agent, you can see the **Authenticated** field value as **Yes** in the **Visitor details** tab of the **Conversation summary** section. Otherwise, the **Authenticated** field value is shown as **No**.

Issue snapshot

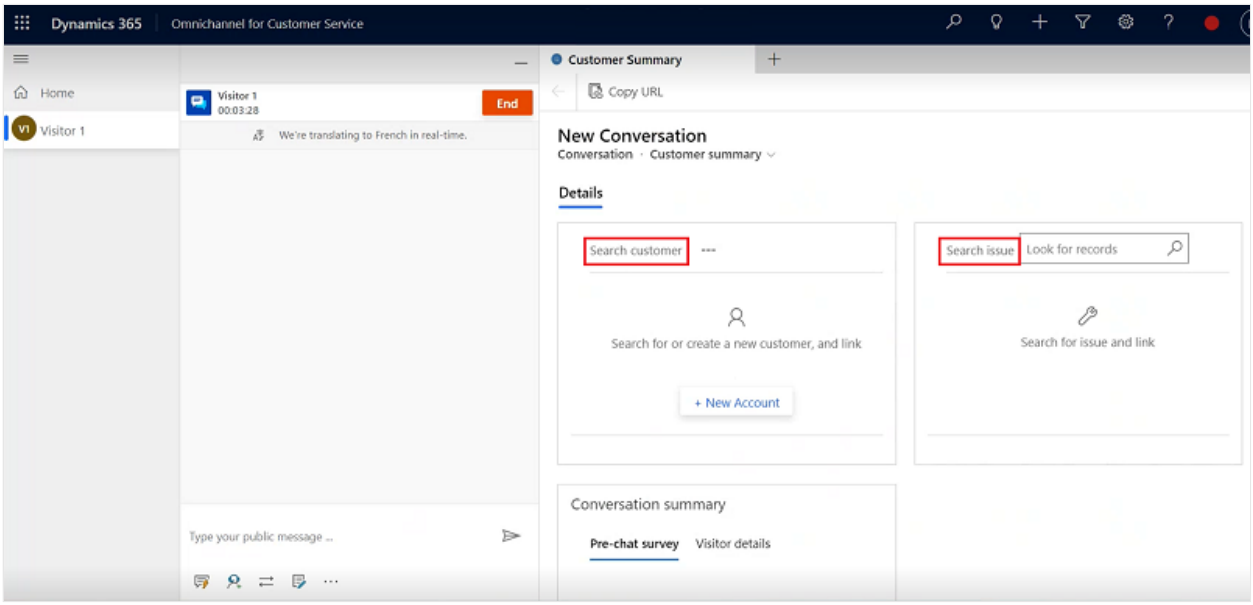
For an incoming conversation request, the system links an existing case to the conversation and shows it on the **Issue Snapshot** section. This section shows information such as the title of the case, the priority, the status of the case, the product, and the owner. You can modify the quick view forms in this section by navigating to the respective entity forms.

Recent cases

This form section displays the recent cases that relate to the customer. You can modify the quick view forms in this section by navigating to the respective entity forms.

Customize the labels for customer, account, and case on the conversation form

You can customize the labels for customer, account, and case that appear on the conversation form so that they are relevant to your business needs. These customizations are applicable to labels such as **Search customer**, **New customer**, **Search issue**, and **New case**. When you update a label, the updated name that you choose will reflect in all occurrences where that name exists.



For example, you could change **Search customer** to **Search client** or **Search issue** to **Search ticket** using the following procedure.

To customize labels on the conversation form:

1. In your Dynamics 365 instance, go to **Customize the System** in **Advanced Settings**, and then select **Web Resources**.

2. Select the filters icon, select the dropdown menu next to the **Type** column, and then select the checkbox for **String (RESX)**.

3. In the **Name** column filter, select **Custom Filter**, and in the dialog that is displayed, set **Select Operator** to **Contains**, and then type **CustomerSummary** for the value. All the CustomerSummary labels for all the languages are displayed.

4. Optionally, use the language filter to narrow the results to show the results for the required language.

5. In the **Name** column, select the **CustomerSummary** label. A dialog opens with the URL link to the content of the CustomerSummaryLabels.resx file.

6. Select the link in the URL field. A dialog opens and displays the contents of the resource file.

    a. Copy and paste the contents into a text editor, and then update the text for the value tag of the labels you want to change with a label of your choice . For example, for **Customer**, update the text in value with "Client". This will replace the "Customer" label with "Client" on the **Active Conversation** form.

    b. Similarly, for the **Issue** tag, update the text in value* with "Ticket". This will replace the "Issue" label with "Ticket" on the **Active Conversation** form.

    The sample tags with the new values are as follows.

```
<data name="Customer" xml:space="preserve">
  <value>Client</value>
  <comment>Client Label</comment>
</data>
<data name="Issue" xml:space="preserve">
  <value>Ticket</value>
  <comment>Issue Label</comment>
</data>
```

7. Save the file locally, and then return to the **CustomerSummaryLabels Web resource** dialog, select **Choose File**, and upload the edited file.

8. Select the recently saved file, select **Save**, and then publish the changes.

9. To view the published changes, in the Customer Service workspace or Omnichannel for Customer Service app, manually refresh the page containing the conversation summary form.

Timeline

This section displays case-related and customer-related activities in the form of a timeline. You can create quick notes based on the discussion with the customer. Use the **Linked records** field to switch the timeline based on the Case, Contact, or Account record linked to the conversation.

You can customize the timeline dropdown labels for case, account, and contact by editing the display name for the corresponding entity and publishing your changes.

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

You can customize the quick view form in the section by navigating to the respective entities and quick view forms. The following are some of the relevant entities.

Card	Entity	Quick View Form
Customer profile	Account > Forms	Customer profile
Customer profile	Contact > Forms	Customer profile
Issue snapshot	Case > Forms	Issue Snapshot
Recent cases	Account > Forms	Cases for customer
Recent cases	Contact > Forms	Cases for customer

The following procedure shows how to modify the **Customer profile** quick view form of the **Account** entity. The process is similar for other forms that are listed in the preceding table.

1. Sign in to the Dynamics 365 instance.
2. Go to **Settings** > **Customization** > **Customize the system**.
3. Expand **Components** > **Entities** > **Account**, and select **Forms**.
4. Select **Customer profile**, which is of the type quick view form.
5. In the form, select the section that you want to customize, such as add a field, and then in the **Field Explorer** pane, double-click the field you want to add to the form. For example, double-click the **Address 1: Address Type** field from the **Field Explorer** pane. The field is added to the section.
6. Select **Save**, and then select **Publish**.

> **Tip**
>

Customize session forms

Article • 04/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

As a system customizer, you might want to customize the session forms to suit your business requirements for the agents who use Omnichannel for Customer Service and other model-driven apps.

Modify the position of sections in the session form

1. Sign in to the Dynamics 365 instance.
2. Go to **Settings** > **Customization** > **Customize the system**.
3. Expand **Components** > **Entities** > **Session** and then select **Forms**.
4. Select **Omnichannel session form** from the list.
5. Drag and drop the field in the order you want to modify.
6. Select **Save** and select **Publish**.

Customizations supported by the Conversation table and form

Article • 08/08/2023

This article lists the customizations that you can and can't use with the **Conversation** table (`msdyn_ocliveworkitem`) and the **Conversation** form in Omnichannel for Customer Service.

Customizations supported by the Conversation table

The following table lists the supported customizations.

Components	Add new?	Edit existing?
Form	No	Yes
View	Yes	No
Chart	Yes	No
Column	Yes	No. But you can change some properties of `msdyn_title` and `msdyn_thirdpartyconversations`.
Dashboard	No	No

You can:

- Create business rules.
- Associate a conversation with a lead or opportunity, or any other activity-enabled table via the **Regarding** column that's available for the conversation. You can't:

You can't:

- Add a Many to Many relationship.
- Use custom columns in unified routing or assignment.

We recommend that:

- You don't add a custom column that's set as system required. If you intend to add such a custom column based on your business needs, then you populate the value

for the custom column via sync pre-validation or pre-operation plug-in to ensure its value isn't null.
- You don't create alternate keys.

Customizations supported by the Conversation form

You can customize the **Conversation** form to:

- Load the **Active Conversation** form as an application tab instead of an anchor tab in a session.
- Edit existing forms in the following ways:
  - Add custom controls. However, we recommend that you don't use custom controls to update a conversation because Omnichannel for Customer Service will overwrite the updates when the conversation ends.
  - Edit the quick view for customers and cases.
  - Add web resources and external website controls.
  - Modify the form layout, resize controls, and create tabs and sections.
  - Edit the quick view for customers and cases.
  - Move sections to different tabs.
  - Remove **Recent cases** subgrid.

Additionally, if customize active conversation form is enabled, you can:

- Add subgrids on the **Conversation** form and view data for related tables in the subgrid.
- Edit existing forms in the following ways:
  - Add custom columns and allow saving of custom and standard columns on the form except some of the logical column names listed in the **Logical column** names section.
  - Add canvas apps.
  - Render columns with values on the form.
  - Configure **Customer 360** card and **Case details** card.

We also recommend that you don't:

- Change the **Conversation** form or the order in which it's displayed, as it's the default form.
- Modify the out-of-the-box JavaScript handlers and web resource used in the **Active Conversation** form.
- Remove the form initiator control from the **Search customer** and **Search issue** lookup controls.

Logical column names

Any updates to the following columns aren't supported:

- activityid
- msdyn_activeagentassignedon
- msdyn_activeagentid
- msdyn_activesessionparticipantid
- msdyn_cdsqueueid
- msdyn_channel
- msdyn_closedon
- msdyn_createdon
- msdyn_customerlanguageid
- msdyn_customerlocale
- msdyn_customersentimentlabel
- msdyn_effortpredictionresult
- msdyn_escalationcount
- msdyn_initiatedon
- msdyn_isoutbound
- msdyn_lastsessionid
- msdyn_liveworkstreamid
- msdyn_modifiedon
- msdyn_ocliveworkitemid
- msdyn_overflowtransfercount
- msdyn_queueid
- msdyn_queueitemid
- msdyn_startedon
- msdyn_statusupdatedon
- msdyn_title
- msdyn_transfercount
- msdyn_urcustomersentimentkeywords
- msdyn_urcustomersentimentlabel
- msdyn_urcustomersentimentscore
- msdyn_workstreamworkdistributionmode
- msdyn_wrapupinitiatedon
- ownerid
- statecode
- statuscode
- subject

Embed chat widget in your website or portal

Article • 10/05/2023

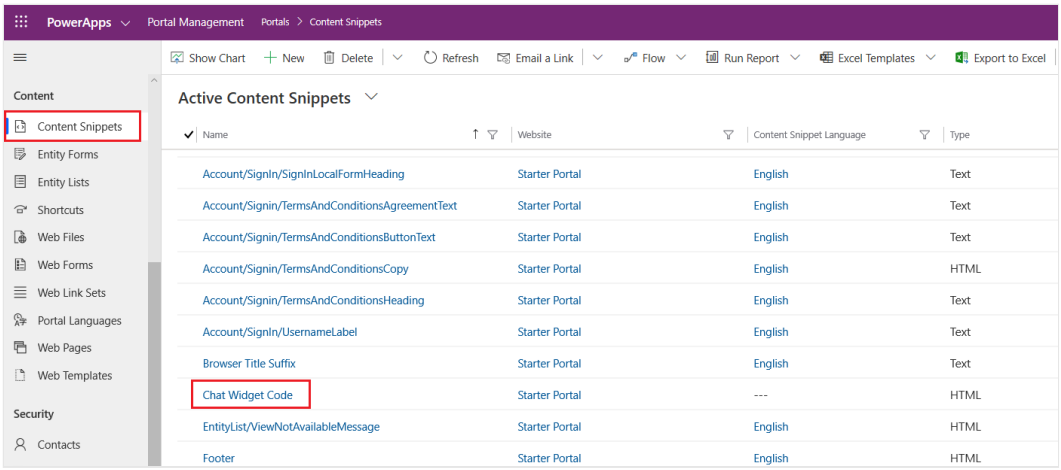
Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Embed chat widget in a website or Power Apps portal

Do the following steps to embed the chat widget in a website or Power Apps portal.

1. In Dynamics 365, go to Customer Service admin center.
2. Go to **Channels** > **Chat**.
3. Select the chat instance that you want to embed in your website, and select **Edit**.
4. On the **Chat widget** tab, copy the widget code snippet in the **chat widget** section and then do one or all of the following:
    - To embed chat widget in your website, paste the code in the HTML source <body> of your website.
    - To embed chat widget in your Power Apps portals,
      a. Open the Portal Management app.
      b. Go to **Portal** > **Content Snippets**.

c. Find the **Chat Widget Code** content snippet and open it.



d. On the **General** tab, scroll down to the **Value (HTML)** field, and paste the chat widget snippet code.

e. Save the changes. The chat widget is now embedded into the portal.

If you don't see your chat widget in the portal, see Troubleshoot issues in Omnichannel for Customer Service.

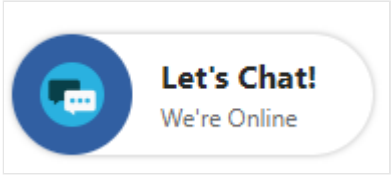
Embed chat widget in mobile experiences

1. Create the code snippet. Refer to Render a live chat widget on the mobile app for samples showing how to enable rendering of the web version of the live chat widget on mobile devices.
2. In Customer Service admin center, go to **Channels** > **Chat**.
3. Open the chat widget you want to embed in your website or create a new one.
4. On the **Chat widget** tab, copy the widget code snippet in the **chat widget** section and paste it in the source code of your mobile operating system.

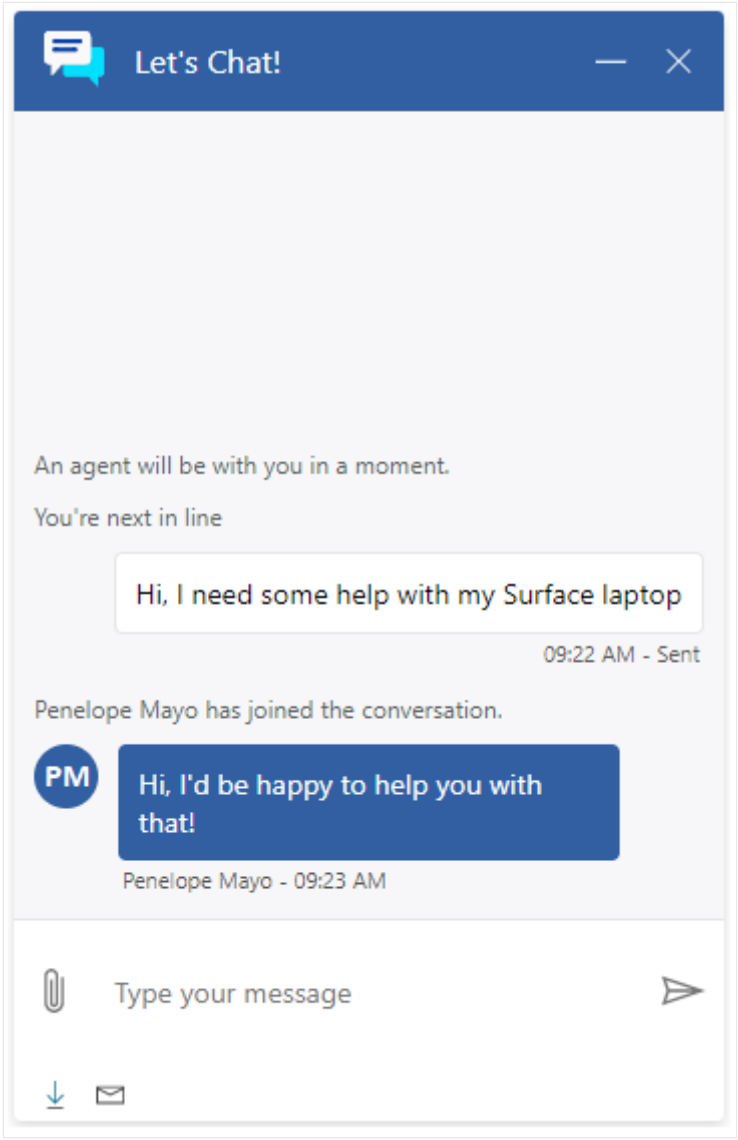
Customer experience of chat widget

After you configure the chat widget, it has the following capabilities:

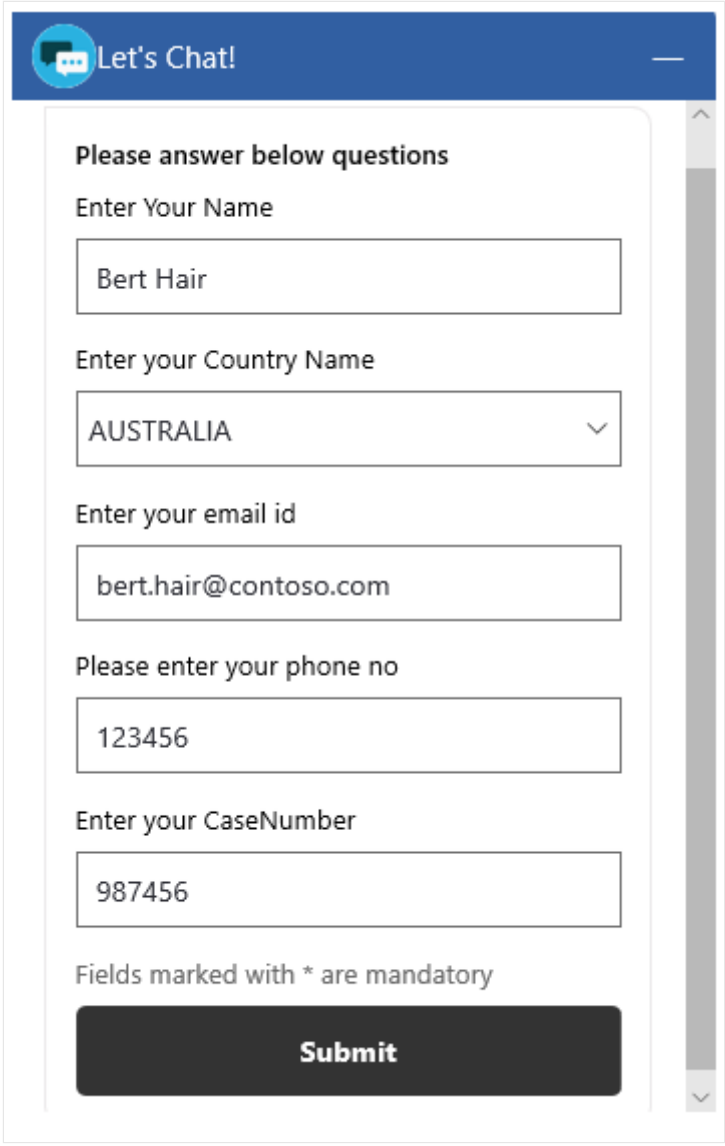
- **Minimized mode**: By default, the chat widget appears in minimized mode. If any messages come while the widget is in the minimized mode, a count of the messages is shown.



- **Maximized mode**: A user can maximize the chat widget to start a conversation with an agent.
- **System events**: System-generated messages appear for events, such as when an agent joins a conversation, or a conversation is transferred by the agent or supervisor to another agent.



- **Keyboard shortcut**: During the chat session, the customer can press **Ctrl+/** to return the cursor to the message send box from elsewhere on the page.
- **Pre-conversation survey**: If a survey is configured by an admin, it appears for the user before the conversation starts. This survey also helps the user connect to an



appropriate agent.

- **End chat**: A customer can end the conversation by selecting the **Close chat** button. A confirmation message appears before the conversation ends.

> ⓘ Note
>
> For advanced configuration like embedding chat widget on specific web pages, see **Create and manage portals**.

Overview of channels

Article • 10/10/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

As new social networks and communication channels rapidly evolve, so do customer expectations on how to reach their favorite brands. Communicating via many channels has become not only comfortable but expected, and businesses seeking to provide personalized services are rapidly working to enable support through the channels their customers want to use.

Adding support channels to your businesses support offering is a powerful way to provide personalized service to customers on the channels of their choice. It is helpful to recognize a common pattern across all channels that are enabled through Omnichannel for Customer Service before diving into the implementation of a single channel. The implementation pattern for out-of-the-box channels is as follows:

- Establish your account and respective requirements (such as a page, and app) with the Channel provider. This ensures you have an entry point with the channel provider through which customers will engage.
- Configure the workstream in Customer Service admin center.
- Configure the Channel in Customer Service admin center and attach it to the workstream.
- Populate the exchange of handshake data (token and secrets) required between Omnichannel and the channel provider. This is usually done in both places, the Customer Service admin center app and the channel provider experience.

The following channels are currently available in Omnichannel for Customer Service:

Chat

If you want to help your customers using live chat, you can use the **Chat for Dynamics 365 Customer Service** channel.

To learn more, see Configure a chat channel.

Voice

To address customer issues, you can configure and use the voice channel. More information: Introduction to the voice channel

SMS

If you want to help your customers using SMS, you can use the following SMS channels:

- SMS through Azure Communication Services
- SMS through TeleSign
- SMS through Twilio

Social channels

If you want to help your customers using social media, you can use the following social channels:

- Apple Messages for Business
- Facebook
- Google's Business Messages
- WhatsApp through Twilio
- WeChat
- LINE

Custom messaging channel

If you want to help your customers using social channels that are not supported as standard channels, such as Telegram, you can use the custom channels. To learn more, see Configure custom messaging application.

If you want to help your customers using your line-of-business messaging channels, you can use the Direct Line Bot Framework method.

Microsoft Teams

If you want to help your customers using a standard collaboration channel, you can use the Microsoft Teams channel.

To learn more, see Configure Microsoft Teams.

Entity records

If you want to help your customers using standard entity records such as incident, quote, campaign and so on, you can use Entity records channel.

To learn more, see Entity records channel.

License requirements

An active subscription of Dynamics 365 for Customer Service Digital Messaging is required for SMS, social channels, Microsoft Teams, and custom messaging. In addition to Dynamics 365 subscriptions, if you choose to use any third-party channels you'll need to acquire subscriptions from those providers as well.

You can get Chat for Dynamics 365 Customer Service with either of the following add-on licenses:

- Chat for Dynamics 365 Customer Service
- Digital Messaging

> **Note**
>
> Digital Messaging add-on license includes Chat for Dynamics 365 Customer, SMS, Facebook, and bot integration.

You can get the SMS, social channels, and custom messaging channels with the following add-on license:

- Digital Messaging

You can get the Microsoft Teams channel with the following add-on license:

- Teams license

Overview of SMS channels

Article • 03/17/2023

The SMS channel in Omnichannel for Customer Service allows your organization to connect to customers via text messages. Your customers can send text messages and connect with an appropriate agent. Agents can view incoming SMS requests on their dashboard and respond accordingly. While agents can't send messages, Omnichannel for Customer Service supports outbound messaging via Power Automate flows. More information: Configure outbound messaging

You can use the same phone number for the SMS channel, and for inbound and outbound calling in the voice channel. SMS is currently only available in US, Canada, and Puerto Rico. For detailed information about numbers and eligibility, see Subscription eligibility and number capabilities.

For best SMS delivery experience, we recommend that you submit a toll-free verification application for your toll-free numbers. More information: How do I submit a toll-free verification?

Prerequisite

You must obtain an active subscription of **Dynamics 365 Customer Service Digital Messaging**. For more information about licenses and pricing, see the Dynamics 365 licensing guide. You can also purchase add-ins on the Microsoft 365 admin center. More information: Buy add-ons

Supported SMS channels

In Omnichannel for Customer Service, you can configure the SMS channel as follows:

- Configure SMS channel using Azure Communication Services
- Configure SMS channel for Twilio
- Configure SMS channel for TeleSign

> **Note**
>
> SMS isn't supported with Azure direct routing. More information: **Azure direct routing**

Next steps

Configure an SMS channel using Azure Communication Services

Article • 06/20/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

This article discusses how you can configure an SMS channel using Azure Communication Services.

Prerequisites

- Purchase and install the voice channel for Dynamics 365 Customer Service. More information: Provision Omnichannel for Customer Service and Install voice channel
- Connect to Azure Communication Services. More information: Connect to Azure Communication Services

  If you've connected your existing Azure resource, ensure that you've enabled SMS services. More information: Enable call recording and SMS services
- Set up a phone number that's enabled for SMS services. Ensure that you select **Send SMS** or **Send and receive SMS** options when you choose your phone number features in Customer Service admin center or Omnichannel admin center. More information: Acquire new phone numbers

  If you're using an existing phone number that's not enabled for SMS, then you can upgrade your plan. More information: Edit phone numbers

Configure a workstream for the SMS channel

1. Go to the **Workstreams** page, and open the workstream that you created.
2. In the **Set up your SMS channel** section, select **Set up SMS**, and then configure the following options.
   a. On the **SMS setup** page, select a number from the list.
   b. On the **Language** page, select the language that you want to set as the default.

c. On the **Behaviors** page, configure the following options:

- **Channel operation hours:** Set the toggle to **On**, and then select an operating hour record. More information: Configure operating hours
- Configure custom automated messages.
- Configure post-conversation survey.

> ⓘ **Note**
>
> File attachments aren't supported in the SMS channel using Azure Communication Services.

d. Verify the settings on the **Summary** page, and then select **Finish**. The SMS channel is now configured.

3. Configure routing rules.
4. Configure work distribution.
5. Add a bot.
6. In **Advanced settings**, configure the following options based on your business needs.

   - Sessions
   - Agent notifications
   - Context variables
   - Smart assist bots
   - Quick replies

Next steps

Configure an SMS channel for TeleSign

Article • 02/17/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

An SMS channel allows your organization to connect to customers by using text messages. After you configure an SMS channel, your customers can send text messages and connect with a customer service agent. This provides your customers the flexibility to connect with their mobile devices when an internet connection is not available to connect to a chat channel.

Agents can view incoming SMS requests on their dashboard and respond accordingly.

The tasks to add SMS support for TeleSign are as follows:

1. Enable SMS channel in your Dynamics 365 organization.
2. Register with TeleSign and get your customer ID and API key, and purchase a phone number.
3. Add SMS support through Omnichannel for Customer Service.

> **Note**
>
> - The maximum number of characters supported for sent and received messages is 1600.
> - To ensure that third-party SMS providers handle opt-out commands properly, you must configure your consent settings with the provider directly.
> - SMS is an asynchronous mode of communication. Agents can close the conversation and then work on them later. Ending the conversation will mark it as resolved. More information: **Understand conversation states**

Prerequisite

Verify that you have permissions on the secure columns. More information: Configure permissions to access secure columns

Enable SMS channel in your Dynamics 365 organization

You can enable the SMS channel from the Dynamics 365 admin center. For steps on enabling SMS in your organization as a part of provisioning Omnichannel for Customer Service, see Provision Omnichannel for Customer Service.

Sign up for TeleSign account

An SMS channel can be enabled within Omnichannel for Customer Service by integrating with TeleSign. This integration uses public APIs of TeleSign for sending and receiving text messages. You must sign up for a TeleSign account to enable an SMS channel in your organization.

1. Go to TeleSign to sign up for a self-service account, and upgrade to standard or enterprise account for a complete integration with Omnichannel for Customer Service. If you expect to send high volumes of SMS traffic, such as more than 100,000 messages per month, contact TeleSign support to request an invoiced enterprise account.

2. Purchase support phone numbers through your TeleSign account.

3. Get the customer ID and API key from your TeleSign account. You will need to provide these while setting up the SMS channel in Omnichannel for Customer Service.

4. You are provided with a callback URL that must be sent to TeleSign support. This callback URL is specific to your organization and is available when you add SMS support for your organization. When you send an email to TeleSign support, include the callback URL, your customer ID, and enter the subject line as **Omnichannel for Customer Service callback URL update request**.

Add SMS support

1. In Dynamics 365, go to one of the admin apps, and perform the following steps:

Customer Service admin center

a. In the site map, in **Customer support**, select **Channels**.

b. In **Accounts**, for **Messaging accounts**, select **Manage**.

2. On the **Accounts and channels** page, select **New account**.

3. Enter the following details:

   a. In **Channel details**, enter a name, and select SMS in **Channel**.

   b. In **Account details**, select TeleSign in **Provider**, and enter the following details:

      - **Customer ID:** Customer ID generated from the TeleSign account.
      - **API key:** API key generated from the TeleSign account.

   c. In **SMS phone numbers**, select **Add**, and enter the following details in **Add SMS number**:

      - **Number:** Specify the support phone number that you purchased from TeleSign in the <*phone_number*> format, such as 14252306549. Make sure that you don't enter blank spaces, special characters, or the plus sign (+).
      - **Type:** Select Geo, Short code, or Toll free.
      - **Description:** Enter a description.
      - **Validate:** Select to validate the customer ID and API key.

   a. In **Callback URL**, copy the value and send it to TeleSign at support@telesign.com with your customer ID; enter the subject line as "Omnichannel for Customer Service callback URL update request".

4. Open the workstream that you created for the SMS channel for TeleSign.

5. Select **Add SMS Channel**, and configure the following options:

   a. On the **SMS number** page, select a number from the list.

   b. On the **Language** page, select the language that you want to set as the default.

   c. On the **Behaviors** page, configure the following options:

      - **Channel operation hours:** Set the toggle to **On**, and then select an operating hour record. More information: Configure operating hours.
      - Custom automated messages
      - Post-conversation survey

   a. In **User features**, set the toggle for **File attachments** to **On** and select the following options if you want both agents and customers to exchange files.

More information: Enable file attachments.

- Customers can send file attachments
- Agents can send file attachments

a. Verify the settings on the **Summary** page, and select **Finish**. The SMS for TeleSign channel is configured.

6. Configure routing rules. More information: Configure work classification.
7. Configure work distribution. More information: Work distribution settings
8. Add a bot. More information: Configure a bot.
9. In **Advanced settings**, configure the following options based on your business needs:

   - Sessions
   - Agent notifications
   - Context variables)
   - Smart assist bots
   - Quick replies

Flow of data between Omnichannel for Customer Service SMS channel and TeleSign

Incoming text messages

For an incoming text message sent by a customer to the support phone number, the message is first sent to the TeleSign service and then pushed by TeleSign to Omnichannel for Customer Service using the callback URL. After this, the message gets routed and associated to either a new or an existing conversation by Omnichannel for Customer Service.

Outgoing text messages

For an outgoing message sent by an agent from within Dynamics 365, the message is first sent to the TeleSign service and then TeleSign sends it to the customer. In addition to the text message, Omnichannel for Customer Service uses the APIs provided by TeleSign to send the customer's phone number, support phone number (TeleSign SenderID), and the TeleSign account information (CustomerID and the API Key) to the TeleSign service.

TeleSign API Key Validation

When you validate the API key while setting up the SMS channel, a call is made to TeleSign to validate customer ID and the API key.

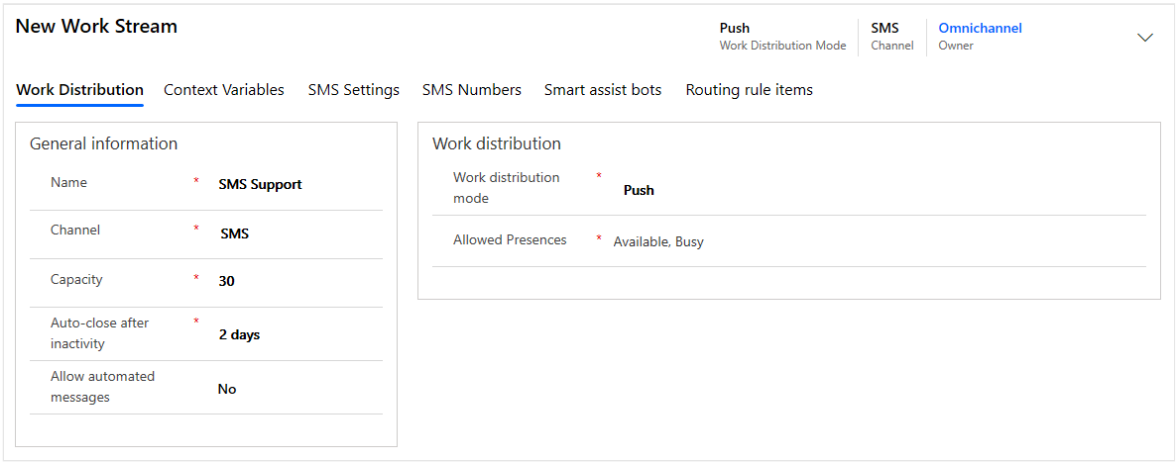
Add SMS support in Omnichannel Administration

> **ⓘ Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

1. In the Omnichannel Administration app, go to **Work Streams** under **Work Distribution Management**.

2. Select **New** to create a workstream. On the **Work Distribution** tab, enter the following information:

   - **Name**: Name of the workstream.
   - **Channel**: Select **SMS**.
   - **Auto-close after inactivity**: Select a duration of at least 8 hours.
   - **Allow automated messages**: Specify **Yes** to be able to define the business hours.

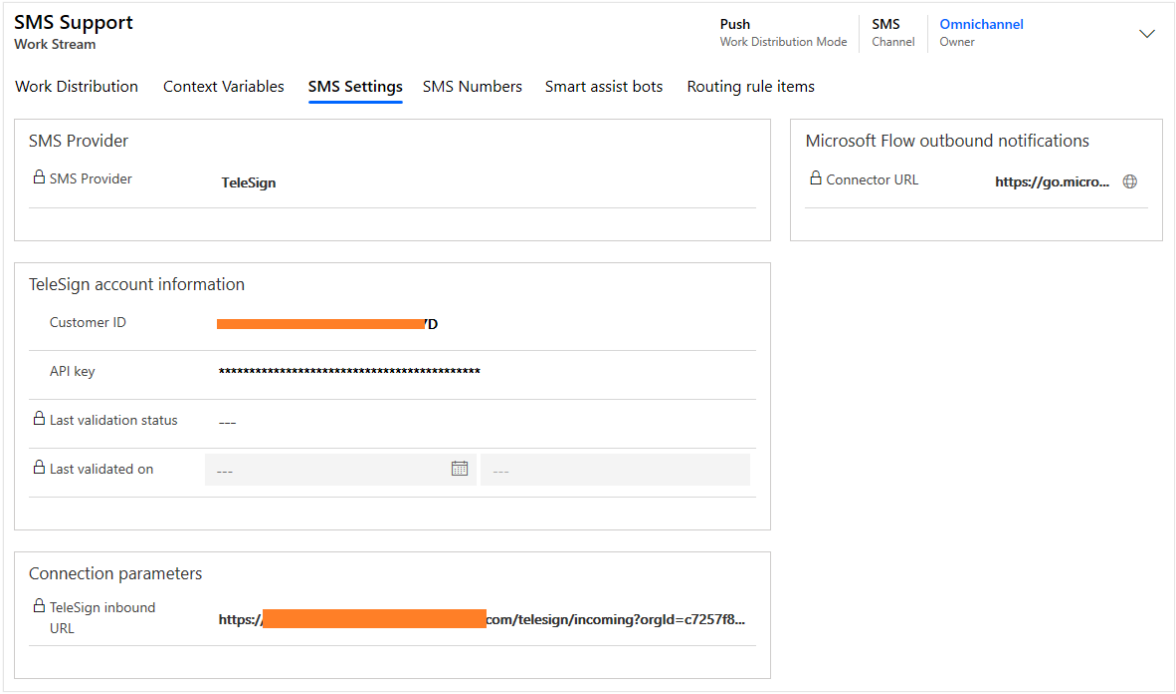


3. On the **SMS Settings** tab, enter the following information:

   - **Customer ID**: Customer ID generated from the TeleSign account.
   - **API key**: API key generated from the TeleSign account.

4. Copy the value from the **TeleSign inbound URL** field, and send it to TeleSign at support@telesign.com with your customer ID; enter the subject line as "Omnichannel for Customer Service callback URL update request". This value is the callback URL that is used to process incoming SMS messages.

5. Select **Save**.



6. On the **SMS Numbers** tab, select **New SMS Number**, and then enter the following details:

   - **Number**: Specify the support phone number that you purchased from TeleSign in the *<country_code><phone_number>* format, such as 14252306549. Make sure that you don't enter blank spaces or special characters.
   - **SMS number language**: This is the preferred language that will be used when you configure automated messages on the **Automated messages** tab.
   - **Type**: Select **Long code**, **Short code**, or **Toll free**.
   - **Description**: Specify a description for the number. (Optional)
   - **Operating Hours**: Specify the business hours when the customer support team is active and available to serve customers.

> ⓘ **Note**
>
> - You can configure only one phone number per workstream.
> - Ensure that the phone number is entered in the following format without spaces and special characters: <phone number>. For information on availability of international numbers, see **TeleSign coverage map**.

- Short code is supported for enterprise accounts.

7. Select **Save**.
8. (Optional). On the **Automated messages** tab, configure automated messages.
9. (Optional). On the **Surveys** tab, configure a post-conversation survey.
10. Select **Validate API Key** from the toolbar at the top of the page to validate the customer ID and API key.
11. Open the workstream you created for SMS.
12. On the **Routing rules items** tab, create a routing rule to transfer the SMS to an appropriate agent. Routing rule for SMS works on the **Mobile Phone** field of the Contact entity. The customer is identified based on the **Mobile Phone** field and the conversation is automatically linked to the contact record.

Configure an SMS channel for Twilio

Article • 10/25/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

The SMS channel through Twilio in Omnichannel for Customer Service allows your organization to connect to customers by using text messages. Your customers can send text messages through Twilio and connect with an appropriate customer service agent. Agents can view incoming SMS requests on their dashboard and respond accordingly.

Prerequisites

Make sure that the following prerequisites are met:

- SMS for Twilio is provisioned in Omnichannel for Customer Service. More information: Provision Omnichannel for Customer Service

  > **Note**
  >
  > To enable the SMS channel for Twilio in an existing Omnichannel for Customer Service environment, you must upgrade to the latest version of Omnichannel for Customer Service. More information: **Upgrade Omnichannel for Customer Service**

- A Twilio account with a phone number and subscription is available.

  > **Note**
  >
  > > For newly created Twilio accounts, you must disable a security setting that blocks the ability to send media files. More information: **Extended notice and update on security changes: HTTP Authentication for Voice and Messaging Media enabled by default**

- Permissions on the secure columns. More information: Configure permissions to access secure columns

Get Twilio account details

An SMS channel is enabled within Omnichannel for Customer Service by integrating with Twilio. This integration uses public APIs of Twilio for sending and receiving text messages.

1. In your Twilio account, note the ACCOUNT SID and AUTH TOKEN values. These values are required to create the SMS configuration in the Omnichannel admin center app.
2. Purchase support phone numbers through your Twilio account.

> **Note**
>
> - Only US phone numbers are supported.
> - To ensure that third-party SMS providers handle opt-out commands properly, you must configure your consent settings with the provider directly.

Set up the SMS channel for Twilio

To configure the SMS channel, complete the following tasks:

- Configure the SMS number
- Configure the workstream for the SMS channel

Configure the SMS number

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, in **Customer support**, select **Channels**.

   b. In **Accounts**, for **Messaging accounts**, select **Manage**.

2. On the **Accounts and channels** page, select **New account**.

3. Enter the following details:
   a. In **Channel details**, enter a name, and select SMS in **Channel**.
   b. In **Account details**, select **Twilio** in **Provider**, and then enter the following details:

      - **Account SID:** Enter the Twilio ACCOUNT SID.
      - **Auth token:** Enter the Twilio AUTH TOKEN.

   c. In **SMS phone numbers**, select **Add**, and enter the following details in **Add SMS number**:

      - **Number:** Specify the support phone number that you purchased from Twilio in the *<country_code><phone_number>* format, such as 14252306549. Make sure that you don't enter blank spaces or special characters.
      - **Type**: Select **Long code**, **Short code**, or **Toll free**.
      - **Description**: Specify a description for the number. (Optional)

   d. In **Callback information**, copy the callback information. The copied information is used for the Twilio account.
   e. Select **Done**. The account is configured.

Configure the workstream for the SMS channel

To configure the workstream, make sure you perform the steps to create a workstream for the SMS channel. More information: Create workstreams

1. Go to workstreams page and open the workstream you created for the channel.
2. In the **Set up your SMS channel** section, select **Set up SMS**, and then configure the following options:
   a. On the **SMS setup** page, select a number from the list.
   b. On the **Language** page, select the language that you want to set as the default.
   c. On the **Behaviors** page, configure the following options:

      - **Channel operation hours:** Set the toggle to **On**, and then select an operating hour record. More information: Configure operating hours
      - Custom automated messages
      - Post-conversation survey

   d. In **User features**, set the toggle for **File attachments** to **On** and select the following options if you want both agents and customers to exchange files. More information: Enable file attachments

- Customers can send file attachments
- Agents can send file attachments

e. Verify the settings on the **Summary** page, and then select **Finish**. The SMS for Twilio channel is configured.

3. Configure routing rules. More information: Configure work classification
4. Configure work distribution. More information: Work distribution settings
5. Add a bot. More information: Configure a bot
6. In **Advanced settings**, configure the following options based on your business needs:

   - Sessions
   - Agent notifications
   - Context variables
   - Smart assist bots
   - Quick replies

Establish a connection between Omnichannel for Customer Service and the Twilio account

Perform the following steps to configure the URL in Twilio for the SMS messages from Omnichannel for Customer Service to be processed in Twilio:

1. Copy the value in **Twilio inbound URL** of the workstream for Twilio.
2. Go to your Twilio account > **Phone Numbers** > **Active Numbers**, and then select the SMS phone number.
3. In the **Messaging** section, paste the Twilio inbound URL.

Flow of data between Omnichannel for Customer Service - SMS channel and Twilio

Incoming text messages

For an incoming text message sent by a customer to the support phone number, the message is first sent to the Twilio messaging service. Then Twilio pushes it to Omnichannel for Customer Service by using the callback URL. The message is then routed and associated to either a new or an existing conversation by Omnichannel for Customer Service.

Outgoing text messages

For an outgoing message sent by an agent from within Dynamics 365, the message is first sent to the Twilio service and then Twilio sends it to the customer. In addition to the text message, Omnichannel for Customer Service uses the APIs provided by Twilio to send the customer's phone number, support phone number, and the Twilio account information (Account SID and the Auth Token) to the Twilio service.

Twilio account and phone number validation

When you validate the SMS settings while setting up the SMS channel, a call is made to Twilio to validate the Account SID and Auth Token.

Configure the SMS for Twilio channel in the Omnichannel Administration app

> **ⓘ Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022, and the app was removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

The information in this section isn't applicable if you're using the new Omnichannel admin center app in the latest version of Omnichannel for Customer Service.

Perform the following steps to create a work stream for the SMS channel for Twilio:

1. In Omnichannel Administration, go to **Work Streams** under **Work Distribution Management**.
2. Select **New**. The **New Work Stream** page appears.
3. In the **General information** area, enter the following details:
    - **Channel**: Select **SMS**.
    - **Auto-close after inactivity**: Select a value that indicates a duration of eight hours or longer.
    - **Allow automated messages**: Specify **Yes** to be able to define the business hours.

4. In **Work distribution**, specify the necessary details. More information: Create a work stream

5. On the **SMS Settings** tab, enter the following details:

   - **SMS Provider**: Select **Twilio**.
   - **Account SID**: Enter the Twilio ACCOUNT SID.
   - **Auth Token**: Enter the Twilio AUTH TOKEN.

6. Select **Save**. The **Twilio inbound URL** is generated and displayed.

7. On the **SMS Numbers** tab, select **New SMS Number**, and then enter the following details:

   - **Number**: Specify the support phone number that you purchased from Twilio in the <*country_code*><*phone_number*> format, such as 14252306549. Make sure that you don't enter blank spaces or special characters.
   - **SMS number language**: The preferred language that's used when you configure automated messages on the **Automated messages** tab.
   - **Type**: Select **Long code**, **Short code**, or **Toll free**.
   - **Description**: Specify a description for the number. (Optional)
   - **Operating Hours**: Specify the business hours when the customer support team is active and available to serve customers.

   > ⓘ **Note**
   >
   > You can configure only one phone number per workstream.

8. Select **Save**.

9. (Optional). On the **Automated messages** tab, configure automated messages.

10. (Optional). On the **Surveys** tab, configure a post-conversation survey.

11. On the command bar, select **Validate API Key**. The Twilio account and phone number are validated.

12. Configure the routing rules on the **Routing rule items** tab. The routing rule for SMS works on **Mobile Phone** of the **Contact** entity. The customer is identified based on **Mobile Phone**, and the conversation is automatically linked to the contact record.

    > ⓘ **Note**

To configure routing rules and other options in the workstream for Twilio, see the following:

- **Skill-based routing**
- **Productivity tools**
- **Smart assist**
- **Templates**

Configure an Apple Messages for Business channel

Article • 10/27/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Many customers use the Apple Messages app for their daily communication needs. The Apple Messages app also supports Messages for Business, a new way to apply iMessage's richer communication capabilities to engage with businesses. The asynchronous nature of this channel gives customers the convenience of resolving their issues when they find time, in contrast to real-time channels such as Chat for Dynamics 365, where the session ends when the chat window is closed.

Apple Messages for Business supports rich messaging experiences, allowing customer and agents to converse through convenient and engaging interactions. More information: Introduction to Messages for Business - Apple Developer

Prerequisites

Before you configure the Apple Messages for Business channel in Dynamics 365 Omnichannel for Customer Service, ensure that the following prerequisites are met:

1. Register your business with Apple Business Register More information: Apple Business Register
2. Enable Messages for Business and create a Messages for Business account for your brand. More information: Apple Messages for Business Accounts Introduction
3. Configure the Messaging Service Provider (MSP) using the correct URL provided for your geo-region in the following table.

Geo location	API Endpoint URL
Asia-Pacific	`https://dynamics365-omnichannel-apac.omnichannelengagementhub.com/applemessagesforbusiness`

Geo location	API Endpoint URL
Australia	`https://dynamics365-omnichannel-aus.omnichannelengagementhub.com/applemessagesforbusiness`
Canada	`https://dynamics365-omnichannel-can.omnichannelengagementhub.com/applemessagesforbusiness`
Europe	`https://dynamics365-omnichannel-eur.omnichannelengagementhub.com/applemessagesforbusiness`
France	`https://dynamics365-omnichannel-fra.omnichannelengagementhub.com/applemessagesforbusiness`
Germany	`https://dynamics365-omnichannel-ger.omnichannelengagementhub.com/applemessagesforbusiness`
India	`https://dynamics365-omnichannel-ind.omnichannelengagementhub.com/applemessagesforbusiness`
Japan	`https://dynamics365-omnichannel-jpn.omnichannelengagementhub.com/applemessagesforbusiness`
North America	`https://dynamics365-omnichannel-nam.omnichannelengagementhub.com/applemessagesforbusiness`
South America	`https://dynamics365-omnichannel-sam.omnichannelengagementhub.com/applemessagesforbusiness`
Switzerland	`https://dynamics365-omnichannel-che.omnichannelengagementhub.com/applemessagesforbusiness`
United Arab Emirates	`https://dynamics365-omnichannel-uae.omnichannelengagementhub.com/applemessagesforbusiness`
United Kingdom	`https://dynamics365-omnichannel-uk.omnichannelengagementhub.com/applemessagesforbusiness`

Configure an Apple Messages for Business channel instance in Omnichannel admin center

To add the Apple Messages for Business channel instance, complete the following steps:

1. In the Omnichannel site map, select **Channels** under **General settings**, and then on the **Accounts and channels** page, select **Add account**.

2. On the **Channel details** page, enter a name and select **Apple Messages for Business** in **Channels**.

3. On the **Add account** page, specify the Apple Messages for Business account ID. To get the account ID, go to your organization's Apple Business Register, open the Messages for Business account, navigate to the Messaging Service Provider configuration and select **Test your Messaging Service Provider connection**, and copy the account ID by selecting **Copy ID**.

   > ⓘ **Note**
   >
   > If your organization uses Customer-managed keys, be aware that Apple Messages for Business acount IDs cannot be encryped. Apple Messages for Business account IDs are part of the URLs used by customer devices to start new conversations and may be visible to users, but this doesn't present a security concern.

4. To configure routing and work distribution, you can create a workstream or select an existing one.

5. Select the workstream that you've created for the Apple Messages for Business channel and on the workstream page, select **Set up Apple Messages for Business**, and do the following steps:

   a. In the **Available Apple Messages for Business accounts** area, select an account from the list.

   b. On the **Language** page, select the language to use.

   c. On the **Behaviors** page, configure the following options:

      - **Custom automated messages**
      - **Post-conversation survey**
      - **Authentication settings:** If you enable authentication, your agents will be able to request customer's authenticate their identity. You must associate a channel specific authentication setting. This step may be completed later, after channel setup. There are two flows to choose from: OAuth 2.0 code flow or OAuth 2.0 OpenID connect flow. More information: Authentication settings for Apple Messages for Business.

   d. On the **User features** page, configure the following options:

- **File attachments:** When set to yes for both customer and agent, customers and agents can send and receive file attachments. More information: Enable file attachments.
- **Apple Pay:** If you enable Apple Pay, your agents will be able to send Apple Pay requests to customers. Each channel instance must have a Payment Profile associated. This step may be completed later, after channel setup. More information: Payment Profiles.

e. Review the **Summary** page, and then select **Create**. The channel instance is configured.

6. Configure routing rules. More information: Configure work classification
7. Configure work distribution. More information: Work distribution settings
8. Optionally, you can add a bot. Skip this step if your conversations are handled by human agents only. More information: Configure a bot
9. In **Advanced settings**, configure the following options based on your business needs:

   - Sessions
   - Agent notifications
   - Context variables
   - Smart assist bots
   - Quick replies
   - Rich messages

Configure Facebook channel

Article • 03/08/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Many customers use social messaging channels like LINE for their personal communication needs. Many also prefer using these messaging channels to engage with businesses. The asynchronous nature of these channels gives customers the convenience of getting their issues resolved as and when they find time, unlike real-time channels like Chat for Dynamics 365 Customer Service, where the session ends when the chat window is closed.

> **Note**
>
> If you use access tokens in Facebook, refresh them on a 60-day schedule or as required because the tokens might randomly expire. More information: **Facebook access tokens**

Prerequisites

The following prerequisites must be met before you configure the Facebook channel in Omnichannel for Customer Service.

- Create a Facebook page and enable Messenger. More information: Create and Manage a Page and Messaging
- Create a Facebook application. More information: App Development
- Add Messenger and Webhooks to the Facebook application. More information: Setting Up Your Facebook App
- If you'll use a test environment, set up test accounts in Facebook so that agents can send and receive messages in Omnichannel for Customer Service.
- Values for application ID and application secret from the **App ID** and **App Secret** fields in the Facebook application > **Settings** > **Basic**.

Roles and permissions

The following Facebook roles and permissions are required for integrating your Facebook app with Omnichannel for Customer Service.

- Facebook users who don't have a role in the Facebook app must have the `pages_messaging` permission to send messages to a Facebook page from Omnichannel for Customer Service. The app owner must provide the `pages_messaging` permission for users to be able to send messages. More information: pages_messaging
- If the Facebook app that you're using is currently in development mode, then only those Facebook users who have roles within the app can send messages to the Facebook page; the messages can be received by or forwarded to Omnichannel for Customer Service. More information: App roles
- For Omnichannel for Customer Service to be able to retrieve the customer's username from Facebook, the customer must request for Business Asset User Profile Access in their Facebook app. More information: Business Asset User Profile Access

Configure a Facebook channel

To configure a Facebook channel, the following steps are required:

1. Create a Facebook channel account.
2. Configure a Facebook workstream and work distribution settings

Create the Facebook channel account

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, in **Customer support**, select **Channels**.

   b. In **Accounts**, for **Messaging accounts**, select **Manage**.

2. On the **Accounts and channels** page, select **New account**.
3. Enter the following details:

   a. On the **Channel details** page, enter a name and select Facebook in **Channels**.

b. On the **Add account** page, in the **Application ID** and **Application secret** fields, specify the Facebook App ID and App secret that you'd copied from the Facebook application.

c. On **Add Facebook Pages to this account**, do the following steps:

d. Select **Add**, and in the **Add Facebook Page** pane, enter the following details:

- **Page name:** Name of the Facebook page.
- **Page ID:** ID of the Facebook page. To get the page ID, go to your Facebook page, select About, and copy the value in the Page ID field.
- **Page access token:** Specify the Page access token of the Facebook application. To get the page access token, go to your Facebook application and then go to **Messenger** > **Settings**. In the **Access Tokens** section, select the page, and copy the value in the **Page Access Token** field.

e. On the **Callback information** page, the **Callback URL** and **Verify token** fields are populated automatically when you save the settings. Use the information to configure webhooks in the Facebook application. The values for the fields will not be generated if the Facebook page is reused across multiple instances of the channel.

Create a Facebook workstream

1. To configure routing and work distribution, perform the steps outlined in create a workstream.

2. Select the workstream that you've created for the Facebook channel and on the workstream page, select **Set up Facebook**, and do the following steps:

a. In the **Available Facebook Pages** area, select a page from the list.

b. On the **Language** page, select the language to use.

c. On the **Behaviors** page, configure the following options:

- Custom automated messages
- Post-conversation survey

d. On the **User features** page, configure the following options:

- **File attachments:** When set to yes for both customer and agent, customers and agents can send and receive file attachments. More information: Enable file attachments. The availability and support of media

is dependent on the Facebook application settings. More information: Facebook updates

- **Facebook message tag:** Set to **Yes** to enable your agents to message customers after 24 hours have passed. When set to **No**, agents will be unable to respond to customers after 24 hours unless the customer sends another message.

If you enable the Facebook human agent message tag during an active conversation between the agent and customer, the agent must close the conversation and reopen it to communicate with customers after 24 hours of inactivity. Agents can start conversations with customers for up to seven days.

To use the Facebook human agent message tag, you must also turn it on in the Facebook app. For more information, see Facebook Developer Tools.

e. Review the **Summary** page, and select **Create**. The channel instance is configured.

3. Configure routing rules. More information: Configure work classification
4. Configure work distribution. More information: Work distribution settings
5. Optionally, you can add a bot; skip this step if your conversations are handled by human agents only. More information: Configure a bot
6. In **Advanced settings**, configure the following options based on your business needs:

   - Sessions
   - Agent notifications
   - Context variables
   - Smart assist bots
   - Quick replies

Customer experience

A customer can start a conversation in any of the following ways:

- Messenger on the Facebook page
- www.messenger.com
- Messenger app on a mobile device
- Messenger widget on a custom website

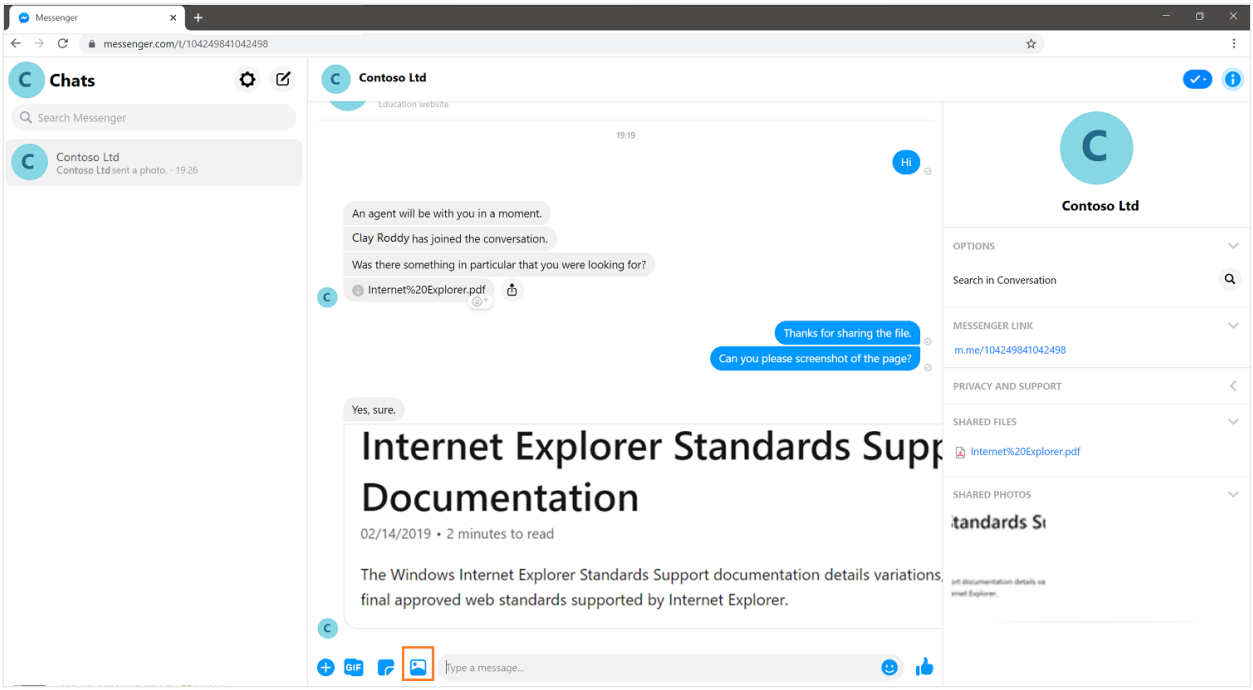
If a customer starts a conversation from the Facebook page and then later switches to the mobile device, the previous conversation persists, and the customer can continue the conversation.

The agent receives the notification of the incoming conversation request. More information: Use Facebook channel

After the Facebook social profile is linked to a customer or contact record by the agent, subsequent Facebook conversations are linked to the customer records and the customer summary is populated.

If the customer is not identified based on name, a new contact record can be created.

The customer can send attachments only if you enable them. When the option isn't enabled for the customers, they can still attempt to send the file. However, agents won't receive the file and will see an error.



Privacy notice

By enabling this feature, your data will be shared with Facebook and flow outside of your organization's compliance and geo boundaries (even if your organization is in a Government Cloud Community region). Consult the feature technical documentation for more information here.

Customers are solely responsible for using Dynamics 365, this feature, and any associated feature or service in compliance with all applicable laws, such as laws relating to monitoring, recording, and storing communications with their end users. This includes adequately notifying end users that their communications with agents may be

monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

> **Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

After completing the prerequisites, you can add the Facebook channel for your organization by following these steps:

1. Create a Facebook workstream
2. Create a Facebook channel
3. Create routing rules
4. Modify settings for a specific Facebook page

Create a Facebook workstream

1. Sign in to Omnichannel Administration.
2. Go to **Work Distribution Management** > **Work Streams**.
3. Select **New** to create a Facebook workstream.
4. On the **Work Distribution** tab, in the **Channel** field, select **Facebook**.
5. Specify other details as required. To learn more, see Understand and create workstreams.
6. Select **Save**.

Create a Facebook channel

1. Go to **Channels** > **Facebook**.

2. Select **New** to create a Facebook channel.

3. On the **New Facebook Application** page, provide the following information:

    - **Name**: Name of the Facebook application.
    - **Application Id**: ID of the Facebook application. To get the application ID, go to your Facebook application, select **Settings** > **Basic**, and copy the value in the **App ID** field.
    - **Application Secret**: Application secret of the Facebook application. To get the application secret, go to your Facebook application, select **Settings** > **Basic**, and copy the value in the **App Secret** field.

4. Select **Save**. After you save the record, the **Facebook Pages** section is enabled, and it allows you to add the Facebook pages through which a customer can connect to an agent.

    > **Note**
    >
    > In this release, you can create only one Facebook application per organization. However, you can add multiple pages in a Facebook application.

5. In the **Facebook Pages** section, select **Add New Facebook Page** to add a Facebook page.

6. On the **New Facebook Page** page, **Account setup** tab, provide the following information:

    - **Page Id**: ID of the Facebook page. To get the page ID, go to your Facebook page, select **About**, and copy the value in the **Page ID** field.
    - **Page Name**: Name of the Facebook page.
    - **Page Access Token**: Page access token from the Facebook application. To get the page access token, go to your Facebook application and then go to **Messenger** > **Settings**. In the **Access Tokens** section, select the page, and copy the value in the **Page Access Token** field.
    - **Facebook Application**: The Facebook application record is auto filled from which you added a Facebook page.
    - **Work Stream**: Browse and select the workstream you created for the Facebook channel.

7. Select **Save** to create the record.

After you add a Facebook page, values for **Callback Uri** and **Verify Token** are generated automatically. These values are used to configure webhooks in the Facebook application.

> ⓘ **Note**
>
> You can add multiple Facebook **Page Id** (pages) to a **Facebook Application** channel. However, a Facebook **Page Id** can be linked to one **Facebook Application** only. If you link the same Facebook **Page Id** to multiple **Facebook Application** channels, then **Callback Uri** and **Verify Token** won't be generated automatically.

Create routing rules

1. Go to **Work Distribution Management** > **Work Streams**.
2. Open the workstream you created in Step 1.
3. On the **Routing rules items** tab, create a routing rule to transfer the message to an appropriate agent. Select the entity as **Facebook Engagement Context**.

   For example, you can create a rule to transfer Facebook chat from a customer named Lesa to the default queue.

When you create conditions for routing rules, the **Facebook Engagement Context (Conversation)** entity enables you to set the following attributes:

- **Customer name**: The customer name is shown in the format "first name, last name".
- **Locale**: For a list of locales, see Facebook developer documentation.
- **Timezone**: Timezone is shown as a number relative to GMT, for example, “5.5”.
- **User Page Scoped Id**: This is shown as a number string.

Modify settings for a specific Facebook page

1. In the Omnichannel Administration app, go to your Facebook application and select the Facebook page you want to modify.
2. On the **General settings** tab, provide the following information:

   - **Language**: Select the preferred language for your Facebook page.

- **Work stream**: Select an existing workstream or create a new one.
- **Enable file attachments for customers**: Set to **Yes** to allow customers to send file attachments to agents. Otherwise, set to **No**.
- **Enable file attachments for agents**: Set to **Yes** to allow agents to send file attachments to customers. Otherwise, set to **No**.

> **Note**
>
> - To learn more about attachments, see **Enable file attachments**.
> - To learn about uploading media in Facebook, see the Facebook developer documentation. The availability and support of media is dependent on the Facebook application settings. More information: **Facebook updates**

- **Turn on your Facebook human agent message tag**: Set to **Yes** to enable your agents to message customers after 24 hours have passed. When set to **No**, agents will be unable to respond to customers after 24 hours unless the customer sends another message.

  If you enable the Facebook human agent message tag during an active conversation between the agent and customer, the agent must close the conversation and reopen it in order to communicate with customers after 24 hours of inactivity. Agents can start conversations with customers for up to seven days.

  To use the Facebook human agent message tag, you must also turn it on in the Facebook app. For more information, see Facebook Developer Tools.

3. On the **Automated messages** tab, configure automated messages.
4. On the **Surveys** tab, configure a post-conversation survey.

Configure Google's Business Messages channel

Article • 05/26/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Many customers use social messaging channels like Google's Business Messages for their personal communication needs. Many also prefer using these messaging channels to engage with businesses. The asynchronous nature of these channels gives customers the convenience of getting their issues resolved as and when they find time, unlike real-time channels like Chat for Dynamics 365, where the session ends when the chat window is closed.

Google's Business Messages channel gives you the opportunity to capitalize on the social media trend and engage with your customers in a seamless and personalized experience.

Prerequisites

Complete the following steps before configuring Google's Business Messages channel in Omnichannel for Customer Service.

- In Customer Service, provision the channels in your environment. More information: Provision Omnichannel for Customer Service
- In Google's Business Messages, complete the following actions:
  - Register as a partner
  - Create a service account with a service account key
  - Configure the agent:
    - Create an agent
    - Set non-local information
    - Set messaging availability
    - Set agent- and location-level settings

    - Set the default locale
    - Verify the agent
- Verify that you have permissions on the secure columns. More information: Configure permissions to access secure columns

Create a Google's Business Messages channel

1. Go to one of the admin apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Channels** in **Customer support**. The **Channels** page appears.

   b. Select **Manage** for **Messaging accounts**. The **Accounts and channels** page appears.

   c. Select **New account**.

2. In the **Name** field, enter the name for the account.

3. In the **Channel** dropdown menu, select **Google's Business Messages**, and then select **Next**.

4. On the **Google's Business Messages Partner account** page, in the **Partner ID** field, copy and paste the Partner ID from the **Settings** page of the Google's Business Messages app.

5. In the **Client token** field, enter the token from Google's Business Messages app. To retrieve the token, in Google's Business Messages app, on the **Settings** page, under **Webhook**, select the **Configure** link. The **Configure your webhook** page is displayed, and then you can copy the token from the **Client token** field.

6. In Omnichannel admin center, on the **Google's Business Messages Partner account** page, next to **Service Account Credentials file (JSON file)**, select **Upload**, and then select the file you downloaded from Google's Business Messages.

   ⓘ Note

> Only users with proper security permissions can use secured fields, such as **Client token** and **Security Credential**. More information: **Set up security permissions for a field**

7. In Omnichannel, in **Configure your two-way connection with Omnichannel for Customer Service**, copy the **Google's Business Messages** URL and then, in the Business Messages app, on the **Configure your webhook** page, paste the URL in the **Webhook endpoint URL** field.
8. Select **Verify** in the Google's Business Messages app.
9. When the verification has completed, select **Save**.
10. In Google's Business Messages, select the tile for the agent profile you created, and then on the **Overview** page, select and copy the **Brand ID**, and then paste it into the **Brand ID** field in Omnichannel.
11. In Google's Business Messages, select and copy the **Agent ID**, and then paste it into the **Agent ID** field in Omnichannel.
12. In Omnichannel, select **Add** > **Save**.

Create a workstream

1. Go to one of the admin apps, and perform the following steps:

   Customer Service admin center

   - In the site map, select **Workstreams** in **Customer support**. The **All Workstreams** page appears.

2. Select **New workstream**, and then enter a name.
3. In **Type**, select **Messaging**.
4. In the **Channel** dropdown list, select **Google's Business Messages**.
5. In the **Choose existing** dropdown list, select an existing queue to use as the fallback for the workstream.
6. Select **Create**.

7. When the workstream has been created, on the workstream page, select **Set up Google's Business Messages**.
8. Select the agent account you prefer from the list, and then select **Next**.
9. On the **Language** page, select the preferred language, and then select **Next**.
10. On the **User features** page, toggle the **File attachments** setting to **On**, and then select **Next**.
11. Select **Create channel**.

Test the messaging for the agent in the Google's Business Messages app

In the Business Messages app, on the **Overview** page, under **Agent test URLs**, select either **Android** or **iOS**, and then select **Test**.

Create routing rules

Configure routing rules for the workstream you created. Select the entity as Google's Business Messages context.

For example, you can create a rule to transfer Google's Business Messages chat from a customer named Google's Business Messages to the default queue.

Privacy notice

By enabling this feature, your data will be shared with Google and flow outside of your organization's compliance and geo boundaries (even if your organization is in a Government Cloud Community region). Consult the feature technical documentation for more information here.

Customers are solely responsible for using Dynamics 365, this feature, and any associated feature or service in compliance with all applicable laws, such as laws relating to monitoring, recording, and storing communications with their end users. This includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

Configure a LINE channel

Article • 08/30/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Many customers use social messaging channels like LINE for their personal communication needs. Many also prefer using these messaging channels to engage with businesses. The asynchronous nature of these channels gives customers the convenience of getting their issues resolved as and when they find time, unlike real-time channels like Chat for Dynamics 365 Customer Service, where the session ends when the chat window is closed.

The LINE channel gives you an incredible opportunity to capitalize on the social media trend and engage with your customers in a seamless and personalized experience.

> **Note**
>
> The LINE channel isn't available in the Government Community Cloud (GCC) region.

Prerequisites

Following are the prerequisites before configuring the LINE channel in Omnichannel for Customer Service.

> **Note**
>
> To enable the LINE channel in an existing Omnichannel for Customer Service environment, you must **upgrade to the latest version of Omnichannel for Customer Service**.

1. Create a LINE handle. More information: Create and Manage a LINE profile
2. Create a LINE channel in the LINE Developers console. More information: Create a LINE channel

After completing the prerequisites, you can add the LINE channel for your organization by following these steps:

1. Create a LINE channel.
2. Create routing rules.

Create a LINE channel

To configure the LINE channel

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Channels** in **Customer support**. The **Channels** page appears.

   b. Select **Manage** for **Messaging accounts**. The **Accounts and channels** page appears.

   c. Select **New account**.

2. Enter the following details:

   a. On the **Channel details** page, enter a name and select **LINE** in **Channel**.

   b. On the **Account details** page, enter the following details:

   - **Channel ID:** ID of the LINE application. Go to the LINE developer portal > **Provider** > **Channel** (ensure that it's a Messaging API) > **Basic settings**, and then copy the value in the **Channel ID** box.
   - **Channel secret:** Application secret of the LINE application. Go to the LINE developer portal > **Provider** > **Channel** (ensure that it's a Messaging API) > **Basic settings**, and then copy the value in the **Channel secret** box.
   - **Channel access token:** Token of the LINE application. Go to the LINE developer portal > **Provider** > **Channel** (ensure that it's a Messaging API) > **Messaging API**, and then copy the value in the **Channel access token (long-lived)** box.

   c. On the **Callback information** page, copy the text in the **Callback URL** box. You'll use the copied information in the LINE account.

   d. Select **Done**.

3. To configure routing and work distribution, you can create a workstream or select an existing one.

4. Select the workstream that you've created for the LINE channel and on the workstream page, select **Set up LINE**, and configure the following options:

   a. On the **LINE** page, select an account from **Available LINE accounts**.

   b. On the **Language** page, select a language.

   c. On the **Behaviors** page, configure the following options:

      - Custom automated messages
      - Post-conversation survey

   d. On the **User features** page, set the toggle for **File attachments** to **On** and select the following checkboxes if you want to allow agents and customers to send and receive file attachments. More information: Enable file attachments.

      - Customers can send file attachments
      - Agents can send file attachments

   e. Verify the settings on the **Summary** page, and select **Finish**. The LINE channel instance is configured.

5. Configure routing rules. More information: Configure work classification

6. Configure work distribution. More information: Work distribution settings

7. Add a bot. More information Configure a bot

8. In **Advanced settings**, configure the following options based on your business needs:

   - Sessions
   - Agent notifications
   - Context variables
   - Smart assist bots
   - Quick replies

Create a LINE channel in Omnichannel Administration

> **Important**

Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

1. Go to **Channels** > **LINE**.
2. Select **New** to create a LINE channel.
3. On the **New LINE Application** page, provide the following account details:
    - **Name**: Name of the LINE application.
    - **Channel ID**: ID of the LINE application. Go to the LINE developer portal > **Provider** > **Channel** (ensure that it's a Messaging API) > **Basic settings**, and then copy the value in the **Channel ID** field.
    - **Channel secret**: Application secret of the LINE application. Go to the LINE developer portal > **Provider** > **Channel** (ensure that it's a Messaging API) > **Basic settings**, and then copy the value in the **Channel secret** field.
    - **Channel access token**: Token of the LINE application. Go to the LINE developer portal > **Provider** > **Channel** (ensure that it's a Messaging API) > **Messaging API**, and then copy the value in the **Channel access token (long-lived)** field.
    - **Enable Webhooks**: Webhooks in the LINE application must be enabled. Go to the LINE account manager > **Settings** > **Response settings**. Under **Main settings**, select **Bot** for **Response mode**, and then under **Detailed Settings**, select **Enabled** for **Webhooks**.
4. Browse to and select the out-of-the-box work stream for the LINE channel, and then select **Save**. After you save the record, the **LINE** channel is enabled. The Callback URL has been created. The next step is to save it.

    To create a work stream, see Create work streams.
5. The Callback URL might take a few minutes to generate. Select **Refresh**.
6. Go to the the LINE developer portal > **Provider** > **Channel** (make sure it's a Messaging API) > **Messaging API**. Copy the **Webhook URL** from Omnichannel for Customer Service, and then paste it into the **Webhook URL** field in the LINE developer console.
7. Make sure that **Use webhook** is enabled in the LINE app dashboard.

> More information about the LINE app: Setting up your LINE app

8. On the **Automated messages** tab, configure automated messages.
9. On the **Surveys** tab, configure a post-conversation survey.

The LINE channel setup is complete.

> **Note**
>
> You can only add one **LINE account** per **LINE Application** channel.

Modify settings for a specific LINE account

1. In the Omnichannel Administration app, go to your LINE application and select the LINE account you want to modify.
2. On the **General settings** tab, provide the following information:
   - **Language**: Select the preferred language for your LINE account.
   - **Work stream**: Select an existing work stream or create a new one.
   - **Enable file attachments for customers**: Set to **Yes** to allow customers to send file attachments to agents. Otherwise, set to **No**.
   - **Enable file attachments for agents**: Set to **Yes** to allow agents to send file attachments to customers. When the agent sends an attachment, the app sends the blob storage URL to the channel. Otherwise, set to **No**.

     To learn more about attachments, see Enable file attachments.

     To learn more about uploading media in LINE, see LINE developer documentation.
3. On the **Automated messages** tab, configure automated messages.
4. On the **Surveys** tab, configure a post-conversation survey.

Create routing rules

1. Go to **Work Distribution Management** > **Work Streams**.
2. Open the out-of-the-box work stream or the one you created.

3. On the **Routing rules items** tab, create a routing rule to transfer the message to an appropriate agent. Select the entity as **LINE Engagement Context**. For example, you can create a rule to transfer LINE chat from a customer named LINE to the default queue.

Customer and agent experiences

A customer can initiate a conversation in any of the following ways:

- LINE app on a mobile device
- LINE app on a desktop device
- line.me/en/

If a customer initiates a conversation from the LINE website and then later switches to the mobile device, the previous conversation persists and the customer can continue the conversation.

The agent receives the notification of the incoming chat request, along with customer details. More information: View notifications

Once the LINE social profile is linked to an user customer/contact record by the agent, subsequent LINE conversations are linked to the customer records and the customer summary is populated.

If the customer isn't identified by name, a new contact record can be created.

Privacy notice

By enabling this feature, your data will be shared with LINE and flow outside of your organization's compliance and geo boundaries (even if your organization is in a Government Cloud environment). Please consult the feature technical documentation for more information here.

Customers are solely responsible for using Dynamics 365, this feature, and any associated feature or service in compliance with all applicable laws, such as laws relating to monitoring, recording, and storing communications with their end-users. This includes adequately notifying end-users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end-users may be monitored, recorded, or stored.

Configure a WhatsApp channel through Twilio

Article • 10/09/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

The WhatsApp channel feature lets you integrate WhatsApp through Twilio with Omnichannel for Customer Service to engage with customers who prefer to use the WhatsApp channel.

The success of social media customer service, like all other customer service, depends on the quality of care provided. Communications from agents should be timely, accurate, sensitive, brief, and friendly, which ultimately improves the customer satisfaction and brand loyalty.

Prerequisites

- Make sure channels are provisioned in your environment. More information: Provision Omnichannel for Customer Service

  > **Note**
  >
  > To enable the Twilio channel in an existing environment, you must upgrade to the latest version of Omnichannel for Customer Service. For information, **Upgrade Omnichannel for Customer Service**.
  >
  > For newly created Twilio accounts, you must disable a security setting that blocks the ability to send media files. More information: **Extended notice and update on security changes: HTTP Authentication for Voice and Messaging Media enabled by default**

- Obtain a Twilio account with an appropriate subscription or a Twilio sandbox account. For information on configuring a Twilio sandbox account, see Integrate a Twilio sandbox account with Omnichannel for Customer Service

- Connect Twilio Number to your WhatsApp Business Profile. To learn more, see Connect your Twilio Number to your WhatsApp Business Profile.
- Verify that you have permissions on the secure columns. More information: Configure permissions to access secure columns

WhatsApp message types and 24-hour session rule

- **Template messages:** Are the outbound messages that agents send through Twilio using one of the preapproved templates? They're typically transactional messages, such as delivery alerts and appointment reminders, sent to users who have opted in to receive messages from your organization. For messages requiring localization, you must get the message approved by WhatsApp in each language. For more information about WhatsApp message templates, see WhatsApp documentation.
- **Session messages:** According to WhatsApp, session messages are incoming messages from a customer or outgoing replies by an agent to the incoming messages, within 24 hours. A messaging session starts when agents receive a message from a customer. It lasts for 24 hours from the most recently received message. Session messages don't need to follow a template, and can include media attachments.
- **24 hours session rule:** A messaging session starts when an agent receives a message from a customer or replies to the incoming message from the customer. When the customer sends a message, the agent has 24 hours to reply from the time the agent received it. However, after 24 hours, the agent can send a message to customer only by using a predefined and approved template.

End-to-end walkthrough

1. Fetch Twilio account details
2. Create a WhatsApp channel
3. Create routing rules
4. Modify settings for a specific WhatsApp phone number

Fetch Twilio account details

> **ⓘ Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

To integrate a WhatsApp channel through Twilio with Omnichannel for Customer Service, you need to go to your Twilio account and fetch the **ACCOUNT SID** and **AUTH TOKEN** values. Save the values safely because they're required to create a WhatsApp channel configuration in the Omnichannel Administration app.

Go to your **Twilio Console Dashboard** > **Settings** > **General** to fetch the details.

Create a WhatsApp channel

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Channels** in **Customer support**. The **Channels** page appears.

   b. Select **Manage** for **Messaging accounts**. The **Accounts and channels** page appears.

   c. Select **New account**.

2. Enter the following details:

   a. On the **Channel details** page, enter a name and select **WhatsApp** in **Channels**.

   b. On the **Account details** page, enter the following details:

   - **Account SID:** Specify the value from your Twilio account.
   - **Authentication token:** Specify the value from your Twilio account.

   c. On the **WhatsApp numbers** page, select **Add**, and on the page that appears, enter the following information:

   - **Name:** Specify a name.

- **Number:** Specify the WhatsApp phone number by prefixing the plus (+) symbol.

d. On the **Callback information** page, copy the value in the **Twilio inbound URL** box to use for the Twilio account.

e. Select **Done**. The account is added to the list.

3. To configure routing and work distribution, you can create a workstream or select an existing one.

4. Select the workstream that you've created for the WhatsApp channel and on the workstream page, select **Set up WhatsApp** to configure the following options:

a. On the **WhatsApp number** page, in the **Available WhatsApp numbers** list, select the number that you created.

b. On the **Language** page, select the language.

c. On the **Behaviors** page, configure the following options:

- Custom automated messages
- WhatsApp message templates
- Post-conversation survey

d. On the **User features** page, set the toggle for **File attachments** to **On** and select the following checkboxes if you want to allow agents and customers to send and receive file attachments. More information: Enable file attachments.

- Customers can send file attachments
- Agents can send file attachments

e. Verify the settings on the **Summary** page, and select **Finish**. The WhatsApp channel instance is configured.

5. Configure routing rules. More information: Configure work classification.

6. Configure work distribution. More information: Work distribution settings

7. Add a bot. More information Configure a bot.

8. In **Advanced settings**, configure the following options based on your business needs:

- Sessions
- Agent notifications

- Context variables)
- Smart assist bots
- Quick replies

Configure WhatsApp message templates

You can configure the option for agents to send WhatsApp-approved messages. If 24 hours pass after a customer's last message, agents will only be able to send messages from WhatsApp-approved templates until the customer responds. You must create your message templates in your Twilio account and have them approved by WhatsApp before you add them in Omnichannel for Customer Service.

Perform the following steps:

1. For the selected workstream for WhatsApp, edit the WhatsApp account.
2. On the **Behaviors** tab, in **WhatsApp message templates**, select **Add**.
3. On the **Add message template** dialog box, do the following:

    - **Name:** Specify a name for the template.
    - **Default language:** Select the language from the list.
    - **WhatsApp approved text:** Copy and paste the approved text from the template that you created in WhatsApp.

4. Select **Save**.
5. Create as many templates as required.

Integrate a Twilio sandbox account with Omnichannel for Customer Service

1. In Twilio, go to the **Programmable SMS** > **Programmable Messaging** > **WhatsApp sandbox**.
2. In the **WHEN A MESSAGE COMES IN** box, enter the Twilio inbound URL that you generated in Omnichannel for Customer Service, and save the changes.
3. To test the WhatsApp channel with the Twilio sandbox, you can send a WhatsApp message to the number provided by Twilio with a unique code that is also provided by Twilio. You can also use the sandbox message template provided by Twilio to test sending messages outside of the 24-hour window.

Create a WhatsApp channel in Omnichannel Administration

> **Important**

Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

After you create a workstream for the WhatsApp channel through Twilio, create a WhatsApp channel in the Omnichannel Administrator app.

To create a WhatsApp channel, follow these steps:

1. Sign in to the Omnichannel Administration app. Select **WhatsApp** under **Channels**.
2. In the **New WhatsApp** page, do the following.

Section	Field	Description
Twilio account details	Name	Specify a name for the WhatsApp channel.
Twilio account details	Account SID	Fetch the value from your Twilio account and paste it here.
Twilio account details	Auth Token	Get the value from your Twilio account and paste it here.

3. Select **Save**. In the **Callback information** section, the **Twilio inbound URL** field is generated with a link. Copy the link from the field.
4. Go to your Twilio console, select **Senders**, and then select the WhatsApp phone number. Under **Messaging**, paste the link that you copied in the preceding step in the **Twilio inbound URL** field.
5. In the **WhatsApp phone numbers** section, select **New WhatsApp Number**. The **New WhatsApp Number** page is displayed.
6. Do the following.

Section	Field	Description	Example value
Phone number details	Name	Specify a name for the WhatsApp channel.	WhatsApp phone number
Phone number details	WhatsApp Account	The **WhatsApp Account** field is populated by default. However, you can change the value using the lookup.	WhatsApp channel

Section	Field	Description	Example value
Phone number details	WhatsApp Number	Specify the WhatsApp number.	123456989
Work distribution	Work stream	Select the out-of-the-box workstream from the lookup. To create a new workstream, see Create work streams.	WhatsApp channel work stream

7. Select **Save**. The WhatsApp phone number is saved.
8. Select the back button on the browser to go to the WhatsApp channel page. You can see that the WhatsApp phone number is added in the **WhatsApp phone numbers** section.
9. Select **Save**.
10. In the **Validation** section, select **Validate** to validate the Account SID, Auth token, and phone numbers. After you validate, a toast notification displays with the success or error.

Create routing rules

1. Go to **Work Distribution Management** > **Work Streams**.
2. Open the out-of-the-box workstream or the one you created.
3. On the **Routing rules items** tab, you can create a routing rule to transfer the message to an appropriate agent. Select the entity as **WhatsApp Engagement Context**. For example, you can create a rule to transfer WhatsApp chat from a customer to the default queue.

When you create conditions for routing rules, the **WhatsApp Engagement Context (Conversation)** entity enables you to set the **Customer Phone Number** and **Customer First Message** attributes. The **Customer First Message** attribute lets you create a prefilled message that automatically appears in the text field of a customer chat, which can be used for routing.

Modify settings for a specific WhatsApp phone number

1. In the Omnichannel Administration app, go to your WhatsApp application and select the WhatsApp phone number you want to modify.
2. On the **General settings** tab, provide the following information:

- **Language**: Select the preferred language for your WhatsApp phone number.
- **Work stream**: Select an existing workstream or create a new one.
- **Enable file attachments for customers**: Set to **Yes** to allow customers to send file attachments to agents. Otherwise, set **No**.
- **Enable file attachments for agents**: Set to **Yes** to allow agents to send file attachments to customers. When the agent sends an attachment, the app sends the blob storage URL to the channel. Otherwise, set **No**.

  To learn more about attachments, see File attachments.

  To learn more about uploading media in WhatsApp, see Twilio support documentation.

3. On the **Automated messages** tab, configure automated messages.
4. On the **Message templates** tab, you can configure agents' ability to send WhatsApp approved messages. If 24 hours pass after a customer's last message, agents will only be able to send messages from WhatsApp approved templates until the customer responds.

   > **Note**
   >
   > Create your message templates in your Twilio account and have them approved by WhatsApp before you add them in Omnichannel for Customer Service.

   Select **New** to create a template and complete the following fields:

   - **Name**: Label the group of messages that go in this template.
   - **Message trigger**: Select the event that triggers the message to be sent.
   - **Message description**: Give the message template a description.

   Select **Save** and the **Localization Data (Message template)** panel appears. Select **New localization** and complete the following fields:

   - **Language code**: Select the language for the message.
   - **Localized text**: Write the message in the language specified. You must create localized text for each translation of the message.

5. On the **Surveys** tab, configure a post-conversation survey.

Configure a WeChat channel

Article • 10/27/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

WeChat channel

organizations enhance business efficiencies in certain geographical areas by integrating social messaging channels such as WeChat, which has a large user base in Asia, into Omnichannel for Customer Service.

> **Note**
>
> The WeChat channel isn't available in the Government Community Cloud (GCC) region.

Prerequisites

Make sure that the following prerequisites are met:

- WeChat is provisioned in your environment. More information: Provision Omnichannel for Customer Service

  > **Note**
  >
  > To enable the WeChat channel in an existing environment, you must upgrade to the latest version of Omnichannel for Customer Service. For information, **Upgrade Omnichannel for Customer Service**.

- An active subscription to the WeChat service account or sandbox account (if using sandbox for testing) exists and is stored as a contact on your phone. You'll initiate WeChat conversations by contacting the subscription account. More information: WeChat documentation

- Verify that you have permissions on the secure columns. More information: Configure permissions to access secure columns

Get WeChat account details

To integrate a WeChat channel with Omnichannel for Customer Service, get the following details:

- **Original ID:** Original ID in the WeChat service or sandbox account.
- **Developer ID:** Application ID associated with your WeChat service or sandbox account.
- **Developer password:** Application secret used for authentication.
- **Token:** Customer-defined string.
- **Message encryption key:** Message encryption key in WeChat. If you're using a sandbox WeChat account, use a key of your choice.

Create a WeChat channel

To create a WeChat channel

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, in **Customer support**, select **Channels**.

   b. In **Accounts**, for **Messaging accounts**, select **Manage**.

2. On the **Accounts and channels** page, select **New account**.

3. Enter the following details:
   a. On the **Channel details** page, specify a name and in **Channels**, select **WeChat**, and select **Next**.
   b. In **Account details**, enter the following information:

      - **Original ID:** Specify the WeChat account number.
      - **Developer ID (AppID):** Specify the WeChat Developer ID.
      - **Developer password (AppSecret):** Specify the WeChat Developer password.
      - **Token:** Specify the WeChat token.
      - **Message encryption key (EncodingAESKey):** Specify the WeChat Message encryption key for service account. If you're configuring a sandbox account,

use a key of your choice.

a. On the **Callback information** page, copy the values that you see in the two boxes. You'll update the copied information in the WeChat account.
b. Select **Done**. The WeChat account instance is created.

4. To configure routing and work distribution, you can create a workstream or select an existing one.

5. Select the workstream that you've created for the WeChat channel and on the workstream page, select **Set up WeChat**, and do the following steps:

   a. On the **WeChat setup** dialog box, on the **WeChat** page, select the account that you created.

   b. On the **Language** page, select a language.

   c. On the **Behaviors** page, configure the following options:

      - Custom automated messages
      - Post-conversation survey

   d. On the **User features** page, set the toggle for **File attachments** to **On** and select the following checkboxes if you want to allow agents and customers to send and receive file attachments. More information: Enable file attachments.

      - Customers can send file attachments
      - Agents can send file attachments

   e. Verify the settings on the **Summary** page, and select **Finish**. The WeChat channel instance is configured.

6. Configure routing rules. More information: Configure work classification.

7. Configure work distribution. More information: Work distribution settings

8. Add a bot. More information Configure a bot.

9. In **Advanced settings**, configure the following options based on your business needs:

- Sessions
- Agent notifications
- Context variables
- Smart assist bots
- Quick replies

Configure WeChat details

If you're using the service account of WeChat, perform the following steps:

1. Sign in to your WeChat Service Account, and then paste the IP allowlist and server address, which you copied from Omnichannel admin center in the preceding procedure, in their respective boxes. The IP address of the Omnichannel for Customer Service application is not blocked in the WeChat firewall. The server address helps establish the connection between WeChat and Omnichannel for Customer Service.

2. In WeChat, make sure that you select **Security Mode** under **Message Encryption Method** for encryption of the chat messages.

3. Select **Submit**.

Create a WeChat channel in Omnichannel Administration

> **ⓘ Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

1. In Omnichannel Administration, under **Channels**, select **WeChat**.

2. Select **New**. The **New WeChat** page appears.

3. On the **General** tab, in the **Step 1: Account details** area, enter the following details:

   - **Name:** Specify a name for the channel.
   - **Owner:** Accept the default owner, or change to specify a different owner.
   - **Service Account:** Specify the WeChat service or sandbox account number.
   - **Developer ID (AppID):** Specify the WeChat Developer ID.
   - **Developer password (AppSecret):** Specify the WeChat Developer password.
   - **Token:** Specify the WeChat token.
   - **Message encryption key (EncodingAESKey):** Specify the WeChat Message encryption key for service account. If you're configuring a sandbox account, use a key of your choice.

4. In the **Step 2: Work distribution** area, for **Work Stream**, select the out-of-the-box workstream for WeChat. Alternatively, you can create a work stream for WeChat

and associate it with the WeChat channel.

5. Select **Save**. The details are saved, and data is populated in the **Step 3: Callback information** section.

6. Copy the information that's displayed in the boxes. This step is required for only WeChat service account.

Modify settings for a specific WeChat account

1. In the Omnichannel Administration app, go to your WeChat application and select the WeChat account you want to modify.

2. On the **General settings** tab, provide the following information:

   - **Language**: Select the preferred language for your WeChat account.
   - **Work stream**: Select an existing workstream or create a new one.
   - **Enable file attachments for customers**: Set to **Yes** to allow customers to send file attachments to agents. Otherwise, set **No**.
   - **Enable file attachments for agents**: Set to **Yes** to allow agents to send file attachments to customers. When the agent sends an attachment, the app uploads the attachment to WeChat and captures the media ID. Otherwise, set **No**.

     To learn more about attachments, see Enable file attachments.

     To learn more about uploading media in WeChat, see WeChat developer documentation.

3. On the **Automated messages** tab, configure automated messages.

4. On the **Surveys** tab, configure a post-conversation survey.

Privacy notice

By enabling this feature, your data will be shared with WeChat and flow outside of your organization's compliance and geo boundaries (even if your organization is in a Government Cloud Community region). Consult the feature technical documentation for more information here.

Customers are solely responsible for using Dynamics 365, this feature, and any associated feature or service in compliance with all applicable laws, such as laws relating

to monitoring, recording, and storing communications with their end users. This includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

Configure Microsoft Teams channel

Article • 04/26/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Use Microsoft Teams as an engagement channel for support of internal functions—such as technical support, human resources, and finance—to allow organizations to connect their employees with internal support personnel by using the Omnichannel Add-in for Dynamics 365 Customer Service.

Prerequisites

Make sure that the following prerequisites are met:

- Microsoft Teams is installed in your environment. More information: Provision Omnichannel for Customer Service

  > **Note**
  >
  > To enable the Microsoft Teams channel in an existing Omnichannel for Customer Service environment, you must upgrade to the latest version of Omnichannel for Customer Service. More information: **Upgrade Omnichannel for Customer Service**

- An app is created and configured in **Teams** > **Developer Portal**. More information: Create and register an app

Configure a Microsoft Teams channel

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, in **Customer support**, select **Channels**.

b. In **Accounts**, for **Messaging accounts**, select **Manage**.

2. On the **Accounts and channels** page, select **New account**.

3. Enter the following details:
   a. On the **Channel details** page, enter a name and select **Microsoft Teams** in **Channels**.
   b. On the **Account details** page, in **Account name**, enter the Microsoft Teams name that you use.
   c. On the **Callback information** page, copy the value in the **Bot ID** box. You'll use it in the Teams app to update the value for the bot ID.
   d. Select **Done**. The account is added to the list.

4. To configure routing and work distribution, go to the **Workstreams** page and create a workstream.

5. Select the workstream that you've created for the Microsoft Teams channel and on the workstream page, select **Set up Microsoft Teams** to configure the following options:

   a. On the **Microsoft Teams setup** page, in the **Available Microsoft Teams accounts** list, select the number that you created.

   b. On the **Language** page, select the language.

   c. On the **Behaviors** page, configure the following options:

      - Custom automated messages
      - Post-conversation survey

   d. On the **User features** page, set the toggle for **File attachments** to **On** and select the following checkboxes if you want to allow agents and customers to send and receive file attachments. More information: Enable file attachments

      - Customers can send file attachments
      - Agents can send file attachments

   e. Turn on the toggle for **Voice and video calls** (preview), and select an option in the **Calling options** dropdown list. At runtime, when agents are in conversation with customers and need to use audio or video to resolve issues, the call and video options are available to them.

      ⓘ Note

> Voice and video calls in Microsoft Teams is in preview, therefore, we recommend that you don't use it in production. Use it only in test and development environments.

f. Verify the settings on the **Summary** page, and select **Finish**. The Teams channel instance is configured.

6. Configure routing rules. More information: Configure work classification
7. Configure work distribution. More information: Work distribution settings
8. Add a bot. More information Configure a bot
9. In **Advanced settings**, configure the following options based on your business needs:

   - Sessions
   - Agent notifications
   - Context variables
   - Smart assist bots
   - Quick replies

Configure Teams details

1. In the Teams app, select the ellipses (...) and then select **Developer Portal**. The **Developer Portal** page appears.
2. On the **Apps** tab, select the app that you configured for Omnichannel for Customer Service.
3. Select **App features** under **Configure**.
4. On the **App features** page, select **Bot**, then select **Enter a bot ID**, and paste the bot ID value.
5. Select the required options, save, preview, and publish.

> **Note**
>
> If you receive an error when trying to add a bot to the team, refer to **Prepare your Microsoft 365 tenant**.

Configure a Microsoft Teams channel in Omnichannel Administration

> **ⓘ Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

1. In Omnichannel Administration under **Channels**, select **Teams**. The **New Teams Channel** page appears.
2. In **Step 1: Account details**, enter the following details:
   - **Name:** Specify a name for the channel.
   - **Owner:** Accept the default value, or specify a different value.
3. In **Step 2: Work distribution**, select the out-of-the-box work stream for Teams. Alternatively, you can create a work stream for Teams and associate it with the Teams channel.
4. Select **Save**. The Teams channel is saved.
5. In **Step 3: Callback information**, copy the value that's displayed in **Bot ID**.
6. Optionally, on the **Automated messages** tab, configure automated messages.
7. Optionally, on the **Surveys** tab, configure a post-conversation survey.

Modify settings for a specific account

1. In the Omnichannel Administration app, go to **Microsoft Teams** and select the account you want to modify.
2. On the **General settings** tab, provide the following information:
   - **Language**: Select the preferred language for your Teams account.
   - **Work stream**: Select an existing work stream or create a new one.
   - **Enable file attachments for customers**: Set to **Yes** to allow customers to send file attachments to agents. Otherwise, set **No**.

- **Enable file attachments for agents**: Set to **Yes** to allow agents to send file attachments to customers. When the agent attempts to send an attachment, the app requests the customer's consent. The attachment is stored in the customer's OneDrive. Otherwise, set **No**.

  To learn more about attachments, see Enable file attachments.

  To learn more about uploading media in Microsoft Teams, see Microsoft Teams documentation.

3. On the **Automated messages** tab, configure automated messages.

4. On the **Surveys** tab, configure a post-conversation survey.

Configure custom messaging channels

Article • 07/19/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Apart from built-in channels like chat and email, your organization can integrate custom messaging channels like Direct Line and Telegram with Omnichannel for Customer Service. With the custom messaging channel capability, you can:

- Bring in the channels your customers already use so that you can engage with them in familiar ways.
- Integrate line-of-business or in-house channels that are specific to your organization.
- Easily configure the administrator experience in the Customer Service admin center.
- Create a single, unified agent experience in the Omnichannel for Customer Service app.

Prerequisites

- Have a bot that's built using the Microsoft Bot Framework and registered with Azure Bot Service. Make sure to register the bot resource as a multitenant app.
- Connect the custom channel to the Azure bot resource.
- Have the app ID.
- Have the client secret value.

Configure a custom messaging channel

1. In the Customer Service admin center, under **Customer support**, select **Channels**. In **Accounts**, for **Messaging accounts**, select **Manage**.

2. On the **Accounts and channels** page, select **New account**.

3. Enter the following information:

    - **Channel details**:

    - **Name**: Enter a name for the custom messaging account.
    - **Channel**: Select **Custom** from the list.
    - **Method**: Select **Azure bot framework** from the list, and then select **Next**.

  - **Account details**:
    - **Microsoft app ID**: Enter the app ID.
    - **Client secret**: Enter the client secret value.

4. Select **Validate**. After validation succeeds, select **Next**.

5. Under **Custom channel**, select **Add**.

6. Enter the following information:

   - **Name**: Enter a name for the custom messaging channel.
   - **Channel**: Select a messaging channel from the list.

7. Select **Add** to add the channel to the account.

   Add more custom channels to the same account if needed.

8. Select **Save and close**.

9. Configure callback information.

Configure workstream and routing rules

1. In Omnichannel for Customer Service, select **Workstreams**, and then create a workstream. Be sure to select **Messaging** for **Type** and **Custom** for **Channel**.

2. Select the workstream that you created for the custom channel.

3. Select **Set up Custom**.

4. On the **Custom channel** page, select the custom messaging account you created earlier.

5. On the **Language** page, select the required language.

6. On the **Behaviors** page, configure the following options:

   - Custom automated messages
   - Post-conversation survey

7. On the **User features** page, if you want customers or agents, or both, to send file attachments, turn on **File attachments** and select the appropriate options.

8. Verify the settings on the **Summary** page, and then select **Finish**.
9. Configure routing rules.

Configure callback information

1. Copy the value in **Messaging endpoint (URL)**.
2. In another browser tab or window, open your Azure bot resource on the **Azure Portal** > **Bot Channel Registration** page.
3. Paste the messaging endpoint URL in the **Messaging endpoint** field.
4. Select **Apply**, and then close the Azure portal.
5. Select **Save and close**.

Create a workstream in Omnichannel Administration

> **Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

1. Sign in to Dynamics 365, and go to the Omnichannel Administration app.
2. Select **Work Streams** under **Work Distribution Management**.
3. Select **New** to create a new workstream.
4. Specify the values for the fields.
5. Select the **Custom** option for the **Channel** field.
6. Select **Save** to save the changes.

You've created a workstream for the custom channel. To learn more, see Create workstreams.

Create a custom messaging account in Omnichannel Administration

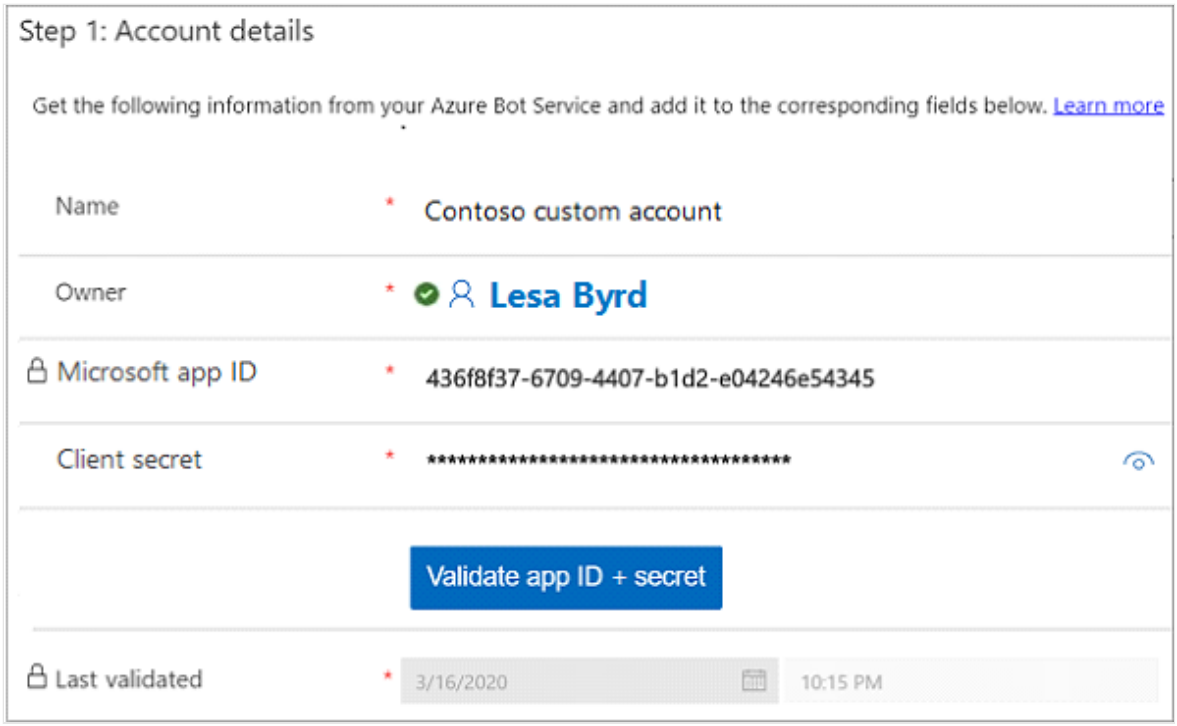
After you create a workstream for a custom channel, you need to create a custom channel with the details of the **Microsoft app ID** and **Client secret** that you retrieved while registering your messaging channel in Azure Bot Service.

To create a custom channel, follow these steps:

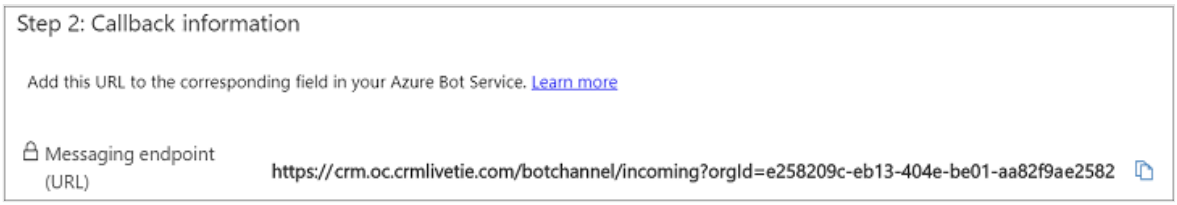
1. Sign in to Omnichannel Administrator.
2. Select **Custom** under **Channels**.
3. Select **New** in the **Active Custom messaging account** view.
4. In the **New Custom messaging account** page, specify the values for the following fields:

Section	Field	Description	Example value
Account details	Name	Specify a name for the custom channel.	Contoso custom channel
Account details	Microsoft app ID	Copy and paste the **Microsoft app ID** that you saved earlier from the Azure Bot Channel Registration page. To learn more, see Get registration password.	cae1d83e-8b07-4fca-8072-c2eb3444vxyz
Account details	Client secret	Copy and paste the **Client secret** that you saved earlier from the Azure Bot Channel Registration page. To learn more, see Get registration password.	

5. Select **Validate app ID + secret** to validate the **Microsoft app ID** and **Client secret** values. After the validation, a toast notification is displayed. Also, the **Last validated** field shows time and date. This ensures that bots are active and client secret refreshes are consumed.



6. Select **Save** to save the changes. After you save, in the **Callback information** section, the **Message endpoint (URL)** field is generated with a URL. Copy the URL from the field.



7. Go to the **Azure Portal** > **Bot Channel Registration** page, paste the URL into the **Message endpoint** field, and save the changes.

8. In the **Channels** section, select **New Custom messaging channel**. The **New Custom messaging channel** page is displayed.

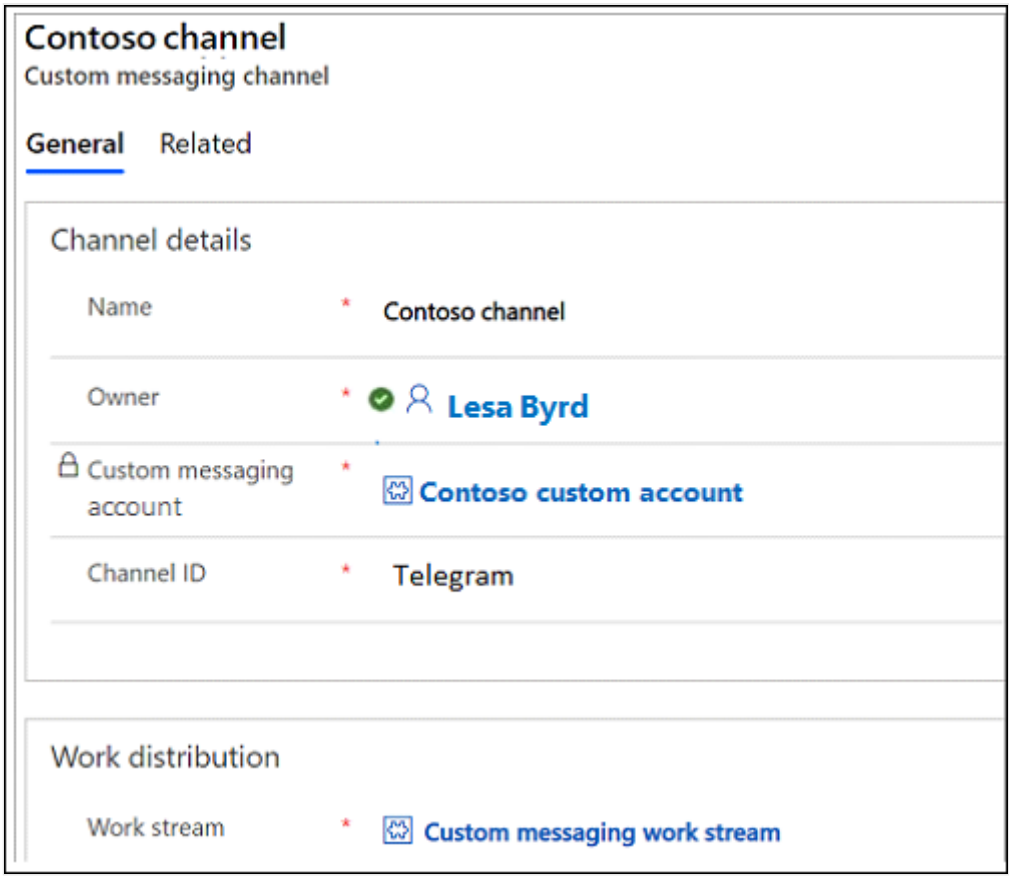
   After you create a **Custom messaging account**, you need to create a custom messaging channel, which is the actual channel from which Omnichannel for Customer Service agents will receive messages from the customer.

9. On the **New Custom messaging account** page, specify the values for the following fields:

Section	Field	Description	Example value
Details	Name	Specify a name for the custom channel	Contoso channel
Details	Custom Messaging	The **Custom messaging account** field is populated. However, you can change	Contoso custom channel

Section	Field	Description	Example value
	Account	the value using the lookup.	
Details	Channel ID	Select a channel from the list. The list might contain line-of-business (in-house) messaging or another messaging channel.	Telegram
Work distribution	Work stream	Select a workstream from the lookup.	Contoso custom channel work stream

> **Note**
>
> A **Custom messaging account** can have multiple unique channel IDs. Don't add two or more same Channel IDs to a **Custom messaging account** because the Azure Bot Framework supports only one messaging account per App ID. For example, for **Contoso custom account**, you can't add two or more **Telegram** Channel IDs.

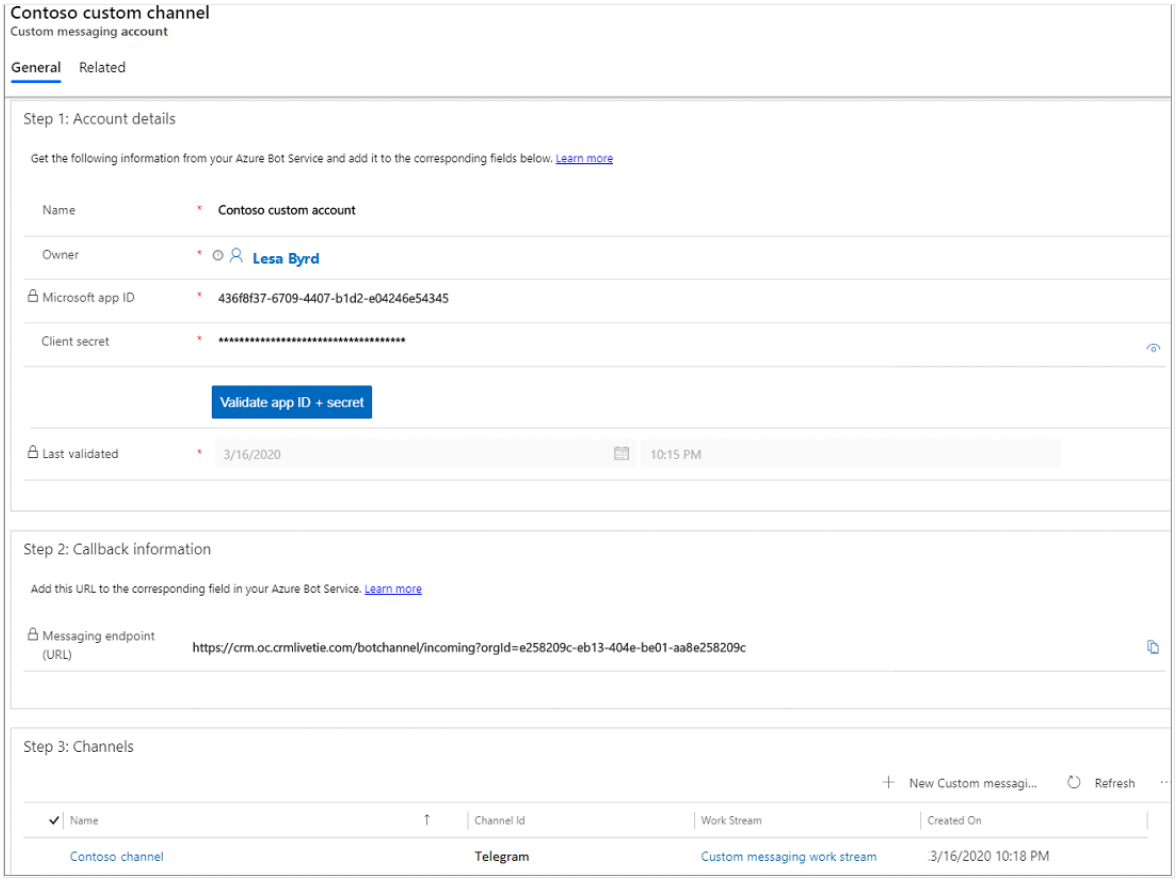


10. Optionally, on the **Surveys** tab, configure a post-conversation survey.

11. Select **Save** to save the custom messaging channel.

12. Select the back button on the browser to go to the custom messaging account page. You can see that the custom messaging channel is added in the **Channels** section.

13. Select **Save** to save the configurations.



To configure other options in the workstream, see the following:

- Skill-based routing
- Productivity tools
- Smart assist
- Templates

Modify settings for a specific custom channel

1. In the Omnichannel Administration app, go to **Custom** and select the custom channel you want to modify.

2. On the **General settings** tab, provide the following information:

    - **Language**: Select the preferred language for your custom channel.

    - **Work stream**: Select an existing workstream or create a new one.

- **Enable file attachments for customers**: Set to **Yes** to allow customers to send file attachments to agents. Otherwise, set **No**.
- **Enable file attachments for agents**: Set to **Yes** to allow agents to send file attachments to customers. When the agent sends an attachment, the app sends the blob storage URL to the channel. Otherwise, set **No**.

  To learn more about attachments, see Enable file attachments.

  To learn more about uploading media in Direct Line, see Azure Bot Service documentation.

  To learn more about uploading media in Telegram, see the Telegram Bot API.

3. On the **Automated messages** tab, configure automated messages.
4. On the **Surveys** tab, configure a post-conversation survey.

Article • 04/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Channels overview

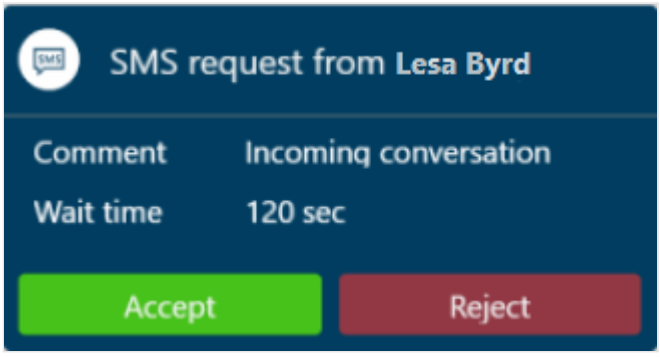
When you sign in to Omnichannel for Customer Service, you can see your work items in the Omnichannel Agent Dashboard. To learn more, see View agent dashboard and agent conversations (work items).

Prerequisite

Make sure your administrator has configured a TeleSign or Twilio channel in Omnichannel for Customer Service.

Incoming chat notifications

You'll receive a notification when a customer requests a conversation through TeleSign or Twilio. You can accept the chat request, after which a session starts and you'll see the communication panel in which you can exchange messages with the customer.



As an agent in Omnichannel for Customer Service, you can:

- View customer information on Active Conversation form.
- View the communication panel.
- Use call options and visual engagement in live chat.

- Monitor real-time customer sentiment.
- Manage sessions.
- Manage applications.
- Use these productivity tools:
  - Use agent scripts
  - View smart-assist cards
  - Use the productivity pane
- Create a record.
- Search, link, and unlink a record.
- Search for and share knowledge articles.
- Take notes specific to a conversation.
- Understand conversation states.
- Manage presence status.
- Search for transcripts.
- View conversation and session forms.
- View the active conversations for an incoming conversation request.
- Search for transcripts.

Configure SMS channel for Twilio

Use Facebook channel

Article • 03/14/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Facebook channel overview

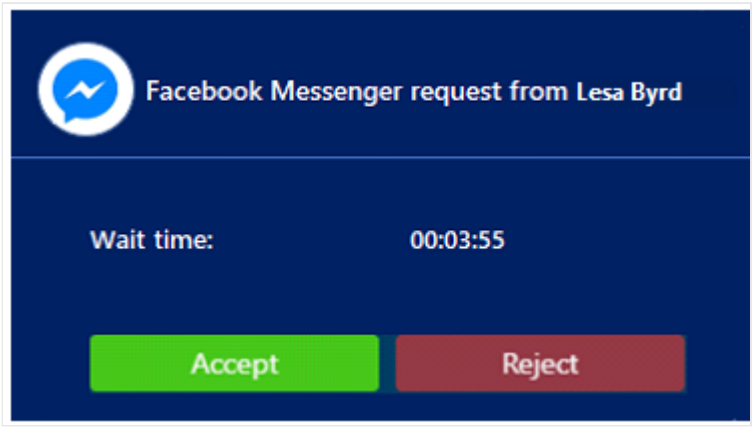
When you sign in to Omnichannel for Customer Service, you can see your work items in Omnichannel Agent Dashboard. To learn more, see View agent dashboard and agent conversations (work items).

Prerequisite

Make sure your administrator has configured a Facebook channel.

Incoming Facebook notification

You'll receive a notification when a customer requests a Facebook conversation. Accepting the Facebook request starts a session and you'll see the communication panel in which you can exchange messages with the customer.



In Omnichannel for Customer Service, you can:

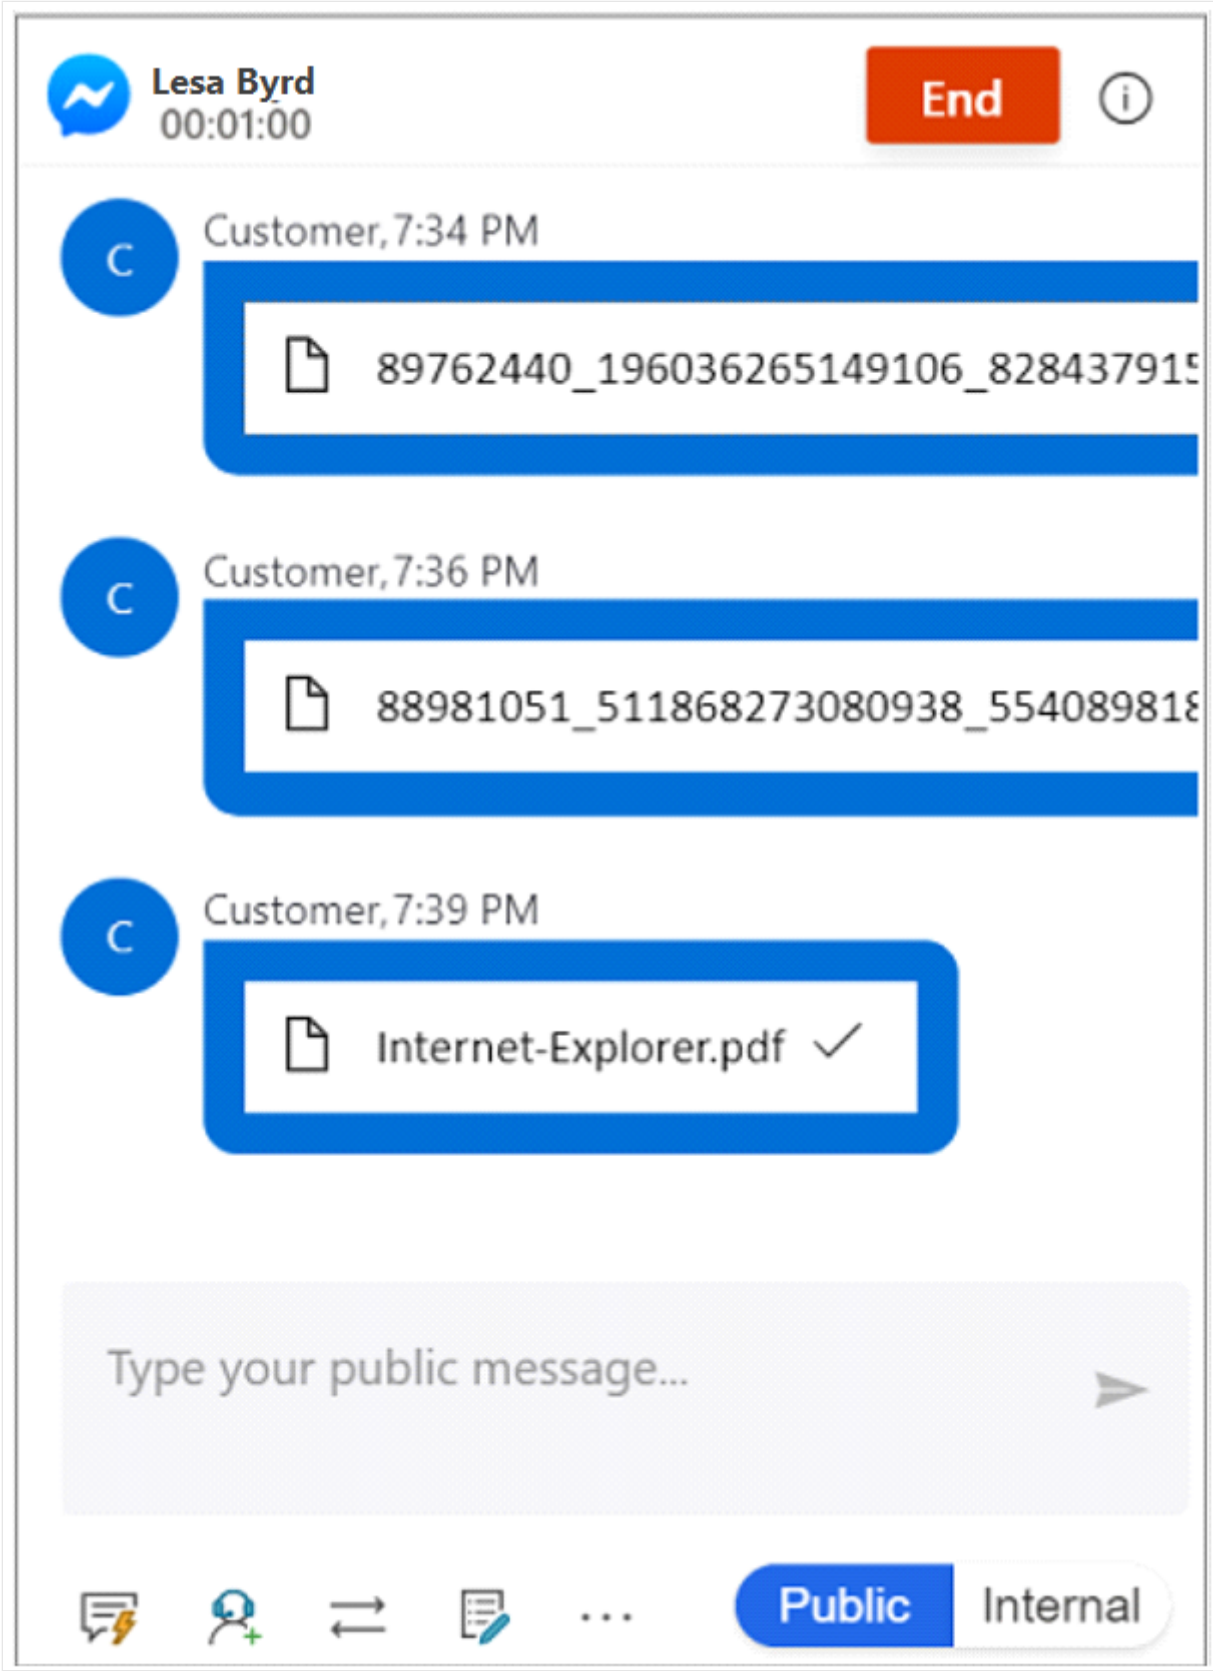
- View customer information on Active Conversation form
- View communication panel

- Use call options and visual engagement in live chat
- Monitor real-time customer sentiment
- Manage sessions
- Manage applications
- Use productivity tools
  - Use agent scripts
  - View Smart assist
  - Use productivity pane
- Create a record
- Search, link, and unlink a record
- Search for and share knowledge articles
- Take notes specific to conversation
- Understand conversation states
- Manage presence status
- Search for transcripts
- View conversation and session forms
- View active conversations for an incoming conversation request
- Search for transcripts

Send and receive file attachments

You can send file attachments to customers during a Facebook channel conversation. Before you send a file, make sure you understand the file size limit and file extension types set by your administrator.

You can see the files that you receive from a customer on the communication panel. To view the file, select it and save it to your computer. The file name you see on an image that was sent by a customer might not reflect the actual file name, but a randomly generated number.

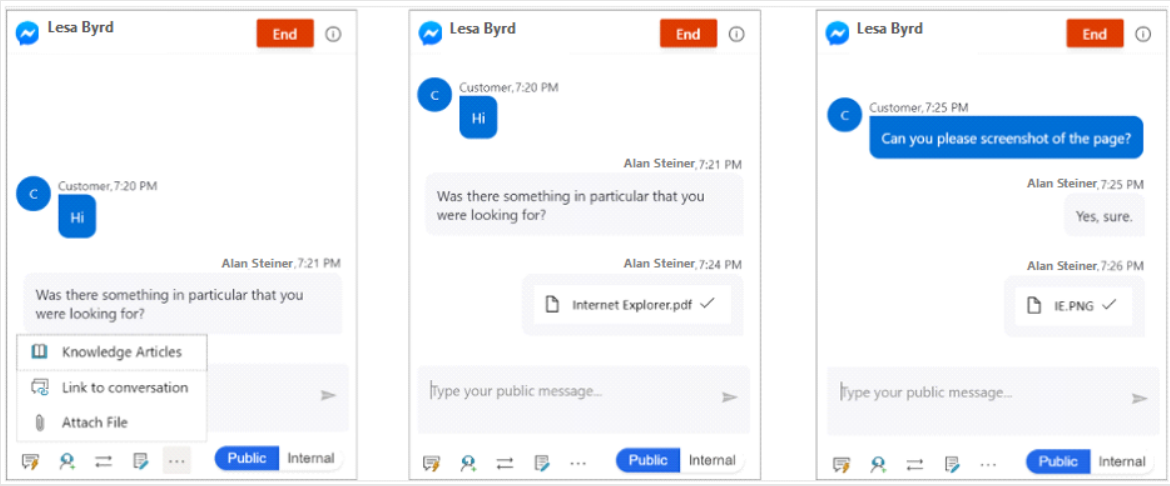


If a customer sends an unsupported file extension type, you will see an error message in the communication panel: **Error: Customer sent an unsupported message type**.

Send a file

To send a file, follow these steps:

1. Select the ellipsis (...) in the communication panel.
2. Select **Attach file**. A window will be displayed.
3. Browse and select the file to send it.



To learn more about the Facebook channel setup, see Configure a Facebook channel.

Privacy notice

Customers are solely responsible for using Dynamics 365, this feature, and any associated feature or service in compliance with all applicable laws, such as laws relating to monitoring, recording, and storing communications with their end users. This includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

Use Google's Business Messages channel

Article • 04/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

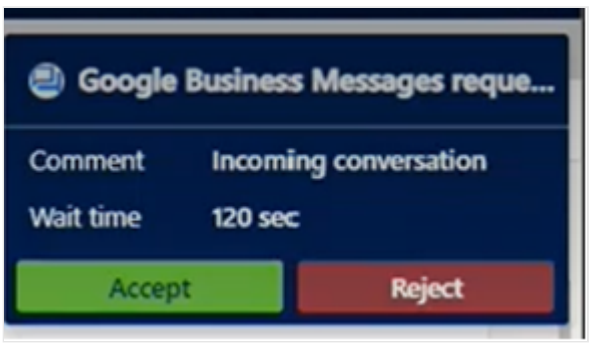
When you sign in to Customer Service workspace or Omnichannel for Customer Service, you can see your work items in the Omnichannel Agent Dashboard. To learn more, see View agent dashboard and agent conversations (work items).

Prerequisites

Make sure your administrator has configured the Google's Business Messages channel in Omnichannel for Customer Service. More information: Configure Google's Business Messages channel

Incoming chat notifications

You'll receive a notification when a customer requests a conversation through Google's Business Messages. You can accept the chat request, after which a session starts and you'll see the communication panel in which you can exchange messages with the customer.



In Omnichannel for Customer Service, you can:

- View customer information on Active Conversation form.
- View the communication panel.

- Use call options and visual engagement in live chat.
- Monitor real-time customer sentiment.
- Manage sessions.
- Manage applications.
- Use these productivity tools:
  - Use agent scripts
  - View smart-assist cards
  - Use the productivity pane
- Create a record.
- Search, link, and unlink a record.
- Search for and share knowledge articles.
- Take notes specific to a conversation.
- Understand conversation states.
- Manage presence status.
- Search for transcripts.
- View conversation and session forms.
- View customer information on Active Conversation form.
- Search for transcripts.

Configure Google's Business Messages channel

Use WhatsApp channel

Article • 04/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

WhatsApp channel overview

When you sign in to Omnichannel for Customer Service, you can see your work items in Omnichannel Agent Dashboard. To learn more, see View agent dashboard and agent conversations (work items).

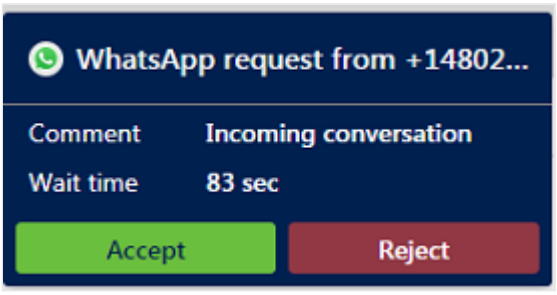
Prerequisite

Make sure your administrator has configured a WhatsApp channel through Twilio.

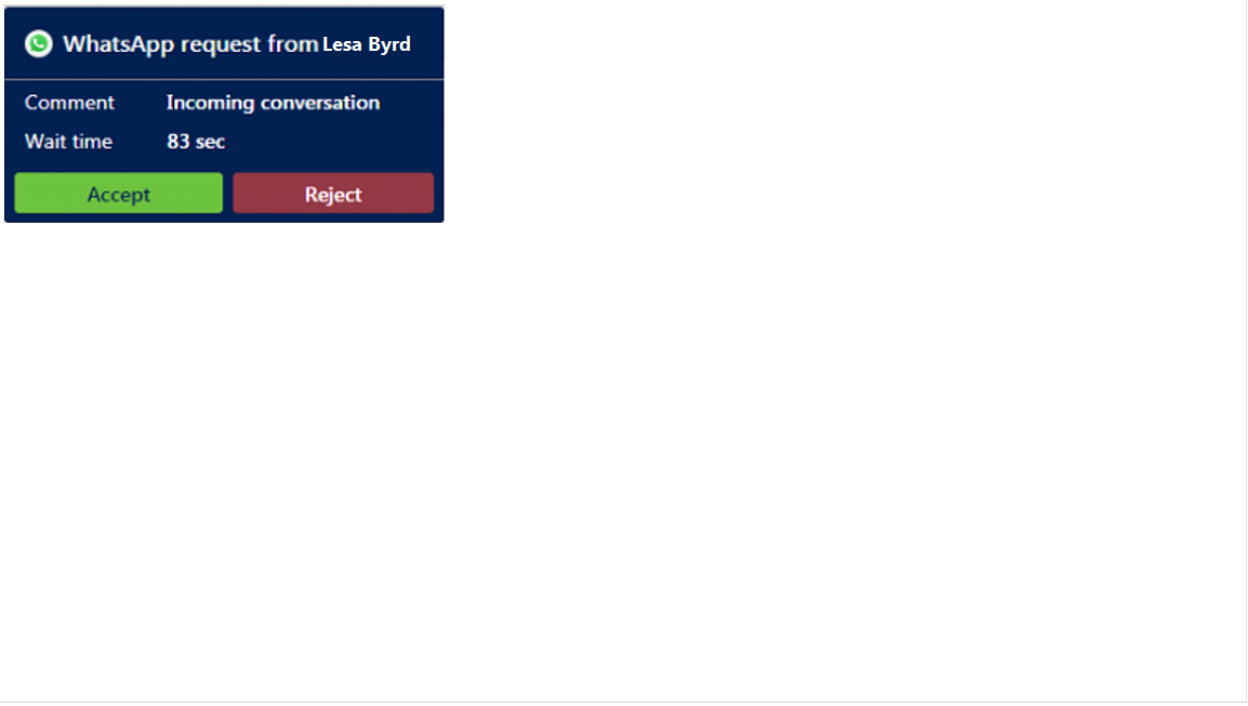
Incoming WhatsApp notification

You'll receive a notification when a customer requests a WhatsApp conversation. Accepting the WhatsApp request starts a session and you'll see the communication panel in which you can exchange messages with the customer.

Unauthenticated customer incoming notification



Authenticated customer incoming notification



In Omnichannel for Customer Service, you can:

- View customer information on Active Conversation form
- View communication panel
- Use call options and visual engagement in live chat
- Monitor real-time customer sentiment
- Manage sessions
- Manage applications
- Use productivity tools
  - Use agent scripts
  - View Smart assist cards
  - Use productivity pane
- Create a record
- Search, link, and unlink a record
- Search for and share knowledge articles
- Take notes specific to conversation
- Understand conversation states
- Manage presence status
- Search for transcripts
- View conversation and session forms
- View active conversations for an incoming conversation request
- Search for transcripts

WhatsApp message type and 24 hours session rule

- **Session messages**: According to WhatsApp, session messages are incoming messages from a customer, or outgoing responses to the incoming messages, within 24 hours. A messaging session starts when you receive a message from a customer. It lasts for 24 hours from the most recently received message. Session messages do not need to follow a template, and can include media attachments.

- **24 hours session rule**: A messaging session starts when you receive a message from a customer or reply to an incoming message from a customer. When the customer sends a message, you have 24 hours to reply to the customer from the time you received it. However, after 24 hours, if you try to send a message to the customer, an error is displayed: **This conversation has exceeded the 24 hour limit to respond to the customer.**

Use Microsoft Teams channel

Article • 04/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Agent dashboard for Teams channel

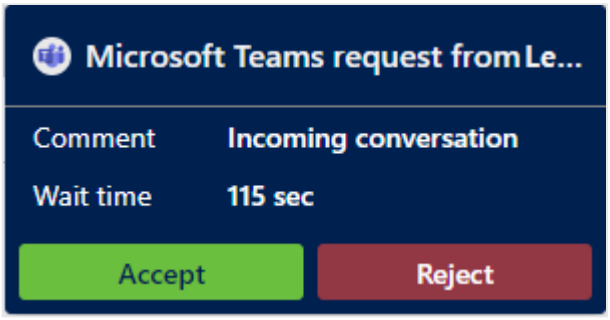
When you sign in to Omnichannel for Customer Service, you can see your work items on the Omnichannel Agent Dashboard. More information: View agent dashboard and agent conversations

Prerequisite

Make sure that your administrator has configured a Teams channel.

Incoming Teams chat notification

You'll receive a notification when a customer requests a conversation through Teams. When you accept the Teams chat request, a session is started, and you'll see the communication panel in which you can exchange messages with the customer.



In Omnichannel for Customer Service, you can:

- View customer information on Active Conversation form.
- View the communication panel.
- Use call options and visual engagement in live chat.
- Monitor real-time customer sentiment.

- Manage sessions.
- Manage applications.
- Use these productivity tools:
  - Use agent scripts
  - View smart-assist cards
  - Use the productivity pane
- Create a record.
- Search, link, and unlink a record.
- Search for and share knowledge articles.
- Take notes specific to a conversation.
- Understand conversation states.
- Manage presence status.
- Search for transcripts.
- View conversation and session forms.
- View the active conversations for an incoming conversation request.
- Search for transcripts.

If your administrator has enabled the option to initiate voice and video calls (in preview) during the conversation, the options to use voice and video will be available on the communication panel menu.

Use a WeChat channel

Article • 04/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Agent dashboard for WeChat channel

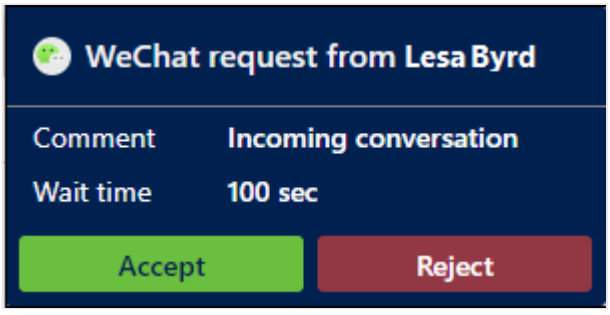
When you sign in to the Omnichannel Add-in for Dynamics 365 Customer Service, you can see your work items on the Omnichannel Agent Dashboard. More information: View agent dashboard and agent conversations

Prerequisites

Make sure that your administrator has configured a WeChat channel.

Incoming WeChat chat notification

You'll receive a notification when a customer requests a conversation through WeChat. When you accept the WeChat chat request, a session is started and you'll see the communication panel in which you can exchange messages with the customer.



In Omnichannel for Customer Service, you can:

- View customer information on Active Conversation form.
- View the communication panel.
- Use call options and visual engagement in live chat.
- Monitor real-time customer sentiment.

- Manage sessions.
- Manage applications.
- Use these productivity tools:
  - Use agent scripts
  - View smart-assist cards
  - Use the productivity pane
- Create a record.
- Search, link, and unlink a record.
- Search for and share knowledge articles.
- Take notes specific to a conversation.
- Understand conversation states.
- Manage presence status.
- Search for transcripts.
- View conversation and session forms.
- View the active conversations for an incoming conversation request.
- Search for transcripts.

Configure a WeChat channel

View social profiles of contacts

Article • 05/08/2023

Omnichannel for Customer Service creates a social profile for incoming requests from asynchronous channels. After a social profile is created for a conversation within a channel, later conversations are linked to the same social profile for the channel so that you can view all the related information in one place.

How social profiles are linked with contacts

When a customer sends a message, a record is automatically created with the social profile for the channel by using the unique identifier for the customer.

With social profiles, you can do the following:

- Automatically identify customers on social channels
- Display the customer name or phone number with conversations and calls on the agent dashboard
- Send outbound messages

The social profiles are supported for the following channels.

Channel	Supported?	Visitor name
Apple Messages for Business	Yes	Visitor
Facebook	Yes	User name
Google's Business Messages	Yes	Display name
LINE	Yes	Display name
WeChat	Yes	Visitor
WhatsApp	Yes	Phone number
Custom messaging (Telegram)	Yes	User name

View social profiles

As an agent, you can see the active social profile information, such as the customer, profile name, social channel, and related social profiles.

1. In the Omnichannel for Customer Service app, select the **Search** box, and scroll to the bottom of the list.
2. Select **Search for rows in a table using advanced filters**.
3. In the **Select a table to search** flyout menu, select **Social Profiles**, and select **Continue**. The **Active Social Profiles** page displays the list of active profiles.
4. Select the profile that you want to view.
5. The **RELATED SOCIAL PROFILES** section displays the related social profiles that are automatically linked after the contact is identified through the unique identifier.

Optionally, you can update the details and save the profile. You can also deactivate or activate the social profile.

View customer information on Active Conversation form

Integrate your own custom channel using Direct Line

Article • 03/17/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

With Omnichannel for Customer Service, you can implement a connector to integrate custom messaging channels by using Direct Line API 3.0, that's part of .NET SDK. The complete sample code illustrates how you can create your own connector. To learn more about the Direct Line API 3.0, see Key concepts in Direct Line 3.0 API.

This article explains how a channel is connected to the Microsoft Direct Line Bot Framework, which is internally attached to Omnichannel for Customer Service. The following section includes code snippets that use Direct Line API 3.0 to create a Direct Line client and the `IChannelAdapter` interface to build a sample connector.

> **Note**
>
> The source code and documentation describe the overall flow of how the channel can connect to Omnichannel for Customer Service through Direct Line, and don't focus on aspects of reliability and scalability.

Components

Adapter Webhook API Service

When the user enters a message, the adapter API is invoked from the channel. It processes the inbound request and sends a success or failure status as response. The adapter API service must implement the `IChannelAdapter` interface, and sends the inbound request to the respective channel adapter to process the request.

```
JavaScript
```

```
/// <summary>
/// Accept an incoming web-hook request from MessageBird Channel
/// </summary>
/// <param name="requestPayload">Inbound request Object</param>
/// <returns>Executes the result operation of the action method
asynchronously.</returns>
    [HttpPost("postactivityasync")]
    public async Task<IActionResult> PostActivityAsync(JToken
requestPayload)
    {
        if (requestPayload == null)
        {
            return BadRequest("Request payload is invalid.");
        }

        try
        {
            await
_messageBirdAdapter.ProcessInboundActivitiesAsync(requestPayload,
Request).ConfigureAwait(false);
        }
        catch (Exception ex)
        {
            _logger.LogError($"postactivityasync: {ex}");
            return StatusCode(500, "An error occured while handling your
request.");
        }

        return StatusCode(200);
    }
```

Channel adapters

The channel adapter processes the inbound and outbound activities, and must implement the `IAdapterBuilder` interface.

Process inbound activities

The channel adapter performs the following inbound activities:

1. Validate the inbound message request signature.

The inbound request from the channel is validated based on the signing key. If the request is invalid, an "invalid signature" exception message is thrown. If the request is valid, it proceeds as follows:

JavaScript

```
  /// <summary>
  /// Validate Message Bird Request
  /// </summary>
  /// <param name="content">Request Content</param>
  /// <param name="request">HTTP Request</param>
  /// <param name="messageBirdSigningKey">Message Bird Signing Key</param>
  /// <returns>True if there request is valid, false if there aren't.
</returns>
  public static bool ValidateMessageBirdRequest(string content, HttpRequest
request, string messageBirdSigningKey)
  {
      if (string.IsNullOrWhiteSpace(messageBirdSigningKey))
      {
          throw new ArgumentNullException(nameof(messageBirdSigningKey));
      }
      if (request == null)
      {
          throw new ArgumentNullException(nameof(request));
      }
      if (string.IsNullOrWhiteSpace(content))
      {
          throw new ArgumentNullException(nameof(content));
      }
      var messageBirdRequest = new MessageBirdRequest(
          request.Headers?["Messagebird-Request-Timestamp"],
          request.QueryString.Value?.Equals("?",
              StringComparison.CurrentCulture) != null
              ? string.Empty
              : request.QueryString.Value,
          GetBytes(content));

      var messageBirdRequestSigner = new
MessageBirdRequestSigner(GetBytes(messageBirdSigningKey));
      string expectedSignature = request.Headers?["Messagebird-Signature"];
      return messageBirdRequestSigner.IsMatch(expectedSignature,
messageBirdRequest);
  }
```

2. Convert the inbound request to a bot activity.

The inbound request payload is converted into an activity that the Bot Framework can understand.

> ⓘ **Note**
>
> The activity payload must not exceed the message size limit of 28 KB.

This Activity object includes the following attributes:

Attribute	Description
from	Stores the channel account information that consists of the unique identifier of the user and name (combination of first name and last name, separated by a space delimiter).
channelId	Indicates the channel identifier. For inbound requests, the channel ID is `directline`.
serviceUrl	Indicates the service URL. For inbound requests, the service URL is `https://directline.botframework.com/`.
type	Indicates the activity type. For message activities, the type is `message`.
text	Stores the message content.
id	Indicates the identifier that the adapter uses to respond to outbound messages.
channelData	Indicates channel data that consists of `channelType`, `conversationcontext`, and `customercontext`.
channelType	Indicates the channel name through which the customer is sending messages. For example, MessageBird, KakaoTalk, Snapchat
conversationcontext	Refers to a dictionary object that holds the context variables defined in the workstream. Omnichannel for Customer Service uses this information to route the conversation to the right agent. For example: "conversationcontext ":{ "ProductName" : "Xbox", "Issue":"Installation" } In this example, the context routes the conversation to the agent who deals with Xbox installation.
customercontext	Refers to a dictionary object that holds the customer details such as phone number and email address. Omnichannel for Customer Service uses this information to identify the user's contact record. "customercontext":{ "email":email@email.com, "phonenumber":"1234567890" }

JavaScript

```
  /// <summary>
  /// Build Bot Activity type from the inbound MessageBird request
payload<see cref="Activity"/>
  /// </summary>
  /// <param name = "messagePayload"> Message Bird Activity Payload</param>
  /// <returns>Direct Line Activity</returns>
  public static Activity PayloadToActivity(MessageBirdRequestModel
messagePayload)
  {
  if (messagePayload == null)
  {
```

```
        throw new ArgumentNullException(nameof(messagePayload));
    }
    if (messagePayload.Message?.Direction == ConversationMessageDirection.Sent
||
    messagePayload.Type == ConversationWebhookMessageType.MessageUpdated)
    {
        return null;
    }
    var channelData = new ActivityExtension
    {
        ChannelType = ChannelType.MessageBird,
        // Add Conversation Context in below dictionary object. Please refer
the document for more information.
        ConversationContext = new Dictionary<string, string>(),
        // Add Customer Context in below dictionary object. Please refer the
document for more information.
        CustomerContext = new Dictionary<string, string>()
    };
    var activity = new Activity
        {
            From = new ChannelAccount(messagePayload.Message?.From,
messagePayload.Contact?.DisplayName),
            Text = messagePayload.Message?.Content?.Text,
            Type = ActivityTypes.Message,
            Id = messagePayload.Message?.ChannelId,
            ServiceUrl = Constant.DirectLineBotServiceUrl,
            ChannelData = channelData
        };

        return activity;
    }
```

The sample JSON payload is as follows:

JSON

```
{
    "type": "message",
    "id": "bf3cc9a2f5de...",
    "serviceUrl": https://directline.botframework.com/,
    "channelId": "directline",
    "from": {
        "id": "1234abcd",// userid which uniquely identify the user
        "name": "customer name" // customer name as First Name <space> Last
Name
    },
    "text": "Hi,how are you today.",
    "channeldata":{
        "channeltype":"messageBird",
        "conversationcontext ":{ // this holds context variables defined in
Workstream
            "ProductName" : "XBox",
            "Issue":"Installation"
```

```
        },
        "customercontext":{
            "email":email@email.com,
            "phonenumber":"1234567890"
        }
    }
}
```

3. Send the activity to the message relay processor.

After building the activity payload, it calls the message relay processor's PostActivityAsync method to send the activity to Direct Line. The channel adapter should also pass the event handler, which the relay processor will invoke when it receives an outbound message from Omnichannel for Customer Service through Direct Line.

Process outbound activities

The relay processor invokes the event handler to send outbound activities to the respective channel adapter, and the adapter then processes the outbound activities. The channel adapter performs the following outbound activities:

1. Convert outbound activities to the channel response model.

The Direct Line activities are converted to the channel-specific response model.

JavaScript

```
  /// <summary>
  /// Creates MessageBird response object from a Bot Framework <see
cref="Activity"/>.
  /// </summary>
  /// <param name="activities">The outbound activities.</param>
  /// <param name="replyToId">Reply Id of Message Bird user.</param>
  /// <returns>List of MessageBird Responses.</returns>
  public static List<MessageBirdResponseModel>
ActivityToMessageBird(IList<Activity> activities, string replyToId)
  {
      if (string.IsNullOrWhiteSpace(replyToId))
      {
          throw new ArgumentNullException(nameof(replyToId));
      }

      if (activities == null)
      {
          throw new ArgumentNullException(nameof(activities));
      }

      return activities.Select(activity => new MessageBirdResponseModel
      {
```

```
            To = replyToId,
            From = activity.ChannelId,
            Type = "text",
            Content = new Content
            {
                Text = activity.Text
            }
        }).ToList();
    }
```

2. Send responses through the channel REST API.

The channel adapter calls the REST API to send an outbound response to the channel, which is then sent to the user.

JavaScript

```
    /// <summary>
    /// Send Outbound Messages to Message Bird
    /// </summary>
    /// <param name="messageBirdResponses">Message Bird Response
object</param>
    /// <returns>A <see cref="Task"/> representing the asynchronous operation.
</returns>
    public async Task
SendMessagesToMessageBird(IList<MessageBirdResponseModel>
messageBirdResponses)
    {
        if (messageBirdResponses == null)
        {
            throw new ArgumentNullException(nameof(messageBirdResponses));
        }

        foreach (var messageBirdResponse in messageBirdResponses)
        {
            using (var request = new HttpRequestMessage(HttpMethod.Post, $"
{MessageBirdDefaultApi}/send"))
            {
                var content =
JsonConvert.SerializeObject(messageBirdResponse);
                request.Content = new StringContent(content, Encoding.UTF8,
"application/json");
                await _httpClient.SendAsync(request).ConfigureAwait(false);
            }
        }
    }
```

Message relay processor

The message relay processor receives the inbound activity from the channel adapter and does the activity model validation. Before sending this activity to Direct Line, the relay processor checks whether the conversation is active for the particular activity.

To look up whether the conversation is active, the relay processor maintains a collection of active conversations in a dictionary. This dictionary contains key as User ID, which uniquely identifies the user and Value as an object of the following class:

JavaScript

```
 /// <summary>
/// Direct Line Conversation to store as an Active Conversation
/// </summary>
public class DirectLineConversation
{
    /// <summary>
    /// .NET SDK Client to connect to Direct Line Bot
    /// </summary>
    public DirectLineClient DirectLineClient { get; set; }

    /// <summary>
    /// Direct Line response after start a new conversation
    /// </summary>
    public Conversation Conversation { get; set; }

    /// <summary>
    /// Watermark to guarantee that no messages are lost
    /// </summary>
    public string WaterMark { get; set; }
}
```

If conversation is not active for the activity received by the relay processor, it does the following steps:

1. Starts a conversation with Direct Line and stores the conversation object sent by Direct Line against the user ID in the dictionary.

JavaScript

```
 /// <summary>
 /// Initiate Conversation with Direct Line Bot
 /// </summary>
 /// <param name="inboundActivity">Inbound message from
Aggregator/Channel</param>
 /// <param name="adapterCallBackHandler">Call Back to send activities to
Messaging API</param>
 /// <returns>A <see cref="Task"/> representing the asynchronous operation.
</returns>
 private async Task InitiateConversation(Activity inboundActivity,
EventHandler<IList<Activity>> adapterCallBackHandler)
```

```
 {
     var directLineConversation = new DirectLineConversation
     {
         DirectLineClient = new
DirectLineClient(_relayProcessorConfiguration.Value.DirectLineSecret)
     };
     // Start a conversation with Direct Line Bot
     directLineConversation.Conversation = await
directLineConversation.DirectLineClient.Conversations.
         StartConversationAsync().ConfigureAwait(false);

     await directLineConversation.DirectLineClient.Conversations.
         StartConversationAsync().ConfigureAwait(false);
     if (directLineConversation.Conversation == null)
     {
         throw new Exception(
             "An error occurred while starting the Conversation with direct
line. Please validate the direct line secret in the configuration file.");
     }

     // Adding the Direct Line Conversation object to the lookup dictionary
and starting a thread to poll the activities from the direct line bot.
     if
(ActiveConversationCache.ActiveConversations.TryAdd(inboundActivity.From.Id,
directLineConversation))
     {
         // Starts a new thread to poll the activities from Direct Line Bot
         new Thread(async () => await PollActivitiesFromBotAsync(
             directLineConversation.Conversation.ConversationId,
inboundActivity, adapterCallBackHandler).ConfigureAwait(false))
         .Start();
     }
 }
```

2. Starts a new thread to poll the outbound activities from Direct Line bot based on the polling interval configured in the config file. The polling thread is active until the end of conversation activity is received from Direct Line.

JavaScript

```
/// <summary>
/// Polling the activities from BOT for the active conversation
/// </summary>
/// <param name="conversationId">Direct Line Conversation Id</param>
/// <param name="inboundActivity">Inbound Activity from
Channel/Aggregator</param>
/// <param name="lineActivitiesReceived">Call Back to send activities to
Messaging API</param>
/// <returns>A <see cref="Task"/> representing the asynchronous operation.
</returns>
private async Task PollActivitiesFromBotAsync(string conversationId,
Activity inboundActivity, EventHandler<IList<Activity>>
```

```
lineActivitiesReceived)
{
    if
(!int.TryParse(_relayProcessorConfiguration.Value.PollingIntervalInMilliseco
nds, out var pollingInterval))
    {
        throw new FormatException($"Invalid Configuration value of
PollingIntervalInMilliseconds:
{_relayProcessorConfiguration.Value.PollingIntervalInMilliseconds}");
    }
    if
(!ActiveConversationCache.ActiveConversations.TryGetValue(inboundActivity.Fr
om.Id,
        out var conversationContext))
    {
        throw new KeyNotFoundException($"No active conversation found for
{inboundActivity.From.Id}");
    }
    while (true)
    {
        var watermark = conversationContext.WaterMark;
        // Retrieve the activity set from the bot.
        var activitySet = await
conversationContext.DirectLineClient.Conversations.
            GetActivitiesAsync(conversationId,
watermark).ConfigureAwait(false);
        // Set the watermark to the message received
        watermark = activitySet?.Watermark;

        // Extract the activities sent from our bot.
        if (activitySet != null)
        {
            var activities = (from activity in activitySet.Activities
                              where activity.From.Id ==
_relayProcessorConfiguration.Value.BotHandle
                              select activity).ToList();
            if (activities.Count > 0)
            {
                SendReplyActivity(activities, inboundActivity,
lineActivitiesReceived);
            }
            // Update Watermark

ActiveConversationCache.ActiveConversations[inboundActivity.From.Id].WaterMa
rk = watermark;
            if (activities.Exists(a => a.Type.Equals("endOfConversation",
StringComparison.InvariantCulture)))
            {
                if
(ActiveConversationCache.ActiveConversations.TryRemove(inboundActivity.From.
Id, out _))
                {
                    Thread.CurrentThread.Abort();
                }
            }
```

```
        }
        await
Task.Delay(TimeSpan.FromMilliseconds(pollingInterval)).ConfigureAwait(false)
;
    }
}
```

> **Note**
>
> At the heart of the code that receives the message is the GetActivitiesAsync method that takes `ConversationId` and `watermark` as parameters. The purpose of the `watermark` parameter is to retrieve the messages that aren't yet delivered by Direct Line. If the watermark parameter is specified, the conversation replays from the watermark, so that no messages are lost.

Send the activity to Direct Line

JavaScript

```
 /// <summary>
 /// Send the activity to the bot using Direct Line client
 /// </summary>
 /// <param name="inboundActivity">Inbound message from
Aggregator/Channel</param>
 /// <returns>A <see cref="Task"/> representing the asynchronous operation.
</returns>
 private static async Task SendActivityToBotAsync(Activity inboundActivity)
 {
     if
(!ActiveConversationCache.ActiveConversations.TryGetValue(inboundActivity.Fr
om.Id,
         out var conversationContext))
     {
         throw new KeyNotFoundException($"No active conversation found for
{inboundActivity.From.Id}");
     }
     await
conversationContext.DirectLineClient.Conversations.PostActivityAsync(
         conversationContext.Conversation.ConversationId,
inboundActivity).ConfigureAwait(false);
 }
```

If the conversation is active for the activity received by the relay processor, it sends the activity to the message relay processor.

End a conversation

To end the conversation, see End a conversation in Direct Line.

Test the custom messaging channel

Article • 01/17/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Omnichannel for Customer Service allows you to implement a connector to integrate custom messaging channels. The complete sample code illustrates how you can create your own connector that integrates with Omnichannel for Customer Service using the Direct Line Bot.

Sample code to test the custom messaging channel

You can use the following sample code to test the custom messaging channel you want to bring in to Omnichannel for Customer Service. You can modify the sample code to suit the needs of your organization.

HTML

```
<!DOCTYPE html>
<html lang="en-US">
<head>
    <title>Web Chat: Full-featured bundle</title>

    <script src="https://cdn.botframework.com/botframework-
webchat/latest/webchat.js"></script>

    <style>
    html, body { height: 100% }
    body {
      margin: 0;
      background-color: paleturquoise;
    }
    #webchat {
      height: 100%;
      width: 100%;
    }
  </style>
</head>
<body>
```

```
        <div id="webchat" role="main"></div>
    <script>
    (async function () {
        const res = await
fetch('https://directline.botframework.com/v3/directline/conversations',
{ method: 'POST', headers: { Authorization: 'Bearer **************Insert
Direct Line Secret here ******************' }});

      const { token } = await res.json();

      (async function () {
    window.WebChat.renderWebChat({
      directLine: window.WebChat.createDirectLine({ token }),
      styleOptions: {
        rootHeight: '100%',
        rootWidth: '50%',
        bubbleMaxWidth: 1200,
        botAvatarInitials: 'C',
        userAvatarInitials: 'A',
      }
    }, document.getElementById('webchat'));
    })()
    })().catch(err => console.error(err));
   </script>
</body>
</html>
```

Markdown formats in custom channels that use Direct Line

Article • 03/17/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

In Omnichannel for Customer Service, you can send and receive messages formatted with Markdown in custom messaging channels using Direct Line API 3.0. As a developer, understanding how the Markdown format is passed through the channel and knowing the details of the format will help you update the HTML styling and tags in your own user interface.

In the Direct Line channel, when an agent sends (*outbound*) a message formatted with Markdown to a Direct Line bot, the bot receives the message in a certain format. Now, if a bot receives (*inbound*) a formatted message from a customer, it must be able to correctly interpret the message that's formatted with Markdown. As a developer, you'll need to use Markdown appropriately so that the message is formatted correctly for your agents and customers.

Markdown formats

The following table lists the Markdown formats used in inbound messages sent by the customer and outbound messages sent by the agent to the customer.

Style	Inbound	Outbound	Example
bold	**bold**	**bold**	**text**
italics	_italics_	_italics_	*text*
strikethrough	~strikethrough~	~strikethrough~	~~text~~
blockquote	> blockquote	> blockquote	text
header (levels 1–4)	### header3	### header3	**Text**

Style	Inbound	Outbound	Example
hyperlink	https://www.microsoft.com	https://www.microsoft.com	https://www.microsoft.com
hyperlink with text	[text] (https://www.microsoft.com)	[text] (https://www.microsoft.com)	Microsoft website
monospace	``` text ```	``` text ```	`text`
numbered list	<number> item one	<number> item one	1. item one 2. item two
unordered list	* item one or - item one	`* item one or - item one	* item one * item two
new line	Paragraph 1 Paragraph 2 </br>	Paragraph 1 Paragraph 2	

> **Note**
>
> Currently, we don't support the **<Shift + Enter>** key combination to add multiple line breaks.

For inbound messages, set the Markdown text to the Activity object's `text` property.

For outbound messages, the Markdown text will be received in the Activity object's `text` property (similar to a normal message).

Support for live chat and asynchronous channels

Article • 10/09/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Support for adaptive cards

The following table lists the rich cards that are supported across different channels when you're using bots. The support categories are intentionally broad because many possible combinations of cards, features, and channels are applicable. We recommend that you use the information in the table as a base reference, and test each of your cards in the required channels.

Channel	Hero card	Thumbnail card	Audio card	Card carousel
Microsoft Teams	✓	✓	✕	✓
LINE	✓	✓	🌐	✓
Custom (Telegram)	✓	✓	🌐	✓
Custom (Direct Line)	✓	✓	✓*	✓*

✓: Supported; card is supported fully with the exception that some channels support a subset of the card actions. The number of actions allowed on each card might be limited that varies by channel.

✓*: Card elements are supported in the Webchat version of custom channel that uses Direct Line, but not in the Android version.

🌐: Card is converted to unformatted text, links might not be active, images might not be displayed, or media might not work. The behavior might vary by channel.

✕: No support

The markdown element for adaptive cards is partially supported across all chat channels. For example, the markdown element isn't supported in live chat, whereas, it's supported in LINE.

Media or audio card and date input elements for adaptive cards are only supported in Live chat channels. Adaptive card elements like text block and images are also supported across channels.

The Apple Messages for Business, Google's Business Messages, SMS, WhatsApp, and WeChat social channels don't support any cards listed in the preceding table.

For more information, see the following article: Send and Receive Media with WhatsApp Messaging on Twilio

> **Important**
>
> The message size must be less than or equal to 28 KB in all messaging channels. The size limit includes metadata like timestamps and tags.

Support for suggested actions

Suggested actions are supported fully with the exception that some channels might limit the number of actions allowed. Also, the number of actions supported varies by channel.

Channel	Supported?
Microsoft Teams	No
Apple Messages for Business	No
Facebook	Yes
Google's Business Messages	No
LINE	Yes
WeChat	No
WhatsApp	No
SMS	No
Custom messaging (Telegram)	Yes
Custom messaging (Direct Line)	Yes

Support for file attachments

You can enable file attachments on the **General settings** tab of a channel so that customers and agents can send files as attachments. Inbound attachments refer to attachments that customers send to agents, and outbound attachments refer to attachments that agents send to customers. For more information about file attachments, see Enable file attachments.

Channel	Inbound attachments	Outbound attachments
Microsoft Teams	Image, Audio, Video, Document, GIF, and Emoji	Image, Audio, Video, Document, and GIF Allowed file extensions: .jpg, .jpeg, .png, .mp3, .oga, .ogg, .amr, .mp4, .pdf, .docx, .txt, .gif, .xlsx
Apple Messages for Business	Image, Audio, Video, Document, GIF, and Emoji	Image, Audio, Video, Document, and GIF. Allowed file extensions: .jpg, .jpeg, .png, .mp3, .amr, .mp4, .pdf, .docx, .txt, .gif, .xlsx, .caf, .pkpass, .usdz
Facebook	Image, Audio, Video, Document, GIF, and Emoji	Image, Audio, Video, Document, and GIF Allowed file extensions: .jpg, .jpeg, .png, .mp3, .oga, .ogg, .amr, .mp4, .pdf, .docx, .txt, .gif, .xlsx, .xls
Google's Business Messages	Image	Image has preview. Audio, video, document only receive a link. Allowed file extentions: .jpg, .jpeg, .png, .amr, .mp4, .pdf, .docx, .txt, .gif, .xlsx
LINE	Image, Audio, Video, and GIF	Image, Audio, Video, Document, and GIF Allowed file extensions: .jpg, .jpeg, .png, .mp3, .oga, .ogg, .amr, .mp4, .pdf, .docx, .txt, .gif
WeChat	Image, Audio, and Video	Image, Audio, and Video Allowed file extensions: .jpg, .jpeg, .png, .amr, .mp4
WhatsApp	Image, Audio, Video, GIF, and PDF	Image, Audio, Video, and PDF Allowed file extensions: .jpg, .jpeg, .png, .mp3, .oga, .ogg, .amr, .mp4, .pdf

Channel	Inbound attachments	Outbound attachments
SMS (Twilio)	Image, Video, GIF, and Emoji	Image, Audio, Video, and GIF Allowed file extensions: .jpg, .jpeg, .gif, .png, .mp3, .oga, .ogg, .amr, .mp4, .pdf, .csv
Custom messaging (Telegram)	Image, Audio, Video, Document, GIF, and Emoji	Image, Audio, Video, Document, and GIF Allowed file extensions: .jpg, .jpeg, .png, .mp3, .oga, .ogg, .amr, .mp4, .pdf, .docx, .txt, .gif
Custom messaging (Direct Line)	All types except blocked types in org	All types except blocked types in org Allowed file extensions: .jpg, .jpeg, .png, .mp3, .oga, .ogg, .amr, .mp4, .pdf, .docx, .txt, .gif, .xlsx

Note

- For Microsoft Teams, when a customer sends an emoji from the Teams client, the agent receives a PNG image. When an agent sends a GIF image (outbound), the customer will receive a PNG image.
- The custom channels that use Direct Line support different types of file attachments, but it's up to the client to implement them.
- For LINE inbound and outbound messages, when a GIF image is sent, the recipient will receive a JPG image.
- For WhatsApp messages, when a customer sends an attachment in document format (for example, a DOCX, XLSX, or TXT file), the agent will receive the attachment name as message text. We recommend converting documents to PDF format before sending them as attachments.
- For newly created Twilio accounts, you must disable a security setting that blocks the ability to send media files. More information: **Extended notice and update on security changes: HTTP Authentication for Voice and Messaging Media enabled by default**

Support for emojis

Channel	Emoji behavior
Microsoft Teams	Yes. Emoji in PNG format

Channel	Emoji behavior
Apple Messages for Business	Yes. Emoji in text like "😬"
Facebook	Yes. Emoji in text like "😬"
Google's Business Messages	Yes. Emoji in text like "😬"
LINE	Yes. When an emoji is sent, the recipient sees a sticker.
WeChat	Yes. When an emoji is sent, the recipient sees characters like :-)
WhatsApp	Not supported.
SMS (Twilio)	Yes. Emoji in text like "😬"
Custom messaging (Telegram)	Yes. Emoji in text like "😬"
Custom messaging (Direct Line)	Yes. Emoji in text like "😬"

> ⓘ **Note**
>
> The custom channels that use Direct Line support emojis, but it's up to the client to implement them.

Support for stickers

Channel	Sticker behavior
Microsoft Teams	Not supported.
Apple Messages for Business	Not supported.
Facebook	Yes, as a PNG image.
Google's Business Messages	Not supported.
LINE	Not supported. Recipient sees "Sticker" text.
WeChat	Not supported. Recipient sees "Unsupported message" text.
WhatsApp	Not supported.
Custom messaging (Telegram)	Not supported.
Custom messaging (Direct Line)	Yes, as sticker image.

> ⓘ **Note**

The custom channels that use Direct Line support stickers, but it's up to the client to implement them.

Support for formatted messages

Agents can use basic formatting capabilities in their outbound messages across both asynchronous and live chat channels. However, for your agents to send and receive formatted messages, you must enable formatted messages.

The following table lists the text styles supported by Microsoft Teams, Facebook, WhatsApp, Telegram, and custom channels that use Direct Line.

Style	Live chat	Microsoft Teams	Facebook	Google's Messages for Business	WhatsApp	Custom messaging (Telegram)	Custom messaging (Direct Line)
bold	✓	✓	✓	✓	✓	✓	✓
italics	✓	✓	✓	✓	✓	✓	✓
strikethrough	✓	✓	✓	✕	✓	✓	✓
blockquote	✓	✓	✕	✕	✕	✕	✓
monospace	✓	✓	✓	✕	✓	✓	✓
hyperlink with text	✓	✓	✕	✕	✕	✓	✓
hyperlink	✓	✓	✓	✓	✓	✓	✓
new line	✓	✓	✓	✕	✓	✓	✓
headers	✓	✓	✕	✕	✕	✕	✓
numbered list	✓	✓	✕	✕	✕	✕	✓
unordered list	✓	✓	✕	✕	✕	✕	✓

Note

- Apple Messages for Business, WeChat, and SMS channels don't support formatted messages.

- A few text styles such as blockquote, headers, numbered lists, and unordered lists, are currently not supported across some channels.

Preconfigured automated message triggers for asynchronous channels

Article • 05/08/2023

Preconfigured automated message triggers for agents

The following table lists the automated messages that are displayed to agents in asynchronous channels.

Channel	Message triggered	Definition	Triggering event
Apple Messages for Business, Facebook, Google's Business Messages, LINE, WeChat, WhatsApp, and custom channel	Message or attachment couldn't be sent. Error details include error code, reason for failure, message ID, timestamp, and transaction ID.	Message that's displayed to agent when the agent's message or attachment couldn't be sent	When agent's message or attachment couldn't be sent
Apple Messages for Business, Facebook, Google's Business Messages, LINE, WeChat, WhatsApp, and custom channel	Customer's file couldn't be attached because it's too large	Message that's displayed to the agent when the customer sends an attachment that exceeds the allowed limit	When customer sends an attachment that exceeds the allowed limit
Apple Messages for Business, Facebook, Google's Business Messages, LINE, WeChat, WhatsApp, and custom channel	Message couldn't be delivered: Unsupported message type	Message that's displayed to the agent when the customer sends an unsupported message type	When customer sends an unsupported message type
Custom channel	Customer disconnected	Message that's displayed to the agent when the customer gets disconnected	When the customer gets disconnected
Custom channel	Customer ended conversation	Message that's displayed to the agent when the customer ends the conversation	When customer ends the conversation

Preconfigured automated message triggers for customers

The following table lists the automated messages that are displayed to customers in asynchronous channels.

Channel	Message triggered	Definition	Triggering event
Apple Messages for Business, Facebook, Google's Business Messages, LINE, WeChat, WhatsApp, and custom channels	Customer's file couldn't be attached because it's too large	Message that's displayed to the customer when the customer sends an attachment that exceeds the allowed limit	When customer sends an attachment that exceeds the allowed limit
Apple Messages for Business, Facebook, Google's Business Messages, LINE, WeChat, WhatsApp, and custom channels	Message couldn't be delivered: Unsupported message type	Message that's displayed to the customer when the customer sends an unsupported message type	When customer sends an unsupported message type
Apple Messages for Business, Facebook, Google's Business Messages, LINE, WeChat, WhatsApp, and custom channels	Greeting Message for async Channels	Message that's displayed to the customer when the customer sends a message request to chat	When customer sends a message request to chat
Custom channel	Customer's position in queue	Message that's displayed to customer when there's a queue of customers waiting	When customer submits a request and is placed in the queue to chat with an agent because other customers are already waiting.
Custom channel	Customer is next in line	Message that's displayed to the customer when no other customer is ahead in the queue	The number of customers waiting to chat gets updated each time a customer in line is served. When no other customer is ahead in the queue, the customer waiting is notified with the message.

Create and manage operating hours

Article • 10/03/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **ⓘ Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

Operating hours define the hours when your organization's customer support team is active and available to serve customers. By setting up operating hours, you help your customers and your organization work together to resolve issues.

The operating hour schedules cater to the following scenarios:

- Display the non-availability of customer support on public holidays that are otherwise operating hours.
- Accommodate change of calendar timings for daylight saving time twice an year for timezones that have implemented the daylight saving time.
- Set up separate schedules for agents, bots, and queues to cater to different business scenarios and product lines seamlessly for any channel.
- Define schedules to transition customer queues from bots to agents.
- Customize the display and other settings of the chat widget during non-business hours.

After you define the business hours for your organization and set up automated messages to be displayed to customers, when customers interact through a channel during non-business hours, they will see the messages that you've set. For example, customers can be shown an offline message on the chat widget as "Our agents are not available. Our business hours are between 8:00 am and 5:00 pm." Similarly, for social channels, you can configure the operating hours at the queue level. When customers

contact your agents through any of the social channels outside the business hours, they'll receive responses that you've set.

In Customer Service admin center and Omnichannel admin center, after you've created an operating hour record, you can do the following steps, depending on your requirement:

- **Queues:** Configure the operating hour on the main page of the queue.
- **Chat widget:** Add the operating hour record on the **Chat widget** tab.
- **SMS channels:** Add the operating hour record on the **Behaviors** tab of the channel instance that can be accessed through the corresponding workstream.

In Omnichannel Administration, you can add the operating hour record on the **Design** tab of the appropriate chat widget to control the display of the widget. For SMS channels and queues, the operating hour record will be available for selection on the **General** and **Summary** tabs respectively.

How work items are routed when operating hours are set

When operating hours are in effect, work items during non-business hours are handled based on the channel they come through.

For live chat and voice, the conversations and calls are routed to the queue and then closed.

For asynchronous channels, such as SMS and WhatsApp, if pick-based option is configured, the conversations remain in the open state till agents sign in and take up the assignments. If push-based option is configured, the assignment method that's configured will be used to route the conversations.

Create a record to define operating hours

You can define operating hours in the Customer Service admin center or Customer Service Hub app.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

a. In the site map, select **Calendars** in **Operations**. The **Calendar** page appears.

b. In the **Operating Hours** section, select **Manage**.

The **Active Operating Hours** view is displayed. You can switch between various system views using the drop-down list.

2. Select **New**. The **New Operating Hour** page is displayed.

3. On the **General** tab, provide the following information:

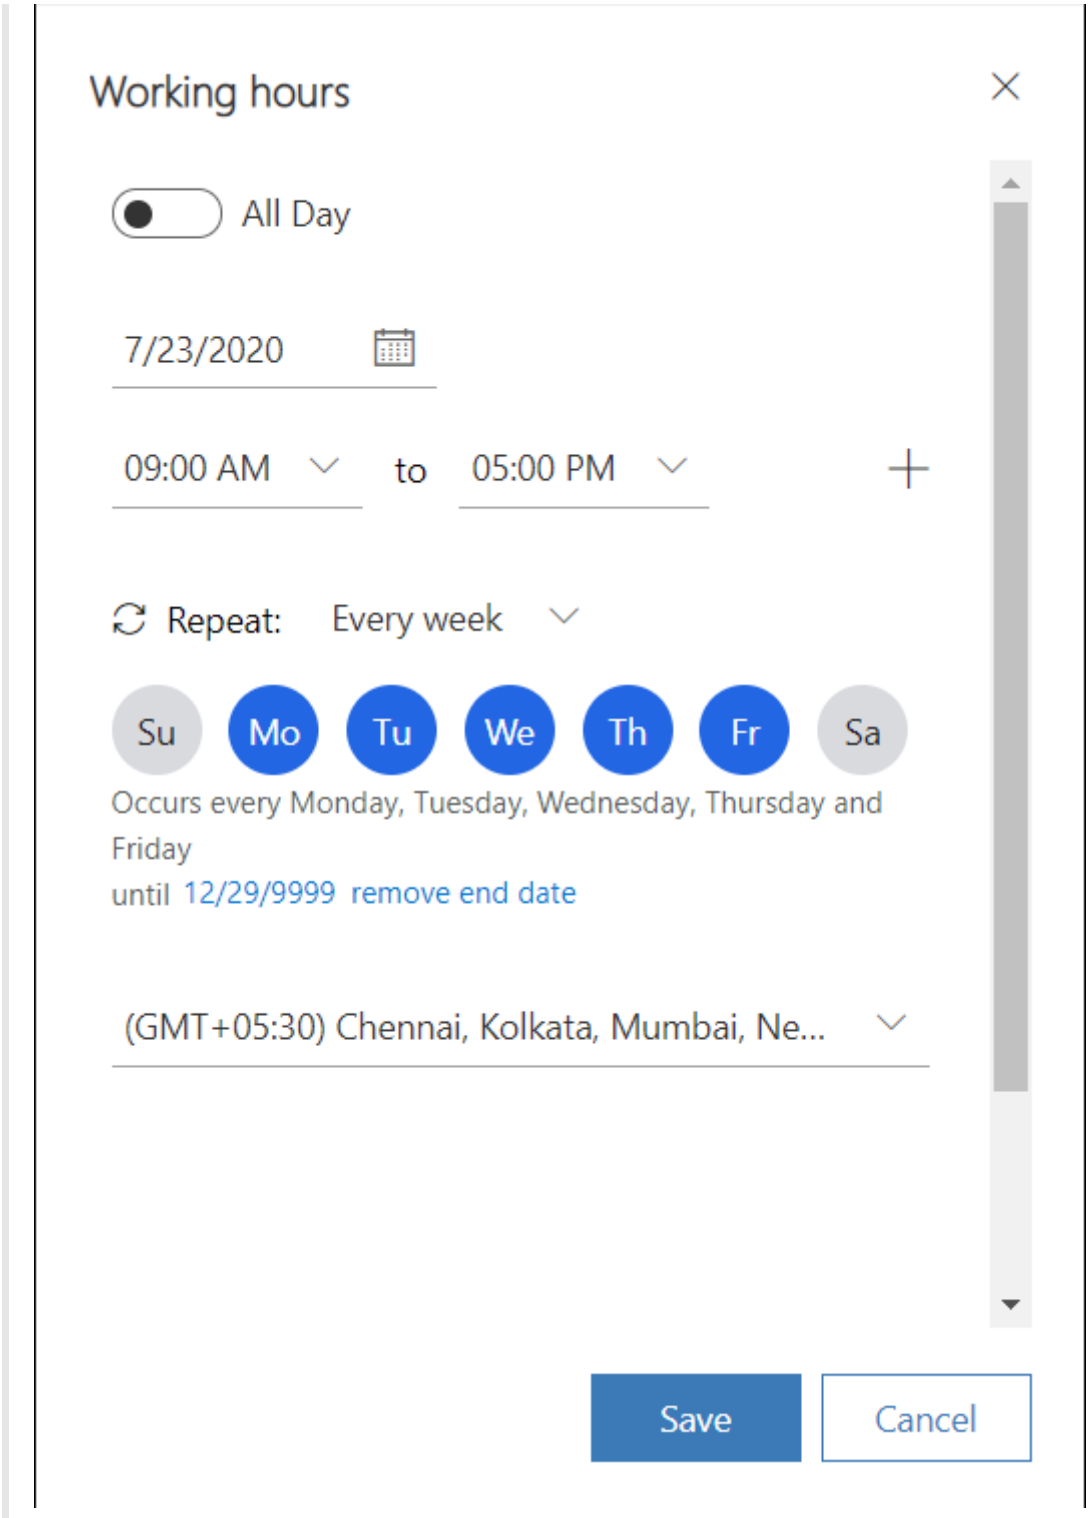
- **Name**: Enter a name for the operating hour record.
- **Owner:** Accept the default value or search to specify a different owner.
- **Description:** Enter an optional description of the operating hour record.

4. Select **Save**. The **Working Hours** tab is displayed. By default, the calendar displays the work hours defined as 8:00 am to 5:00 pm.

5. On the **Working Hours** tab, select **New** > **Working hours** in the calendar.

6. In the **Working hours** panel, set the following options to define the working hours schedule.

- **All Day:** Specify Yes, if the chat widget should be available 24/7.
- **Calendar:** Specify the period for the schedule. The option to choose dates is available only when **All Day** is Yes.
- **Time:** Select the start and end time for the schedule.
- **Repeat:** Select a recurrence option.
- **choose an end date:** Optionally, specify an end date.
- **Time zone:** Select an applicable time zone. The daylight saving timings are taken into account, if applicable for the selected time zone.



7. Select **Save**. You are returned to the **Working Hours** tab.

Define a holiday on the calendar

1. To set unavailability of customer support for a public holiday, on the calendar view, select **New** > **Holiday**.

2. Select the date or date range, and specify a reason.

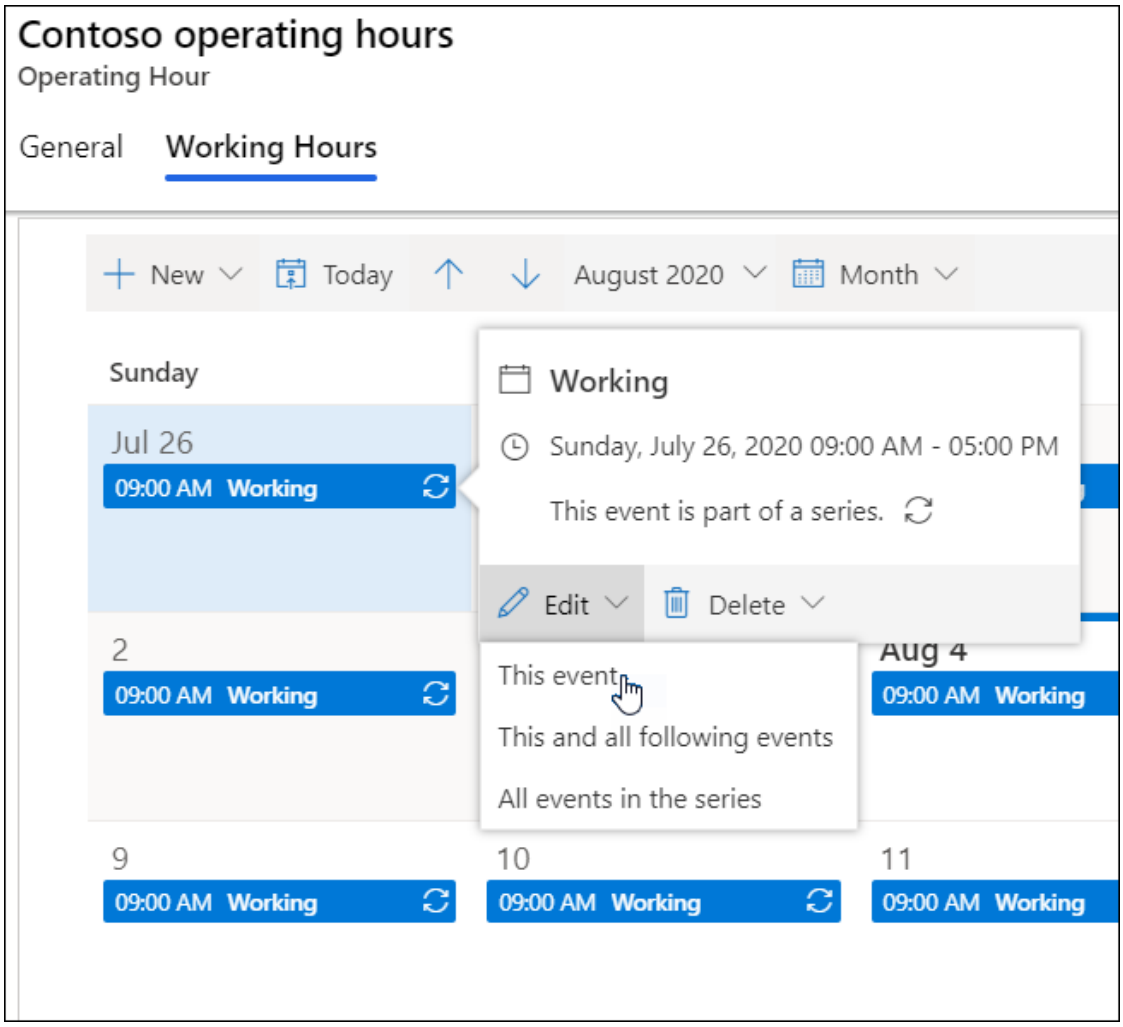
3. Save the settings.

4. Select **Save** on the navigation bar.

Edit or delete the work hour settings

You can edit or delete the operating hours schedule in an existing record.

1. Go to the record in which you want to modify the schedule.
2. Select an event on the calendar.
3. On the menu that appears, select **Edit**, and select one of the options:
   - **This event**
   - **This and all following events**
   - **All events in the series**
4. If you want to delete an event, select **Delete**.



Add operating hours to a chat widget

Do the following to specify operating hours for a chat widget:

1. Open the Chat channel settings widget, and select the **chat widget** tab.
2. Toggle the **Show widget during operation hours** to **On**.
3. In the **Operating hours name** field, browse, and select the operating hour record. The chat widget is displayed during the hours specified in the selected operating hour record.
4. Select **Show widget outside of operation hours** to display the widget outside work hours.
5. Save the changes.

Add operating hours to a queue

You can add operating hours to a queue that can later be configured for a social channel. If operation hours aren't configured, the queues will be available round the clock.

Do the following to specify operating hours for a queue:

1. Navigate to the Customer Service admin center or Customer Service Hub app, and perform the following steps:

   Customer Service admin center

   a. In the site map, select **Queues** in **Customer Support**. The **Queues** page appears.

   b. In the **Advanced Queues** section, select **Manage**.

      The **Queues** view is displayed.

2. Open the queue for which you want to specify the operating hours.
3. On the **Operation hours** tab, select **Set operation hours**.
4. In the **Set operation hours** page, search and select the operating hour record that you want to specify.
5. Save the changes.

Limitation

You can't migrate the Calendar entity by using the export and import options and need to set up the work hours manually.

Configure and manage custom presence

Article • 02/18/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

The presence status indicates an agent's availability. A presence status consists of two elements:

- **Base status**: The base presence status that indicates an agent's status. The work distribution system distributes work items to agents according to the base statuses that you select as allowed presences at the time of creating a workstream. The base statuses are as follows:
  - Available
  - Busy
  - Busy-DND
  - Away
  - Offline

  Only the base statuses are available for selection in **Allowed Presences** while creating a work stream.

- **Presence text**: The text that is associated with a specific base status. This is the text that is visible to agents.

A default presence should be assigned to the agents that will be set when they sign in for work. If no default presence is assigned, the application will set "Available" as the default.

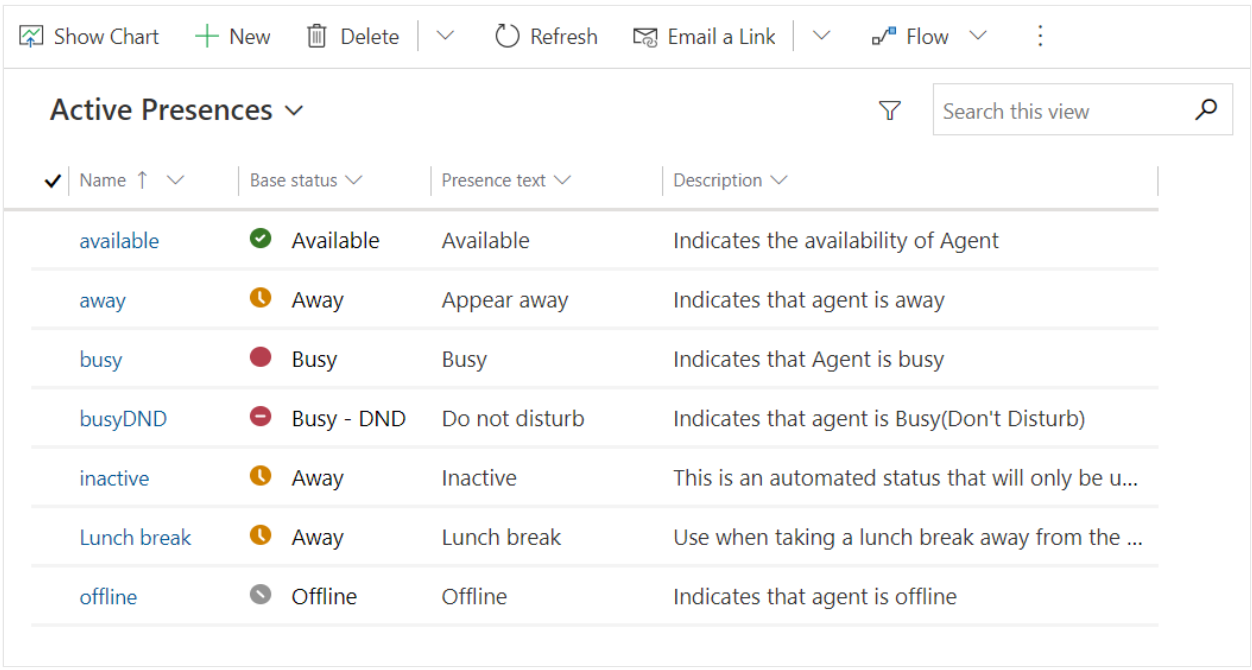
Out-of-the-box presence statuses

Omnichannel for Customer Service provides the following presence statuses out of the box:

- Available
- Away
- Busy

- Busy - DND
- Inactive
- Offline

The inactive presence is not available for manual selection by the agents; if the missed notifications feature is enabled, the agent status will be changed to inactive when agents do not respond to the incoming conversation request notification.



Name	Base status	Presence text	Description
available	Available	Available	Indicates the availability of Agent
away	Away	Appear away	Indicates that agent is away
busy	Busy	Busy	Indicates that Agent is busy
busyDND	Busy - DND	Do not disturb	Indicates that agent is Busy(Don't Disturb)
inactive	Away	Inactive	This is an automated status that will only be u...
Lunch break	Away	Lunch break	Use when taking a lunch break away from the ...
offline	Offline	Offline	Indicates that agent is offline

> **Note**
>
> You cannot edit or delete these out-of-the-box base and presence statuses.

Create custom presence status

In addition to the out-of-box presence statuses, admins can configure custom presence statuses for agents that must be mapped to a base presence. For example, if the agents on your team want to attend a training, you can create a custom **Away – In Training** presence status. When you map a custom presence to a base presence, make sure that the configurations are logically viable. For example, if you map an available custom presence to offline base status, the application will treat it as offline while the visual effect would be available.

To create a presence record

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

- In the site map, in **Agent experience**, select **Productivity**.

2. Select **Manage** for **Custom Presence**.

3. On the command bar, select **New** to create a presence record.

4. On the **Summary** tab, provide the following information:
   a. **Name**: Enter a name for the custom presence status.
   b. **Presence Text**: Enter presence text that should be associated with the new custom entity.
   c. **Base Status**: Select the most applicable base status in the list.
   d. **Description**: Enter a brief description of the custom presence record.

5. Select **Save**.

Configure file attachment capability

Article • 07/24/2023

> **Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

As an administrator, you can enable or disable the capability for your agents and customers to attach files during a conversation. When enabled, your customers and agents can send files and share more information about their issues. For example, if a customer receives an error while trying to complete a process, they can send the screenshots of the steps and error message to the agent.

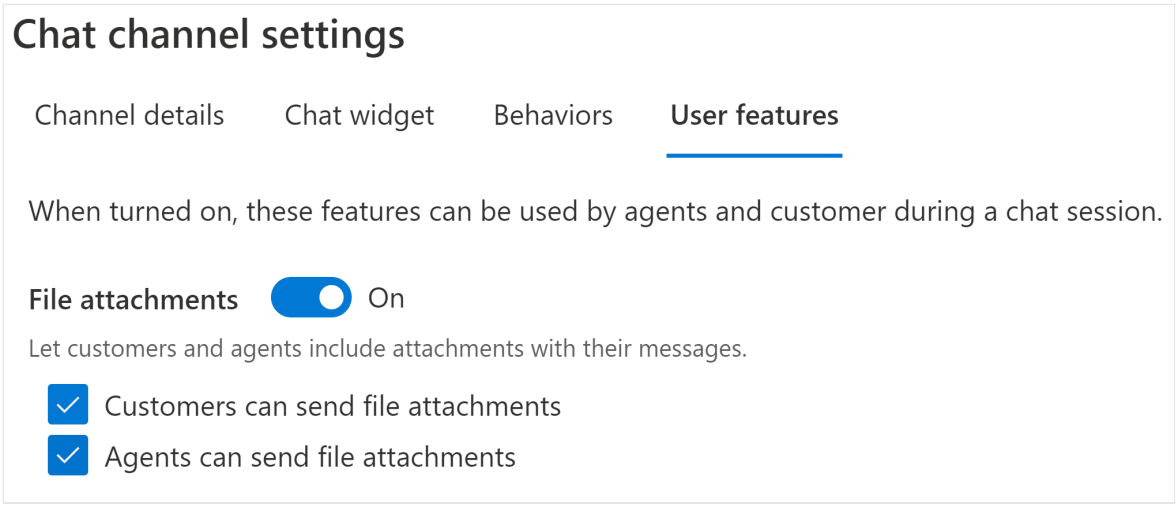
Customers must use the **Attach** icon to send files. The drag-and-drop operation is not supported in the live chat widget. For information about file attachment limitations, see Enable file attachments.

If an agent transfers the chat to another agent, the agent who receives the chat can also access the files attached in the conversation.

> **Note**
>
> In Unified Service Desk, if you sign in as an agent and want to attach a file while conversing with a customer, ensure that you select the required file type first and then attach the required file.

1. Sign in to Customer Service admin center.
2. In Customer support, go to **Channels** > **Chat**.
3. Edit the chat channel in which you need to configure the file attachment capability.
4. Go to the **User features** tab.
5. Set **File attachments** to **On**, and then select the check boxes for the following if they aren't selected:

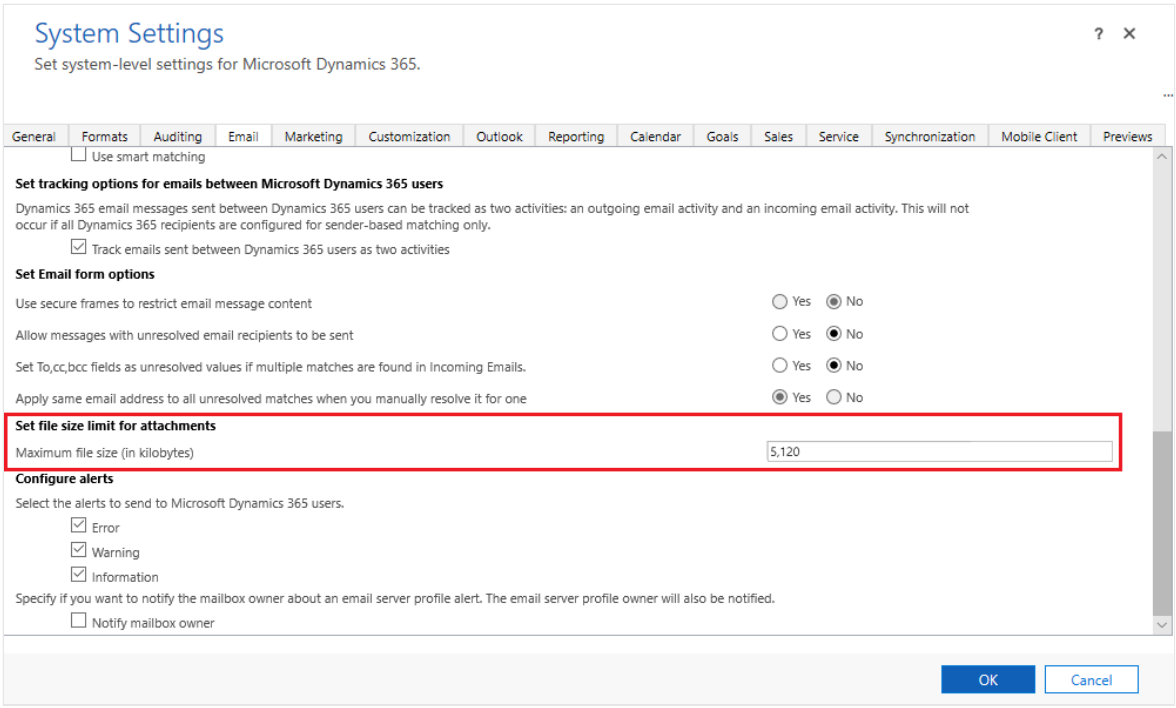
- **Customers can send file attachments**: Allows your customers to send a file to the customer service agent during a conversation.
- **Agents can send file attachments**: Allows your customer service agents to send a file to a customer during a conversation.



Set size limit, supported file types for file attachments

You can define the file size limit for attachments and unsupported file types in the advanced settings of Dynamics 365.

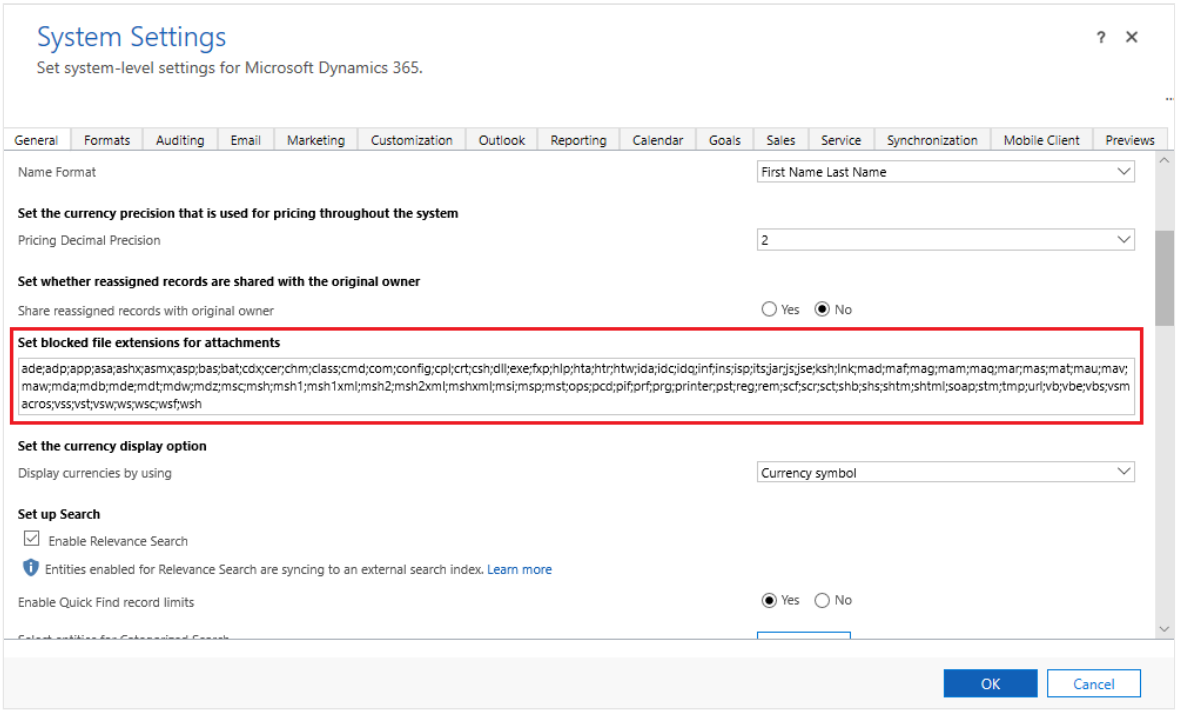
1. In the admin app, go to **Advanced Settings** on the top right, and then select **Settings** > **Administration** > **System Settings**.
2. In the **System Settings** window, go to the **Email** tab.
3. In the **Maximum file size (in kilobytes)** field, enter the value in kilobytes.



> **Note**
>
> By default, the size is set to 5 MB. You can specify up to 128 MB for all attachments. However, the maximum size for image files in live chat can be 20 MB only.

4. To specify unsupported file types, go to the **General** tab.

5. In the **Set blocked file extensions for attachments** field, add or edit the file types.



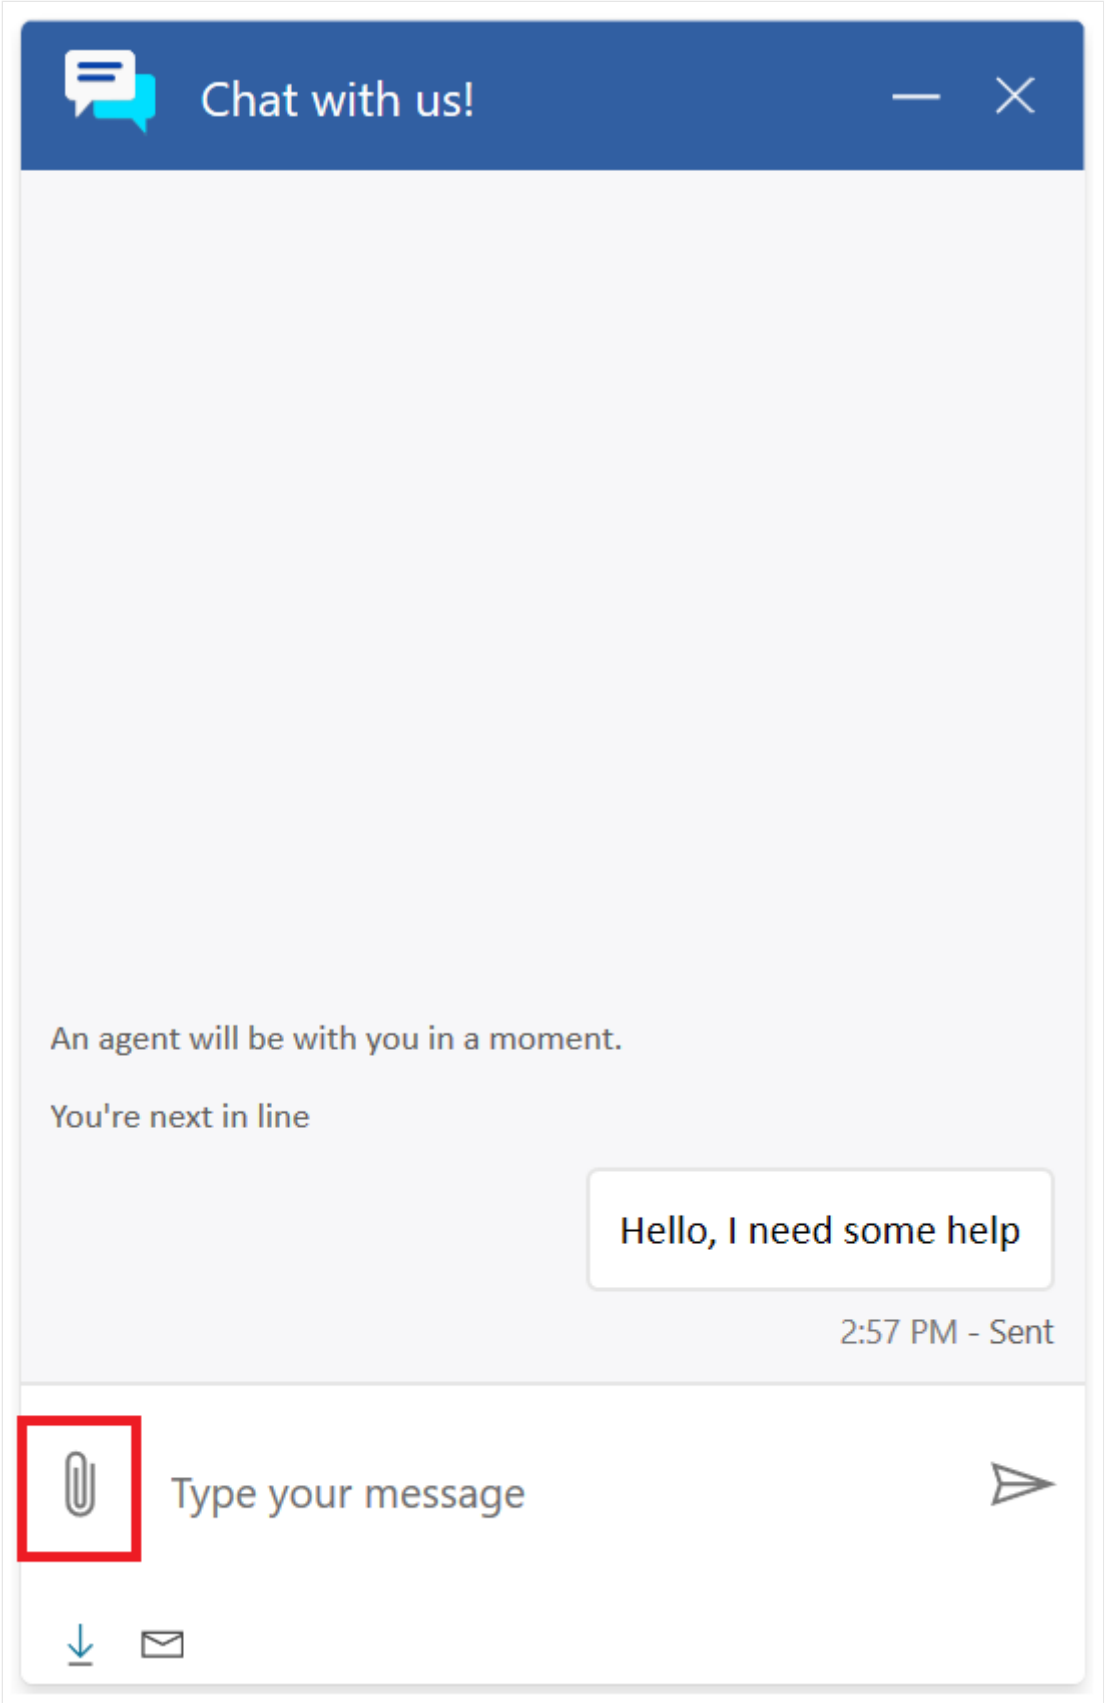
6. Select **OK**.

> **Note**
>
> Customers with Apple devices must have iOS version 13 to send file attachments.

Customer experience of attaching a file

When the file attachment capability is enabled for customers, the attachment icon is displayed in the chat widget. A customer can then use the **Attach** icon to send files. The drag-and-drop operation is not supported.

When the conversation is going on, the file attachment is scanned and then uploaded. After the conversation ends, the attachment will be stored in the Annotations collection in Dataverse, which is an Azure BLOB-based entity. Customers can access attachments in transcripts by selecting the attachments, which are retrieved from the Dataverse entity.



If a customer tries to attach an unsupported file type or a file larger than the allowed size limit, the file won't be uploaded and a corresponding error message is displayed.

Enable file attachments

Article • 05/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

You can enable or disable the capability for your agents and customers to send file attachments during a conversation.

When you enable the option for customers in the **General settings** configuration of your channel, customers can include attachments with their messages. Similarly, when you enable the option for agents, agents can send attachments from the communication panel to the customers. Agents can upload files by dragging and dropping the file from the file explorer into the conversation canvas. Customers must use the **Attach** icon to upload files.

If an agent transfers the conversation to another agent, the agent who receives the chat can also access the files attached in the conversation.

For more information about the agent and customer experience of using file attachments in chat, see Configure file attachment.

For more information about which file types are supported in each channel, see Asynchronous channel support.

File size limit and unsupported extensions (types) for attachments

By default, Omnichannel for Customer Service has a file size limit of 5 megabytes (MB) (5,120 kilobytes). However, you can configure the file as per your organization's requirements.

> **Tip**
>
> Refer to documentation for your channel when determining message size limits. When you are enabling file attachments for Facebook messenger, we recommend

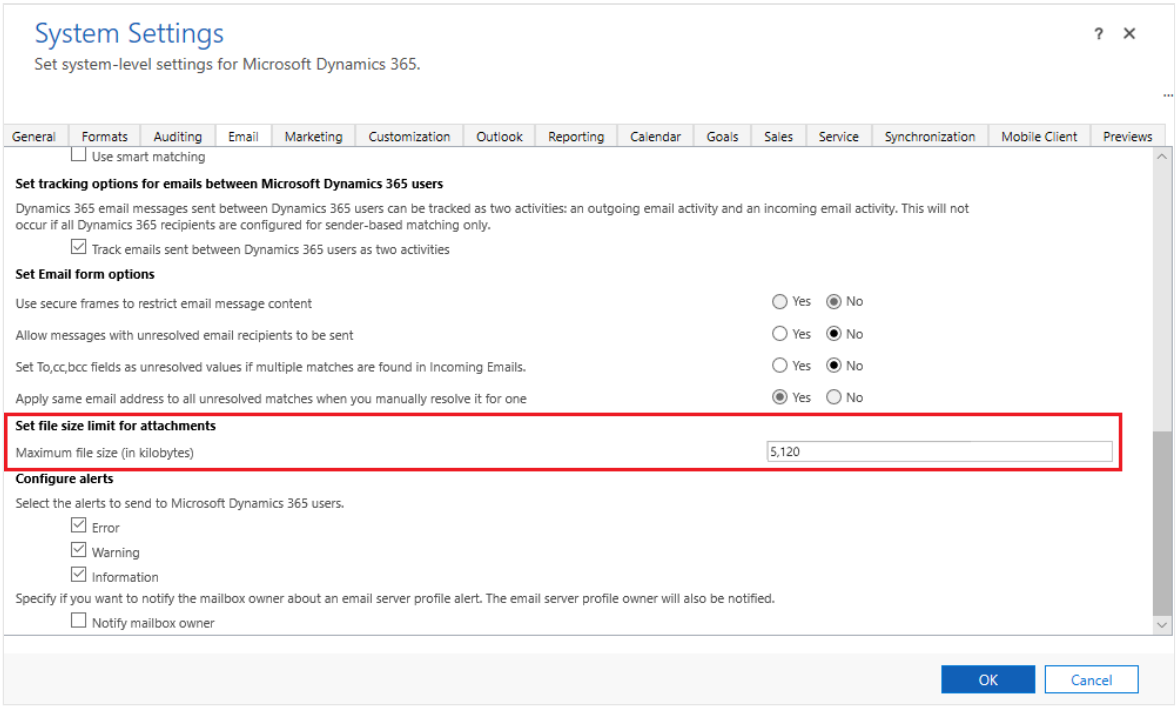
that you configure a maximum limit of 25 MB (25,600 kilobytes) because the Facebook messenger file size limit is 25 MB.

You can set the file extension types that customers and agents can share.

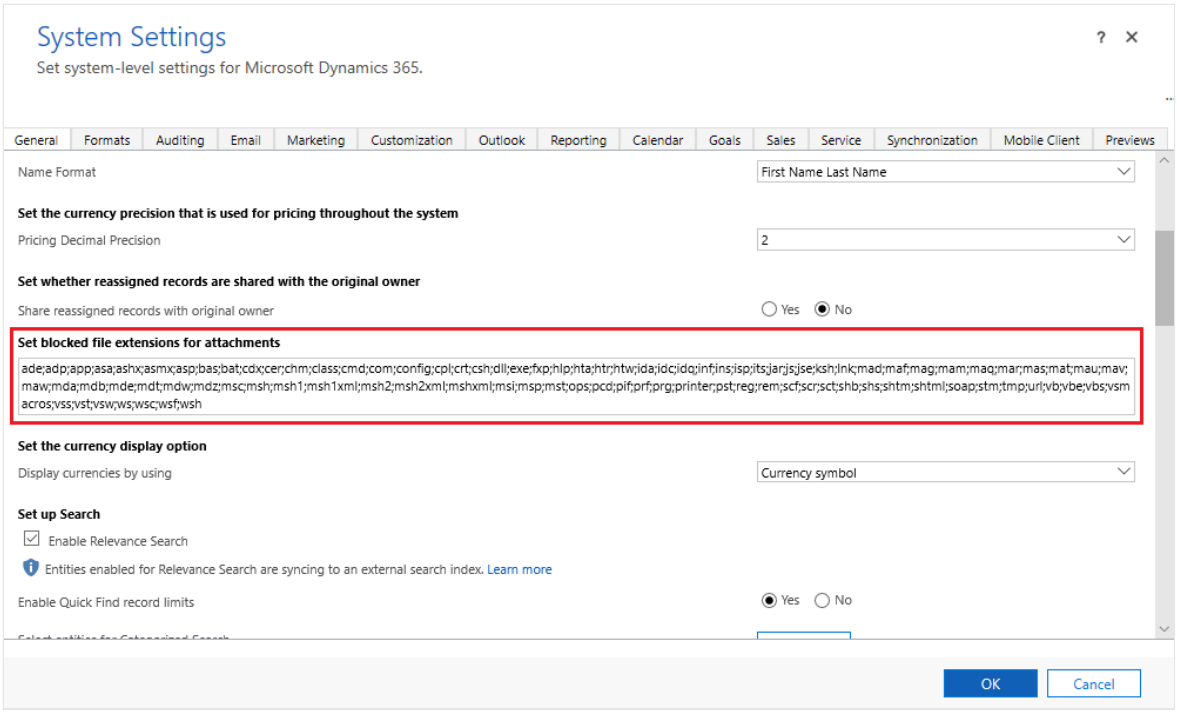
Configure file size limit and file extensions

To configure the file size limit and file extensions, follow these steps:

1. Sign in to Dynamics 365.
2. Select the settings icon in the nav bar, and then select **Advanced Settings**.
3. Go to **Settings** > **Administration** > **System Settings**.
4. In the **System Settings** window, go to the **Email** tab.
5. Go to the **Set file size limit for attachments** section, and in the **Maximum file size (in kilobytes)** field, enter the value in kilobytes.



6. To specify unsupported file types, go to the **General** tab.
7. In the **Set blocked file extensions for attachments** field, add or edit the file types.



8. Select **OK**.

Now, agents and customers can share file attachments during their conversation.

Enable formatted messages

Article • 03/17/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Your agents can send and receive messages formatted using Markdown.

To enable your agents to send and receive formatted messages

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   - In the site map, in **Agent experience**, select **Productivity**.

2. For **Message formatting**, select **Manage**.
3. In the **Markdown settings** area under **Omnichannel Configuration**, set the **Turn on Markdown** toggle to **Yes**.
4. Select **Save & Close**.

Manage context variables

Article • 02/02/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Context variables enrich conversations with pre-conversation data, channel data, and custom context data. These attributes can then be used to define routing rules to route conversations to different queues. Context variables are also used in agent productivity tools like macros and agent scripts.

This article lists the considerations to use context variables and how you can create them.

Considerations

When you configure context variables, check for the following conditions:

- The context variable name must be less than or equal to 100 characters.
- The context variable value must be less than or equal to 4,000 characters.
- Use exact match to pass the value to the context variable because it is case-sensitive.
- Use the context variable names as defined and don't change them when you author flows in Azure or Power Virtual Agents bots.

We recommend that you don't update or delete the context variables after you create them. If you do need to update or delete the variables, make sure that they aren't used in any of the unified routing classification or assignment rules.

Add context variables

1. Go to one of the admin apps, and perform the following steps:

   Customer Service admin center

- In the site map, select **Workstreams** in **Customer support** and open a workstream from the list.

2. Select **Add context variable** in the **Advanced settings** section of a workstream.
3. In the **Edit** pane, select **Add**, and enter **Name**. Make sure that the variable name is less than or equal to 100 characters.
4. Select the **Type** of variable from the dropdown list. You can choose either **Text** or **Number**.
5. Repeat steps 3 and 4 to create the required variables.

Configure context variables for Azure and Power Virtual Agents bots

You can also configure context variables for Azure and Power Virtual Agents bots in Omnichannel for Customer Service. When customers initiate a conversation, the relevant context that's related to the customer, the issue they're facing, and recent activities performed by them can be made available for the bot to intelligently provide contextual responses to resolve customer issues in a quick and efficient manner. For example, the bot can use the signed-in user details to look up the recent case information or order history of the customer and provide a response. Similarly, the pre-conversation information, custom context, or recent pages browsed on a website by the customer can be passed on to the bot by configuring context variables for the bot. Context variables set by the bot can also be passed to Omnichannel for Customer Service when the bot escalates to the human agent. For example, you can pass the ticketnumber for the case created by the bot to Omnichannel for Customer Service to link the case and load the customer summary for the agent to view.

To configure context variables for bots, see Configure context variables for bots. But, before you configure context variables for bots, we recommend that you read the best practices for configuring bots. More information: Best practices for configuring bots

To learn about using and sending custom context in a conversation, see Send custom context.

Configure a pre-conversation survey

Article • 10/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Configure a pre-conversation survey

For the chat channel, you can configure a survey that users can respond to when they access the widget to start a conversation.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   - In the site map, select **Workstreams** in **Customer support**.

2. Select the workstream for the chat channel in which you want to configure the pre-conversation survey.

3. On the page that appears, select the channel instance from the dropdown list, and then select **Edit**.

4. On the **Chat channel settings** dialog, go to the **Behaviors** tab, and set the toggle for **Pre-conversation survey** to **On**.

5. In the **Survey questions** area, select **Add**, and then enter the following details on the **Survey question** page:

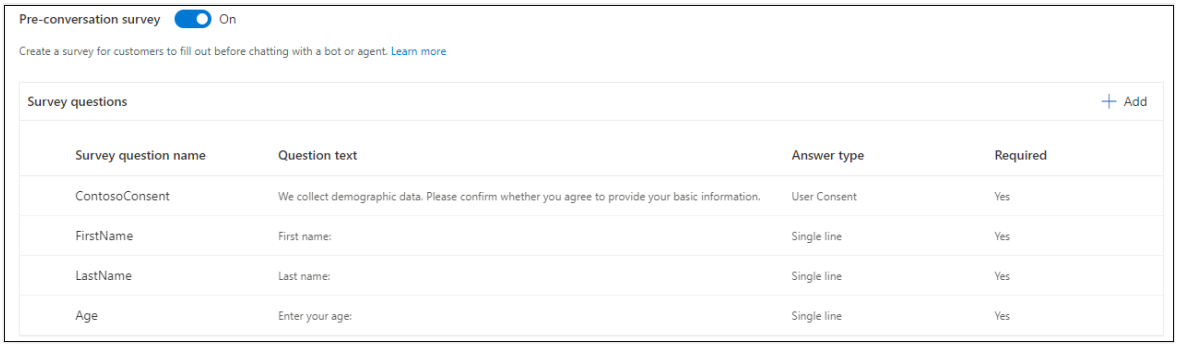
   - **Survey question name**: Specify a name that's used internally.
   - **Question text**: Enter the question text. The text appears as a question to the user at runtime. The length of each question must be less than or equal to 512 characters.
   - **Answer type**: Select one of the following values from the list:
     - **Single line**: The user can enter a single line of text.
     - **Multiple lines**: The user can enter multiple lines of text.

    - **Option set**: The user can select an option in a drop-down list. You must enter options separated by a semicolon.
    - **User consent**: Use this option to request user consent for the pre-chat survey. You can provide a link to a webpage, such as the privacy policy page. Links must be in the following format: [link text](link to the webpage). A checkbox appears beside the question text in the pre-conversation survey.
- **Required**: Set the toggle to **Yes** if the response to the question needs to be mandatory. If the answer type is **User Consent**, make sure you specify **Yes**.

> ⓘ Note
>
> - Validations in pre-conversation surveys are supported for mandatory fields only.
> - After you add the survey questions, corresponding context variables are created and displayed in the **Advanced settings** > **Context variables** section of the workstream.

6. Select **Confirm**. The survey question with its details is listed in the **Survey questions** area.

7. Repeat the steps pertaining to creating questions. You can add up to five questions only.



8. Optionally, you can change the order in which the questions are listed.

Configure a pre-conversation survey in Omnichannel Administration

> ⓘ Important
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service

admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

You can configure your chat widget to show users a survey that they must respond to before they start the conversation.

1. Sign in to Omnichannel Administration.
2. Go to **Channels** > **Chat**.
3. Open the chat widget in which you want to configure a pre-chat survey, and select **Surveys**.
4. In the **Pre-conversation survey** area, set the **Turn on** toggle to **Yes**. The options to add questions and refresh the page appear.
5. Select **Add question**.

   > ⓘ **Note**
   >
   > - You can add only five questions to a pre-conversation survey. The length of each question should be less than or equal to 512 characters.
   > - When you add a question to the pre-conversation survey, a corresponding context variable is created and is displayed in the **Advanced settings** > **Context variables** section.

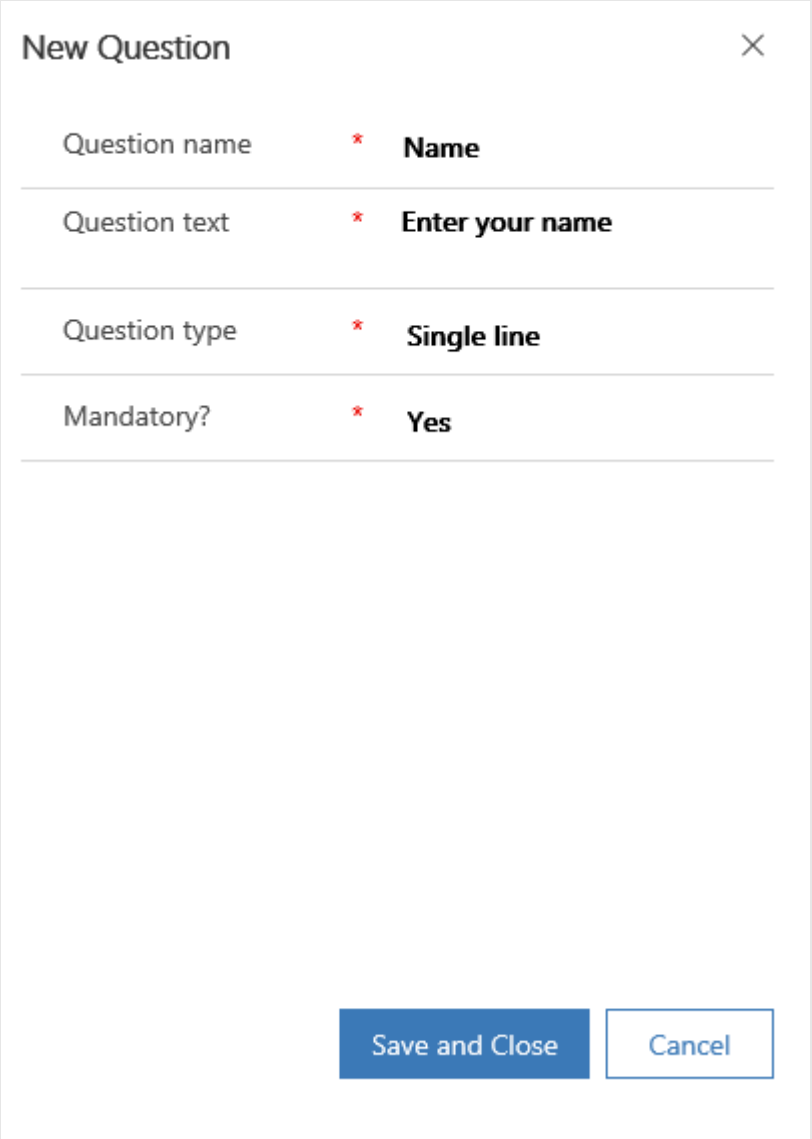
6. In the **New Question** pane, provide the following information:

   - **Question name**: Enter a name for the question.
   - **Question text**: Enter the text of the question.
   - **Question type**: Select one of the following options to indicate how users can respond:
     - **Single line**: The user can enter a single line of text.
     - **Multiple lines**: The user can enter multiple lines of text.
     - **Option set**: The user can select an option in a drop-down list. You must enter options separated by a semicolon.
     - **User consent**: Use this option to request user consent for the pre-chat survey. You can provide a link to a webpage, such as the privacy policy page. Links must be in the following format: [link text](link to the

webpage). A checkbox appears for the question text in the pre-conversation survey.

- **Mandatory**: Select **Yes** or **No** to indicate whether the question is mandatory. If question type is **User Consent**, make sure you specify **Yes**.

> **Note**
>
> Validations in pre-conversation surveys are available for mandatory fields only.



7. Select **Save and Close**. The questions are added in the **Pre-chat unauthenticated questions** area.

8. Optionally, select a question and select **Move up** or **Move down** in the right corner to change its order.

Runtime view of survey questions

The following screenshot is a sample of the pre-conversation survey that will be displayed for customers.

Configure a post-conversation survey

Article • 03/08/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

You can configure your chat widget to show users a survey that they can respond to after they finish a conversation.

> **Note**
>
> Post-conversation surveys are not supported in Government Community Cloud.

How post-conversation surveys work

When you enable a post-conversation survey for a channel, the survey will appear for the customer after the agent or customer ends the conversation. While configuring the survey, you can use the settings for the response options available in Dynamics 365 Customer Voice. More information: Work with survey settings

The post-conversation works as follows:

1. Create a survey in Dynamics 365 Customer Voice
2. Configure a survey
3. Experience the runtime behavior

You can enable post-conversation surveys for the following channels:

- Live chat
- SMS for Twilio, SMS for TeleSign
- Facebook
- LINE
- Twitter
- WeChat
- WhatsApp
- Custom channel

- Microsoft Teams
- Apple Messages for Business
- Google's Business Messages

For the Live chat channel only, you can configure the survey link or survey questions to be displayed in the chat window.

Prerequisite

The post-conversation survey uses Dynamics 365 Customer Voice to create surveys. Make sure that you have access to create surveys in Dynamics 365 Customer Voice in the same org as Omnichannel for Customer Service, and you've created the required survey. The survey that you create will be listed as an option to choose for linking to the conversation. More information: Create surveys with Dynamics 365 Customer Voice

Configure the post-conversation survey

In the Customer Service admin center or Omnichannel admin center, you can set up surveys when configuring a channel or update an existing channel instance that is already configured.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   - In the site map, select **Workstreams** in **Customer support**.

2. Select the channel instance, and then select **Edit**.

3. On the **Behaviors** tab, set the toggle for **Post-conversation survey** to **On**.

4. In **Dynamics 365 Customer Voice survey**, search for the survey you want to configure, and select it.

   - Optionally, if you want to create a survey, select **Create Dynamics 365 Customer Voice**. The Dynamics 365 Customer Voice page opens on a new tab, where you'll perform the steps to create a survey. After you create the survey, it will be available for selection in the **Dynamics 365 Customer Voice survey** box in the **Post-conversation survey** area.

5. In the **How should we send the survey** box, the following options are available depending on the channel you select:

    - **Send survey link to conversation:** At runtime, the survey link is sent to the customers.
        - In the **Message** box that appears, select the default message text or type a custom message. The personalized survey link will be appended to the message and displayed to the customer.

    - **Insert survey in conversation:** At runtime, the agent can insert a survey link in an active conversation that results in the survey questions being displayed on the customer chat window. This option is available only for the Live chat channel.

6. Select the **Bot conversation survey** checkbox to share surveys for conversations that are handled by bots.

    By default, the **Use same survey settings as above** checkbox is selected.

7. If you want to use different survey settings for the conversations handled by bots, repeat steps 4 and 5.

8. Select **Save and close**.

Runtime experience of post-conversation surveys

If the post-conversation survey is enabled for a conversation, after the conversation ends, the pre-designed survey is shared with the customer. This survey allows you to keep a track of the customer feedback for the service provided. Any conversation can be considered as closed when one of the following scenarios happen:

- Agent closes the chat conversation.
- Customer closes the chat conversation.
- System closes the chat conversation after a pre-defined time.

For Live chat conversations, customers can receive survey questions within the same conversation or through a link that takes them to an external site. For SMS and social channels, a survey link is shared.

> ⓘ **Note**

The surveys that you create and the survey data that's processed are not hosted or stored in Omnichannel for Customer Service.

Configure the survey in Omnichannel Administration

> **Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

1. Go to **Channels**, and select a channel for which you want to configure a post-conversation survey.
2. On the page that appears, select the channel instance in which you want to configure the survey.
3. Go to the **Surveys** tab.

   > **Note**
   >
   > The navigation to the **Surveys** tab varies for every channel. For example, for the Facebook channel, surveys can be configured at the page level.

4. In the **Post-conversation survey** area, set the toggle for **Turn on** to **Yes**.
5. In **Dynamics 365 Customer Voice survey**, search for a survey and select it.
6. Optionally, if you want to create a survey, select **Open Dynamics 365 Customer Voice**. The Dynamics 365 Customer Voice page opens on a new tab. After you create the survey, it will be available for selection in the **Dynamics 365 Customer Voice survey** box in the **Post-conversation survey** area.
7. In the **How should we send the survey** box, the following options are available depending on the channel you select:

   - **Send survey link to conversation:** At runtime, the survey link is sent to the customers.
     - In the **Message** box that appears, select the default message text or type a custom message. The personalized survey link will be appended to the

message and displayed to the customer.

- **Insert survey in conversation:** At runtime, the agent can insert a survey link in an active conversation that results in the survey questions being displayed on the customer chat window. This option is available only for the Live chat channel.

8. Select **Save**.

Add a chat widget
Channels

Identify customers automatically

Article • 04/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

You can assist customers better if you can automatically identify them and view their account and case details on the **Active Conversation** page. One of the ways is by setting up pre-conversation questions in the relevant chat widgets. Customer responses can be used to search for details in the records and display the results. For an account or contact, the search is performed on the **Name**, **Email**, or **Phone Number** fields. For an account, the **Phone Number** pertains to the **Phone** field of the **Account Summary** page; for a contact, the **Phone Number** pertains to the **Mobile Number** field of the **Contact Summary** page. For cases, the search is performed on the **Case Number** field.

> **Note**
>
> The record search identifies records that have an active status code for contacts or accounts; if you use custom status codes, then record identification won't work.

For every incoming conversation request that an agent receives, a notification appears that includes contextual information for the request and customer details, if available. After the agent accepts the incoming notification, the **Active Conversation** page opens and shows the details of the identified customer and case. If the identified contact or account has one active case linked to it, then case will be automatically linked to the conversation. If the customer has reached out for a different case, the agent can manually change the linked case.

You can identify incoming voice calls out of the box if the incoming phone number matches with the phone number specified for a contact in the mobile phone field or account phone field. If you want to use other phone number fields like home phone for customer identification, then contact Microsoft Support.

If more than one account, contact, or case is identified, the record won't be linked to the conversation. More information: View Active Conversation for an incoming engagement request

Set up pre-conversation questions

Use the following question names to create pre-conversation questions. To know how to create pre-conversation questions and use them in a pre-conversation survey, see Configure a pre-conversation survey.

Entity	Mapping	Answer type
Account	Question context key: Name Attribute logical name: name Question context key: Email Attribute logical name: emailaddress1 Question context key: Phone Attribute logical name: telephone1 (**Phone** field on the **Account Summary** page)	Single line
Contact	Question context key: Name Attribute logical name: fullname Question context key: Email Attribute logical name: emailaddress1 Question context key: Phone Attribute logical name: telephone1 (**Mobile Phone** field on the **Contact Summary** page)	Single line
Incident	Question context key: CaseNumber Attribute logical name: ticketnumber	Single line

> **Note**
>
> If you'd like other fields to be recognized for phone number lookup, contact **Microsoft Support**.

Use the setContextProvider API method

You can automatically identify records using custom context set using the setContextProvider API apart from pre-conversation answers. To programmatically set these values, see Manage custom context.

Link customer and case to conversations when bot escalates or ends conversations

When a bot ends a customer conversation, the bot can link the case number to the conversation. The bot can create a new case number or obtain an existing one from the customer based on the customer name, email address, or telephone number.

If the bot needs to escalate the conversation to a human agent, then bot can link the customer and case number to the conversation so that when the human agent accepts the escalation request, all relevant information is available to the agent in the **Active Conversation** section. The escalation summary gives the human agent the background information about the escalation and enables quicker resolution of the customer issue.

To link the customer or case, set the values for the associated attributes, such as customer name and phone number. These attributes will be searched in the corresponding entities such as customer and case, and the result will be linked to the conversation if a single matching record is found. The bot will need to set context parameters for the following that are also set when the customer is automatically identified when the conversation is transferred.

Entity to be linked	Variable name to be set by bot	Attribute for Dynamics 365 entity to match with corresponding variable name in bot
Account	• Name • Email • Phone	• name • emailaddress1 • telephone1
Contact	• Name • Email • Phone	• name • emailaddress1 • telephone1
Case	CaseNumber	ticketnumber

For information about creating context variables for Azure and Power Virtual Agents bots, see Configure context variables for the bot.

Context variables for bots

Close conversations automatically

Article • 10/04/2023

Omnichannel for Customer Service has a default time set for the conversation to close automatically. That is, if a conversation in a certain stage remains in the stage for more than the default time, then the conversation is moved to the closed state. Conversations achieve closure, allowing agents to focus on other tasks, enhancing productivity.

The Omnichannel for Customer Service scheduler checks conversations every 5 minutes to identify conversations that don't transition for more than the default configured time. Such conversations become eligible for automatic closure, so the next time the scheduler runs, the conversations are moved from the existing state to the **Closed** state.

> **Important**
>
> - To avoid inaccurate statuses, we recommend that you don't change the conversation state and status reason by manually updating the records in Microsoft Dataverse.
> - For any actions performed on the conversations such as monitor, consult, or transfer, the scheduler will automatically recalculate the time to close the conversation.

Default time for automatic closure of conversations

All channels have different default configured time after which conversations can be moved to the **Closed** state. However, the exact time at which the scheduler runs is dependent on the Omnichannel for Customer Service deployment time in your region. For more information, contact Microsoft Support.

The following table describes the channel, status reason, and default configured time.

Channel	Existing status reason	Default configured time	Description
Chat	Open	20 min	For a chat channel, a conversation in the **Open** state for more than 20 minutes is eligible for automatic closure. Next time, when the scheduler runs, the conversation will be moved from the **Open** state to the **Closed** state.

Channel	Existing status reason	Default configured time	Description
Chat	Active	None	For a chat channel, a conversation in the Active state won't be automatically closed.
Chat	Wrap-up	15 minutes	For a chat channel, a conversation that is in the **Wrap-up** stage for more than 15 minutes is eligible for automatic closure. Next time, when the scheduler runs, the conversation will be moved from **Wrap-up** to the **Closed** state.
Records (Case)	Open	None	For a records (case) channel, a conversation that's **Open** will be closed if the corresponding record is deleted.
Records (Case)	Active	None	For a records (case) channel, a conversation that's **Active** will be closed if the corresponding record is deleted.
Voice	Open	30 days	The conversation is eligible for automatic closure after the default time, 30 days, elapses. The conversation is moved from the **Open** to **Closed** state when the scheduler runs after the elapsed time.
Voice	Active	2 hours	The conversation is eligible for automatic closure after the default time, 2 hours, elapses. The conversation is moved from the **Active** to **Wrap-up** state when the scheduler runs after the elapsed time.
Voice	Wrap-up	1 day	The conversation is eligible for automatic closure after the default time, 1 day, elapses. The conversation is moved from the **Wrap-up** to **Closed** state when the scheduler runs after the elapsed time.
SMS, Teams, persistent chat, and social	Open	30 days	In an asynchronous channel—such as SMS, Teams, persistent chat, or a social channel—a conversation that has been in the **Open** state for more than 30 days is eligible for automatic closure. Next time, when the scheduler runs, the conversation will be moved from the **Open** state to the **Closed** state.
SMS, Teams, and social	Active	30 days	In an asynchronous channel—such as SMS, Teams, or a social channel—a conversation that has been in

Channel	Existing status reason	Default configured time	Description
			the **Active** state for more than 30 days is eligible for automatic closure. Next time, when the scheduler runs, the conversation will be moved from **Active** to the **Closed** state.
SMS, Teams, persistent chat, and social	Wrap-up	One day	In an asynchronous channel—such as SMS, Teams, persistent chat, or a social channel—a conversation that has been in the **Wrap-up** state for more than one day is eligible for automatic closure. Next time, when the scheduler runs, the conversation will be moved from **Wrap-up** to the **Closed** state.

Conversation in waiting

A conversation in **Waiting** is moved to the **Closed** state when the conversation is inactive for a specified time. The inactive time can be set in the workstream for the **Auto-close after inactivity** option, based on which the conversation will be moved to the closed state after the criteria is met.

For example, when you set **Auto-close after inactivity** to 5 minutes, the conversation is moved to the **Closed** state if it has been in **Waiting** for more than 5 minutes.

> **Note**
>
> The **Auto-close after inactivity** option is available for persistent chat, SMS, social, and Microsoft Teams channels only.

To learn more, see Create a workstream.

Close conversations using Power Apps

You can configure the auto-close duration of a conversation in Power Apps by performing the following steps:

1. In Power Apps, select the environment that contains your solution.
2. Select **Tables**, and then select **Channel State Configuration** table.
3. Select **Edit**, and in **Auto close conversation after** column, set the auto-close duration.

Close conversations using API

Programmatically, you can change the default time and set it as per your organization's requirements using the Web APIs. To learn more, see Configure automatic closure of conversations using web API.

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

You can create authentication settings to validate a signed-in customer from a domain, and extract information based on the context variables that are defined. You can differentiate your anonymous customers from authenticated customers, and you can create rules based on the context variables.

For example, you can have separate queues for anonymous customers and authenticated customers. Because you have more information about your authenticated customers, you can also prioritize them based on specific variables, such as a shopping cart value or a privileged status.

After you create an authentication settings record, you must add it to a channel instance within a workstream's channel setup to make it work. Authentication is supported for these channels:

- Chat
- Apple Messages for Business

The agent will get a notification in the **Conversation summary** section whether the customer is authenticated or not. The **Authenticated** field is set to **Yes** or **No** based on the authentication of the customer. More information: Conversation summary

Prerequisites

- Make sure your organization has working knowledge of OAuth 2.0 and JSON Web Tokens (JWTs).
- Verify that you have permissions on the secure columns. More information: Configure permissions to access secure columns

Create an authentication setting record for chat

You can create a chat authentication setting record in the admin app.

1. Go to one of the admin apps, and perform the following steps.

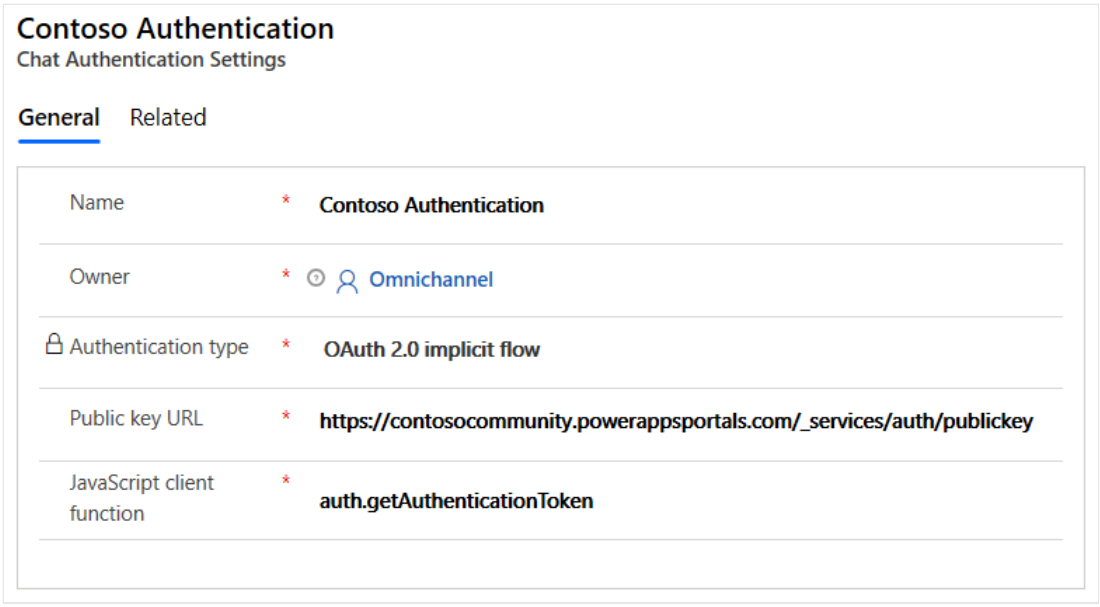
   Customer Service admin center

   a. In the site map, select **Customer Settings** in **Customer support**. The **Customer settings** page appears.
   b. In the **Authentication settings** section, select **Manage**.

   The **Authentication settings** page is displayed.

2. Select **New Authentication Settings**, and provide the following information on the **Add authentication setting** page:

   - **Name**: Enter a name for the authentication setting.
   - **Owner:** Accept the default value or change to a required value.
   - **Authentication type:** By default, it's OAuth 2.0 implicit flow that can't be edited.
   - **Public key URL**: Specify the public key URL of the domain. This URL is used to validate the information that comes in from the JavaScript Object Notation (JSON) Web Token (JWT) of the domain that a customer has signed in to.
   - **JavaScript client function**: Specify the JavaScript client function to use for authentication. This function extracts a token from the token endpoint.



For more information about how to find the public key URL and JavaScript client function, see the Setup for Power Apps portals or Setup for custom portals section later in this article.

3. Select **Save**.

Add authentication to chat widget

1. Open the chat widget to which you want to add authentication and do one of the following steps:

   - In Customer Service admin center or Omnichannel admin center, go to the **Behaviors** tab.
   - In Omnichannel Administration, go to the **Basic details** tab.

2. In the **Authentication settings** box, browse and select the chat authentication record.

When a signed-in customer on a portal opens the chat widget, the JavaScript client function passes the JWT from the client to the server. The JWT is decrypted and validated by using the public key, and the information is then passed to the chat agent in Omnichannel for Customer Service. As an admin, you can also pass additional information about the signed-in customer in the JWT by defining custom context variables. The context variables must be defined exactly as they're defined in the workstream that's associated with the chat widget. More information: Manage context variables

Setup for Power Apps portals

If you're adding authentication for a chat widget on a website developed using Power Apps portals, then the public key URL and JavaScript client function are available out of the box. You'll need to upload a custom certificate to have a valid public key URL on Power Apps portals.

- **Public key URL**: `<portal_base_URL>/_services/auth/publickey`
- **JavaScript client function**: `auth.getAuthenticationToken`

The Power Apps portal will try to automatically link a contact record to the conversation through the context passed in its JavaScript client function.

Setup for custom portals

If you're adding an authenticated chat experience to a custom website that isn't developed using Power Apps portals, your web development team must perform the following steps before your administrators can configure authenticated chat:

1. Generate a public/private key pair in their authentication servers. The keys must be generated using the RSA256 algorithm.

   Here's sample code for generating private/public key pairs.

   Powershell

   ```
   openssl genpkey -algorithm RSA -out private_key.pem -pkeyopt
   rsa_keygen_bits:2048
   openssl rsa -pubout -in private_key.pem -out public_key.pem
   ```

2. Create an endpoint that will return your public keys. The Omnichannel servers will use the public keys to validate the JWT token passed as a part of authorizing the chat request. The URL of this endpoint will be entered into the admin app when creating an authentication setting record.

   Your public key endpoint will look similar to this example:

   ```
   -----BEGIN PUBLIC KEY-----
   NIIBIjANBgkqhkiG9w0BAQEFABCOPQ8AMIIBCgKCAQEAn+BjbrY5yhSpLjcV3seP
   mNvAvtQ/zLwkjCbpc8c0xVUOzEdH8tq4fPi/X5P/Uf2CJomWjdOf1wffmOZjFasx
   ELG+poTqy5uX2dNhH6lOMUsV31QGG36skLivpLBCSK6lWlzsV6WGkb/m8r86aGzp
   jtNhw8yvoTYB4updDrJ8pC+tx4EWK0WEmKn1GsW6TjUtxJjcTLI1puSbmcGHbkSi
   RSbWkKPqaEVFALprw+W5ZCung5QX3KOkY/rJd+2JwULm7okyQCQaF7qwa5i9Uf65
   7M6ZL4vsDevq7E/v3tf6qxpSSHzt4XspXVQty9QHhqDqBEY3PfI4L2JjgIGuPhfS
   YQIDAQAB
   ```

```
    -----END PUBLIC KEY-----
```

If you need to use multiple public keys, your public key endpoint can return a set of `<kid, publickey>` pairs, where `kid` refers to the key ID. Key ID pairs must be unique. The kid will need to be passed in the JWT token in step 4. If you're using multiple keys, your public key endpoint should return something that looks like this. The public key is base64-encoded.

```
 [
      {
          "kid": "qWO4EaKT1xRO7JC/oqALz6DCVr41B/qL0Hqp4in7hu4=",
          "publicKey":

tLS0NCg==",
          "expiry": 1608495423
      }
 ]
```

3. You'll need a service that generates the JWT to send to Omnichannel's servers as a part of starting a chat for an authenticated user.

   a. The JWT header will look similar to the following example.

   ```
   JavaScript
   ```

```
{
  "alg": "RS256",
  "typ": "JWT",
}
```

If you're using multiple public keys, you'll need to pass in the key ID (kid). Your header will look similar to this example:

JavaScript

```
{
  "alg": "RS256",
  "typ": "JWT",
  "kid": "qWO4EaKT1xRO7JC/oqALz6DCVr41B/qL0Hqp4in7hu4="
}
```

b. The JWT payload should include:

- At minimum, the following claims:

Claim	Definition
iss	The issuer of the token.
iat	The date the token was issued, in numeric date format.
exp	The expiration date of this token, in numeric date format.
sub	The subject of the claim. **NOTE:** We recommend that you pass the GUID of the contact or account record in Customer Service for the logged-in user. This GUID will be used to identify and link the contact record to the conversation.

- **lwicontexts** The context variables to pass in as part of the conversation, either for routing purposes or to display to the agent.
  More information:
  Manage custom context
  setAuthTokenProvider method
  Identify records automatically using context variables

- Any other data that you want to pass.

Your payload will look similar to this example:

JavaScript

```
  {
      "sub" : "87b4d06c-abc2-e811-a9b0-000d3a10e09e",
      "lwicontexts" :"{\"msdyn_cartvalue\":\"10000\",
\"msdyn_isvip\":\"false\", \"portalcontactid\":\"87b4d06c-abc2-e811-
a9b0-000d3a10e09e\"}",
      "iat" : 1542622071,
      "iss" : "contosohelp.com",
      "exp" : 1542625672,
      "nbf" : 1542622072
  }
```

c. The JWT signature should be signed by your private key.

> **Note**
>
> - If the token has expired or is invalid, the chat widget will throw an error event.
> - The **setContextProvider method** is not supported for authenticated chat. You should pass in your lwicontexts as a part of the JWT payload.

4. Create a JavaScript function on your website that will accept a callback function and return a JWT to the callback function. To avoid timeout, this JavaScript function should return a JWT within 10 seconds. This JWT must:

   - Contain the header, payload, and signature from step 3.
   - Be signed by the private key from the key pair in step 1.

     (We recommend generating your JWT on your web server).

     The name of this JavaScript method will be used to create the authentication settings record in the Omnichannel admin app.

     JavaScript

     ```
     // This is a sample JavaScript client function

     auth.getAuthenticationToken = function(callback){

       var xhttp = new XMLHttpRequest();
       xhttp.onreadystatechange = function() {
           if (this.readyState == 4 && this.status == 200) {
               callback(xhttp.responseText);
           }
       };
       xhttp.onerror = function(error) {
     ```

```
        callback(null);
    };
//Replace this with a call to your token generating service
    xhttp.open("GET", "https://contosohelp.com/token", true);
    xhttp.send();
}
```

5. Your developer will need to share the following information with your Omnichannel administrator:

   a. The URL of the public key service from step 2.

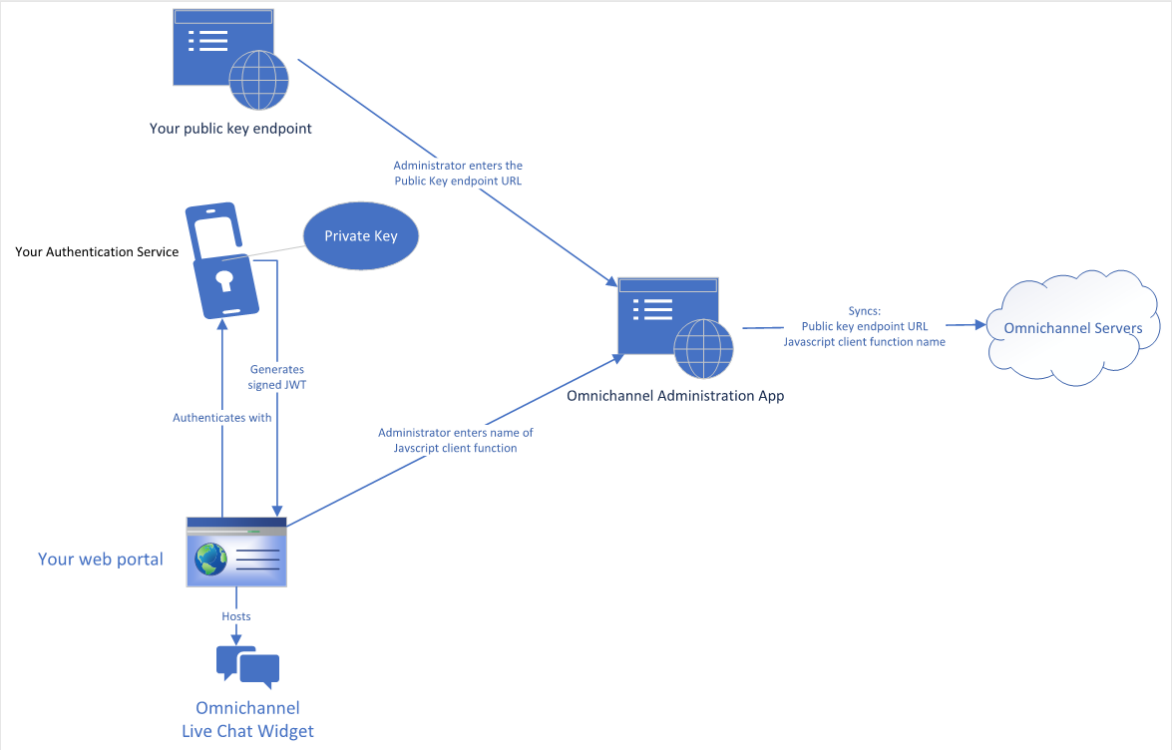
   Example: https://www.contoso.com/auth/publickey

   b. The name of the JavaScript client function from step 4. The live chat widget will call this name internally during the start of a chat.

   Example: auth.getAuthenticationToken

   > **Note**
   >
   > If your user experience exposes the chat button before users are authenticated, make sure to redirect them to your authentication page as needed. This can be done in the method in step 4, or as an earlier step in your user flow.

   The following illustration demonstrates the setup.



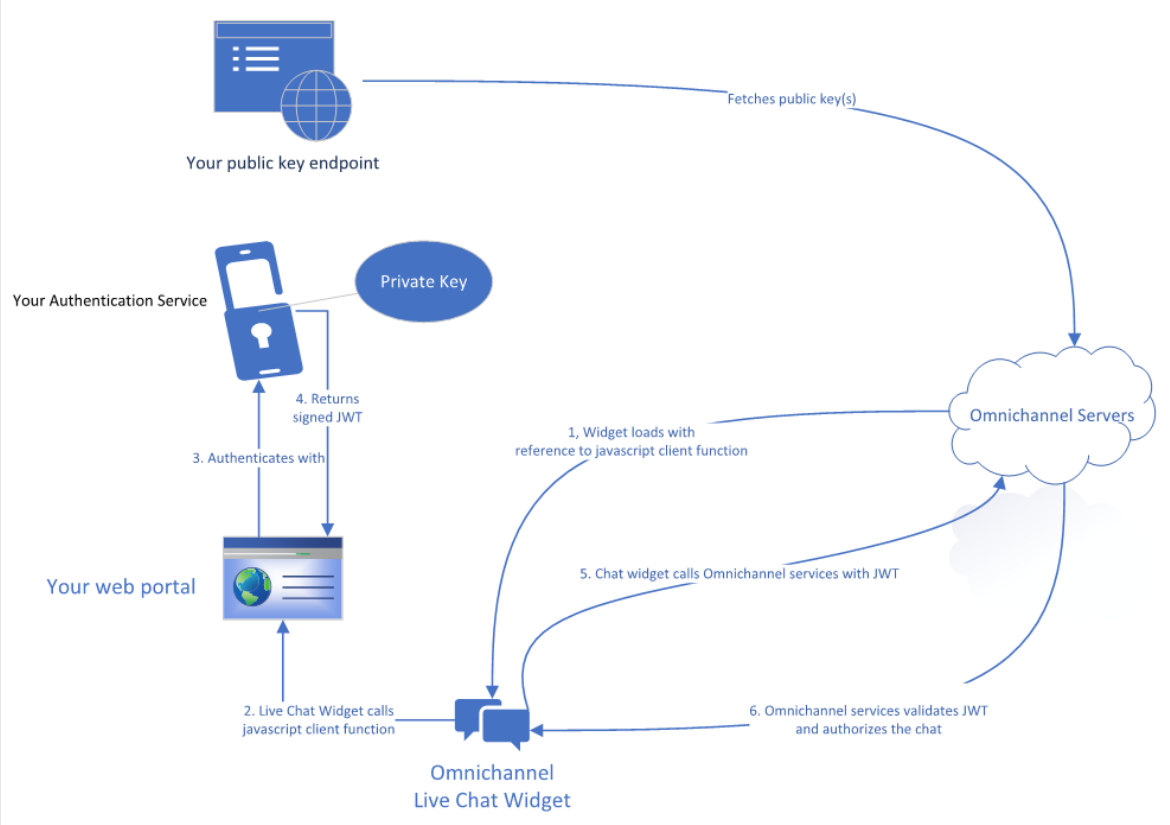
Then, you can set up authenticated chat by following these steps:

Set up authenticated chat

1. Go to the admin app, and create an authentication settings record with the information from step 5 of the previous section. More information: Create an authentication setting record for chat

2. Associate the authentication settings to the chat widget that will have an authenticated experience. More information: Add authentication to chat widget

   The following illustration demonstrates the call sequence when a user accesses your chat in an authenticated setup.



Create authentication settings for Apple Messages for Business

Prerequisites

- Administrators who are configuring authentication settings will need more security permissions. More information: Set up security permissions for a field

- Make sure your organization has working knowledge of OAuth 2.0 code flow or OAuth 2.0 OpenID connect flow. Steps for both types are outlined below.
- Confirm that your organization has at least one Apple Messages for Business **Authentication type rich message**. This rich message is required for setup.

Create an authentication setting record for Apple Messages for Business using OAuth 2.0 code flow

1. In the Customer Service admin center or Omnichannel admin center app site map, select **Customer settings**, and then select **Manage for Authentication settings**. A list of existing authentication settings is shown.
2. Select **New authentication setting**, and on the **Add authentication setting** page, provide the following details:

    a. On the **Channel type** page, enter a name and select **Apple Messages for Business** as the channel type.
    By default, the authentication type is **OAuth 2.0 code flow**.

    b. On the **Add authentication setting** page, provide the following information:

    - **Client ID**: OAuth 2.0 Client Identifier issued by an authorization server.
    - **Client secret**: Client secret used to authenticate requests sent to an authorization server.
    - **Scope**: Each scope added will specify which pieces of user data you've requested from the customer. The scope content must exactly match the ones available through your service provider.
    - **Access Token URL**: The service provider's endpoint where an access token can be requested.
    - **Decrypted token URL**: Endpoint where the OAuth 2.0 API can retrieve the customer info requested in the scope.

    c. On the **Additional details** page, you can optionally define an access token expiry time, in seconds. The default expiry time is one hour.
    After the specified time, the **Authenticated** field in the **Active Conversation** section of a previously authenticated conversation will change to **No**.

    d. On the **Rich messages** page, select **Add**, and then select one or more rich messages to associate to this authentication setting.

    e. Review the **Summary** page, and then select **Finish**. The authentication setting is configured.

Create an authentication setting record for Apple Messages for Business using OAuth 2.0 OpenID connect flow

1. In the Customer Service admin center or Omnichannel admin center app site map, select **Customer settings**, and then select **Manage for Authentication settings**. A list of existing authentication settings is shown.

2. Select **New authentication setting**, and on the **Add authentication setting** page, provide the following details:

   a. On the **Channel type** page, enter a name and select **Apple Messages for Business** as the channel type.

   b. Change the authentication type **OAuth 2.0 OpenID connect flow**.

   c. On the **Add authentication setting** page, provide the following information:

      - **Client ID**: OAuth 2.0 Client Identifier issued by an authorization server.
      - **Client secret**: Client secret used to authenticate requests sent to an authorization server.
      - **Scope**: Each scope added will specify which pieces of user data you've requested from the customer. The scope content must exactly match the ones available through your service provider.
      - **Access Token URL**: The service provider's endpoint where an access token can be requested.
      - **Decrypted token URL**: Endpoint where the OAuth 2.0 API can retrieve the customer info requested in the scope.
      - **Additional parameters**: Allows authentication services to take extra parameters from the request.

   d. On the **Additional details** page, you can optionally define an access token expiry time, in seconds. The default expiry time is one hour.
   After the specified time, the **Authenticated** field in the **Customer summary** section of a previously authenticated conversation will change to **No**.

   e. On the **Rich messages** page, select **Add**, and then select one or more rich messages to associate to this authentication setting.

   f. Review the **Summary** page, and then select **Next**. The authentication setting is configured.

   g. On the **Redirect information** page, copy the URL. You'll add this URL to the authentication service provider's website under allowed callback URLs.

h. Select **Finish**.

Add authentication to an Apple Messages for Business channel

1. Open the workstream containing the channel instance to which you want to add authentication.
2. On the **Behaviors** page of the channel settings, navigate to **Authentication settings**, enable the capability, and select the correct setting from the dropdown menu. More information: Configure an Apple Messages for Business channel
3. Review or update the authentication settings for each channel instance by selecting **Edit**.

Configure authentication settings

Article • 04/06/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

You can create authentication settings to validate a signed-in customer from a domain, and extract information based on the context variables that are defined. You can differentiate your anonymous customers from authenticated customers, and you can create rules based on the context variables.

For example, you can have separate queues for anonymous customers and authenticated customers. Because you have more information about your authenticated customers, you can also prioritize them based on specific variables, such as a shopping cart value or a privileged status.

After you create an authentication settings record, you must add it to a channel instance within a workstream's channel setup to make it work. Authentication is supported for these channels:

- Chat
- Apple Messages for Business

The agent will get a notification in the **Conversation summary** section whether the customer is authenticated or not. The **Authenticated** field is set to **Yes** or **No** based on the authentication of the customer. More information: Conversation summary

Prerequisites

- Make sure your organization has working knowledge of OAuth 2.0 and JSON Web Tokens (JWTs).
- Verify that you have permissions on the secure columns. More information: Configure permissions to access secure columns

Create an authentication setting record for chat

You can create a chat authentication setting record in the admin app.

1. Go to one of the admin apps, and perform the following steps.

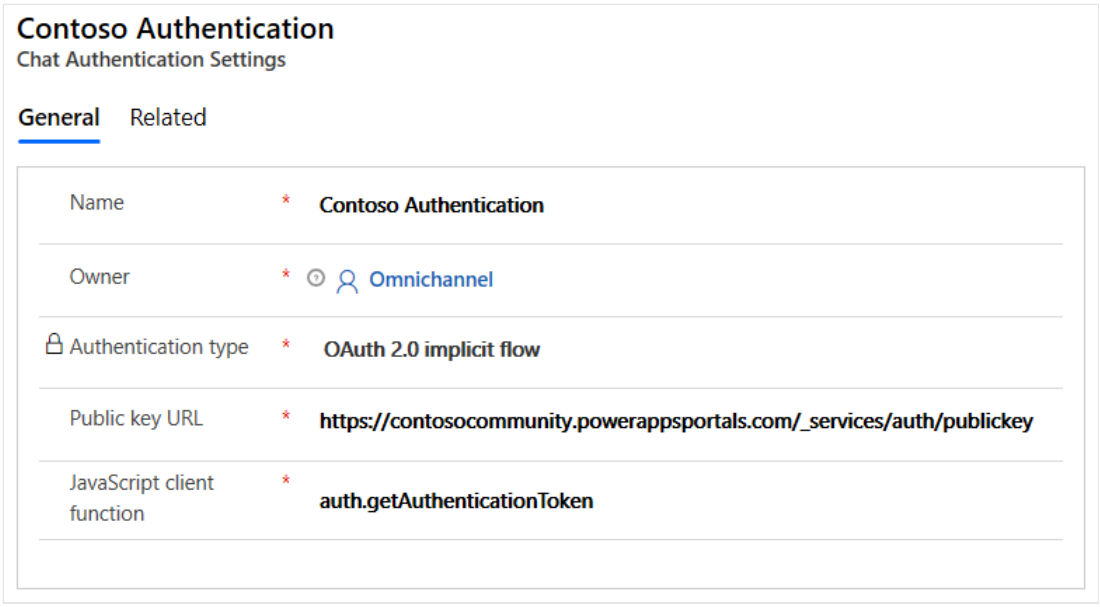
   Customer Service admin center

   a. In the site map, select **Customer Settings** in **Customer support**. The **Customer settings** page appears.
   b. In the **Authentication settings** section, select **Manage**.

   The **Authentication settings** page is displayed.

2. Select **New Authentication Settings**, and provide the following information on the **Add authentication setting** page:

   - **Name**: Enter a name for the authentication setting.
   - **Owner:** Accept the default value or change to a required value.
   - **Authentication type:** By default, it's OAuth 2.0 implicit flow that can't be edited.
   - **Public key URL**: Specify the public key URL of the domain. This URL is used to validate the information that comes in from the JavaScript Object Notation (JSON) Web Token (JWT) of the domain that a customer has signed in to.
   - **JavaScript client function**: Specify the JavaScript client function to use for authentication. This function extracts a token from the token endpoint.



For more information about how to find the public key URL and JavaScript client function, see the Setup for Power Apps portals or Setup for custom portals section later in this article.

3. Select **Save**.

Add authentication to chat widget

1. Open the chat widget to which you want to add authentication and do one of the following steps:

   - In Customer Service admin center or Omnichannel admin center, go to the **Behaviors** tab.
   - In Omnichannel Administration, go to the **Basic details** tab.

2. In the **Authentication settings** box, browse and select the chat authentication record.

When a signed-in customer on a portal opens the chat widget, the JavaScript client function passes the JWT from the client to the server. The JWT is decrypted and validated by using the public key, and the information is then passed to the chat agent in Omnichannel for Customer Service. As an admin, you can also pass additional information about the signed-in customer in the JWT by defining custom context variables. The context variables must be defined exactly as they're defined in the workstream that's associated with the chat widget. More information: Manage context variables

Setup for Power Apps portals

If you're adding authentication for a chat widget on a website developed using Power Apps portals, then the public key URL and JavaScript client function are available out of the box. You'll need to upload a custom certificate to have a valid public key URL on Power Apps portals.

- **Public key URL**: `<portal_base_URL>/_services/auth/publickey`
- **JavaScript client function**: `auth.getAuthenticationToken`

The Power Apps portal will try to automatically link a contact record to the conversation through the context passed in its JavaScript client function.

Setup for custom portals

If you're adding an authenticated chat experience to a custom website that isn't developed using Power Apps portals, your web development team must perform the following steps before your administrators can configure authenticated chat:

1. Generate a public/private key pair in their authentication servers. The keys must be generated using the RSA256 algorithm.

   Here's sample code for generating private/public key pairs.

   Powershell

   ```
   openssl genpkey -algorithm RSA -out private_key.pem -pkeyopt
   rsa_keygen_bits:2048
   openssl rsa -pubout -in private_key.pem -out public_key.pem
   ```

2. Create an endpoint that will return your public keys. The Omnichannel servers will use the public keys to validate the JWT token passed as a part of authorizing the chat request. The URL of this endpoint will be entered into the admin app when creating an authentication setting record.

   Your public key endpoint will look similar to this example:

   ```
   -----BEGIN PUBLIC KEY-----
   NIIBIjANBgkqhkiG9w0BAQEFABCOPQ8AMIIBCgKCAQEAn+BjbrY5yhSpLjcV3seP
   mNvAvtQ/zLwkjCbpc8c0xVUOzEdH8tq4fPi/X5P/Uf2CJomWjdOf1wffmOZjFasx
   ELG+poTqy5uX2dNhH6lOMUsV31QGG36skLivpLBCSK6lWlzsV6WGkb/m8r86aGzp
   jtNhw8yvoTYB4updDrJ8pC+tx4EWK0WEmKn1GsW6TjUtxJjcTLI1puSbmcGHbkSi
   RSbWkKPqaEVFALprw+W5ZCung5QX3KOkY/rJd+2JwULm7okyQCQaF7qwa5i9Uf65
   7M6ZL4vsDevq7E/v3tf6qxpSSHzt4XspXVQty9QHhqDqBEY3PfI4L2JjgIGuPhfS
   YQIDAQAB
   ```

```
    -----END PUBLIC KEY-----
```

If you need to use multiple public keys, your public key endpoint can return a set of `<kid, publickey>` pairs, where `kid` refers to the key ID. Key ID pairs must be unique. The kid will need to be passed in the JWT token in step 4. If you're using multiple keys, your public key endpoint should return something that looks like this. The public key is base64-encoded.

```
 [
      {
          "kid": "qWO4EaKT1xRO7JC/oqALz6DCVr41B/qL0Hqp4in7hu4=",

```

3. You'll need a service that generates the JWT to send to Omnichannel's servers as a part of starting a chat for an authenticated user.

   a. The JWT header will look similar to the following example.

   ```
   JavaScript
   ```

```
{
  "alg": "RS256",
  "typ": "JWT",
}
```

If you're using multiple public keys, you'll need to pass in the key ID (kid). Your header will look similar to this example:

JavaScript

```
{
  "alg": "RS256",
  "typ": "JWT",
  "kid": "qWO4EaKT1xRO7JC/oqALz6DCVr41B/qL0Hqp4in7hu4="
}
```

b. The JWT payload should include:

- At minimum, the following claims:

Claim	Definition
iss	The issuer of the token.
iat	The date the token was issued, in numeric date format.
exp	The expiration date of this token, in numeric date format.
sub	The subject of the claim. **NOTE:** We recommend that you pass the GUID of the contact or account record in Customer Service for the logged-in user. This GUID will be used to identify and link the contact record to the conversation.

- **lwicontexts** The context variables to pass in as part of the conversation, either for routing purposes or to display to the agent.
  More information:
  Manage custom context
  setAuthTokenProvider method
  Identify records automatically using context variables

- Any other data that you want to pass.

Your payload will look similar to this example:

JavaScript

```
  {
      "sub" : "87b4d06c-abc2-e811-a9b0-000d3a10e09e",
      "lwicontexts" :"{\"msdyn_cartvalue\":\"10000\",
\"msdyn_isvip\":\"false\", \"portalcontactid\":\"87b4d06c-abc2-e811-
a9b0-000d3a10e09e\"}",
      "iat" : 1542622071,
      "iss" : "contosohelp.com",
      "exp" : 1542625672,
      "nbf" : 1542622072
  }
```

c. The JWT signature should be signed by your private key.

> **Note**
>
> - If the token has expired or is invalid, the chat widget will throw an error event.
> - The **setContextProvider method** is not supported for authenticated chat. You should pass in your lwicontexts as a part of the JWT payload.

4. Create a JavaScript function on your website that will accept a callback function and return a JWT to the callback function. To avoid timeout, this JavaScript function should return a JWT within 10 seconds. This JWT must:

   - Contain the header, payload, and signature from step 3.
   - Be signed by the private key from the key pair in step 1.

     (We recommend generating your JWT on your web server).

     The name of this JavaScript method will be used to create the authentication settings record in the Omnichannel admin app.

     JavaScript

     ```
     // This is a sample JavaScript client function

     auth.getAuthenticationToken = function(callback){

       var xhttp = new XMLHttpRequest();
       xhttp.onreadystatechange = function() {
           if (this.readyState == 4 && this.status == 200) {
               callback(xhttp.responseText);
           }
       };
       xhttp.onerror = function(error) {
     ```

```
        callback(null);
    };
//Replace this with a call to your token generating service
    xhttp.open("GET", "https://contosohelp.com/token", true);
    xhttp.send();
}
```

5. Your developer will need to share the following information with your Omnichannel administrator:

   a. The URL of the public key service from step 2.

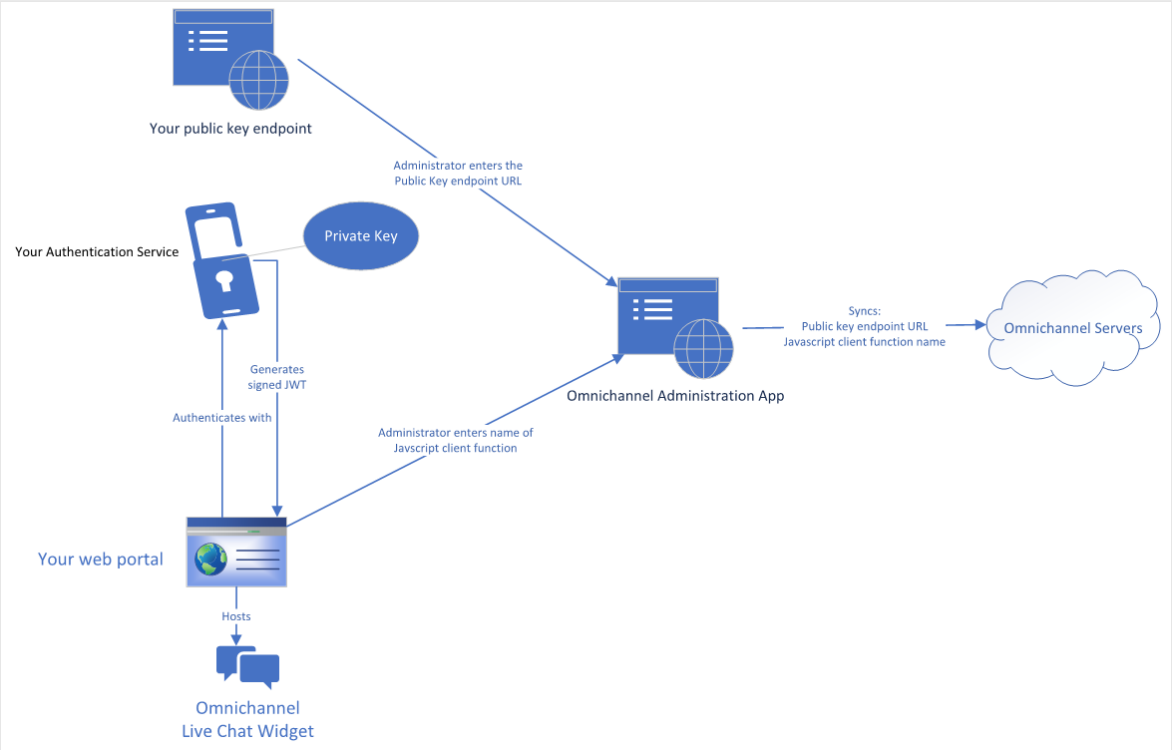
   Example: https://www.contoso.com/auth/publickey

   b. The name of the JavaScript client function from step 4. The live chat widget will call this name internally during the start of a chat.

   Example: auth.getAuthenticationToken

   > **Note**
   >
   > If your user experience exposes the chat button before users are authenticated, make sure to redirect them to your authentication page as needed. This can be done in the method in step 4, or as an earlier step in your user flow.

   The following illustration demonstrates the setup.



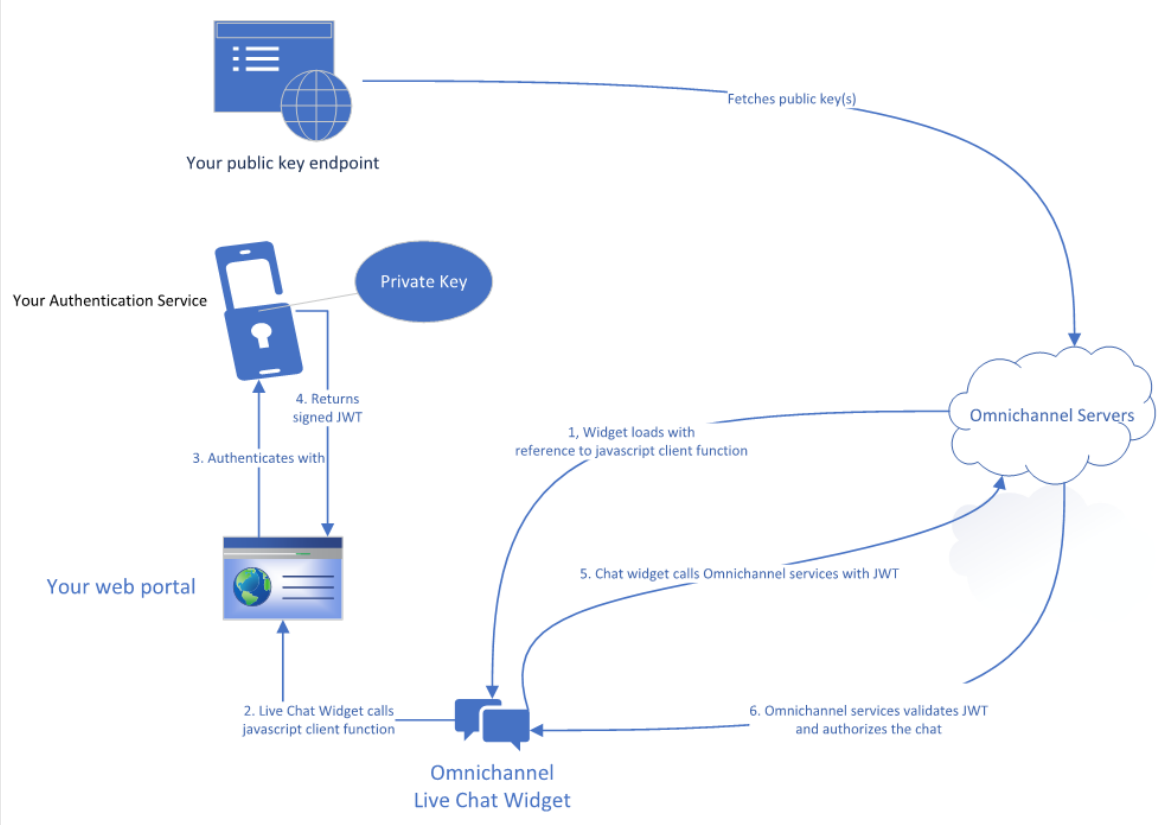
Then, you can set up authenticated chat by following these steps:

Set up authenticated chat

1. Go to the admin app, and create an authentication settings record with the information from step 5 of the previous section. More information: Create an authentication setting record for chat

2. Associate the authentication settings to the chat widget that will have an authenticated experience. More information: Add authentication to chat widget

   The following illustration demonstrates the call sequence when a user accesses your chat in an authenticated setup.



Create authentication settings for Apple Messages for Business

Prerequisites

- Administrators who are configuring authentication settings will need more security permissions. More information: Set up security permissions for a field

- Make sure your organization has working knowledge of OAuth 2.0 code flow or OAuth 2.0 OpenID connect flow. Steps for both types are outlined below.
- Confirm that your organization has at least one Apple Messages for Business **Authentication type rich message**. This rich message is required for setup.

Create an authentication setting record for Apple Messages for Business using OAuth 2.0 code flow

1. In the Customer Service admin center or Omnichannel admin center app site map, select **Customer settings**, and then select **Manage for Authentication settings**. A list of existing authentication settings is shown.
2. Select **New authentication setting**, and on the **Add authentication setting** page, provide the following details:

    a. On the **Channel type** page, enter a name and select **Apple Messages for Business** as the channel type.
    By default, the authentication type is **OAuth 2.0 code flow**.

    b. On the **Add authentication setting** page, provide the following information:

    - **Client ID**: OAuth 2.0 Client Identifier issued by an authorization server.
    - **Client secret**: Client secret used to authenticate requests sent to an authorization server.
    - **Scope**: Each scope added will specify which pieces of user data you've requested from the customer. The scope content must exactly match the ones available through your service provider.
    - **Access Token URL**: The service provider's endpoint where an access token can be requested.
    - **Decrypted token URL**: Endpoint where the OAuth 2.0 API can retrieve the customer info requested in the scope.

    c. On the **Additional details** page, you can optionally define an access token expiry time, in seconds. The default expiry time is one hour.
    After the specified time, the **Authenticated** field in the **Active Conversation** section of a previously authenticated conversation will change to **No**.

    d. On the **Rich messages** page, select **Add**, and then select one or more rich messages to associate to this authentication setting.

    e. Review the **Summary** page, and then select **Finish**. The authentication setting is configured.

Create an authentication setting record for Apple Messages for Business using OAuth 2.0 OpenID connect flow

1. In the Customer Service admin center or Omnichannel admin center app site map, select **Customer settings**, and then select **Manage for Authentication settings**. A list of existing authentication settings is shown.

2. Select **New authentication setting**, and on the **Add authentication setting** page, provide the following details:

   a. On the **Channel type** page, enter a name and select **Apple Messages for Business** as the channel type.

   b. Change the authentication type **OAuth 2.0 OpenID connect flow**.

   c. On the **Add authentication setting** page, provide the following information:

      - **Client ID**: OAuth 2.0 Client Identifier issued by an authorization server.
      - **Client secret**: Client secret used to authenticate requests sent to an authorization server.
      - **Scope**: Each scope added will specify which pieces of user data you've requested from the customer. The scope content must exactly match the ones available through your service provider.
      - **Access Token URL**: The service provider's endpoint where an access token can be requested.
      - **Decrypted token URL**: Endpoint where the OAuth 2.0 API can retrieve the customer info requested in the scope.
      - **Additional parameters**: Allows authentication services to take extra parameters from the request.

   d. On the **Additional details** page, you can optionally define an access token expiry time, in seconds. The default expiry time is one hour.
   After the specified time, the **Authenticated** field in the **Customer summary** section of a previously authenticated conversation will change to **No**.

   e. On the **Rich messages** page, select **Add**, and then select one or more rich messages to associate to this authentication setting.

   f. Review the **Summary** page, and then select **Next**. The authentication setting is configured.

   g. On the **Redirect information** page, copy the URL. You'll add this URL to the authentication service provider's website under allowed callback URLs.

h. Select **Finish**.

Add authentication to an Apple Messages for Business channel

1. Open the workstream containing the channel instance to which you want to add authentication.
2. On the **Behaviors** page of the channel settings, navigate to **Authentication settings**, enable the capability, and select the correct setting from the dropdown menu. More information: Configure an Apple Messages for Business channel
3. Review or update the authentication settings for each channel instance by selecting **Edit**.

Configure payment profiles

Article • 10/27/2022

You can create payment profiles to enable conversational commerce for supported channels. Once configured, your agents can help customers complete secure transactions without having to leave the messaging experience.

After you create a payment profile record, you must add it to a channel instance within a workstream's channel setup to make it work. Conversational commerce is supported for Apple Messages for Business.

Create an Apple Messages for Business payment profile for Apple Pay

Prerequisites

Verify that you have permissions on the secure columns. More information: Configure permissions to access secure columns

Before adding an Apple Pay payment profile, make sure to complete the Apple Pay integration steps documented by Apple. More information: Apple Pay - Apple Messages for Business

Create an Apple Pay payment profile

1. In the site map of Omnichannel admin center app, select **Customer settings**, and then select **Manage for Payment profiles**. A list of existing records is shown.
2. Select **Add** at the top of the page to create a new record.
3. In the **Create new payment profile** pages, provide the following details:
    - On the **Channel type** page, enter a name and select Apple Messages for Business as the channel type. By default, the only channel type currently supported is Apple Messages for Business.
4. On the **Details** page, provide the following information:
    - **Merchant friendly name**: Your business's customer-facing name. This will be the name your customer sees within the Apple Pay request. This name shouldn't be localized.

- **Merchant ID**: Your unique identifier assigned to your business when registering as a merchant for Apple Pay.
- **Merchant certificate**: A certificate associated with your merchant ID, used to secure transaction data. Apple Pay servers use the certificate's public key to encrypt payment data.
- **Certificate password**: The private key used to generate secure Apple Pay sessions.
- **Payment gateway URL**: The endpoint where payment information and requested contact information and sent to be processed.
- **Merchant domain URL**: The website domain associated with your Apple Pay Merchant Account.
- **Merchant two-letter country code**: Country codes are formatted by their ISO 3166-1 alpha-2 code. Use the country code for where payments will be processed.

5. On the **Payment options** page, provide the following information:
    - **Merchant capabilities**: The payment types you can accept. 3D Secure is required for channel support.
    - **Supported Networks**: The networks that support transactions between your Apple Pay merchant account and card issuers.
6. On the **Rich messages** page, select **Add**, and then select one or more Apple Pay rich messages to associate with this authentication setting.
   An Apple Pay type rich message may be associated to more than one payment profile. This is because each channel instance may only support one payment profile.
7. Review the **Summary** page, and then select **Finish**. The authentication setting is configured.

Add a payment profile to an Apple Messages for Business channel

1. Open the workstream containing the channel instance for which you want to enable Apple Pay.

2. On the **User features** page of the channel settings, navigate to **Apple Pay**, enable the capability, and select the correct setting from the dropdown. More information: Configure an Apple Messages for Business channel instance in Omnichannel admin center

3. Save your changes.

4. Review or update the Apple Pay settings for any channel instance by selecting **Edit**.

Limitations

Description	Limitation
Country code: This is the two-letter ISO 3166-1 alpha-2 code that denotes which country payments will be processed in.	China isn't currently a supported country, as payments must go through a separate payment endpoint.
Merchant capabilities: Capabilities for processing payments	- It isn't currently possible to enable support for China UnionPay. - You can build an adaptive card by adding a skill through Power Virtual Agents. More information: Use Microsoft Bot Framework Skills in Power Virtual Agents - Adaptive card styling isn't supported.
Supported networks: This property constrains the payment methods that the user can select to fund the payment.	- Supported networks are currently limited to American Express, Visa, Discover, and Mastercard. - Some locally issued cards may not work even when the **Merchant two-letter country code** is correct. The following countries/regions may be impacted: Saudi Arabia and China.

Enable real-time translation of conversations

Article • 08/18/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making, and should not be used to make, decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using Dynamics 365 Customer Service, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

With the real-time message translation feature, agents can support customers in the language they elect to be serviced in. When you enable language translation, messages between the customer and support agent—and messages among support agents who consult and collaborate internally, such as supervisors or SMEs—are translated. The real-time translation feature is enabled as a plug-in that exposes APIs to bring in third-party translation services and also provides a native implementation.

All the languages that are supported in Omnichannel for Customer Service are supported for the agent in the conversations. For the list of supported languages, see Language availability.

> **Important**
>
> The language translation feature isn't supported in Omnichannel for Customer Service on Unified Service Desk.

Prerequisites

- You must add a web resource and make sure that the required language translation services are configured. More information: Add a web resource for real-time translation
- Enable call recording and transcription for the translated voice call transcripts to be displayed. More information: Enable call recording and transcription for voice

Enable real-time translation for agent and customer conversations

You can enable real-time translation in the Customer Service admin center or Omnichannel admin center app.

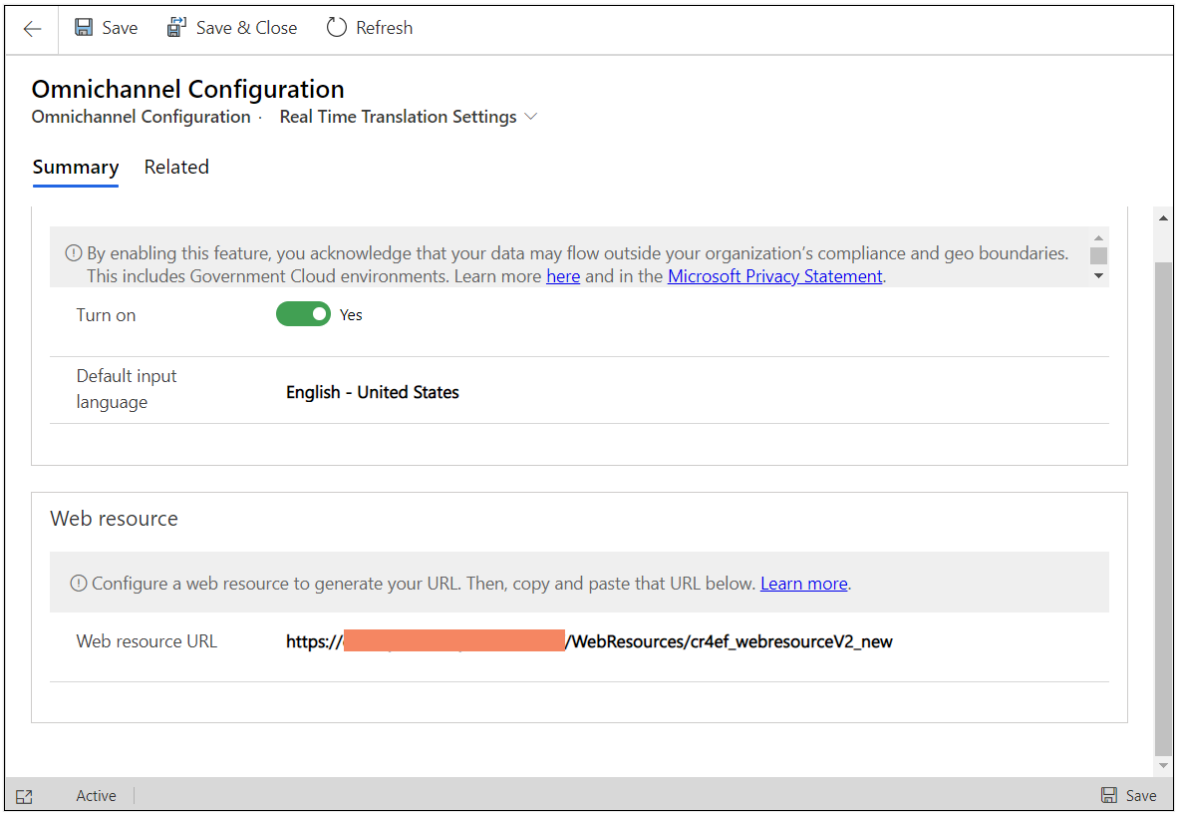
1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Insights** in **Operations**. The **Insights** page appears.
   b. In the **Real-time translation** section, select **Manage**.

   The **Omnichannel Configuration** page is displayed.

2. On the **Omnichannel Configuration·Real Time Translation Settings** page, in the **General Information** area, set the toggle for **Turn on** to **Yes**.
3. In **Default input language**, select the language for agents to converse with customers. The translation engine translates the customer messages for agents to the language specified. By, default, it's set to English (en-us).
4. In the **Web resource** area, in the **Web resource URL** box, enter the link of the web resource.



5. Select **Save**.

Real-time language translation of conversations for agents and customers

Set up visitor location detection

Article • 10/27/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

You can configure your chat widget to detect a visitor's location based on their latitude and longitude. With location detection enabled, visitors receive a prompt in their web browser when they start to chat. If the visitor allows their location to be shared, it will passed through to the agent. Agents can then use this information to provide a personalized support experience.

> **Note**
>
> If a customer has turned off location sharing from their web browser, the location cannot be detected even if you have enabled location detection.

To enable location detection, you must first get your Bing Maps API key and create a geo location provider record. After you create a geo location provider record, you must add it in the **Location** tab of the appropriate chat widgets to enable location detection. For information on how to get the Bing Maps API key, see Getting a Bing Maps Key.

Prerequisite

Make sure you have permissions on the secure columns. More information: Configure permissions to access secure columns

Create a geo location provider record

You can create a geo location provider record in the Customer Service admin center or Omnichannel admin center app.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

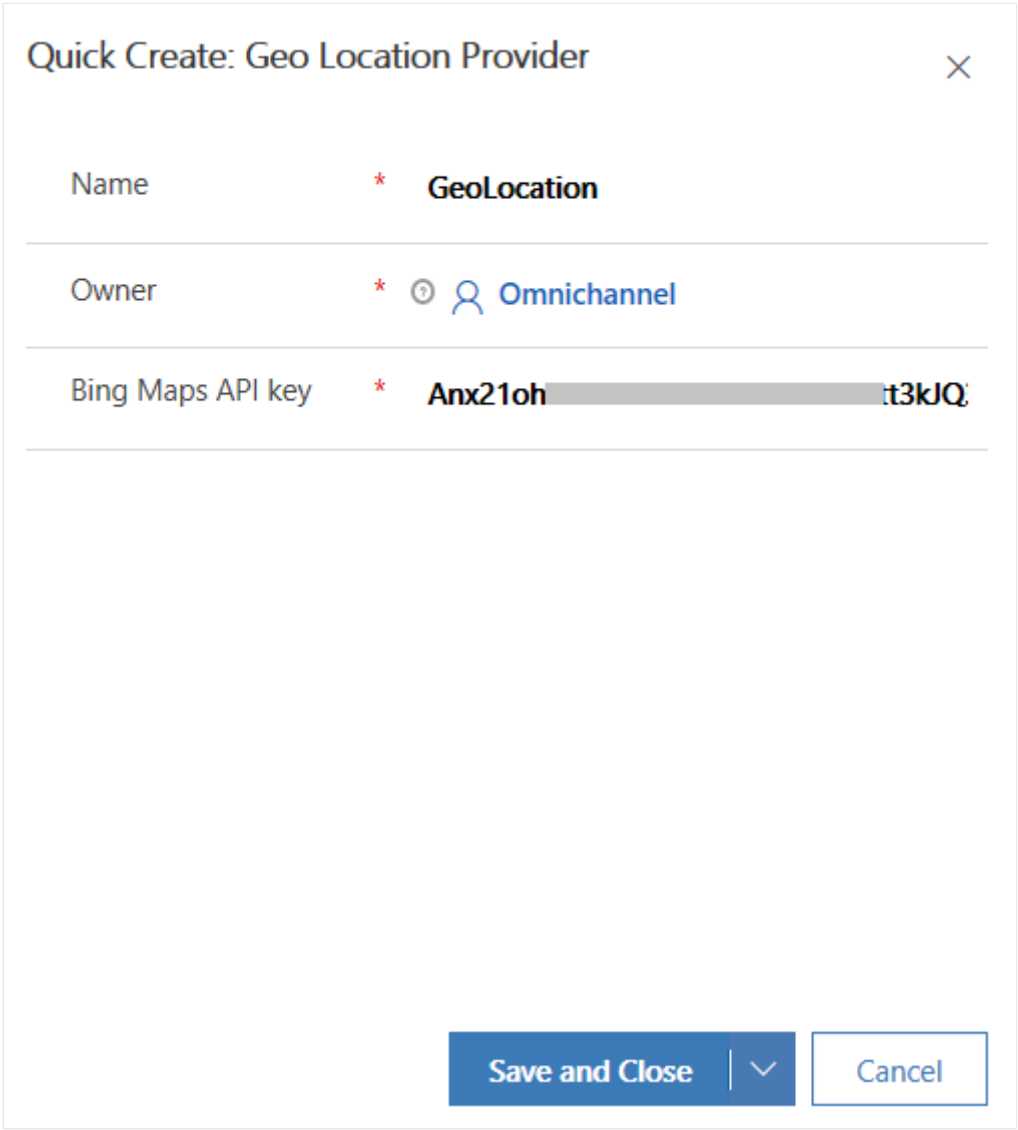
a. In the site map, select **Customer Settings** in **Customer support**. The **Customer settings** page appears.
b. In the **Geo location** section, select **Manage**.

The **Active Geo Location Providers** page is displayed.

2. Select **New** to add a geo location provider record.

3. In the **New Geo Location Provider** pane, provide the following information:

- **Name**: Name of the geo location record.
- **Bing Maps API key**: API key of Bing Maps to get the visitor's location.



4. Select **Save and Close**.

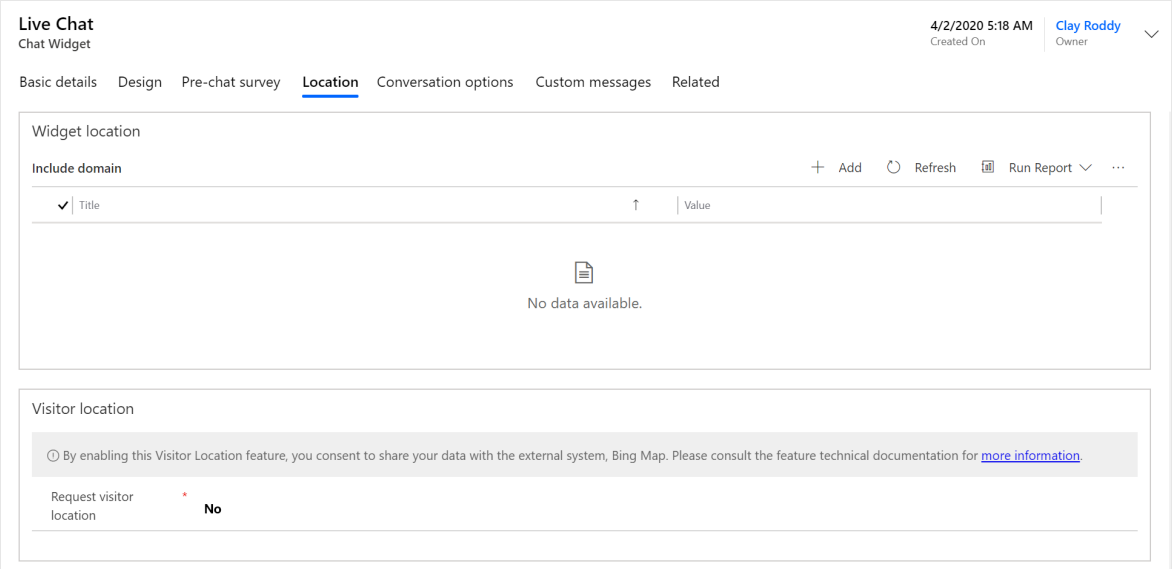
Enable visitor location detection

If you're using Customer Service admin center or Omnichannel admin center app, do the following:

1. Go to the chat channel settings of the chat widget in which you want to enable geo location.
2. On the **Behaviors** tab, for **Customer location detection**, set the toggle to **On**.
3. In the Geo location provider list, select the provider that you've configured.
4. Save the settings.

If you're using the Omnichannel Administration app, do the following:

1. Open the chat widget in which you want to add geo location.
2. Go to the **Location** tab.
3. In the **Visitor location** section, select **Yes** in the **Request visitor location** field.
4. In the **Geo Location Provider** field, browse and select the geo location provider record.



Privacy notice

Location data: If a user approves the browser request for detecting location, the app or website may collect and use precise data about the user's location. Precise location data can be Global Position System (GPS) data, as well as data identifying nearby cell towers and Wi-Fi hotspots. The app or website collects latitude and longitude information from the user's browser and sends it to Bing Maps for converting it into precise location data such as street, city, state, country, and zip code of the user. The app or website may also

send location data to Microsoft Dynamics 365. A user may disable the location detection by turning off the location settings in their web browser settings. All use of Bing Maps is governed by the Bing Maps End User Terms of Use available at https://go.microsoft.com/?linkid=9710837 and the Bing Maps Privacy Statement available at https://go.microsoft.com/fwlink/p/?LinkID=248686. An administrator can turn off this visitor location feature by setting the “Request visitor location” to “No”, so that no further information will be sent to Bing Map from the app or website.

NOTE: Bing Maps is not provisioned in a dedicated data center for exclusive use by you and does not provide data segregation, such as for the Government Community Cloud. Your use of Bing Maps shall not be subject to any product-specific terms and conditions applicable to Dynamics 365 online for Government. If you do not wish to use the Visitor Location feature, then you must ensure that your administrator keeps the feature off.

Enable self-service settings for customer actions in a conversation summary

Article • 03/20/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Overview

The self-service feature displays information about the recent actions that a customer performs before starting a conversation with an agent. This information helps agents understand customer issues and provide a personalized service for enhanced customer satisfaction.

The data about the recent actions is stored in an entity for the conversation that has been closed. A record is created for each self-service action and action type. To learn more, see msdyn_visitorjourney Entity Reference.

Enabling the self-service feature is a two-step process as follows:

1. Add a code snippet in the self-service portal that is configured for your organization. For the sample code and to learn more, see Pass self service history as context.
2. Update the settings in the Omnichannel Administration app.

Enable self service

You can enable the self service feature in the Customer Service admin center or Omnichannel admin center app.

1. Add the code snippet in the customer self-service portal.

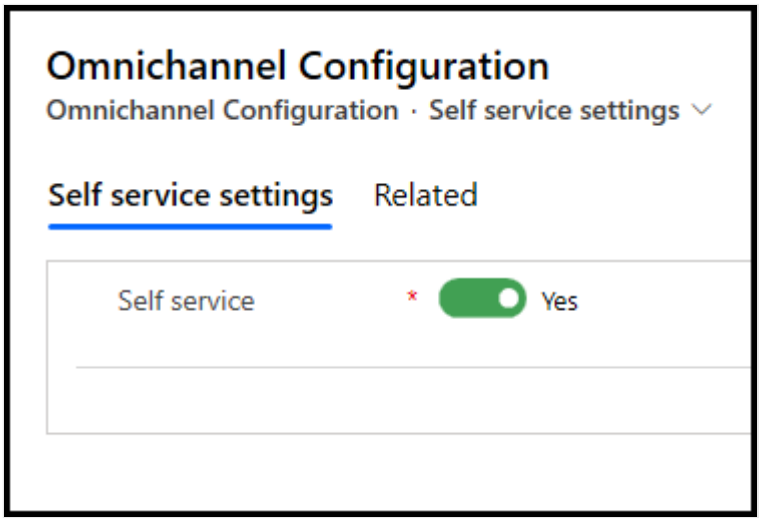
2. Go to one of the apps, and perform the following steps.

   Customer Service admin center

a. In the site map, select **Customer Settings** in **Customer support**. The **Customer settings** page appears.
b. In the **Self service** section, select **Manage**.

The **Omnichannel Configuration . Self service settings** page is displayed.

3. Set the **Self service** toggle to **Yes**.



4. Select **Save**. The **Self service** tab will appear for the agent when a chat is started with a customer.

Self service

Configure automated messages

Article • 10/12/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

You can configure Omnichannel for Customer Service to send automated messages through a channel, such as chat, voice, SMS, or social channels. The **Automated messages** tab in each channel instance enables you to create channel-specific and locale-specific text. You can customize, deactivate, and activate customer and agent-facing messages at the channel level. As an administrator, you can also overwrite or deactivate the preconfigured, out-of-the-box automated messages for any channel instance. The preconfigured automated message triggers are listed in this section.

Display a list of all automated messages

You can view a list of all agent and customer-facing automated messages in your Omnichannel for Customer Service environment.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Customer Settings** in **Customer support**. The **Customer settings** page appears.
   b. In the **Automated messages** section, select **Manage**.

   The **Automated messages** page is displayed.

2. Select one or more of the records to edit the language code and text. If you want to deactivate the messages, select the **Deactivate** button.

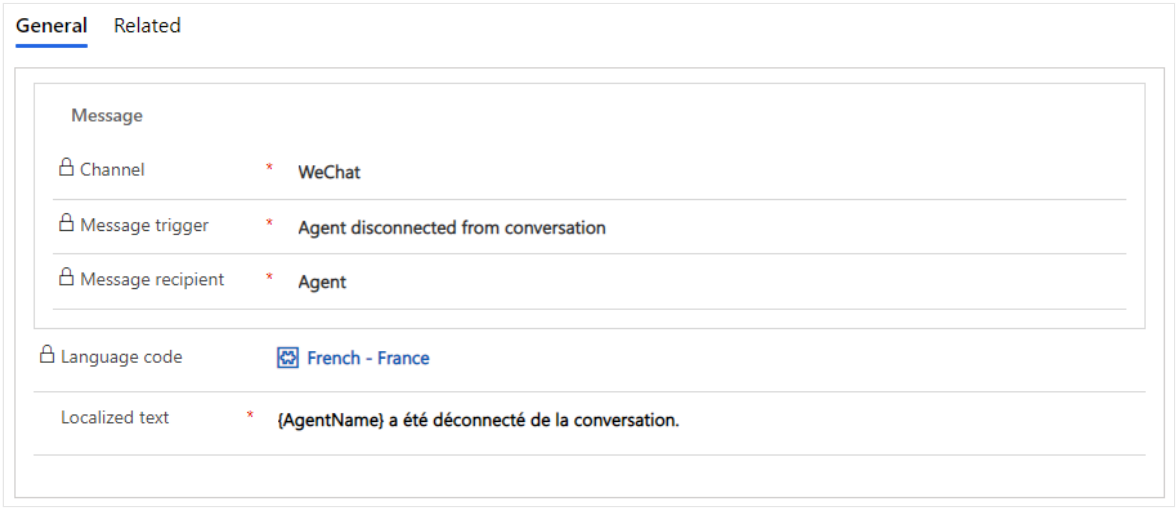
Customize automated messages at the channel level

You can customize messages across instances within a channel. For example, you can apply a change to all Facebook accounts or all SMS numbers.

1. Select a message on the **Automated messages** page, and then select **Edit**.
2. On the **General** tab, edit the **Localized text** field, and then select **Save**.

   The message field supports the following slugs.

Slug	Description
{AgentName}	The full name of the agent who is assigned to the conversation.
{QueueName}	The name of the queue.



Customize automated messages at the channel instance level

You can customize automated messages at the channel instance level. For example, you can apply a change to a specific Facebook account or a specific SMS number. If you don't create customized automated messages at the channel instance level, each instance will inherit the channel-level settings. If you create customized automated messages at the channel instance level, then the channel-level settings are overwritten.

Add custom automated messages

Do the following for the channel in which you want to create custom automated messages in the Customer Service admin center or Omnichannel admin center app:

1. Go to the workstream, and edit the channel instance.

2. On the **Behaviors** page, select **Add message** in the **Custom automated messages** area.
3. On the **Add automated message** pane, select a trigger from the **Select a message trigger** dropdown list.
4. In the **Automated message** box, type the message that should be displayed.
5. Select **Confirm**.
6. Repeat steps 3 through 5 to create multiple messages.
7. Save the settings.

Preconfigured automated message triggers

Message trigger	Definition	When to trigger
Greeting Message for Async Channels and Voice	The automated message played for the customer as soon as the call is connected **Note** If the bot is enabled, ensure that the automated greeting message is different from the bot message.	You can set it up to be played as the first message that the customer should hear when they call the digital contact center.
Agent assigned to a conversation	Message displayed to the customer when the agent is assigned to the conversation	When the agent is assigned to the conversation.
Agent couldn't be assigned to conversation	Message displayed to the customer when agent assignment fails	When work distribution fails or when routing is unable to add the agent to the chat due to system (CBB/IC3) failure. For example, no agents are linked to the queue, or the default queue isn't found. **Note** This trigger isn't applicable to a scenario when a matching agent can't be identified based on the assignment configuration.
Agent disconnected from conversation	Message displayed to the customer when the agent gets disconnected	When the agent gets disconnected due to browser tab closure, browser closure, offline agent presence, or network issue.
Agent ended conversation	Message displayed to the customer when the agent ends the conversation	When the agent selects the End button
Agent joined conversation	Message displayed to the customer when the agent joins a conversation	When the agent accepts the notification.

Message trigger	Definition	When to trigger
Agent joined customer conversation	Message displayed to the customer when the agent joins a customer conversation	When the agent joins a customer conversation.
Agent left customer conversation	Message displayed to the customer when the agent leaves a customer conversation.	When the agent leaves a customer conversation.
Average wait time for customers: Hours (applies to live chat and voice channels only)	Message displayed to the customer with the average wait time displayed in hours	When customer is waiting in queue.
Average wait time for customers: Hours and minutes (applies to live chat and voice channels only)	Message displayed when the customer is waiting in queue with average wait time being displayed in both minutes and hours	When customer is waiting in queue
Average wait time for customers: Minutes (applies to live chat and voice channels only)	Message displayed to the customer with the average wait time displayed in minutes	When customer is waiting in queue.
Consult accepted	Message displayed to the customer when another agent is consulted successfully	When another agent accepts the consult request.
Consult session ended	Message displayed to the customer when consulted agent ends the session	When the consulted agent closes the session.
Customer is next in line	Message displayed when the customer is next in line in the queue	When customer is next in line in the queue.
Customer's position in queue	Message displayed when the customer is waiting in queue at the second position or beyond	When customer is waiting in queue at the second position or beyond.
Customer disconnected from	Message displayed to the agent when the customer gets	When customer explicitly closes the browser tab or gets disconnected because

Message trigger	Definition	When to trigger
conversation	disconnected	of network issue.
Holiday message to customer	Message displayed to the customer on holidays	When the customer initiates a conversation on holidays set up for the Live Chat, channel, or queue.
Out of operating hour message to customer	Message displayed to the customer outside of the business hours	When customer initiates a conversation outside of business hours set up for the Live Chat, channel, or queue.
Session ended	Message displayed to the customer when the agent ends the conversation and closes the session	When the agent ends the conversation and closes the session.
Transfer to agent accepted	Message displayed to the customer when the conversation is transferred successfully	When another agent accepts the transfer request.
Offer customer callback	The callback message played for the customer when the wait times are longer than expected	When the customer calls and wait time is long.
Customer callback response	When the customer presses 1 on the call menu, a confirmation message is played to indicate the customer choice.	Customer presses 1 on the call menu. The response to offer customer callback message is played.

Best practices for using automated messages

Use the following best practices when you configure automated messages for the voice channel:

- Make sure that you configure concise messages when you use automated and custom messages because lengthy messages might mean that agents take longer to connect with customers.
- Consider configuring **Greeting Message for Async Channels and Voice** instead of **Agent assigned to a conversation**.
- If you've configured both **Agent assigned to a conversation** and **Greeting Message for Async Channels and Voice**, consider configuring **Greeting Message**

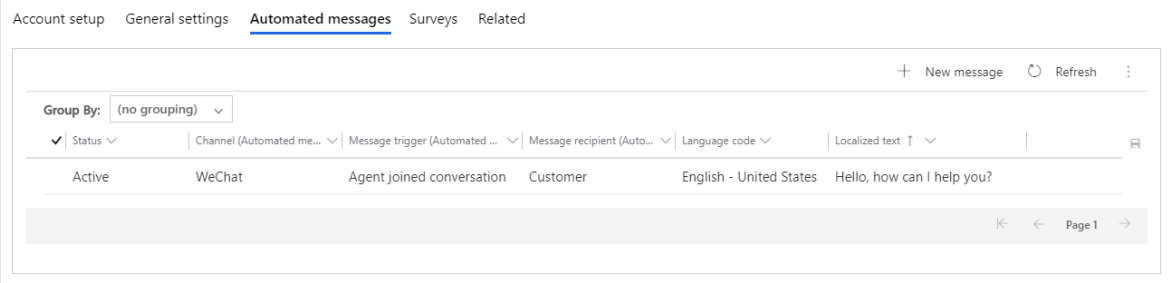
for Async Channels and Voice to avoid the accumulation of messages in the queue.

- Disable messages that announce the average wait times, unless your business requires that customers know this information.

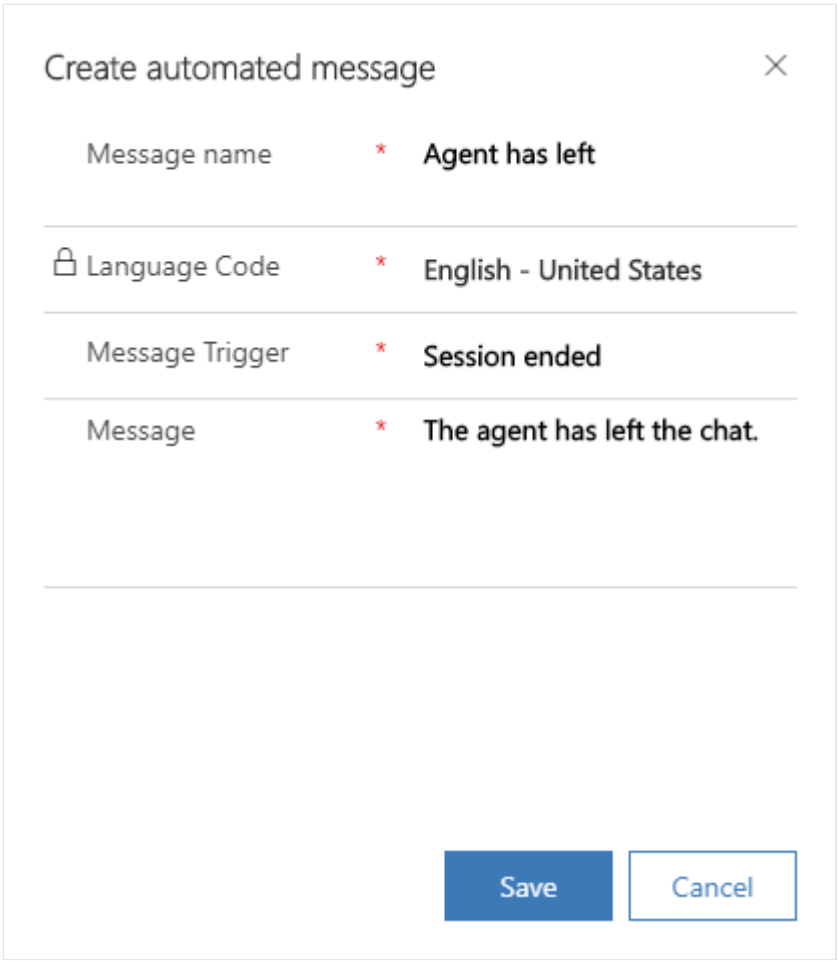
Add custom automated messages in Omnichannel Administration

> **ⓘ Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

1. In Omnichannel Administration, go to **Channels**, and select the channel you will use to send automated messages. This example uses WeChat.
2. In the list of accounts, open the channel instance for which you want to configure an automated message.
3. Select the **Automated messages** tab, and select **New message**.



4. Enter the name of your message, select the message trigger, and then type your message. The **Language Code** field is determined by the language set in the **General settings** tab of the channel instance and cannot be modified. The **Message Trigger** field contains the system events that prompt an automated message to be sent.
5. Select **Save**.



The message is added to the list of channel instance-specific messages. To create localized versions of the message, repeat the steps for each language required.

To deactivate messages at the channel instance level, select one or more messages, and select the **Deactivate** button.

Create message templates

Article • 05/07/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Message templates enable the one-time creation of reusable messages that can be sent to multiple customers. With message templates, you can maintain high-quality content and avoid spam in the ecosystem. You can save time and personalize the messages by using placeholder values that can be replaced with dynamic content when the message is sent.

To create a message template

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   - In the site map, in **Agent experience**, select **Productivity**.

2. Select **Manage** for **Message templates**.

3. Select **New**, and enter the following details:

   - **Name:** Enter a name.
   - **Channel:** Select SMS.
   - **Default language:** Select a language.
   - **Default text:** Enter the default text for the message.

4. Select **Save**. After saving the template, the **Message template** panel appears.

5. Select **New message** and create a message using localized text in each language that you want to support.

Message templates support the following slugs.

Slug	Description
{FullName{Customer}}	The full name of the customer who initiated the conversation.
{LastName{Customer}}	The last name of the customer.
{NickName{Customer}}	The nickname for the customer.
{FullName{Agent}}	The full name of the agent who is assigned to the conversation.
{FirstName{Agent}}	The first name of the agent.
{LastName{Agent}}	The last name of the agent.
{Nickname{Agent}}	The nickname for the agent.

For more information, see Slugs.

6. Select **Save & Close** to see your localized message appear in the list of message templates.

Configure outbound messaging

Article • 05/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Outbound messaging enables organizations to send messages to their customers through supported channels, based on system-triggered or user-defined events. You can configure message templates for only SMS and WhatsApp channels.

As an administrator, you can do the following tasks:

- Create message templates that can be adopted for outbound messages.
- Configure outbound messages to be sent for events that are triggered for an entity, such as creation of a case.
- Configure outbound messages to be sent manually based on non-system events, such as a shipping delay due to weather.

Prerequisites

The following prerequisites must be met.

- The channel that you want to use must be provisioned in your environment. More information: Provision Omnichannel for Customer Service
- To send outbound messages through SMS, you must configure the SMS channel using Twilio, TeleSign, or Azure Communication Services. More information: Configure an SMS channel for Twilio, Configure an SMS channel for TeleSign, and Configure an SMS channel using Azure Communication Services
- To send outbound messages through WhatsApp, you must configure the WhatsApp channel by using a Twilio account.
- You must have a Power Automate account.

After meeting the prerequisites, you can send outbound messages from your organization by following these steps:

- Set up message templates
- Set up outbound configuration

- Set up a Power Automate flow

Set up message templates

Set up templates to send outbound messages. To create a template, consider the scenarios that require your organization to send outbound messages.

1. Sign in to the Customer Service admin center or Omnichannel admin center app.
2. Create a template for your outbound message.
    - Create a template for SMS.
    - Create a template for WhatsApp.

Set up outbound configuration

You can set up the outbound configuration in the Customer Service admin center or Omnichannel admin center app.

1. Go to one of the apps, and perform the following steps.

    Customer Service admin center

    a. In the site map, select **Customer Settings** in **Customer support**. The **Customer settings** page appears.
    b. In the **Outbound** section, select **Manage**.

    The **Active Outbound Configurations** page is displayed.

> **Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

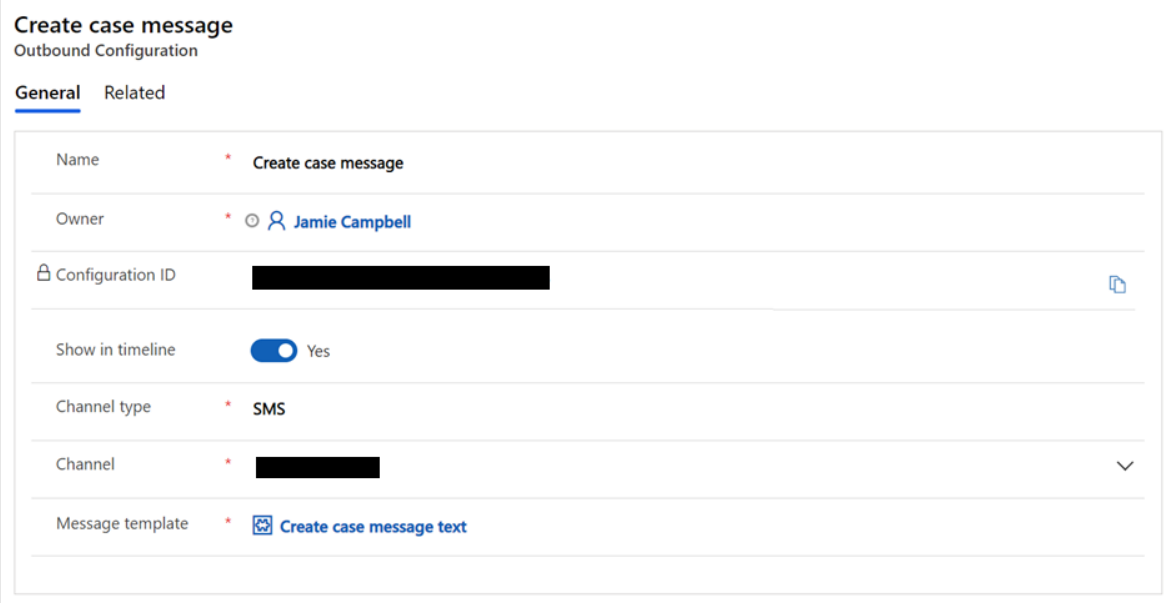
2. Select **New**, and on New Outbound Configuration page, enter the details for the settings mentioned in the following table.

Field	Description	Sample value

Field	Description	Sample value
Name	Name of the case	**Case create message**
Show in timeline	The **Show in timeline** field displays the outbound message in the customer's timeline and activities. Set the toggle to **Yes** for event-based messages that apply to the support journey of a specific set of customers. For bulk messages that will be sent to a high volume of customers, we recommend that you leave this setting at **No**, to conserve resources in your Omnichannel for Customer Service environment and storage.	**Yes**
Channel type	Name of the channel for which the configuration is being set up.	**SMS**
Channel	Channel number	***The preconfigured channel number***
Message template	Name of the template	***Your previously created template***

The **Configuration ID** will be generated when you select **Save**. You'll use it later to identify this outbound configuration when you set up the flow in Power Automate.

You can choose a message template for the outbound message. The default message language and other localized message versions are part of the message template configuration and will apply to outbound messages.



Set up a Power Automate flow

Power Automate provides a low-code platform for workflow and process automation. Outbound messaging in Omnichannel for Customer Service relies on flow-based business logic. For more information, see Power Automate documentation. You can download and import the following sample flows to get started:

- Case Creation flow (.zip file): This template sends an automatic outbound message when a case is created.
- Case Resolved flow (.zip file): This instant-type template sends an outbound message manually to all customers who have a case in the resolved state.

To set up a Power Automate flow

1. Go to one of the apps and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Productivity** in **Agent experience**. The **Productivity** page appears.
   b. In the **Message templates** section, select **Manage**.

   The **Message template view** page is displayed.

2. Select **Flow** at the top of the screen, and then select **Create a flow**.

   or

   Go to https://us.flow.microsoft.com/, sign in to your account and select **My flows**.

3. In Power Automate, set up a flow that aligns with your outbound messaging scenario:

   - **Automated:** Send an automatic message triggered by a system event, for example, case creation.
   - **Instant:** Send a message manually about a non-system event, for example, a shipping delay or a sale on products.
   - **Scheduled:** Send a message at a point in time, at one or more times, or after an amount of time that you specify.

For more information about the current limits and configuration details for flows, see Limits and configuration in Power Automate.

4. Add the action, *incident_msdyn_ocoutboundmessages*. This action enables outbound activity tracking and reporting in Omnichannel for Customer Service.

5. Initialize a ContactList array variable, which will be used as contact information.

6. Get the required customer contact records that contain phone numbers and other contact details, which can be used as slugs in outbound messaging.

7. Fill in the values for the ContactList in the **Append to array variable** template.

Field	Requirement	Description
tocontactid	Required	The customer's phone number that the outbound service uses to send messages.
channelid	Required	The customer's preferred social channel: SMS or WhatsApp.
option	Required	The customer's preference to be contacted by phone. This field can be set to **true** or **false**.
locale	Chosen by default	Enable dynamic message languages, by replacing the default variable with a locale column reference, such as the customer's preferred language. If the locale value is missing, the fallback locale in the omnichannel message template will be applied.
context items	NA	Contains values to be processed with individual messages as they're sent.
entityrelationshipname	Not required	This field refers to the **ActivityRelationship** that was previously defined. Although this field isn't required, it's essential for being able to track outbound activities in the timeline. So, if **show in timeline** in the outbound configuration is set to **Yes**, this field will have to be added to the flow for it to work.
CustomerName	Required	The name of the customer. This value isn't case-sensitive and can throw an error if the customer name values are different.
CaseName	Required	The name of the case.

8. In the **Perform an unbound action** window, you'll need the outbound message configuration ID that you generated. When you add the ID to the *msdyn_ocoutboundconfigurationid* field, the field references the correct outbound configuration for a flow run.

9. Add the output from the compose action.

When the customer responds back to the outbound messages, the customer's message will be treated like any other incoming conversation that exists today in Omnichannel for Customer Service. The conversation will be routed and assigned to an agent, and the agent will be able to respond back to the customer.

> **Note**
>
> Outbound messaging imposes limits of 100 contacts per request and 30,000 requests per org per hour. Where higher loads are expected, we recommend that you implement batch processing logic in flows to limit contacts per request to 100.

Create and manage data masking rules

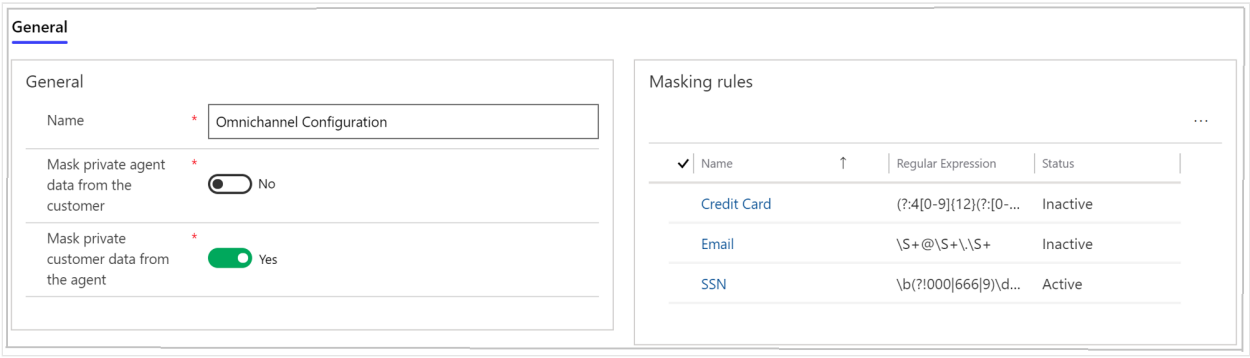
Article • 06/09/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

Use data masking to block sensitive data such as credit card information, social security number (SSN), or even profanity in a conversation. You can create a masking rule and define a regular expression to identify the sensitive information and replace it with the masked characters. Any text that's masked in a conversation will also be masked in the conversation transcript. Data masking works for chat and asynchronous channels.

Masking rules can be configured to apply to messages sent by a customer, an agent, or both. You must make sure that the masking rules you want applied are set to **Active**; otherwise, they won't apply to the selections you make.



You can choose to:

- **Mask private agent data from the customer**: Data the agent sends is masked for both the customer and agent for live chat and async channel messages.
- **Mask private customer data from the agent**: Data the customer sends is masked for both the customer and agent for live chat, but only for the user interface of the

agent when using async channels.

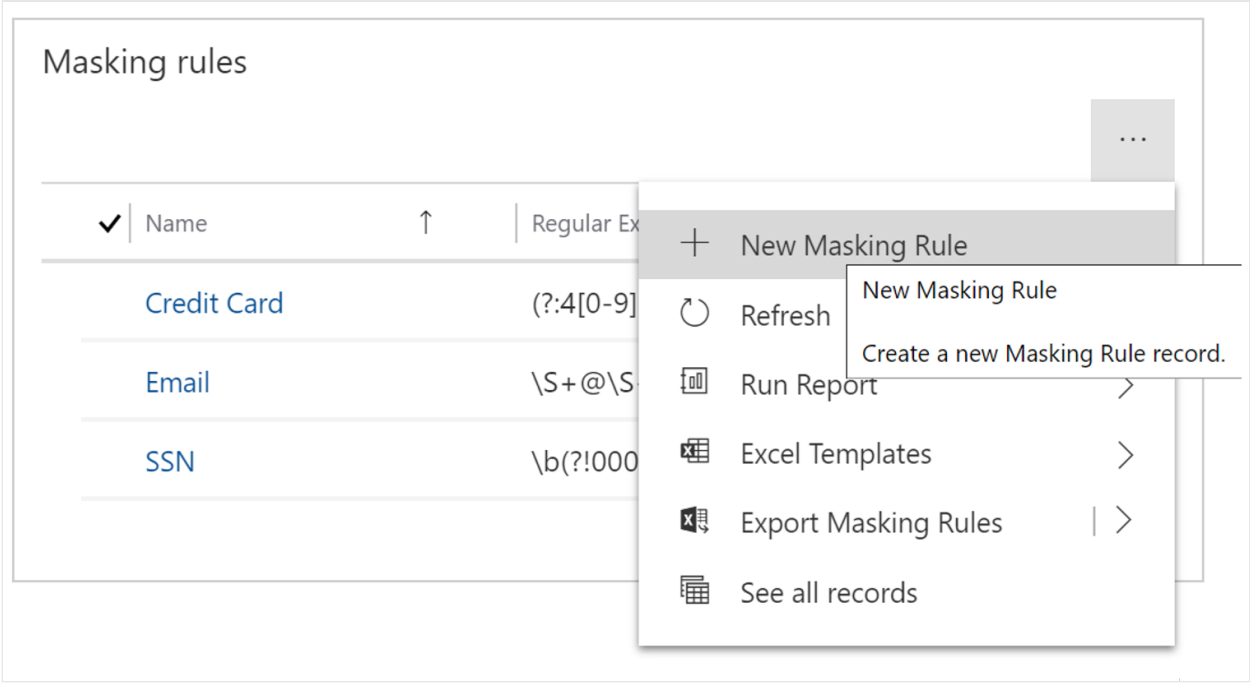
The following masking rules are provided out of the box:

- **Credit Card**: Masks the credit card number, if provided in a message.
- **Email**: Masks the email address, if provided in a message.
- **SSN**: Masks the SSN, if provided in a message.

As an administrator, you can delete or modify the out-of-the-box masking rules and create new masking rules.

> **Note**
>
> - Only an administrator can access and edit data masking rules.
> - Only 10 data masking rules, including the rules provided out of the box, can exist in Omnichannel for Customer Service.

Create a data masking rule



1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center)

   - In the site map, in **Agent experience**, select **Productivity**.

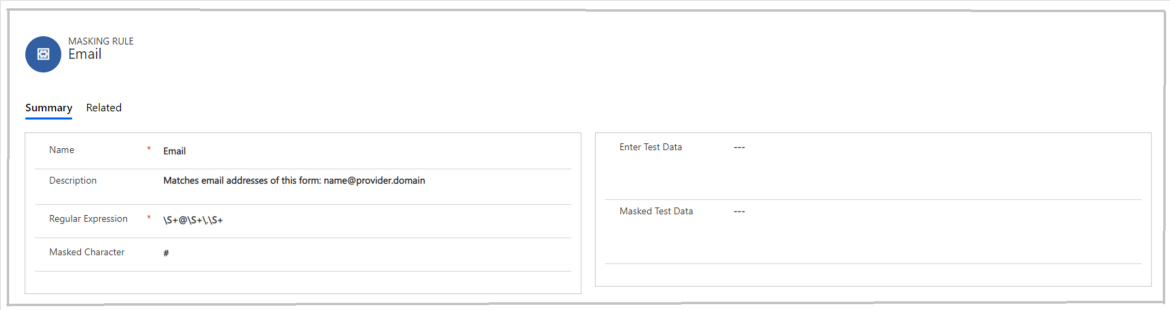
2. Select **Manage** for **Data masking**.

3. In **Masking rules**, select **New Masking Rule**.

4. On the **New Masking Rule** page, provide the following information:

    - **Name**: The name of the masking rule.
    - **Description**: An optional description of the masking rule.
    - **Regular expression**: A regular expression to identify the data to be masked.

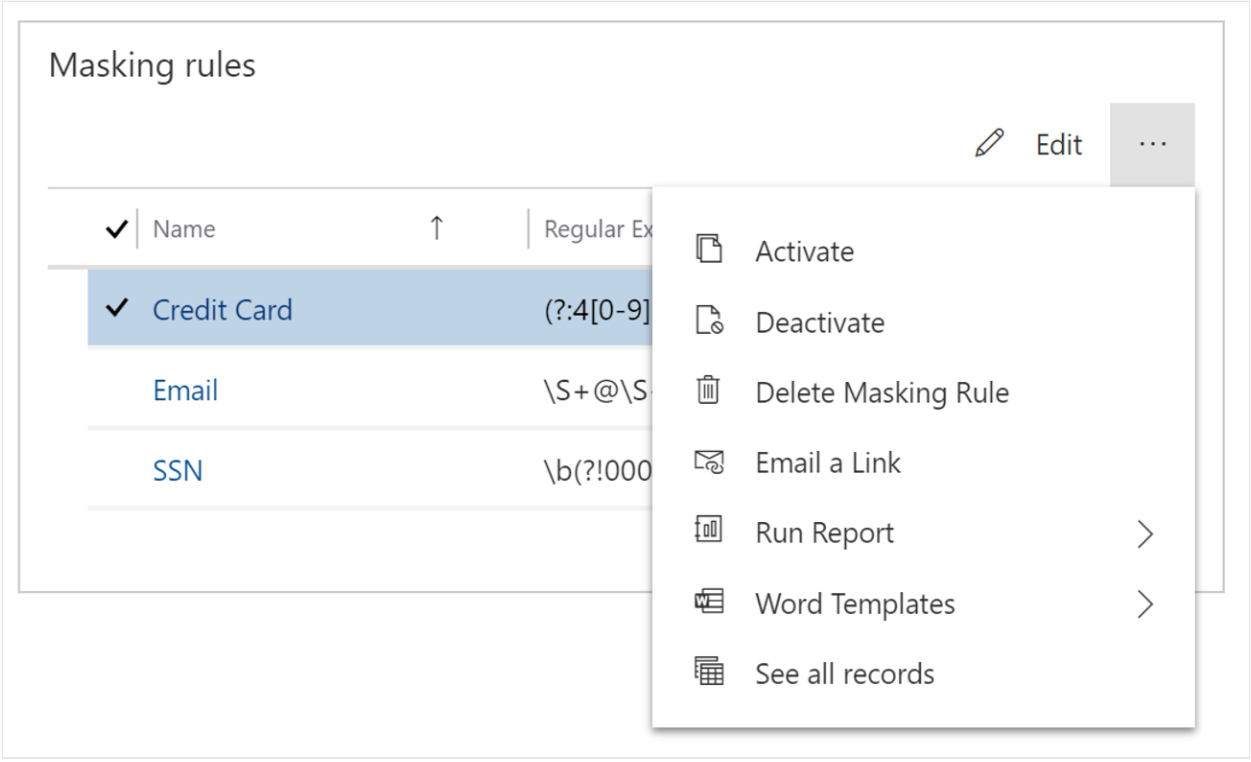
5. To test the data masking as defined by the specified regular expression, enter a value in the **Enter test data** field. The masked value is displayed in the **Masked test data** field. By default, the number sign (#) is used to mask sensitive data.



6. Select **Save**.

Manage data masking rules

After a masking rule is created, you can edit, activate, deactivate, or permanently delete it.



1. Under **Masking rules**, select the ellipsis to see the options for managing an existing masking rule.

2. To activate, deactivate, or delete a masking rule, select the rule, and then select the appropriate action from the list.

Productivity pane overview

Article • 02/11/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

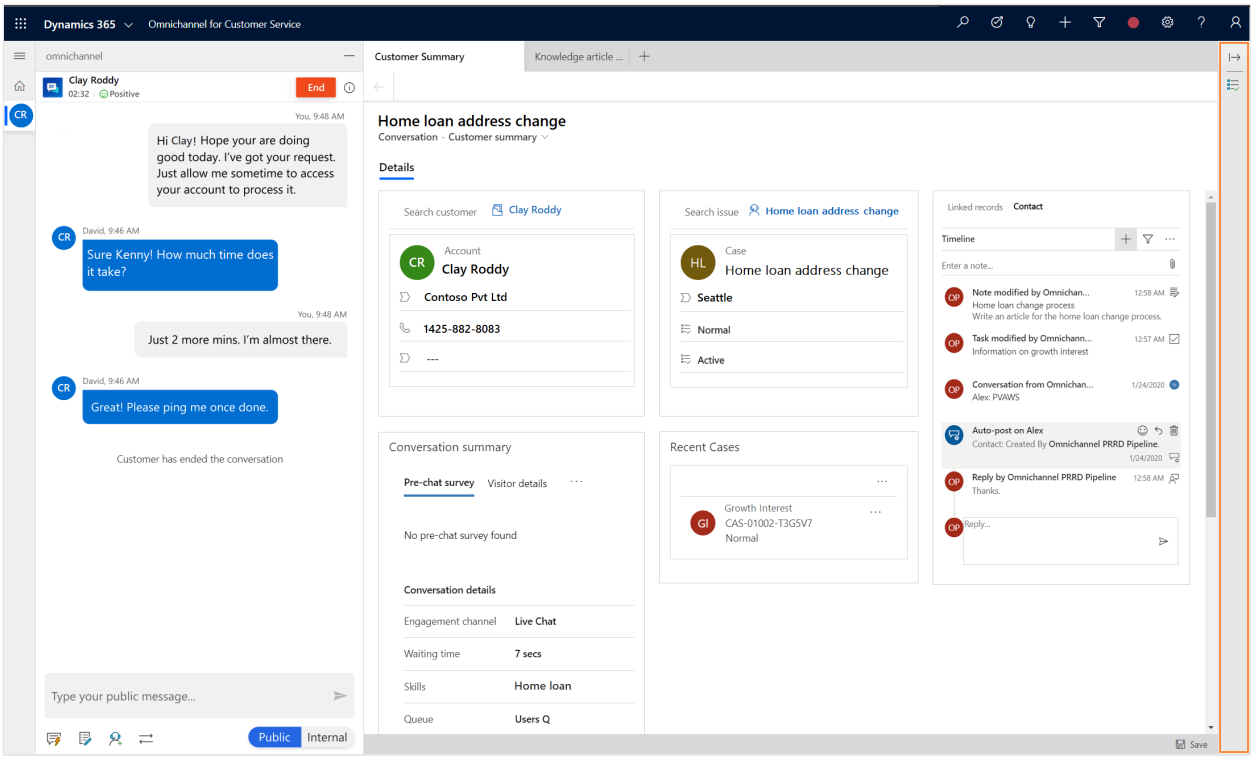
The productivity pane in Customer Service workspace and Omnichannel for Customer Service enables you to display knowledge search, agent scripts, and smart-assist cards in a unified view. Configure knowledge search, agent scripts, and smart-assist cards so these agent guidance tools will appear in Customer Service workspace and Omnichannel for Customer Service.

If you have recently updated the Omnichannel Administration app, you will no longer enable or disable the productivity pane in the app. On upgrade, an app profile would have been created for your environment through Power Apps. The app profile contains your existing settings and the ability to toggle each of the agent guidance components that are available in the productivity pane:

- Knowledge search
- Smart assist
- Agent scripts

You can set the productivity pane in collapsed mode or expanded mode, as shown in the following illustrations.

Collapsed mode



Expanded mode

[App profile manager]

Create an app profile

Article • 02/01/2023

> **ⓘ Important**
>
> With the release of the Customer Service admin center app that consolidates admin experiences across the Customer Service suite, we announce that the following admin experiences are deprecated and no longer supported after April 2023.
>
> - Service Management area in the Customer Service Hub app
> - Omnichannel admin center
> - **App profile manager:** Is removed in April 2023.
>
> Also, starting in October 2022, the Omnichannel admin center and the service management area in Customer Service Hub will be hidden by default in newly created organizations and environments. You have the option to bring them back, but we recommend that you start using the Customer Service admin center app to perform tasks like manage cases, and configure unified routing, channels, and agent experience profiles. More information: **Get started with Customer Service admin center**

Perform the following steps to create an app profile:

1. Sign in to Power Apps.
2. Select the environment in which you want to create the app profiles.
3. Do one of the following:

    - On the **Home** page, go to **Your apps** section.
    - In the left pane, select **Apps**.

4. Select **More commands** in **Omnichannel for Customer Service** or **Customer Service workspace**, and then select **App profile manager** on the menu that appears.
5. In the left pane, select **App profiles**.
6. On the **App profile manager** page, select **New profile**.
7. On the **New profile** pane, specify the following:

    - **Name:** The app profile name.
    - **Unique name:** A unique identifier in the *<prefix>_<name>* format.

        > **ⓘ Important**

The following are required for the unique name:

- The prefix can only be alphanumeric and its length must be between 3 to 8 characters.
- An underscore must be used between the prefix and name.

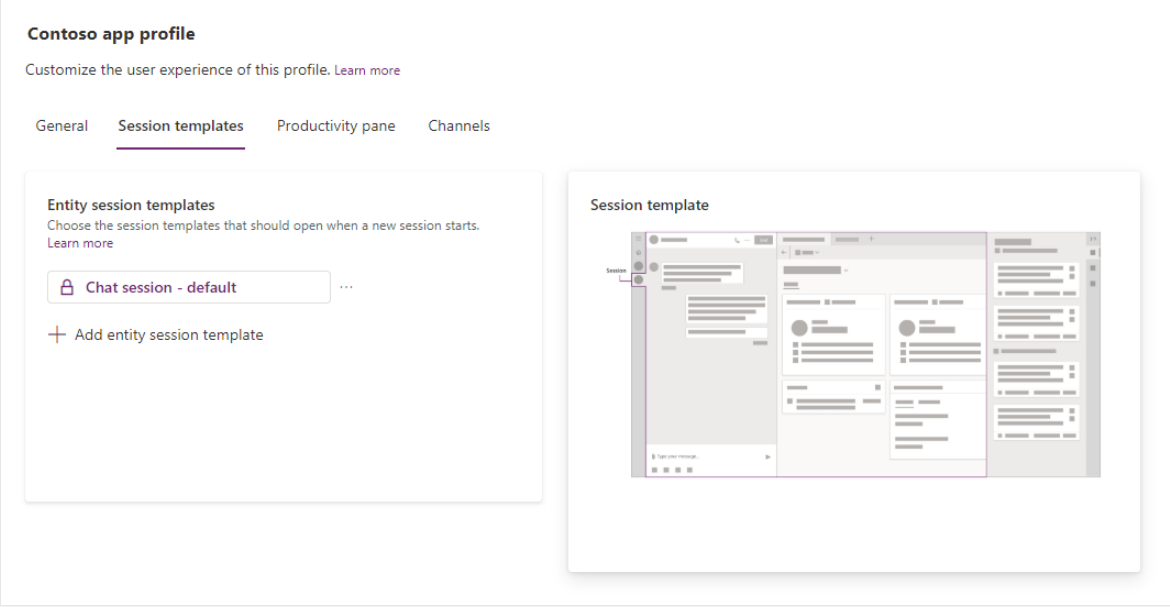
- **Description:** A description for the profile.

Assign templates and enable productivity pane and channels

For an app profile, you can add only one session template for each entity type. Typically, you'll add one session template for each entity type, such as one each session template for accounts, contacts, and cases.

The settings that you enable for the app profile will be available for agents and supervisor only when you configure the corresponding templates and settings in the Customer Service Hub or Omnichannel admin center app. For example, channels must be provisioned in Omnichannel for Customer Service and channel instances must be configured.

1. In the **App profiles** section, select the app profile to which you want to assign templates.
2. On the **Session templates**, select **Add entity session template**.
3. Search for the template you want to add and select it. Make sure that the selected template is based on **Entity** type. More information: Manage session templates



4. Do the following on the **Productivity pane** tab:

a. If you want to enable productivity tools, set the toggle to on for **Turn on productivity pane**.
b. Select the default mode as collapsed or expanded.
c. In the **Productivity tools** section, set the toggle to on for the following:

- **Smart assist tool configuration**
- **Knowledge search tool configuration**
- **Agent scripts** to allow access to smart assist configuration and agent scripts.

5. On the **Channels** tab, set the toggle to on for **All active channels**. The channels configured in Omnichannel for Customer Service will be available for the user to whom the profile is assigned.

> ⓘ Note
>
> The toggle for channels will be enabled in the out-of-the-box app profile for Omnichannel for Customer Service.

6. To add a third-party channel provider, in the **Voice channels** section, select **Add channel providers**, search for the configured channel, and select it.

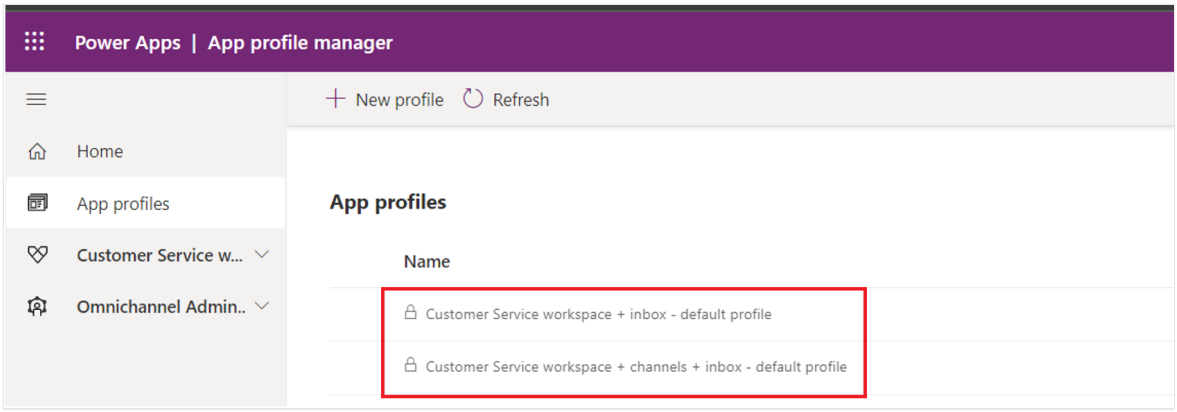
7. If a channel doesn't exist, select **Create a new channel provider in Unified Interface**. The channel configuration page opens on a new tab. More information: Configure channel provider using app profile manager

> ⓘ Note
>
> - Only telephony or voice channels are supported.
> - A number of voice channel providers can be configured at a time.

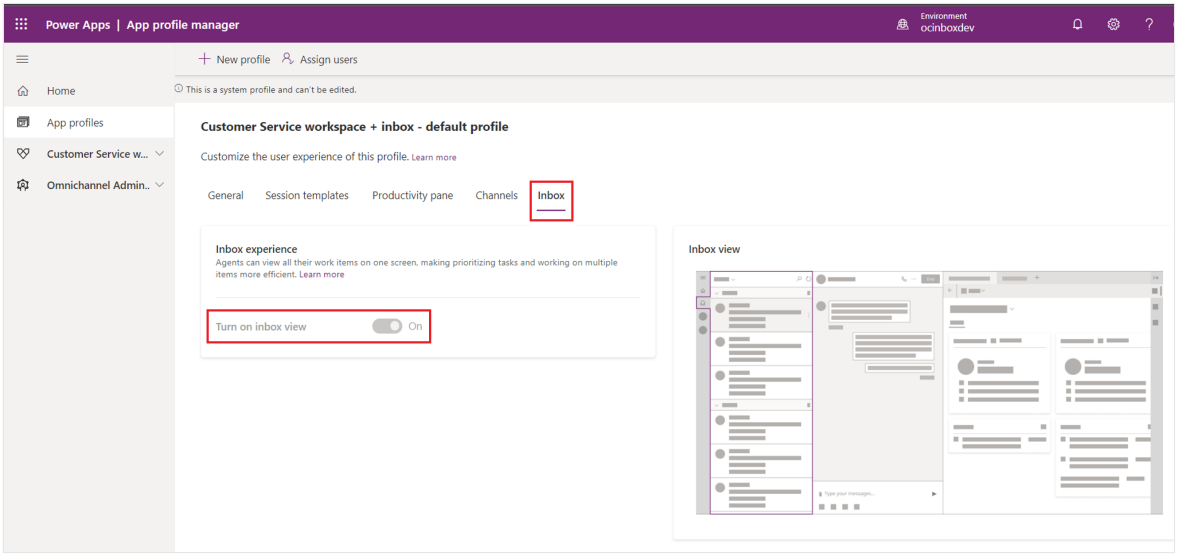
Configure the inbox view

For an app profile, you can enable the inbox view in the Customer Service workspace or Omnichannel for Customer Service apps. From the inbox, users can view their conversations and cases.

1. On the **App profiles** page, select the profile for which you want to enable the inbox.

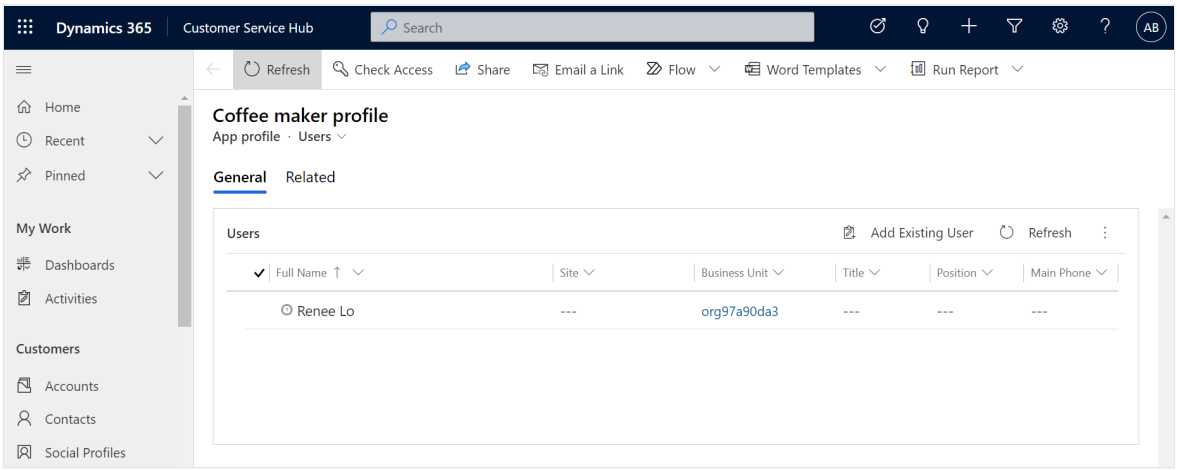


2. Select the **Inbox** tab, and then toggle **Turn on inbox view** to **On**.



Assign profiles to users

1. On the **App profiles** page, select the profile that you want to assign to a user.
2. On the <***profile_name***> page, select **Assign users** on the command bar, and select **OK** on the message dialog box. The profile opens on a new tab.



3. On the **General** tab, select **Add Existing User**.
4. On the **Lookup Records** pane, search and select the user.

> **Note**
>
> You can select **Assign users** on the <***profile_name***> page to view the list of users who have been assigned to the profile.

Default profile assignment

When users are assigned roles corresponding to Customer Service workspace or Omnichannel for Customer Service, the default app profiles are assigned as follows.

- **Customer Service workspace**: Users with the CSR Manager and Customer Service Representative roles.
- **Omnichannel for Customer Service**: Users with the Omnichannel administrator, Omnichannel supervisor, and Omnichannel agent roles.

More information: Roles and privileges associated with app profile manager

Create quick replies

Article • 05/26/2023

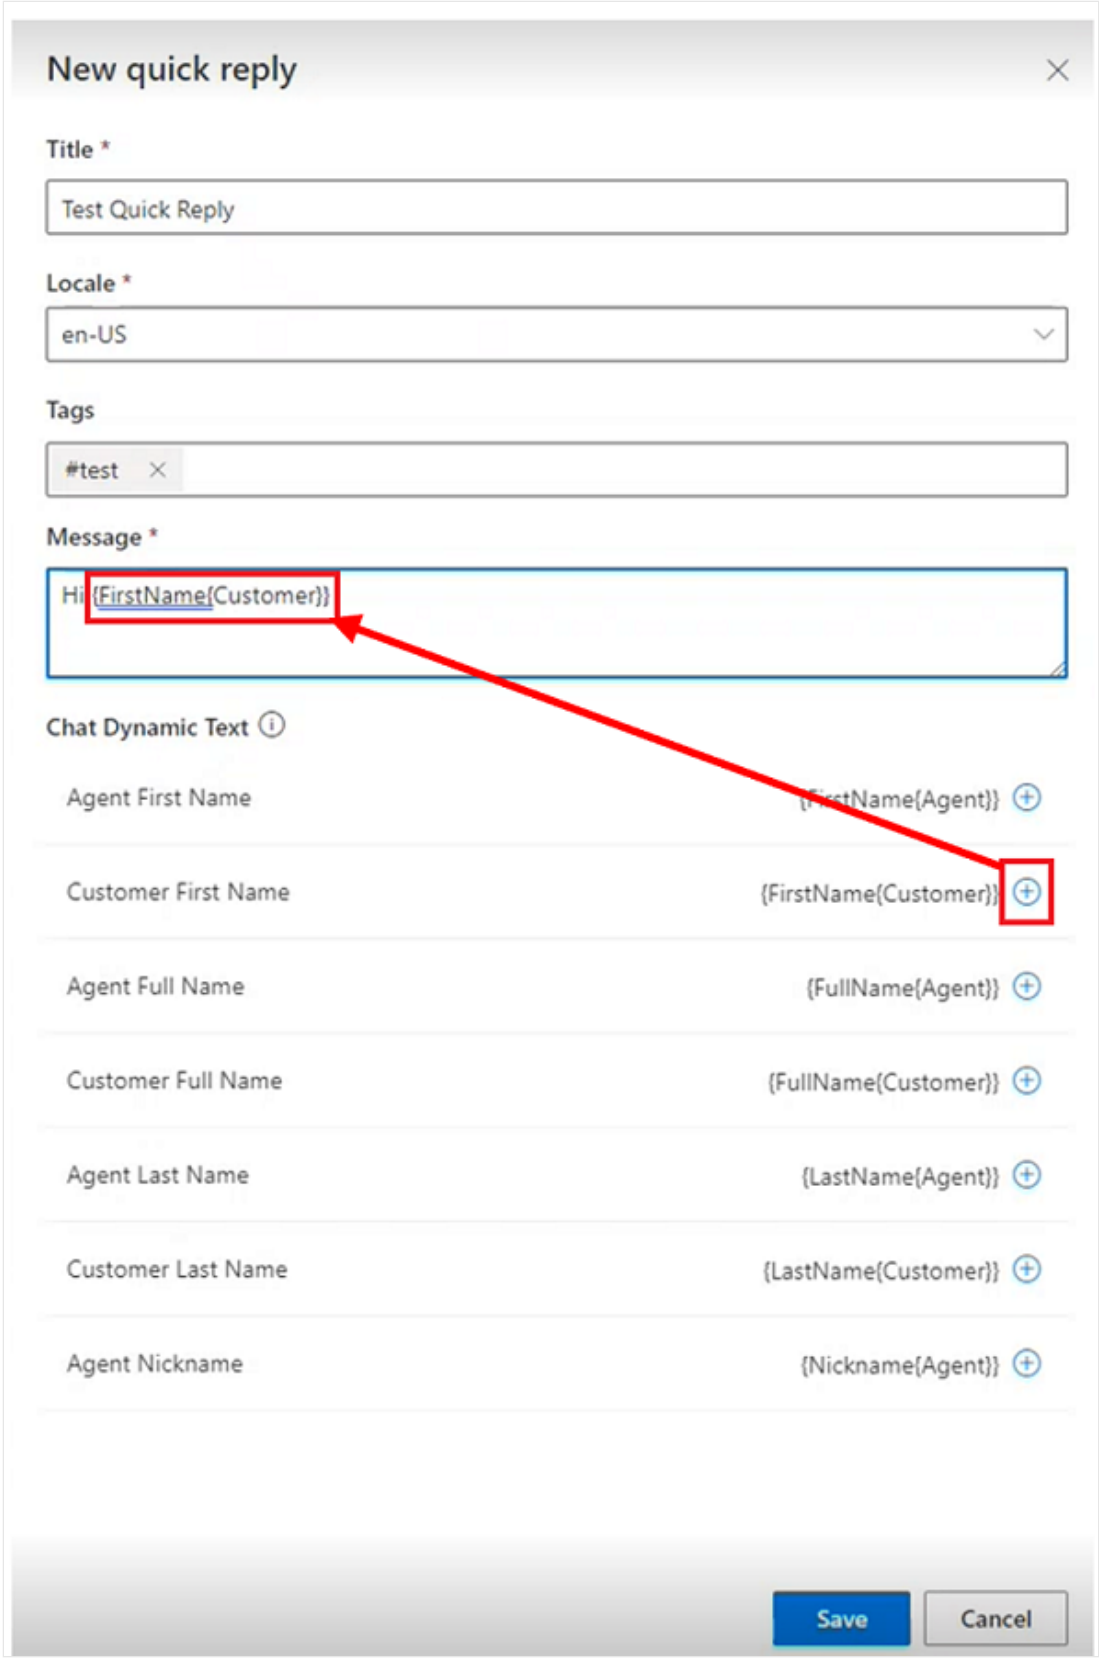
Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Quick replies are predefined messages that can be created for agents to quickly respond to common questions from customers. For information about the agent's quick reply experience, see Send quick replies.

1. In the Customer Service admin center site map, in **Agent experience**, select **Productivity**, and then select **Manage** for **Quick replies**.
2. To create a quick reply, select **New**, or to edit an existing quick reply, select the name of the quick reply.
3. Provide or change the following information:
    - **Title:** Enter the title of the message.
    - **Locale:** Specify the language of the message.

      > **Note**
      >
      > Customer Service admin center doesn't localize quick replies. To provide quick replies in multiple languages, create a separate quick reply for each language and select its corresponding locale.

    - **Message:** Enter the text of the message. To use chat dynamic text (also called slugs), select the plus icon next to the name of the dynamic text slug you want to use. The dynamic text populates in the **Message** field.

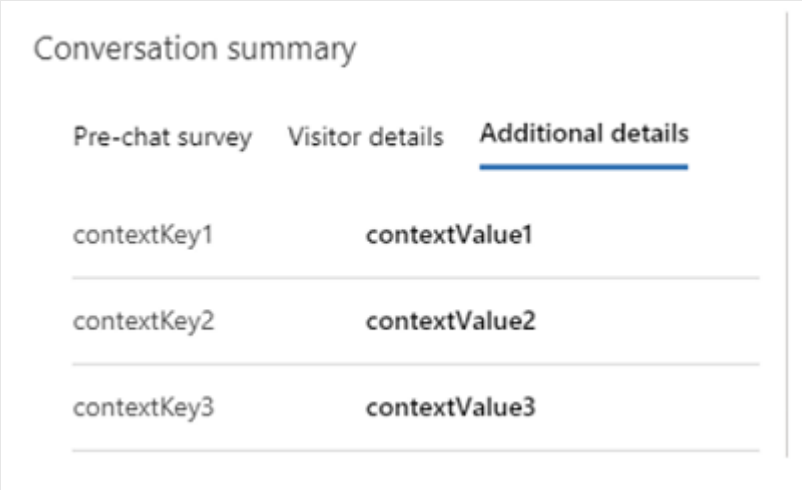


The **Message** field lets you quickly add the following chat dynamic text (slugs).

Chat dynamic text (slug)	**Description**
{FullName{Customer}}	The full name of the customer who initiated the conversation.

Chat dynamic text (slug)	Description
{FirstName{Customer}}	The first name of the customer.
{LastName{Customer}}	The last name of the customer.
{FullName{Agent}}	The full name of the agent who's assigned to the conversation.
{FirstName{Agent}}	The first name of the agent.
{LastName{Agent}}	The last name of the agent.
{Nickname{Agent}}	The nickname for the agent.

If you've defined a context key, you can create a quick reply that contains dynamic text that corresponds to that context key in the following format: {OCContext.contextKey1}, where "contextKey1" in the syntax is a placeholder for the predefined custom context field in the conversation. For example, {OCContext.OrderID} would be a context key that populates the message field with the Order ID for a record. More information: Add context variables and setContextProvider.



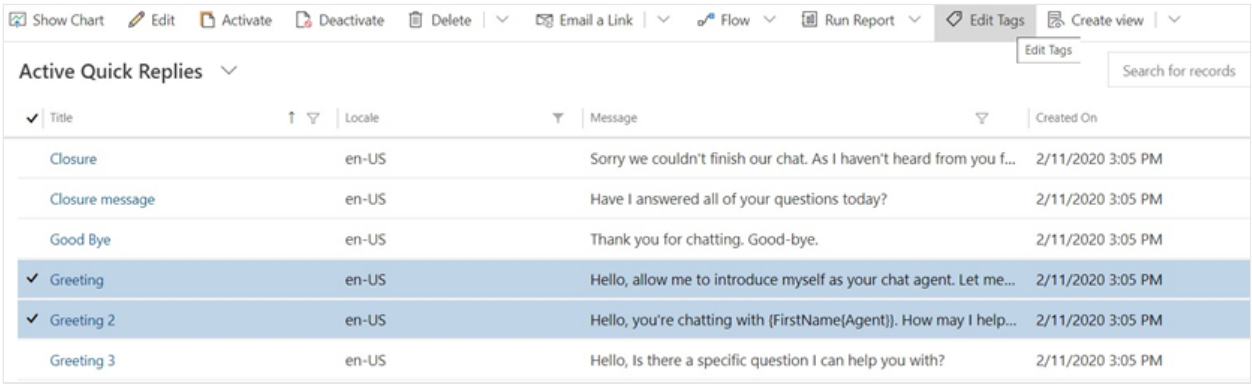
4. Select **Save**.

Create or edit tags for common categories of quick replies

Quick replies can be classified and tagged into categories. The categorization capability can also be used to group quick replies into logical chunks that represent key conversational states for agents. These logical chunks help agents select appropriate messages that correspond to customer issues.

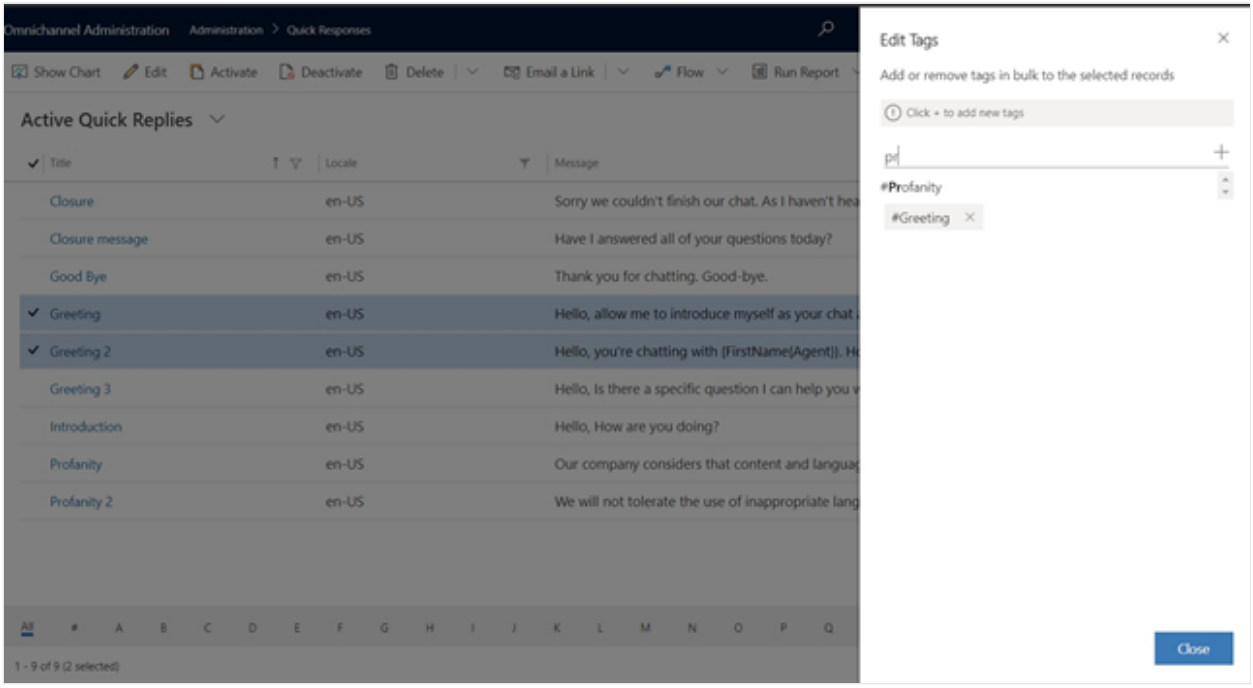
1. In the Customer Service admin center site map, in **Agent experience**, select **Productivity**, and then select **Manage** for **Quick replies**.

2. Select two or more quick replies for which you want to create a tag, and then select **Edit**.



The **Edit records** dialog appears.

1. In the **Tags** field, start typing the tag you want to create. If it already exists, it will appear in a list below the field. If it doesn't appear, select + (plus sign) to add it.



1. After you're done, select **Close**.

Associate quick replies with a workstream

For organizations with diverse lines of businesses, agents will send a variety of messages, depending on their area of expertise. Administrators can determine which quick replies are necessary for different groups of agents to use. Administrators can

associate quick replies with workstreams to show agents only those quick replies that apply to them. If no workstream is associated, the quick reply is available for all agents.

1. In the site map of Customer Service admin center, in **Agent experience**, select **Productivity**, and then select **Manage** for **Quick replies**.
2. Select a quick reply from the list.
3. In the **Workstreams** section, select **Add Existing Work Stream**.
4. Select the workstream from the list of records, and then click **Add**.

   The workstream appears in the list.
5. Select **Save**.

   If you select the workstream in the list, you can view the workstream record, and see the quick replies associated with the workstream.

Availability of quick replies and language settings

The quick replies that the agents will see are determined by the following parameters:

- The language mapped to the channel instance
- The language configured in the agent's personal settings
- The workstream the quick reply is mapped to

For example, when you set up a live chat widget or Facebook page, the quick replies will be available in the language that is configured for the chat widget or Facebook page. Then, when you associate the chat widget with a queue containing agents, the agent-specific language setting, if configured, will determine the language in which the quick replies will be available to the agents. The agents will see the quick replies mapped to the workstream that is associated with the channel with other quick replies.

Manage rich messages

Article • 10/11/2022

Some channel apps such as Apple Messages for Business support a set of custom rich messages. Rich messages contain information that can be used to generate interactive content and experiences that take place within that app.

By creating and publishing channel-specific rich messages, your organization's customer support team can send them to customers, and their content can be used when designing automated experiences. For information about using rich messages in Omnichannel for Customer service, see Rich messages in conversation control.

Create rich messages for Apple Messages for Business

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Productivity** in **Agent experience**.
   b. On the **Productivity** page, select **Manage** for **Rich messages**.

2. Select **New**, and then enter the following information:

   - **Name**: A descriptive name that'll be used by agents to search for rich messages.
   - **Locale**: The language of the rich message. Rich messages are filtered by locale within agent sessions.
   - **Type**:
     - Apple Pay
     - Authentication
     - Custom JSON
     - Forms
     - List Picker
     - Suggested Reply
     - Time Picker
     - Video Rich Link
     - Website Rich Link

- **Tags**: A message type tag is automatically added to each rich message. In addition to the type tag, any relevant search tags can be added to the rich message. These tags will help agents identify the correct rich message when they search for rich messages.
- **Allow agents to configure**: Some rich message types allow agents to update the contents before sending to customers. By enabling configurations, agents can make single-use customizations, which don't affect the original rich message made here. Agent editing can be enabled for the following rich message types:
  - List picker
  - Suggested reply
  - Time picker
  - Video rich link
  - Website rich link

3. Select **Create**.

4. Begin building your rich message within the rich message designer. Save your work at any time by selecting **Save** at the top of the designer. For more information about building each rich message type, select the type to learn more:

   - Apple Pay
   - Authentication
   - Custom JSON
   - List Picker
   - Suggested Reply
   - Time Picker
   - Video Rich Link
   - Website Rich Link

Publish rich messages

For agents to send a rich message in conversations, the message must first be published.

1. Complete the steps for building your rich message, as defined above.

2. At the top of the designer page, select **Publish**. If there are any missing fields, the designer will highlight them in red, and won’t allow the rich message to be published.

3. You can confirm that your rich message was successfully published in two ways:

- The **Publish Save** button will no longer appear above the designer.
- The status will show as **Active** within the designer and the rich messages settings page.

Update a published rich message

You can update rich messages that are published and active.

1. Select the rich message and open it in the designer.
2. Fill in all required fields, and then select **Publish**. This step ensures that rich messages that are missing required fields don't become active.

Workstream association

Workstream association for rich messages behaves similarly to quick replies today. By default, an active rich message will be available to use across all Apple Messages for Business workstreams.

After a rich message has been associated with one or more specific workstreams, it will no longer be available to use in all other workstreams.

To associate rich messages with a workstream, complete the following steps:

1. Within a workstream, expand the **Advanced settings** panel by selecting **Show advanced settings**.
2. Within the advanced settings, navigate to **Rich messages**.
3. Select **Add rich messages**. All existing rich messages are displayed.
4. Select one or more rich messages from the list, then select **Add**. Any associated rich messages will appear within the **Rich messages** table in **Advanced settings**.
5. To edit a workstream's rich messages, select **Edit**, and then add or remove rich messages as required.
6. To add more rich messages, select **Add**. Select more rich messages, and then select **Add**. They should now appear in the list of rich messages.
7. To remove rich messages, select one or more within the table, and then select **Remove**. The removed rich message will no longer appear in the list.

Apple Pay

Properties

messageTitle

Text displayed in the message bubble.

Type: `string` - Required: Yes

imageURL

URL linking to the image displayed in the message bubble.

Type: `string` - Required: No

currencyCode

The three-letter ISO 4217 currency code for the currency used in the payment request.

Type: `string` - Required: Yes

requiredBillingContactFields

The customer's billing contact fields that are needed to process the transaction.

Type: `requiredBillingContactFields[]` - Required: Yes - Allowed values: - "email" - "name" - "phone" - "phoneticName" - "post"

requiredShippingContactFields

The customer's shipping address information. Include this value only if the purchase must be shipped.

Type: `requiredShippingContactFields[]` - Required: No - Allowed values: - "email" - "name" - "phone" - "phoneticName" - "post"

shippingMethods

An array of shippingMethods. Omnichannel currently supports only one shipping method per payment request. If more than one shipping methods are included, only the first will be used.

Type: `shippingMethods[]` - Required: No - Allowed values: - "shippingMethod"

shippingMethod

Describes the shipping method, which contains the amount, detail, label, and identifier properties.

amount

A non-negative value associated with this shipping method.

Type: `string` - Required: Yes

identifier

Internally defined, unique value used to identify this shipping method.

Type: `string` - Required: Yes

label

Description of the shipping method.

Type: `string` - Required: Yes

type

Property to represent whether the line item amount is final or pending.

Type: `string` - Required: Yes - Allowed values: - "final" - "pending"

total

Describes the final amount of the Apple Pay request. It contains the amount, label, and type properties.

amount

The monetary amount of the Apple Pay request. This value must be greater than zero.

Type: `string` - Required: Yes

label

The friendly business name customers will see when the charge appears on statements. For example, "Contoso Coffee".

Type: `string` - Required: Yes

type

Property to represent whether the Apple Pay request's total amount is final or pending.

Type: `string` - Required: Yes - Allowed values: - "final" - "pending"

Example

```
{
    "messageTitle" : "Purchase your Contoso Barista Home",

    "imageUrl" : "https://images-us-
prod.cms.commerce.dynamics.com/cms/api/qbvttlwqcm/imageFileData/search?
fileName=/Products%2FSP-
DCM1008_000_001.png&w=315&h=315&q=80&m=6&f=jpg&cropfocalregion=true",

    "imageStyle" : "large",

    "currencyCode" :"USD",

    //Billing contact information requested during purchase
    "requiredBillingContactFields" : [
        "post",
        "email",
        "phone",
        "name",
        "phoneticname"
    ],

}
```

Limitations

Description	Limitation
Merchant country	Payment processing for merchants in China and Saudi Arabia, country codes CN and SA, respectively, is not supported in Omnichannel.
Merchant capabilities	EMV – Omnichannel does not currently support China Union Pay transactions.
Supported networks	The list of supported networks is limited to: - American Express - Discover - Mastercard - Visa

Authentication

Properties

receivedmessage

Text displayed in the message alongside the “sign in” button.

Type: `string` - Required: Yes

replymessage

Text displayed to the customer once they have successfully authenticated.

Type: `string` - Required: Yes

Example

```
{
    "receivedmessage":"Please sign-in",
    "replymessage":"You're signed in"
}
```

Limitations

Description	Limitation
Message contents	Images aren't currently supported for authentication.
Agent	Authentication request-type rich messages don't currently support agent configuration.

Custom JSON

Properties

bid

A string identifying the iMessage extension that the user interacts with while using Messages. The bid value format is `com.apple.messages.MSMessageExtensionBalloonPlugin:team-id:extension-id`. Replace `team-id` and `extension-id` with your Apple Developer team and extension IDs.

Type: `string` - Required: Yes

URL

A URL string containing data that the Messages app sends to the iMessage app.

Type: `string` - Required: Yes

Example

```
{   "bid":"com.apple.messages.MSMessageExtensionBalloonPlugin:{team-id}:
{ext-bundle-id}",
"URL":"?name=WWDC%20Goodies&deliveryDate=09-06-
2017&destinationName=Contoso%20Coffee%20Redmond&street=1%20Microsoft%20Way&s
tate=WA&city=Seattle&country=USA&postalCode=98052&latitude=47%2E6395&longitu
de=%2D122%2E1281&extraCharge=15%2E00"
}
```

Forms

Survey-level properties

1. When a form rich message is created, you'll see the form level properties panel and builder. First, provide a title by selecting **Form Title** in the builder, or **Title** in the properties panel. You can also provide information for the following optional fields, which appear as part of the form's opening page:

    - **Header** (Optional): A large central header with a short text greeting or call to action.
    - **Image URL** (Optional) The image displayed to customers within the list picker's message and customer response message. Image URLs must be a valid image type. Videos and GIFs aren't supported.
    - **Start button**: You can change the label from the default string, but it can't be left blank.

2. The following form behaviors may be configured by navigating to the **Behavior** section in the property panel:
   a. By default, form responses are shown to the customer before they submit responses. This summary can be removed by deselecting **Show summary page**.
   b. Form responses can be hidden from live agents, which may be helpful when designing automated processes to handle sensitive information. When **Hide customer responses in chat** is toggled on, agents will be unable to see any customer responses within the form. Privacy cannot be toggled per question.

3. The **Outbound message** properties determine the appearance of the message bubble containing the form. The outbound message may contain the following elements:
   a. **Message title**: The main text that informs the customer of what type of content the message contains. It could be the full or shortened title of your form.
   b. **Message description** (Optional): This text appears below the message title. It can be used as a call-to-action or to provide more context not included in the message title.
   c. **Image URL** (Optional): The image displayed to customers within the list picker's message and customer's response message. Image URLs must be a valid image type, and do not support videos or GIFs.

4. To begin adding questions, select one of the question types from the **toolbox** located between the properties panel and builder. Each question will contain required **Title** and optional **Header** fields, in addition to type-specific configurations. Apple Messages for Business forms support the following question types: Single input, multiline input, single-select, multi-select, dropdown picker, and date picker.

5. A form can contain no more than 10 questions, and should be completable without needing to leave the messages application. While building a form, select **Save** to keep your changes. An unpublished form can be saved with missing fields. Changes made to a published form may only be saved if rich message has all required fields filled.

6. New forms will be available for agents to use once they are published. To publish a new form, select **Publish** at the top of the page. To confirm that the form is published, confirm that its status displays as **Active**.

Single input question

Single input questions are a short-answer free response style question. This question type is good for collecting information like name, contact information, and numbers. These questions are limited to a maximum of 30 characters. For longer responses, see the multiline input question type.

1. Provide a **Question title**, optional **Header** text, and use the **Required** toggle to control whether the question may be left unanswered.

2. The **Input** type may be changed from the default **Text** type. Changing the input type will change the input keyboard on iOS devices. The keyboard input field won't verify whether the customer response matches the keys that are available on the keyboard. To limit customer responses and validate formatting, use the **Regular expression** field. The type options and their impact on input are as follows:

    - **Text** (Default): Default keyboard
    - **Name**: Default keyboard and name autofill suggestion
    - **Url**: URL keyboard and URL autofill suggestion
    - **Phone**: Phone pad keyboard and phone number autofill suggestion
    - **Email**: Email keyboard and email address autofill suggestion
    - **Number**: Numbers and punctuation keyboard

    > ⓘ **Note**
    >
    > Autofill suggestions are generated by Apple from the customer's Apple ID contact information, which isn't shared in forms responses.

3. The **Input place holder** value appears in the empty textbox to provide example data or relevant information. If no place holder value is provided the form will automatically set the place holder value to “Required” or “Optional” based on your selection in step 1.

4. The **Label** is an optional value that appears beside the text field and can serve as another prompt. For a question titled “What is your name?” the label might be set to “Name”.

5. A single input can have a **Maximum length** between 1 and 30 characters. By default, the maximum length is 30.

6. The **Prefix** value can be used to automatically add the first characters in an answer. For example, when asking for a LinkedIn profile link, the prefix might be set to “https://www.linkedin.com/in/”, so that the person completing the form would only need to type their specific information.

7. The **Regular expression** is a Regex expression used to validate the customer response. The regex is used to validate customer responses on their device to ensure they are providing correctly formatted information. For example, regex can be used when asking for an email address.

Multiline input question

Multiline input questions are a long-answer, free-response style question. This question type is good for collecting customer feedback, explanations, and responses that need line breaks. These questions are limited to a maximum of 300 characters. For shorter responses that support different iOS keyboards see the single input question type.

1. Provide a **Question title**, optional **HeaderI** text, and use the **Required** toggle to control whether the question may be left unanswered.

2. The **Input place holder** value appears in the empty textbox to provide example data or relevant information. If no place holder value is provided, the form will automatically set the place holder value to “Required” or “Optional” based on your selection in Step 1.

3. The **Regular expression** is a regex expression used to validate the customer response. The regex is used to validate customer responses on their device to ensure they are providing correctly formatted information. For example, regex can be used when asking for an email address.

4. A single input may have a **Maximum length** between 1 and 300 characters. By default, the maximum length is 300.

Single-select question

Single-select questions can be used to quickly select a single option from a set of two or more choices. Each choice can support an image. This question type is good for choosing between products and choices, simple triage questions, and any single-select question with a limited number of choices. For multi-select questions that support images, see the multi-select question type, or for single selection questions with ten or more choices, see the dropdown picker question type.

1. Provide a **Question title** and an optional **Header** text.

2. Under **Choices**, you can add each of your options. We recommend that the number of choices is between two and 10 or fewer. Each choice has the following fields:

   a. **Value**: The true identifier for a choice. This value is what appears in the conversation control when a customer selects a choice. By default, the value is also used as the text that is shown to customers. However, when working in multiple languages or listing products, you might prefer to show an agent the product reference number and product name.

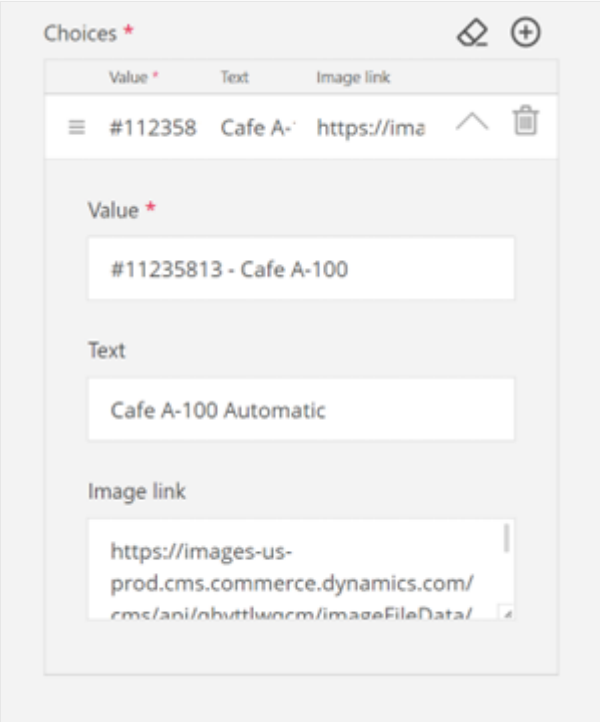
   b. **Text** (Optional): The text is what the customer will see when viewing the question. By default, this text will match the Value. Changing the **Text** content can allow you to localize selection questions without changing what the agent sees in the response.

   c. **Image link** (Optional): The image displayed to customers within the list picker's message and customer's response message. Image URLs must be a valid image type, and do not support videos or GIFs.

   For example, let's say we want to ask a Contoso customer to select the model of expresso maker that they own. The agent will need the model number, but a customer might only know the model by its name or image. In this instance, we would provide the following content:

Type	Description	Notes
Value	#11235813 Cafe A-100	The agent will see this text.
Text	Cafe A-100 Automatic	The customer will see this text.

Type	Description	Notes
Image link	https://contoso.com/[image].jpg	The customer will see this image.



3. To add more choices, select the + icon within the properties panel or builder. You can rearrange the choices by dragging them up or down while selecting the handle button to the left of each choice. You can remove a choice by selecting the delete button. To remove all choices, select the erase icon next to the + icon at the top of the list.

Multi-select question

Multi-select questions can be used to quickly select one or more options from a set of two or more choices. Each choice can support an image. This question type is good for selecting from a subset of choices, simple triage questions, and any multi-select other multi-select question types. For single selection questions that support images, see the single-select question type, or the dropdown picker question type for single-select questions with a large set of choices.

1. Provide a **Question title** you may also include an optional **Header** text.

2. Under **Choices**, you can add each of your options. We recommended that the number of choices is between two and 10 or fewer. Each choice has the following fields:

   a. **Value**: The true identifier for a choice. This value is what appears in the conversation control when a customer selects a choice. By default, the value is also

used as the text that is shown to customers. However, when working in multiple languages or listing products, you might prefer to show an agent the product reference number and product name.

b. **Text** (Optional): What the customer will see when viewing the question. By default, this text will match the Value. Changing the Text content can allow you to localize selection questions without changing what the agent sees in the response.

c. **Image link** (Optional): The image that is displayed to customers within the list picker's message and customer's response message. Image URLs must be a valid image type, and do not support videos or GIFs.

For an example of the difference between **Value** and **Text**, see the section on single-select question types.

3. To add more choices, select the + icon within the properties panel or builder. You can rearrange the choices by dragging them up or down while selecting the handle button to the left of each choice. A choice may be removed by selecting the delete icon. To remove all choices, press the erase icon that is located beside the + icon at the top of the list.

Dropdown picker question

Dropdown picker questions are used to quickly select a single option from a list of choices. These questions use a wheel-like scrolling interaction that only shows a small set of the options at a time. This question type is good for alphabetically sorted single-select questions like country, colors, brands, or categories. For single-select questions that support images but fewer choices, see the single-select question type.

1. Provide a **Question title**. You can also include an optional **Header** text.

2. Under **Choices**, you can add each of your options. As these questions can support a large number of options, it is recommended that you add choices in a logical ordering such as alphabetical. Each choice has the following fields:

a. **Value**: The true identifier for a choice. This value is what appears in the conversation control when a customer selects a choice. By default, the value is also used as the text that is shown to customers. However, when working in multiple languages or listing products, you might prefer to show an agent the product reference number and product name.

b. **Text** (Optional): What the customer will see when viewing the question. By default, the text will match the value. Changing the text content can allow you to

localize selection questions without changing what the agent sees in the response.

3. To add more choices, select the + icon within the properties panel or builder. Choices can be rearranged by dragging them up or down while selecting the handle button to the left of each choice. You can remove a choice by selecting the delete button. To remove all choices, select the erase icon located beside the + icon at the top of the list.

4. Once you've listed all your choices, you can choose a default answer by selecting **Set default value** and choosing an item from the dropdown. If you choose not to select one, the default is automatically set to the first item in your choices. For a large, sorted set of choices, setting the default value to an item in the middle or the most common answer might reduce the amount of scrolling needed.

Date picker question

Date picker questions are used to quickly select a date using a wheel-like scrolling interaction. Date picker can be configured to only allow dates within a pre-defined timespan. This question type is good for adding birthdays, purchase dates, or future events. Date pickers don't support times, which would need to be provided in a single line or multiline input question type.

1. Provide a **Question title**. You can also include an optional **Header** text.

2. **Label** is an optional value that appears beside the text field and can serve as an more prompt. For a question titled "When were you born", the label might be set to "Birthday".

3. To limit the timerange that customers can add, there are two optional range values:

   a. **Min**: This value represents the furthest back date that can be selected. When this value is set, no dates earlier than this date can be selected.

   b. **Max**: The value represents the furthest-forward date that can be selected. If this value isn't set, the maximum date will be the date that the customer responds. When asking a question about a future date, this value must be set.

4. The **Start date** value is the preset value that appears when the question opens. If this value isn't set, the start date will be the date when the customer is completing the form.

List Picker

Within the designer, the first fields are related to the message that appears within the messages application.

1. First, provide a message title that'll serve as title for both the message and the list picker.

2. The following fields are optional:

   a. **Message subtitle**: This text appears below the message title. It can be used as a call-to-action text or to provide more context that's not included in the header.

   b. **Image URL**: The image displayed to customers within the list picker's message and customer's response message. Image URLs must be a valid image type; videos and GIFs aren't supported.

3. A list picker is composed of one or more sections containing at least one item. The following fields are part of each section:

   a. **Section title**: A title for each section that can provide context and instructions for customer responses.

   b. **Allow multi-select**: Determines whether the customer can select one or more items within the section. By default, sections will be single-select.

   c. **List items**: Each section must include at least one option. Options can be added by selecting **Add option**, or removed by selecting **Remove**. Each option has the following fields:

   i. **Option title**: The title field is required and will be what appears as the customer's response in the messages app and in conversation control. Titles should be simple and straightforward, using the subtitle field for more details.

   ii. **Option subtitle**: Subtitles are an optional field that can be used to provide details about an option, such as add-on costs, item descriptions, and other secondary information.

   iii. **Image URL**: A valid image URL for adding an image beside a list option. Images are optional and shouldn't be used in place of the title or subtitle text.

4. To add more sections, select **Add section**. When there are two or more sections, a section can be deleted by selecting **Remove**.

5. An optional response message can be added to the list picker rich message. This text will appear in the customer's response, below selection choices.

Suggested reply

1. The **Summary text** field contains helper text for the customer to see after they've responded to a suggested reply message. This field shouldn't be used as the question, as customers won't see it until after they select a choice.

2. Suggested reply messages can have between two and five options that should be kept concise.

3. To add more options, select **Add option**. When there are more than two options, an option can be removed by selecting the option's corresponding **Remove** icon.

Time picker

1. Within the designer, the first fields are related to the message that appears within the messages application. First provide a message title, which will serve as the title for the message.

2. The following fields are optional:

   a. **Message subtitle**: This text appears below the message title. It can be used as a call-to-action or to provide more context not included in the header.

   b. **Image URL**: The image displayed to customers within the list picker's message and customer's response message. Image URLs must be a valid image type, and videos and GIFs aren't supported.

3. Under **Event information**, you can configure the details and time slots as follows:

   a. **Event title**: The event title will appear within the customer's calendar application if they choose to add the event to their calendar.

   b. **Location name**: The location name will appear within the customer's calendar application if they choose to add the event to their calendar.

   c. **Event time zone**: This field is the time zone where the event will take place.

   d. **Adjust for daylight saving time**: By default, time zones are listed by their standard offset from GMT. However, if the event takes place in a region that uses daylight savings, this can result in timeslots being incorrectly converted. By toggling this setting to **Yes**, the daylight saving offset will be automatically applied for each timeslot listed.

   e. **Customer display option**: By default, each time slot's start times will be converted to the customer's local time zone. To cause events to display in the

event time zone regardless of the customer's current time zone, select **match event time**. Matching the event time can be helpful when customers may be travelling across time zones for the event, and need to more clearly understand the start time.

f. **Duration**: The duration of an event is not visible during time slot selection. It's automatically added to the calendar event and used to calculate the end time of an event. Events can range from zero minutes to multiple days long. Duration can be defined in the following units:

- Minutes
- Hours
- Days

g. **Time slot**: The set of choices a customer can select from. To create time slots, select **Add date**, then add the following fields:

- **Date**: The date used for each associated start time.
- **Start time**: Define each time slot that a customer can select. These will be grouped under the selected date.
- To add more start times for a specific date, select the Add time slot button below existing start time.

h. To add more dates, select **Add date**, and then complete preceding steps for adding time slots.

> ⓘ **Note**
>
> Past time slots won’t display on the customer's device.

4. An optional response message can be added to the time picker rich message. This text will appear in the customer's response, below their time slot selection.
    - **Recommendation**: Use the response message as a call to action, encouraging customers to click the message for more details. The added details will include an **Add to Calendar** option that will display information such as event title and duration.

Video rich link

1. Provide a **Title** for the website rich link, which will be displayed alongside the image within the messages application.
2. Provide the **Video URL**, which is the plain text URL that links directly to a video file.

   > **Note**
   >
   > Embedded videos and video streaming websites won't work correctly. The video URL must link directly to a video's source. If a video streaming website's URL is used, the rich link won't work. To link to video streaming sites, instead use the **Website rich link** style rich message. Supported format types include .mp4, .mkv, .wmv, .m4v, .mov, .avi, .flv, .webm, .flac, .mka, .m4a, .aac, and .ogg.

3. Provide the **Image URL**, which is used to display a relevant image alongside the rich link title. The image URL must be a valid, still image in order to display correctly.

   While an image URL is not required for video rich link messages, it's highly recommended. Video rich links that are sent without an image preview will appear as blank previews. Adding a keyframe or relevant image will improve the customer experience.

Website rich link

1. Provide a **Title** for the website rich link, which will be displayed alongside the image within the messages application.
2. The **Website URL** is the plain text URL that the rich link will launch when the customer selects or long-presses on the message.
3. The **Image URL** is used to display a relevant image alongside the rich link title. The image URL must be a valid, still image in order for it to display correctly.

Enable personal quick replies for agents

Article • 03/08/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

You can allow agents to create their own personal quick replies that are stored in the agent's context and which the agent can invoke by using the associated tags during a session with a customer. Agents can use personal quick replies to respond to customer queries efficiently with minimal turnaround time.

As an administrator, you can use a Power Automate utility to delete unused tags.

Enable personal quick replies

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   - In the site map, in **Agent experience**, select **Productivity**.

2. For **Personal quick replies**, select **Manage**.

3. On the **Personal quick replies** tab, set the **Allow agents to create personal quick replies** toggle to **Yes**.

The settings for creating personal quick replies is made available for agents.

> **Note**
>
> - It can take up to 15 minutes for the setting to take effect.
> - We recommend that you do not assign the System administrator role to agents or supervisors to avoid enabling access to other users personal quick replies on the **Quick replies** panel of a conversation.

Enable the transcription experience for messaging channels

Article • 08/02/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

As an administrator, you can enable live transcription and recording of conversations, which allows agents and supervisors to view transcripts of customer conversations. The transcriptions include sentiment analysis data and can be searched through.

> **Important**
>
> Many countries and states have laws and regulations that apply to the recording of PSTN, voice, and video calls, and may require that users first consent to the recording of their communications. It is your responsibility to use the call recording capabilities in compliance with the law. Before using call recording features, you must obtain consent from the parties of recorded communications in a manner that complies with all applicable laws for each participant.

Enable the transcript experience

> **Note**
>
> The transcript feature is generally available; however, in some environments, you might see a preview tag or banner in the interface. Any preview annotations for this feature can safely be ignored.

To enable transcripts

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

a. In the site map, select **Productivity** in **Agent experience**.
b. On the **Productivity** page, select **Manage** for **Transcript**.

2. On the **Omnichannel Configuration - Transcript settings** page, turn on the **Try out our new transcript experience for digital messaging channels** toggle.

3. Select **Save**.

View the transcripts

You can view the conversation transcriptions in the Customer Service admin center, Omnichannel admin center, and Omnichannel for Customer Service apps.

To view transcripts in Omnichannel admin center, do the following:

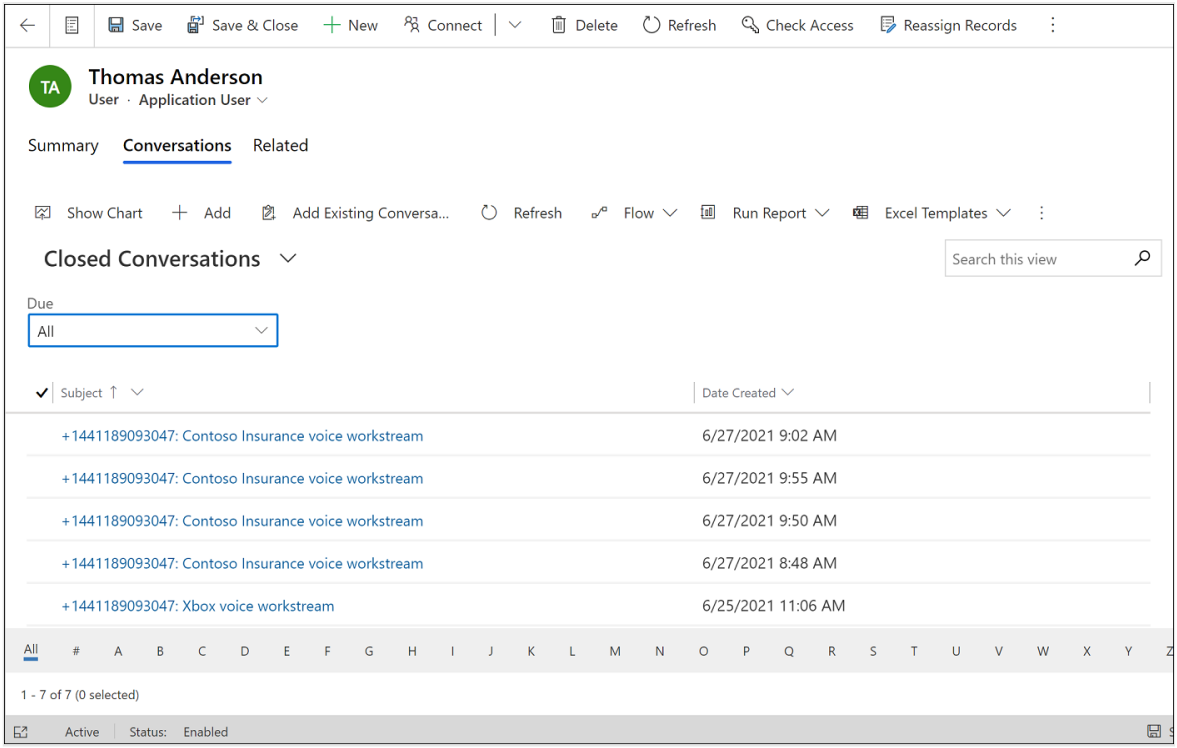
1. In the Customer Service admin center site map, select **User management**, and then select **Manage** for **Users**. If you're using Omnichannel admin center, in the site map, select **Users**.

2. Select the user whose conversations you want to view.

3. Select the **Related** tab, and then select **Conversations** from the dropdown menu.

4. Select **Closed conversations** from the dashboard dropdown menu.

5. Select the conversation for which you want to access the transcript.



To view transcripts in Omnichannel for Customer Service, do the following:

1. Open the Omnichannel for Customer Service app, and then switch to the **Omnichannel Agent Dashboard** view. Completed chat conversations are displayed in the **Closed work items** column.
2. Do one of the following:
   a. Select the closed work item for which you want to view the transcript.
   b. Right-click the three dots to view the transcript.

> **Note**
>
> As an administrator, only you have access to the conversations that are handled by other agents.

Enable sound notifications for conversations

Article • 05/31/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Sound notifications for incoming conversation requests, such as live chat, that require immediate response are helpful in making sure the requests are not missed. Administrators can enable the sound notification settings in the configuration settings of Omnichannel for Customer Service. The option to personalize allows agents to customize their preferences for sound and volume selections, among other things. The sound notifications are available across all channels and can also be set for messages for ongoing conversations.

Prerequisite for sound notifications

Make sure the browsers used by agents allow sounds to be played. In Microsoft Edge, sound is allowed by default. However, if for some reason, sound settings are turned off, you can enable them by going to the media autoplay setting in Microsoft Edge. For information on how to enable sound notifications for other browsers, see the browser-specific documentation.

Enable sound notifications

When you enable sound settings, the options to personalize settings are available for all the channels that are provisioned in your environment.

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

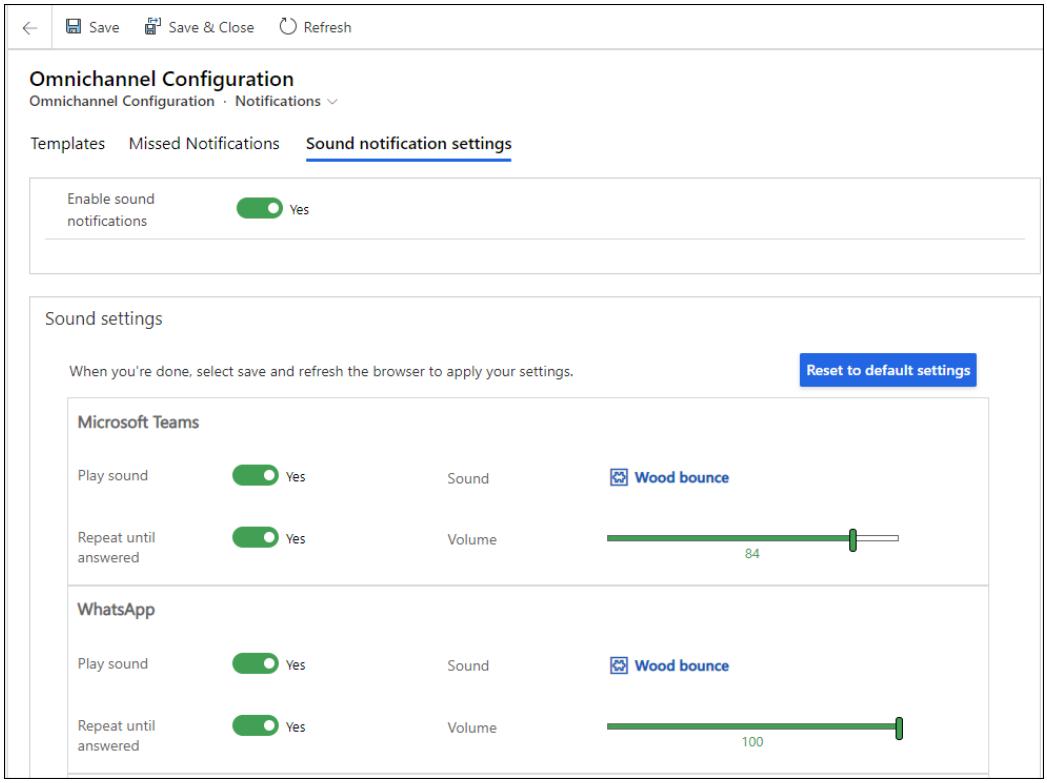
   a. In the site map, select **Workspaces** in **Agent experience**.
   b. On the **Workspaces** page, select **Manage** for **Notification templates**.

2. On the **Omnichannel Configuration - Notifications** page, select **Sound notification settings**.

3. Set the toggle to **Yes** for **Enable sound notifications**. The **Sound settings** area is displayed.

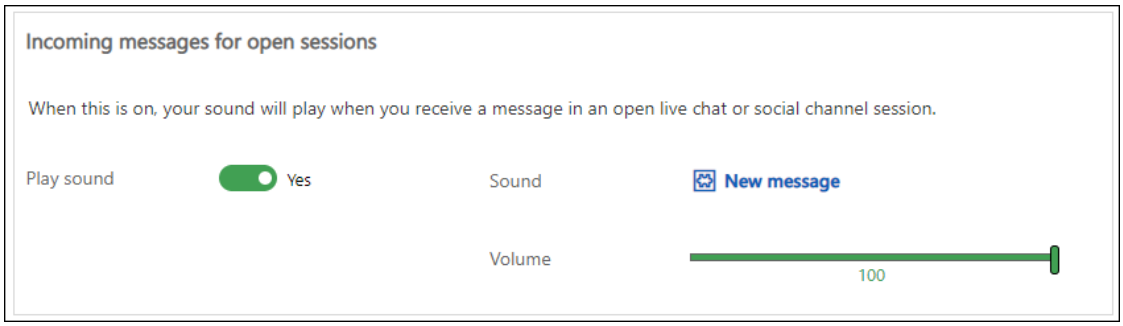
4. Customize the notification settings for the required channels. The following settings are for Microsoft Teams:

    - **Play Sound:** Set the toggle to **Yes**.
    - **Repeat until answered:** Set the toggle to **Yes** if you want the sound to be played till the agent responds.
    - **Sound:** Accept the default setting or search and select a different audio file. You can use the **New Audio File** option to upload and use an audio file of your choice. You also have the option to preview the audio.
    - **Volume:** Accept the default setting or use the slider to adjust the volume.



- **Reset to default settings:** When you customize any setting, the button is enabled for you to reset to the out-of-the-box settings.

5. In the **Incoming messages for open sessions** section, customize the options for sound notifications for messages in open sessions, such as live chat or a social channe



6. Select **Save.**

Personalize notifications

Enable missed notifications

Article • 04/04/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

With the missed notifications feature, you can choose to automatically set agent presence to inactive, so that no new tasks will be assigned when agents miss notifications for incoming chat requests. In addition to the status change, a message bar indicating that a notification has been missed will be displayed on the agent dashboard. Agents can reset their status by using the reset presence option that's displayed with the notification or by manually changing their status.

Important

- Missed notifications won't work if **Away** is included as an allowed presence for work streams. More information: **Understand and create work streams**
- Missed notifications is not supported in Omnichannel for Customer Service on Unified Service Desk.

Enable automatic update of agent presence when a notification is missed

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   - In the site map, select **Workspaces** in **Agent experience**, and then select **Notification templates**.

2. On the **Omnichannel Configuration** page, select the **Missed Notifications** tab.

3. Set the **Change agent status to inactive after a missed notification** toggle to **Yes**. The **Status name** and **Status description** settings appear.

4. Select **Save**.

Enable automatic update of presence on rejection of work assignment

Article • 05/23/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

You can enable agent presence to be updated automatically to **Do not disturb** when agents reject an incoming notification for a work assignment. No new tasks are assigned when agents reject notifications for incoming chat requests. Also, a message indicating that the agent presence has been changed is displayed at the top of the agent dashboard. Agents can reset their status by using the reset presence option that's displayed with the notification, or by manually changing their status.

> **Important**
>
> - Work items will continue to be routed to the agent if **Do not disturb** is an allowed presence in the workstream. More information: **Create workstreams for unified routing**
> - Automatic change of agent status when agent rejects a notification is not supported in Omnichannel for Customer Service on Unified Service Desk.

Enable automatic update of agent presence

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Workspaces** in **Agent experience**.
   b. On the **Workspaces** page, select **Manage** for **Notification templates**.

2. On the **Omnichannel Configuration** page, select the **Agent Reject** tab.

3. Set the **Change agent status to "Do not disturb" after a notification is rejected** toggle to **Yes**. The **Status name** and **Status description** settings appear.

4. Select **Save**.

Enable conversations to be assigned automatically

Article • 04/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making, and should not be used to make decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using Dynamics 365 Customer Service, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

Some customer conversation requests, such as those coming from a Facebook channel or an SMS channel, might not need an immediate response because of a longer service-level agreement. For such requests, you can enable the auto-assign option in the notification templates. When an incoming notification appears, the conversation is assigned to the agent automatically, either instantly or after the timeout period elapses.

> **Important**
>
> Auto-assign isn't supported in Omnichannel for Customer Service on Unified Service Desk.

Perform the following steps:

1. In Customer Service admin center, in the site map, go to **Workspaces** under **Agent experience**.
2. Select **Manage** for **Notification templates**.
3. On the **Omnichannel Configuration** > **Omnichannel Configuration - Notifications** page, select the template for which you want to enable the incoming conversation to be assigned.
4. On the **General** tab of the **<*notification_name*> Notification Template**, set the toggle to **Yes** for **Auto-assign work items**. The label for **Accept Button** changes to **Open**, and the toggle for **Show Reject Button** is disabled.
5. Select **Save**.

> **Note**
>
> We recommend that you don't enable the auto-assign setting in consult notification templates.

Enable voice calls and chats to be accepted automatically

When an agent rejects an incoming conversation, it is routed back to the queue. This impacts customer SLAs, queue wait times, and customer satisfaction. To avoid such scenarios, a conversation can be automatically accepted by an agent, either instantly or after the timer elapses.

Perform the following steps to enable the incoming conversations to be assigned automatically:

1. In Customer Service admin center, in the site map, go to **Workspaces** under **Agent experience**.
2. Select **Manage** for **Notification templates**.
3. On the **Omnichannel Configuration** > **Omnichannel Configuration - Notifications** page, select the required template.
4. On the **General** tab of the **<*notification_name*> Notification Template**, set the toggle to **Yes** for **Auto-assign work items**, and then set the **Auto-accept**

voice/chat calls toggle to **Yes**. The **Show Countdown** field is set to **Yes** and disabled.

5. Select **Save**.

Configure the agent calendar view

Article • 10/28/2023

As an administrator or a supervisor, you can help agents in your organization view their work schedules. The **My Schedule** view in the Dynamics 365 Customer Service workspace app lets agents quickly view their working hours, nonworking hours, breaks, and any scheduled time off.

The calendar view is a read-only visual that provides daily, weekly, and monthly views of an agent's schedule. It also has an agenda view that provides a list-type view of the agent's schedule.

Prerequisites

- You must have **Workforce Management for Customer Service** enabled in your environment.

  To enable Workforce Management, complete the following steps:

  1. Navigate to your environment in Power Platform admin center (PPAC).

     > **Note**
     >
     > You must have the System Administrator role to make changes to your environment.

  2. On the command bar, select **Resources** > **Dynamics 365 apps**. The Dynamics 365 apps page is displayed.
  3. Select **Install app**. The **Install Dynamics 365 apps** page is displayed.
  4. Scroll down to locate and select **Workforce Management for Customer Service**, and then select **Next**.
  5. You must agree to the terms of service, and then select **Install**.
  6. Wait until the **Workforce Management for Customer Service** shows as installed on the **Dynamics 365 apps** page.

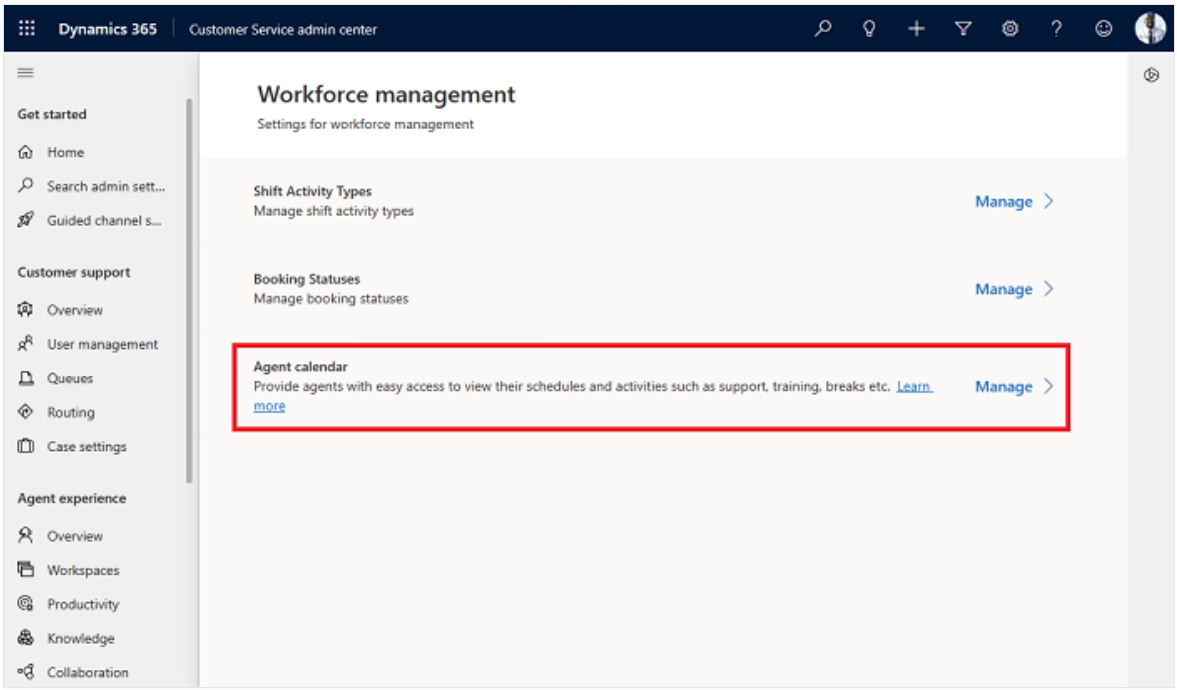
- To enable the calendar view for agents, you must have at least one of the following roles:
  - System Administrator

    - CSR Manager
    - Omnichannel administrator
    - Omnichannel supervisor

- You must have a third-party adapter configured to import agent bookings from an external system. Without an adapter in place, external bookings can't be surfaced in the agent calendar, and agents can't view their schedules.

Enable the agent calendar

1. In the Customer Service admin center site map, select **Workforce management**.
2. In the **Agent calendar** section, select **Manage**. The **Agent calendar** page is displayed.



3. Turn on the **Enable agent calendar** toggle.
4. Select **Save and close**.

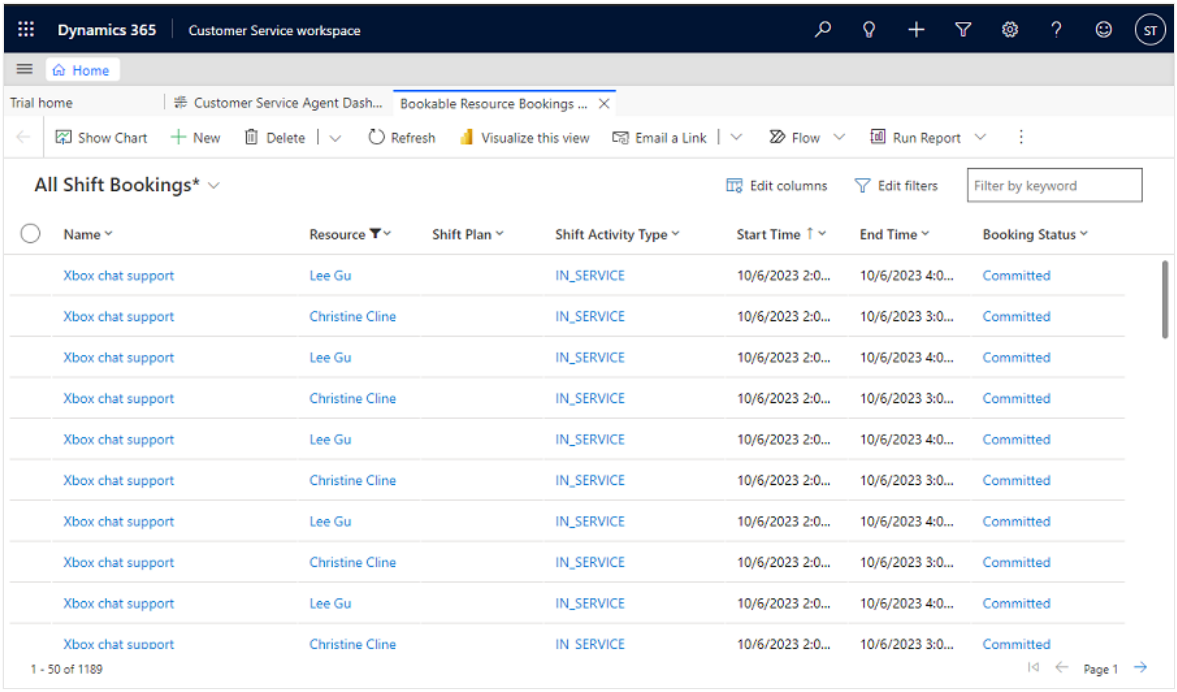
Shift bookings view for supervisors

The shift booking list view lets supervisors view the bookings that are imported from their third-party workforce management system. Supervisors can use this view to access a consolidated list of bookings for all agents in their system. The shift bookings view offers a comprehensive breakdown of each agent's individual activities, including work hours, time off, lunch breaks, trainings, and more.

Administrators can utilize this view to verify the proper functioning of the third-party adapter booking sync process.

1. In Customer Service workspace, expand the site map, and then select **Shift Bookings**.

2. Select the **All Shift Bookings** view.



Next Steps

Get started with Customer Service workspace

Use the agent calendar view

Configure knowledge management

Article • 07/03/2023

Introduction

A comprehensive knowledge base is a key to increased customer satisfaction and improved productivity of users. Give users quick access to the knowledge base by setting up knowledge management in Dynamics 365 Customer Service.

> **ⓘ Important**
>
> Usage of Parature knowledgebase as a knowledge management solution has been deprecated. For more information, see **Important changes coming**.

After knowledge management is set up, users will be able to:

- Search for relevant knowledge base articles from Customer Service while they're working on a record.
- Set up the search logic, suggest-as-you-type option, and search filters to get only the required knowledge articles, thereby providing timely and consistent information to customers while working on their cases.
- Use smart assist to receive AI suggestions on related knowledge articles and similar cases.
- See the content of the knowledge base article inline, including images and videos.

Setup overview

You can set up knowledge management on the Customer Service admin center, Customer Service Hub, or manually for a model-driven app.

- Set up knowledge management
- Set up knowledge management settings page manually for a model-driven app

After you have configured knowledge management on your app, you must also set up the various other aspects of knowledge management, based on your organizational requirements, such as:

- Configure knowledge base article URLs

- Create and manage categories
- Create templates for knowledge articles
- Set up AI suggestions for article keywords and description
- Set up external search providers

Set up knowledge management

Make sure that you have the System Administrator or System Customizer security role or equivalent permissions. You must also be the tenant administrator of Microsoft 365.

You can set up knowledge management in the Customer Service admin center or Customer Service Hub app. The settings you configure for knowledge management in the Customer Service Hub app are carried over to the Customer Service admin center app, and vice versa.

Customer Service admin center

1. In the site map, select **Knowledge** in **Agent experience**. The **Knowledge** page appears.

2. In the **Record types** section, select **Manage**.
   a. On the **Record Types** page, add and configure the record types for which you want to turn on knowledge management. More information: Configure knowledge search control on app side pane for an entity record. By default, knowledge management is enabled for **Case** and **Conversation** record types. The ability to set up knowledge search control for app side pane is available only in the Customer Service admin center app.

3. In the **General Settings** section, select **Manage**. The **General Settings** page appears.
   a. In the **Search results display count** section, select the display count from the dropdown. This option is only available for the app side pane knowledge base search control, and standalone knowledge base search control in single session and multisession apps.
   b. In the **Feedback** section, set the **Enable feedback** toggle to **Yes**. To learn more about how users use this option, see Submit ratings and feedback for knowledge articles.
   c. In the **Authoring language** section, set the **Enable default authoring language** for your users to **Yes**.

- If you want to select a default knowledge authoring language for your organization, then select the **Organization's UI language** radio button.
- If you want to use the organizations' s UI language as the default knowledge authoring language, select the **Other language** radio button, and then select a language from the **Language** dropdown.
- If you also want to allow users to set their default knowledge authoring language, set the **Allow users to set default knowledge authoring language** toggle to **Yes**. More information: Configure a default knowledge article authoring language for your organization
- In the **Origins allow list** section, add your origins links to the **Add origin links** field. More information: Configure origins allowlist for knowledge articles.
- In the **Knowledge search logic** section, set the **Set search mode as all** toggle to **Yes**. More information: Set up knowledge search logic
- Select **Save**.

4. Optionally, in the **Categories** section, select **Manage**. The **Categories System Views** page appears. You can create and manage a logical structure of categories for your records. More information: Create and manage categories.

5. In the **Filters** section, set the **Enable search filters** toggle to **Yes**. If you want to allow agents to save the the search filters according to their areas, set the **Allow agent to personalize** toggle to **Yes**.

6. In the **Portals** section, select **Manage**. The **Portals** page appears.
   a. In the **Support portal connection** section, do the following to share knowledge articles as URLs:

      - Set the **Use an external portal** toggle to **Yes** to integrate an external portal to publish knowledge articles.
      - **URL Format**: Type the portal URL that will be used to create external (public-facing) portal links for knowledge articles, which the service agents can share with the customers. The external URL is created in the following format: https://support portal URL/kb/{kbnum}. The placeholder, "{kbnum}", is replaced by an actual knowledge article number.

   b. In the **Sync knowledge article attachments to portal** section, set the **Sync attachments to the portal** toggle to **Yes**. More information: Update knowledge article attachments for portal

7. Optionally, in the **Article templates** section, select **Manage**. The **Article Templates System Views** page appears. You can create templates to help

knowledge authors use consistent language and messaging. More information: Create templates for articles.

8. Optionally, in the **Search providers** section, select **Manage**. The **Search providers System Views** page appears. You can use search providers to federate the search of files, documents, or articles from data sources outside of your current Dynamics 365 organization. More information: Set up external search providers

> **Note**
>
> During the creation of knowledge articles, duplicate detection rules aren't supported on the Knowledge Article entity.

Set up knowledge management settings page manually for a model-driven app

> **Note**
>
> The embedded knowledge search control is deprecated in the web client. You must use the Knowledge Settings page in Unified Interface.

If you are using the custom model-driven app, you need to manually update your sitemap with the Knowledge Settings page. To update the sitemap:

1. Select your custom app.
2. Select **Open in app designer**.
3. Select **Site Map**.
4. Select **Add** > **Subarea** to create a new sub area for your area.
5. In the **Properties** > **SUB AREA** section, provide the following information:
   - Type: Select **URL**.
   - URL: Enter `/main.aspx?pagetype=inlinedialog&name=KnowledgeSettings`

Configure knowledge base article URLs

Knowledge articles can be configured with their portal URLs, and then agents can copy and share the URL links.

> **Note**
>
> Before you can configure knowledge articles with their own URLs, you must create a portal using your domain name. For information on how to create a portal, see **Create a portal in an environment containing customer engagement apps**.

You can configure a knowledge base article URL in the Customer Service admin center or Customer Service Hub app by performing the following steps:

1. Go to the **Support portal connection** section.

Customer Service admin center

1. In the site map, select **Knowledge** in **Agent experience**. The **Knowledge** page appears.
2. On the **Knowledge** page, go to the **Portal** section and select **Manage**. The **Portal** page appears.
3. On the **Portal** page, go to the **Support portal connection** section.

2. Set the **Use an external portal** toggle to **Yes**.
3. In the **URL format** field, enter the URL name.
4. Select **Save**.

The knowledge base article link is now active and can be copied and shared.

Update knowledge article attachments for portal

With the knowledge article attachments option, you can stop using notes attachments for the portal. To use knowledge article attachments for the portal, you must enable the feature in the Customer Service admin center or Customer Service Hub app by performing the following steps:

1. Go to the **Sync knowledge article attachments to portal** section.

Customer Service admin center

1. In the site map, select **Knowledge** in **Agent experience**. The **Knowledge** page appears.
2. In the **Portals** section, select **Manage**. The **Portal** page appears.
3. On the **Portals** page, go to the **Sync knowledge article attachments to portal** section.

2. Set the **Sync attachments to portal** toggle to **Yes**.
3. Select **Save**.

Set up AI suggestions for article keywords and description

You can enable knowledge authors to get suggested keywords and description based on the article content stored in the built-in knowledge article entity. More information: Configure AI suggestions for article keywords and description.

Set up knowledge search logic

If you have Dataverse search enabled, you can apply knowledge search logic for your knowledge articles to help agents find only the articles they need. By default, knowledge search works by the `searchMode=any` logic, which brings up articles that match any of the keywords used in your search. If you search for Contoso Coffee, the search results will show articles that have either "Contoso" or "Coffee", as seen in the following example:

- Article 1: Contoso machine repair
- Article 2: Coffee powder quality
- Article 3: Contoso coffee order price
- Article 4: Coffee machine order for Contoso
- Article 5: Espresso coffee machine troubleshooting

You can enable the knowledge search to work by the `searchmode=all` logic, which matches all the keywords that you used in the search. If you search for Contoso Coffee, the search results will show articles that match both "Contoso" and "Coffee", as seen in the following example:

- Article 1: Contoso coffee order price
- Article 2: Coffee machine order for Contoso

You can set up the knowledge search logic in the Customer Service admin center or Customer Service Hub app by performing the following steps:

1. Go to the **Settings** page.

Customer Service admin center

1. In the site map, select **Knowledge** in **Agent experience**.
2. On the **Knowledge** page, in the **General settings** section, select **Manage**. The **General settings** page appears.

2. In the **Knowledge search experience** section, set the **Set search mode as all** toggle to **Yes**.
3. Select **Save**.

More information: Search across table data using Dataverse search

Enable the suggest-as-you-type option

You can help agents improve their productivity by setting the **Enable suggest as you type** toggle to **Yes**. This feature provides suggestions on the most relevant records as agents type keywords in the search box. The search phrase is matched against the title of the article, and the matching results appear in a flyout menu. The matched text is highlighted to show the presence of the keyword.

When an agent selects the record, the system displays the article inline on the knowledge search control embedded on a form, on an application tab in Customer Service workspace, and as an inline view in the independent knowledge search control. More information: Use suggest-as-you-type

1. In the Customer Service admin center site map, select **Knowledge** in **Agent experience**.
2. On the **Knowledge** page, in the **General settings** section, select **Manage**. The **General settings** page appears.
3. In the **Knowledge search experience** section, set the **Enable suggest as you type** toggle to **Yes**.
4. Select **Save**.

Add the Knowledge Base Search control to a form

Use the productivity pane to help resolve customer issues

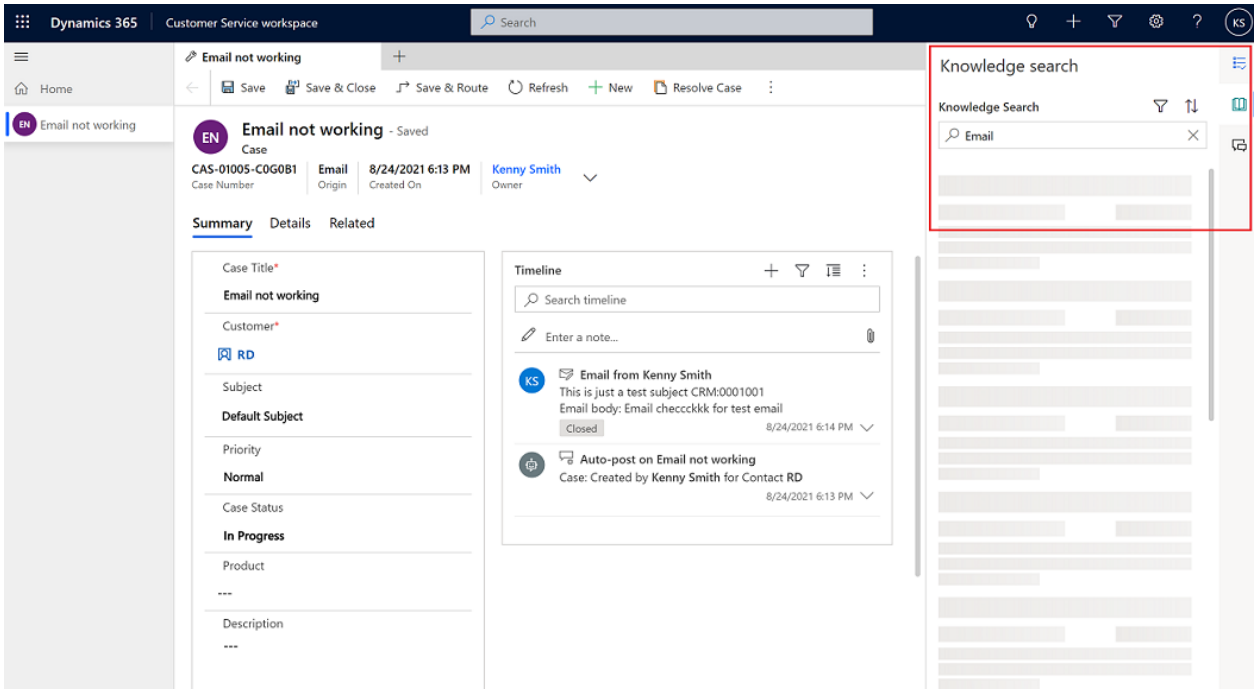
Article • 11/10/2021

The productivity pane in the Customer Service workspace is an auxiliary work area that contains tools for supporting or expediting tasks when agents are resolving customer issues.

Currently, the productivity pane includes controls to help agents quickly view and interact with relevant AI-generated knowledge articles and similar cases suggestions for the case they are working on, work with agent scripts and macros, and search for knowledge base articles.

The productivity pane and the controls are enabled for agents through profiles that are managed in app profile manager. More information: App profile manager

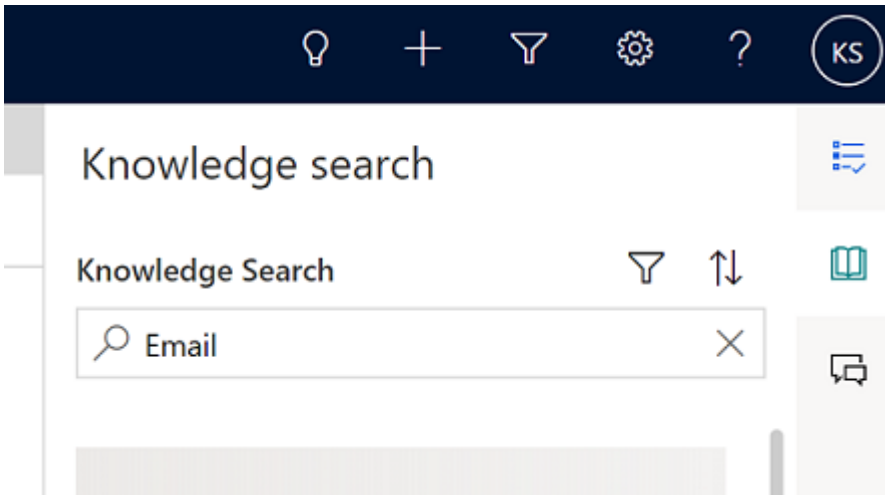
> **Important**
>
> The productivity pane displays information (for example, knowledge article and similar case suggestions) for the first tab (referred to as the anchor tab) of an active case session.



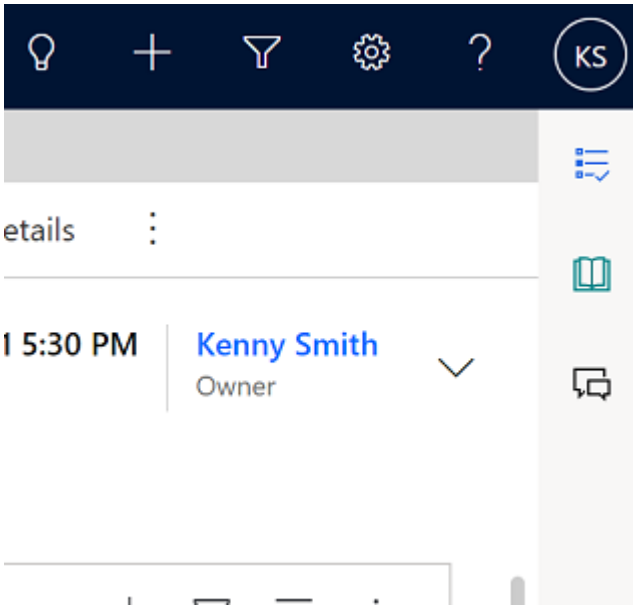
Productivity pane modes

The productivity pane has two modes: expanded and collapsed. Depending on which settings your administrator has configured, you can use the arrow to set the mode of the productivity pane, and the mode you choose is preserved in different sessions. For example, say in session A you expanded the pane, but while in session B, you collapsed it. When you switch from session A to session B, the pane mode changes from expanded to collapsed. Then if you switch back to session A, the pane is still in its expanded mode.

Expanded mode:



Collapsed mode:



Two things to keep in mind about the productivity pane modes:

The productivity pane stays collapsed for entities that don't have productivity controls configured to use it. For example, if you open an account record, which typically doesn't have smart assist or knowledge enabled for it, or if agent scripts or macros aren't enabled by your administrator, the pane remains collapsed.

The productivity pane places focus on the first control that has data for any table. Typically, the order is smart assist, agent scripts and macros, and then knowledge controls. For example, if you open an account record that has only scripts configured, when the record opens, the productivity pane expands and the focus is on the agent scripts and macros.

Smart assist

Smart assist is an intelligent assistant that provides real-time recommendations to help you take actions while interacting with customers. It allows organizations to build a custom bot and plug-in to their environment. These custom bots interpret conversations in real time and provide relevant recommendations such as knowledge articles, similar cases, and next-best steps to the agent's user interface.

Smart assist displays the relevant suggestions as individual cards that are grouped as either Knowledge article suggestions or Similar cases suggestions. For more information, see View AI-suggested similar cases and knowledge articles.

Agent scripts and macros

> **Important**
>
> - In the out-of-box Customer Service workspace application, you must first create a custom profile before you can enable agent scripts. Only the Smart assist and knowledge article search functions are available in the out-of-box experience. For information about creating custom profiles, see **Overview of app profile manager**.

Agent scripts in Customer Service workspace help provide guidance for what you should do when you have a customer issue, and helps ensure that you share only accurate and company-endorsed information. These scripts help you be accurate, effective, and efficient in customer handling. For more information, see Guide customer interaction with agent scripts. For administrator information about configuring scripts, see Guide agents with scripts.

A macro is a set of instructions that tells the system how to complete a task. When a macro runs, the system performs each instruction. Macros in agent scripts show a title, instruction that system performs, and the macro icon. For administrator information about configuring macros, see Automate tasks with macros.

Knowledge article search

The knowledge base search lets you search for relevant knowledge articles to resolve a case. These articles are displayed based on relevance and full-text search mechanisms. For more information, see Search for knowledge articles.

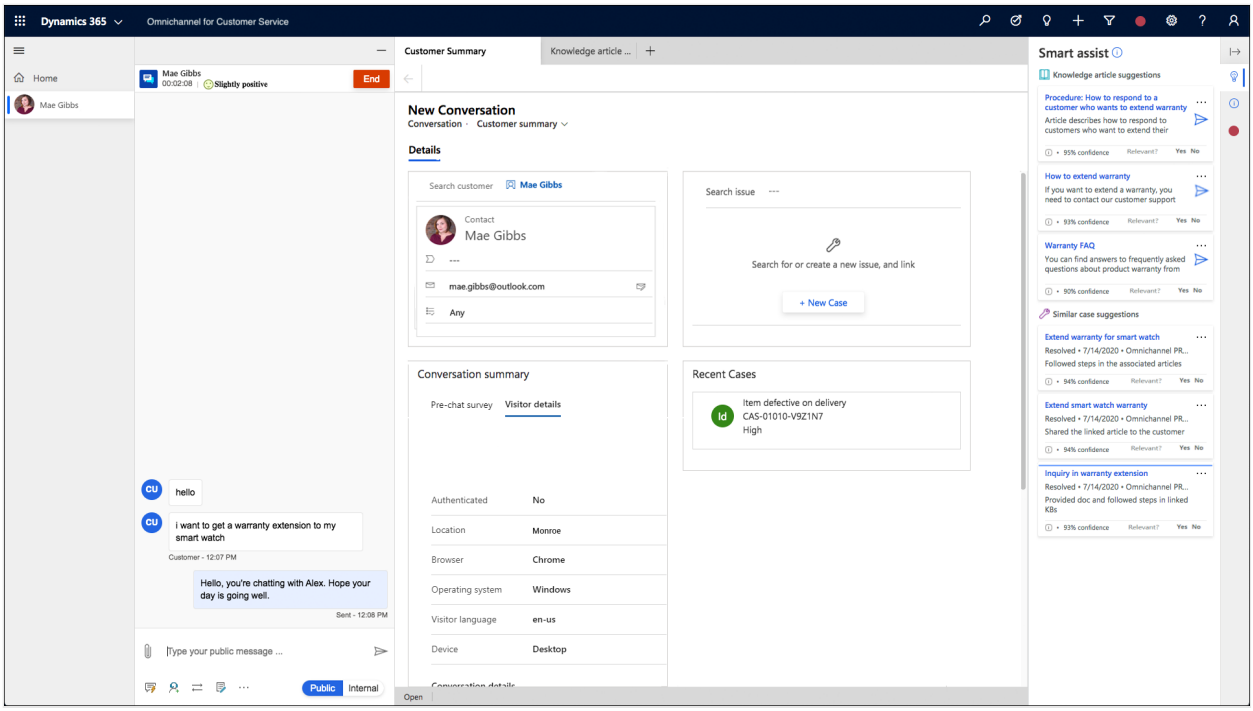
Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Introduction

The AI suggestions are displayed in smart assist, which is an intelligent assistant that provides real-time recommendations to you, helping you take actions during your interactions with customers.

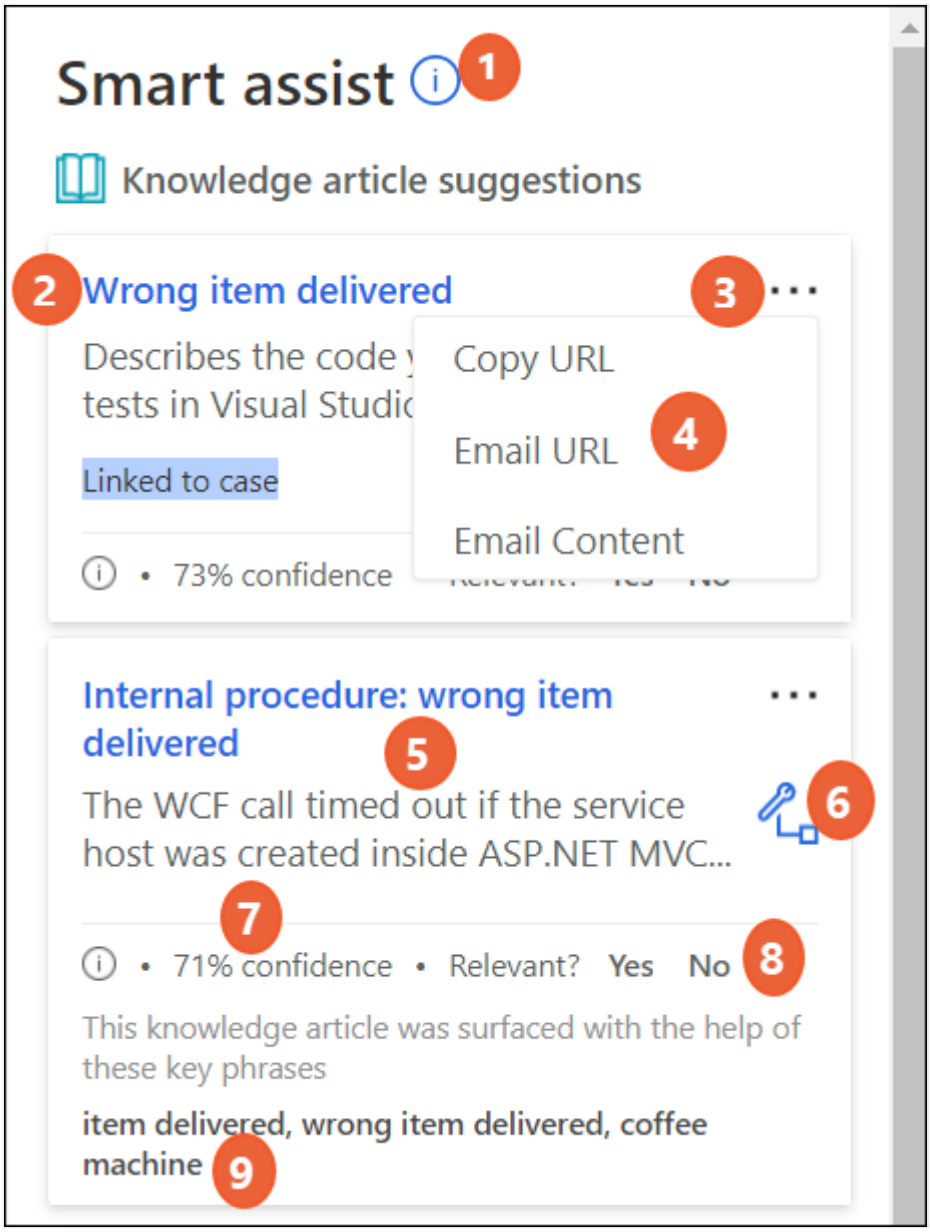
The AI-suggestions for similar cases and knowledge articles are powered by a set of pretrained natural language understanding models that help you find relevant knowledge articles or similar cases quickly, based on the context of ongoing conversations that you're handling. Your administrator can enable AI-suggested similar cases and knowledge articles through a single click. These suggestions are displayed in real time based on the conversation context.



If the productivity pane has been enabled for you, the smart assist cards appear on the productivity pane when you're interacting with a customer in an ongoing conversation. By default, the productivity pane is enabled out of the box.

Understand the knowledge article components in smart assist

When you're interacting with a customer in an ongoing conversation, up to three top knowledge articles that match the conversation context are displayed in the **Smart assist** pane. The suggestions are dynamically refreshed based on the conversation context.



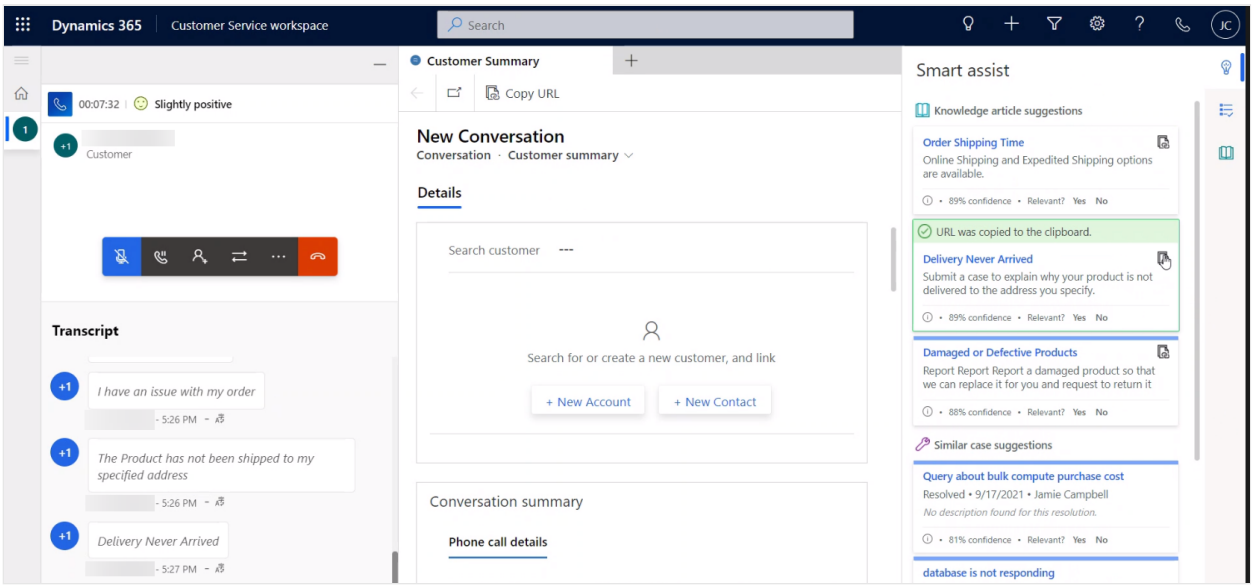
The following table lists the components of the smart assist card for AI-suggested knowledge articles.

Label	Description
1	Displays the information about the cards when selected.
2	Title of the related knowledge article. When selected, opens the knowledge article in an application tab.
3	More commands.
4	Displays the actions that can be performed when you select more commands.
5	A brief summary of the knowledge article that is generated by the AI model.
6	When selected, the link to the knowledge article is pasted in the conversation window that the agent can share with the customer.

Label	Description
7	Displays the confidence score based on which knowledge article was selected by the AI model. Usually, the suggested knowledge articles are highly relevant to the context of conversations when the confidence score is above 80%; suggestions with lower confidence score may still be relevant based on the semantic meaning of some key words in the conversation. The minimum confidence score is 65%.
8	The feedback from agents is used by the AI model to retrain and improve the suggestions over time. When agent selects **Yes**, the label is highlighted and the card remains on the pane. If agent selects **No**, the card is replaced with a new suggestion, if it exists.
9	Displays information on the keywords that were used by the AI model to match the article.

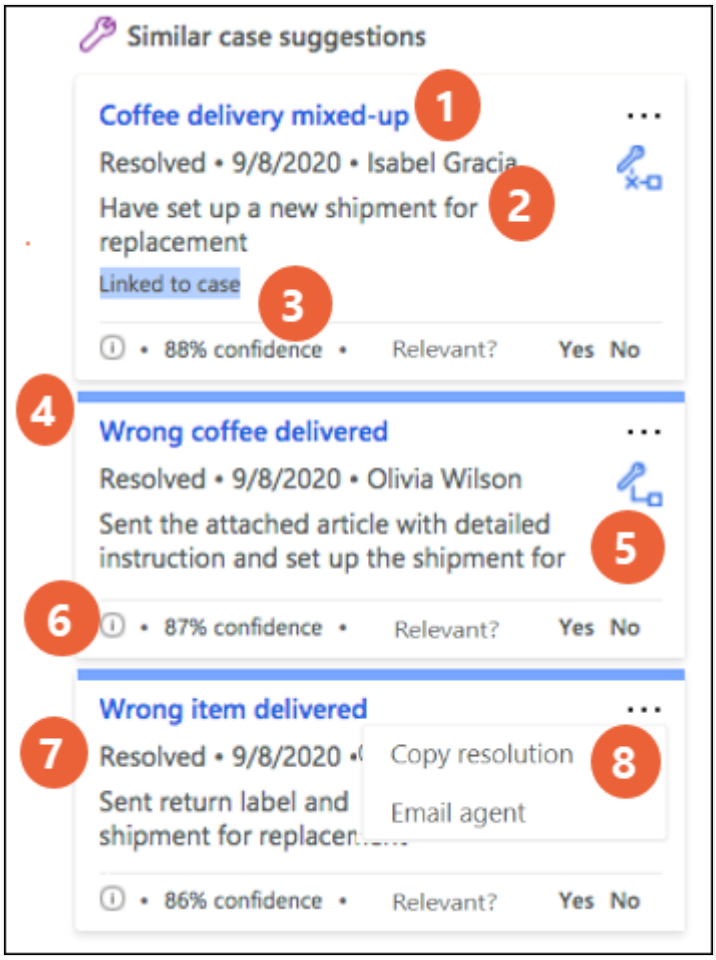
Understand the knowledge article components in smart assist for the voice channel

When you're on a call with a customer and want to share knowledge articles for the customer issue, you can select the **Copy URL** option on the **Smart assist** pane, whereby the article link gets copied to the clipboard. You can then email the link to your customer.



Understand the similar cases components in smart assist

When you're interacting with a customer in an ongoing conversation, up to three top similar cases that match the conversation context are displayed in the **Smart assist** pane. The suggestions are dynamically refreshed based on the conversation context.



The following table lists the components of the smart assist card for AI-suggested similar cases.

Label	Description
1	Title of the similar case. When selected, opens the **Active Conversation** form in an application tab.
2	Summary of the case resolution that is generated by the AI model.
3	The confidence score based on which the similar case was selected by the AI model. Usually, the suggested similar cases are highly relevant to the context of conversations when the confidence score is above 80%; suggestions with lower confidence score may still be relevant based on the semantic meaning of some key words in the conversation. The minimum confidence score is 65%.
4	A blue bar indicates that the user hasn't interacted with the card yet.
5	When selected, links to the current active case or removes the link to the similar case.
6	When selected, displays information on the keywords that were used by the AI model to match the article.
7	Status of the similar case.
8	The actions that can be performed when you select more commands.

If no cases match, then the card displays an appropriate message, such as "No suggestions found for similar cases."

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Smart assist is an intelligent assistant that provides real-time recommendations to you, thereby helping you take actions during your interactions with customers. It shows relevant recommendations such as knowledge articles, similar cases, and the next-best steps.

By default, the productivity pane is enabled. The smart assist cards appear on the productivity pane.

How smart assist suggestions work

The smart assist bot interprets the conversation in the communication panel and provides real-time recommendations.

The recommendations appear in the user interface as cards. The most recent card (recommendation) appears at the top on the control. If you feel a recommendation doesn't meet the context of the conversation, you can choose to dismiss the card.

For a macro recommendation card, if the run is successful, a success message is displayed; otherwise, an error message is displayed in the user interface.

When a conversation is escalated from a bot, the agent needs to accept the request and start the conversation with the customer. Now, from this instance, the smart assist bot interprets the conversation in real time and provides recommendations.

View the agent calendar

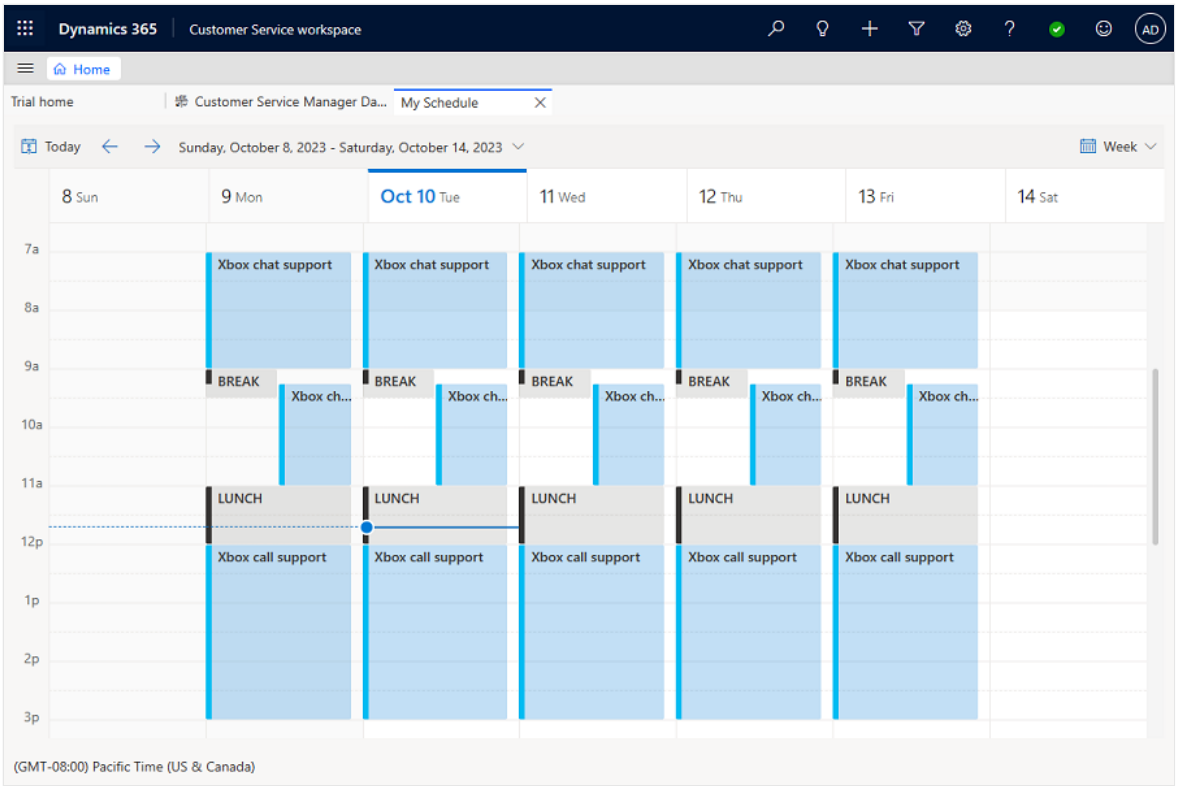
Article • 10/28/2023

As an agent, it's helpful to know your work schedule, breaks, trainings, and other activities. If your administrator has enabled the calendar view, you can quickly see your work hours, nonwork hours, and any scheduled time off.

The calendar view is read-only and has daily, weekly, and monthly views. It also has an agenda view where you can see a list-type view of your schedule.

1. In Customer Service workspace, expand the site map, and then select **My Schedule**.

   The **My Schedule** page opens with a read-only calendar view of your work hours, nonwork hours, and any scheduled time off. Work hours are displayed in blue, and nonwork hours are displayed in gray.



2. (Optional) Use the top-right menu to change the view to agenda, daily, weekly, or monthly.

Configure the agent calendar view

Use agent diagnostics as a self-help tool (preview)

Article • 09/21/2023

[This article is prerelease documentation and is subject to change.]

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and may have restricted functionality. These features are available before an official release so that customers can get early access and provide feedback.

The agent diagnostics tool helps you identify and address issues in your environment. Use the tool to run a set of predefined rules from Microsoft to diagnose frequent issues. You can download a report to send to admins or support and reduce support tickets.

Out of the box, the following rules are available:

- App Profile Assignment
- Inbox
- Live Chat Communication
- Omnichannel Presence
- Omnichannel Provider URL
- Productivity Pane

One of the following rule result messages appear after you run the rules.

- **No issues found**: When the rule runs successfully.
- **Issue found**: When the rule identifies one or more issues.
- **Not reproduced**: When something unexpected occurs with the rule. You'll need to run the rule after refreshing the app. If the issue persists, contact your support team.

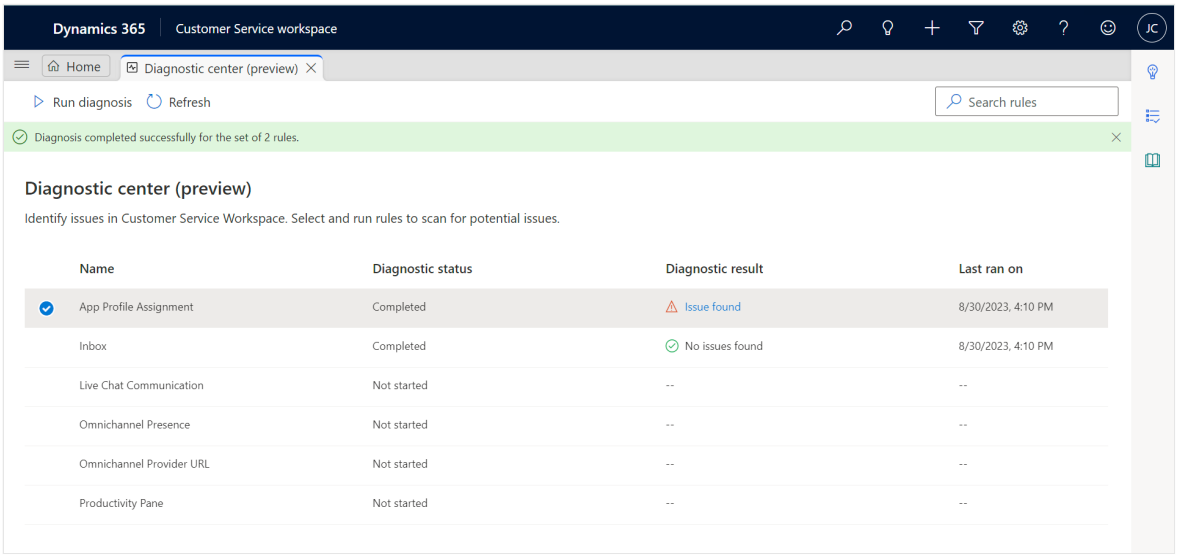
Run agent diagnostics

The rules that you can run in the agent app are specific to your permissions.

1. Sign in to Customer Service workspace.

2. After the presence loads, select **Ctrl**+**Shift**+**F12**. Optionally, you might need to select the **fn** key. The **Diagnostic center (preview)** page displays a list of tests.

3. Select one or more rules, and then select **Run diagnosis**. The rule results are displayed in the **Diagnostic result** column.



4. If you see a result as **Issue found**, select its link. The **Diagnostic Report** pane displays the issue details.

5. Select **Download Report**. The report details are available in a text file that you can share with the administrator.

6. Optionally, run the rule again after the administrator resolves the issue to make sure that no further issues are present.

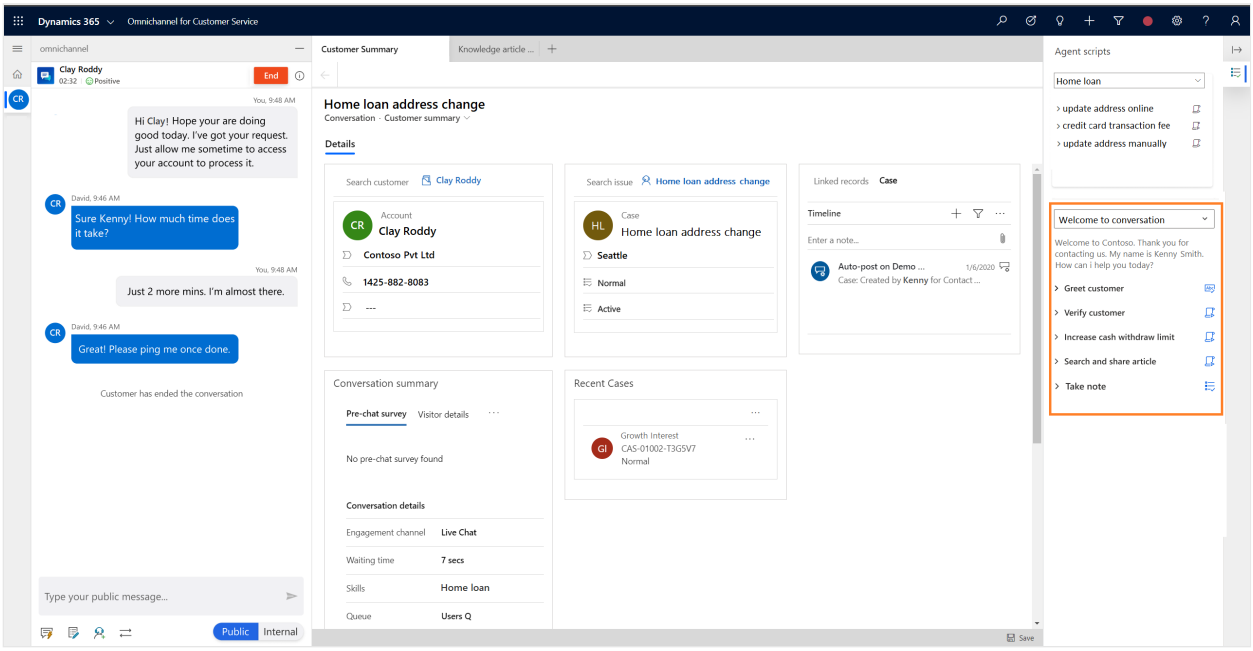
Guide customer interaction with agent scripts

Article • 05/26/2022

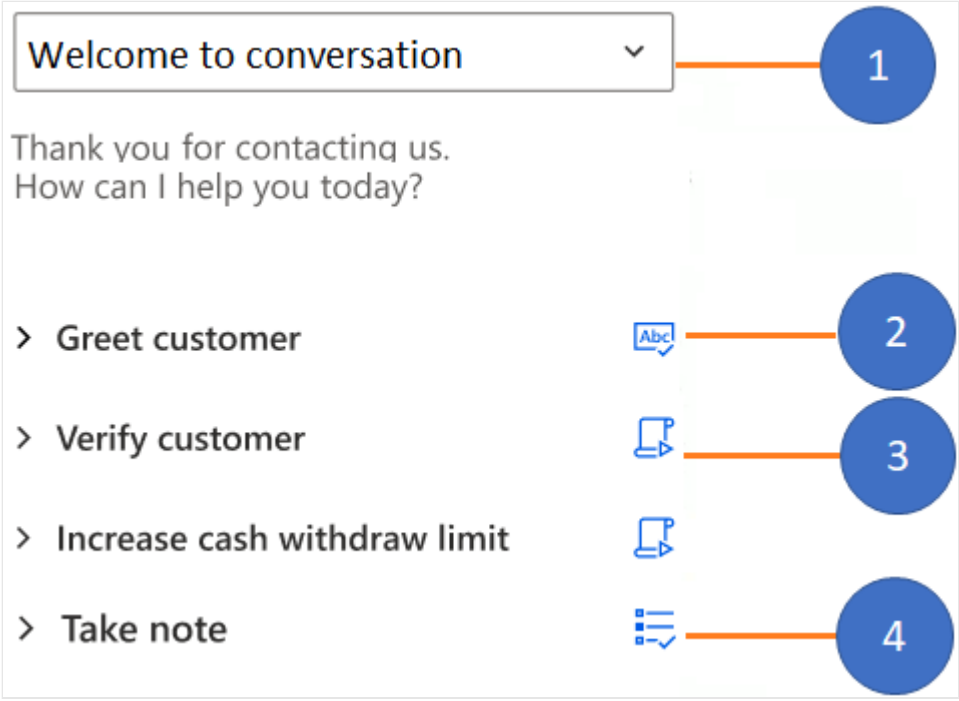
Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Overview of agent scripts

Agent scripts in Omnichannel for Customer Service provide guidance about what you (an agent) should do when you get a customer issue and ensure that you share only accurate and company-endorsed information. Agent scripts help you be accurate, effective, and efficient in customer handling.



Components in agent script



1. Agent script menu
2. Text instructions
3. Macro
4. Agent script

The agent script section consists of a set of steps. Based on the type of agent script the administrator has configured, you might see the following types:

- Text instructions
- Macro
- Agent script

Each of the steps can be identified with the actionable icon. When you expand a step, the section displays a short description of what the step entails and the action you need to perform using the icons next to it. The step that is executed successfully is indicated with a green Tick icon, and the step that has an error is indicated with a red Cross icon. You can run the steps again as needed, and the final state of the step, green Tick or red Cross, is based on the last run.

Prerequisite

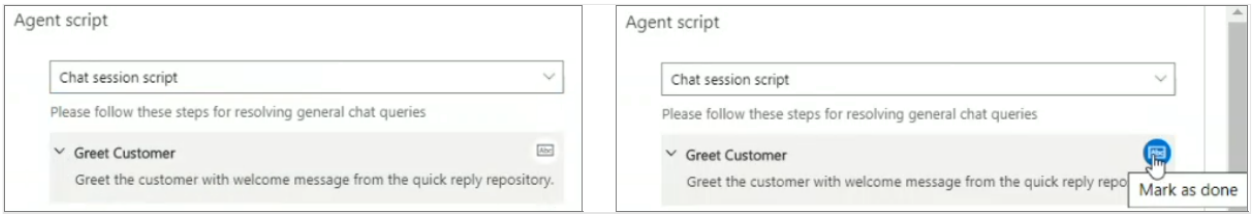
Ensure you (agent and supervisor) have the **Productivity tools user** security role. To learn more, see Assign roles and enable users.

Text instructions

The text instruction provides guidance on the actions you need to perform. The step in the agent script shows the title, instructions, and the Text instruction icon that is actionable. After you perform the step based on the instructions, you can select the **Mark as done** icon to indicate that you've completed the step.

Example:

Title	Action you need to perform
Greet customer	Greet the customer with welcome message from the quick reply repository.



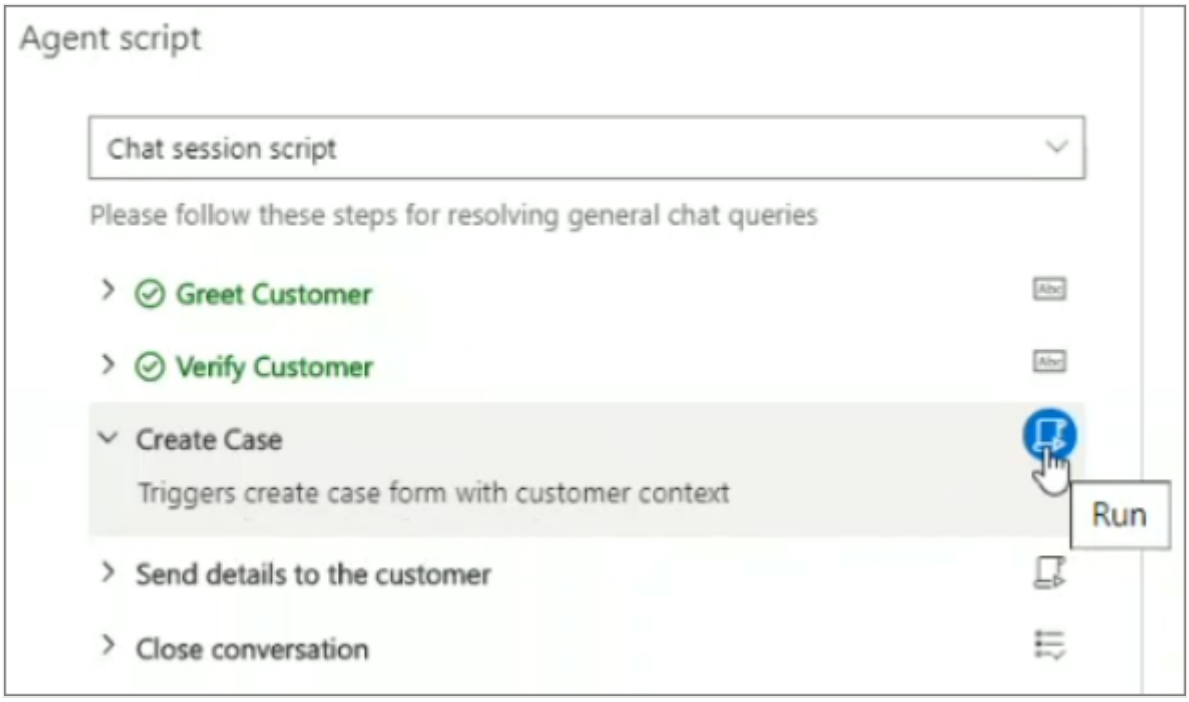
Macro

A macro is a set of instructions that tells the system how to complete a task. When a macro runs, the system performs each instruction. The **Macro** step in the agent script shows a title, instruction that system performs, and the macro icon. When you select **Run** icon, the system performs the macro.

Example:

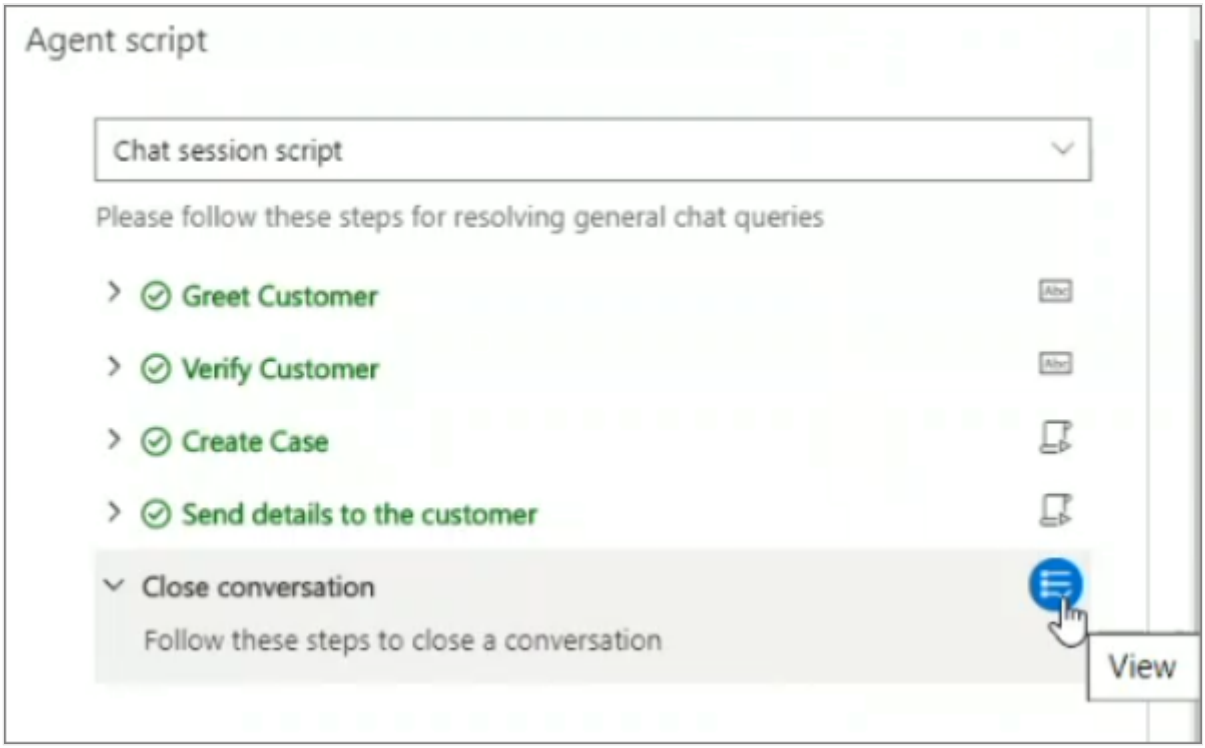
Title	Instruction system performs
Create case	Triggers create case from customer context

In this example, when an agent selects the **Macro** icon, the system opens a new **Create case** form in the application tab panel with prepopulated fields based on the customer context.



Agent script

The step is used to load another agent script from the current agent script. When you select the view icon, the system loads the agent script. You can see that newly loaded script replaces the current script in the Agent script menu.



Sample agent script

When you get an incoming conversation notification, you accept the conversation request and then a chat session starts. Now, the agent script is available in a form based

on the administrator configuration.

For example, if the administrator has configured agent scripts in the **Active Conversation** form, then you can view the agent script in the **Active Conversation** form.

Let's see the sample agent script:

- Chat session
- Close session

Below the menu you can see the description for the selected script.

When the Chat session script is selected, the step you see is:

Please follow these steps for resolving general chat queries

The **Chat session** script has the following steps

Step	Title	Instruction	Icon	Agent action
Text instruction	Greet Customer	Greet the customer with welcome message from the quick reply repository.	Mark as done	After you greet the customer, select the mark as done icon.
Text instruction	Verify Customer	Use any two of the following to verify the customer Kenny Smith: 1. Date of Birth 2. Email id 3. Zip code 4. Mobile	Mark as done	After you verify the customer, select the mark as done icon.
Macro	Create case	Triggers create case form with customer context	Run	When you select the run macro icon, the system opens a case form in a new application tab panel.
Macro	Send details to the customer	Opens email to send details to the customer	Run	When you select the run macro icon, the system opens an draft email so you can send an email to the linked customer.

Step	Title	Instruction	Icon	Agent action
Agent script	Close conversation	Follow these steps to close a conversation	View	When you select the view icon, the system loads another agent script from the current agent script. In this sample, the another agent script is **Close conversation** script.

Similarly, the administrator can create more agent scripts as per your business scenarios. To learn how to configure agent scripts, see Guide agents with scripts.

Rich messages in conversation control

Article • 11/08/2022

When conversing in supported channels, the communication panel includes an additional feature for sending rich messages. These interactive messages can help you collect and share information with customers more easily.

> **ⓘ Important**
>
> Rich messages are currently supported only in the Apple Messages for Business channel.

Start using rich messages in your conversation with one of the following options:

- Select the **Rich messages** button to launch the rich message panel.
- Use a keyboard command to see the list of rich messages. Type "/rm" (forward slash followed by the letters "rm").

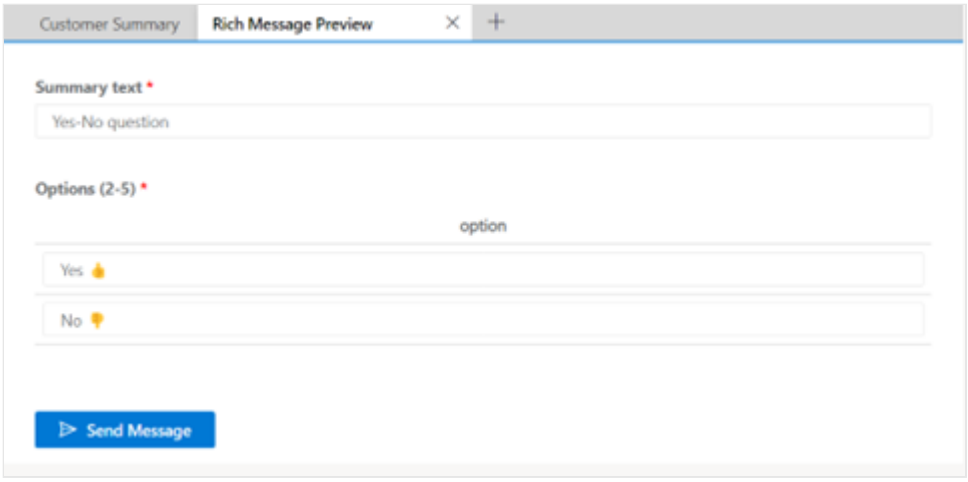
Search for rich messages and tags

After launching the rich message panel by selecting the rich message icon or typing /rm, you can type any of the following options in the compose box to search for relevant rich messages:

- Type "/rm", followed by <keyword>, to list messages that match the keyword.
- Type "/rm", followed by the number sign (#), to list all tags. All rich messages will have a tag containing their type.
- Type "/rm", followed by <tagname><keyword>, to list quick replies that match the tag and keyword.
- Type "/rm", followed by <tagname>, to list all rich messages that match the tag. Additionally, you can also add another tag after the <tagname>. For example, type "/rm", followed by <tagname> <tagname>, to further refine the rich messages matching both the tags.

View and send rich messages

When you find the rich message you want to send, you can select the rich message to open it. This will open the **Rich Message Preview** application pane.



Within the preview tab, you'll be able to see the contents of the rich message you've selected, along with a **Send Message** button. When you're ready to send a rich message, use **Send Message**.

If your administrator has enabled agent configuration, you can customize some types of rich messages before sending them. These customizations are single-use and aren't saved for the next time you send the same rich message.

> ⓘ Note
>
> As an agent, you must understand how customizable rich messages are constructed and how they appear on the customer's device before editing them.

Customizable rich messages

Some types of rich messages may need their content to be customized before they can be sent to customers. Others can be customized to add personalized touches or additional options that might change depending on context.

The following rich messages support admin-enabled customization:

Channel	Message type
Apple Messages for Business	List picker Suggested reply Time picker Video rich link Website rich link

Build a smart assist bot

Article • 02/17/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

To quickly get started, follow the instructions mentioned in this topic for building a smart assist bot that displays knowledge article recommendations to the agent. After this, you can do additional steps for creating custom scenarios.

Prerequisites

You must understand how to create a bot using Azure Bot Service.

Sample bot that displays knowledge article recommendations

For setting up a sample for smart assist bot for displaying knowledge article recommendations to the agent, please see the instructions mentioned in the sample README file.

For information on how to create a knowledge article using template, see Create a knowledge article using a template.

Sample bot that displays similar case recommendations

After setting up a sample bot using above steps, you can configure your bot to show similar case recommendations for 'printer noise' using the instructions mentioned in the topic Implement a custom scenario.

Important

See this administrator guide topic on how to enable smart assist: **Smart assist for agents**. It provides instructions on how to create a bot user, how to add a smart assist bot to a workstream and how to enable a productivity pane.

See Next: Implement a custom scenario for smart assist bot

Implement a custom scenario for smart assist bot

Article • 08/09/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

This topic provides information on how you can enable similar case suggestions in your smart assist bot.

Prerequisites

> **Important**
>
> Read the topic **Build a smart assist bot** for information on how to get started with building a custom smart assist bot.

- You need to have an understanding on how to create a bot using Azure Bot Service.
- Create a LUIS app by following the instructions mentioned in Add natural language understanding to your bot. See the section Retrieve application information from the LUIS.ai portal for information on how to retrieve the values you need to setup the bot.

Scenario: Similar case suggestion

This scenario enables you to suggest similar cases with open case action button. The customer service agent is presented with a list of similar cases as a recommendation. The agent clicks on the case that they finds most similar and relevant, and then goes to the case note and looks at the resolution in note. The agent suggests the same resolution to the customer over chat.

Generate intent to interpret the context of the conversation

It is necessary analyze the conversation and understand its context before recommending an action to the agent. Use Language Understanding (LUIS) to find the intent of the ongoing conversation. Here is an example on how you can create a LUIS app to find intent from a given text: Quickstart: Use prebuilt Home automation app.

You can create intents for each issue type or topic that you want to address for incoming requests from customers or the most common topics being discussed.

For the example scenario of similar case recommendations for 'printer noise' issue, create an intent with the same name and add 10-15 examples like 'printer noise, loud noise from printer, printer making grinding noise, loud clicking noise, loud sound' etc. The LUIS app then needs to be trained for this intent.

Author adaptive cards to display recommendations in the smart assist UI

Adaptive cards is an open-source standard that helps apps and services exchange rich snippets of native UI.

Custom actions for implementing custom functionalities

Custom actions can help you implement custom functionalities in your smart assist bot.

Given below are the steps for enabling the similar case scenario.

1. **Set up Similarity Rules**

Setup similarity rule by following the steps 1 to 7 in mentioned here: Create a new similarity rule to view similar cases.

2. **Turn Relevance search ON**

Turn On Relevance Search in the administrator section. More information: Enable a field for exact matching of similar cases.

3. **Similar cases API**

Similar cases can be fetched using the `GetSimilarRecords` function. But before you execute the Web API query with this function, make sure that you have set up similarity rules. More information: Use advanced similarity rules to view similar case suggestions.

Also, make sure to enable **Relevance Search** in the administrator section to ensure that similarity rules work in the expected manner. Also, in the **Match Field** section add a few criteria such as case title and case type.

Request

HTTP

```
GET [Organization
URI]/api/data/v9.1/GetSimilarRecords(Id=@Id,Filter=@Filter,ReturnFields=@Ret
urnFields)?@Id={"@odata.id":"incidents(<incident
id>)"}&@Filter=null&@ReturnFields={"AllColumns":false,"Columns":
["title","description"]}
Accept: application/json
OData-MaxVersion: 4.0
OData-Version: 4.0
```

Replace the `incident id` in the Web API request above with the unique identifier of the case for which you want to find similar cases.

Response

JSON

```
{
    "@odata.context": "[Organization
URI]/api/data/v9.1/$metadata#incidents",
    "value": [
        {
            "@odata.type": "#Microsoft.Dynamics.CRM.incident",
            "@odata.etag": "W/\"1571835\"",
            "title": "Product question re warranty",
            "modifiedon": "2019-03-03T12:58:25Z",
            "incidentid": "f69e62a8-90df-e311-9565-a45d36fc5fe8"
        },
        {
            "@odata.type": "#Microsoft.Dynamics.CRM.incident",
            "@odata.etag": "W/\"1572750\"",
            "title": "Shipment question re order",
            "modifiedon": "2019-03-03T12:58:27Z",
            "incidentid": "129f62a8-90df-e311-9565-a45d36fc5fe8"
        }
    ]
}
```

Calling custom actions using adaptive cards

You will have to create a web resource if you want to use embed a custom action within a suggestion. See the Power Apps topic on Create your own actions for information on how to build a custom action. See the topic Web resources in model-driven apps for information on how to create web resources. These web resources will have to be uploaded under the **Active Conversation** form. Given below are the supported custom actions.

OpenForm custom action

This custom action enables you to open any entity record.

JSON

```
{
              "type": "Action.Submit",
              "title": "Open",
              "data": {
                            "CustomAction": "OpenForm",
                            "CustomParameters": {
                                          "entityName": "incident",
                                          "entityId": "c3356c37-bba6-4067-
b1a1-8c66e1c203a1",
                                          "data": {}
                            }
              }
}
```

SendKB custom action

This custom action enables you to send a knowledge base article.

> **Note**
>
> The `CustomAction` key should contain `SendKB` and `kbLink` key should contain the link of the KB article. You cannot have another custom action with the same name as `SendKB`.

JSON

```
{

          "type": "Action.Submit",
          "title": "Send",
          "data": {
                        "CustomAction": "SendKB",
                        "CustomParameters": {
                        "kbLink":
```

```
"https://ocddemoebc.powerappsportals.com/knowledgebase/article/KA-01011/en-
us"
                    }
            }
}
```

You can use the client-side APIs to open knowledge base articles. See Client API reference for model driven apps for more information.

Retrieve and format rich messages

Article • 03/17/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Because the Power Virtual Agents and Omnichannel for Customer Service platforms process rich messages differently, you'll need to modify the strings to get valid `MessageObject` type strings that can be sent via the `sendMessageToConversation` method to the conversation. You must process the rich message payload before sending it to the conversation, else the method will send the desired rich object payload in plain `String` format.

This articles describes how you can programmatically retrieve and format rich messages that can then be passed using the `MessageObject` type to the `sendMessageToConversation` method.

Retrieve the rich message payload

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Productivity** in **Agent experience**.
   b. On the **Productivity** page, select **Manage** for **Rich messages**.

2. From the list of all available list messages, select a rich message that you'd like to send to the conversation.

3. Select the **Details** tab and select **Copy** under the **Rich message JSON** field.

You'll use this JSON value when you format the rich message types.

Format rich messages

This section includes JSON samples for the rich message types available in the Apple Messages for Business channel in Omnichannel for Customer Service. More information: Manage rich messages

> **Note**
>
> You can't send rich messages of the Forms type to conversations.

Apple Pay

JavaScript

```
let applePayJSON = // <copy_and_paste_details_content>
applePayJSON.survey = { Questions: JSON.parse(applePayJSON.survey)
[0].Questions, Answers: JSON.parse(applePayJSON.survey)[1].Answers };
applePayJSON.survey.Answers.AppleMessagesforBusinessJSON =
JSON.parse(applePayJSON.survey.Answers.AppleMessagesforBusinessJSON);
applePayJSON.survey.Answers.AppleMessagesforBusinessJSON =
JSON.stringify(applePayJSON.survey.Answers.AppleMessagesforBusinessJSON);
applePayJSON.survey = JSON.stringify(applePayJSON.survey);

// Can now send this payload using the API
Microsoft.Omnichannel.sendMessageToConversation(applePayJSON, false);

// Or take the JSON elsewhere for use in bringing your own logic
copy(applePayJSON);
```

Authentication

JavaScript

```
let authJSON = // <copy_and_paste_details_content>
authJSON.survey = { Questions: JSON.parse(authJSON.survey)[0].Questions,
Answers: JSON.parse(authJSON.survey)[1].Answers };
authJSON.survey = JSON.stringify(authJSON.survey);

// Can now send this payload using the API
Microsoft.Omnichannel.sendMessageToConversation(authJSON, false);

// Or take the JSON elsewhere for use in bringing your own logic
copy(authJSON);
```

Custom JSON (iMessage Application)

JavaScript

```
let customJSON = // <copy_and_paste_details_content>
customJSON.survey = { Questions: JSON.parse(customJSON.survey)[0].Questions,
Answers: JSON.parse(customJSON.survey)[1].Answers };
customJSON.survey.Answers.AppleMessagesforBusinessJSON =
JSON.parse(customJSON.survey.Answers.AppleMessagesforBusinessJSON);
customJSON.survey.Answers.AppleMessagesforBusinessJSON =
JSON.stringify(customJSON.survey.Answers.AppleMessagesforBusinessJSON);
customJSON.survey = JSON.stringify(customJSON.survey);

// Can now send this payload using the API
Microsoft.Omnichannel.sendMessageToConversation(customJSON, false);

// Or take the JSON elsewhere for use in bringing your own logic
copy(customJSON);
```

List Picker

JavaScript

```
listPickerJSON = // <copy_and_paste_details_content>
listPickerJSON.survey = { Questions: JSON.parse(lpFromDetails.survey)
[0].Questions, Answers: JSON.parse(listPickerJSON.survey)[1].Answers };
listPickerJSON.survey = JSON.stringify(listPickerJSON.survey);

// Can now send this payload using the API
Microsoft.Omnichannel.sendMessageToConversation(listPickerJSON, false);

// Or take the JSON elsewhere for use in bringing your own logic
copy(listPickerJSON);
```

Suggested Reply

JavaScript

```
suggestedReplyJSON = // <copy_and_paste_details_content>
suggestedReplyJSON.survey = { Questions:
JSON.parse(suggestedReplyJSON.survey)[0].Questions, Answers:
JSON.parse(suggestedReplyJSON.survey)[1].Answers };
suggestedReplyJSON.survey = JSON.stringify(suggestedReplyJSON.survey);

// Can now send this payload using the API
Microsoft.Omnichannel.sendMessageToConversation(suggestedReplyJSON, false);

// Or take the JSON elsewhere for use in bringing your own logic
copy(suggestedReplyJSON);
```

Time Picker

JavaScript

```
timePickerJSON = // <copy_and_paste_details_content>
timePickerJSON.survey = { Questions: JSON.parse(timePickerJSON.survey)
[0].Questions, Answers: JSON.parse(timePickerJSON.survey)[1].Answers };
timePickerJSON.survey = JSON.stringify(timePickerJSON.survey);

// Can now send this payload using the API
Microsoft.Omnichannel.sendMessageToConversation(timePickerJSON, false);

// Or take the JSON elsewhere for use in bringing your own logic
copy(timePickerJSON);
```

Video Rich Link

JavaScript

```
videoRichLinkJSON = // <copy_and_paste_details_content>
videoRichLinkJSON.survey = { Questions: JSON.parse(videoRichLinkJSON.survey)
[0].Questions, Answers: JSON.parse(videoRichLinkJSON.survey)[1].Answers };
timePickerJSON.survey = JSON.stringify(videoRichLinkJSON.survey);

// Can now send this payload using the API
Microsoft.Omnichannel.sendMessageToConversation(videoRichLinkJSON, false);

// Or take the JSON elsewhere for use in bringing your own logic
copy(videoRichLinkJSON);
```

Website Rich Link

JavaScript

```
websiteRichLinkJSON = // <copy_and_paste_details_content>
websiteRichLinkJSON.survey = { Questions:
JSON.parse(websiteRichLinkJSON.survey)[0].Questions, Answers:
JSON.parse(websiteRichLinkJSON.survey)[1].Answers };
timePickerJSON.survey = JSON.stringify(websiteRichLinkJSON.survey);

// Can now send this payload using the API
Microsoft.Omnichannel.sendMessageToConversation(websiteRichLinkJSON, false);

// Or take the JSON elsewhere for use in bringing your own logic
copy(websiteRichLinkJSON);
```

Manage Copilot features in Customer Service

Article • 10/20/2023

Copilot in Customer Service provides real-time AI assistance that helps agents automate time-consuming tasks to handle cases efficiently and resolve issues faster so that they can deliver value to customers.

Enable the Copilot features for agents to use Copilot to:

- Respond to questions
- Compose an email
- Draft a chat response
- Summarize a case and conversation

> **Note**
>
> Respond to questions, Compose an email, and summarize case and conversations are generally available in the North America region only. This feature is in preview in the rest of the supported regions.

License requirements

Requirement type	You must have
License	• Dynamics 365 Customer Service Enterprise for summarize cases, ask a question, draft emails, and copilot analytics • Customer Service add-in (Chat, Digital Messaging, or Voice) for draft a chat response and summarize conversations

Prerequisites

- You have the System Administrator role.
- Knowledge management is configured in your environment.
- Your knowledge article parameters are as follows:
  - Updated with the latest version
  - The state is set to Published

- The locale is set to English

Region availability and supported languages

Copilot AI features are available by default to only those customers with environments that have United States as their geography for data processing and storage. See: Region availability of analytics and insights.

For enabling the Copilot features outside the United States, see Copilot data movement across geographies.

To learn about supported languages for Copilot, see Language support for AI-based analytics and insights in Customer Service.

Enable public preview for geographies outside of United States

1. Enable cross geo support based on your location.
2. Go to Power Platform admin center and select **Environments**.
3. Select the environment in which you'd like to enable the copilot features, and then copy the value of the **Organization ID**.
4. Email a request to `d365_csaipreview@microsoft.com` with your **Organization ID** to enable the preview.

Opt in to continue with Copilot setup

Before you enable a Copilot feature, review the terms and conditions, and then provide your consent to use Copilot. To opt in, go to the **Copilot help pane** or **Summaries** pages in Customer Service admin center, and then select **Opt in** to continue with the setup.

Record feedback

In the **Summaries** and **Copilot help pane** configuration pages, you can select **Record transcripts of agent interaction with Copilot, agent actions, and agent feedback on AI suggestions** to record and understand how agents are interacting with Copilot and how Copilot is performing in a support organization. Agents can also share feedback about Copilot actions, which helps Copilot perform better. You can use the data to analyze knowledge sources, and also build usage reports.

Make Copilot available to agents

For agents to be able to use the copilot help pane and copilot summaries in Customer Service workspace, you need to enable the copilot features in agent experience profiles. For Customer Service Hub, when you enable the feature, it will be available to all the agents.

1. Go to Agent experience profiles in **Agent experience** > **Workspaces**.
2. Select the required agent experience profile.
3. In the **Productivity Pane**, select **Turn On** for **Copilot**. The **Copilot AI features** section appears.
4. In **Copilot AI features**, select the required features **Ask a question**, **Scan customer conversation and suggest a response**, **Write an email**, **Case summary**, **Live conversation summary**, you want to enable for that profile.

Assign roles and privileges

Out of the box, users with the Customer Service Representative role only can use the copilot features. Therefore, make sure that users with custom roles have the following privileges:

- prvCreatemsdyn_copilotinteraction
- prvAppendmsdyn_copilotinteraction
- prvCreatemsdyn_copilotinteractiondata
- prvReadmsdyn_copilotagentpreference
- prvCreatemsdyn_copilotagentpreference
- prvWritemsdyn_copilotagentpreference
- prvReadmsdyn_agentcopilotsetting
- prvReadmsdyn_copilotsummarizationsetting
- prvReadmsdyn_conversationinsight
- prvWritemsdyn_copilottranscriptdata
- prvAppendTomsdyn_copilottranscriptdata
- prvReadmsdyn_copilottranscript
- prvCreatemsdyn_copilottranscript
- prvWritemsdyn_copilottranscript
- prvAppendTomsdyn_copilottranscript
- prvReadmsdyn_copilottranscriptdata
- prvCreatemsdyn_copilottranscriptdata
- prvWritemsdyn_copilottranscriptdata
- prvAppendmsdyn_copilottranscriptdata
- prvIntelligenceUsage

More information: Security roles and privileges

Data sharing for copilot features

You can enable data sharing for Dynamics 365 copilot features in the Power Platform admin center. This allows Microsoft to capture and manually review customer data including, but not limited to, users' natural language inputs, outputs, and related telemetry to build, improve, and/or validate Microsoft's features, services, machine learning models, and related systems for Dynamics 365 and Power Platform Copilot AI features. We don't use customer data to train Azure OpenAI Service foundation models.

More information: Tenant settings and FAQ for optional data sharing for Copilot AI features in Dynamics 365 and Power Platform

Enable Copilot case and conversation summaries

Article • 10/18/2023

Copilot case and conversation summaries help you to quickly understand the context of a case and resolve customer issues more efficiently.

> ⓘ **Note**
>
> Copilot conversation and case summaries are generally available in the North America region only. This feature is in preview in the rest of the supported regions.

Enable case summaries

Case summaries help agents understand the context of a case, enabling them to resolve customer issues efficiently. Agents get a concise summary of the case with the case title, customer, case subject, product, priority, case type, and case description.

1. In Customer Service admin center, select **Make Copilot available to agents** in **Copilot help pane (preview)** for Copilot case summaries to be available.
2. Use one of the following navigation options:

    - **Agent Experience** > **Productivity** > **Summaries**
    - **Operations** > **Insights** > **Summaries**

3. Select **Manage** in **Summaries**.
4. Select **Make case summaries available to agents** to display a summary of the case on the **Case** page.

Perform the steps in Display case summary on custom case forms for the Copilot case summary to be displayed on custom case forms.

Enable conversation summaries

Conversation summaries enable agents to collaborate effectively with other agents and contacts, by enabling agents to easily recap an ongoing chat or a transcribed voice conversation.

For Copilot to automatically trigger a conversation summary for a live conversation, in Customer Service admin center, select the following options on the **Summaries** page:

- **When an agent joins a conversation**: Generates a summary when an agent joins a conversation. A summary is also generated when the primary agent invites a collaborator and a second agent joins the conversation or when the primary agent transfers a conversation.
- **When a conversation ends**: Generates a summary when the conversation ends.
  - Select **Allow agents to create case with a button in the summary** to allow agents to see the **Create case** button in the conversation summary. A new case is created when the agent selects **Create case**.
- **On demand, by selecting a button to summarize the conversation**: Generate a summary at any point in the conversation, whenever the agent selects the copilot **Summarize conversation**.

Next steps

Use Copilot to summarize cases and conversations Enable features in Copilot pane

Enable Copilot case and conversation summaries

Article • 10/18/2023

Copilot case and conversation summaries help you to quickly understand the context of a case and resolve customer issues more efficiently.

> ⓘ **Note**

> Copilot conversation and case summaries are generally available in the North America region only. This feature is in preview in the rest of the supported regions.

Enable case summaries

Case summaries help agents understand the context of a case, enabling them to resolve customer issues efficiently. Agents get a concise summary of the case with the case title, customer, case subject, product, priority, case type, and case description.

1. In Customer Service admin center, select **Make Copilot available to agents** in **Copilot help pane (preview)** for Copilot case summaries to be available.
2. Use one of the following navigation options:

    - **Agent Experience** > **Productivity** > **Summaries**
    - **Operations** > **Insights** > **Summaries**

3. Select **Manage** in **Summaries**.
4. Select **Make case summaries available to agents** to display a summary of the case on the **Case** page.

Perform the steps in Display case summary on custom case forms for the Copilot case summary to be displayed on custom case forms.

Enable conversation summaries

Conversation summaries enable agents to collaborate effectively with other agents and contacts, by enabling agents to easily recap an ongoing chat or a transcribed voice conversation.

For Copilot to automatically trigger a conversation summary for a live conversation, in Customer Service admin center, select the following options on the **Summaries** page:

- **When an agent joins a conversation**: Generates a summary when an agent joins a conversation. A summary is also generated when the primary agent invites a collaborator and a second agent joins the conversation or when the primary agent transfers a conversation.
- **When a conversation ends**: Generates a summary when the conversation ends.
  - Select **Allow agents to create case with a button in the summary** to allow agents to see the **Create case** button in the conversation summary. A new case is created when the agent selects **Create case**.
- **On demand, by selecting a button to summarize the conversation**: Generate a summary at any point in the conversation, whenever the agent selects the copilot **Summarize conversation**.

Next steps

Use Copilot to summarize cases and conversations Enable features in Copilot pane

Enable features in Copilot pane

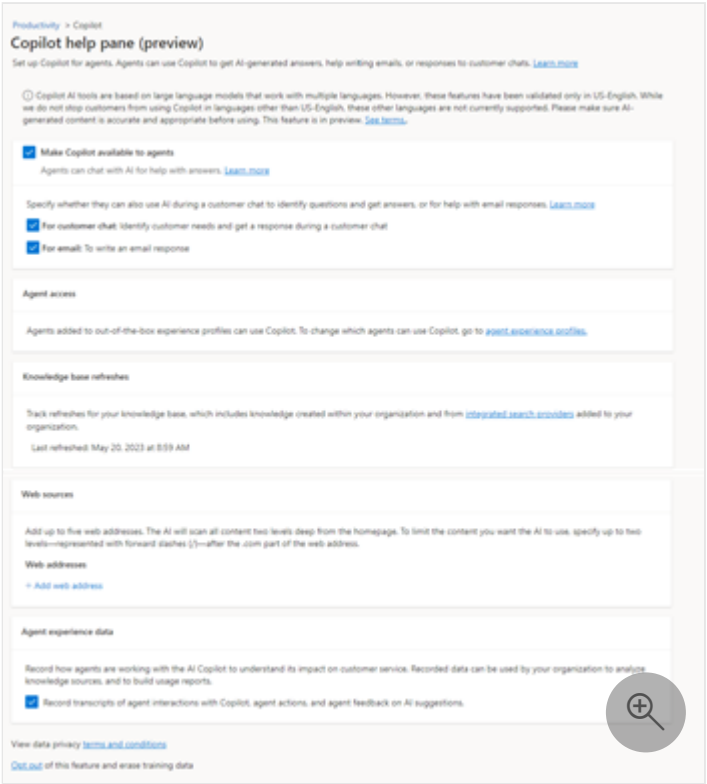
Article • 10/20/2023

The Copilot help pane allows agents to use Copilot features such as respond to questions, compose an email, and draft a chat response in Customer Service workspace.

> **Note**
>
> Respond to questions and compose an email features are generally available in the North America region only. These features are in preview in the rest of the supported regions.

Perform the following steps to enable the Copilot features in Customer Service admin center:

1. Use one of the following navigation options:
    - **Agent Experience** > **Productivity** > **Copilot help pane**
    - **Operations** > **Insights** > **Copilot help pane**
2. Select **Manage** in **Copilot help pane**. The **Copilot help pane** page appears. You can select the Copilot features you'd like to enable for agents on this page.



Features supported with different knowledge sources

The following table summarizes the Copilot features supported for a configured knowledge source.

Feature	Knowledge base	External web resources
Ask a question	✓	X
Write an email	✓	✓
Draft a response	✓	✓

Enable ask a question

Select **Make Copilot available to agents** in the **Copilot help pane** page of Customer Service admin center. The **Ask a question** tab on the **Copilot help pane** appears when agents sign in to Customer Service workspace. Agents can ask questions conversationally, and Copilot answers the questions based on the internal and external knowledge base sources and trusted domains.

Enable draft a response (Preview)

> **ⓘ Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and may have restricted functionality. These features are available before an official release so that customers can get early access and provide feedback.

Select **For customer chat** in the **Copilot help pane** page of Customer Service admin center. The one-click response generation button appears on both the conversation panel for a conversation and on the **Ask a question** tab on the Copilot help pane in Customer Service workspace. Copilot retrieves the context and drafts the response based on the knowledge resources configured for your organization.

Enable write an email

Select **For email** in the **Copilot help pane** page of Customer Service admin center. The **Write an email** tab appears on **Copilot help pane** in Customer Service. Copilot helps agents create email responses based on the context of the case.

Add trusted webpages as sources

You can select **Add web address** in **Web resources** to add trusted domains. You can add up to five trusted web domains for Copilot to search and generate responses from. Copilot searches for information up to two levels down from the configured domain.

Copilot uses articles that are two nodes down the configured domain.

> **Note**
>
> - The knowledge base content is refreshed every day.
> - Web domains are used by Copilot to only draft emails and chat replies.

Set up filters

Filters enable Copilot to generate responses based on a specific set of topics. You can set up filters for ask a question and draft a response features by sending an email a request to d365_csaipreview@microsoft.com. See: Apply filters.

Use Copilot to solve customer issues

Enable features in Copilot pane

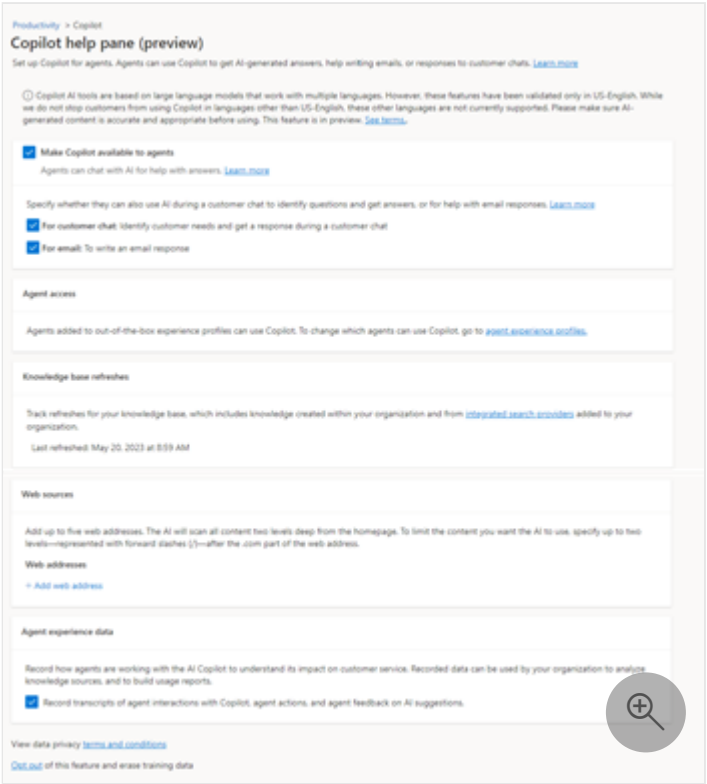
Article • 10/20/2023

The Copilot help pane allows agents to use Copilot features such as respond to questions, compose an email, and draft a chat response in Customer Service workspace.

> **Note**
>
> Respond to questions and compose an email features are generally available in the North America region only. These features are in preview in the rest of the supported regions.

Perform the following steps to enable the Copilot features in Customer Service admin center:

1. Use one of the following navigation options:
    - **Agent Experience** > **Productivity** > **Copilot help pane**
    - **Operations** > **Insights** > **Copilot help pane**
2. Select **Manage** in **Copilot help pane**. The **Copilot help pane** page appears. You can select the Copilot features you'd like to enable for agents on this page.



Features supported with different knowledge sources

The following table summarizes the Copilot features supported for a configured knowledge source.

Feature	Knowledge base	External web resources
Ask a question	✓	X
Write an email	✓	✓
Draft a response	✓	✓

Enable ask a question

Select **Make Copilot available to agents** in the **Copilot help pane** page of Customer Service admin center. The **Ask a question** tab on the **Copilot help pane** appears when agents sign in to Customer Service workspace. Agents can ask questions conversationally, and Copilot answers the questions based on the internal and external knowledge base sources and trusted domains.

Enable draft a response (Preview)

> **ⓘ Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and may have restricted functionality. These features are available before an official release so that customers can get early access and provide feedback.

Select **For customer chat** in the **Copilot help pane** page of Customer Service admin center. The one-click response generation button appears on both the conversation panel for a conversation and on the **Ask a question** tab on the Copilot help pane in Customer Service workspace. Copilot retrieves the context and drafts the response based on the knowledge resources configured for your organization.

Enable write an email

Select **For email** in the **Copilot help pane** page of Customer Service admin center. The **Write an email** tab appears on **Copilot help pane** in Customer Service. Copilot helps agents create email responses based on the context of the case.

Add trusted webpages as sources

You can select **Add web address** in **Web resources** to add trusted domains. You can add up to five trusted web domains for Copilot to search and generate responses from. Copilot searches for information up to two levels down from the configured domain.

Copilot uses articles that are two nodes down the configured domain.

> **Note**
>
> - The knowledge base content is refreshed every day.
> - Web domains are used by Copilot to only draft emails and chat replies.

Set up filters

Filters enable Copilot to generate responses based on a specific set of topics. You can set up filters for ask a question and draft a response features by sending an email a request to d365_csaipreview@microsoft.com. See: Apply filters.

Manage Copilot features in Customer Service

Article • 10/20/2023

Copilot in Customer Service provides real-time AI assistance that helps agents automate time-consuming tasks to handle cases efficiently and resolve issues faster so that they can deliver value to customers.

Enable the Copilot features for agents to use Copilot to:

- Respond to questions
- Compose an email
- Draft a chat response
- Summarize a case and conversation

> **Note**
>
> Respond to questions, Compose an email, and summarize case and conversations are generally available in the North America region only. This feature is in preview in the rest of the supported regions.

License requirements

Requirement type	You must have
License	• Dynamics 365 Customer Service Enterprise for summarize cases, ask a question, draft emails, and copilot analytics • Customer Service add-in (Chat, Digital Messaging, or Voice) for draft a chat response and summarize conversations

Prerequisites

- You have the System Administrator role.
- Knowledge management is configured in your environment.
- Your knowledge article parameters are as follows:
  - Updated with the latest version
  - The state is set to Published

- The locale is set to English

Region availability and supported languages

Copilot AI features are available by default to only those customers with environments that have United States as their geography for data processing and storage. See: Region availability of analytics and insights.

For enabling the Copilot features outside the United States, see Copilot data movement across geographies.

To learn about supported languages for Copilot, see Language support for AI-based analytics and insights in Customer Service.

Enable public preview for geographies outside of United States

1. Enable cross geo support based on your location.
2. Go to Power Platform admin center and select **Environments**.
3. Select the environment in which you'd like to enable the copilot features, and then copy the value of the **Organization ID**.
4. Email a request to `d365_csaipreview@microsoft.com` with your **Organization ID** to enable the preview.

Opt in to continue with Copilot setup

Before you enable a Copilot feature, review the terms and conditions, and then provide your consent to use Copilot. To opt in, go to the **Copilot help pane** or **Summaries** pages in Customer Service admin center, and then select **Opt in** to continue with the setup.

Record feedback

In the **Summaries** and **Copilot help pane** configuration pages, you can select **Record transcripts of agent interaction with Copilot, agent actions, and agent feedback on AI suggestions** to record and understand how agents are interacting with Copilot and how Copilot is performing in a support organization. Agents can also share feedback about Copilot actions, which helps Copilot perform better. You can use the data to analyze knowledge sources, and also build usage reports.

Make Copilot available to agents

For agents to be able to use the copilot help pane and copilot summaries in Customer Service workspace, you need to enable the copilot features in agent experience profiles. For Customer Service Hub, when you enable the feature, it will be available to all the agents.

1. Go to Agent experience profiles in **Agent experience** > **Workspaces**.
2. Select the required agent experience profile.
3. In the **Productivity Pane**, select **Turn On** for **Copilot**. The **Copilot AI features** section appears.
4. In **Copilot AI features**, select the required features **Ask a question**, **Scan customer conversation and suggest a response**, **Write an email**, **Case summary**, **Live conversation summary**, you want to enable for that profile.

Assign roles and privileges

Out of the box, users with the Customer Service Representative role only can use the copilot features. Therefore, make sure that users with custom roles have the following privileges:

- prvCreatemsdyn_copilotinteraction
- prvAppendmsdyn_copilotinteraction
- prvCreatemsdyn_copilotinteractiondata
- prvReadmsdyn_copilotagentpreference
- prvCreatemsdyn_copilotagentpreference
- prvWritemsdyn_copilotagentpreference
- prvReadmsdyn_agentcopilotsetting
- prvReadmsdyn_copilotsummarizationsetting
- prvReadmsdyn_conversationinsight
- prvWritemsdyn_copilottranscriptdata
- prvAppendTomsdyn_copilottranscriptdata
- prvReadmsdyn_copilottranscript
- prvCreatemsdyn_copilottranscript
- prvWritemsdyn_copilottranscript
- prvAppendTomsdyn_copilottranscript
- prvReadmsdyn_copilottranscriptdata
- prvCreatemsdyn_copilottranscriptdata
- prvWritemsdyn_copilottranscriptdata
- prvAppendmsdyn_copilottranscriptdata
- prvIntelligenceUsage

Data sharing for copilot features

You can enable data sharing for Dynamics 365 copilot features in the Power Platform admin center. This allows Microsoft to capture and manually review customer data including, but not limited to, users' natural language inputs, outputs, and related telemetry to build, improve, and/or validate Microsoft's features, services, machine learning models, and related systems for Dynamics 365 and Power Platform Copilot AI features. We don't use customer data to train Azure OpenAI Service foundation models.

Copilot data movement across geographies (preview)

Article • 09/28/2023

[This article is prerelease documentation and is subject to change.]

> **ⓘ Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and may have restricted functionality. These features are available before an official release so that customers can get early access and provide feedback.

Copilot AI features use Azure OpenAI Service and are provided by default to only those customers with environments that have United States as their geography for data processing and storage. While the Azure OpenAI Service is available in multiple geographies including Australia, Canada, United States, France, Japan and UK, Copilot does not follow the same regional rollout schedule.

Meanwhile, customers with environments outside the United States can use Copilot AI features by opting in to share relevant data with the Azure OpenAI Service in United States or Switzerland.

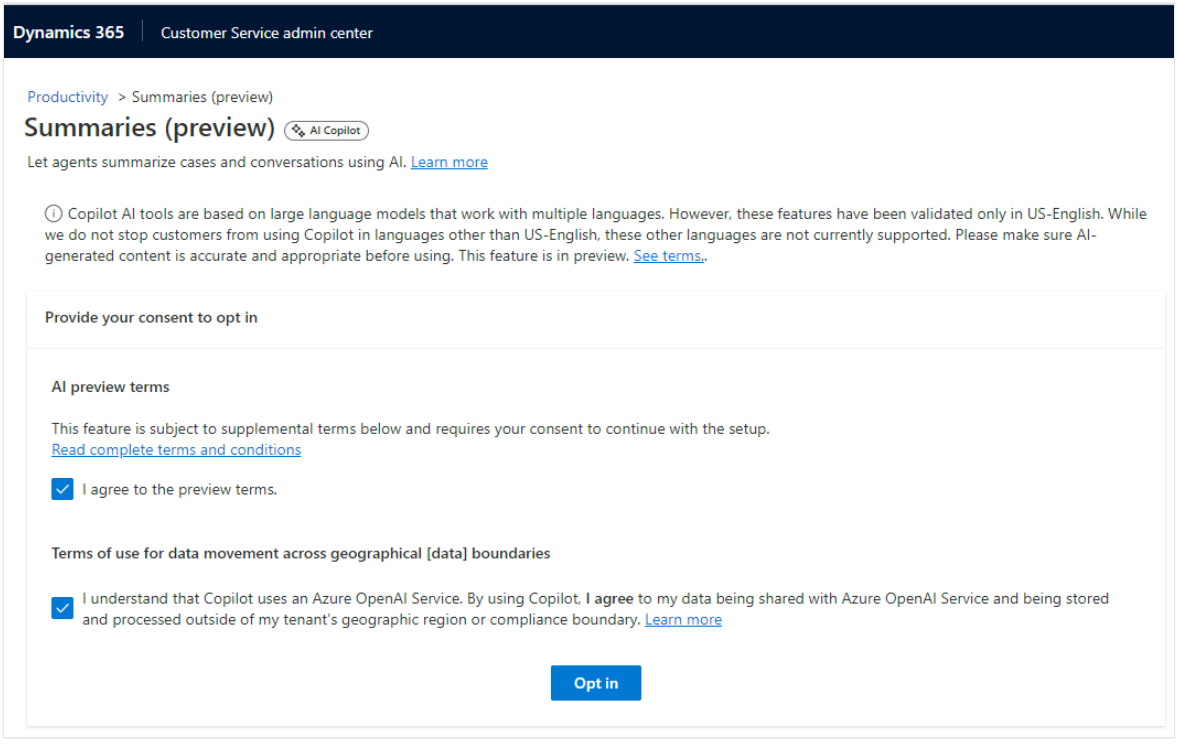
The information in the following table outlines the Azure OpenAI service that's used by the Copilot services based on the geography of their Dynamics 365 environment when they opt-in to share data.

Copilot availability	Dynamics 365 geography	Azure OpenAI geography
Yes	Asia Pacific	United States
Yes	Australia	United States
Yes	Canada	United States
No	China	N/A
Yes	Europe	Switzerland
Yes	France	Switzerland
Yes	Germany	Switzerland

Copilot availability	Dynamics 365 geography	Azure OpenAI geography
No	Government Community Cloud (GCC)	N/A
Yes	India	United States
Yes	Japan	United States
No	Korea	N/A
No	Norway	N/A
No	Singapore	N/A
No	South Africa	N/A
Yes	South America	United States
Yes	Switzerland	Switzerland
Yes	United Arab Emirates	United States
Yes	United Kingdom	Switzerland
Yes	United States	United States

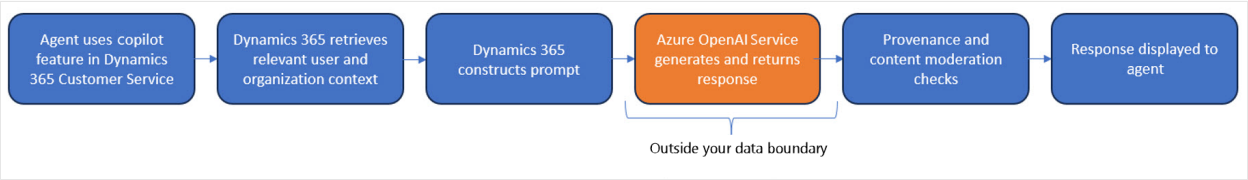
The copilot AI opt-in is in limited preview. Do the following steps to opt-in to data movement across geographies:

1. Send an email to `d365_csaipreview@microsoft.com` with the Organization ID of the Dynamics 365 instance where you want to use Copilot. In two business days, the copilot setup experience will be visible in your Dynamics 365 instance.



2. Opt-in and set up Copilot using Enable copilot features in Customer Service. The opt-in terms don't apply to organizations in the United States and therefore aren't visible to them.

When you use any copilot feature in an organization that's outside the United States or Switzerland geography, your data, including personal data, that's used in prompts or returned in responses might be transmitted outside the geographic locations that you've selected for your primary data residency.



To learn more about how Azure OpenAI protects your data, read Data, privacy, and security for Azure OpenAI Service.

Examples of customer data, along with personal data that's shared with Azure OpenAI, include relevant customer and agent chat messages, emails, case attributes, knowledge articles, agent name, email address, and customer name. Personal information is used to provide replies to a specific user.

Configure copilot capabilities

Use Copilot to solve customer issues

Article • 09/28/2023

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and may have restricted functionality. These features are available before an official release so that customers can get early access and provide feedback.

Copilot is an AI-powered tool that revolutionizes the agent experience in Dynamics 365 Customer Service. It provides real-time assistance to resolve issues faster, handle cases more efficiently, and automate time-consuming tasks so you can focus on delivering high-quality service to your customers.

> **Important**
>
> The AI-generated content is a suggestion. It's your responsibility to review and edit the suggested content to make sure it's accurate and appropriate before sharing the responses.

License requirements

Requirement type	You must have
License	• Dynamics 365 Customer Service Enterprise for summarize cases, ask a question, draft emails, and copilot analytics • Customer Service add-in (Chat, Digital Messaging, or Voice) for draft a chat response and summarize conversations

Prerequisites

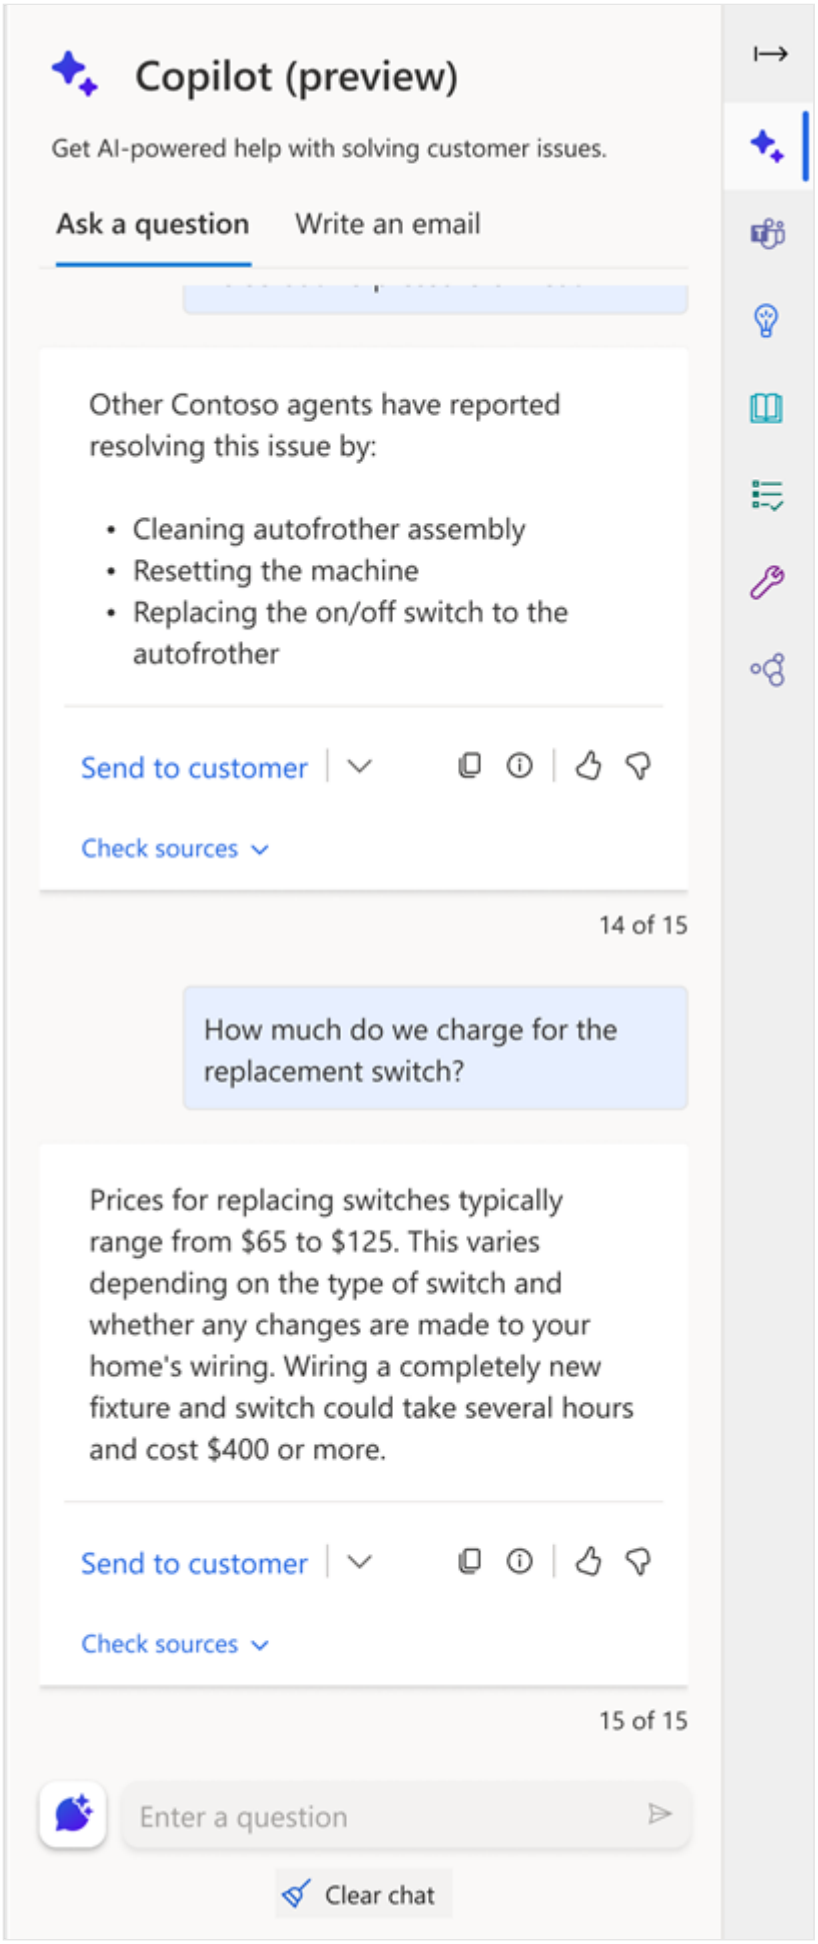
Make sure that your administrator has turned on the copilot features.

Ask a question

When you sign in to any of the Customer Service agent apps, Copilot opens in the right side panel with the **Ask a question** tab ready. Copilot acts as your partner, helping to answer questions without your having to search for the information.

Draft questions

You can ask free-form questions just as you'd ask your colleague or supervisor who might know the answers.



With Copilot, you can take the following actions:

- **Ask a direct question**: Copilot shows the most relevant answer from the knowledge sources your organization has made available.
- **Ask follow-up turn by turn questions**: If Copilot's response isn't immediately useful, you can ask follow-up questions and guide Copilot in a natural, conversational way.
- **Ask Copilot to attempt a better response**: Copilot can also rephrase responses based on more guidance such as, "Can you summarize your response?" or "Can you attempt a response providing details for each of the steps you mentioned?"

Use the responses

If you're satisfied with the response Copilot provides, you can use the whole thing or a part of it to answer the customer's question:

- Copy part of Copilot's reply into your chat or read from it during a voice conversation. Select the copy icon to copy the entire response to the clipboard.
- When you're in an active digital messaging conversation, select **Send to customer** to open an editing window where you can revise the response and send it to the customer. You can also change customer keywords to prompt Copilot to generate a more accurate response.
- Select **Check sources** to see the knowledge base or website links from which Copilot drew the response. You can use this supplemental information as a resource or share it with the customer.

Clear chat to start over

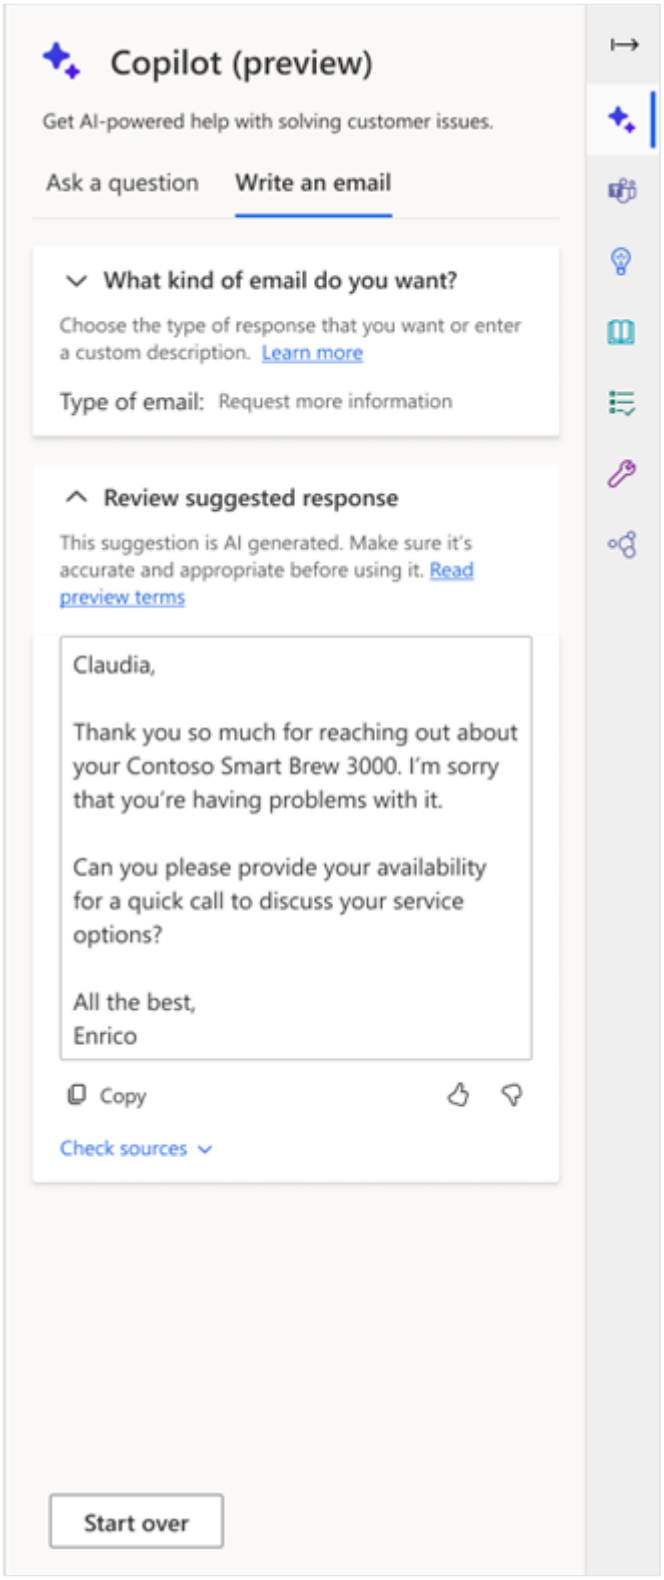
After a customer conversation has ended, or if you want Copilot to disregard the conversation so far, select **Clear chat** at the bottom of the Copilot pane.

Provide feedback

To rate the usefulness of Copilot's responses, select the thumbs-up or thumbs-down icon.

Draft emails

With Copilot, you can draft email replies to customers quickly and be more effective in solving customer issues.



Write an email with Copilot

When you start to draft an email, Copilot opens in the right side panel and presents five predefined prompts and one custom prompt:

- **Suggest a call**: Drafts a reply that suggests a call with the customer today or tomorrow.
- **Request more information**: Drafts a reply that requests more details from the customer to help resolve the problem.

- **Empathize with feedback**: Drafts a reply that provides an empathetic response to a customer who expresses a complaint.
- **Provide product/service details**: Drafts a reply that offers details or answers customer questions about a particular product or service.
- **Resolve the customer's problem**: Drafts a reply that provides a resolution—and resolution steps, if applicable—to the customer's problem.
- **Custom**: Allows you to provide your own prompt for the reply.

Review and copy suggested replies

When you select one of the predefined prompts, Copilot generates a suggested reply. *Always review the response.* Make any necessary changes, and then select **Copy to email** to copy the entire response to your draft. Or, select part of the response and use the right-click menu to copy and paste the selection.

Use the custom prompt

Use the custom prompt to include talking points, provide your objectives for the email, and determine its length and tone. Then select the **Create response** arrow to generate the response. *Always review the response* before sharing it with your customer. You can revise the custom prompt, if needed, above the reply and select **Refresh** to update the response.

How Copilot uses knowledge base and web sources

By default, Copilot uses internal knowledge base sources for generating responses. If your administrator has set up trusted domains, Copilot searches the internal knowledge base and up to five trusted domains to produce the result.

Start over

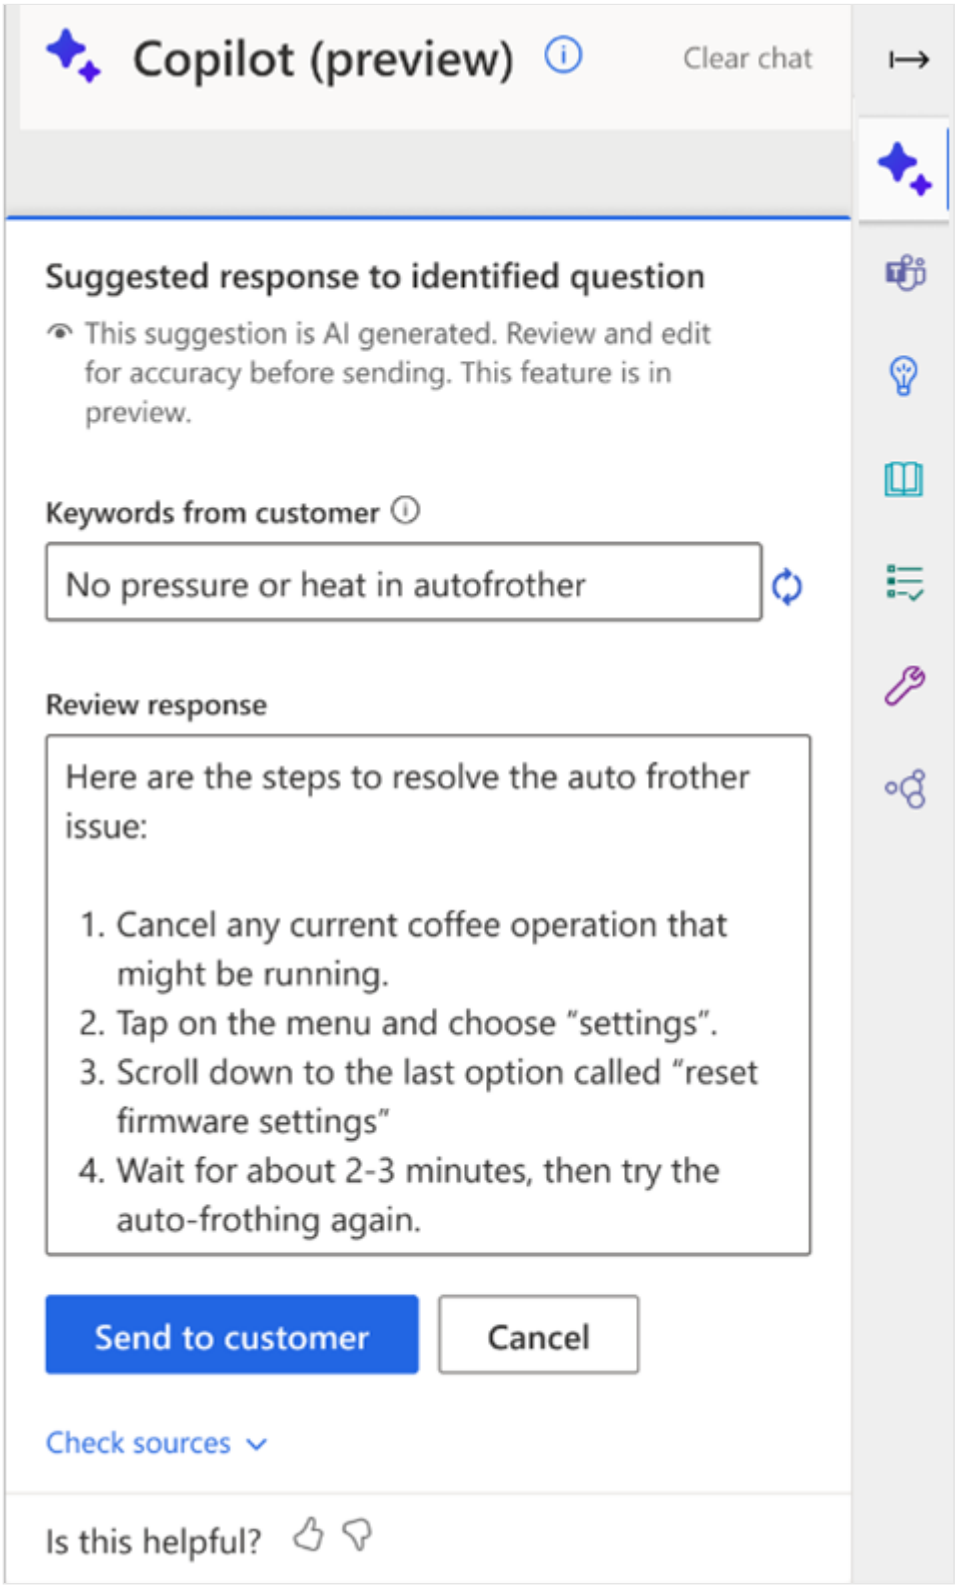
To return to the choice of six prompts, select **Start over** at the bottom of the Copilot pane.

Draft a chat response (Preview)

> **Important**
>
> - This is a preview feature.

- Preview features aren't meant for production use and may have restricted functionality. These features are available before an official release so that customers can get early access and provide feedback.

Use Copilot to draft chat responses when you're in a conversation with a customer.



Generate a chat response

Select the one-click response generation button at the lower-right corner of the Conversation control panel and at the lower-left corner of the Copilot pane. Copilot analyzes the context of the conversation and the latest customer question or message, and drafts a response to send directly to the customer. You don't need to manually type the question.

> ⓘ **Note**
>
> The one-click response generation feature is available in North America, Europe, and the United Kingdom only.

Apply filters

You can setup filters for Copilot to generate responses based on a specific set of topics. Filters provide immediate context and reduce the chance of getting irrelevant responses.

For example, your organization has several departments and you work only on credit card related queries. If you apply the credit card filter, Copilot retrieves only the relevant credit card content from the knowledge source and which is then used to generate responses.

To apply a filter, perform the following steps:

- Select **Filters** on the Copilot (preview) pane. The **Select filters** menu appears.
- Select the required options. You can also search for a filter option.
- Select **Apply**.

Once you set a filter, the following actions are applicable:

- A message indicating the filters are applied when Copilot generates new responses appears on the Copilot (preview) pane. This message also appears whenever you modify the filter configuration.
- A visual indicator with the number of filter options selected is displayed next to **Filters**..
- The filters set apply to the following Copilot features: ask a question, draft a chat, and email.
- The filter is saved. You don't have to set the filter each time you log in.

Responsible AI FAQ for copilot features

Use Copilot to summarize cases and conversations

Article • 10/20/2023

You can use Copilot to summarize cases and conversations if your administrator has turned on this feature.

> **Note**
>
> Copilot conversation and case summaries are generally available in the North America region only. This feature is in preview in the rest of the supported regions.

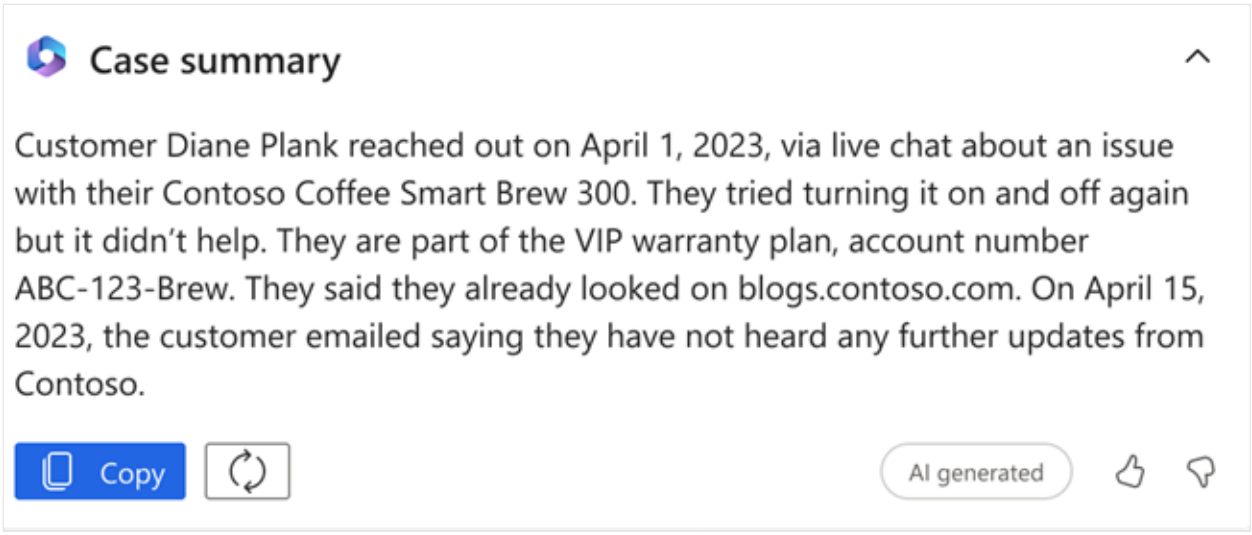
> **Note**
>
> Copilot conversation and case summaries are generally available in the North America region only. This feature is in preview in the rest of the supported regions.

Summarize cases

Copilot case summaries help you to quickly understand the context of a case and resolve customer issues more efficiently. The case summary includes key information such as the case title, customer, subject, product, priority, case type, and description.

Get a case summary

The case summary appears as a card on the case form. When you open a case, the case summary card is collapsed by default so that that your screen isn't cluttered with information. Select the card to expand the summary.



You can copy the summary, refresh it, and provide feedback.

> **Note**
>
> You can also generate a case summary for cases that are resolved or canceled.

Summarize conversations

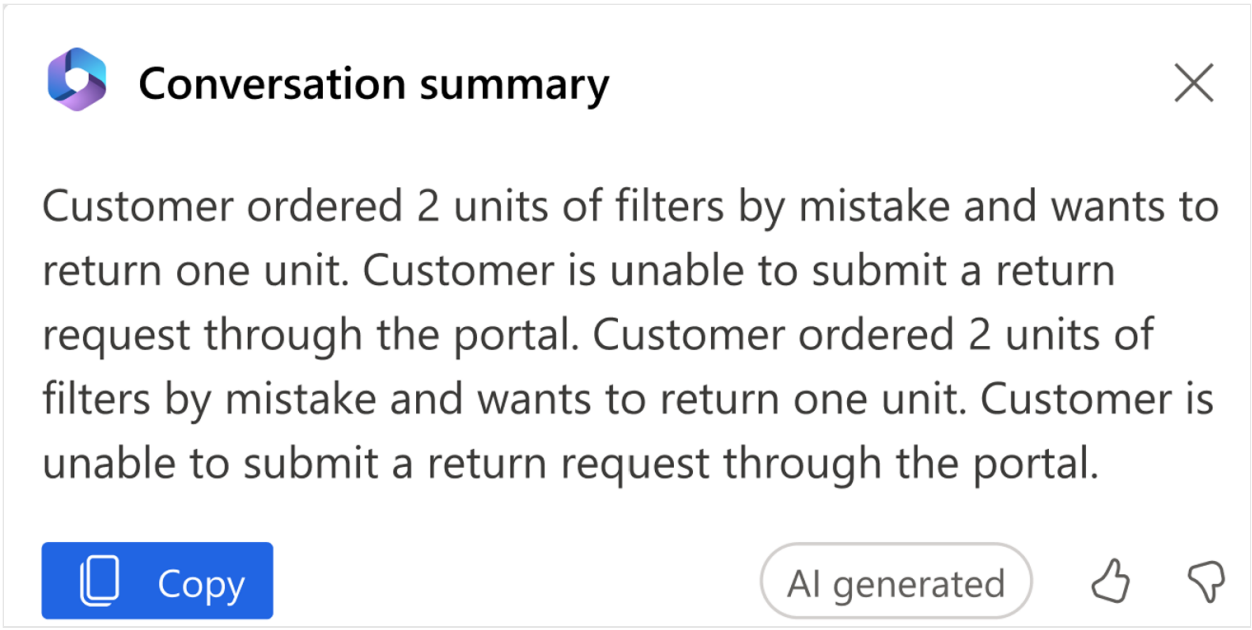
Copilot conversation summaries provide context and relay the steps that you've already taken to solve the issue. You can summarize chat and transcribed voice conversations.

> **Note**
>
> If your administrator has turned on auto-summarization for ongoing conversations, you get an AI-generated summary of the conversation along with the Copilot-generated conversation summary. The two summaries may be slightly different. **Learn more about auto-summarized conversations**.

Get a conversation summary

Depending on the triggers your administrator has set up, the Copilot conversation summary is generated like this:

- Automatically when you request a consultation with another agent, transfer the conversation, or end the conversation.
- When you select **Summarize conversation** in an ongoing conversation.



You can also take the following actions:

- Copy the summary.
- Select **Create case** to create a case and populate the description with the summary, if your administrator has turned on this feature.
- Share feedback about the summary.
- Close the summary card.

Use Copilot to summarize cases and conversations

Article • 10/20/2023

You can use Copilot to summarize cases and conversations if your administrator has turned on this feature.

> **Note**
>
> Copilot conversation and case summaries are generally available in the North America region only. This feature is in preview in the rest of the supported regions.

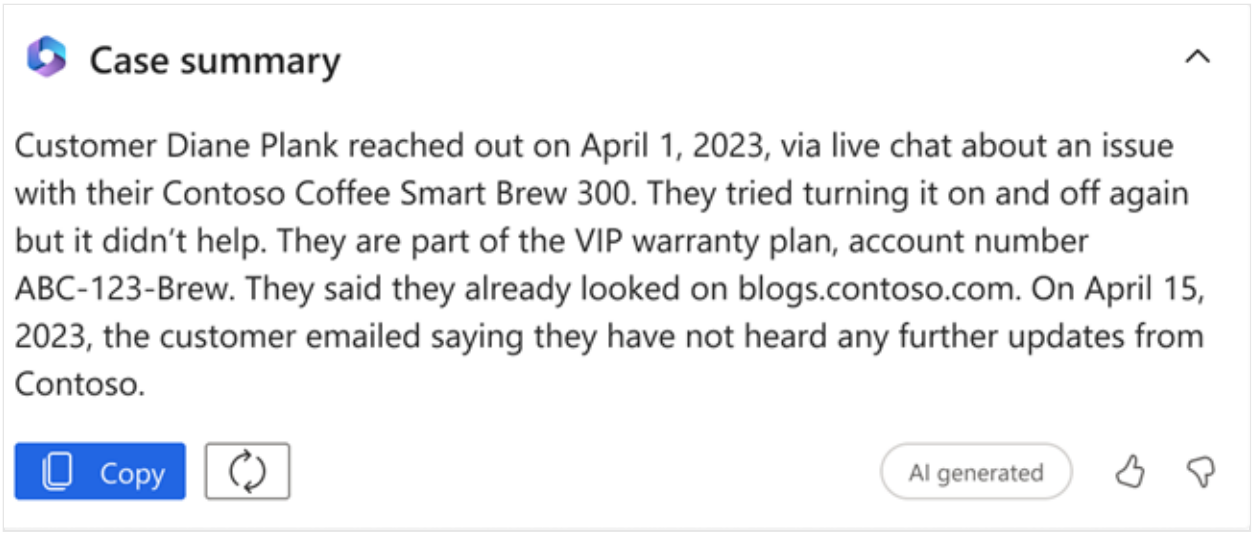
> **Note**
>
> Copilot conversation and case summaries are generally available in the North America region only. This feature is in preview in the rest of the supported regions.

Summarize cases

Copilot case summaries help you to quickly understand the context of a case and resolve customer issues more efficiently. The case summary includes key information such as the case title, customer, subject, product, priority, case type, and description.

Get a case summary

The case summary appears as a card on the case form. When you open a case, the case summary card is collapsed by default so that that your screen isn't cluttered with information. Select the card to expand the summary.



You can copy the summary, refresh it, and provide feedback.

> **Note**
>
> You can also generate a case summary for cases that are resolved or canceled.

Summarize conversations

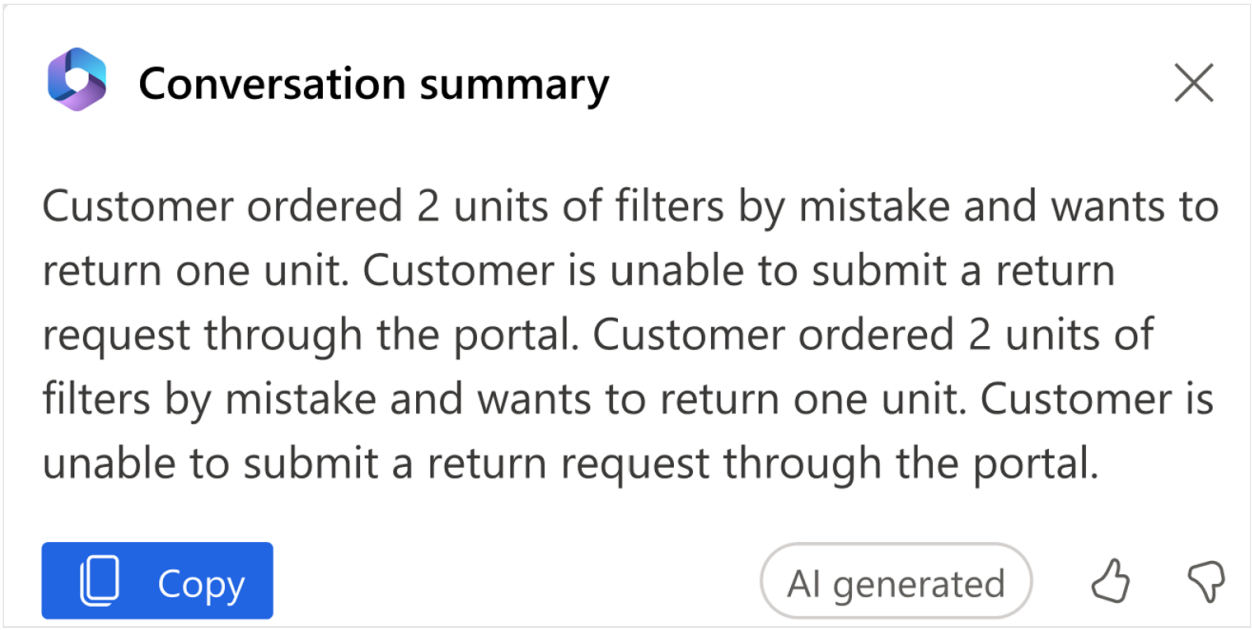
Copilot conversation summaries provide context and relay the steps that you've already taken to solve the issue. You can summarize chat and transcribed voice conversations.

> **Note**
>
> If your administrator has turned on auto-summarization for ongoing conversations, you get an AI-generated summary of the conversation along with the Copilot-generated conversation summary. The two summaries may be slightly different. **Learn more about auto-summarized conversations**.

Get a conversation summary

Depending on the triggers your administrator has set up, the Copilot conversation summary is generated like this:

- Automatically when you request a consultation with another agent, transfer the conversation, or end the conversation.
- When you select **Summarize conversation** in an ongoing conversation.



You can also take the following actions:

- Copy the summary.
- Select **Create case** to create a case and populate the description with the summary, if your administrator has turned on this feature.
- Share feedback about the summary.
- Close the summary card.

Copilot is an AI-powered tool that revolutionizes the agent experience in Dynamics 365 Customer Service. It provides real-time assistance to resolve issues faster, handle cases more efficiently, and automate time-consuming tasks so you can focus on delivering high-quality service to your customers.

> **Important**
>
> The AI-generated content is a suggestion. It's your responsibility to review and edit the suggested content to make sure it's accurate and appropriate before sharing the responses.

License requirements

Requirement type	You must have
License	• Dynamics 365 Customer Service Enterprise for summarize cases, ask a question, draft emails, and copilot analytics • Customer Service add-in (Chat, Digital Messaging, or Voice) for draft a chat response and summarize conversations

Prerequisites

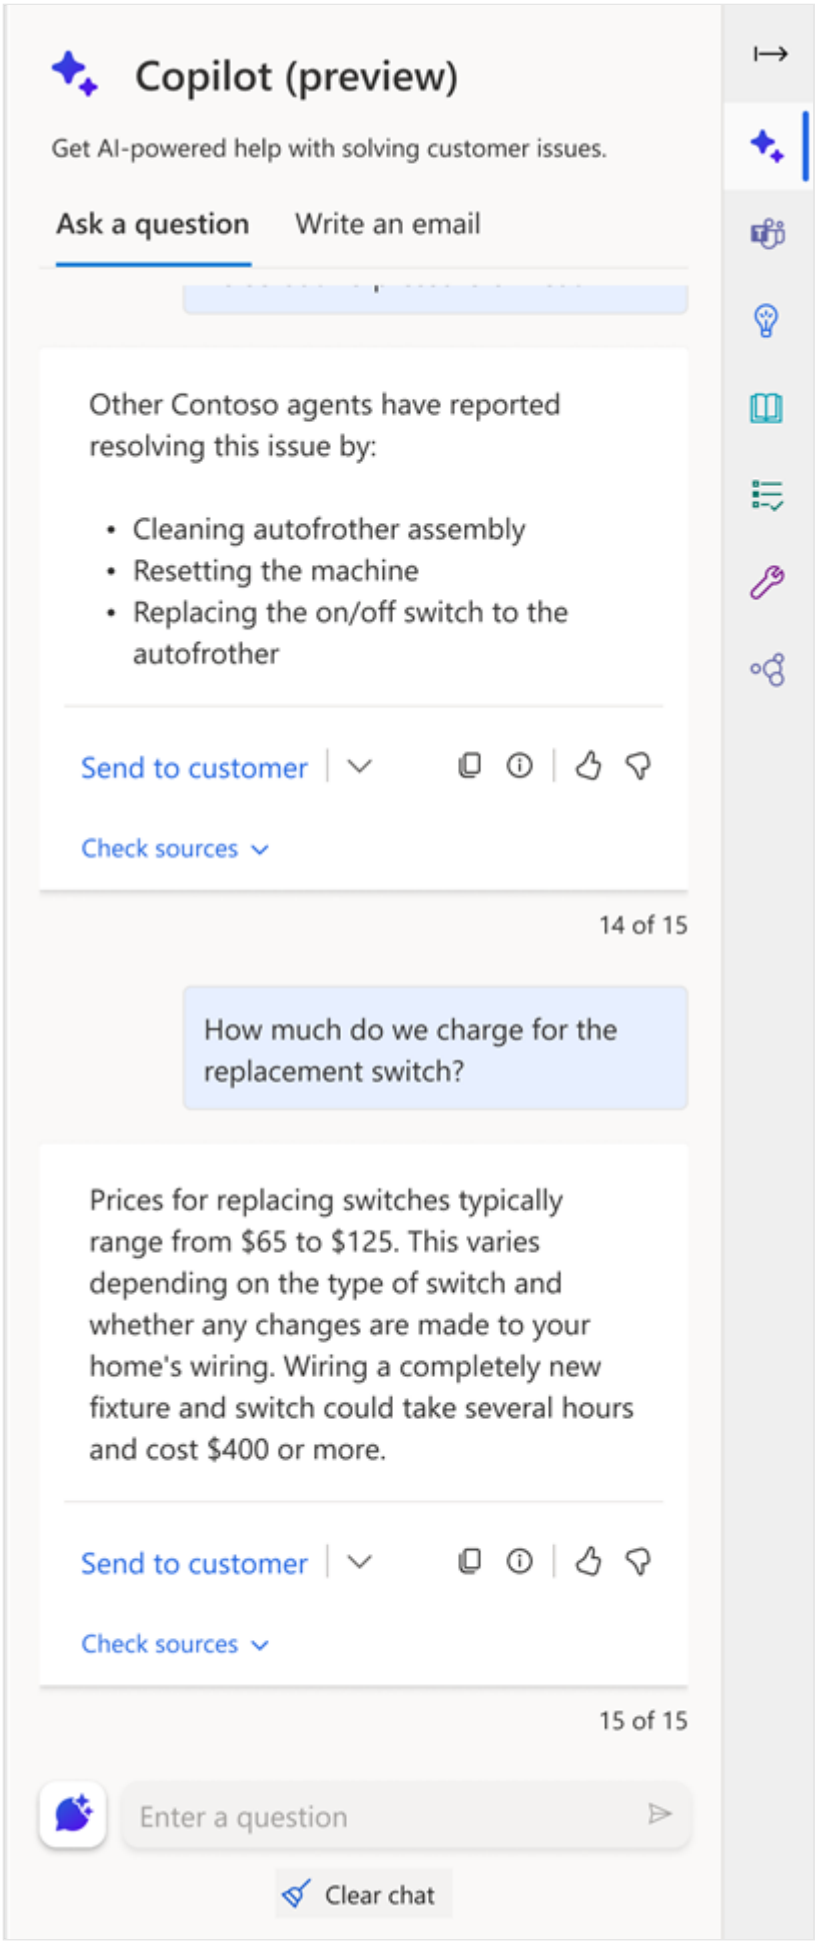
Make sure that your administrator has turned on the copilot features.

Ask a question

When you sign in to any of the Customer Service agent apps, Copilot opens in the right side panel with the **Ask a question** tab ready. Copilot acts as your partner, helping to answer questions without your having to search for the information.

Draft questions

You can ask free-form questions just as you'd ask your colleague or supervisor who might know the answers.



With Copilot, you can take the following actions:

- **Ask a direct question**: Copilot shows the most relevant answer from the knowledge sources your organization has made available.
- **Ask follow-up turn by turn questions**: If Copilot's response isn't immediately useful, you can ask follow-up questions and guide Copilot in a natural, conversational way.
- **Ask Copilot to attempt a better response**: Copilot can also rephrase responses based on more guidance such as, "Can you summarize your response?" or "Can you attempt a response providing details for each of the steps you mentioned?"

Use the responses

If you're satisfied with the response Copilot provides, you can use the whole thing or a part of it to answer the customer's question:

- Copy part of Copilot's reply into your chat or read from it during a voice conversation. Select the copy icon to copy the entire response to the clipboard.
- When you're in an active digital messaging conversation, select **Send to customer** to open an editing window where you can revise the response and send it to the customer. You can also change customer keywords to prompt Copilot to generate a more accurate response.
- Select **Check sources** to see the knowledge base or website links from which Copilot drew the response. You can use this supplemental information as a resource or share it with the customer.

Clear chat to start over

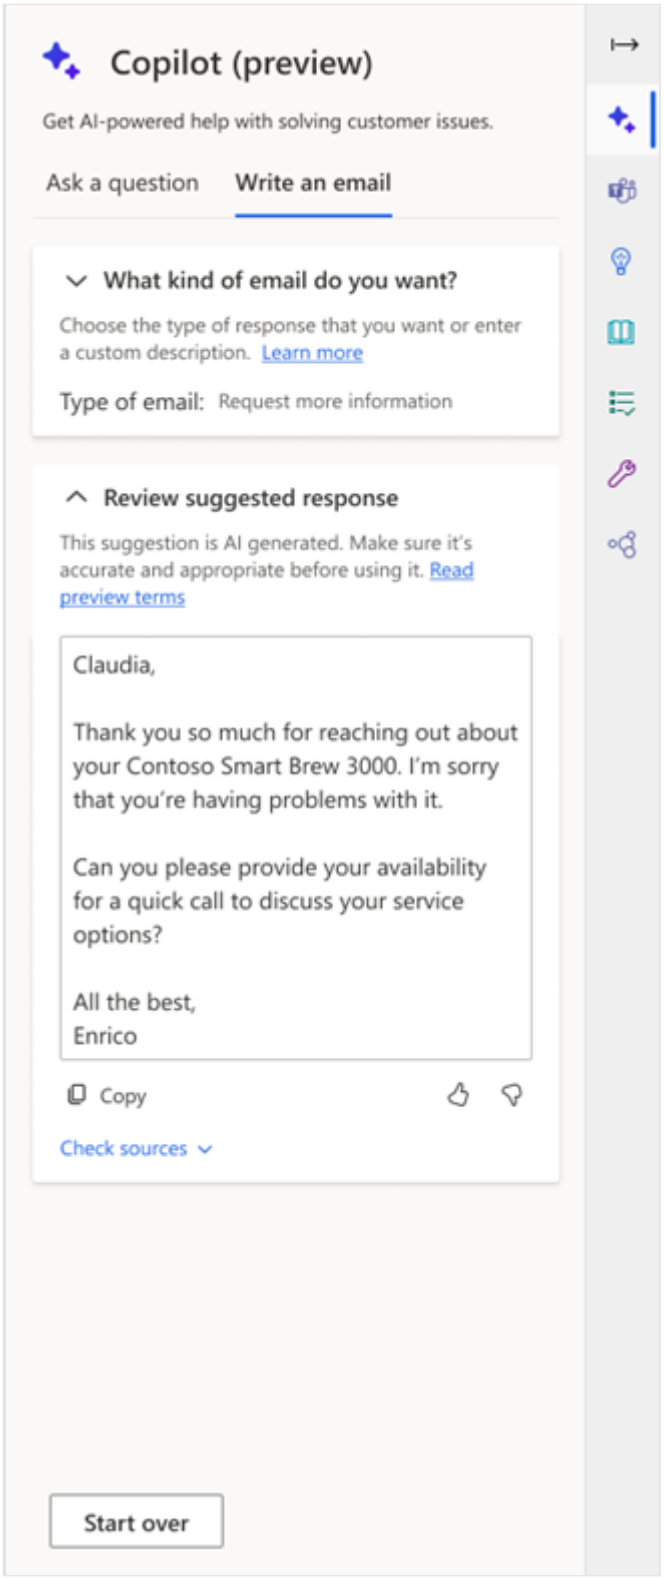
After a customer conversation has ended, or if you want Copilot to disregard the conversation so far, select **Clear chat** at the bottom of the Copilot pane.

Provide feedback

To rate the usefulness of Copilot's responses, select the thumbs-up or thumbs-down icon.

Draft emails

With Copilot, you can draft email replies to customers quickly and be more effective in solving customer issues.



Write an email with Copilot

When you start to draft an email, Copilot opens in the right side panel and presents five predefined prompts and one custom prompt:

- **Suggest a call**: Drafts a reply that suggests a call with the customer today or tomorrow.
- **Request more information**: Drafts a reply that requests more details from the customer to help resolve the problem.

- **Empathize with feedback**: Drafts a reply that provides an empathetic response to a customer who expresses a complaint.
- **Provide product/service details**: Drafts a reply that offers details or answers customer questions about a particular product or service.
- **Resolve the customer's problem**: Drafts a reply that provides a resolution—and resolution steps, if applicable—to the customer's problem.
- **Custom**: Allows you to provide your own prompt for the reply.

Review and copy suggested replies

When you select one of the predefined prompts, Copilot generates a suggested reply. *Always review the response.* Make any necessary changes, and then select **Copy to email** to copy the entire response to your draft. Or, select part of the response and use the right-click menu to copy and paste the selection.

Use the custom prompt

Use the custom prompt to include talking points, provide your objectives for the email, and determine its length and tone. Then select the **Create response** arrow to generate the response. *Always review the response* before sharing it with your customer. You can revise the custom prompt, if needed, above the reply and select **Refresh** to update the response.

How Copilot uses knowledge base and web sources

By default, Copilot uses internal knowledge base sources for generating responses. If your administrator has set up trusted domains, Copilot searches the internal knowledge base and up to five trusted domains to produce the result.

Start over

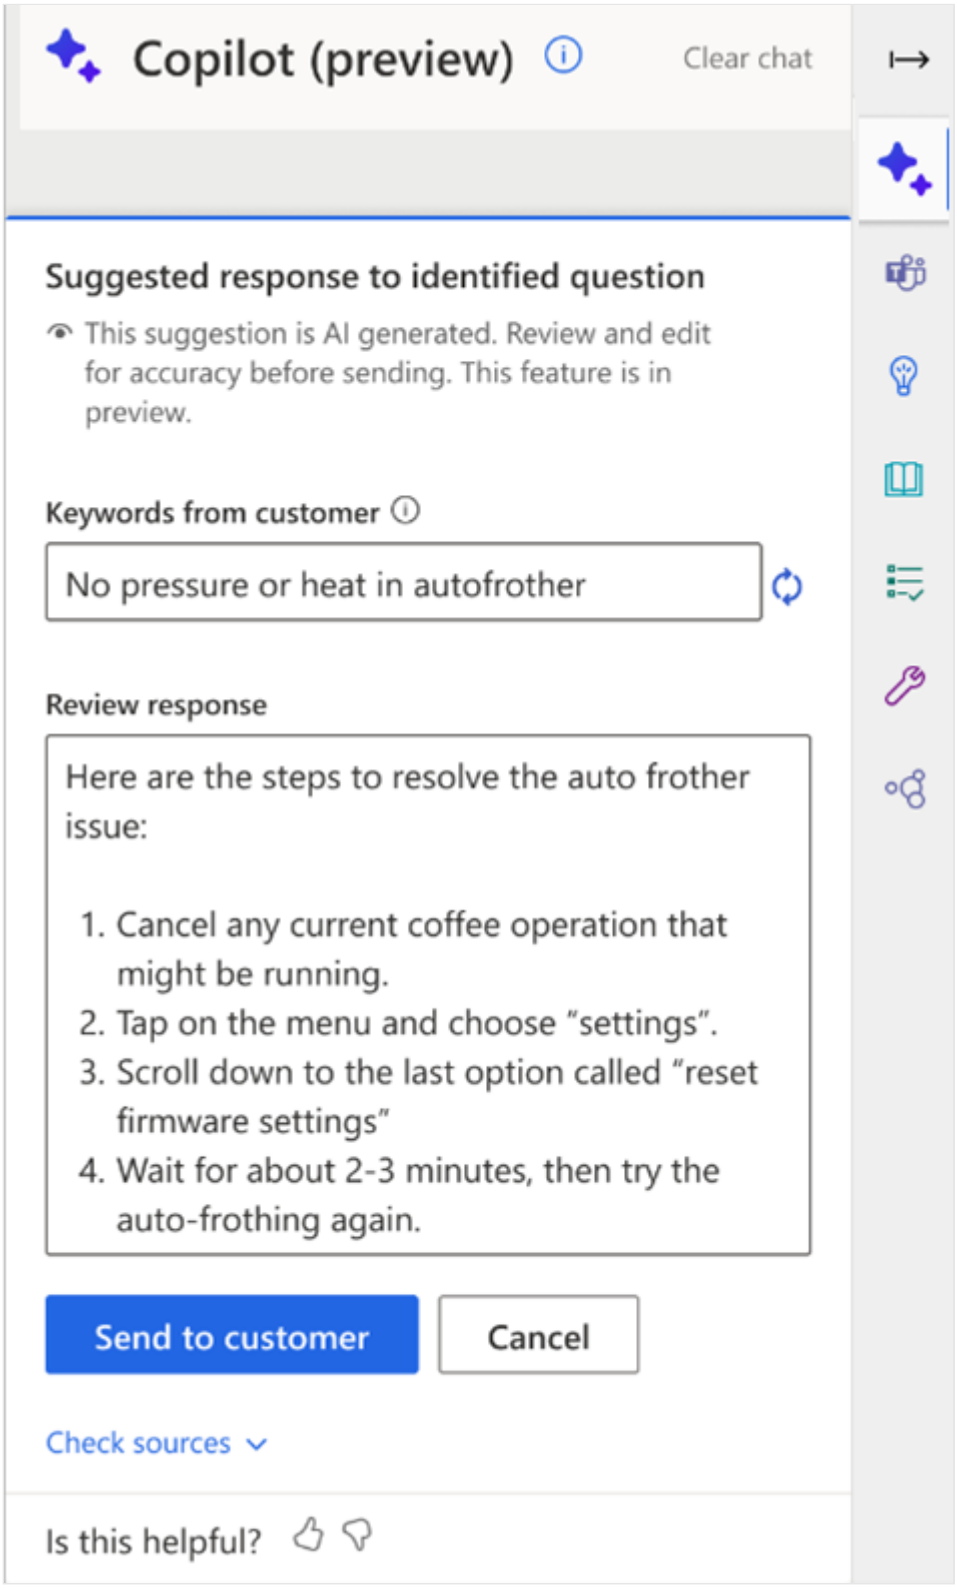
To return to the choice of six prompts, select **Start over** at the bottom of the Copilot pane.

Draft a chat response (Preview)

> **Important**
>
> - This is a preview feature.

- Preview features aren't meant for production use and may have restricted functionality. These features are available before an official release so that customers can get early access and provide feedback.

Use Copilot to draft chat responses when you're in a conversation with a customer.



Generate a chat response

Select the one-click response generation button at the lower-right corner of the Conversation control panel and at the lower-left corner of the Copilot pane. Copilot analyzes the context of the conversation and the latest customer question or message, and drafts a response to send directly to the customer. You don't need to manually type the question.

> ⓘ **Note**
>
> The one-click response generation feature is available in North America, Europe, and the United Kingdom only.

Apply filters

You can setup filters for Copilot to generate responses based on a specific set of topics. Filters provide immediate context and reduce the chance of getting irrelevant responses.

For example, your organization has several departments and you work only on credit card related queries. If you apply the credit card filter, Copilot retrieves only the relevant credit card content from the knowledge source and which is then used to generate responses.

To apply a filter, perform the following steps:

- Select **Filters** on the Copilot (preview) pane. The **Select filters** menu appears.
- Select the required options. You can also search for a filter option.
- Select **Apply**.

Once you set a filter, the following actions are applicable:

- A message indicating the filters are applied when Copilot generates new responses appears on the Copilot (preview) pane. This message also appears whenever you modify the filter configuration.
- A visual indicator with the number of filter options selected is displayed next to **Filters**..
- The filters set apply to the following Copilot features: ask a question, draft a chat, and email.
- The filter is saved. You don't have to set the filter each time you log in.

Responsible AI FAQ for copilot features

View copilot analytics report

Article • 10/31/2023

Copilot in Dynamics 365 Customer Service helps agents to complete tasks related to conversations, cases, and email more easily. With the Copilot report in Customer Service historical analytics, supervisors and customer service managers can identify the impact that Copilot is having across their customer service operation.

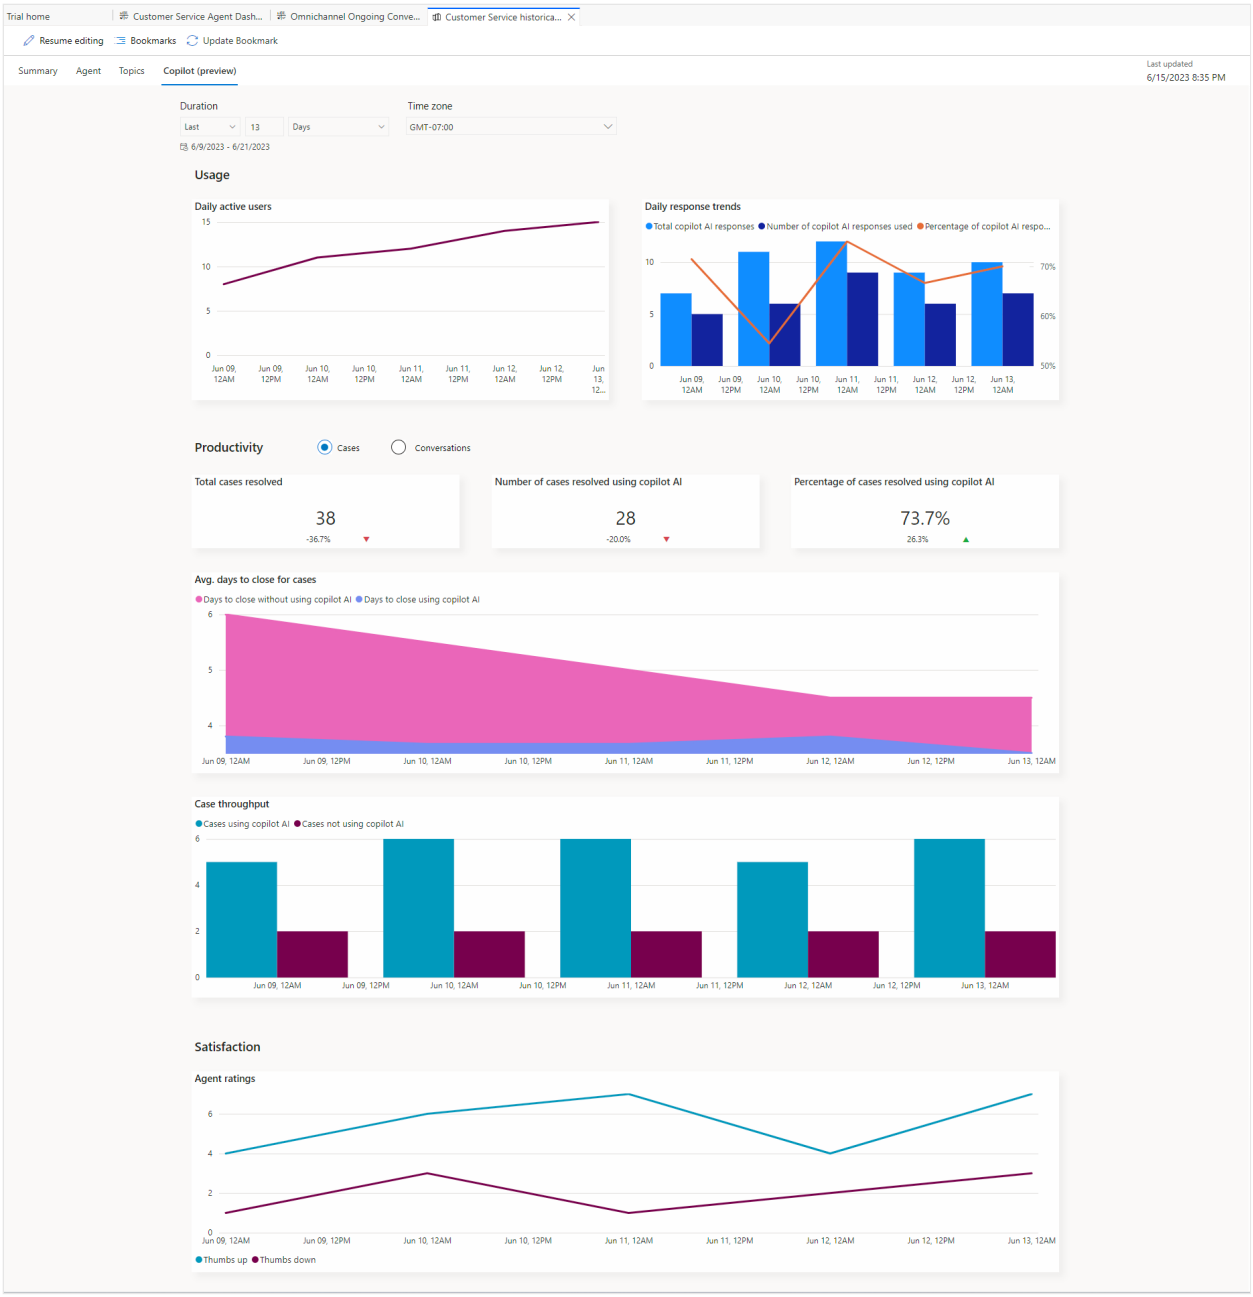
To view the Copilot report, open Customer Service historical analytics and select the **Copilot** tab.

Copilot report

You can use filters to focus on the information that's important to you:

- **Duration**: Filters the data by the selected value of day, week, or month.
- **Time zone**: Filters the data for the selected time zone.

The Copilot report displays the following metrics.



Usage

Metric	Description
Daily active users	The number of unique agents who used Copilot at least once in the last day
Total copilot AI responses	The total number of responses that Copilot provided
Number of responses used	The number of times that text from a copilot response was copied
Percentage of copilot AI responses used	The percentage of responses that were copied

Productivity: Cases

Metric	Description
Total cases resolved	The number of cases that were resolved when Copilot was available for use
Number of cases resolved using copilot AI	The number of cases that were resolved when Copilot was used
Percentage of cases resolved using copilot AI	The percentage of cases that were resolved when Copilot was used
Avg. days to close for cases	The average time that elapsed after the case was created and until it was resolved; displays data when Copilot was used and when it wasn't used
Case throughput	The number of cases that were resolved on average per day; displays data when Copilot was used and when it wasn't used

Productivity: Conversations

Metric	Description
Total conversations	The total number of conversations in which the agent engaged with the customer at least once while Copilot was available; doesn't include email and voice
Number of conversations using copilot AI	The number of engaged conversations that have used Copilot; lists only conversations that have ended
Percentage of conversations using copilot AI	The percentage of engaged conversations that have used Copilot
Avg conversation handle time	The average time that elapsed after a conversation started until it ended; displays data when Copilot was used and when it wasn't used
Conversation throughput	The number of conversations, excluding email and voice, completed on average per day; displays data when Copilot was used and when it wasn't used

Satisfaction

Metric	Description
Agent ratings	The number of times agents rated a Copilot response positively or negatively

Manage fields Copilot uses for case summaries and emails

Article • 10/27/2023

Per your business requirement, you can modify the source case fields that Copilot uses to generate summaries or draft emails, thereby improving the context and accuracy of the results. You can also select a custom field that the Copilot should use to generate responses.

Modify the fields used to generate case summaries

Copilot uses the following fields to generate case summaries:

- Customer
- Case Title
- Case Type
- Subject
- Case Description
- Product
- Priority

In Customer Service admin center, perform the following steps to map your preferred fields:

1. Use one of the following navigation options:
    - **Agent Experience** > **Productivity** > **Summaries**
    - **Operations** > **Insights** > **Summaries**
2. In **Summaries**, for **Case summaries**, select the **Manage Data Attributes** link. On the **Data Attributes** pane, you see the default data attributes that Copilot uses.
3. Do the following actions:
    a. Select the attributes that Copilot uses to generate case summaries. Copilot considers only the selected fields when it's generating a summary.

> **Note**

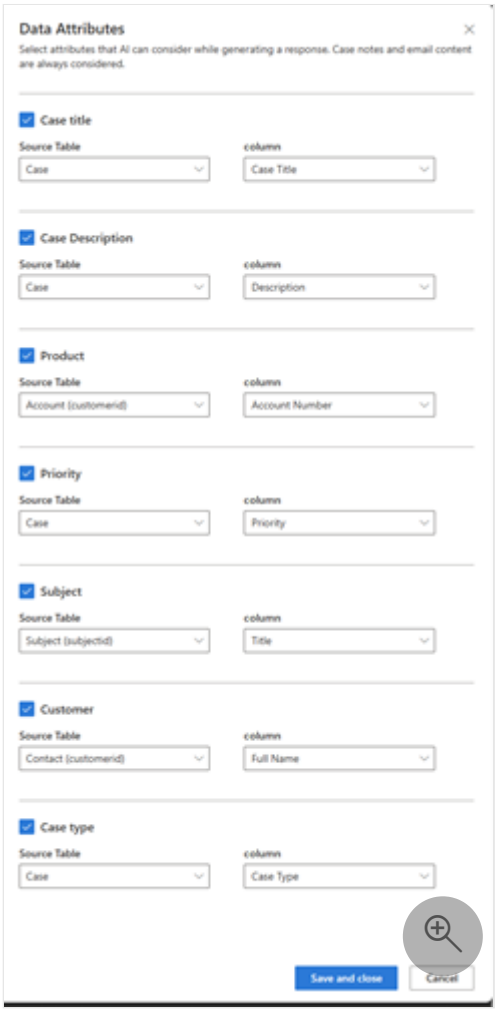
> The attributes related to case notes and email content aren't available on **Manage Data Attributes** but are considered to generate case summaries.

b. To modify the default attributes, perform the following steps:

- For the **Source Table** of the attribute, you can specify **Case** or any other related table. For example, for **Customer** attribute instead of **Case** and **Contact** you can specify **Account** as the source table and **Account Name** as the column. When Copilot generates a summary, it uses the value in the **Account Name** column of the **Account** table as the customer contact.
- For the column attribute, specify a column from the **Source Table**.

c. Select **Save and Close**.

4. Select **Save**.



Modify the fields used to draft emails

Copilot uses the following out-of-the-box case fields to draft emails:

- Case Title
- Case Description

- Customer Contact
- Subject

In Customer Service admin center, go to **Copilot help pane** and perform the steps in the Modify the fields used to generate case summaries section to modify the source fields that Copilot uses to draft emails.

Configure copilot features for custom case forms and custom apps

Article • 10/20/2023

You can configure the Copilot case summary on custom case forms and enable the Copilot features for custom apps.

Display Copilot case summary on custom case forms

When you enable the Copilot case summary feature, agents can see the case summary by default on out-of-the-box case forms. You can perform the following steps for the application to display the Copilot case summary on your custom case forms:

1. In Power Apps, add the **msdyn_CopilotCaseSummaryLibrary.js** web resource to your solution. For more information, see: Add a web resource to a solution.
2. Select **Add existing** > **More** > **Developer** > **Custom Control**. Search for and add the **mscrmcontrols.csintelligence.copilotcasesummarycontrol** custom control.
3. Select **Tables**, select **Case**, and then select **Forms**.
4. Create a new form or use an existing form. More information: Create, edit, or configure forms using the model-driven form designer.
5. In the form designer, select **Components** from the left navigation, select **CopilotCaseSummaryControl** and drag it on to the form.
6. Set the values of the following fields as:

    - **CC_CaseSummary**: Any unused string column. Copy the unique name of the specified column.
    - **CC_IncidentId**: **Case (Text)**

7. Set the **Show hidden** toggle to **On**.
8. Save and publish the customizations.

You must also configure the following settings to make sure that copilot summary doesn't load on the custom case form when the Copilot case summary feature isn't enabled or the agent experience profile linked to the agent doesn't have **Copilot** option enabled:

1. In Power Apps, add the event handler function for the On Change event. More information: Add or remove event handler function to event using UI.
2. Specify the following details in **Configure Event**:

- Set the **Event Type** to **On load**.
- Set the **Library** to **msdyn_CopilotCaseSummaryLibrary.js**
- Specify **Mscrm.CSIntelligence.CopilotCaseSummary.setVisibilityOfCaseSummary** in **Function**.
- Select **Pass execution context as first parameter** and specify the unique name of the table column value specified in **CC_CaseSummary**.

3. Save and publish the changes.

Enable Copilot features for custom apps

You can enable the Copilot features for custom apps in your organization. Perform the following steps enable the Copilot features for a specific app:

1. In Power Apps, add the **Customer Service Copilot Enabled** setting definition. More information: Add an existing setting definition.
2. In the **Edit Customer Service Copilot Enabled** pane, in set the **Setting app values** section, for a required app, set the **New app value** to **Yes**. More information: Update a setting definition.

Configure copilot features for custom case forms and custom apps

Article • 10/20/2023

You can configure the Copilot case summary on custom case forms and enable the Copilot features for custom apps.

Display Copilot case summary on custom case forms

When you enable the Copilot case summary feature, agents can see the case summary by default on out-of-the-box case forms. You can perform the following steps for the application to display the Copilot case summary on your custom case forms:

1. In Power Apps, add the **msdyn_CopilotCaseSummaryLibrary.js** web resource to your solution. For more information, see: Add a web resource to a solution.
2. Select **Add existing** > **More** > **Developer** > **Custom Control**. Search for and add the **mscrmcontrols.csintelligence.copilotcasesummarycontrol** custom control.
3. Select **Tables**, select **Case**, and then select **Forms**.
4. Create a new form or use an existing form. More information: Create, edit, or configure forms using the model-driven form designer.
5. In the form designer, select **Components** from the left navigation, select **CopilotCaseSummaryControl** and drag it on to the form.
6. Set the values of the following fields as:

    - **CC_CaseSummary**: Any unused string column. Copy the unique name of the specified column.
    - **CC_IncidentId**: **Case (Text)**

7. Set the **Show hidden** toggle to **On**.
8. Save and publish the customizations.

You must also configure the following settings to make sure that copilot summary doesn't load on the custom case form when the Copilot case summary feature isn't enabled or the agent experience profile linked to the agent doesn't have **Copilot** option enabled:

1. In Power Apps, add the event handler function for the On Change event. More information: Add or remove event handler function to event using UI.
2. Specify the following details in **Configure Event**:

- Set the **Event Type** to **On load**.
- Set the **Library** to **msdyn_CopilotCaseSummaryLibrary.js**
- Specify **Mscrm.CSIntelligence.CopilotCaseSummary.setVisibilityOfCaseSummary** in **Function**.
- Select **Pass execution context as first parameter** and specify the unique name of the table column value specified in **CC_CaseSummary**.

3. Save and publish the changes.

Enable Copilot features for custom apps

You can enable the Copilot features for custom apps in your organization. Perform the following steps enable the Copilot features for a specific app:

1. In Power Apps, add the **Customer Service Copilot Enabled** setting definition. More information: Add an existing setting definition.
2. In the **Edit Customer Service Copilot Enabled** pane, in set the **Setting app values** section, for a required app, set the **New app value** to **Yes**. More information: Update a setting definition.

Configure copilot features for custom case forms and custom apps

Article • 10/20/2023

You can configure the Copilot case summary on custom case forms and enable the Copilot features for custom apps.

Display Copilot case summary on custom case forms

When you enable the Copilot case summary feature, agents can see the case summary by default on out-of-the-box case forms. You can perform the following steps for the application to display the Copilot case summary on your custom case forms:

1. In Power Apps, add the **msdyn_CopilotCaseSummaryLibrary.js** web resource to your solution. For more information, see: Add a web resource to a solution.
2. Select **Add existing** > **More** > **Developer** > **Custom Control**. Search for and add the **mscrmcontrols.csintelligence.copilotcasesummarycontrol** custom control.
3. Select **Tables**, select **Case**, and then select **Forms**.
4. Create a new form or use an existing form. More information: Create, edit, or configure forms using the model-driven form designer.
5. In the form designer, select **Components** from the left navigation, select **CopilotCaseSummaryControl** and drag it on to the form.
6. Set the values of the following fields as:

    - **CC_CaseSummary**: Any unused string column. Copy the unique name of the specified column.
    - **CC_IncidentId**: **Case (Text)**

7. Set the **Show hidden** toggle to **On**.
8. Save and publish the customizations.

You must also configure the following settings to make sure that copilot summary doesn't load on the custom case form when the Copilot case summary feature isn't enabled or the agent experience profile linked to the agent doesn't have **Copilot** option enabled:

1. In Power Apps, add the event handler function for the On Change event. More information: Add or remove event handler function to event using UI.
2. Specify the following details in **Configure Event**:

- Set the **Event Type** to **On load**.
- Set the **Library** to **msdyn_CopilotCaseSummaryLibrary.js**
- Specify **Mscrm.CSIntelligence.CopilotCaseSummary.setVisibilityOfCaseSummary** in **Function**.
- Select **Pass execution context as first parameter** and specify the unique name of the table column value specified in **CC_CaseSummary**.

3. Save and publish the changes.

Enable Copilot features for custom apps

You can enable the Copilot features for custom apps in your organization. Perform the following steps enable the Copilot features for a specific app:

1. In Power Apps, add the **Customer Service Copilot Enabled** setting definition. More information: Add an existing setting definition.
2. In the **Edit Customer Service Copilot Enabled** pane, in set the **Setting app values** section, for a required app, set the **New app value** to **Yes**. More information: Update a setting definition.

Overview of bots

Article • 07/19/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

A bot is a program that provides automated responses in a conversational manner to a customer. It can also help resolve customer queries by using case deflection. A bot can also collect basic information from a customer and then provide it to a customer service agent to work further on the issue raised by the customer.

A bot eases the load on your customer service agents by handling basic queries. This saves your agents' time so they can work on more complex issues. You can configure your bots to escalate a query to a human agent as required, or when requested by the customer.

In Omnichannel for Customer Service, you can integrate both Azure and Power Virtual Agents bots to perform tasks like starting a conversation with the customer, providing automated responses, and then transferring the conversation to a human agent, as required.

Integrate Azure and Power Virtual Agents bots

When you integrate bots with Omnichannel for Customer Service, you get the following capabilities:

- Seamlessly integrate your bots with chat and social channels without needing to add channel-specific code in the bot.
- Transfer chat conversations from bots to human agents, together with the full context of the conversation.
- Analyze the bot transcript that's available in Microsoft Dataverse after the conversation is completed.
- Configure routing rules to selectively route incoming requests to bots based on context, such as issue type or customer type. For example, you can route low-complexity issues to bots, or route the conversation to a sales or support bot based on the web browsing history of the customer.

- Monitor bot conversations in real time by using the supervisor dashboard, which includes details such as customer sentiment.
- Use historical dashboards to get insights into the effectiveness of the bots through metrics such as resolution rate, escalation rate, resolution time, escalation time, and average sentiment.
- Configure post-call surveys to measure customer satisfaction.

Best practices for configuring bots

Article • 08/30/2022

When you configure context variables, check for the following conditions:

- The context variable name must be less than or equal to 100 characters.
- The context variable value must be less than or equal to 4,000 characters.
- Use exact match to pass the value to the context variable because it is case-sensitive.
- Use the context variable names as defined and don't change them when you author flows in Azure or Power Virtual Agents bots.

We recommend that you don't update or delete the context variables after you create them. If you do need to update or delete the variables, make sure that they aren't used in any of the unified routing classification or assignment rules.

When you configure Azure and Power Virtual Agents bots in Omnichannel for Customer Service, use the following best practices:

- In a queue, if both bots and human agents are available, set the bot's capacity higher than all agents. A bot's capacity isn't reduced even after a work item is assigned to it. This ensures that any conversation routed to the queue is first picked up by the bot.

- When a bot escalates a conversation to a human agent, make sure that the context variables being updated by the bot and the corresponding routing rules match correctly.

- When a conversation that's escalated by a bot comes back to the bot queue due to incorrect routing or context variables not being updated at runtime, the bot won't be assigned to the same conversation again. So, to prevent conversations from ending up in an infinite loop, you must configure a human agent for the bot queue.

- Unlike human agents, bots aren't added to a "default" queue at the outset; you must add them from the Omnichannel admin center or Customer Service admin center apps.

- The message size must be less than or equal to 28 KB in all messaging channels. The size limit includes metadata like timestamps and tags. If you're a bot author or developer and want to pass complex cards or message types across channels, ensure that your message size doesn't exceed the limit. If you're integrating a

custom channel via Direct Line, then make sure that the activity payload doesn't exceed the message size limit.

Manage your bots in Omnichannel for Customer Service

Article • 07/06/2023

In Omnichannel for Customer Service, you can seamlessly add a bot and get it up and running within a few minutes while the integration is taken care of in the background.

You can manage your Power Virtual Agents bots on the **Bots** page.

Prerequisites

Power Virtual Agents bots must be available in the tenant where Omnichannel for Customer Service is available.

Add a bot

When you add a bot by using the steps outlined in this section, the Power Virtual Agents bot is automatically registered in Azure and connected to Omnichannel for Customer Service. You'll then configure topics in Power Virtual Agents for the scenarios that you want the bot to handle.

1. In Customer Service admin center, select **Bots** under **Customer support**.
2. On the **Bots** page, select **Add**, and on the **Add a bot** page, select **Create new bot**, and then select **Next**.
3. On the **Create a basic bot** page, enter a name for your bot and select the primary language that the bot should use, and then select **Create**. The bot is created and listed on the **Bots** page.
4. Optionally, you can also add an existing bot if a bot is already created in Power Virtual Agents. The **Connect existing bot** option let you connect the bot. The bot is connected after a few minutes and listed on the **Bots** page.

> **ⓘ Important**
>
> Bots that you've created in Power Virtual Agents by using the **Try the unified canvas (preview)** option won't work with the voice workstreams.

Manage your bots

On the **Bots** page, you can review the bot details and also perform the following actions:

- Disconnect the bot.
- Select the bot name. The Power Virtual Agents app opens on a new tab where you can configure topics and other settings for the bot.

Next steps

Add a bot to a workstream
End bot conversation

Configure context variables for bots

Article • 07/21/2023

This article lists the context variables for Azure and Power Virtual Agents bots, and how you can configure them in Omnichannel for Customer Service. To understand how to create context variables, see Manage context variables.

Context variables for Azure bots

The following table contains the list of context variables in Omnichannel for Customer Service that you can use for configuring Azure bots.

Context variable type	Context variable name	Description	How to map in Azure
Pre-conversation survey	Use the question type that you create in Omnichannel for Customer Service.	The context variables for pre-conversation answers store the customer answers for questions in the pre-conversation survey.	Use the following information to map the question type variable in Omnichannel for Customer Service with the variable type in Azure: • **Single line**: String **Multiple lines**: String • **Option set**: String • **User Consent**: Boolean
Custom context	Use the variable name that you create in Omnichannel for Customer Service or pass using the setContextProvider API.	These are custom context variables	Map the user's response as a JSON to use custom

		that can be created and passed through the live chat SDK.	context variable in Omnichannel for Customer Service.
Conversation	msdyn_ConversationId	Use the context variable that contains the conversation ID for the ongoing conversation and can fetch and perform operations on the record in Microsoft Dataverse.	**String**: String
Contact	msdyn_contact_msdyn_ocliveworkitem_Customer	Use this context variable that contains the record ID for the customer (contact) record that is linked to the conversation.	Parse JSON to extract record ID
Account	msdyn_account_msdyn_ocliveworkitem_Customer	Use this context variable that contains the record ID for the account record linked to the conversation.	Parse JSON to extract record ID

Context variable type	Context variable name	Description	How to map in Azure
Case	msdyn_incident_msdyn_ocliveworkitem	Use this context variable that contains the record ID for the case record linked to the conversation.	Parse JSON to extract record ID

> **Note**
>
> Use the context variable names as defined and don't change them when you author flows in Azure or Power Virtual Agents bots. Also, be sure to use exact match to pass the value to the context variable because it is case-sensitive. If there's a mismatch, the record won't get automatically identified. More information: **Identify records automatically**

Context variables for Power Virtual Agents bots

The following table contains the list of context variables available in Omnichannel for Customer Service that you can use for configuring Power Virtual Agents bots.

> **Important**
>
> To be able to use the messaging and voice variables, ensure that you first **install the extension solutions**.

Context variable type	Context variable name	Description	How to map in Power Virtual Agents
Pre-conversation survey	Use the question type that you create in Omnichannel for Customer Service.	The context variables for pre-conversation answers store the customer answers for questions in the pre-conversation survey.	Use the following information to map the question type variable in Omnichannel for Customer Service with the variable type in Power Virtual Agents:

Context variable type	Context variable name	Description	How to map in Power Virtual Agents
			• **Single line**: User's entire response **Multiple lines**: User's entire response • **Option set**: User's entire response • **User Consent**: Boolean
Custom context	Use the variable name that you create in Omnichannel for Customer Service or pass using the setContextProvider API.	These are custom context variables that can be created and passed through the live chat SDK.	Use the following information to map the custom context variable in Omnichannel for Customer Service with the variable type in Power Virtual Agents: • **String**: User's entire response **Boolean**: Boolean • **Number**, **Floating Number**: Number
Conversation	msdyn_ConversationId	Use the context variable that contains the conversation ID for the ongoing conversation and can fetch and perform operations on the record in Microsoft Dataverse.	**String**: User's entire response.
Messaging and voice variables	msdyn_CustomerType	Use this context variable that contains the customer type for the *account* or	Select the Omnichannel for Customer Service extension solution variable.

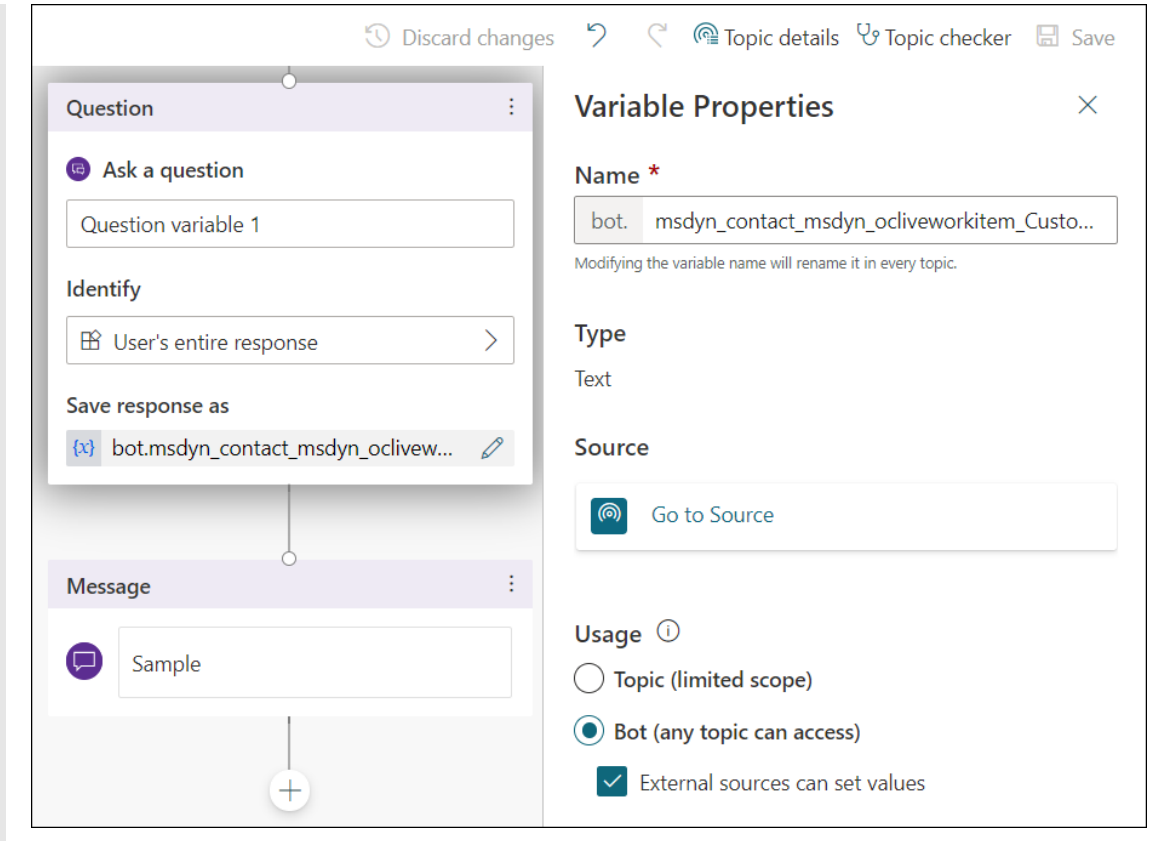
name		customer has agreed to participate in surveys during the conversation.	details to Omnichannel for Customer Service.
	va_CustomerLocale	Use this dialog to transfer the user currently talking to the bot to another bot that can speak in a different language.	Set the code by selecting the input variable and using the correct locale code. For an example on how to set up this scenario, see Configure the routing rule in Dynamics 365 for Customer Service .

Configure context variables for Power Virtual Agents bot

In Power Virtual Agents, do the following:

1. On the **Topics** page, select **New topic**.
2. On the **Setup** tab, enter a name and description, and save the topic.
3. Select **Go to authoring canvas**.
4. Select **Add node**, choose the **Ask a question** action.
5. Edit the **Identify** field, and in the **Choose information to identify** dialog box, select an option that will match the context variable data type. For information on the data type mapping, see the information in the preceding table.
6. Edit **Save response as**, and in the **Variable Properties** dialog, update the value for **Name** with the required Omnichannel for Customer Service context variable. Make sure **Bot (any topic can access)** and **External sources can set values** are selected. The **External sources can set values** option is applicable only for getting the context variable.



7. Save and publish the changes.

At runtime, the required information is captured in the context variable that can then be used for further actions based on the workflow you configure. The bot can set the information for the context variables to link the conversation and case when the bot escalates the conversation to an agent. More information: Link customer and case to a conversation

You can also configure the **Transfer to agent** node in the Power Virtual Agents topic to send a private message with relevant context variables to the live agent during the escalation.

The global variables that are created in Power Virtual Agents can be passed to Omnichannel for Customer Service when a conversation is escalated. For the complete list, see Contextual variables available upon hand off.

Parse JSON object to extract record ID

Make sure that you have the following details:

- The Omnichannel for Customer Service context variable, such as msdyn_contact_msdyn_ocliveworkitem_Customer.
- The schema details

A copy of the sample schema details is as follows:

JavaScript

```
        Schema:
        {
            "type": "array",
            "items": {
                "type": "object",
                "properties": {
                    "RecordId": {
                        "type": "string"
                    },
                    "PrimaryDisplayValue": {
                        "type": "string"
                    }
                },
                "required": [
                    "RecordId",
                    "PrimaryDisplayValue"
                ]
            }
        }
```

`PrimaryDisplayValue` will contain the value from the attribute in the Dataverse entities. The mapping for the entity attributes is as follows:

- **Cases:** Case title
- **Contacts:** Full name
- **Accounts:** Name

Here's a sample context record.

JavaScript

```
{
    "msdyn_contact_msdyn_ocliveworkitem_Customer": [
        {
            "RecordId": "<GUID>",
            "PrimaryDisplayValue": "<FullName>"
        }
    ],
    "msdyn_liveworkitemid": "<GUID>"
}
```

Live chat SDK reference

Bot sessions and licensing

Article • 11/18/2022

A bot session is defined as a conversation in which a bot is invoked. The bot can be invoked at the start, middle, or end of a conversation.

- If two different bots are invoked in the same conversation, it is considered a single conversation.
- A conversation with a bot that's escalated to a human agent is considered a bot conversation.

The add-in applications such as Chat, Digital Messaging, and Voice channel are licensed per user. Each add-in application is entitled to a specific number of bot sessions. You can also purchase additional bot sessions on the Microsoft 365 admin center. More information: Buy add-ons

To know about the required subscriptions to use the chat and voice channels, see the Licensing section. For more information on licenses and pricing, see the Dynamics 365 licensing guide.

Integrate an Azure bot

Article • 08/31/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> Azure Active Directory is being renamed to Microsoft Entra ID: No action is needed from you. **Learn more**

In Omnichannel for Customer Service, you can integrate Azure bots seamlessly with chat and social channels, and also repurpose Azure bots to be smart assist bots and provide recommendations to agents. For more information, see Manage smart assist and View smart assist suggestions. This article discusses how you can integrate Azure bots, configure routing rules, and set escalation rules.

Prerequisites

- Have a bot that's built using the Microsoft Bot Framework and registered with Azure Bot Service. Ensure that you register the bot resource as a multitenant app.

  To create an Azure bot resource, see Create Azure bot resource section in the Bot Framework SDK documentation. Be sure to note the values of the Microsoft App ID and the bot handle.

- Set the messaging endpoint in your bot configuration. More information: Configure bot settings

- Register your app on the Azure portal. Make a note of the registered app name.

> **Note**
>
> If you're using multiple bots, make sure that you create unique applications and have unique application IDs for each bot.

- To use the bot over messaging channels:
  - Add Omnichannel channel as a supported channel, if you're using public cloud services.
  - Add both Omnichannel channel and Microsoft Teams as supported channels, if you're using GCC (Government Community Cloud) services.

Integrate Azure bots with Omnichannel for Customer Service

After you've checked for the prerequisites, perform the following steps to integrate your Azure bots with Omnichannel for Customer Service.

1. Connect your Azure bot resource to Omnichannel channel.
2. Configure the bot user as an omnichannel agent.
3. Configure routing rules and context variables.
4. Add the bot user to queues.
5. Set escalation rules as required.

Connect your bot resource to Omnichannel channel

Perform the following steps to connect and register your bot with the Omnichannel channel.

1. Open the Azure portal, and then select your bot resource.
2. On the left pane, under **Settings**, select **Channels** and then select **Omnichannel** from the list of channels.
3. On the **Configure Omnichannel** page, select **Apply**.

Your bot is now registered with the Omnichannel channel.

Configure the bot user as an omnichannel agent

The bot user is first created as an application user and then assigned the **Omnichannel agent** role.

1. Open the PowerPlatform admin center.
2. Select the environment you want to configure, and then select **Settings**.
3. On the **Settings** page, select **Users + permissions**, and then select **Application users**.

4. On the **Application users** page, select **New app user** and in the **Create a new app user** dialog that opens, do the following:

   a. Select a **Business unit** in the list. Make sure that you select the top-level business unit.

   b. Edit the **Security roles** field, and in the **Add security roles** page, select **Omnichannel agent** from the dropdown list and select **Save** to go back to the **Create a new app user** dialog.

   c. Select **Add an app**. The **Add an app from Microsoft Entra Identity** dialog opens.

   d. Select the app that you created during your Azure app registration, and then select **Add** and **Create**.

5. Open your Power Platform environment and under **Settings** > **System** > **Security** > **Users**, search and open the newly created user.

6. Select the **APPLICATION USER** form.

7. In the **User Information** section, do the following:

   - **User type**: Select **Bot application user** from the dropdown list.
   - **Bot application ID**: Enter the Microsoft App ID from Microsoft Entra ID that you noted earlier from the **Prerequisites** section.
   - **Bot handle**: Enter the bot handle that you noted earlier from the **Prerequisites** section.

8. Select the save icon at the bottom of the page.

Add the bot user to queues

You can add a bot user to specific queues where you want the bot to handle the customer queries first, instead of the agent. For this, you must ensure that the bot user has the highest capacity among all users in the queue.

Alternatively, you can also create a queue with the bot user only. In such a case, ensure that the routing rules are set in a way that customer queries are sent to this queue first. This ensures that the bot acts as the first recipient for all queries.

An agent can transfer a chat to a bot by adding the bot to a queue, and then transferring the chat to the queue.

> ⓘ **Note**

- The chat cannot be transferred to the same bot.
- The bot works with the chat widget, workstream, and queues created in Omnichannel for Customer Service.

Configure routing rules

Routing rules route the incoming customer queries to their respective queues. Each routing rule has a condition and a destination queue. If the condition is evaluated as true, the customer query is routed to the destination queue. For bots, the condition is built by using context variables. To learn about context variables and how to add them, see Configure context variables for a bot.

Bots can be developed to receive customer queries first, gain information about the query, and then pass the query to a human agent if required. To achieve this behavior, you must first add the bot user to the queue and configure routing rules in a way that the incoming customer queries are routed to the queue with the bot user. Be sure to map the routing rules to the correct queues so that the queries are routed appropriately.

Set escalation rules

Escalation rules allow you to create rules for the bot to escalate the queries to the appropriate agent. For escalation rules, you must configure context variables and set routing rules to route the customer queries. If the bot escalates a customer query, it's routed to the appropriate queue as per the defined routing rule. Even if the query is redirected to the same queue, another agent in the queue will pick the conversation as per the capacity.

Privacy notice

You understand that your data may be transmitted and shared with external systems and that your data may flow outside of your organization's compliance boundary (even if your organization is in a Government Cloud environment). For example, your messages will be shared with the bot which could be interacting with a third-party system based on the integration done by you. For more information on how we process your data, please refer to the Microsoft Privacy Statement.

Sample configuration to integrate an Azure bot

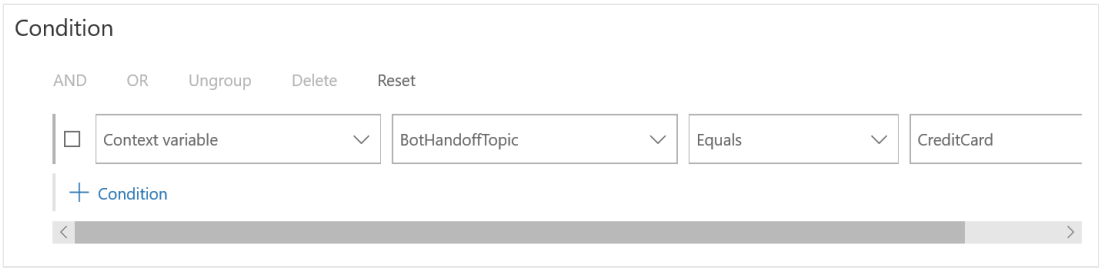
Article • 08/30/2022

This article provides the exact steps and configuration values to integrate an Azure bot with Omnichannel for Customer Service, and then escalate the query to a human agent.

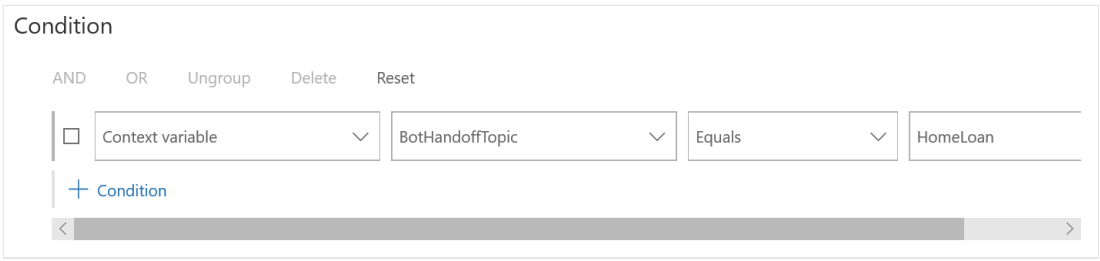
In this sample configuration, three queues and three routing rules are created. The bot user is added to one queue, and the agents are added to the two other queues. Routing rules are defined in such a way that whenever a customer starts a chat, it will be first sent to the bot, and then escalated to a human agent as per the conditions defined in the routing rules. The workstream used in this sample is **ChatWorkStream**.

1. Configure the bot user as an omnichannel agent.
2. Create the following three queues and add users as follows:
    - **BotQueue**: Add the bot user to this queue.
    - **CreditCardQueue**: Add agents who will handle queries related to credit card.
    - **HomeLoanQueue**: Add agents who will handle queries related to home loan.
3. Add a context variable. Let's say you create a context variable named **BotHandoffTopic** in the **ChatWorkStream** workstream.
4. Create the following routing rules in the **ChatWorkStream** workstream in this order:
    - **BotRule**: Specify the workstream and queue as **ChatWorkStream** and **BotQueue**, respectively. Add the condition as follows:

      
    - **CreditCardRule**: Specify the workstream and queue as **ChatWorkStream** and **CreditCardQueue**, respectively. Add the condition as follows:



- **HomeLoanRule**: Specify the workstream and queue as **ChatWorkStream** and **HomeLoanQueue**, respectively. Add the condition as follows:



5. Configure the Azure bot to escalate and end conversations.

When a chat is started by a customer, the query is routed to the bot through the **BotRule** routing rule. If the bot escalates the query, it is sent to the appropriate agent as per the configured routing rules. The bot needs to send the correct context variable and its value in the escalation request to route the query appropriately.

Integrate a Power Virtual Agents bot

Article • 08/31/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> Azure Active Directory is being renamed to Microsoft Entra ID: No action is needed from you. **Learn more**

> **Tip**
>
> If you'd like to try Dynamics 365 Customer Service for free, you can sign up for a **30-day trial**.

Microsoft Power Virtual Agents allows organizations to automate routine conversations, letting agents focus on high-value interactions. When a conversation is escalated from a bot to a human agent, the agent can see the full transcript of the bot conversation and get complete context while engaging with the customer. More information: Enable a bot to escalate and end conversation

When you integrate a Power Virtual Agents bot with Omnichannel for Customer Service, you get the following capabilities for bot conversations:

- Seamlessly integrate your bot with all channels without needing to add channel-specific code in the bot.
- Transfer bot conversations to human agents, and include the full context of the conversation.
- Analyze the bot transcript that's available in Microsoft Dataverse after the chat is completed.
- Configure routing rules to selectively route incoming requests to bots based on context, such as issue type or customer type. For example, you can route low-complexity issues to bots, or route the conversation to a sales or support bot based on the webpage browsing history of the customer.

- Monitor the bot conversations in real time by using the supervisor dashboard, which includes details such as customer sentiment.
- Use the historical dashboards to get insights into the effectiveness of the bots through metrics, such as resolution rate, escalation rate, resolution time, escalation time, and average sentiment.

Prerequisites

Before you integrate Power Virtual Agents bots in Omnichannel for Customer Service, check the following:

1. You must have:

    - A product license for Power Virtual Agents. More information: Licensing for Power Virtual Agents

    - A product license for chat, digital messaging, or voice channel for Dynamics 365 Customer Service, depending on your business requirements. More information: Licensing

2. You must have the Omnichannel administrator role. More information: Manage user roles

3. You'll need an application registered on the Azure portal before connecting to Omnichannel for Customer Service. More information: Register an application with Azure AD

4. You must have a preconfigured bot that can integrate with Omnichannel for Customer Service. More information: Configure seamless and contextual hand-off to Omnichannel for Customer Service

Install Power Virtual Agents extensions

Power Virtual Agents lets you seamlessly hand off voice and text-based conversations to human agents using the chat, digital messaging, and voice channels in Dynamics 365 Customer Service. For your bot to hand off conversations to the omnichannel interface, you must install the Power Virtual Agents extension solutions for Dynamics 365 Customer Service.

To do so, perform the following steps:

1. Ensure the prerequisites are met.
2. Install the extension solutions.

3. Verify if the extension solutions are successfully installed by checking whether the extension solution variables are available in Power Virtual Agents.

Connect your Power Virtual Agents bot to omnichannel instance

Follow the procedure in the section Connect omnichannel to your Power Virtual Agents bot to connect your Power Virtual Agents bot to the omnichannel instance.

> ⓘ **Note**
>
> If you're using multiple bots, make sure that you create unique applications and have unique application IDs for each bot.

Configure your Power Virtual Agents bot in the admin app

In Customer Service admin center or Omnichannel admin center, select the Power Virtual Agents bot from the list of bots in the **Workstreams** area, so the bot can be used to hand off conversations to human agents. For more information, see Add a bot to a workstream.

> ⓘ **Note**
>
> Bots can receive conversations only if they're added to push-based workstreams.

Enable a human agent to transfer a conversation back to a bot

Some support scenarios may require a human agent to transfer a conversation back to a Power Virtual Agents bot after delivering personalized support. This transfer from human agent to bot may be used to provide further assistance with basic, repetitive tasks, or to collect additional data, as in a customer survey.

You can facilitate the transfer of a conversation from a human agent back to a bot in the following ways:

- Create two bots that reside in two queues

- Create two bots that reside in the same queue

Two bots in two queues

In this scenario, a bot has transferred a conversation to a human agent. The human agent will transfer the conversation again to another bot in another queue.

1. A customer starts a conversation.
2. The conversation is routed to Queue 1.
3. The first bot (Bot A) accepts the conversation.
4. The customer requests to chat with a human agent.
5. The conversation is transferred to a human agent within Queue 1.
6. The customer converses with the human agent.
7. The human agent has completed delivering support and wants to hand off the conversation to a second bot (Bot B), which resides in Queue 2.
8. The human agent is disconnected from the conversation.
9. The conversation routed to Bot B in Queue 2.
10. The system triggers Bot B to send a greeting message.
11. The customer now chats with Bot B.

Two bots in one queue

In this scenario, after a bot has transferred a conversation to a human agent, the agent will transfer the conversation to another bot in the same queue when the agent's task is over. For the conversation to flow correctly, you must set the first bot (Bot A) with the highest capacity, the human agent with the next highest capacity, and the second bot (Bot B) with the lowest capacity.

1. A customer starts a conversation that is routed to a queue.
2. The first bot (Bot A) that has the highest capacity accepts the conversation.
3. The customer requests to chat with a human agent.
4. The conversation is transferred to a human agent as the agent has second-highest capacity.
5. The customer chats with the human agent.
6. The human agent has finished delivering support and wants to hand off the conversation to a second bot (Bot B), which resides in the same queue.
7. The human agent is disconnected from the conversation, and the conversation is routed to Bot B.
8. Bot B receives the messages in the following order:

    - A conversation update that the “Bot is added”

- The Omnichannel Set context event

9. The system triggers Bot B to send a greeting message.
10. The customer now chats with Bot B.

Configure context variables for the Power Virtual Agents bot

After you've configured your bot and added it to a workstream, you can configure context variables to route work items. You can also share context from Omnichannel with your Power Virtual Agents bot to create a rich and personalized experience. For information about creating context variables, see Manage context variables. For information about configuring context variables for Power Virtual Agents bots, see Configure context variables for Power Virtual Agents bot.

Automatically close a conversation

When a bot receives a conversation that's subsequently not escalated to a human agent, the conversation is closed if the customer abandons it. The conversation will also be closed automatically after 30 minutes of inactivity.

This conversation will then appear in the **Closed** state in the Omnichannel for Customer Service dashboard and in the **Resolved/abandoned** state in the Power Virtual Agents dashboard. For more information on the state of conversations, see Session outcomes over time chart.

End bot conversation

You must configure the Power Virtual Agents web app bot to end a conversation. More information: End conversation

After a customer closes the chat window, you must also configure a context variable that explicitly ends the conversation in Omnichannel for Customer Service.

1. In Power Virtual Agents, for the selected bot, add a new topic.

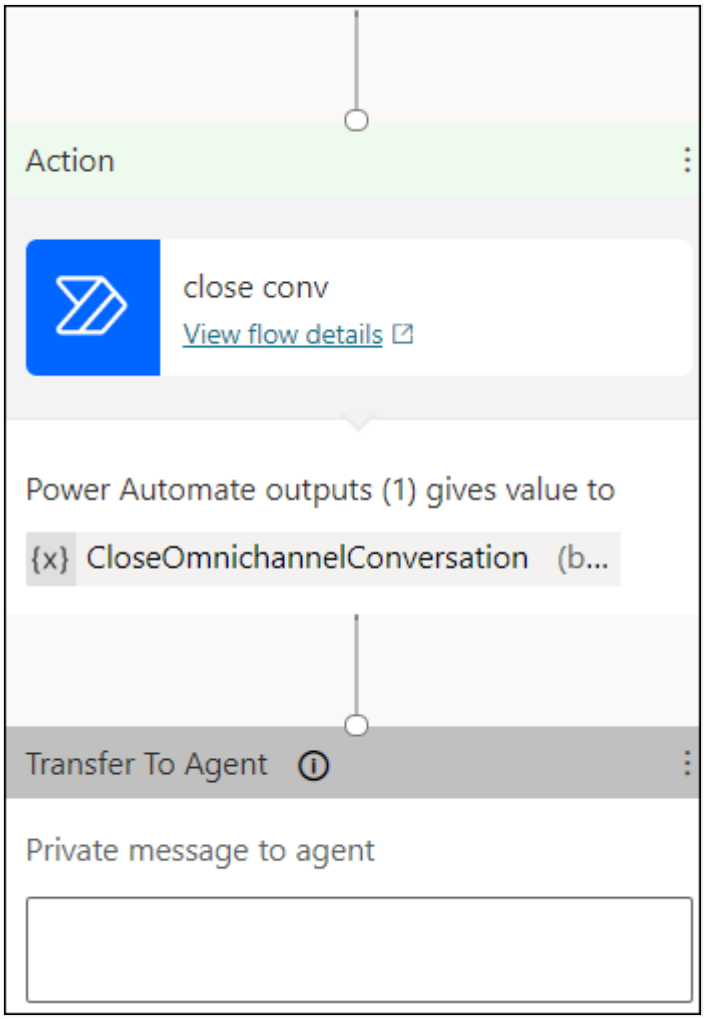
2. Select **Go to authoring canvas**, and in **Add node**, select **Call an action**, and then select **Create a flow**.

3. On the Power Automate window that opens on a new tab, do the following:
   a. In the **Return value(s) to Power Virtual Agents** box, select **Add an output**, and then select **Yes/No**.

b. In the **Enter title** box, enter CloseOmnichannelConversation, which is the Omnichannel for Customer Service context variable name.
c. In the **Enter a value to respond** box, select the **Expression** tab, and then enter **bool(true)** to build the expression, and select **OK**.
d. Save the changes, and then exit Power Automate.

4. In the topic that you were editing, select **Call an action** again, and then in the list, select the flow that you created.

5. In **Add node**, select **End the conversation**, and then select **Transfer to agent**.



6. Go to the topic in which you need to invoke the topic for ending the bot conversation in Omnichannel for Customer Service, and use the **Go to another topic** option in **Add a node**.

7. Select the topic that you created for ending the bot conversation.

8. Save and publish the changes.

Limitations

Description	Limitation
Adaptive cards An adaptive card is a customizable card that can contain any combination of text, speech, images, buttons, and input fields.	• You can build an adaptive card by adding a skill through Power Virtual Agents. More information: Use Microsoft Bot Framework Skills in Power Virtual Agents • Adaptive card styling isn't supported.
Typing A bot receives a typing activity to indicate that the user is typing a response. A bot may send a typing activity to indicate to the user that it is working to fulfill a request or compile a response.	Typing indicators won't appear.
Format bot messages You can set the optional `TextFormat` property to control how the text content of your message is rendered.	• Power Virtual Agents does not support Markdown with images and text. • When Power Virtual Agents sends Markdown text, there's an extra space between lines.
OAuth card in Microsoft Teams Using a chat bot and presenting an OAuth card in the Microsoft Teams channel.	In Power Virtual Agents, the sign-in node presents an OAuth card and it doesn't work properly.

Privacy notice

You understand that your data may be transmitted and shared with external systems and that your data may flow outside of your organization's compliance boundary (even if your organization is in a Government Cloud environment). For example, your messages will be shared with the bot which could be interacting with a third-party system based on the integration done by you. For more information on how we process your data, see Microsoft Privacy Statement.

Troubleshoot issues for bots

How to end a bot conversation in Omnichannel for Customer Service

Configure your Power Virtual Agents bot in Omnichannel Administration

Important

> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

In Omnichannel Administration, after the Power Virtual Agents bot is created and configured to work with Omnichannel for Customer Service, you can configure it to hand off conversations to queues. To receive incoming messages, you must add the bot to at least one queue. The bot will use the routing rules that were created at setup.

1. Connect the bot to Omnichannel for Customer Service and go to the Omnichannel Administration app. More information: Configure seamless and contextual hand-off to Omnichannel for Customer Service
2. Assign the bot to an existing queue.
3. Select **Done**. Now you're on the bot profile page and you can see that your bot is connected.

   Your bot is ready to accept and respond to customer-initiated conversations.

Create a bot queue and a human agent queue

1. Select or create a workstream. More information: Understand and create workstreams
2. Create context variables.

   You must use the context variables that were created during setup for the bot to handle the customer queries appropriately. The context variable is used in routing the incoming customer queries to the appropriate bots and agents. More information: Contextual variables available upon hand-off
3. Create a routing rule for the human agent and add it to the workstream.
4. Create a routing rule for the virtual agent and add it to the workstream.

Routing rules route the incoming customer queries to their respective queues. Each routing rule has a condition and a destination queue. If the condition is evaluated as true, the customer query is routed to the destination queue. For bots, the condition is built by using the context variable.

Bots are developed to receive customer queries first, gain information of the query, and then pass the query to a human agent, if required. To achieve this behavior, you must

add a bot user to the queue and configure routing rules in a way that the incoming customer queries are routed to the queue with bot user.

Be sure to map the routing rules to the correct queues so that the queries are routed appropriately.

> **Note**
>
> When you run a report on Power Virtual Agents activity, the number of bot sessions may differ from the number of sessions in Omnichannel for Customer Service.

Set escalation rules

You can set escalation rules in one of the following ways so the bot can route the queries to the appropriate agent:

- **Add the bot to an existing human agent queue**: If you add the bot to an existing human agent queue, you don't need to change your existing routing rule. Existing routing rules will send incoming messages to the Power Virtual Agents bot. When a handoff is triggered, customers will be transferred from the Power Virtual Agents bot to the human agent according to the escalation routing rules.
- **Create a bot queue and a human agent queue**: If you create two queues, you must create workstreams that contain context variables and appropriate routing rules to route the customer queries. More information: Work with queues in Omnichannel for Customer Service

Configure bot context

Article • 07/21/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Bot context includes context name-value pairs for the current conversation and custom context passed by API programmatically. When customers start a conversation, the relevant context that's related to the customer, the issue they're facing, and recent activities performed by them can be made available for the bot to intelligently provide contextual responses to resolve customer issues in a quick and efficient manner. For example, the bot can use the signed-in user details to look up the recent case information or order history of the customer and provide a response. Similarly, the pre-conversation information, custom context, or recent pages browsed on a website by the customer can be passed on to the bot by configuring context variables for your bots.

For Azure bots, see Configure bot context in Azure bots. For Power Virtual Agents bots, see Configure bot context in Power Virtual Agents bots.

Configure bot context in Azure bots

Article • 07/21/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

For Azure bots, you must install the bot SDK and instantiate the Omnichannel middleware before you configure bot context.

Install the bot SDK in your project

1. To open the NuGet Package Manager, right-click your project and then select **Manage NuGet Packages**.
2. In the NuGet Package Manager, select the package source as **nuget.org** and browse for "Microsoft.Xrm.Omnichannel.BotSDK". Select the package and then select **Install**. More information: Nuget page

Alternatively, you can use the following command in NuGet CLI.

```
JavaScript

Install-Package Microsoft.Xrm.Omnichannel.BotSDK
```

The bot SDK is now installed and the Omnichannel middleware is available in your project.

Use the Omnichannel middleware in your bot code

Use this procedure if you've created your bot using Visual Studio Azure Bot template or Azure portal.

1. Open the **AdapterWithErrorHandler.cs** file.
2. Add the import statement and instantiate the Omnichannel middleware.

CSharp

```
using Microsoft.Omnichannel.Bot.Middleware;
Use(new OmnichannelMiddleware());
```

Parse event activity JSON to get bot context

Article • 07/21/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

The Omnichannel for Customer Service context messages are sent as event activity to bots. Context information such as customer info, live work item, or conversation ID, is sent to the bot as part of an activity JSON. The JSON can be of type **startConversation** for most channels and **ConversationUpdate** for voice conversations.

Fetch and use context for bots in your bot code

To process these context messages, use activity handlers and override them in your bot code. For information on how to use activity handlers, see Event-driven conversations using an activity handler.

In the following example, when the event activity is received, the `OnEventActivityAsync` method is called to fetch and use the context.

CSharp

```
protected override async Task
OnEventActivityAsync(ITurnContext<IEventActivity> turnContext,
CancellationToken cancellationToken)
        {
            if (turnContext.Activity.Name == "omnichannelSetContext")
           {
                // Replace with your logic to fetch the context from
Activity.Value
                IActivity replyActivity = MessageFactory.Text($"Received
context :  {turnContext.Activity.Value.ToString()}");

                // Replace with your logic to consume the context
                await turnContext.SendActivityAsync(replyActivity,
cancellationToken);
            }
        }
```

Integrate an Azure bot

Integrate Power Virtual Agents bot

Configure Azure bots to escalate and end conversations

Article • 08/30/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

This article explains how you can program an Azure bot to route a conversation to a human agent in Omnichannel for Customer Service. It also describes how to program the bot to end the conversation.

Important

- Bots can receive conversations only if they're added to push-based workstreams.
- Bot agents are not supported in consult mode.

Prerequisites

- You must have an Azure bot that's configured and integrated with Omnichannel for Customer Service. More information: Integrate an Azure bot
- Skill-based routing should be enabled.

Escalate a conversation to a human agent

In Omnichannel for Customer Service, a bot can escalate the current conversation to a human agent. The routing of the conversation depends on the routing rule that's configured for the workstream.

When the conversation is transferred from the bot to a human agent, the customer and case details are automatically identified when the agent accepts the escalation request. The bot routes conversations by using the Omnichannel for Customer Service context variables that are associated with the conversation. The bot can send a list of context variables and associated values to Omnichannel for Customer Service, together with the

escalation request. The bot can also set context items that can be used by skill finder models to identify new skills and append them to the existing skills list for the conversation. Omnichannel for Customer Service will then update the context variables with the specified values, and run the routing engine again. This ensures that the escalated conversation is routed to the right queue. For information on the context items and variable names, see Link customer and case to conversations when bot escalates or ends conversations.

After the agent accepts the escalation request, the transcript of the bot's conversation with the customer is visible on the agent's conversation widget. The agent can then continue the conversation with the customer.

> **Note**
>
> The conversation summary won't be visible to the customer.

End a conversation

The Azure bot can choose to end the conversation if it determines that the customer's questions have been answered, or if the customer is no longer responding. The bot can send an `EndConversation` request to Omnichannel for Customer Service.

Sample code

This section includes code samples that you can use to configure an Azure bot to escalate and end conversations.

1. Implement a command class to model tasks related to escalating and ending conversations.

The sample code is as follows.

C#

```
using System.Collections.Generic;
using System.Runtime.Serialization;
using Newtonsoft.Json;
using Newtonsoft.Json.Converters;

namespace EchoBot.OmniChannel
{
    /// <summary>
    /// Command types that bot can send to Omnichannel
```

```
    /// </summary>
    [JsonConverter(typeof(StringEnumConverter))]
    public enum CommandType
    {
        [EnumMember(Value = "Escalate")]
        Escalate = 0,
        [EnumMember(Value = "EndConversation")]
        EndConversation = 1,
    }
    /// <summary>
    /// Action
    /// </summary>
    [DataContract]
    public class Command
    {
        /// <summary>
        /// Type of action that bot can send to Omnichannel
        /// </summary>
        [DataMember(Name = "type")]
        public CommandType Type { get; set; }

        /// <summary>
        /// Dictionary of Workstream Context variable and value pairs to be
sent to Omnichannel for Customer Service
        /// </summary>
        [DataMember(Name = "context")]
        public Dictionary<string, object> Context { get; set; }
    }
}
```

2. Implement an Omnichannel for Customer Service client class to set the command context.

The sample code is as follows.

C#

```
using Microsoft.Bot.Schema;
using Newtonsoft.Json;
using System.Collections.Generic;

namespace EchoBot.OmniChannel
{
    /// <summary>
    /// Extension class for middleware implementation management
    /// </summary>
    public static class OmnichannelBotClient
    {
        /// <summary>
        /// Delivery mode of bot's reply activity
        /// </summary>
        private const string DeliveryMode = "deliveryMode";
        /// <summary>
```

```
        /// Delivery Mode value bridged
        /// </summary>
        private const string Bridged = "bridged";
        /// <summary>
        /// Custom data tag
        /// </summary>
        private const string Tags = "tags";

        /// <summary>
        /// Adds Omnichannel for Customer Service escalation context to the
bot's reply activity.
        /// </summary>
        /// <param name="activity">Bot's reply activity</param>
        /// <param name="contextVars">Omnichannel for Customer Service
workstream context variable value pairs</param>
        public static void AddEscalationContext(IActivity activity,
Dictionary<string, object> contextVars)
        {
            Command command = new Command
            {
                Type = CommandType.Escalate,
                Context = contextVars
            };

            string serializedString = JsonConvert.SerializeObject(command);
            if (activity.ChannelData != null)
            {
                (activity as IActivity).ChannelData[Tags] =
serializedString;
            }
            else
            {
                activity.ChannelData = new Dictionary<string, object>() { {
Tags, serializedString } };
            }
        }

        /// <summary>
        /// Adds Omnichannel end conversation context to the bot's reply
activity.
        /// </summary>
        /// <param name="activity">Bot's reply activity</param>
        public static void AddEndConversationContext(IActivity activity)
        {
            Command command = new Command
            {
                Type = CommandType.EndConversation,
                Context = new Dictionary<string, object>()
            };

            string serializedString = JsonConvert.SerializeObject(command);
            if (activity.ChannelData != null)
            {
                (activity as IActivity).ChannelData[Tags] =
serializedString;
```

```
            }
            else
            {
                activity.ChannelData = new Dictionary<string, object>() { {
Tags, serializedString } };
            }
        }

        /// <summary>
        /// Sets delivery mode for bot as bridged so that Customer can see
bot messages
        /// </summary>
        /// <param name="activity">Bot's reply activity</param>
        public static void BridgeBotMessage(IActivity activity)
        {
            if (activity.ChannelData != null)
            {
                (activity as IActivity).ChannelData[DeliveryMode] = Bridged;
            }
            else
            {
                activity.ChannelData = new Dictionary<string, object>() { {
DeliveryMode, Bridged } };
            }
        }
    }
}
```

3. Call the appropriate client method in the Bot ActivityHandler class.

   Change the `Escalate` and `EndConversation` command criteria based on your requirements.

   Add the code statement `OmnichannelBotClient.BridgeBotMessage(turnContext.Activity);` in your bot code to send messages to Omnichannel for Customer Service. This method must be called for every Activity message that's sent to the customer.

The sample code is as follows.

C#

```
using System;
using System.Collections.Generic;
using System.Threading;
using System.Threading.Tasks;
using EchoBot.OmniChannel;
using Microsoft.Bot.Schema;

namespace Microsoft.Bot.Builder.EchoBot
```

```
{
    public class EchoBot : ActivityHandler
    {
        /// <summary>
        /// This method is called when the bot receives a message.
        /// </summary>
        /// <param name="turnContext">Turn Context object</param>
        /// <param name="cancellationToken">CancellationToken</param>
        /// <returns></returns>
        protected override async Task
OnMessageActivityAsync(ITurnContext<IMessageActivity> turnContext,
CancellationToken cancellationToken)
        {
            if (turnContext.Activity.Type == ActivityTypes.Message)
            {
                // Replace with your own message
                IActivity replyActivity = MessageFactory.Text($"Echo:
{turnContext.Activity.Text}");

                // Replace with your own condition for bot escalation
                if (turnContext.Activity.Text.Equals("escalate",
StringComparison.InvariantCultureIgnoreCase))
                {
                    Dictionary<string, object> contextVars = new
Dictionary<string, object>() { { "Bo-tHandoffTopic", "CreditCard" } };
                    OmnichannelBotClient.AddEscalationContext(replyActivity,
contextVars);
                }
                // Replace with your own condition for bot end conversation
                else if (turnContext.Activity.Text.Equals("endconversation",
StringComparison.InvariantCultureIgnoreCase))
                {

OmnichannelBotClient.AddEndConversationContext(replyActivity);
                }
                // Call method BridgeBotMessage for every response that
needs to be delivered to the customer.
                else
                {
                    OmnichannelBotClient.BridgeBotMessage(replyActivity);
                }

                await turnContext.SendActivityAsync(replyActivity,
cancellationToken);
            }
        }

        /// <summary>
        /// This method is called when there is a participant added to the
chat.
        /// </summary>
        /// <param name="membersAdded">Member being added to the
chat</param>
        /// <param name="turnContext">TurnContext</param>
        /// <param name="cancellationToken">CancellationToken</param>
```

```
        /// <returns></returns>
        protected override async Task
OnMembersAddedAsync(IList<ChannelAccount> membersAdded, ITurn-
Context<IConversationUpdateActivity> turnContext, CancellationToken
cancellationToken)
        {
            foreach (var member in membersAdded)
            {
                if (member.Id != turnContext.Activity.Recipient.Id)
                {
                    //Set the bridge mode for every message that needs to be
delivered to customer

OmnichannelBotClient.BridgeBotMessage(turnContext.Activity);
                    await
turnContext.SendActivityAsync(MessageFactory.Text($"Welcome to Echo Bot."),
cancellationToken);
                }
            }
        }
    }
}
```

The dictionary `contextVars` contains all the Omnichannel for Customer Service context variable name value pairs that you want to update as part of the escalation request. Here `BotHandoffTopic` is the context variable name and **CreditCard** is the context variable value. If there's an agent queue with the rule **BotHandoffTopic** equals **CreditCar**, then this escalated chat will be routed to that queue.

The context variable name is of type String. The context variable value must be of type Integer or String, and should be passed as Dictionary<string, object> during escalation. The sample code is as follows.

C#

```
Dictionary<string, Object> keyValues = new Dictionary<string, object>() {
{ "BotHandoffTopic", "CreditCard" },
{ "IDNumber", 101}
}
```

The bot can also send an escalation summary that'll be visible only to the agent after the escalated chat request is accepted. To send the summary, set the activity text appropriately in the escalation Activity message.

Bring your own custom messaging channel: Direct Line Bot

Best practices for configuring Azure and Power Virtual Agents bots

Download file attachments from an Azure bot

Article • 03/17/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Follow these steps to download attachments from an Azure bot in the Microsoft Teams channel.

1. Get the token for your bot using your bot's Microsoft App ID and client secret.
2. Get the `attachmentId` from the attachment URL.

   For example, if the URL is `https://us-api.asm.skype.com/v1/objects/0-eus-d1-5360689c55c308cb4e3b51722e46b801/`, then the `attachmentId` is `0-eus-d1-5360689c55c308cb4e3b51722e46b801`.
3. Insert the `attachmentId` in a `RequestUri` variable and then use `RequestUri` in a `GET` request, like this:

```
C#

string requestUri =
$"https://botapi.skype.com/amer/v3/attachments/{attachmentId}/views/ori
ginal";
var httpRequest = new HttpRequestMessage(HttpMethod.Get, requestUri);

var authorization = new AuthenticationHeaderValue("bearer", <add the
botToken here>);
var requestHeaders = new Dictionary<string, string>()
  {
     { "Authorization", authorization.ToString() }
  };

foreach (var header in requestHeaders)
  {
      httpRequest.Headers.Add(header.Key, header.Value);
  }

HttpResponseMessage response = await client.SendAsync(httpRequest);
```

Manage file attachments during migration

This section describes how to manage file attachments when you migrate an omnichannel implementation from the Microsoft Teams channel to the Omnichannel bot service messaging platform.

First, let's quickly review file attachment formats in the Teams bot service channel and the Omnichannel bot service channel.

File attachment formats

When file attachments are sent from Omnichannel for Customer Service to an Azure bot on the Teams bot service channel, the attachment format is passed in the `Activity.Attachments` property. The attachment's content type is "application/vnd.microsoft.teams.file.download.info".

Teams bot service channel

JSON

```
{
   "attachments":[
      {
         "contentType":" text/html",
         "contentUrl":null,
         "content ":{
            "name":null,
            "thumbnailUrl":null
         }
      },
      {
         "contentType":"application/vnd.microsoft.teams.file.download.info",
         "contentUrl":"https://us-api.asm.skype.com/v1/objects/0-wus-d8-111
a550dfI 6e947f250519ffc242763d/",
         "content":{
            "downloadUrl":"https://us-api.asm.skype.com/v1/objects/0-wus-d8-
111 a550dfI 6e947f250519ffc242763d/",
            "uniqueId":"0-wus-d8-111 a550dfI 6e947f250519ffc242763d",
            "fileType":"png "
         },
         "name":"bot.png",
         "thumbnailUrl":null
      }
   ]
}
```

However, when file attachments are sent from Omnichannel for Customer Service to the Azure bot on the Omnichannel bot service channel, the information required to

download the files is passed in the `amsReferences` and `amsMetadata` fields of the `Activity.ChannelData` property.

Omnichannel bot service channel

JSON

```
{
   "recipient":{
      "id":"8:acs:5ecf37b1-11 Oc-414g-ab33-804ffd6b4a33_eooe0010-7c57-1ceb-
nec-113aOdOOb272",
      "name":"Omnichannel-test-bot",
      "aadObjectId":null,
      "role":null
   },
   "attachments ":null,
   "channelData":{
      "tags":"Channelld-lcw,FromCustomer",
      "deliveryMode":"bridged",
      "fromUserId":"8:acs:5ecf37b1-110c-4149-ab33-804ffd6b4a33_00000010-61
b9-ab1 d-3dfe-9c3aOd009ea4",
      "amsReferences":[
         "0-wus-d6-20e7797d208fab388cc11b09674d166"
      ],
      "amsMetadata":[
         {
            "contentType":"image/png",
            "fileName":"SurnmerTime.png"
         }
      ],
      "sourceChannelId":"omnichannel"
   }
}
```

How to manage file attachments in your Azure bot code

Attachment information is passed differently in the Omnichannel bot service channel and the Teams bot service channel. To ensure smooth migration between the two chat channels, keep both the Teams channel-specific logic and the Omnichannel bot service channel-specific logic in the bot code, as shown in the following example.

C#

```
// 1. Retrieve Attachment ID from ChannelData["amsReferences"]
if (turnContext.Activity.ChannelData != null &&
    turnContext.Activity.ChannelData is JObject incomingRequestChannelData
&&
    incomingRequestChannelData.TryGetValue("amsReferences", out JToken
amsReferencesArray))
```

```
{
    string attachmentId = JsonConvert.DeserializeObject<string[]>
(amsReferencesArray.ToString()).FirstOrDefault();

    // 2. Build HTTP request for specified attachment ID.
    string requestUri =
$"https://botapi.skype.com/amer/v3/attachments/{attachmentId}/views/original
";
    var httpRequest = new HttpRequestMessage(HttpMethod.Get, requestUri);

    // 3. Acquire authentication token and add it to request headers
    var token = await new MicrosoftAppCredentials("botAppId",
"botAppSecret").GetTokenAsync();
    var authorization = new AuthenticationHeaderValue("bearer", token);
    httpRequest.Headers.Add("Authorization", authorization.ToString());

    // 4. Add Azure Communication Services Bot ID to request header. This is
required to achieve good download performance.
    httpRequest.Headers.Add("BotAcsId", turnContext.Activity.Recipient.Id);

    // 5. Use HttpClient to execute the request and download attachment
    var response = await client.SendAsync(httpRequest);

    // 6. Save HTTP response stream to the file
    var responseContentStream = await response.Content.ReadAsStreamAsync();
    using (FileStream fileCreateStream = new FileStream("file path",
FileMode.Create))
    {
        fileCreateStream.CopyTo(responseContentStream);
    }
}
else if (turnContext.Activity.Attachments != null)
{
    // 1. Retrieve Teams attachment
    var teamsAttachment =
turnContext.Activity.Attachments.FirstOrDefault(attachment =>
attachment.ContentType.Equals("application/vnd.microsoft.teams.file.download
.info", StringComparison.OrdinalIgnoreCase));

    if (teamsAttachment != null)
    {
        // 1. Retrieve Teams Attachment ID from Content["uniqueId"] field
        string attachmentId = (teamsAttachment.Content as
JObject).GetValue("uniqueId").ToString();

        // 2. Build HTTP request for specified attachment ID.
        string requestUri =
$"https://botapi.skype.com/amer/v3/attachments/{attachmentId}/views/original
";
        var httpRequest = new HttpRequestMessage(HttpMethod.Get,
requestUri);

        // 3. Acquire authentication token and add it to request headers
        var token = await new MicrosoftAppCredentials("botAppId",
"botAppSecret").GetTokenAsync();
```

```
        var authorization = new AuthenticationHeaderValue("bearer", token);

        httpRequest.Headers.Add("Authorization", authorization.ToString());

        HttpClient client = new HttpClient();
        HttpResponseMessage response = await client.SendAsync(httpRequest);
    }
}
```

Get user details on Microsoft Teams from Azure bot

Article • 05/16/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

If you integrate an Azure bot with the Microsoft Teams channel in Omnichannel for Customer Service, you might want to get user details. The Azure bot needs to use the Microsoft Graph SDK to fetch the user details. More information: Get user details with Microsoft Graph

Privacy notice

You understand that your data may be transmitted and shared with external systems and that your data may flow outside of your organization's compliance boundary (even if your organization is in a Government Cloud environment). For example, your messages will be shared with the bot which could be interacting with a third-party system based on the integration done by you. For more information on how we process your data, please refer to the Microsoft Privacy Statement.

Display suggested actions in a vertical layout

Article • 02/17/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Your bot can use suggested actions to present buttons or options in the chat window, which the user can tap to provide input. This way, users can answer a question or make a selection without having to use a keyboard.

Suggested actions can be displayed vertically to enhance the user experience and promote easy readability. More information: Customize a chat widget

The suggested actions feature is now supported in Microsoft Teams along with other asynchronous chat channels.

Pass authentication token to bot during single sign-on in live chat

Article • 03/17/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

With single sign-on (SSO) in Omnichannel for Customer Service, your bots can perform secure actions on behalf of the customer during an ongoing customer conversation. This provides a seamless, personalized, and secure experience for the customer, thereby improving customer satisfaction.

In the live chat channel, you can set up authentication in Azure or Power Virtual Agents bots. You can request authentication during a customer conversation before seeking or processing any confidential information such as bill payment, order returns, and any other sensitive data. As a bot author or developer, you can choose to show the OAuth card if the customer hasn't signed in or if the customer sign-in couldn't be validated. You can choose to hide the card if the customer has already signed in.

Here's how this works:

- During the live chat, your bot requests the customer for authentication before processing any sensitive or confidential information.
- You intercept the OAuth card and call your function to send the authentication token directly to the bot.
- Your function will then pass an authentication token (if found) and tell Omnichannel for Customer Service whether the OAuth or sign-in card should be displayed or not, based on the customer's sign-in status.

Prerequisites

If you're using Azure bots, ensure that you've installed the latest versions of the following two library packages:

- **Microsoft.Bot.Builder.Dialogs** This library implements the .NET Simple Dialog classes.
- **Microsoft.Bot.Builder.Integration.AspNet.Core** This library integrates the Bot Builder SDK with ASP.NET Core.

If you're using a Power Virtual Agents bot, ensure that you manually set up end user authentication for Power Virtual Agents. More information: Configure manual user authentication

Sample code

Here's a code sample that illustrates how you can pass an authentication token to an Azure or Power Virtual Agents bot during single sign-on.

JavaScript

```
const signInIds = [];
window.Microsoft.Omnichannel.LiveChatWidget.SDK.setBotAuthTokenProvider(asyn
c (botTokenUrl, callback) => {
  const urlSearchParams = new URLSearchParams(botTokenUrl);
  const signInId = urlSearchParams.get("state");

  if (signInIds.includes(signInId)) { // Ignore authenticated sign-in cards
    callback({show: false});  // Hide card
    return;
  }

  signInIds.push(signInId);

  const authUrl = ""; // Customer's Authentication API
  const authResponse = await fetch(authUrl, method: "POST"});
  const {token} = authResponse;  // Customer's Auth Token

  const data = {
    token: "token"
  };

  const payload = {
    method: "POST",
    headers: {
      "Content-Type": "application/json"
    },
    body: JSON.stringify(data)
  };

  try {
    const botAuthResponse = await fetch(botTokenUrl, payload); // Posts Auth
Token to Bot directly

    // Sign in through Bot is successful
```

```
    if (botAuthResponse.status === 200) {
      signInIds.push(signInId); // Track authenticated sign-in card
      callback({show: false}); // Hide card
    }

    if (botAuthResponse.status === 404 || botAuthResponse.status == 202) {
      callback({show: false}); // Hide card
      return;
    } else {
      // Other condition handling
    }

    return;
  } catch (error) {

  }

  callback({show: true});  // Show sign-in card by default
});
```

Customer Service Insights

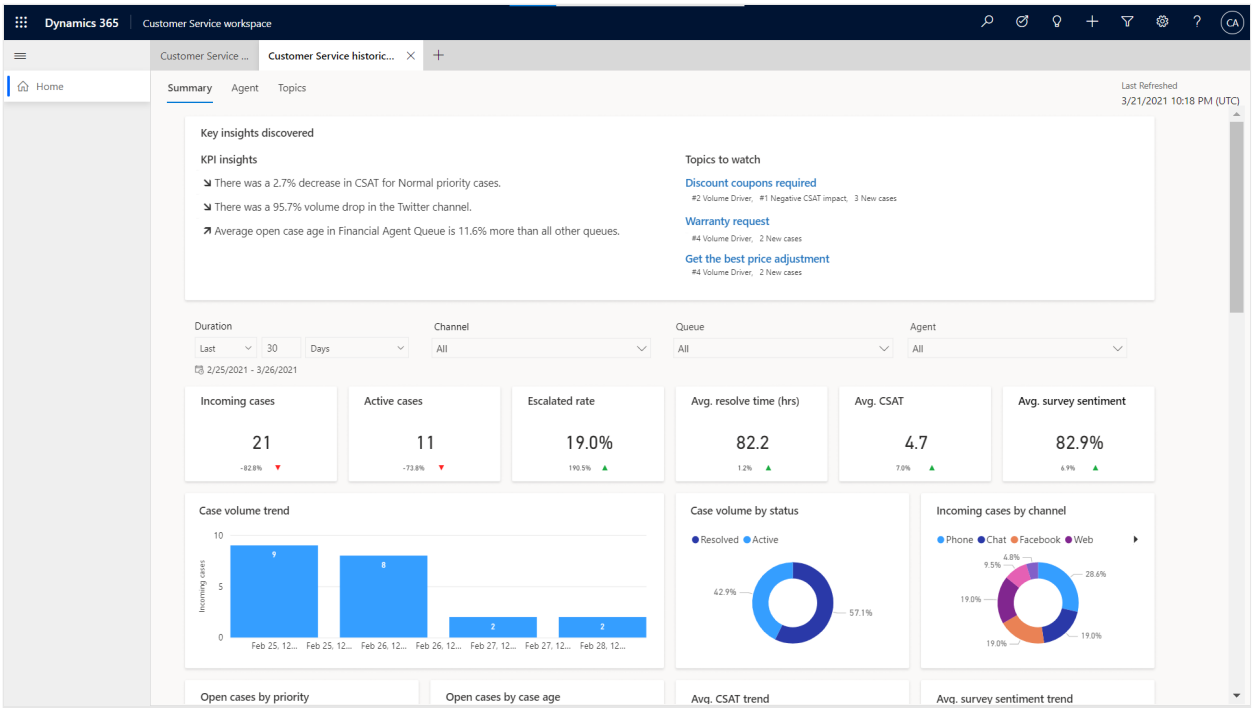
Article • 11/01/2023

> **Note**
>
> Microsoft Power BI template reports for **Customer Service Analytics dashboards** and **Omnichannel Insights** will be deprecated as of November 6, 2023. We recommend that you start using the out-of-box **Omnichannel historical analytics** and **Customer Service historical analytics**, which don't need additional Microsoft Power BI licenses. You can **visually customize** and extend these reports to add additional data sources and metrics through **data model customization**. For details on the deprecation, go to **Deprecations in Customer Service**.

Dynamics 365 Customer Service Insights helps both agents and customer service managers make better decisions and improve customer satisfaction. Agents and customer service managers can use AI and analytics capabilities for Customer Service Insights and Omnichannel for Customer Service. You can empower your teams with insights into customer satisfaction–boosting analytics and AI-powered features to spend less time searching and more time engaging with customers.

The premium AI capabilities in Customer Service Insights use advanced AI technology in natural language understanding and natural language generation to help your service team focus on what matters and guide them to success. As an agent, you can use real-time similar cases and knowledge article suggestions that are customized for the current context. The AI-driven technology allows agents to help solve customer issues more quickly, improving resolution rates, and customer satisfaction.

These capabilities are deeply embedded into the core agent and manager experiences in Customer Service and Omnichannel.



Customer Service Insights across your organization

Customer Service Insights connects with your Dynamics 365 Customer Service and Omnichannel for Customer Service data to provide your support organization with out-of-box AI and BI capabilities, such as customer service analytics, similar case suggestions and more. Different applications will surface slightly different feature sets, as detailed below.

Customer Service applications

Customer Service Insights is now embedded in Dynamics 365 Customer Service. After it is enabled, this experience allows you to start seeing historical analytics directly within the Customer Service environment. Several reports and dashboards can be viewed by your management team.

For more information on the Customer Service offerings, see the following capabilities.

- Customer Service Historical analytics
- Topic clustering for cases
- Customer Service analytics in Power BI
- Knowledge search analytics
- AI Suggestions for similar cases and knowledge articles

Omnichannel for Customer Service

Customer Service Insights for Omnichannel for Customer Service brings many of the same key operational metrics and features right into your daily contact center operations. Real-time customer sentiment analysis, combined with contextual AI suggestions of relevant cases and knowledge articles, helps agents reduce customer frustration and case resolution times. With the sentiment analysis dashboard, you can use the real-time sentiment data to gain a better understanding of how customer interactions drive KPIs and satisfaction scores.

For more information on the Omnichannel for Customer Service offerings, see the following topics.

- Analyze real-time customer sentiment
- Enable AI suggestions for similar cases and knowledge articles
- Dashboards overview

Important

If you're a customer who uses the Customer Service Insights standalone web application, your current working environments will be terminated and inaccessible by December 8, 2021. You can no longer use the standalone service after this date. The embedded Customer Service Insights features in the core applications will continue to be available and supported. For users who hold Customer Service Enterprise licenses, you can no longer create new workspaces, but you'll retain access to existing ones. Meanwhile, the standalone app guide contains documentation for the web application.

Supported regions and languages, and service limits for analytics and insights

Article • 10/09/2023

Depending on your location, certain features are available for in Dynamics 365 Customer Service insights. Service limits also apply.

Prerequisites

The AI Builder preview models setting should be enabled in Power Platform Admin Center.

Region availability of analytics and insights

The following features are available in all geographic locations where the voice channel in Omnichannel for Customer Service is supported:

- Call transcription
- Call insights

Geographic support for real-time message translation is dependent on your translator service.

The following table lists the region availability of analytics and insights.

> **Note**
>
> The features listed in the table aren't available in South Africa, Korea, and Norway.

Feature	North America	Europe	Asia Pacific	South America	Australia	Japan	China	India	Canada	United Kingdom	France	United Arab Emirates	Switzerland	Germany
Copilot—Summarize cases[1]	✓	✓	✓	✓	✓	✓	✕	✓	✓	✓	✓	✓	✓	✓

Service limits for analytics and insights

The built-in limits are designed to ensure reliability and stability of the service. Use the Ideas forum to request changes.

The following table lists the built-in limits for the embedded version of insights that can be accessed through the Customer Service Hub, Customer Service workspace, and Omnichannel for Customer Service apps.

Area	Limits	Notes
Data age limit	24-month period	Reports are limited to case data from the past 24 months.
Dashboard interaction	No limit	No limits on the number of interactions or drill-throughs within reports.
Topics	At least three related cases	Topics require at least three semantically related cases for the model to generate topics.
Topics refresh	100k per run	Refresh of topics uses up to 100,000 cases or conversations per run.
Data refresh	Once every 24 hours	Data refresh occurs automatically each day, starting at midnight UTC. The time when the refresh completes isn't guaranteed. More information: Dashboard overview.
AI suggestions for active cases	Each user license adds 30 active cases where agents can get AI suggested knowledge articles and similar cases in real time.	
AI suggestions for conversations	150 conversations per month per user license	Each user license adds 150 Omnichannel conversations where agents can get AI suggested knowledge articles and similar cases in real time.

Service protection limits for AI suggestions

AI suggestions for case and knowledge was introduced in October 2020 with service protection limits on these capabilities to maintain a consistent quality of service for all our customers. However, there aren't penalties if customers exceed predefined limits. Over time, Microsoft might adjust these limits in keeping with customer usage patterns. Microsoft provides options for customers with high usage scenarios and patterns to purchase more capacity in a manner that's minimally disruptive.

For information on the service protection limits for AI suggestions, see Enable AI suggestions for similar cases and knowledge articles. The total limits are pooled at the tenant level based on the number of Customer Service Enterprise user licenses that are available in the tenant.

Microsoft Power Platform capacity impact

Configure analytics and insights dashboards

Article • 07/28/2023

You can enable and configure the Customer Service Insights features and services and share them with service managers, who can then view and analyze different activities. You can configure the features and services in Customer Service admin center app, and they can be viewed on both the Customer Service Hub and Customer Service workspace apps.

> **Note**
>
> Settings for the Power BI template applications are separate from these services.

Configuration details

See the following articles for configuring analytics and insights:

- Configure Customer Service historical analytics
- Configure Omnichannel historical analytics
- Configure AI topic clustering for cases
- Configure Omnichannel real-time analytics
- Configure Knowledge search insights
- Configure intraday insights

Configure user access to analytics and dashboards

Users with the system administrator or supervisor role can access the analytics and dashboards. To grant other users access to analytics and dashboards, go the Power Platform admin center and perform the following steps:

1. Open the Power Platform admin center and select your environment.
2. In the **Access** section, under **Security roles**, select **See all**. A list of security roles available in the environment is displayed.
3. To add privileges to an existing role, select a role from the list of security roles, and then select **Edit** on the navigation bar.

If you'd like to create a new role for analytics users, then perform the following steps:

a. Select **New role** on the navigation bar. The **New Security role** dialog opens.
b. On the **Details** tab, enter a name in the **Role Name** field.

4. Select the **Custom Entities** tab, move through the list of analytics reports, and then grant **Read** privileges for the following:

   - Omnichannel historical analytics dashboards
   - Omnichannel real-time analytics dashboards
   - Customer Service historical analytics dashboards
   - Knowledge analytics dashboards
   - Report Bookmarks

   > **Note**
   >
   > For custom roles, select **Read** privileges for **the entities used by historical and real-time analytics**, as applicable.

5. Select **Save and close**.

6. On the **Security roles** page, select the role that you just created or updated, and then select **Add people** to add users to the role.

> **Note**
>
> - To bookmark a report, grant **Create**, **Read**, **Write**, and **Delete** privileges to the security roles as applicable, for the **Report Bookmark** custom entity.
> - To edit analytics reports, grant the **Analytics Report Author** role. For information about assigning user roles, go to **Assign roles to users**.

Manage real-time analytics reports in Omnichannel for Customer Service

Article • 05/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Important

This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making, and should not be used to make, decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using Dynamics 365, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

Note

Any visual customizations that you might have made on the preview version will be overwritten when your organization gets upgraded to the latest generally available version. Future updates to the data model will be backward compatible and visual customizations will be retained. More information: **Future data model updates**

You can configure real-time analytics in Omnichannel for Customer Service and give your supervisors access to real-time metrics and KPIs that reflect the situation in the

contact center as they oversee agents who handle customer conversations that come through multiple channels.

The following real-time analytics reports are available:

- Summary
- Voice
- Agents
- Ongoing conversation

Omnichannel real-time analytics reports aren't enabled by default. Once you enable these reports, they're enabled by default for the System Administrator, Omnichannel Administrator, Omnichannel Supervisor, Analytics Reports author, and CSR manager roles. To configure user roles to access analytics and dashboards, see Configure user access to analytics and dashboards.

Manage Omnichannel real-time analytics reports

Use the Customer Service admin center app to enable or disable Omnichannel real-time analytics reports.

1. Sign in to Dynamics 365, and on the apps page, select Customer Service admin center.

   > **Note**
   >
   > The Customer Service admin center app is automatically installed in all the Customer Service organizations. More information: **Get started with Customer Service admin center**

2. In the site map, select **Insights** in **Operations**. The **Insights** page appears.
3. On the **Insights** page, **Report Settings** section, go to **Real-time Analytics**, and select **Manage**.
4. On the **Real-time analytics** page, turn on the **Enable Omnichannel real-time analytics** toggle.
5. In the **Additional options** section, select the **Add real-time analytics for Omnichannel voice** option. This option is available only if your organization has the voice feature configured.

View Omnichannel real-time analytics reports

To view the reports in Customer Service workspace, see Access reports.

If you've customized the Customer Service workspace, you need to perform the following steps to be able to view the reports.

1. Go to make.powerapps.com.
2. Select **Apps**.
3. Select **Customer Service workspace** and then select **Edit**.
4. On **Pages**, select **New**.
5. On the **New page** dialog, select **URL** and then select **Next**. Fill in the following information:
   a. **URL**: **/main.aspx?pagetype=control&controlName=MscrmControls.Analytics.ReportingControl&data={"featureIds":"e67a1ada-6c62-4b45-b758-0b246f32c1a5"}**
   b. **Title**: Omnichannel real-time analytics (or any other sub area title you would want to add).
6. Select **Add**.
7. Optionally, on the **Omnichannel real-time analytics** pane, on the **Icon** dropdown list, select **Use web resource**.
8. On the **Select web resource image** dialog, search and select the **msdyn_/Analytics/imgs/RealtimeReportIcon.svg** display name, and then select **Apply**. The **Omnichannel real-time analytics** page gets displayed on Customer Service workspace.
9. Select **Save**, and then select **Publish**.

Manage access to Ongoing Conversations dashboard

Article • 06/02/2021

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

To access the **Omnichannel Ongoing Conversations** dashboard, you must assign **Omnichannel supervisor** role to the users. To learn more, see Assign roles and enable users for Omnichannel for Customer Service.

Once the users get access, the **Omnichannel Ongoing Conversations** dashboard is available on **Unified Service Desk** and **Omnichannel for Customer Service** app on web.

For **Unified Service Desk**, you must add users to supervisor configuration for the dashboard to be available in the home session app tab. To learn more, see Add users to supervisor configuration.

Configure intraday insights for supervisors

Article • 08/31/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Important

Azure Active Directory is being renamed to Microsoft Entra ID: No action is needed from you. **Learn more**

Note

Intraday insights reports for Omnichannel for Customer Service are deprecated as of May 1, 2023. We recommend that you use **real-time analytics reports**, our latest analytics capability, which provide real-time information about the health and key performance indicators of your organization. For more information on the deprecation, go to **Intraday insights for Omnichannel for customer service are deprecated**.

Important

This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making, and should not be used to make, decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using Dynamics 365, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the

feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

Supervisors have a dual responsibility with respect to agents and customers. They monitor and manage agents and make sure they remain highly productive. At the same time, they help provide a superior experience for customers. To help supervisors carry out this dual responsibility, the insights consist of intraday health tracking of agent productivity and performance.

You can customize intraday insights if you use Power BI or Power BI Premium licenses. You can't customize insights in a pre-configured Power BI workspace that doesn't have a Power BI license.

> **Note**
>
> The pre-configured Power BI workspace version of intraday insights is only available for organizations that are provisioned in a public cloud and isn't available in Government Community Cloud (GCC) and Unified Service Desk.

As an administrator, you must configure intraday insights before supervisors can use it. To configure intraday insights for your organization, follow the scenario that is applicable for your environment.

Provisioning scenario	Need to customize intraday insights?	Details
New organization created in August 2020 or later	No	Intraday insights is preconfigured and non-customizable by default. For more information, see Intraday insights in a preconfigured Power BI workspace.
Existing organization with customized intraday insights	Yes	No further action needed.
Existing organization with customized reports wanting to switch to preconfigured Power BI workspace version	No	Convert your reports to a non-customized version of intraday insights by following the steps in Intraday insights in a preconfigured Power BI workspace.
Existing or new organization with need for customized intraday	Yes	Follow the steps in Configure customized intraday insights reports.

Provisioning scenario	Need to customize intraday insights?	Details
insights		

Intraday insights in a preconfigured Power BI workspace

As an administrator for a new organization, intraday insights is configured by default, so you don't need to take extra steps to configure it, but if you want to switch from using customized reports to using the preconfigured Power BI workspace, follow the steps in this section. The preconfigured Power BI workspace feature allows you to access intraday insights without customizing the reports.

For supervisor users in your organization to access the report and dashboard, ensure the Omnichannel supervisor role is assigned. More information: Enable users for Omnichannel for Customer Service

To enable the preconfigured Power BI workspace:

1. In the site map of Omnichannel admin center, select **Supervisor settings** under **Advanced settings**, and then select **Manage** for **Intraday insights**. If you're using the Omnichannel Administration app, from the site map , select **Supervisor Experience** > **Intraday Insights**.

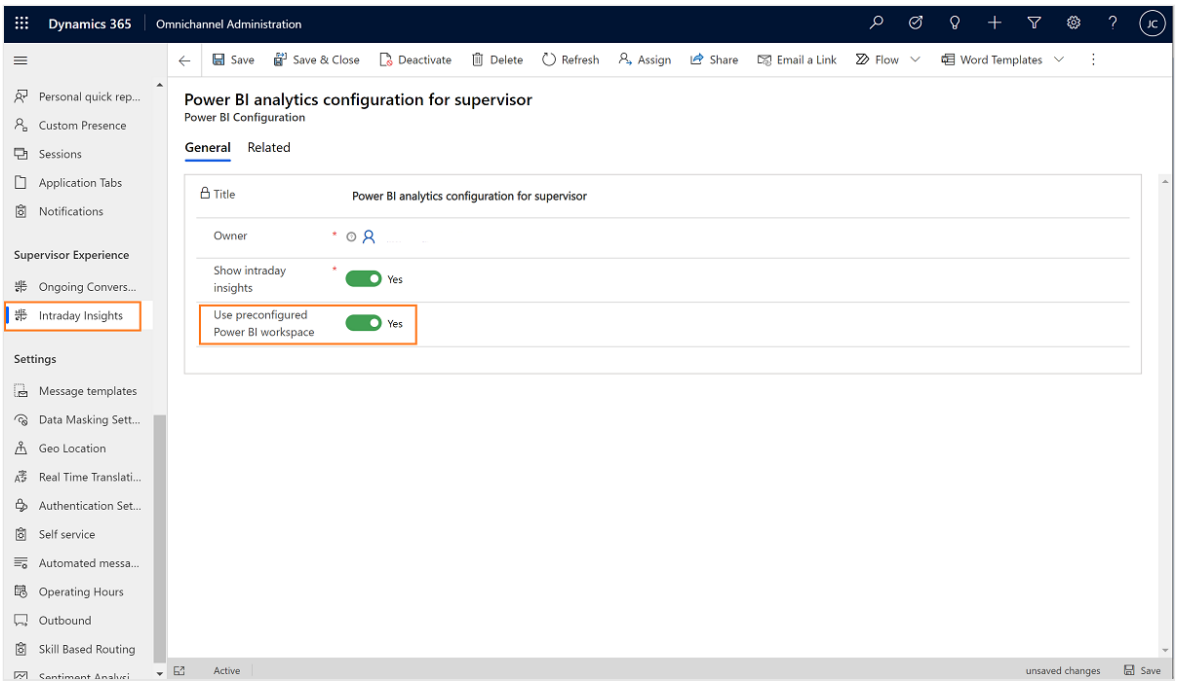
   The Power BI configuration view opens.

   > **ⓘ Important**
   >
   > Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

2. Select **New**.

   The **Power BI Configuration** form opens, where you can verify that **Use preconfigured Power BI workspace** is enabled or you can toggle it to **Yes** to

enable it.



3. Save and close the page.

Configure customized intraday insights reports

As an administrator, if you want to customize the intraday insights reports for your organization, you can configure the insights for the **Omnichannel for Customer Service** app on the web and for **Unified Service Desk**.

Prerequisites

Review the following prerequisites before configuring the supervisor insights:

- You have administrative privileges for Dynamics 365 Customer Service and Power BI.
- You have a **Power BI Pro** or **Power BI Premium** license for all supervisors and administrators.
- As a system administrator, allow the **Omnichannel for Customer Service** app to read and write data on behalf of users in your organization. More information: Provide data access consent
- The Omnichannel supervisor role has been assigned to supervisor users in your organization to access the report and dashboard. More information: Enable users for Omnichannel for Customer Service

- As a system administrator, you must create and add a security group for Power BI service. Follow these steps to create and add a security group:

    1. Create a security group in Microsoft Entra ID, and add **Omnichannel for Customer Service** as a member to that security group. For GCC, you must add only **Omnichannel Engagement Hub - GCC** as a member.

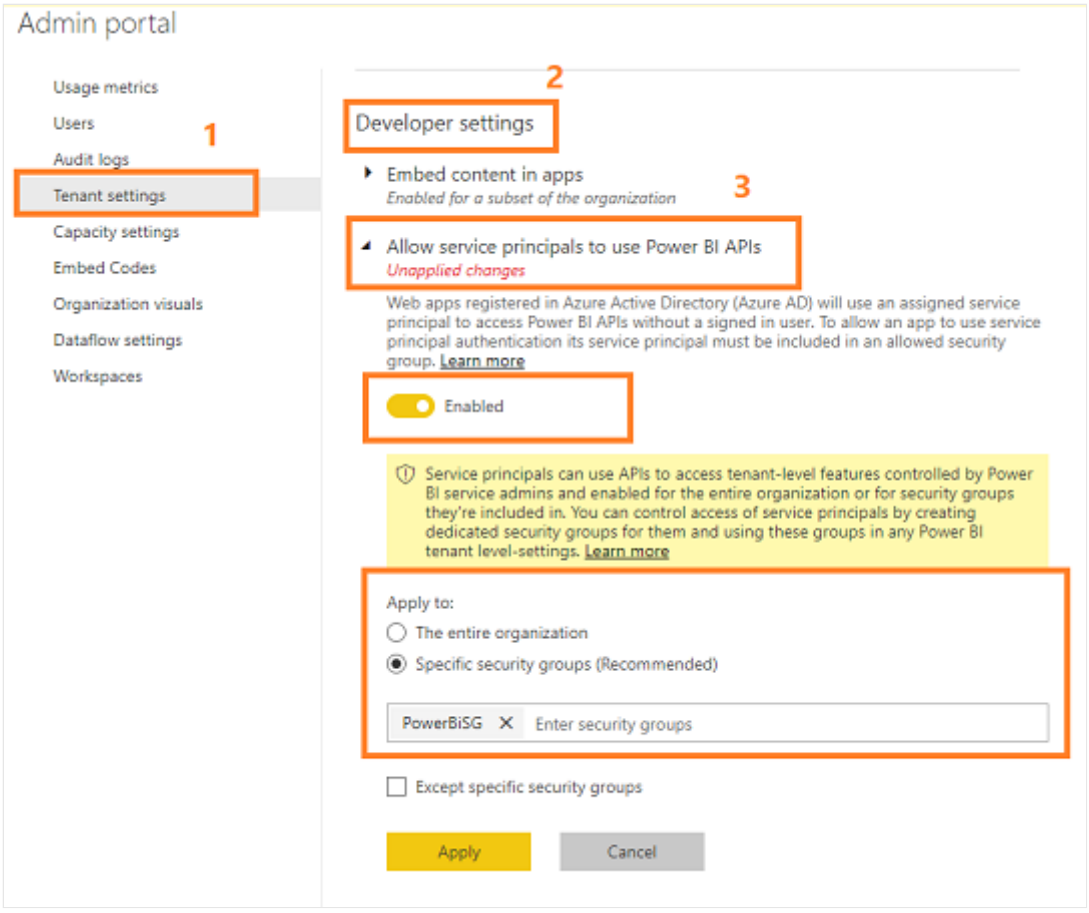
        More information: Create a basic group and add members using Microsoft Entra ID

    2. As a Power BI admin, enable the service principal in the **Developer settings** in the Power BI admin portal and the security group that you created in Microsoft Entra ID.

        a. Sign in to Power BI service and go to **Settings** > **Admin portal**.

        
        b. In the admin portal, go to **Tenant settings** > **Developer settings** > **Allow service principals to use Power BI APIs**.

        c. Enable **Allow service principals to use Power BI APIs** and specify the security group to which you want to give access.



d. Select **Apply**.

Configure intraday insights for Omnichannel for Customer Service

Follow these steps to configure intraday insights for the Omnichannel for Customer Service app on the web:

1. Configure Power BI workspace
2. Share workspace and reports with supervisors

Configure the Power BI workspace

> **ⓘ Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

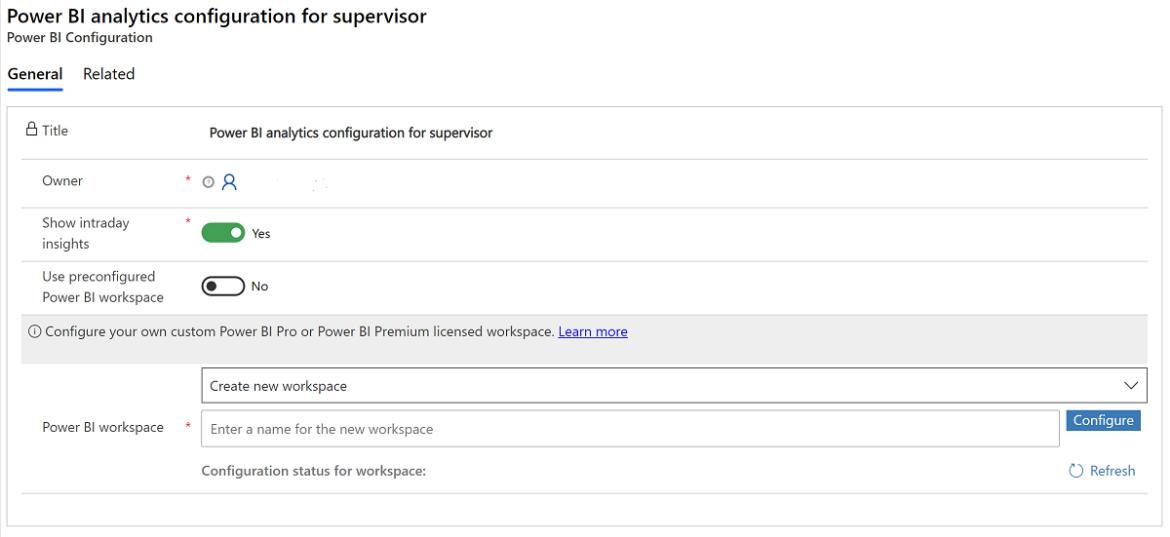
You must configure the Power BI workspace using the Omnichannel admin center or Omnichannel Administration app to create datasets and reports in Power BI. When configured, the supervisor users in your organization can see the Intraday insights reports as an app tab. Follow these steps to configure the Power BI workspace to display Intraday insights reports as an app tab in the **Omnichannel for Customer Service** app on the web.

1. In the site map of Omnichannel admin center, select **Supervisor settings** under **Advanced settings**, and then select **Manage** for **Intraday insights**. If you're using the Omnichannel Administration app, from the **Site Map** ☰, select **Supervisor Experience** > **Intraday Insights**.

   The Power BI configuration view opens.

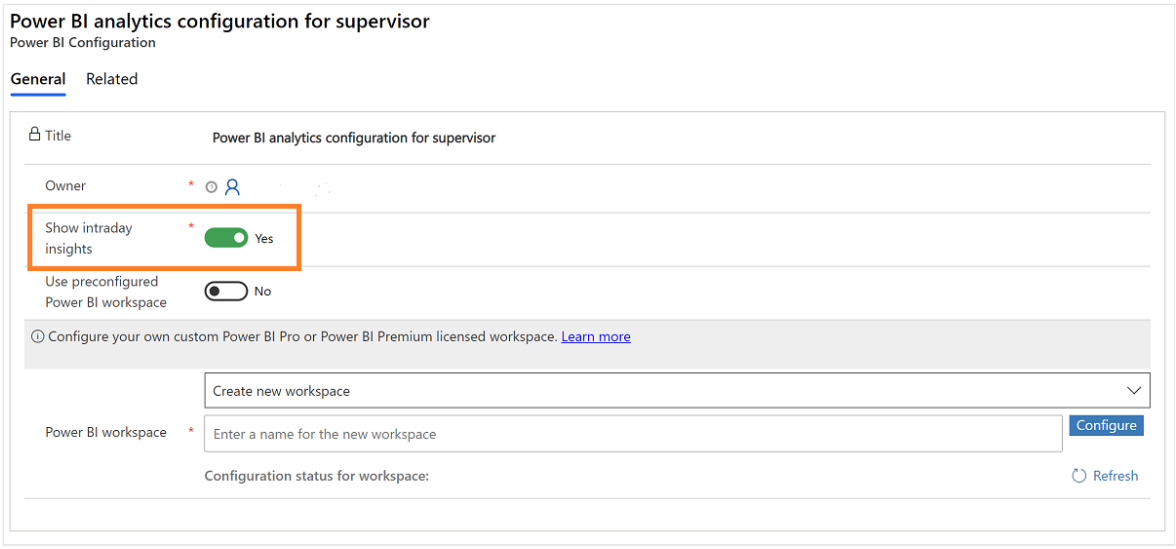
2. Select **New**.

   The **Power BI Configuration** form opens.

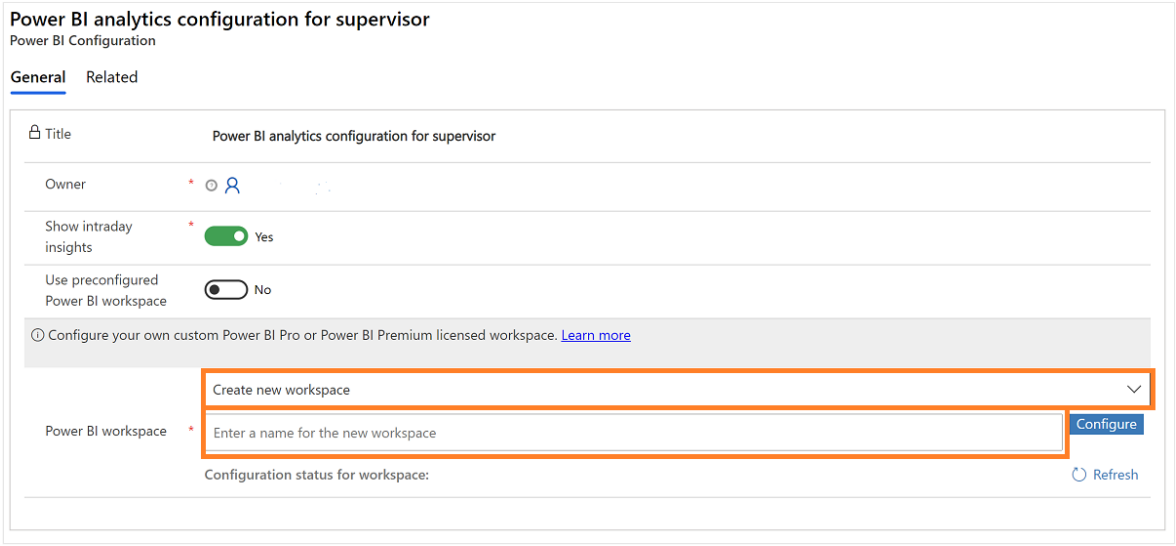


3. Set the **Show intraday insights** toggle to **Yes** to make intraday insights an app tab on the home session for supervisors.

4. For **Use preconfigured Power BI workspace**, set the toggle to **No**.

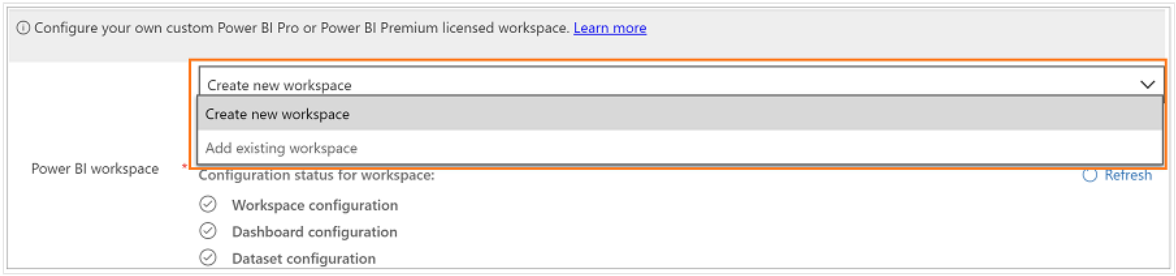


5. In the **Power BI workspace** section, select **Create new workspace** and enter a name for the workspace in **Power BI workspace** (this name must be unique).



-OR-

If you want to add an existing Power BI workspace, select **Add existing workspace** and the existing workspaces are listed. Select the workspace that you want to add.



> **Note**
>
> We recommend that you configure separate workspaces for your test and production environments.

6. Select **Configure**. The workspace creation takes a few seconds and then a confirmation message is displayed with the generated workspace ID.

   In Power BI, a workspace is created.

7. Save and close the configuration.

   After you save the configuration, it might take up to 15 minutes for the datasets, dashboard, and reports to appear in your created workspace.

   > **Note**
   >
   > You can also see the status of different configuration stages such as workspace, dashboard, and datasets. When a workspace is created successfully, all the statuses will have a green check. If failed, the respective configuration stage check will be red, and an error message is displayed. Resolve the error and create the workspace again.

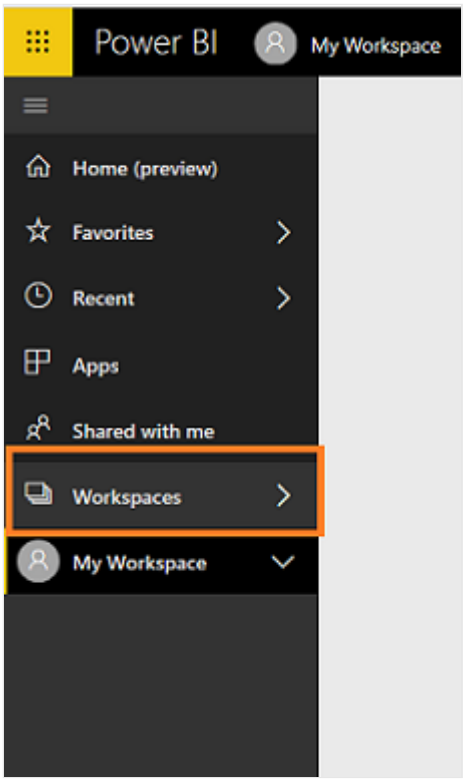
8. In Power BI Service, share the reports with supervisor users to access the report in the **Omnichannel for Customer Service** app on the web. More information: Share Power BI dashboards and reports with coworkers and others

   > **Important**
   >
   > - You can configure only one record in the **Omnichannel Administration** app.
   > - If you want to create a new configuration, deactivate and delete the existing configuration.
   > - You can edit an existing configuration to update the Power BI workspace details.

Share workspace and reports with supervisors

1. Sign in to Power BI Service.

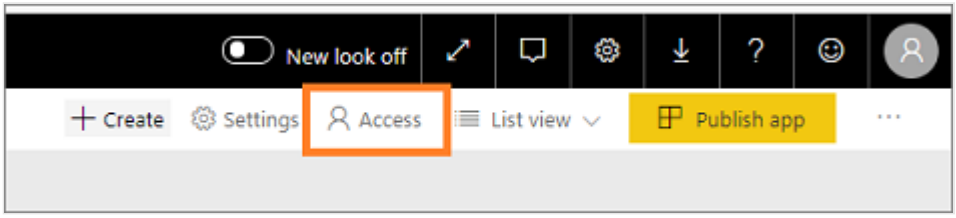
2. Go to **Workspaces** and verify that a workspace with the name that you have entered is created.



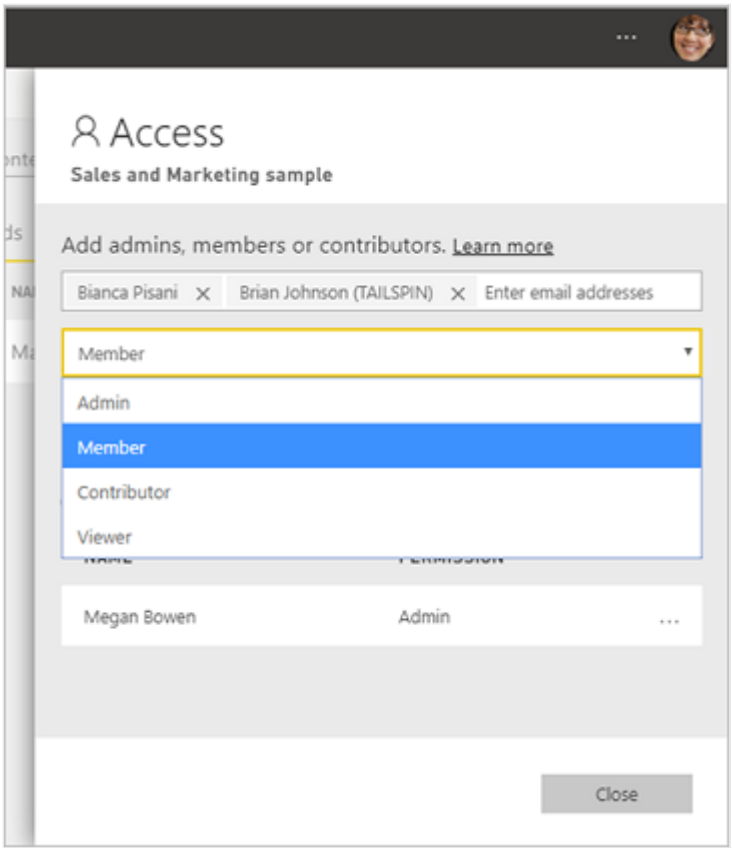
3. Open the workspace that you have created and verify that the following are available:

   - An empty dashboard with the name of the workspace.
   - The report and datasets **Intraday Monitoring**.

4. Select **Access**.



5. Add email address of the security groups, distribution lists, Microsoft 365 groups, or individuals to these workspaces as viewers, members, contributors, or admins.



6. Select **Add** > **Close**.

7. Select the report and share with supervisor users to access the report as an app tab in the **Omnichannel for Customer Service** app on the web. More information: Share Power BI dashboards and reports with coworkers and others

Configure customized intraday insights for Unified Service Desk

Before you configure the Intraday insights for Unified Service Desk, you must configure Intraday insights for the Omnichannel for Customer Service app on the web. This configures the Power BI datasets, reports, and dashboards for Omnichannel for Customer Service and enables you to configure the insights for Unified Service Desk.

> **Note**
>
> Supervisor and agent sentiment notifications are not available in Omnichannel for Customer Service on Unified Service Desk.

Configure dashboard in Power BI

Configuring the Power BI workspace provides you only the **Intraday Monitoring** report. Create the dashboard out of the **Intraday Monitoring** Power BI report after it is

available.

> **Important**
>
> In Power BI settings for **Intraday Monitoring**, DO NOT select the option **Take over**. If you select this option, the dataset will not connect to the datasource and you will have to reconfigure Intraday insights.

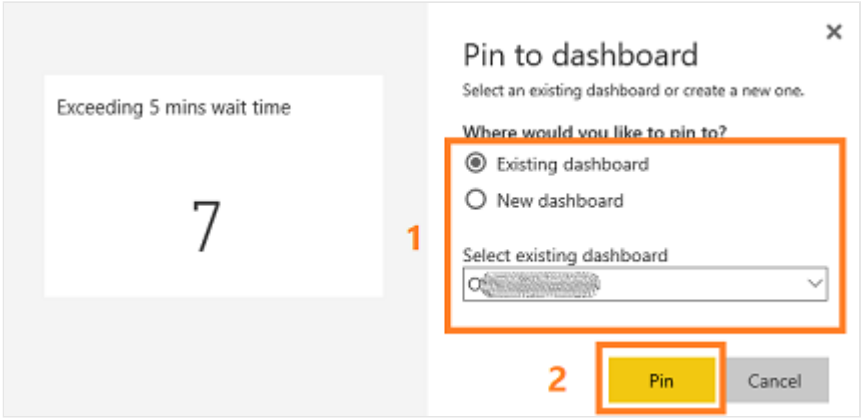
Follow these steps to configure Power BI dashboards:

1. In Power BI Service, open the reports that are available in the workspace. More information: Open a report in Power BI service

2. Pin the required tiles to dashboards.

   The following screenshot shows how to pin a visual to the dashboard.

   Choose the dashboard to which you want to pin and select **Pin**. The report is pinned to the chosen dashboard.



More information: Pin a tile to a Power BI dashboard from a report

3. Select **Set as featured** so the created dashboard will display at the top each time you open the Power BI service.

4. Share the dashboard and reports with supervisor users. This allows supervisors to access the dashboards. More information: Share Power BI dashboards and reports with coworkers and others

5. For Unified Service Desk configuration, copy the URL of the dashboard.

   The dashboard is ready, and you can configure the **Unified Service Desk** to make this dashboard available for supervisors.

Configure Unified Service Desk to display Intraday insights

You must configure **Unified Service Desk** to display the supervisor Intraday insights when a supervisor signs in to the workspace in Omnichannel. To configure **Unified Service Desk**, follow these steps:

1. Sign in to **Dynamics 365 Customer Service** and go to **Settings** > **Unified Service Desk**.

   The Unified Service Desk settings page opens.

2. Select **Action Calls** and open **Load Supervisor Dashboard**.

3. In the **Action** section, enter the **Data** as `url= https://powerbi.com/dashboards/<id>;` that you copied in Configure dashboard in Power BI. Also, add the parameters **chromeless=1** and **nosignupcheck=1** at the end of the URL.

   For example:

   url=`https://powerbi.com/dashboards/g12466b5-a452-4e55-8634-xxxxxxxxxxxx?chromeless=1&nosignupcheck=1`

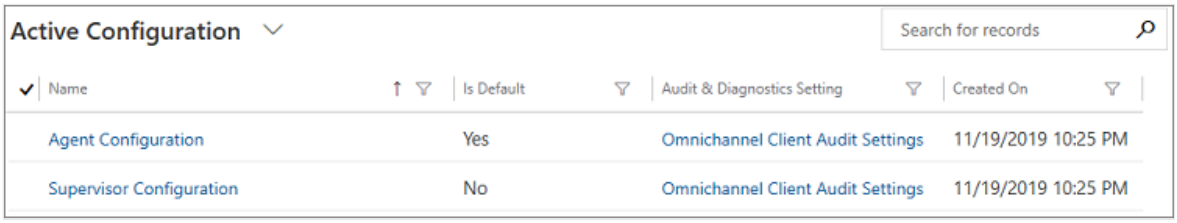
4. Save and close the settings page.

The supervisor insights is configured and available. Add users to the supervisor configuration to view the dashboards when signing on to Omnichannel in **Unified Service Desk**.

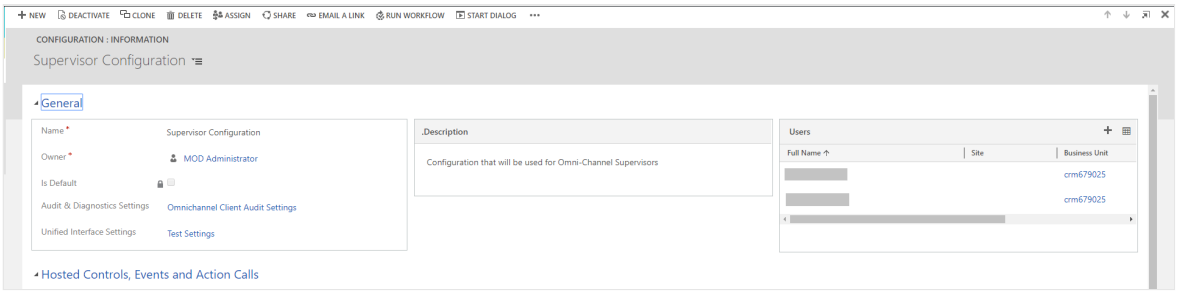
Add users to supervisor configuration

You must add users in the supervisor configuration to access any supervisor insights in **Unified Service Desk**. To add users in supervisor configuration, follow these steps:

1. Sign in to Dynamics 365 Customer Service.
2. Go to **Settings** > **Unified Service Desk** and then select **Configuration**.
3. On the configuration page, select **Supervisor Configuration**.



4. On the **Users** section, select **+ Add User record** and enter the user name to add the user.



5. Save and close the configuration.

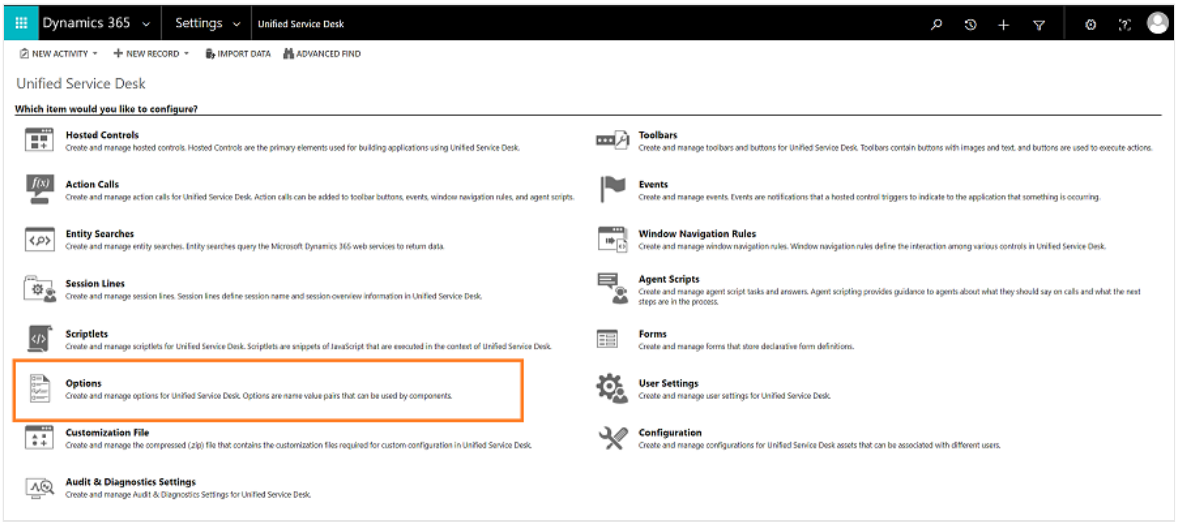
   Users are added to the supervisor dashboard and when they sign in to Omnichannel on Unified Service Desk, the supervisor dashboard tabs are available.

Update client cache version

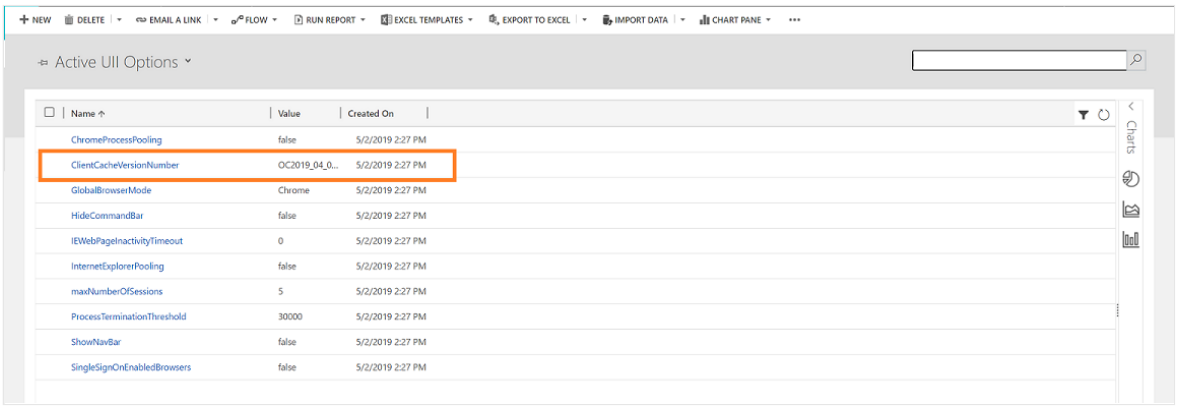
Update the client cache version number to reduce the amount of bandwidth required at the startup of the Unified Service Desk client on the computers of agents, and over the lifecycle of the client application.

More information: Client caching overview

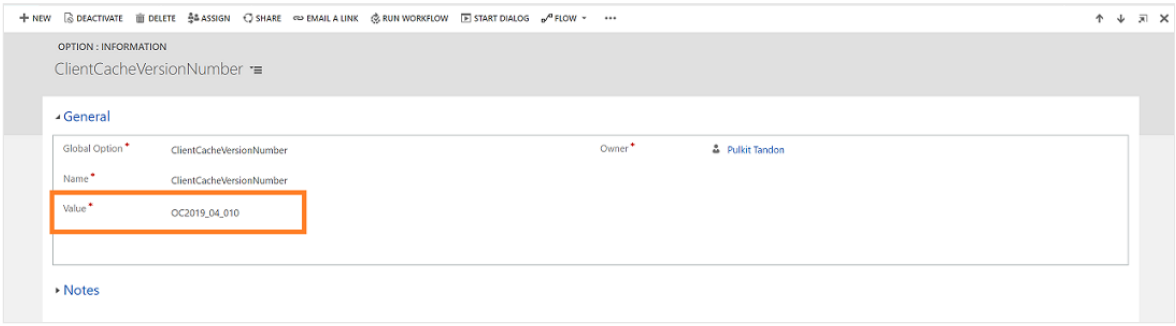
1. Sign in to **Dynamics 365 Customer Service**.
2. Go to **Settings** > **Unified Service Desk** and then select **Options**.



3. Select **ClientCacheVersionNumber**.



4. In the **Value** box, update the existing alphanumeric number. For example, if the existing alphanumeric number is OC2019_04_010, update it to OC2019_04_011.



5. Select **Save**.

Enable supervisor access to manage conversations

Article • 10/20/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

As an administrator, you can enable your supervisors to take specific actions on various conversations being handled by their agents in Omnichannel for Customer Service. You can grant your supervisors permissions to monitor, assign, transfer, and forcibly end conversations by enabling the respective permissions in the admin app.

Configure supervisor settings

1. Go to one of the admin apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Insights** in **Operations**. The **Insights** page appears.
   b. In the **Ongoing conversation insights** section, select **Manage**.

   The **Omnichannel Configuration.Supervisor Settings** page is displayed.

2. To enable the supervisors to perform the following actions, set the corresponding toggles to **Yes**:

   - **Supervisor Monitor**: Monitor how conversations are happening or being handled by their agents.
   - **Supervisor Assign**: Assign conversations to agents.
   - **Supervisor Transfer**: Transfer conversations from one agent to another.
   - **Force Close**: End voice calls and conversations that take place on the voice and messaging channels. More information: Monitor, assign, transfer, and forcibly end conversations

3. To disable any of the settings, set the corresponding toggle to **No**.

Manage historical analytics reports in Customer Service

Article • 06/23/2023

You can configure Customer Service historical analytics to give your service managers a combination of BI analytics and AI insights for their organization. The reports use natural language understanding to automatically detect the language used in your support cases and group related support cases into topics.

By default, the Customer Service historical analytics reports are enabled for the System Administrator and CSR Manager roles. To configure other user roles to access analytics and dashboards, see Configure user access to analytics and dashboards.

The historical reports include:

- Summary report
- Agent report
- Topics report
- Unified routing

After you enable the reports, you can access them in one of the following ways:

- In Customer Service workspace, select the hamburger menu, and then select **Customer Service historical analytics** in the site map.
- In Customer Service Hub, in **Service**, in the site map, select **Customer Service historical analytics**.

Manage Customer Service historical analytics reports

Use the Customer Service admin center or Customer Service Hub app to enable or disable the reports.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Insights** in **Operations**. The **Insights** page appears.

b. For **Customer Service historical analytics**, select **Manage**.

c. On the **Customer Service historical analytics** page, set the **Enable Customer Service historical analytics report** toggle to **On** to enable the reports or set the toggle to **Off** to disable the reports.

2. Select **Save** or **Save and Close**.

   This configuration will also enable AI-discovered topics from cases with default settings.

Enable historical analytics for unified routing

Use the Customer Service admin center or Customer Service Hub app to enable or disable the reports. The metrics will be available in the report after 24 hours.

> **ⓘ Important**
>
> Unified routing must be enabled to enable historical analytics for unified routing. More information: **Provision unified routing for Customer Service**

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Insights** in **Operations**. The **Insights** page appears.

   b. For **Customer Service historical analytics**, select **Manage**. The **Customer Service historical analytics** page is displayed.

   c. Select the **Add historical analytics for unified routing** check box.

2. Select **Save and Close**.

Enable historical analytics for Copilot (preview)

[This section is prerelease documentation and is subject to change.]

> **ⓘ Important**

- This is a preview feature.
- Preview features aren’t meant for production use and may have restricted functionality. These features are available before an official release so that customers can get early access and provide feedback.

Customer Service historical analytics must be enabled and you must opt in to the Copilot help pane and Copilot summaries to turn on analytics for Copilot.

1. In the Customer Service admin center, go to Insights, and on the page that appears, select **Manage** for **Customer Service historical analytics**.

2. On the **Customer Service historical analytics** page, select the **Add historical analytics for Copilot (Preview)** checkbox, and then save the changes.

You'll see a message on the command bar that your reports are being provisioned and it might take up to 24 hours for the process to complete.

Manage historical analytics reports in Omnichannel for Customer Service

Article • 02/02/2023

You can configure Omnichannel historical analytics to give your service managers a combination of BI analytics and AI insights for their organization. The reports use natural language understanding to automatically detect the language used in your support conversations and to group related conversations into topics.

By default, the Omnichannel historical analytics reports are enabled for the System Administrator, Omnichannel Administrator, Omnichannel Supervisor, and CSR Manager roles. To configure other user roles to access analytics and dashboards, see Configure user access to analytics and dashboards.

The historical analytics reports include:

- Summary
- Conversation
- Queue
- Voice
- Voicemail
- Agent
- Bot
- Conversation Topics
- Unified routing

Manage Omnichannel historical analytics reports

Use the Customer Service admin center or Customer Service Hub app to enable or disable the Omnichannel historical analytics reports.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Insights** in **Operations**. The **Insights** page appears.
   b. In the **Omnichannel historical analytics** section, select **Manage**. The **Omnichannel historical analytics** page is displayed.

c. Set the **Enable Omnichannel historical analytics report** toggle to **On** to enable the reports or set the toggle to **No** to disable the reports.

2. Select **Save** or **Save and Close**.

This configuration will also enable AI-discovered topics from conversations with default settings and historical analytics for unified routing.

Enable historical analytics for unified routing in Omnichannel for Customer Service

You can enable historical analytics for unified routing in the Customer Service admin center or Omnichannel admin center app. The metrics are available in the report after 24 hours.

> **Important**
>
> Omnichannel historical analytics must be enabled before you can enable historical analytics for unified routing.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Insights** in **Operations**. The **Insights** page appears.
   b. In the **Omnichannel historical analytics** section, select **Manage**.

   The **Omnichannel historical analytics** page is displayed. Select the **Add historical analytics for unified routing** checkbox.

2. Select **Save** or **Save and Close**.

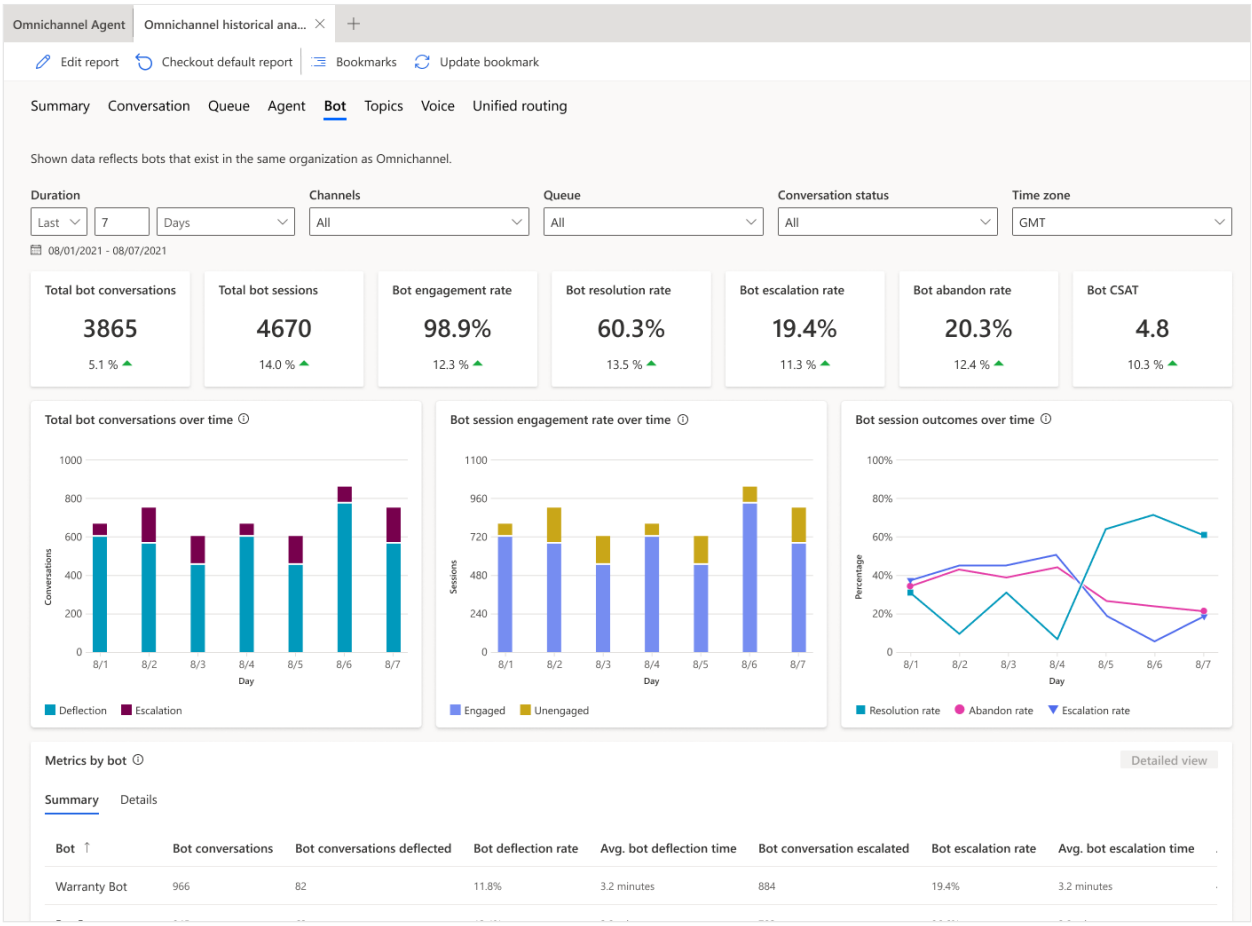
The Unified routing historical analytics report will be available as a tab in the Omnichannel historical analytics report.

Enable historical analytics for bots in Omnichannel for Customer Service

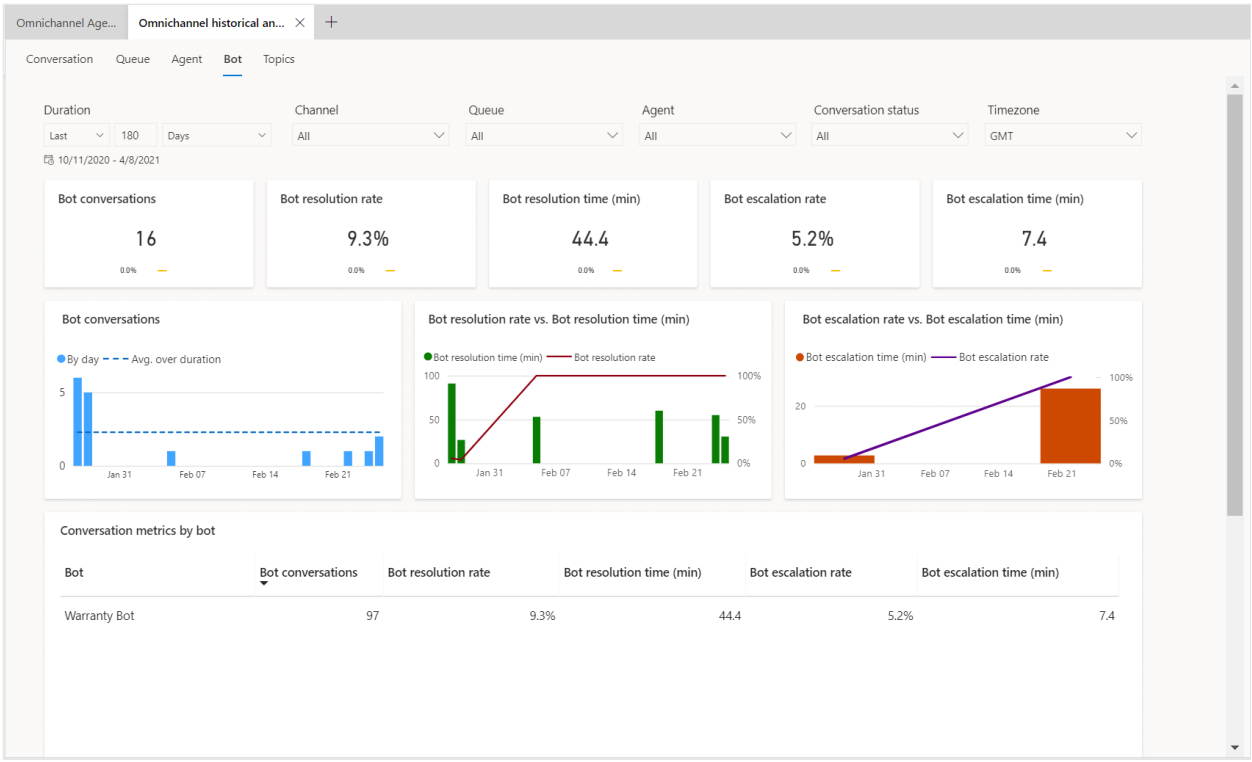
In Customer Service admin center, you can enable the historical analytics for bots to give your service managers integrated reports that combine Power Virtual Agents bots and Omnichannel conversation metrics.

> **ⓘ Important**
>
> Omnichannel historical analytics must be enabled before you can enable historical analytics for bots. This feature is available only if Power Virtual Agents bots are integrated with Omnichannel for Customer Service.

- If you select this option, the Omnichannel Summary and Bot dashboards will be available as a tab in the Omnichannel historical analytics report. The Bot dashboard shows metrics specific to the Power Virtual Agents bot.



- If no Power Virtual Agents bots are integrated with the application or you haven't selected this option, then the Bot dashboard displays the key performance indicators (KPIs) and charts for all bots.



Enable historical analytics for bots in Omnichannel for Customer Service

1. In the site map, select **Insights** in **Operations**. The **Insights** page appears.
2. In the **Omnichannel historical analytics** section, select **Manage**. The **Omnichannel historical analytics** page is displayed.
3. Select the **Add historical analytics for bot** checkbox.
4. Select **Save** or **Save and Close**.

The unified routing historical analytics report will be available as a tab in the Omnichannel historical analytics report.

Enable historical analytics for voice in Omnichannel for Customer Service

You can enable the historical analytics dashboard for voice in the Customer Service admin center or Omnichannel admin center app. The metrics will be available in the dashboard 24 hours after you've enabled historical analytics.

> **ⓘ Important**
>
> Omnichannel historical analytics must be enabled before you can enable historical analytics for unified routing.

1. Go to one of the apps, and perform the following steps.

Customer Service admin center

a. In the site map, select **Insights** in **Operations**. The **Insights** page appears.
b. In the **Omnichannel historical analytics** section, select **Manage**.

The **Omnichannel historical analytics** page appears. Select the **Add historical analytics for voice** checkbox.

2. Select **Save** or **Save and Close**.

The historical analytics for voice dashboard will be available as a tab in the Omnichannel historical analytics report.

Enable historical analytics for voicemail in Omnichannel for Customer Service

You can enable the historical analytics dashboard for voicemail in the Customer Service admin center app. The metrics are available in the dashboard after 24 hours of enabling it.

1. In Customer Service admin center, select **Insights** in **Operations**.
2. For Omnichannel historical analytics, select **Manage**.
3. Select **Add historical analytics for voicemail**.

The historical analytics for voicemail dashboard will be available as a tab in the Omnichannel historical analytics report.

Manage knowledge analytics

Article • 11/15/2022

The Knowledge analytics dashboard is designed to provide your supervisors and knowledge workers with valuable insights into how your support agents are searching and using knowledge articles.

By default, the Knowledge analytics dashboard is enabled for the System Administrator, Knowledge Manager, and CSR Manager roles. To configure user roles to access analytics and dashboards, see Configure user access to analytics and dashboards.

> **Note**
>
> Knowledge analytics provides data that's based on internal knowledge search and doesn't provide information about customer search behavior.

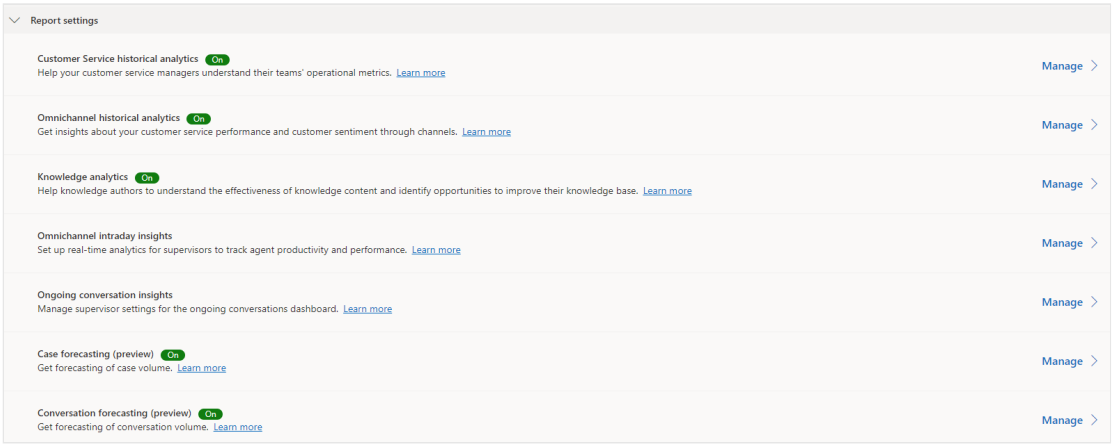
Manage Knowledge analytics dashboard

Use the Customer Service admin center or Customer Service Hub app to enable or disable the knowledge analytics reports.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Insights** in **Operations**. The **Insights** page appears.
   b. In the **Knowledge analytics** section, select **Manage**. The **Knowledge analytics** page is displayed.



2. Set the **Enable Knowledge analytics** toggle to **On** to enable the reports or set the toggle to **Off** to disable the reports.

3. Select **Save** or **Save and Close**.

Configure Search term insights dashboard

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Insights** in **Operations**. The **Insights** page appears.
   b. In the **Knowledge analytics** section, select **Manage**. The **Knowledge analytics** page is displayed.

2. In the **Additional features** section, select the **Add knowledge search analytics** checkbox.

3. Select **Save** or **Save and Close**.

View Knowledge analytics dashboards

To view the reports in Customer Service Hub, go to **Service** > **Insights** > **Knowledge analytics**.

To view the reports in Customer Service workspace, select the **plus (+)** icon, and then select **Knowledge analytics** from the dropdown list.

The **Article insights** dashboard is displayed. The **Search term insights dashboard** will be displayed if you have previously configured the steps in Configure Search term insights dashboard.

Configure Customer Service Analytics dashboards in Power BI

Article • 08/01/2023

> **Note**
>
> We recommend that you try out the latest analytics capabilities from Dynamics 365 Customer Service. The out-of-the-box reporting capabilities include **Omnichannel historical analytics** and **Customer Service historical analytics**. The reports can be **visually customized** and extended to add your additional data sources and metrics through **data model customization**.

You must perform the following steps to configure the historical Customer Service Analytics dashboards to display in the Customer Service Hub app:

Step 1: Review the prerequisites

Step 2: Install Dynamics 365 Customer Service Analytics app

Step 3: Connect Dynamics 365 organization to Customer Service Analytics app

Step 4: Configure refresh frequency on Power BI dataset

Step 5: Publish application within your organization

Step 6: Enable Power BI reporting

Step 7: Add Power BI Dashboard to Customer Service Hub

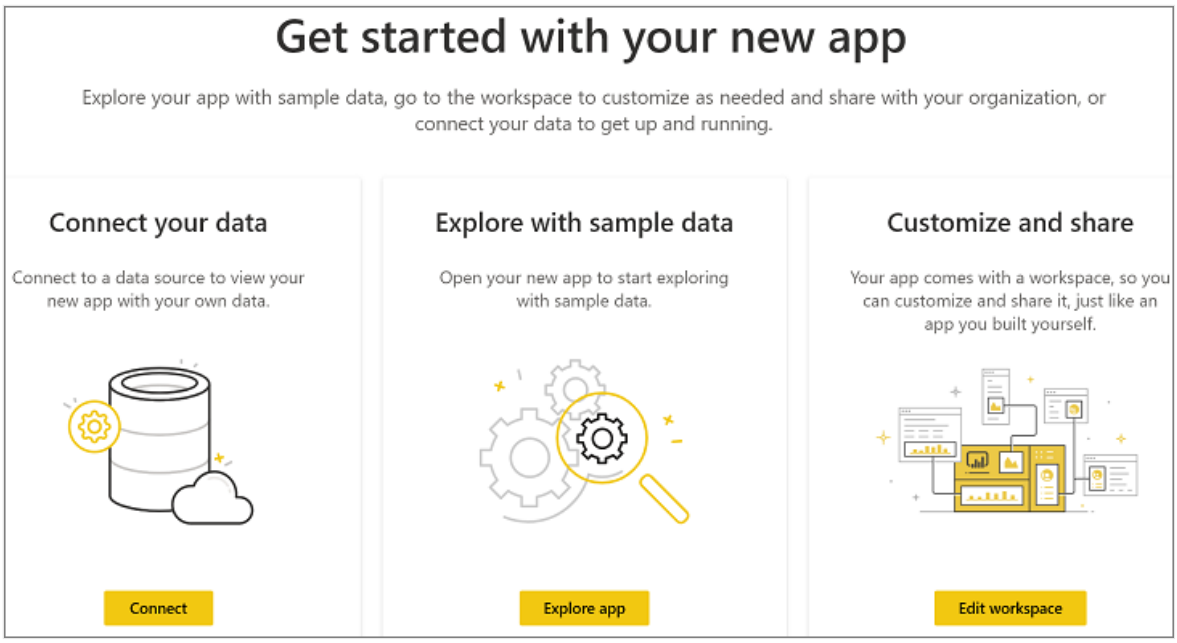
Step 1: Prerequisites

Review the following prerequisites before configuring the supervisor dashboard:

- You have administrative privileges for Dynamics 365 and Microsoft Power BI.
- You have a Power BI Pro license for all supervisors.
- Service Root URL of your Dynamics 365 instance.

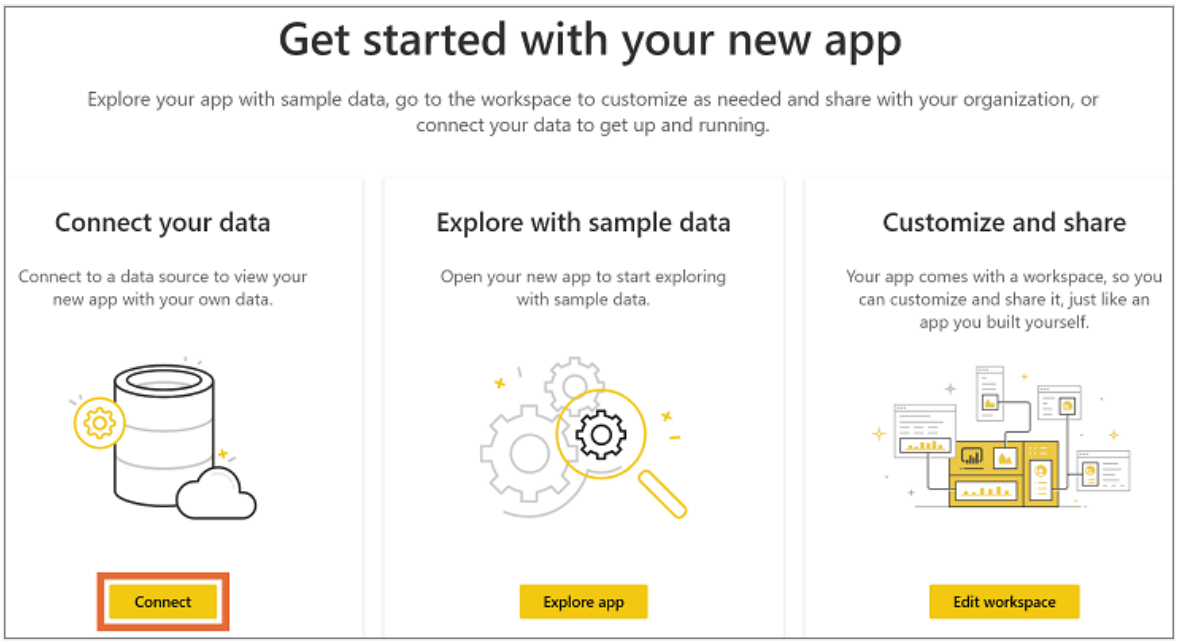
Step 2: Install Dynamics 365 Customer Service Analytics app

1. Sign in to Power BI app as an administrator.
2. As a Power BI admin, open the link: https://aka.ms/cs-analytics
3. Install the **Customer Service Analytics for Dynamics 365** app. The app configuration options page is displayed.

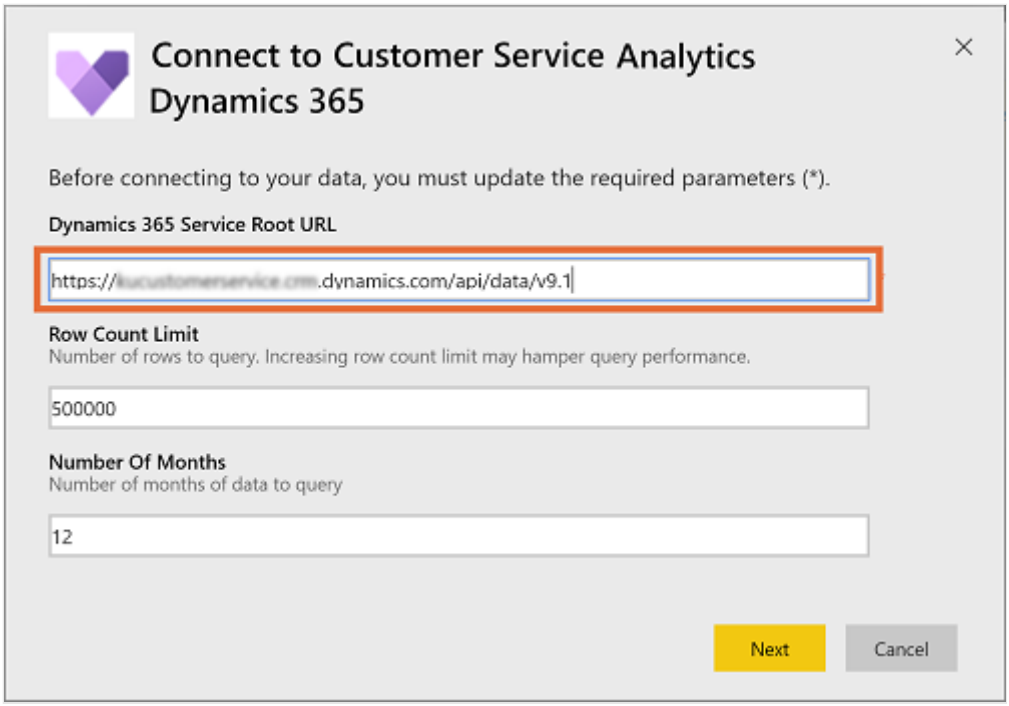


Step 3: Connect Dynamics 365 organization to Customer Service Analytics app

1. On the app configuration options page, select **Connect**.



2. On the **Connect to Customer Service Analytics for Dynamics 365** page, enter your organization's Dynamics 365 Service Root URL, and select **Next**.

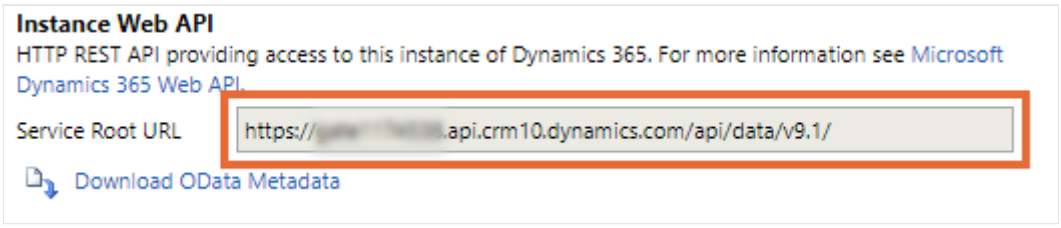


3. (Optional) To find the Microsoft Dynamics 365 Data URL, follow these steps:

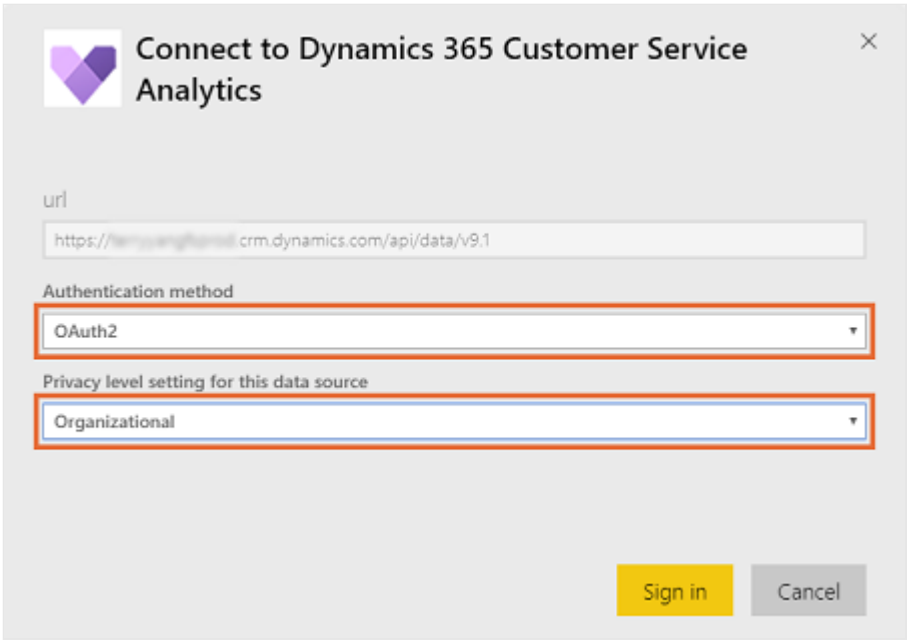
   a. Sign in to Dynamics 365 Customer Service.

   b. Go to **Settings** and then select **Developer Resources**.

   c. Find the Data URL under **Service Root URL**.



4. On the page that appears, select **OAuth2** in **Authentication method**, and **Organizational** in **Privacy level setting for this data source**.



5. Select **Sign in**. The sign-in page appears.

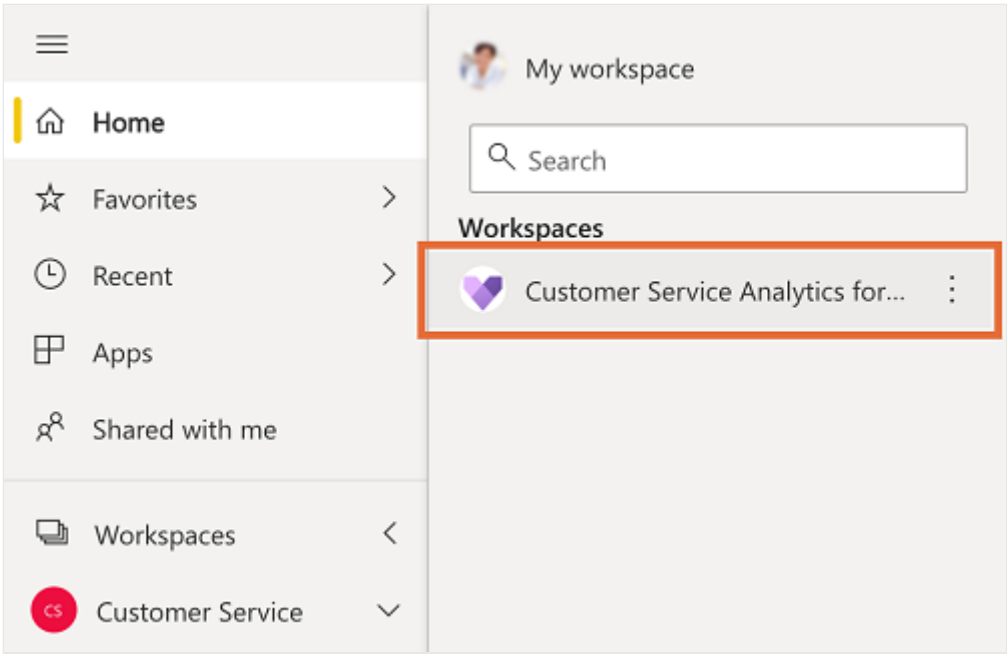
6. Enter your Dynamics 365 organization credentials, and select **Enter**. After you're signed in, the existing report is updated with the data from your organization.

Step 4: Configure refresh frequency on Power BI dataset

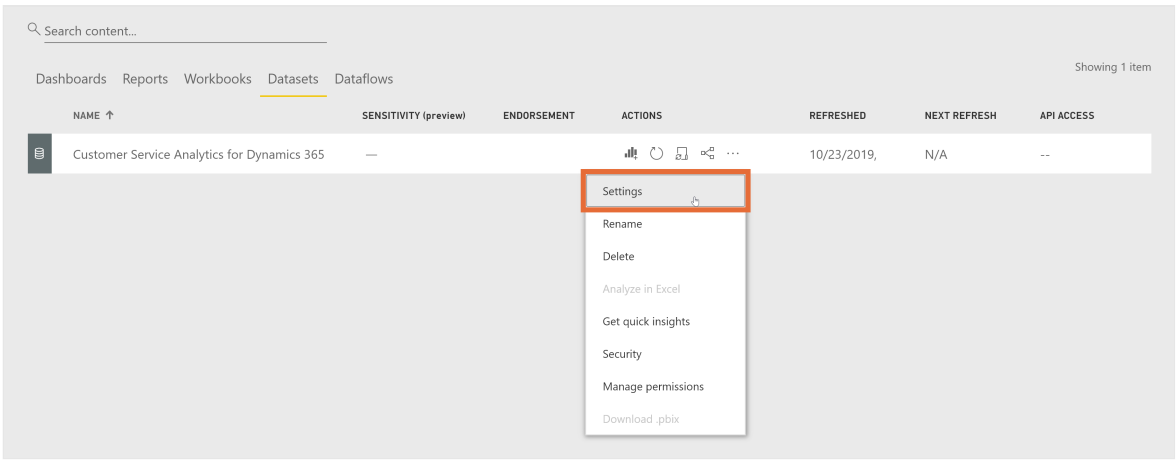
After you connect the Dynamics 365 Customer Service Analytics app with a Dynamics 365 organization, you need to configure the refresh frequency on the Power BI dataset to update reports and dashboards properly.

1. Sign in to Power BI as an administrator.

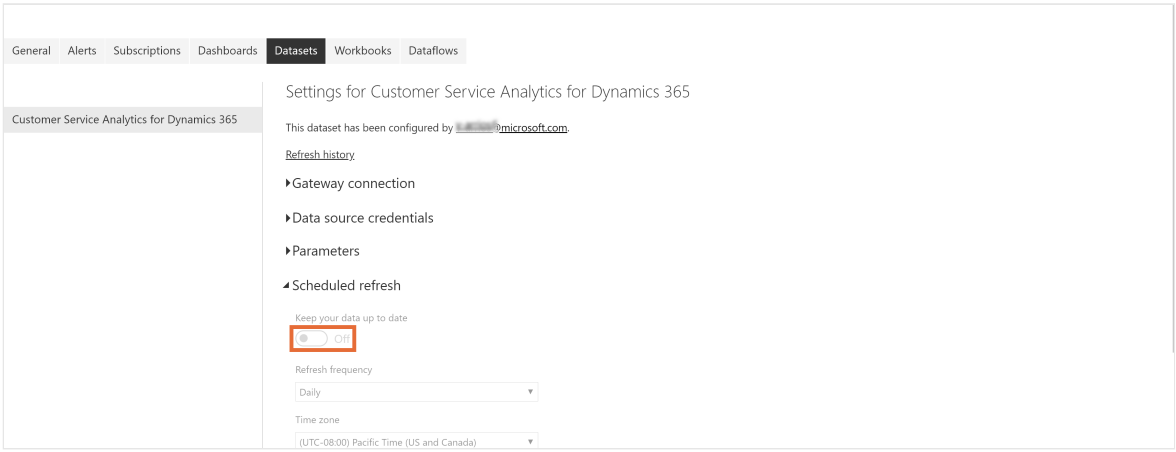
2. Go to the **Dynamics 365 Customer Service Analytics** app workspace.



3. Go to the **Datasets** tab and select **Settings**.



4. Turn **Scheduled refresh** to **On**.



Now, publish the application in your organization.

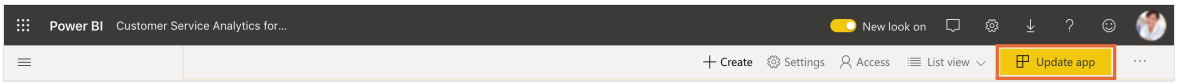
> **Note**

We recommend you configure the refresh frequency to **Daily**.

Step 5: Publish application within your organization

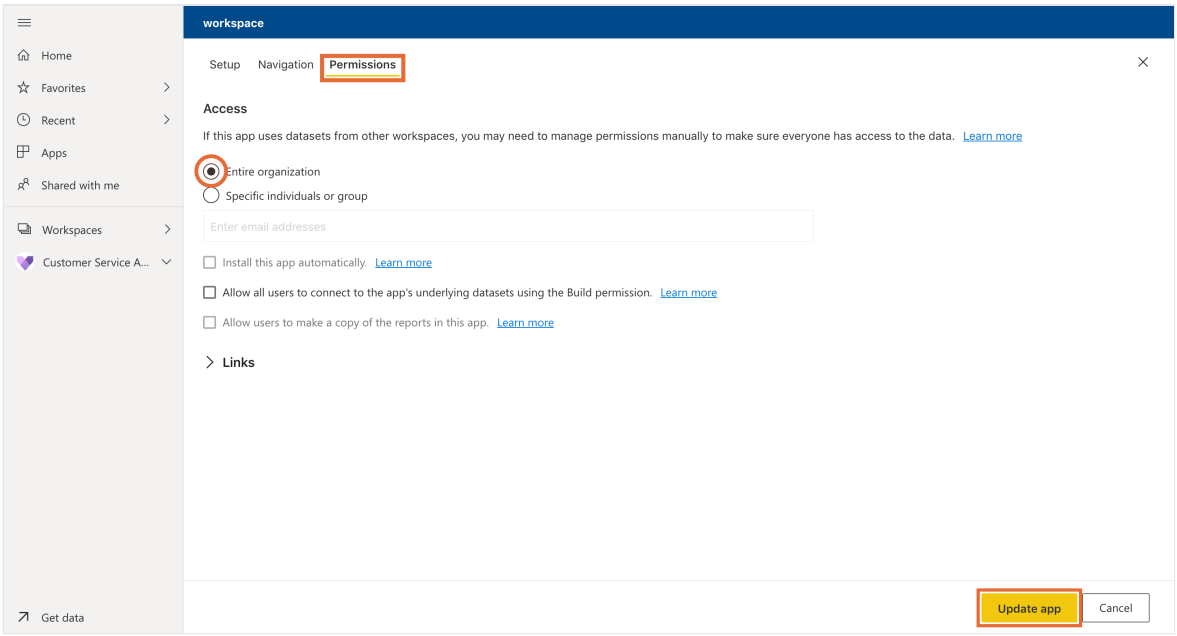
You must share the configured application with your entire organization for supervisors to view **Customer Service Analytics** dashboards and reports with their own **Power BI Pro** accounts.

1. On the app workspace, select **Update app**.



2. In the Update app wizard, go to the **Access** tab.

3. Choose **Entire organization** and select **Update app**.



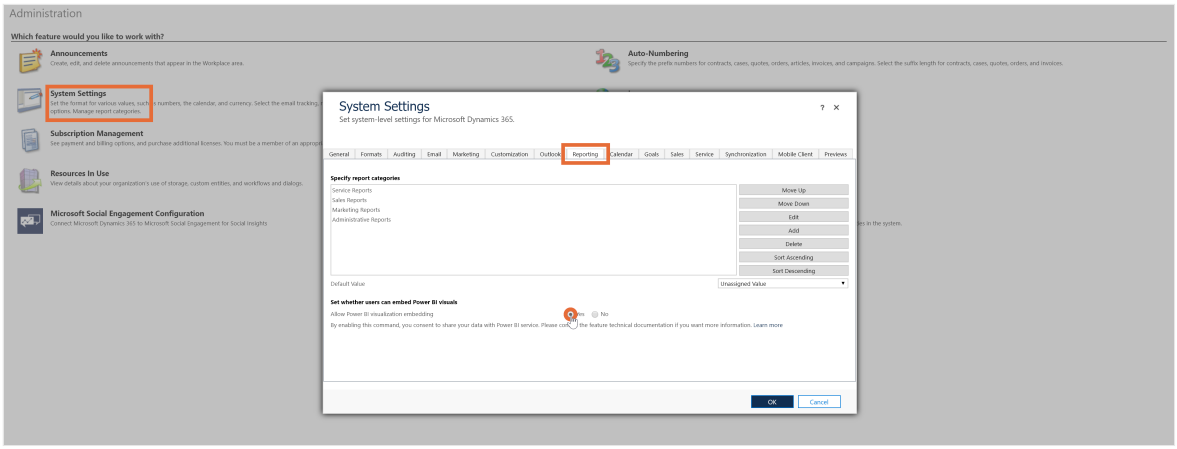
The app is now available to install for all individuals in your organization.

> **Note**
>
> Verify your administrator has allowed users in your organization to have read/write data permissions in Omnichannel Engagement Hub. To learn more, see **Set up Omnichannel for Customer Service**.

Step 6: Enable Power BI reporting

As an administrator, you must enable Power BI reporting in the Power Platform environment for supervisors to view the dashboards.

1. Sign in to Dynamics 365, and go to **Settings**.
2. Select **Administration** > **System Settings**.
3. Go to the **Reporting** tab and enable **Allow Power BI visualization embedding**.

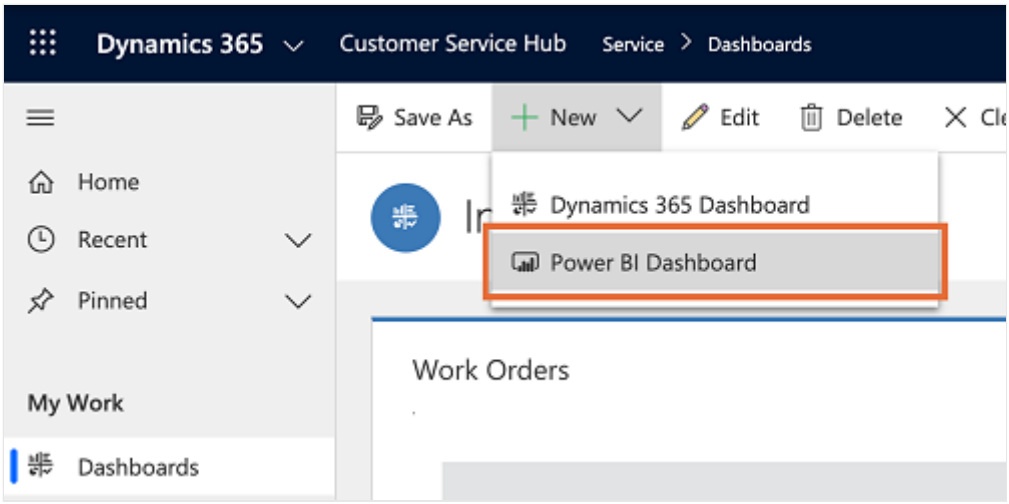


Supervisors can now configure dashboards.

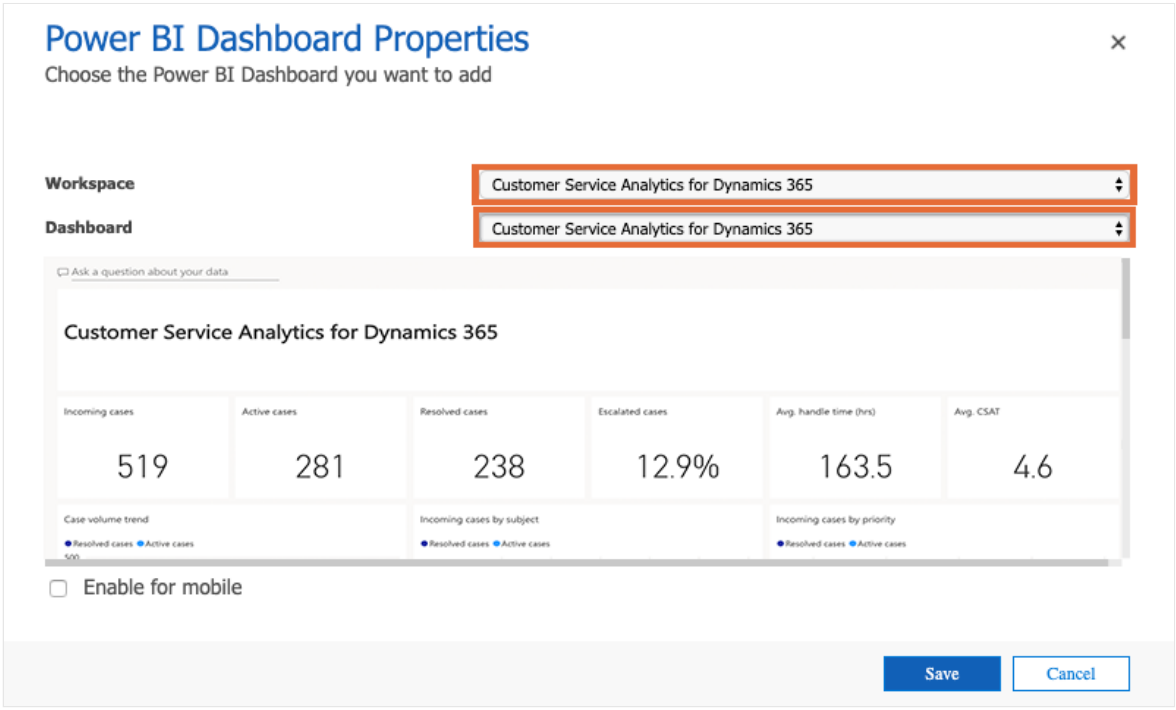
Step 7: Add Power BI dashboards to Customer Service Hub

Each supervisor must configure their environment to integrate the Customer Service Analytics dashboard.

1. Sign in to Dynamics 365 Customer Service and open the **Customer Service Hub** app.
2. Select **Dashboards** under **My Work**.
3. Select **New** > **Power BI Dashboard**.



4. For **Workspace**, select **Customer Service Analytics for Dynamics 365**. For **Dashboard**, select **Customer Service Analytics for Dynamics 365**.



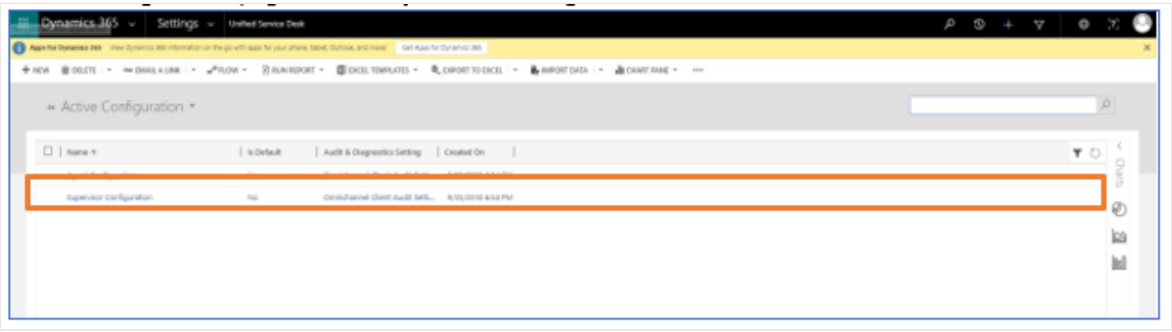
5. Save and close.

   The Customer Service Analytics dashboard is now available in Dynamics 365.

Add users to supervisor configuration

You must add users to the supervisor configuration to access any supervisor dashboard in Unified Service Desk. To add users in supervisor configuration, follow these steps:

1. Sign in to the Unified Service Desk Administrator app.
2. Select **Configuration**.
3. On the configuration page, select **Supervisor Configuration**.



4. On the **Users** section, select **+ Add Existing User**. The **Lookup Records** pane is displayed.
5. Search for the user and select **Add**.
6. Select **Save**.

   Users are now added to the supervisor dashboard. When they sign in to Omnichannel Engagement Hub on Unified Service Desk, the supervisor dashboard tabs will be available.

Customize Customer Service Analytics

> **ⓘ Important**
>
> Microsoft does not support customizations made to the Power BI template app and does not provide updates once modifications are made.

Power BI is a comprehensive collection of services and tools that you use to visualize your business data. Power BI Template apps make it easy to visualize and analyze the Customer Service Analytics data with Power BI based on a standard data model. The Customer Service Analytics template app is built with a set of entities and fields that are useful for most reporting scenarios.

Dynamics 365 apps are often extended with custom fields. These custom fields don't automatically show up in the Power BI model. This article describes how you can edit and extend the report included in the template app to include custom fields in the Power BI model.

Before you customize the template app, read the information here and perform each task, as necessary.

Prerequisites

- Power BI service registration.
- Power BI Desktop application for editing Power BI reports.
- Power BI report for the Customer Service template app that you want to customize.

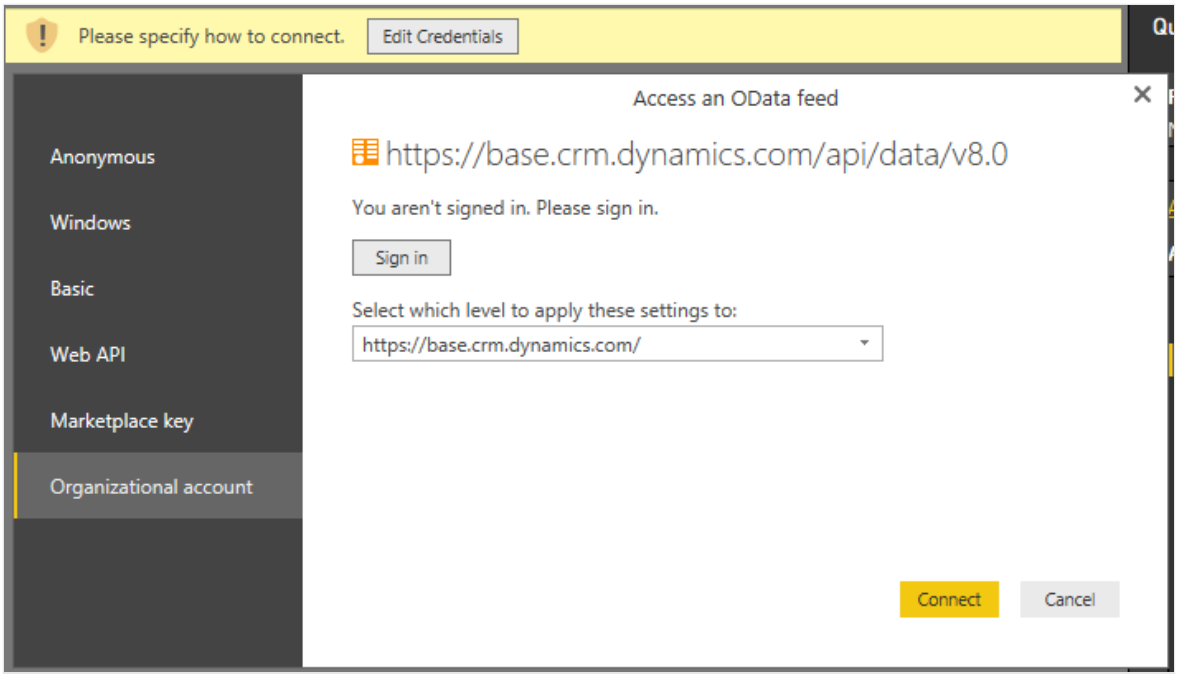
  Download the Power BI report for Customer Service Analytics for Dynamics 365

Prepare a PBIX for customization

1. Start Power BI Desktop.
2. Select **File** > **Open**. Open Customer Service Analytics for Dynamics 365.pbix, and then select **Open**.

   Several pages of reports are loaded and displayed in Power BI Desktop.
3. On the Power BI Desktop ribbon, select **Edit Queries**.
4. In the left navigation pane of the Edit Queries window, under **Queries**, select the **Dynamics 365 Service Root URL** query, and then on the ribbon, select **Advanced Editor**.

   In the source definition, replace **contosuites.crm10.dynamics.com** with your app's instance URL. For example, if the organization name is *Contoso*, the URL looks like this: Source = https://contoso.crm.dynamics.com/api/data/v9.1/
5. Select **Done** and then select **Close & Apply** in the Query Editor.
6. When the Access an OData feed dialog appears, select **Organizational account** and then select **Sign in**.



7. When the sign-in field appears, enter your credentials to authenticate to your instance.

8. In the Access an OData feed dialog, select **Connect**.

   The queries are updated. This might take several minutes.

Configure Omnichannel Insights dashboards

Article • 01/10/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Note**
>
> We recommend that you try out the latest analytics capabilities from Dynamics 365 Customer Service. The out-of-the-box reporting capabilities include **Omnichannel historical analytics** and **Customer Service historical analytics**. The reports can be **visually customized** and extended to add your additional data sources and metrics through **data model customization**.

Customer service managers or supervisors are responsible for managing agents who work to resolve customer queries every day through various service channels. They need to know key operational metrics to ensure that their agents are providing quality support. Omnichannel Insights consists of channels and sentiment analysis dashboards that can help with this.

> **Important**
>
> The supervisor dashboards that are based on Power BI, such as Omnichannel Insights and sentiment analysis, aren't available on Government Community Cloud (GCC).

Configure Omnichannel Insights

As an administrator, you must download the Omnichannel Insights for Dynamics 365 app and configure it to display channels and sentiment analysis dashboards in the Omnichannel for Customer Service app. To configure Omnichannel Insights, follow these steps:

Step 1: Review prerequisites

Step 2: Install Omnichannel Insights for Dynamics 365 app

Step 3: Connect to Omnichannel Insights for Dynamics 365 app

Step 4: Configure refresh frequency on Power BI Dataset

Step 5: Publish application within your organization

Step 6: Add Power BI Dashboards to Omnichannel for Customer Service

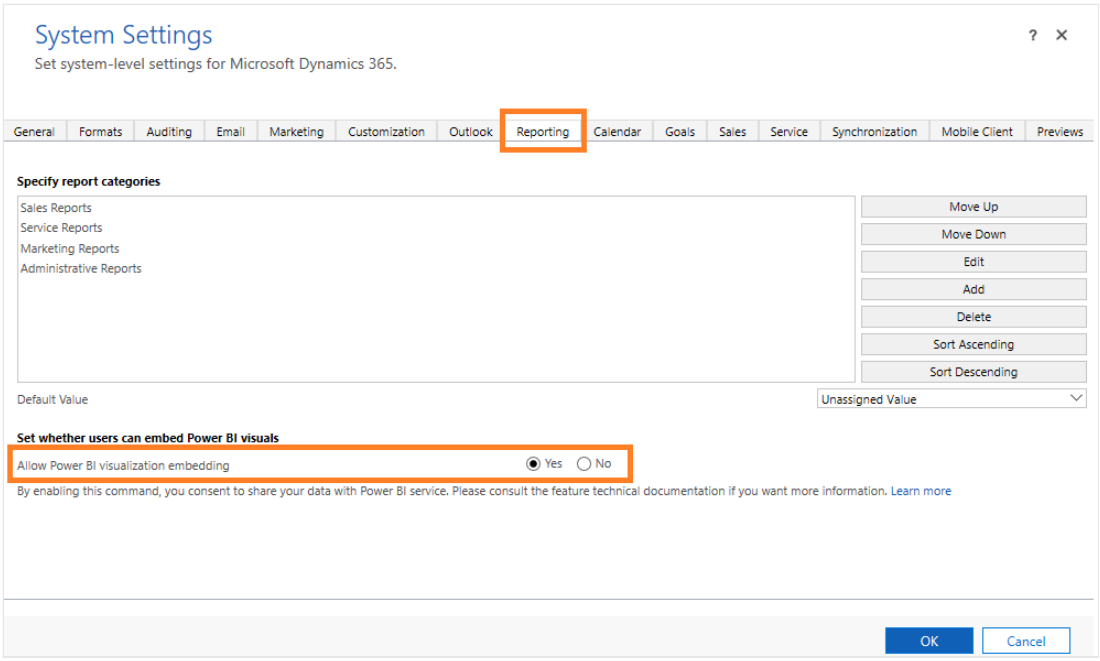
Step 1: Review prerequisites

Make sure the following prerequisites have been met before configuring the dashboard:

- You have administrative privileges for Dynamics 365 Customer Service and Power BI.
- You have Power BI Pro license that is required to do the following:
  - To get Omnichannel insights from app store and install it in your organization.
  - For users to use the template app or to share it with other Power BI Pro users.
- You have assigned template app workspace to a premium capacity so that every free user in the organization can consume the report. For information, see Ways to collaborate and share in Power BI.
- You have enabled the embedding of Power BI reports in Dynamics 365 Customer Service by doing the following:

    1. Sign in to **Dynamics 365 Customer Service** and go to **Settings** > **Administration** > **System Settings**.

    2. Go to the **Reporting** tab and select **Yes** for **Allow Power BI visualization embedding**.



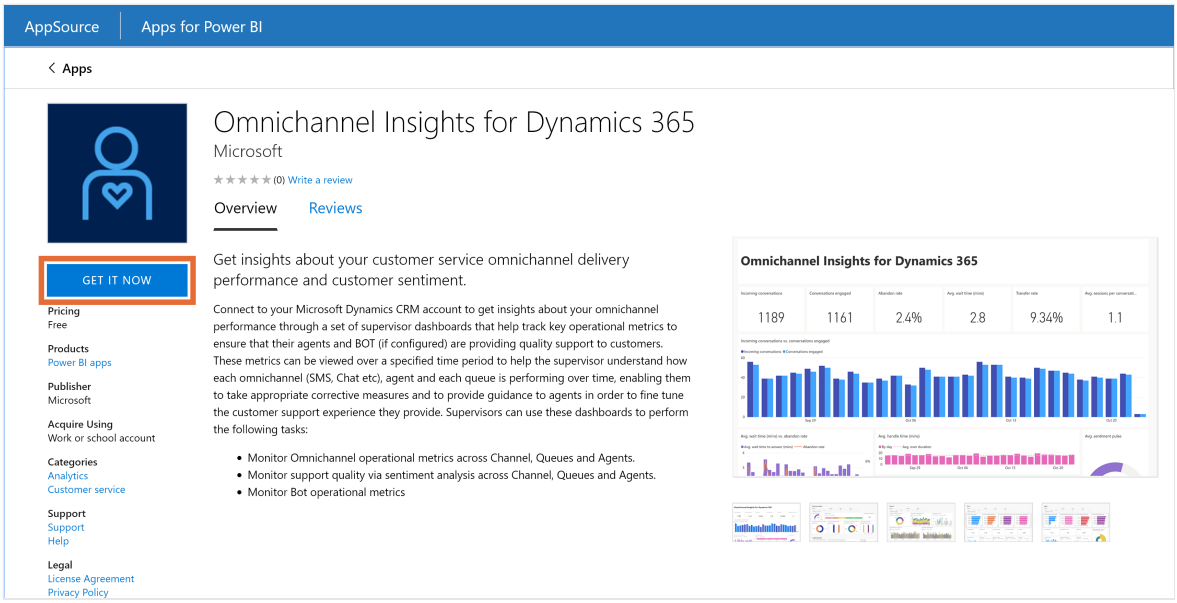
3. Select **OK**.

Step 2A: Install Omnichannel Insights for Dynamics 365 app

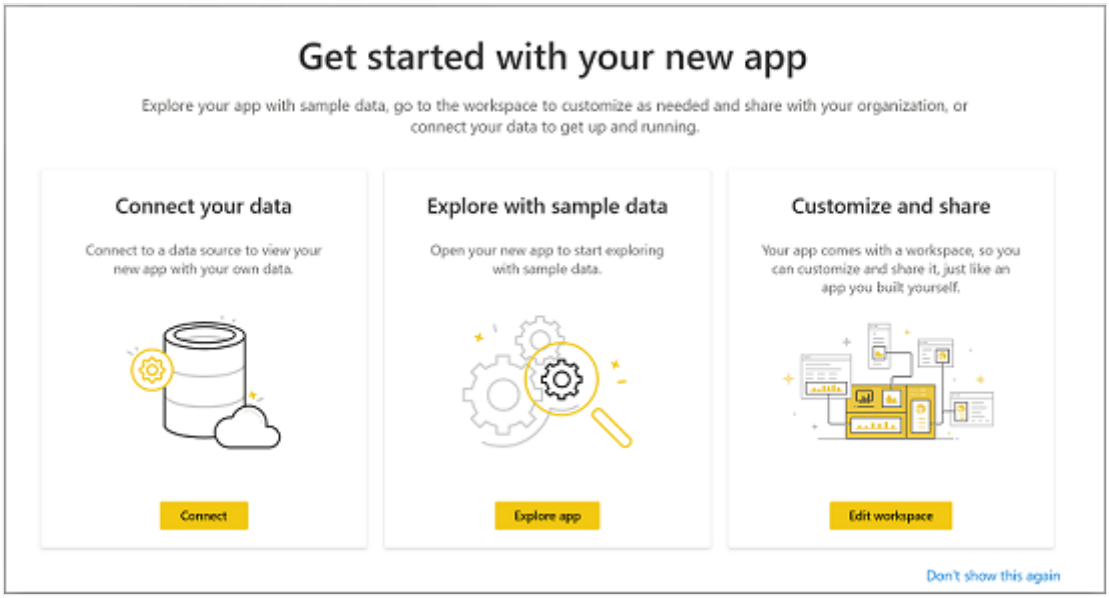
1. Sign in to the Power BI app as an administrator.
2. As a Power BI administrator, open the Omnichannel Insights for Dynamics 365 app page.

> **Important**
>
> The **Install template apps not listed in AppSource** in **Tenant settings** should be enabled by your administrator in the Power BI admin portal.

3. Select **GET IT NOW** to install the app.



4. After the **Omnichannel Insights** app is installed, select the app and the configuration options page will be displayed.

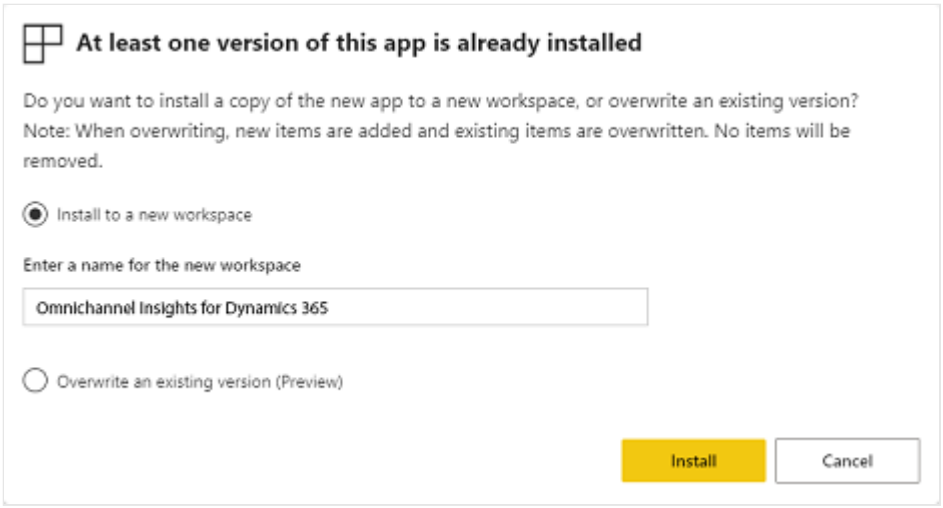


Proceed to configure the app by connecting your organization.

Step 2B: Configure existing Omnichannel Insights for Dynamics 365 app

If a previous version of Omnichannel Insights was installed, we strongly recommend that you install the latest version of Omnichannel Insights to avoid losing any customization.

1. During the Omnichannel Insights app installation, the following appears:



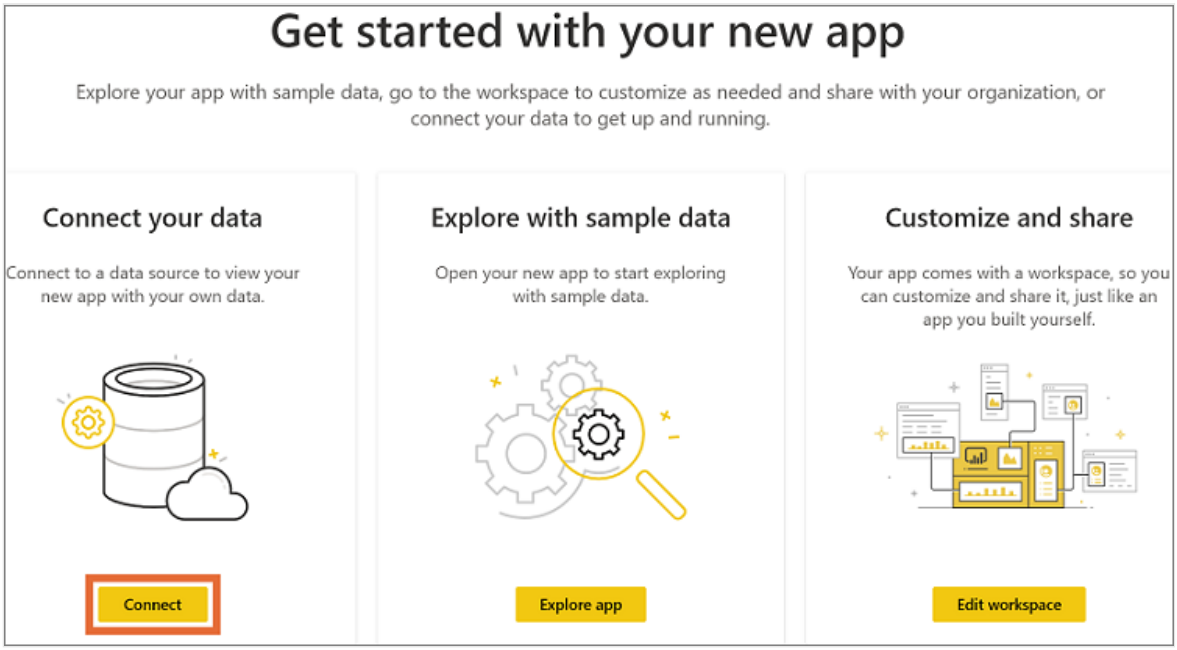
2. Choose the **Install to a new workspace** option.

3. Select **Install**.

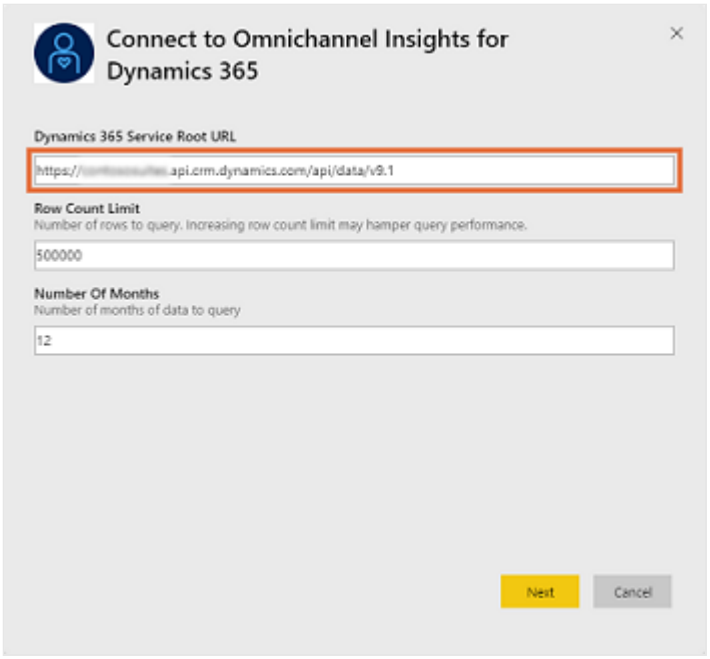
4. Re-implement customizations into the new workspace.

Step 3: Connect to Omnichannel Insights for Dynamics 365 app

1. On the **Omnichannel Insights for Dynamics 365** app configuration page, select **Connect**.



2. On the connect data page, enter your organization's CRM OData feed URL, and select **Next**.

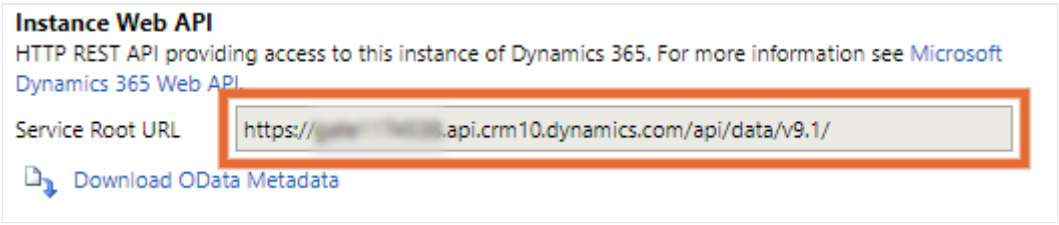


3. (Optional) To find the Microsoft Dynamics 365 OData URL, follow these steps:

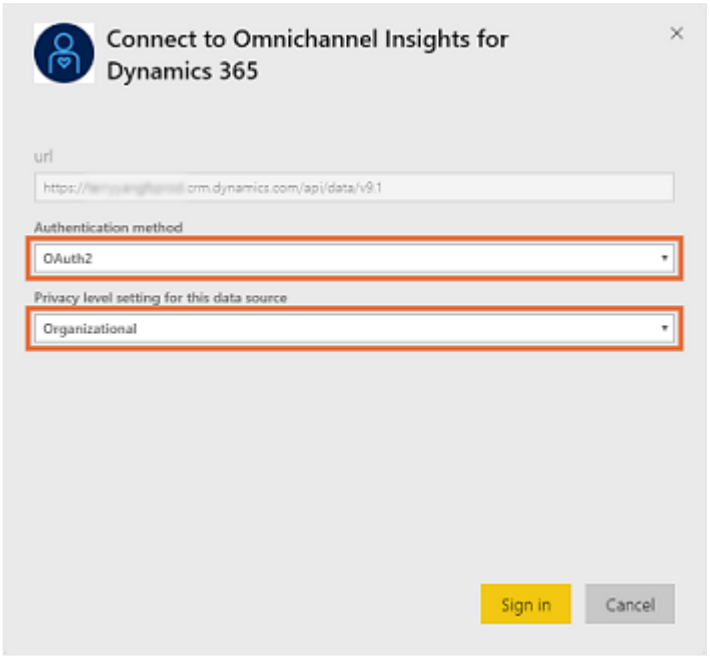
   a. Sign in to Dynamics 365 Customer Service.

   b. Go to **Settings** > **Customizations** and then select **Developer Resources**.

   c. Find the OData URL under **Service Root URL**.



4. Select **Authentication method** as **OAuth2** and **Privacy level** as **Organizational**. Select **Sign in**.



5. Enter your Dynamics 365 Customer Service credentials and select **Enter**.

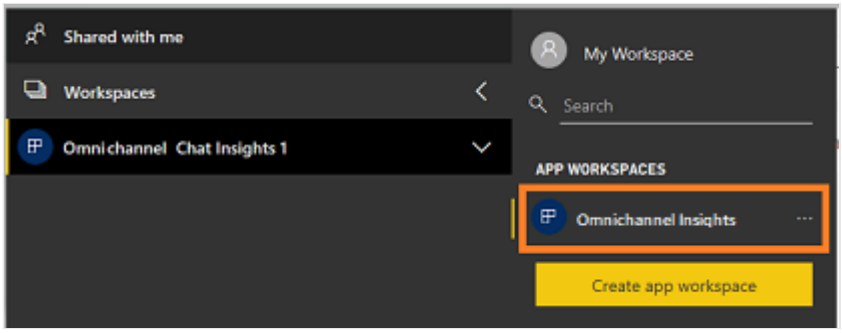
   When you are signed in, the existing report is updated with the data from your organization.

Step 4: Configure refresh frequency on Power BI dataset

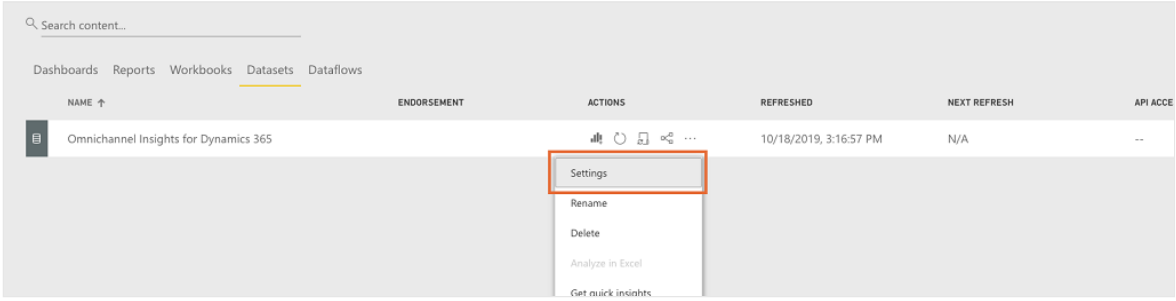
After you connect the Dynamics 365 Omnichannel Insights app with a Dynamics 365 organization, you need to configure the refresh frequency on the Power BI dataset so reports and dashboards refresh properly.

1. Sign in to Power BI as an administrator.

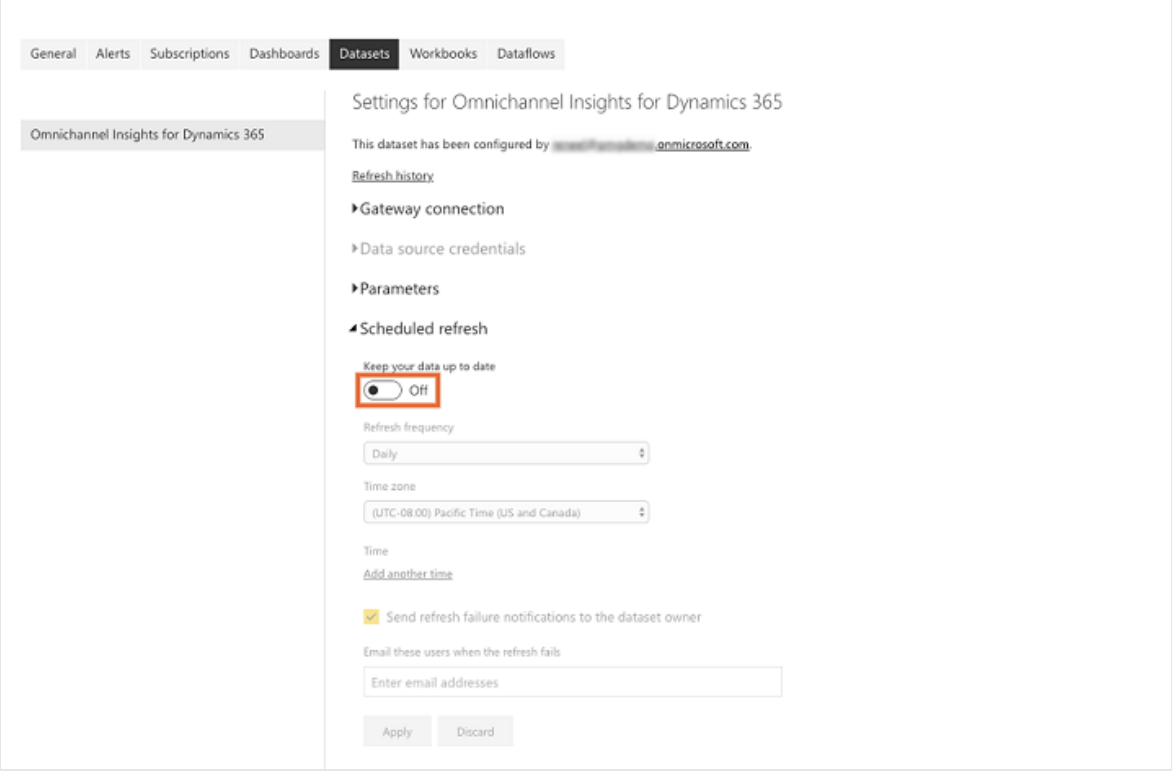
2. Go to the **Omnichannel Insights** app workspace.



3. On the **Datasets** tab, select **Settings**.



4. Turn **Scheduled refresh** to **On**.



> **Note**
>
> We recommend that you set the refresh frequency to **Daily**.

5. Select **Apply**.

Omnichannel Insights reports and dashboards will refresh daily.

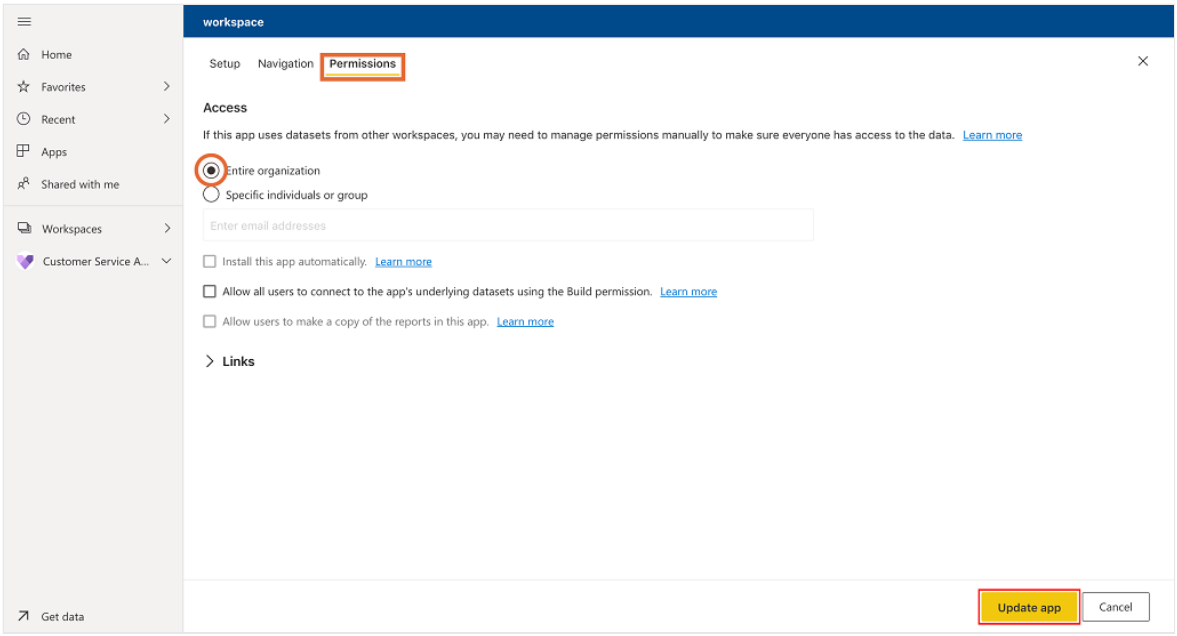
Step 5: Publish application within your organization

You must share the configured application with your entire organization for supervisors to view the **Omnichannel Insights** dashboards and reports with their own **Power BI Pro** accounts.

1. On the App workspace, select **Update app** to open the Update app wizard.

2. On the **Update app** wizard, go to the **Access** tab.

3. Choose **Entire organization** and select **Update app**.



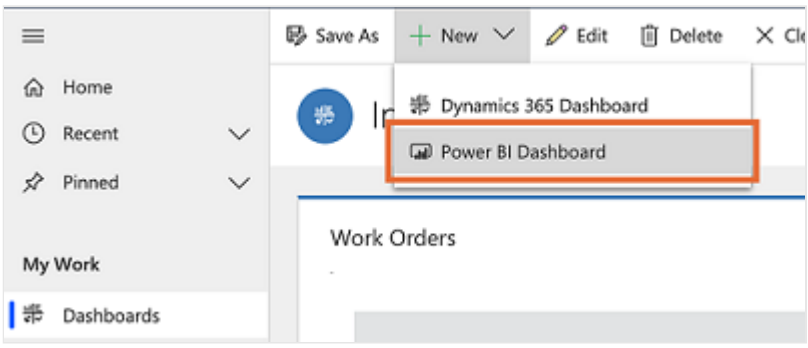
The app is now available to install for all individuals in your organization.

> **Note**
>
> Verify your administrator has allowed users in your organization to have read/write data permissions in Omnichannel Engagement Hub. To learn more, see **Provide data access consent**.

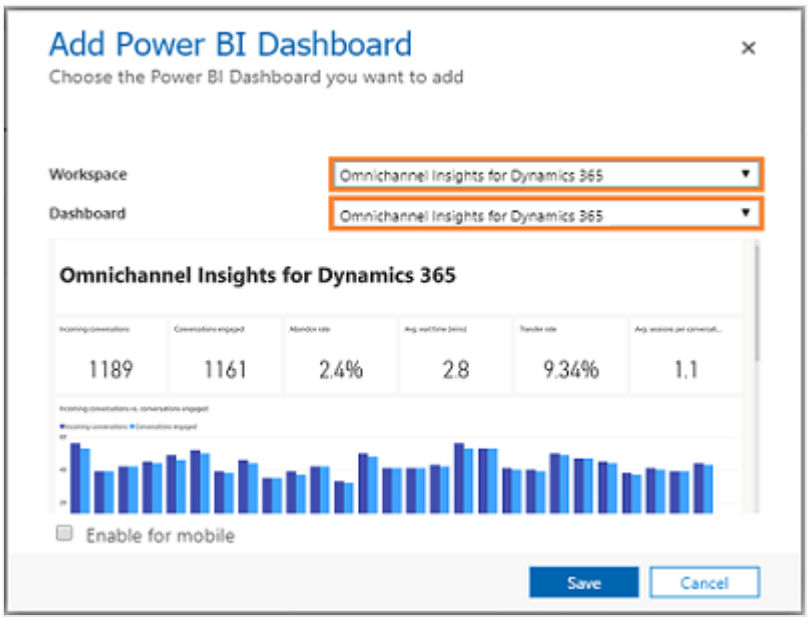
Step 6: Add Power BI Dashboards to Omnichannel for Customer Service

Each supervisor must configure their Power Platform environment to integrate the Omnichannel Insights and Omnichannel Sentiment Analysis dashboards.

1. Sign in to the Omnichannel for Customer Service app.
2. Select **Overview Dashboard** under **Supervisor Experience**.
3. Select **New** and then select **Power BI Dashboard**.



4. a. In the Workspace field, select **Omnichannel Insights for Dynamics 365**.
   b. In the Dashboard field, select **Omnichannel Insights for Dynamics 365**.



5. Save and close.

6. Repeat Steps 3–5 to add Omnichannel Insights - Sentiment Analysis dashboard.

   The Omnichannel Insights and Omnichannel Sentiment Analysis dashboards are now available in Dynamics 365.

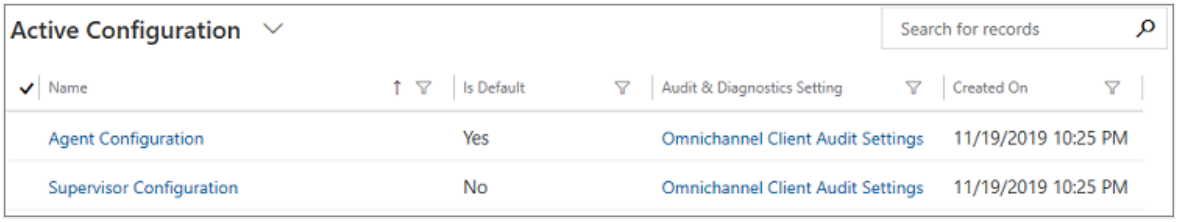
Add users to supervisor configuration

You must add users to the supervisor configuration to access any supervisor dashboard in Unified Service Desk. To add users to the supervisor configuration, follow these steps:

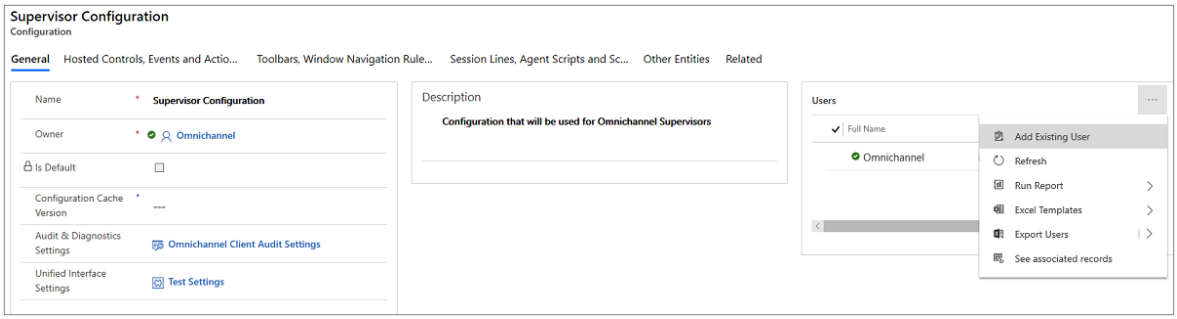
1. Sign in to Unified Service Desk.

2. Go to **Configuration** under **Advanced Settings**.

3. Select **Supervisor Configuration**.



4. On the **Users** section, select **...** and select **Add Existing User**. The **Lookup Records** pane is displayed.



5. Type the name of the user you want to add, and select **Add**.

6. Save and close the configuration.

   Users are added to the supervisor dashboard. Now when they sign in to Omnichannel on Unified Service Desk, the supervisor dashboard tabs are available.

Customize Omnichannel Insights

> **ⓘ Important**
>
> Microsoft does not support customizations made to the Power BI template app and does not provide updates after modifications are made.

Power BI is a comprehensive collection of services and tools that are used to visualize business data. The Power BI Template apps make it easy to visualize and analyze the Omnichannel Insights data with Power BI based on a standard data model.

The Omnichannel Insights template app is built with a set of entities and fields that are useful for most reporting scenarios. Dynamics 365 apps are often extended with custom fields. These custom fields don't automatically show up in the Power BI model.

The following shows you how edit and extend the report included in the template app to include custom fields in the Power BI model.

Before customizing the template app, read the following information and perform each task as necessary.

Requirements

- Power BI service registration.
- Power BI Desktop application for editing Power BI reports.
- Power BI report for Omnichannel Insights template app that you want to customize. Download the Omnichannel Insights report.
- Preview: Download template app for sentiment drivers reporting

Prepare PBIX for customization

1. Start Power BI Desktop.
2. Select **File** > **Open**, open Omnichannel Insights for Dynamics 365.pbix, and then select **Open**.

   Several pages of reports are loaded and displayed in Power BI Desktop.
3. On the Power BI Desktop ribbon, select **Home** > **Transform Data**.
4. In the left dropwdown menu under Transformation Data, select **Edit Paramaters**.
5. In the source definition, replace `**https://kucustomerservice.crm.dynamics.com/api/data/v9.1**` with your apps instance URL.

   Example: if the organization name is Contoso, the URL looks like this: Source = `https://contoso.crm.dynamics.com/api/data/v9.1/`

   For GCC users the format is: `**https://yourserver.crm9.dynamics.com/api/data/v9.1**`
6. Select **Done**.
7. Select **Close & Apply** in the yellow warning ribbon that appears under the Power BI Desktop Ribbon.

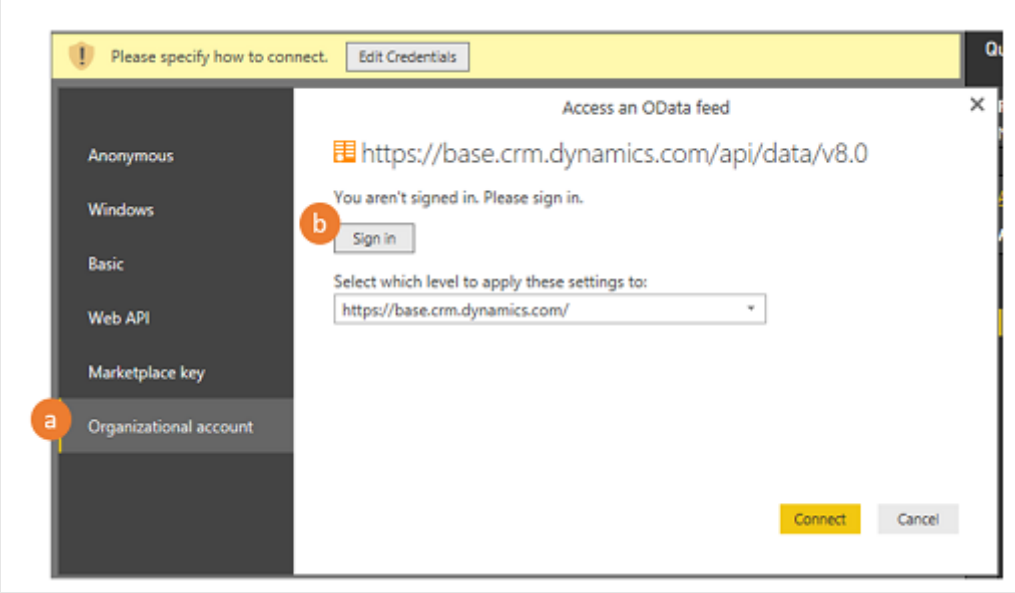
   Queries are updated. This might take several minutes.

8. If the "Access an OData feed" appears, select **Organizational account**.

9. Select **Sign in**.

10. If needed, you can also access this from Power BI desktop by going to **File** > **Options and Settings** > **Data Source Settings.**

    a. Select **Edit Permissions** > **Edit** b. Select **Organizational account.** c. Select **Sign in.**



11. When the sign-in field appears, enter your credentials to authenticate to your instance.

12. In the **Access an OData feed** dialog, select **Connect**.

    Queries are updated. This might take several minutes.

Customize data models of historical and real-time analytics reports

Article • 08/31/2023

> **Important**
>
> Azure Active Directory is being renamed to Microsoft Entra ID: No action is needed from you. **Learn more**

Use the extensibility feature in Microsoft Power BI to extend the out-of-the-box data models for the analytics reports in Customer Service and integrate with other datasets to create new custom metrics. You can customize the out-of-the-box standard reports and add your own KPIs to view the key metrics that are relevant to your organization. You can add custom metrics to the detail reports also.

The key capabilities of model customization include the ability to:

- Edit the out-of-the-box data model and add new metrics.
- Bring in your own custom entities from Dataverse or any other source and extend the Power BI data model.
- Publish the customized report to a specific Power BI workspace.
- Customize the report site map and enable users to access the reports natively from Customer Service workspace.

Enable data model customization for historical and real-time analytics reports in Customer Service admin center, and then do the following tasks:

1. Select a Power BI workspace.
2. Provision the data models and copy of reports.
3. Grant permissions for dataset and reports.
4. Embed customized reports back to Dynamics 365.

Prerequisites

Before you begin, you must complete the following prerequisites:

- Your organization must have the Power BI Professional or Power BI Premium license for all supervisors and administrators.

- Enable insights features in Customer Service:
  - If you are enabling historical data model customization, you must enable at least one of the historical reports, such as Customer Service historical analytics, Omnichannel historical analytics, or knowledge analytics. More information: Configure analytics and insights dashboards
  - If you are enabling real-time data model customization, you must enable real-time analytics for Omnichannel. More information: Configure analytics and insights dashboards

- Create a Microsoft Entra ID security group:

  - Your Microsoft Entra ID administrator must create a security group with your preferred name in Microsoft Entra ID and add **Dynamics 365 Analytics** service account as a member of this security group. More information: Create a basic group and add members using Azure Active Directory

    The out-of-the-box **Service Principal Dynamics 365 Analytics** is used to deploy the data model and make changes to the Power BI workspace on behalf of Customer Service.

    Permissions within Power BI can be granted to groups only and not individual service principals, and therefore a group needs to be created.

  > **Note**
  >
  > In organizations where Dynamics 365 Analytics service account may not be available, you'll need to use the Dynamics CCA Data Analytics service account.

- Enable Power BI service features from the Power BI admin portal. The Power BI administrator must enable the following, either for the entire organization or the for the security group created earlier:

  - **Create workspace (new workspace experience)**: Enabling this creates two workspaces, a managed workspace and a customer workspace to deploy Dynamics data model and reports.

  - **Allow service principals to use Power BI APIs**: This uses the Power BI APIs for creating workspaces, deploying reports and models.

  - **Allow DirectQuery connections to Power BI datasets**: When report authors build new metrics or bring additional data sources, they create composite models, so DirectQuery needs to be enabled. Users who view reports built on top of data model in Dynamics 365 require this permission. Work with your

Microsoft Entra ID administrator to identify a security group that has all the required Dynamics users.

- **Allow XMLA endpoints and Analyze in Excel with on-premise datasets**: When report authors build new metrics or bring additional data sources, they create composite models, so this feature needs to be enabled. Users who view reports built on top of data model in Dynamics 365 require this permission.

- **Embed content in apps** (**Optional**): Enabling this embeds customized reports in Dynamics 365 (Step 4: Embed customized reports back to Dynamics 365). Users who view the custom reports from Dynamics 365 Customer Service require this permission. Work with your Microsoft Entra ID administrator to identify a security group that has all the required Dynamics users.

- If you plan to use an existing Power BI workspace to host the copy of the out-of-the-box reports (customer workspace), make sure that the Dynamics Administrator (user login) enabling the model customization is a workspace administrator of that Power BI workspace.

Enable Power BI data model customization

1. In the Customer Service admin center site map, select **Insights** in **Operations**.
2. On the **Insights** page in the **Report settings** section:
   a. For historical, select **Embedded Power BI extensibility - Historical data model customization** and then select **Manage**.
   b. For real time, select **Embedded Power BI extensibility - Real-time data model customization** and then select **Manage**.
3. On the selected page, switch the **Enable embedded Power BI data model customization** toggle to **On**.

Step 1: Select a Power BI workspace

Specify the Power BI workspace where the Dynamics data model and reports will be provisioned.

1. From the Insights page, go to the data model for which you want to select a Power BI workspace.

2. Select **Create new workspace** or to use an existing workspace, select a workspace from the dropdown list.

3. Select **Save**. This initiates the provisioning of the reports.

> **Note**
>
> The specified workspace applies only to the customer's workspace. A new managed workspace will be created by Microsoft for historical and real-time reports each, when configured. For more information, go to: **How data model customization works**. You can also specify the same workspace for both historical and real-time analytics reports.

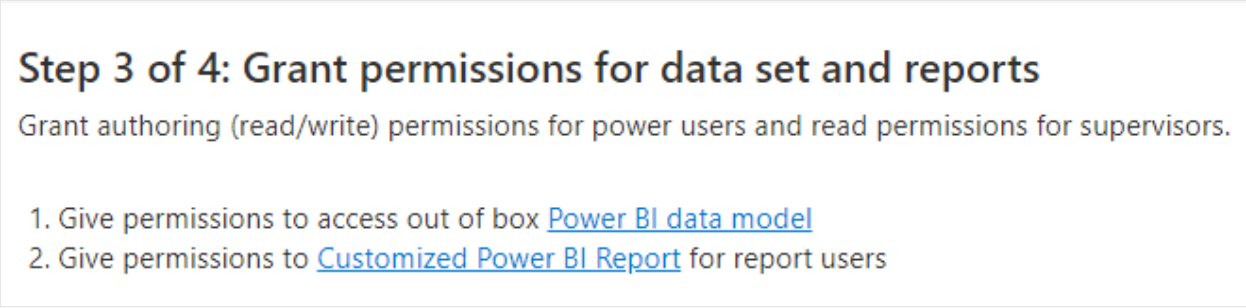
Step 2: Provision the data models

It could take up to 24 hours for the provisioning to complete. You can leave the **Settings** page and check back after a few hours. Select **Refresh** to check the provisioning status.

Step 3: Grant permissions for dataset and reports

After the report is provisioned, you must provide **Write** permissions for users who will be authoring reports in Power BI and **Read** permissions for supervisors and other consumers of the reports.

You'll need to be a **Workspace Administrator** on both managed and customer workspaces (configured on Step 1) in Power BI to complete this step. By default, the user who starts the provisioning (Step 2) will have the necessary permissions added.



Grant access to the Power BI data model

Report authors will connect to the specified data model to build custom reports. When you select the **Power BI Data model** link, the managed workspace opens up and the details of the data model are displayed. Use the **Share** dialog to provide access to users by entering their email address. More information: Share access to a dataset.

You need to:

- Provide report authors with **Allow recipients to build content with the data associated with this dataset** access.
- For report viewers like supervisors, you may choose to share the dataset without providing any additional permissions.

Grant permissions to the customized Power BI report (optional)

When you select the **Customized Power BI Report** link, the Power BI workspace where the sample reports will be provided appears in a lineage view. These reports are the copy of your out-of-the-box reports and can be edited and modified. You'll have to provide access to the workspace only if your organization plans on using these copies to develop reports.

From the lineage view, select **Access**, and provide **Contributor** access to your report authors and **Viewer** access to users who will be viewing these or any other reports built in this workspace. For more information on data permissions, go to: Manage dataset access permissions (preview). You'll have to provide these permissions only if you plan to use these reports.

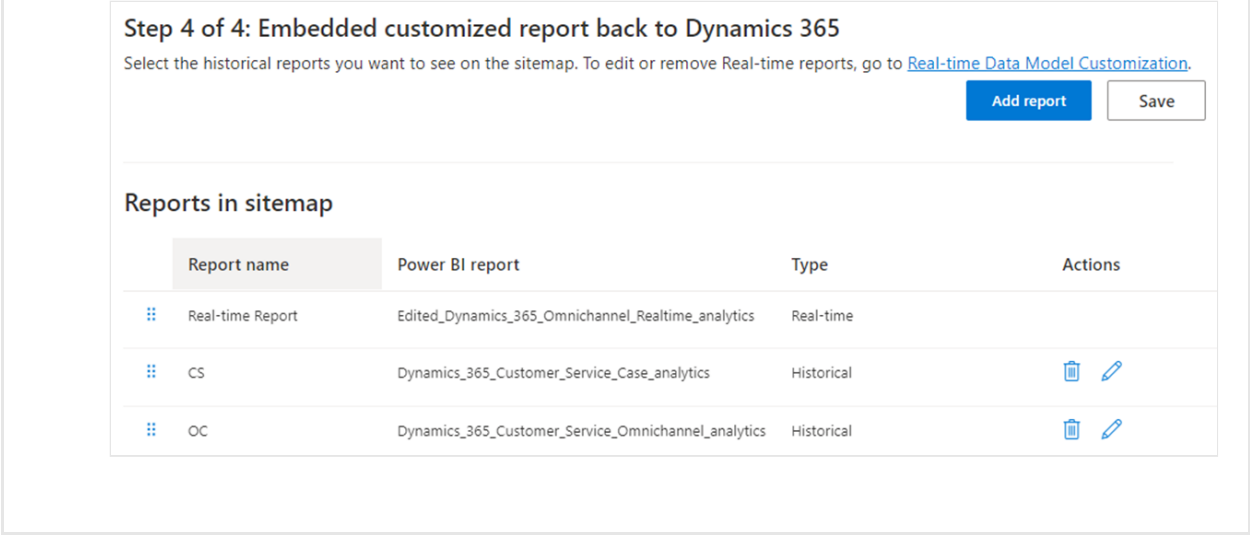
Step 4: Embed customized reports back to Dynamics 365

After your report authors have created and published the customized reports, you can allow Dynamics users to access these reports from the Customer service workspace.

1. Select the data model reports.

Historical data model customization

- From the **Embedded Power BI extensibility - Historical data model customization** page, go to Step 4.



2. Select **Add report**. The **Add report** dialog appears.
3. Enter a preferred name in the **Report name** text box.
4. From the **Select Power BI report** dropdown list, select the Power BI report in the workspace.
5. Select **Add** and **Save**.

The dropdown list is populated with the reports in the workspace configured on Step 1. The preferred report name will appear for your Dynamics users when they access the reports. You can add a maximum of 40 reports.

The customized reports site map in the Customer service workspace is shared between historical and real-time data model customization features. You'll be able to reorder the reports on both historical and real time admin pages. For both historical and real time, you'll be able to modify or delete reports added from the respective historical and real-time data model customization pages only.

Article • 07/12/2023

> **Important**
>
> To use this feature, it must be turned on and the license terms must be accepted. **What are Preview features and how do I enable them?**
>
> A preview feature is a feature that is not complete, but is made available before it's officially in a release so customers can get early access and provide feedback. Preview features aren't meant for production use and may have limited or restricted functionality.
>
> We expect changes to this feature, so you shouldn't use it in production. Use it only in test and development environments.
>
> Microsoft doesn't provide support for this preview feature. Microsoft Dynamics 365 Technical Support won't be able to help you with issues or questions. Preview features aren't meant for production use and are subject to a separate **supplemental terms of use**.

Introduction

> **Important**
>
> This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making, and should not be used to make, decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using Dynamics 365 Customer Service, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to

inform their agents that their communications with end users may be monitored, recorded, or stored.

Customer service supervisors in your organization need to ensure that they have an adequate number of agents available to serve their customers. Overcapacity results in higher costs, while undercapacity results in longer customer wait times, which in turn can negatively impact customer satisfaction.

As an administrator, you can configure the Case forecasting report to help your supervisors plan the right level of staffing for your business based on predicted volumes of cases.

Supervisors can use the Case forecasting report in the following ways:

- Forecast upcoming case volumes based on historical traffic.
- Visualize forecasted case volumes on a daily basis for a time range up to six months, depending on how many days of cases were created in the past. This forecast can be used to plan agent resourcing and recruitment to meet future demand.
- Visualize forecasted case volumes on a 15-minute interval basis, for a time range up to six weeks depending on how many days of cases were created in the past. This forecast can be used to schedule agents to meet the near-term demand.
- Slice forecasted volumes by channel and queue.
- View a rollup of actual and forecasted volume by hourly, daily, weekly, monthly, and yearly basis.
- Automatically detect seasonality from historical traffic with the settings option to import your holiday calendar. This helps the forecasting model to accurately predict case volume during special, seasonal events.

Note

Be aware of the following when using the Case forecasting report:

- Forecasts might misstate volume estimates for many reasons, including unanticipated trends or business developments.
- The Forecast report is currently available in certain geographical locations. More information: **Regional availability and Service limits for Customer**

Service.

How case forecasting works

The Forecast report uses an AI-backed forecasting model that predicts case volumes based on historical case data. The model uses an ensemble forecasting method with seasonality support (automatic detection and custom settings) to enhance the quality of forecasting.

The report can forecast daily trends for a date range up to six months, and intraday (15-minute interval) trends for a date range up to six weeks, depending on how many days of historical data are available and used. In general, the model can forecast for a period that is half of the input date range, with the following conditions:

- For daily case volume forecasting, if the historical data time range is less than 12 months, the forecasting time range is the half of the input time range. For example, eight months of historical date range can forecast for the next four months. If the historical range equals or is more than 12 months (up to 24 months), the report forecasts for the next six months.
- For intraday (15 minutes interval) case volume forecasting, the model only analyzes the recent six weeks of historical data. The time range of forecast is half of the total input time range. For example, 12 weeks historical date range can forecast for the next six weeks (which is the maximum). Out of these 12 weeks of historical data, only the recent six weeks are analyzed to generate the forecast.

The historical data must meet the following minimum requirements for the models to generate forecasting. Otherwise, an error message is posted on the admin settings page.

- At least two weeks of historical data is available.

Key considerations to enhance forecast accuracy

We recommend the following criteria for utilizing users' data to generate accurate forecasts.

- Non-sparse data: The dataset contains information for every day, ensuring that there isn't missing or incomplete data. Each day has a recorded volume, providing a comprehensive set of observations.

- Clear weekly pattern: The data exhibits a weekly pattern, wherein the volume consistently follows a specific trend. For instance, weekends consistently have low volumes, while workdays show higher volumes, and vice versa. This pattern helps in establishing a reliable basis for forecasting.
- Volume-based accuracy: If the criteria are met, the forecast quality improves with larger volume inputs. Higher volumes of data contribute to a more accurate and robust forecast.
- Absence of level shift: Recent days and future periods don't experience any sudden or significant shifts in volume levels. This absence of sudden changes ensures that the historical patterns remain relevant and dependable for forecasting purposes.
- Longer historical data set: If all the above criteria are met, a longer history of data further improves the forecast accuracy. A greater historical data set provides a broader perspective and a more comprehensive understanding of the patterns and trends over time. With an extended history, the forecast model can capture and incorporate more variations, leading to more accurate predictions.
- Weighting recent forecast accuracy: When considering future periods, it's important to acknowledge that the accuracy of the forecast tends to be higher for more immediate timeframes. As time progresses into the future, the certainty and precision of the forecast may decrease. Therefore, the most recent forecast should be given more weight and considered to have better accuracy compared to forecasts for distant future periods.

Prerequisites

To configure the **Case forecasting (preview)** report, you must have the System Administrator role.

For users in your organization to be able to access the forecast reports, they must be part of a role that has **Read** privileges on the **msdyn_dataanalyticsreport_forecast** table. Your system administrator must assign this privilege to any role that needs access to the forecasting reports. Out of the box, the following roles already have read privileges on the Forecast table:

- CSR Manager
- Omnichannel administrator
- Omnichannel supervisor

Enable the case forecasting (preview) report

1. In the Customer Service admin center app, under **Operations**, select **Insights**. The **Insights** page is displayed.

2. Under the **Report settings** section, next to **Case forecasting (preview)**, select **Manage**. The **Case forecasting (preview)** page is displayed.

3. Toggle **Enable case forecasting** to **On**.

4. The report reflects the day on which it's enabled. If you want to choose a different day of the month for the report to be updated, in **Daily forecasting schedule**, select the day for which you want the report to refresh.

5. After the report is generated for the first time, you'll see a **Model run summary** section at the top of the page that displays the date and time on which the forecast was last created. The time reflects your time zone. If you want to set a different default time zone, do the following steps:

   a. Select the **Settings** (gear) icon in the top-right corner of the app, and then select **Personalization Settings**. The **Set Personal Options** page is displayed.

   b. In **Set the time zone you are in**, choose the time zone you want from the dropdown menu.

   c. Select **OK**.

6. If you want to change the time zone to use for forecasting, under **Time zone for daily forecasting**, select time zone you want.

7. If you want to select a particular date that the data starts from, under **Historical data start date (optional)**, choose the **Start date** you want. The latest (closest) date that the start date can be is at least two weeks back from the current date. If nothing is selected, the start date is decided based on the earliest creation date of all of your historical records, up to two years. If the start date you select is earlier than two years, only last two years of data is used.

8. If you want to specify seasonality, under **Seasonality**, select the **Use schedules from Holiday Calendar** check box. Selecting the **Holiday Calendar** link opens the **All Holiday Schedules** page, where you can create a new schedule or select an existing schedule.

9. Save your changes. If this is the first time you've enabled the forecast feature, it may take up to 24 hours until the forecasting data is ready to view in the forecast report.

Configure agents for conversations forecasting (preview)

Article • 07/12/2023

> **Important**
>
> To use this feature, it must be turned on and the license terms must be accepted. **What are Preview features and how do I enable them?**
>
> A preview feature is a feature that is not complete, but is made available before it's officially in a release so customers can get early access and provide feedback. Preview features aren't meant for production use and may have limited or restricted functionality.
>
> We expect changes to this feature, so you shouldn't use it in production. Use it only in test and development environments.
>
> Microsoft doesn't provide support for this preview feature. Microsoft Dynamics 365 Technical Support won't be able to help you with issues or questions. Preview features aren't meant for production use and are subject to a separate **supplemental terms of use**.

Introduction

> **Important**
>
> This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making, and should not be used to make, decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using Dynamics 365 Customer Service, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to

inform their agents that their communications with end users may be monitored, recorded, or stored.

Customer service supervisors in your organization need to ensure that they have an adequate number of agents available to serve their customers. Overcapacity results in higher costs, while under capacity results in longer customer wait times, which in turn can negatively impact customer satisfaction.

As an administrator, you can configure the Agent forecasting for conversation report to help your supervisors plan the right level of staffing for your business based on predicted volumes of conversations.

Supervisors can use the Agent forecasting for conversation report in the following ways:

- Forecast upcoming conversation volumes based on historical traffic. For conversation volume forecasting, if chatbots are enabled for your conversational channels, then the chatbot conversations that don't include a human agent are excluded from the forecast. You can then rely on the predicted conversation volumes for human agent staffing.
- Forecast agent demand to meet the forecasted conversation volume, based on business requirements, such as service level agreement, shrinkage, and concurrency.
- Visualize forecasted conversation volumes and agent demand on a daily basis, for a time range up to six months depending on how many days of cases were created in the past. This forecast can be used to plan agent resourcing and recruitment, to meet future demand.
- Visualize forecasted conversation volumes and agent demand on a 15-minute interval basis, for a time range up to 6 weeks depending on how many days of cases were created in the past. This forecast can be used to schedule agents to meet the near-term demand.
- Slice forecasted volumes and agent demand by channel and queue.
- View rollup of actual and forecasted volume by hourly, daily, weekly, monthly and yearly basis. For agent demand report, option to select the type of rollup from Maximum, Minimum, Average and Sum.
- Automatically detect seasonality from historical traffic with the settings option to import your holiday calendar. This automatic detection helps the forecasting model to accurately predict case or conversation volume during special, seasonal events.

> **Note**
>
> Be aware of the following when using the Forecast report:
>
> - Forecasts might misstate volume estimates for many reasons, including unanticipated trends or business developments.
> - The agent forecasting for conversation report is currently available in certain geographical locations. More information: **Regional availability and Service limits for Customer Service**.

How agent forecasting for conversation works

The forecast report for conversations uses an AI-backed forecasting model to predict conversation volumes based on historical conversation data. The model uses ensemble forecasting methodology with seasonality support (automatic detection and custom settings) to enhance the quality of forecasting. The forecast report for agents for conversations uses a statistical model to calculate the agent demand from the forecasted volumes.

The report can forecast daily trends for a date range up to six months, and intra day (15-minute interval) trends for a date range up to six weeks, depending on how many days of historical data are available and used. In general, the model can forecast for a period that is half of the input date range, with the following conditions:

- For the daily conversation volume and agent demand forecast, if the historical data time range is less than 12 months, the forecasting time range is the half of the input time range. For example, eight months of historical date range can forecast for the next four months. If the historical range equals or is more than 12 months (up to 24 months), the report forecasts for the next six months.
- For the intraday (15-minute interval) conversation volume and agent demand forecast, the model only analyzes the recent six weeks of historical data. The time range of forecast is half of the total input time range. For example, 12 weeks historical date range can forecast for the next six weeks (which is the maximum). Out of these 12 weeks of historical data, only the recent six weeks are analyzed to generate the forecast.

The historical data must meet the following minimum requirements for the models to generate forecasting. Otherwise, an error message is posted on the admin settings page.

- At least two weeks of historical data is available.

Key considerations to enhance forecast accuracy

We recommend the following criteria for utilizing users' data to generate accurate forecasts.

- Non-sparse data: The dataset contains information for every day, ensuring that there isn't missing or incomplete data. Each day has a recorded volume, providing a comprehensive set of observations.
- Clear weekly pattern: The data exhibits a weekly pattern, wherein the volume consistently follows a specific trend. For instance, weekends consistently have low volumes, while workdays show higher volumes, and vice versa. This pattern helps in establishing a reliable basis for forecasting.
- Volume-based accuracy: If the criteria are met, the forecast quality improves with larger volume inputs. Higher volumes of data contribute to a more accurate and robust forecast.
- Absence of level shift: Recent days and future periods don't experience any sudden or significant shifts in volume levels. This absence of sudden changes ensures that the historical patterns remain relevant and dependable for forecasting purposes.
- Longer historical data set: If all the above criteria are met, a longer history of data further improves the forecast accuracy. A greater historical data set provides a broader perspective and a more comprehensive understanding of the patterns and trends over time. With an extended history, the forecast model can capture and incorporate more variations, leading to more accurate predictions.
- Weighting recent forecast accuracy: When considering future periods, it's important to acknowledge that the accuracy of the forecast tends to be higher for more immediate timeframes. As time progresses into the future, the certainty and precision of the forecast may decrease. Therefore, the most recent forecast should be given more weight and considered to have better accuracy compared to forecasts for distant future periods.

Prerequisites

To configure the **Agent forecasting for conversation (preview)** report, you must have the system administrator role.

For users in your organization to be able to access the forecast reports, they must be part of a role that has **Read** privileges on the **msdyn_dataanalyticsreport_forecast** table. Your system administrator must assign this privilege to any role that needs access to the

forecasting reports. Out of the box, the following roles already have read privileges on the Forecast table:

- CSR Manager
- Omnichannel administrator
- Omnichannel supervisor

Enable the Agent forecasting for conversation (preview) reports

1. In the Customer Service admin center app, under **Operations**, select **Insights**. The **Insights** page is displayed.

2. Under the **Report settings** section, next to **Agent forecasting for conversation (preview)**, select **Manage**. The **Agent forecasting for conversation (preview)** page is displayed.

3. Toggle **Enable agent capacity forecasting** to **On**.

4. The report reflects the day on which it's enabled. If you want to choose a different day of the month for the report to be updated, in **Daily forecasting schedule**, select the day for which you want the report to refresh.

5. After the report is generated for the first time, you'll see a **Model run summary** section at the top of the page that displays the date and time on which the forecast was last created. The time reflects your time zone. If you want to set a different default time zone, do the following steps:

   a. Select the **Settings** (gear) icon in the top-right corner of the app, and then select **Personalization Settings**. The **Set Personal Options** page is displayed.

   b. In **Set the time zone you are in**, choose the time zone you want from the dropdown menu.

   c. Select **OK**.

6. If you want to change the time zone to use for forecasting, in **Time zone for daily forecasting**, select time zone you want.

7. If you want to select a particular date that the data starts from, under **Historical data start date (optional)**, choose the **Start date** you want. The latest (closest) date that the start date can be is at least two weeks back from the current date. If nothing is selected, the start date is decided based on the earliest creation date of

all of your historical records, up to two years. If the start date you select is earlier than two years, only last two years of data is used.

8. If you want to specify seasonality, under **Seasonality**, select the **Use schedules from Holiday Calendar** check box. Selecting the **Holiday Calendar** link opens the **All Holiday Schedules** page, where you can create a new schedule or select an existing schedule.

9. Under **Global Forecasting configuration** specify the following settings at the global level to apply to all channels. Some default values are provided as a suggestion to get you started, but you may want to change them to meet the needs of your organization.

    - **Required Service Level (%)**: The percentage of the conversations needed to meet the target answer time. For example, if you set your required service level percentage to 80 and your target answer time to 77, it indicates that you want 80 percent of your conversations to be answered in 77 seconds or less.
    - **Target Answer Time (Seconds)**: The number of seconds in which you want your agents to answer their conversations.
    - **Shrinkage (%)**: The percentage of time agents are unavailable to handle conversations. If you increase this number, the percentage of time that the agents are unavailable goes up, which means you would need more agents to meet the service-level agreement.
    - **Concurrency (#)**: The number of simultaneous interactions per agent. For voice calls, this value should be set to one. For chats and messaging channels, this value can be set as desired.

10. (Optional) If you want to override the values that are set in the **Global Forecasting configuration** for specific channels, you can use the settings in **Override Channel Forecasting configuration** to set values for each channel that's available in your organization. Any settings you don't change in the override remain as set at the global level. To specify overrides for one or more channels, do the following:

    - Select the channels you want to specify overrides for in the **Select channels to override configuration** dropdown list. Once selected, click on the **Add to override** button.
    - An override section for each channel that you selected is added to the configuration page. Specify the overrides for the channel. You do not need to override all values. Any value that you don't override uses the value specified in the **Global Forecasting configuration** section.

- To remove a channel override, click on the **Remove this channel override** link in the override section for that channel. You'll be prompted to confirm the remove action.

An example of when an override might be useful is if you have both voice and chat channels. The **Concurrency (#)** setting in **Global Forecasting configuration** would be set to one for the voice channel, but then you could use the **Live Chat-override** setting to change the chat concurrency to a higher frequency, such as three.

11. Save your changes. If this is the first time you've enabled the forecast feature, it may take up to 24 hours until the forecasting data is ready to view in the forecast report.

Configure case forecasting (preview)
Introduction to Customer Service Insights
Regional availability and Service limits for Customer Service

Configure AI topic clustering for cases

Article • 08/26/2022

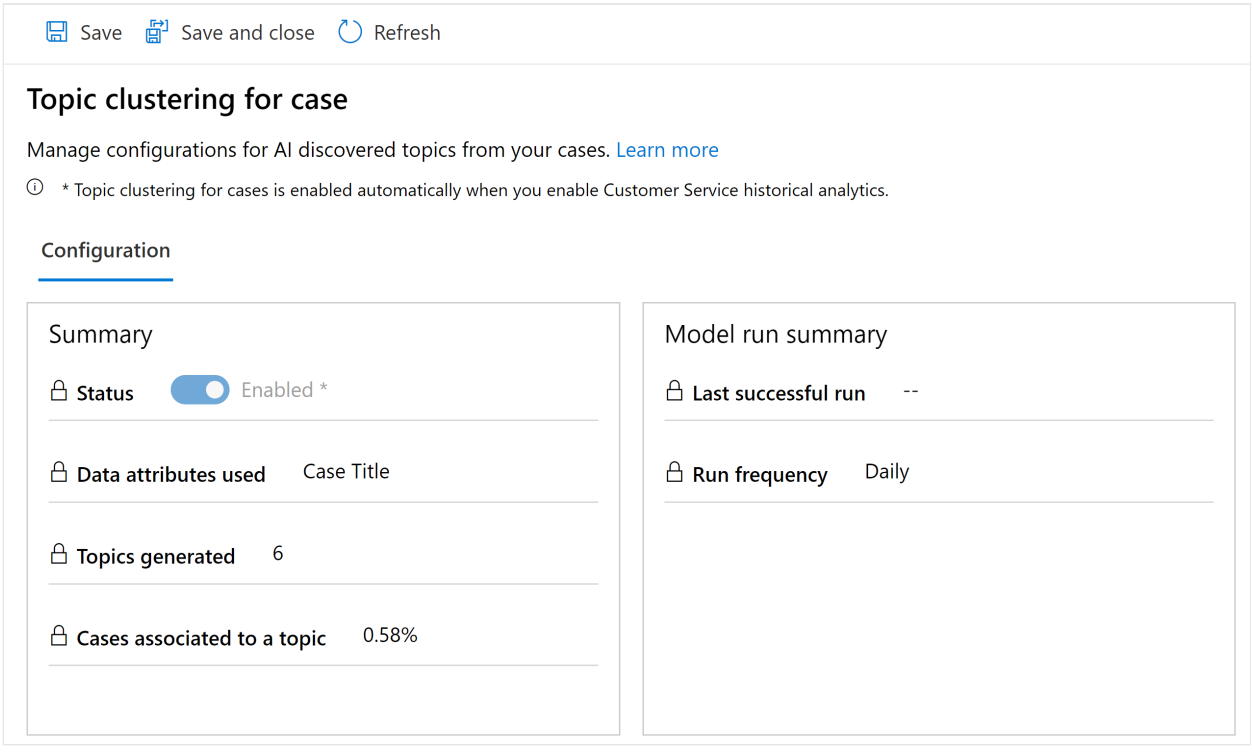
Customer Service Insights uses AI to give you insights into your customer service data by grouping semantically related cases and generating a topic. New cases that match the generated topic will be automatically added to the topic group. This can help you identify areas for improvement that can have the greatest impact on system performance.

The AI-driven technology empowers informed decision-making about how to improve resolution rates, reduce wait times, and decrease customer service costs. You can use case resolution insights, backlog trends, and historical comparisons to evaluate agent performance and business impact, and address inefficiencies in your system.

Enable topic clustering for cases

Topic clustering is enabled by default when you enable historical analytics. To enable historical analytics, see Configure Customer Service historical analytics.

Summary and Model run summary views

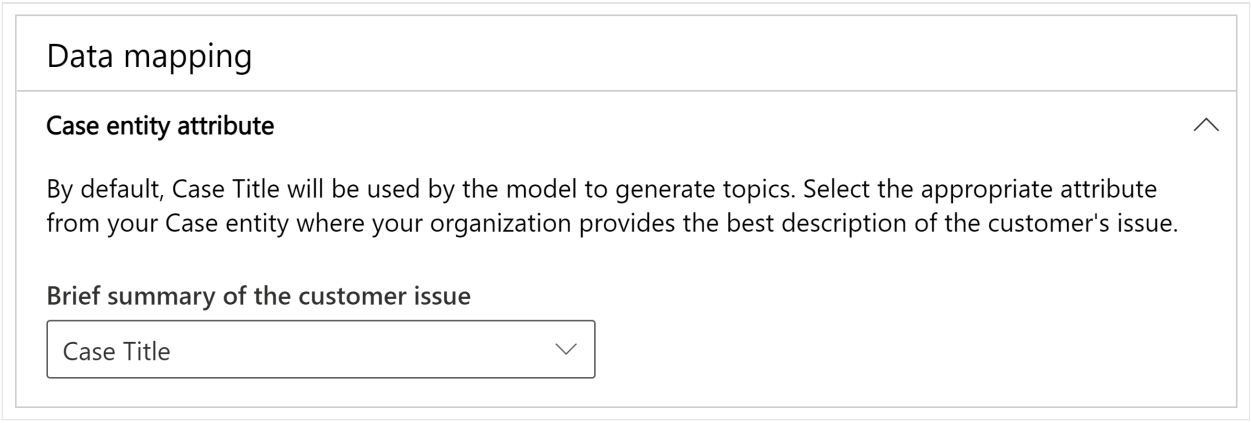


The Summary and Model run summary views provide key information about how the topic model is operating.

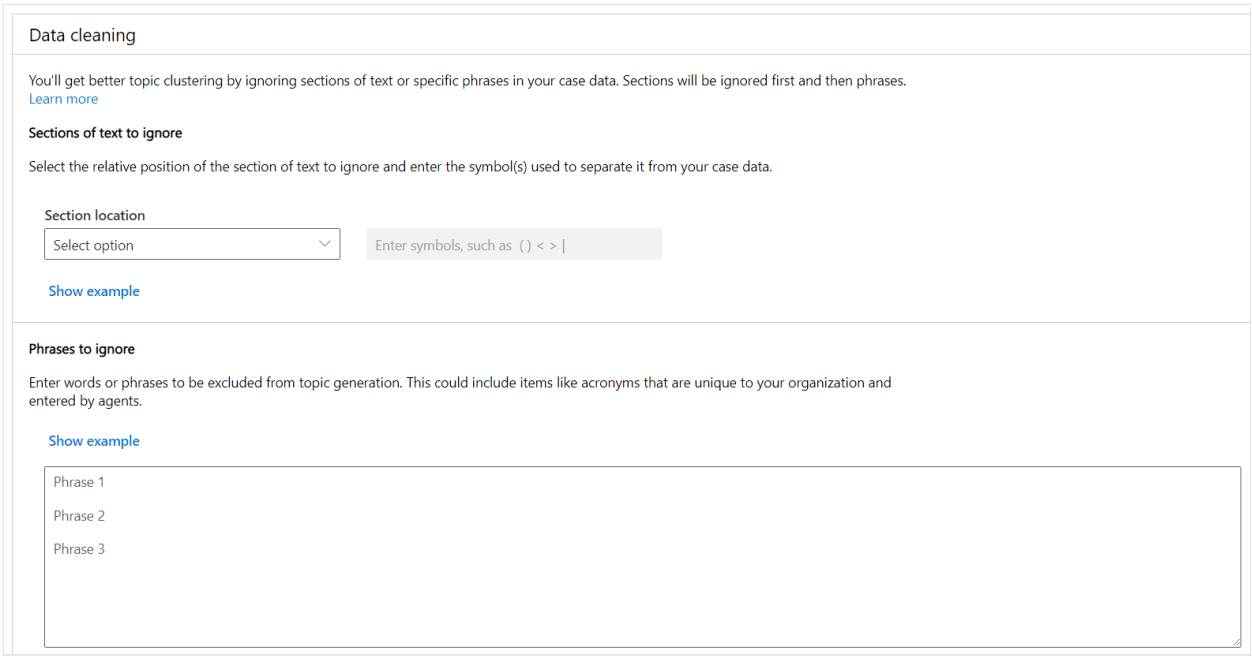
View	Description
Status	Whether the feature is enabled or disabled.
Data attributes used	Which text field from the Case entity is used for topic generation.
Topics generated	The total number of topics generated by the model.
Cases associated to a topic	The percentage of cases that were considered for topic generation and classified to a topic.
Last successful run	Timestamp of the last time new cases were processed.
Run frequency	The cadence in which new cases are processed and tagged with topics.

Data mapping

Data mapping enables you to choose the text field that the agents in your organization will most likely use to describe the reason why a customer reached out to support. By default, the Case Title attribute is used. The other attributes available to you are Serial Number, Description, and Case Title.



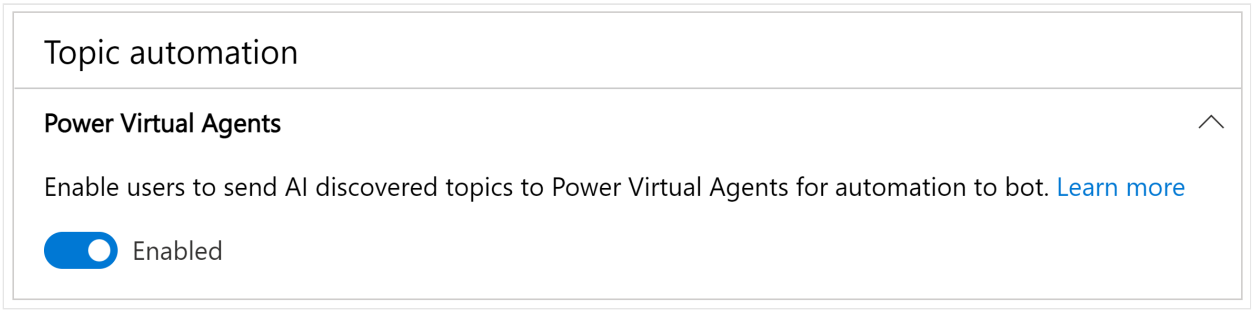
Improve data quality by cleaning support case data



The AI Insights charts displayed on the Customer Service Insights dashboards are generated by applying language understanding technology to the titles of support cases. However, the results can be misleading if the titles include extraneous information such as product name, case status, or ticket number tags. You can improve the quality of the results displayed in AI Insights charts by specifying Data Cleaning settings to disregard tags in titles when they are grouped into topics, as well as specific phrases that should be ignored. Note that when you choose to apply both options, sections are ignored first, followed by phrases.

Enable topic automation for Power Virtual Agents

AI discovered topics in Customer Service Historical Analytics are often prime candidates as topics for automation in Power Virtual Agents bots. If Power Virtual Agents is available in the region that your Customer Service organization is in, then the feature can be enabled by switching the **Disabled** toggle to **Enabled**.



> **Note**
>
> Topic automation to Power Virtual Agents bot is currently not supported in Government Community Cloud.

Language availability for topics

The topics capability in the Customer Service historical analytics reports comes with a natural language understanding model that can understand the text semantics and intent in the following languages:

- English
- French
- German
- Italian
- Japanese
- Portuguese
- Simplified Chinese
- Spanish

> **Note**
>
> While topic discovery is not prevented and still possible in languages that are not listed above, there may be differences in experience for users who leverage topics in unsupported languages.

Enable AI suggestions for similar cases and knowledge articles

Article • 05/18/2023

With the use of AI, suggestions about similar cases that were previously resolved successfully help agents find the right solutions quickly, increase their productivity, and provide better and faster service to customers.

The key highlights of the feature are as follows:

- AI-driven case and knowledge article suggestions that are based on case context and historical success rate.
- Secondary actions that agents can take, such as collaborating with an expert, after a similar case has been found.
- Capability of the AI model to process up to 1 million of the most recent cases for listing them at runtime.

> **Note**
>
> The AI suggestions feature is currently available in a few geographical locations. More information: **Regional availability and Service limits for Customer Service**.

How AI suggestions for similar cases and knowledge articles work

The AI suggestions are displayed in smart assist, an intelligent assistant that provides real-time recommendations to agents to help them take action during their interactions with customers. After the productivity pane is enabled in Customer Service workspace or Omnichannel for Customer Service, the smart assist cards with suggestions appear on the productivity pane.

The AI suggestions use a set of pre-trained natural language understanding models. These models are designed to help agents find relevant knowledge articles or similar cases quickly, based on the context of active cases or ongoing conversations.

The AI models work as follows:

- Knowledge articles and similar cases can be suggested based on the semantic meaning in case context and knowledge article content.

- The model pre-processes published knowledge articles and resolved cases every day to prepare suggestion candidates. For the first time preprocessing, up to 1,500 published articles and 15,000 recently resolved cases will be processed. After, newly published articles and resolved cases will be processed up to the daily limit. Over time, accumulatively, up to 1 million of the latest resolved cases will be processed to serve suggestions.
- After a case is created or updated, or during an ongoing conversation, the model finds out matching knowledge articles and similar cases from suggestion candidates.
- A brief summary is auto-generated for each pre-processed knowledge article, based on its content. When the system suggests a knowledge article, both the article title and auto-generated summary are surfaced to agents. This data can help agents get a better idea about an article before they click through it.
- In addition to the suggestions, agents can also tell why an article or similar case is suggested through a list of key phrases that are auto-extracted from knowledge articles and cases. These key phrases highlight the relevance between a suggestion and an active case or an ongoing conversation in addition to the confidence score (a percentage number that indicates the degree to which an article or similar case matches with the active case).
- During an ongoing conversation, for the first three messages sent by the customer, the AI suggestions are triggered for each message. After these first three customer messages, AI suggestions are triggered for every third customer message. The AI suggestions are based on the context described in the last 18 messages.

> ⓘ **Note**
>
> - After you enable the settings, it might take up to 24 hours for the models to process data and complete the first time setup.
> - After you enable or disable the settings, they'll be in place only after agents refresh or reopen their browser; they won't appear in the currently active sessions or on session switch.

Language support for AI suggestions

AI suggestions for similar cases and knowledge articles are now supported in the following languages:

- Dutch
- English

- French
- German
- Italian
- Japanese
- Spanish

After an agent opens a case or accepts a conversation, smart assist checks the language from the following sources:

- Whether the language selected in the language settings is supported.
- Whether the language that the AI has detected in the case or conversation that the agent accepts matches the language settings.

If the language verification passes, the suggestions are displayed in the language used in the case or the conversation. Suggestions aren't displayed if the language doesn't match or isn't supported. In such cases, the agent should update the settings to use supported languages. The language settings used in AI suggestions are listed as follows:

- For similar case suggestions, the language selected in the user's **User Interface Language** settings is used to display similar cases and knowledge article suggestions.
- For knowledge article suggestions, smart assist first checks for the language that's set in the **Knowledge Personalization** settings. If no language setting is found, the user's **User Interface Language** setting is used to display knowledge article suggestions. More information: Personalize your knowledge search article filters.

Prerequisites

Make sure that the following requirements are met:

- Customer Service workspace is installed and accessible. More information: Customer Service workspace
- The productivity pane is enabled. By default, the productivity pane is enabled out of the box. More information: Enable productivity pane.
- The System Administrator role is granted.
- The workflow processes used by the AI model and AI configuration entities are in the activated status. More information: Workflow processes.
- If administration mode is enabled, make sure that background operations are also enabled. More information: Administration Mode.
- For the AI suggestions to work, customer-managed keys should be disabled.

Enable AI suggestions for similar cases

> **Note**
>
> AI suggestions for similar cases is enabled out of the box.

You can enable AI suggestions for similar cases in the Customer Service admin center, Omnichannel admin center, or Customer Service Hub app.

1. Go to one of the apps, and then perform the following steps.

   Customer Service admin center

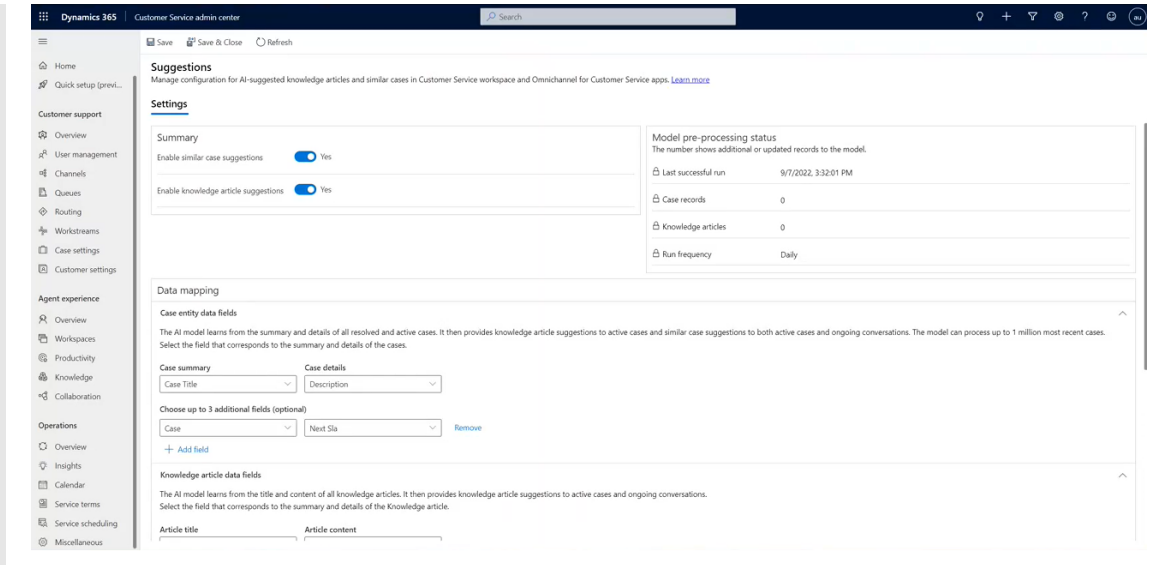
   a. In the site map, select **Insights** in **Operations**. The **Insights** page appears.
   b. In the **Suggestions for agents** section, select **Manage**.

   The **Suggestions** page is displayed.

2. In the **Settings** > **Summary** area, set the **Enable similar case suggestions** toggle to **Yes**.

3. In the **Data mapping** > **Case entity data fields** area, select values for the **Case summary** and **Case details** boxes respectively, if you don't want to use **Case Title** and **Description** that are set by default. You can choose up to three more fields for the case suggestion model to use to find similar cases. For example, you can look at cases with a similar age, cases owned by a particular team, and so forth. The AI model uses the data that corresponds to the selected boxes to understand the case context to provide similar case suggestions.

   > **Note**
   >
   > We recommend that you use text fields with plain text because suggestions might not be generated for text fields that are enabled for rich text format.



4. Select **Save**.

Enable AI suggestions for knowledge articles

> **Note**
>
> AI suggestions for knowledge articles is enabled out of the box.

You can enable AI suggestions for knowledge articles in the Customer Service admin center, Omnichannel admin center, or Customer Service Hub app.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Insights** in **Operations**. The **Insights** page appears.
   b. In the **Suggestions for agents** section, select **Manage**.

   The **Suggestions** page is displayed.

2. In the **Summary** area, set the **Enable knowledge article suggestions** toggle to **Yes**.

3. In the **Data mapping** > **Knowledge article data fields** area, ensure that **KB articles** is selected for **Article entity**, and **Title** and **Content** are selected in the **Article title** and **Article content** boxes, respectively. You can choose three more fields for the model to find similar knowledge articles, such as article keywords, description, and so forth. The selected options are used by the AI model to understand and find a

good match for a case or conversation. Article content is used by the AI model to generate a brief article summary that's displayed to the agent at runtime.

4. Select **Save**.

Model preprocessing rules

You can use model preprocessing rules to limit the pre-processed cases that the AI model will suggest to your agents. You can choose from a variety of conditions, such as sentiment value, associated with the resolved case, and so forth.

You can also apply model preprocessing rules to knowledge articles to limit the suggestions to knowledge articles based on things such as keywords, language, the number of views on the knowledge article, and so forth.

Model preprocessing status

The **Model preprocessing status** area displays the following metadata pertaining to the AI processing. The run frequency is set out of the box. Every day, the model pre-processes newly published or updated knowledge articles and resolved or updated cases to prepare the candidates for suggestions.

- **Last successful run**: Displays the date and time the model was last run.
- **Case records**: Displays the number of new or updated resolved case records that were processed.
- **Knowledge articles**: Displays the number of new or updated published knowledge articles that were processed.
- **Run frequency**: Displays the frequency that has been set for the model to run.

Workflow processes

The AI model and AI configuration entities use the following workflow processes. Make sure these processes are in the activated status. By default, these processes are activated:

- IsPaiEnabled
- Predict
- PredictionSchema
- Train
- QuickTest
- BatchPrediction

- ScheduleTraining
- SchedulePrediction
- ScheduleRetrain
- UnschedulePrediction
- UnscheduleTraining
- CancelTraining
- PublishAIConfiguration
- UnpublishAIConfiguration

Service protection limits for AI suggestions

AI suggestions for Case and Knowledge became available as of October 2020. We're introducing service protection limits on these capabilities to maintain a consistent quality of service for all our customers, but there's no penalty if customers exceed predefined limits. Over time, Microsoft might adjust these limits in keeping with customer usage patterns and provide options for customers with high usage scenarios and patterns to purchase more capacity in a manner minimally disruptive to those customers.

The service protection limits for AI suggestions are defined in the following table. The total limits are pooled at the tenant level based on the number of Customer Service Enterprise user licenses that are available in the tenant.

Area	Limits	Notes
AI suggestions for active cases	30 cases/month per user license	Each user license adds 30 active cases, where agents can get AI-suggested knowledge articles and similar cases in real time.
AI suggestions for conversations	150 conversations/month per user license	Each user license adds 150 omnichannel conversations, where agents can get AI-suggested knowledge articles and similar cases in real time.

Configure AI suggestions for article keywords and description

Article • 04/04/2022

Correct metadata helps to locate articles that users search for. When authors create or update knowledge articles, AI suggestions for article keywords and descriptions can help them select the right metadata, thereby improving their productivity.

The key highlights of the AI suggestions feature are as follows:

- Enable authors by suggesting keywords and description based on the article content stored in the built-in knowledge article entity.
- Enable admins to select the source data (text only) fields that the AI model will use; the default fields are **Title** and **Content**.

> **Note**
>
> The AI suggestions feature is currently available only in specific geographical locations. More information: **Regional availability and service limits for Customer Service**.

How AI suggestions for article keywords and descriptions work

The **View suggested keywords and description** link appears in the default knowledge article form for authors when the article content field is updated and the knowledge article is saved. When authors select the link, it displays a dialog with suggested keywords and a description.

If you have a custom form, you can add the **View suggested keywords and description** link only to the knowledge article entity. More information: Enable AI suggestions for article keywords and description in a custom form

The AI model works as follows:

- The text values from selected source data fields in **Settings** are sent to the AI model to generate suggestions. By default, the source data fields are **Title** and **Content**.

- The model takes the first 2,200 characters to generate suggestions. To get good suggestions, we recommend that authors describe the problem to be solved within the first 2,200 characters in their articles.
- Knowledge article keywords and a description are then suggested based on the knowledge article title and content, and are displayed in the **View suggested keywords and description** dialog.

Language support for article keywords and description suggestions

AI suggestions for article keywords and description are supported in the following languages:

- Dutch
- English
- French
- German
- Italian
- Japanese
- Spanish

The language used in AI-generated suggestions is based on the language that the author has selected in the article record. An author can specify the language for an article on the **Summary** tab of the knowledge article form.

Prerequisites

Ensure to meet the following requirements:

- You have the System Administrator role.
- Authors have **Read** access to the **Keywords Description Suggestion Setting** custom entity.

Enable AI suggestions for article keywords and description

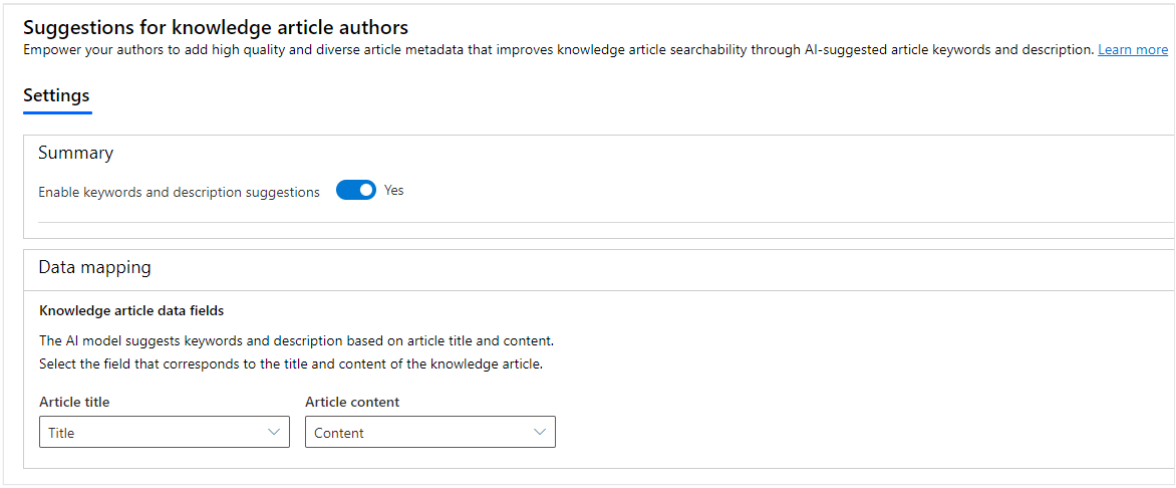
You can enable AI suggestions for article keywords and description in the Customer Service admin center or Customer Service Hub app by performing the following steps:

1. Go to the **Insights** page.

Customer Service admin center

- In the site map, select **Insights** in **Operations**. The **Insights** page appears.

2. On the Insights page, in the **Suggestions for knowledge article authors** section, select **Manage**. The **Suggestions for knowledge article authors** page appears.
3. On the **Settings** tab in the **Summary** area, set the **Enable keywords and description suggestions** toggle to **Yes**. By default, the model is based on the **Title** and **Content** values specified in the **Data mapping** area in **Knowledge article data fields**.
4. Optional: Change the values for **Article title** and **Article content** if you don't want the model to use the default values. The AI model will use the data that corresponds to the values you select.
5. Select **Save**.



Enable AI suggestions for article keywords and description in a custom form

1. In Dynamics 365, go to **Customizations** in **Advanced Settings**.
2. Select **Customize the System** to open the default solution.
3. From the **Solution: Default Solution** navigation pane, select **Components** > **Entities** > **Knowledge Article** > **Forms**.
4. Select the form that you want to customize.

5. From **Field Explorer**, select **Keywords and Description Suggestion control** and add it to the form.
6. Select **Keywords and Description Suggestion control** in the form and then select **Change Properties** on the ribbon.
7. On the **Field Properties** dialog, go to the **Controls** tab, and select **Add Control**.
8. On the **Add Control** dialog, select **Knowledge Suggestion Section Control** > **Add**.
9. On the **Field Properties** dialog, **Controls** tab, select **Web**, **Phone**, and **Tablet** for **Knowledge Suggestion Section Control**.
10. Select **OK**.
11. Select **Save** and **Publish**.

Configure AI topic clustering for conversations

Article • 08/26/2022

Customer Service Insights uses AI to give you insights into your customer service data by grouping semantically related conversations and generating a topic. New incoming conversations that match this topic will be automatically added to the topic group. This can help you identify areas for improvement that can have the greatest impact on system performance.

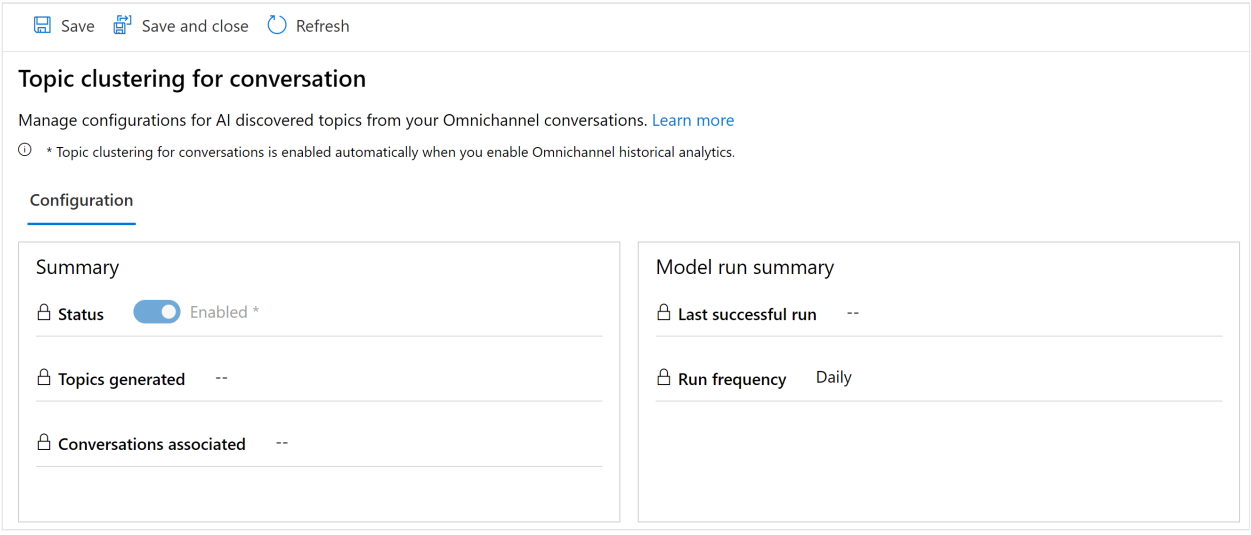
The AI-driven technology empowers informed decision-making about how to improve resolution rates, reduce wait times, and decrease customer service costs. You can use case resolution insights, backlog trends, and historical comparisons to evaluate agent performance and business impact, and address inefficiencies in your system.

Enable topic clustering for conversations

Topic clustering is enabled by default when you enable historical analytics. To enable historical analytics, see Configure Omnichannel historical analytics reports

Summary and Model Run Summary Views

The Summary and Model Run Summary views provide key information about how the topic model is operating.

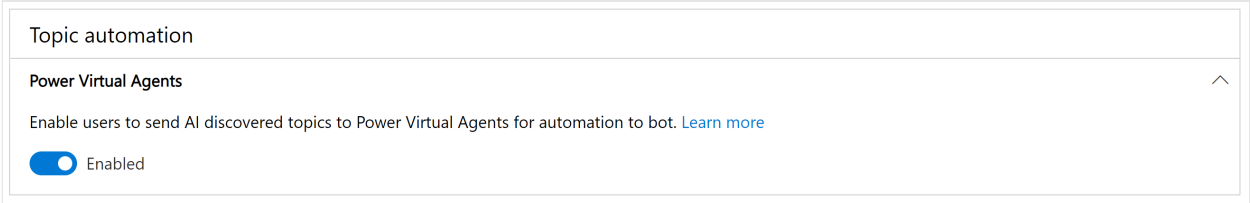


View	Description
Status	Whether the feature is enabled or not.

View	Description
Topics generated	Total number of topics generated by the model.
Conversations associated	The percentage of conversations that were considered for topic generation and classified to a topic.
Last successful run	Time stamp of the last time new cases were processed.
Run frequency	The cadence in which cases are processed and tagged with topics.

Automate topics to Power Virtual Agents bots

AI discovered topics in Omnichannel historical analytics are often prime candidates as topics for automation in Power Virtual Agents bots. If Power Virtual Agents is available in the region that your Customer Service organization is in, the feature can be enabled by switching the **Disabled** toggle to **Enabled**.



> **Note**
>
> Topic automation to Power Virtual Agents bot isn't available in Government Community Cloud.

Language availability for topics

The topics capability in the Omnichannel historical analytics reports comes with a natural language understanding model that can understand the text semantics and intent in the following languages:

- English
- French
- German
- Italian
- Japanese
- Portuguese
- Simplified Chinese

- Spanish

Analyze real-time customer sentiment

Article • 04/13/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making, and should not be used to make, decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using Dynamics 365 Customer Service, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

> **Note**
>
> Supervisor and agent sentiment notifications are not available in Omnichannel for Customer Service on Unified Service Desk.

Sentiment analysis settings in Omnichannel for Customer Service provide agents and supervisors with real-time insight regarding how customers are interacting with agents during chat sessions.

Sentiment analysis

To let agents and supervisors see the customer's satisfaction levels instantly while communicating with the customer, you need to enable sentiment analysis.

> **Note**
>
> Sentiment analysis is enabled by default.

Enable sentiment analysis

You can enable the sentiment analysis feature in the Customer Service admin center or Omnichannel admin center app.

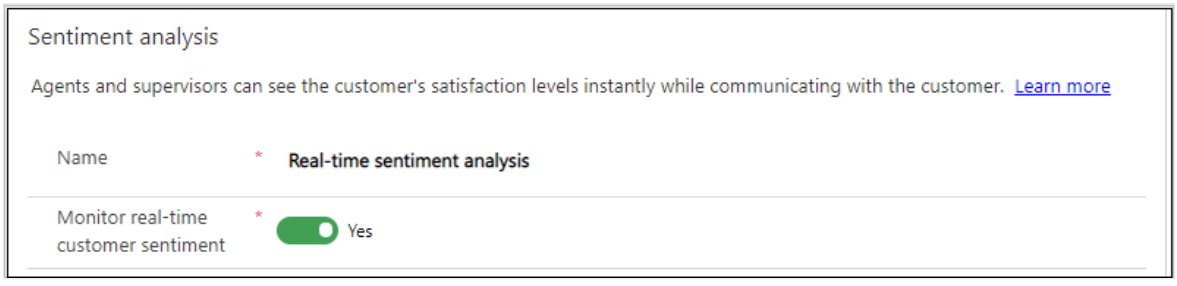
1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Insights** in **Operations**. The **Insights** page appears.
   b. In the **Sentiment analysis** section, select **Manage**.

   The **Sentiment analysis** page is displayed.

2. In the **Sentiment analysis** section, set the **Monitor real-time customer sentiment** toggle to **Yes**, and then select **Save**.



After you enable real-time customer sentiment, you can view scores in the Omnichannel Insights dashboards.

Agent settings

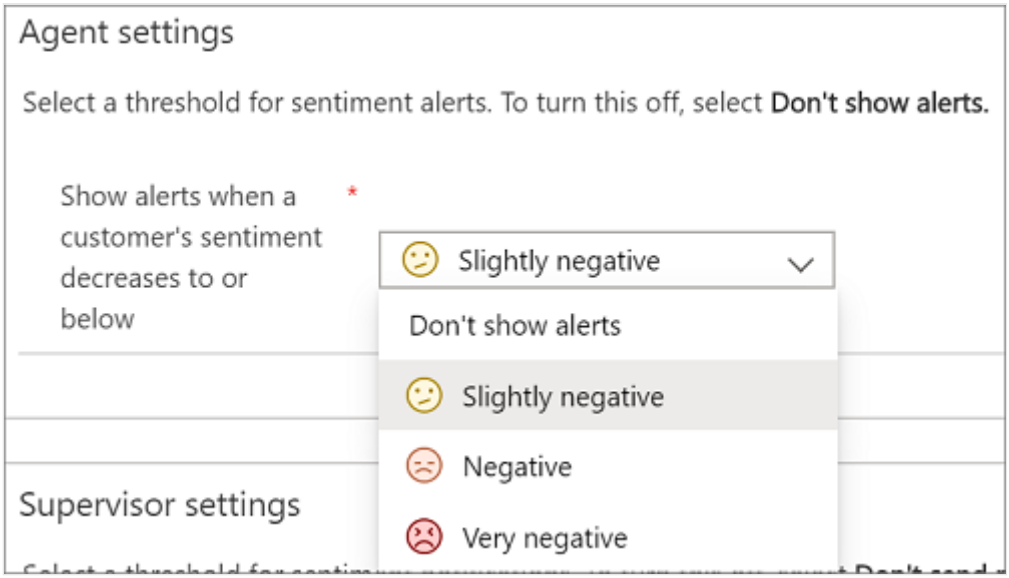
Agents can view the customer sentiment in the communication panel for a conversation session that is active and in focus. For a session that is not in focus, the alert is shown on the session panel.

You can show alerts to the agents when a customer's sentiment decreases to or below a particular value. You can set the customer's sentiment to any of the following values:

- Don't show alerts
- Slightly negative
- Negative
- Very negative

For example, you set the threshold value as **Slightly negative**. When the customer's sentiment reaches **Slightly negative** or any other sentiment value below this, an alert is displayed to the agent.

1. Navigate to the **Sentiment analysis** page.
2. In the **Agent settings** section, select a value from the **Show alerts when a customer's sentiment decreases to or below** list. The options are:
    - Don't show alerts
    - Slightly negative
    - Negative
    - Very negative



To turn off agent alerts, select **Don't show alerts**.

Supervisor settings

Supervisors can use the **Omnichannel Ongoing Conversations** dashboard to view customer sentiment in real time during conversations between customers and agents.

You can show notifications to the supervisors when a customer's sentiment decreases to a particular value or below it. The supervisor must be assigned to the queue to receive

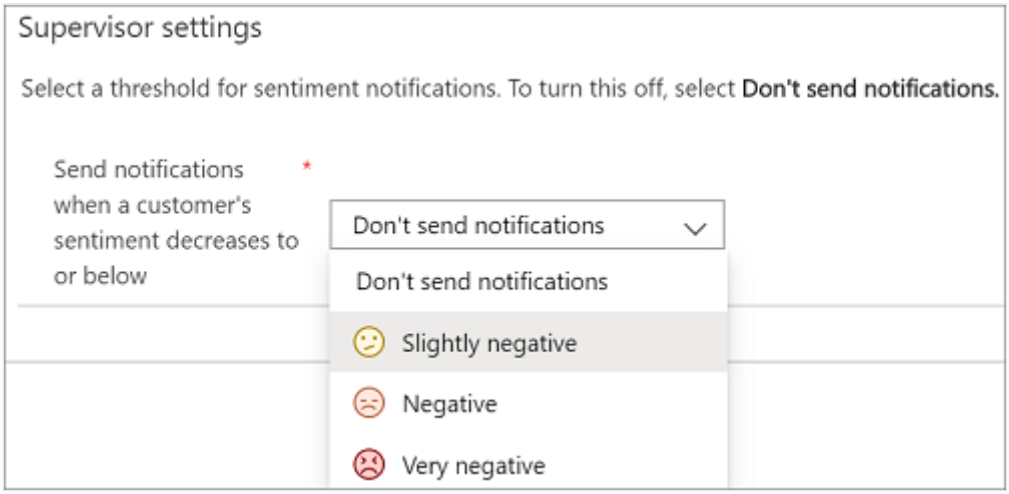
sentiment notifications.

You can set the sentiment threshold to any of the following values:

- Don't show notifications
- Slightly negative
- Negative
- Very negative

For example, you set the threshold value as **Slightly negative**. When the customer's sentiment reaches **Slightly negative** or any other sentiment value below this, a notification is displayed to the supervisor.

1. Navigate to the **Sentiment analysis** page.
2. In the **Supervisor settings** section, select a value from the **Send notifications when a customer's sentiment decreases to or below** list. The options are:
    - Don't send notifications
    - Slightly negative
    - Negative
    - Very negative



To turn off supervisor notifications, select **Don't send notifications**.

Multilingual sentiment

Multilingual sentiment scoring is enabled by default. Conversations in more than 40 languages are scored. The languages listed in the following table are supported in the analytics features.

Arabic	German	Portuguese
Bulgarian	Greek	Romanian

Chinese (Hong Kong SAR)	Hebrew	Russian
Catalan	Hindi	Serbian (Cyrillic)
Chinese Simplified	Hungarian	Serbian (Latin)
Chinese Traditional	Indonesian	Slovak
Croatian	Italian	Slovenian
Czech	Japanese	Spanish
Danish	Korean	Swedish
Dutch	Latvian	Thai
English	Lithuanian	Turkish
Estonian	Malay	Ukrainian
Finnish	Norwegian	Vietnamese
French	Polish	

> **Note**
>
> For languages supported in the product user interface (UI), see **Language availability**.

Monitor, assign, and transfer conversations

Overview of Omnichannel real-time analytics dashboard

Article • 10/19/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. It isn't intended to be used, and should **not** be used, to make decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements.
>
> Customers are solely responsible for using Dynamics 365, this feature, and any associated feature or service in compliance with all applicable laws, including laws that are related to accessing individual employee analytics, and monitoring, recording, and storing communications with users. As part of this compliance, customers must adequately notify users that their communications with agents might be monitored, recorded, or stored. As required by applicable laws, customers must also obtain consent from users before they use this feature with them. In addition, customers are encouraged to have a mechanism in place to inform their agents that their communications with users might be monitored, recorded, or stored.

In the digital contact center world, supervisors must be able to react to events by optimizing the allocation of agents in real time to provide quick support and boost customer satisfaction. Such events include an increase in the volume of incoming customer interactions, longer call lengths, and agent absenteeism. By providing visibility into overall support performance, real-time reporting helps supervisors monitor key operational metrics, make course corrections at the appropriate time, and keep service levels high.

The real-time analytics reports provide information about the health and key performance indicators (KPIs) for your organization. They reflect the current situation in the contact center as supervisors oversee agents who handle customer conversations that come in through multiple channels. You can change the visual display of the reports and save your personalized views as bookmarks.

As a supervisor, you can use the real-time analytics reports to perform these tasks:

- Monitor key operational metrics in near-real time, and make course corrections at the appropriate time to help keep service levels high.
- Review the allocation of agents in near-real time, and then optimize to provide top-notch support and boost customer satisfaction.
- Improve agent staffing, effectiveness, and utilization by reviewing the skill set and capacity profile of the agent. You can then assign or transfer ongoing conversations by filtering through queue or agent.
- Monitor ongoing conversations, track customer sentiment, and intervene as required.
- Drill down to a specific channel, queue, or agent as required, to gain key operational insights in real time and take necessary action.

> **Note**
>
> The reports include conversations that were handled only by agents. They also include conversations that were escalated by the Power Virtual Agents bots. However, they don't include conversations that were resolved by Power Virtual Agents bots.

Security roles and permissions

Real-time analytics takes advantage of the security permissions that are defined in Dataverse. For example, if your organization has set business unit–level permissions for you, only metrics that are computed based on business unit–level data are shown to you.

As a supervisor, you can view the **Omnichannel real-time analytics** dashboard in Customer Service workspace. However, your administrator must enable the required permissions for you. Learn how to configure user roles to access analytics and dashboards.

> **Note**

If different values are shown to different users in the metrics, you must investigate the permissions for those users.

Access reports

You can view the different reports in the Customer Service workspace app. In the default view of Customer Service workspace, select **Omnichannel real-time analytics** in **Service**. By default, the **Summary** report is shown. To view the **Ongoing conversation**, **Agents**, and **Voice** reports, select the appropriate tabs.

If you can't view the reports, contact your system administrator. For more information, go to Manage real-time analytics reports in Omnichannel for Customer Service.

Dashboard details

The **Omnichannel real-time analytics** dashboard consists of the following reports:

- **Summary**: This report provides an overview of your organization in real time. It provides KPIs across the volume of customer interactions and service levels, together with the available capacity in real time. Learn more about the Summary report.
- **Voice**: This report provides an overview of conversations for the Omnichannel for Customer Service voice channel. Learn more about the Voice report.
- **Agents**: This report provides an overview of the health and KPIs of agents in your organization. The information that is shown on this report is based on the conversations. Learn more about the Agents report.
- **Ongoing conversation**: This report provides information about the conversations that agents are handling that are in active, open, wrap-up, or waiting status. Use it to monitor, assign, transfer, and forcibly close conversations for an agent, after reviewing their skill set and capacity profiles. Learn more about the Ongoing conversation report.

Filter information displayed on dashboard

Use the filters to drill down to KPIs across the dashboard. Adjust the filters based on the insights that you're looking for. The available filters include **Time**, **Agent**, **Channels**, **Queue**, **Time zone**, and **Conversation status**.

For example, the dropdown list for the **Time** filter includes the following options:

- **Include open conversations**: Show all conversations that started in the last 24 hours, and conversations that started in the last three days and are still open.
- **Last 24 hrs**: Show all conversations that started in the last 24 hours.
- **Today**: Shows all conversations that started on the current date in the selected time zone.

Pause updates on report data

Report data is automatically updated in real time for all the reports except the **Ongoing conversation** report. The report data on that report must be manually updated. You can use the **Pause updates** option to view and analyze real-time metrics at any point in time. To resume automatic updates of the report data, select **Resume updates**.

View and understand the Summary report in Omnichannel real-time analytics

Article • 10/19/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

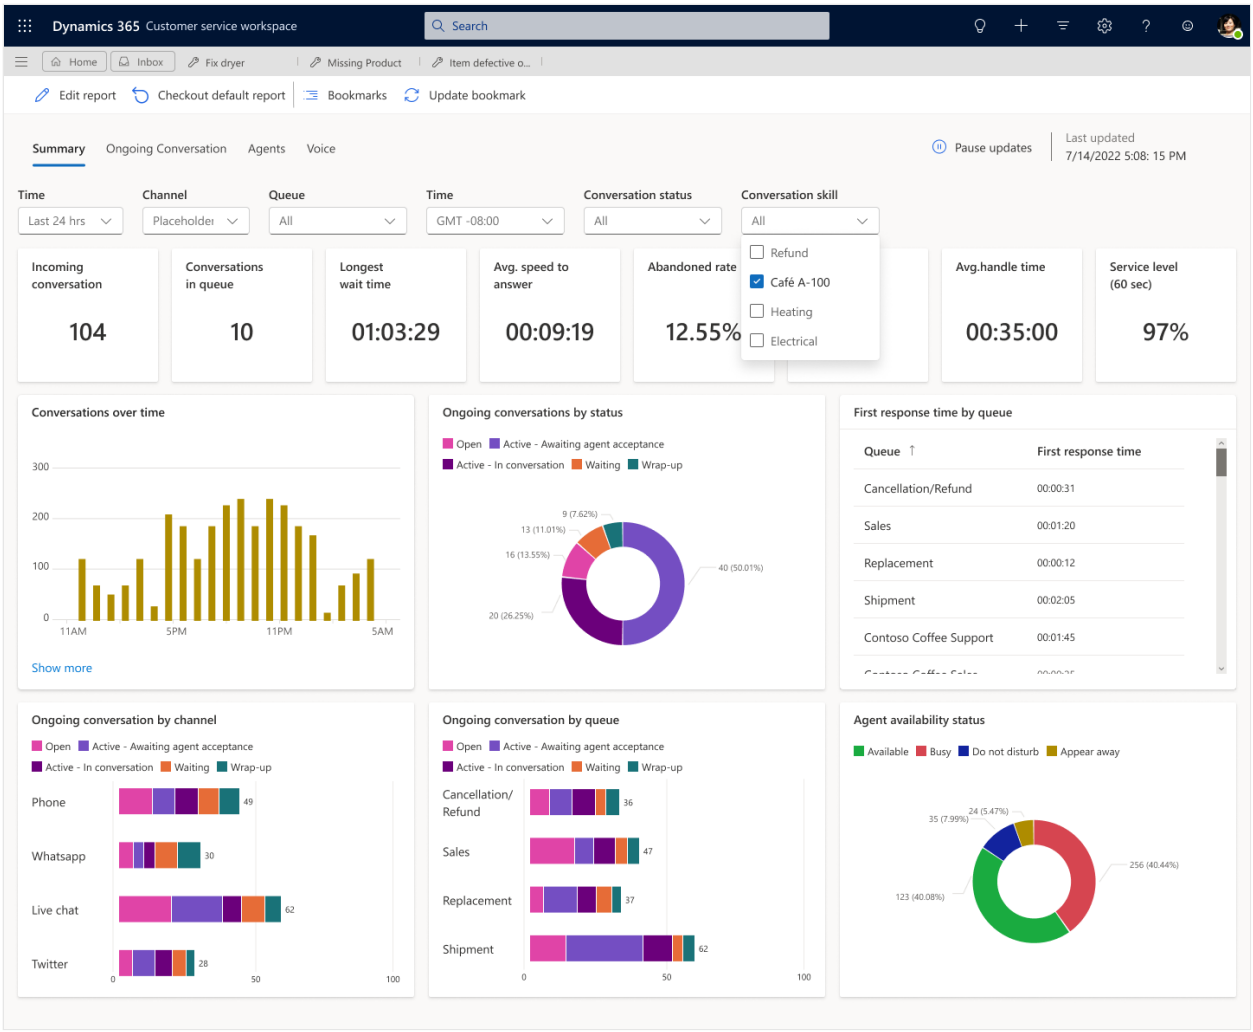
The **Summary** report appears by default when you open the **Omnichannel real-time analytics** dashboard in Customer Service workspace. You can filter this report by time, channels, queue, time zone, conversation status, and skills. For more information, go to Overview of the real-time Omnichannel analytics dashboard.

The **Summary** report provides a summary of customer conversations over time, by channel or queue. Statistics about the channel that a conversation came in through can help you analyze and manage queue distribution. For example, a high rate of abandoned conversations can lead to decreased customer satisfaction. To address the rate of abandoned conversations, you can examine operational metrics such as agent availability and queue distribution in real time.

Additionally, you can track customer sentiment to analyze whether customers are getting adequate support. For example, a high average handle time might indicate that agents are taking more than the required time to resolve customer issues. Depending on the issue, you can provide the required training or support to help agents resolve customer issues faster.

By editing the visual display, you can add metrics to the ones that are already shown on the **Summary** report. For more information, go to Customize visual display.

Learn more about the metrics that are shown on the Summary report.



Interactive charts

You can view different types of charts on the report, such as bar, horizontal bar, and donut charts. The visual display helps you discern changes and patterns in the data, so that you can act quickly to address the most important issues.

When you select a component in a chart, the data is filtered accordingly. In this way, you can view only data that is related to the selected component. For example, if you select the **Busy** component in the **Agent availability status** chart, the dashboard is refreshed and shows only the agents who are currently in the **Busy** state.

Drill-down reports

Drill down to sections of a report to find the data that interests you the most. This section provides details about the two drill-down reports that you can view on the **Summary** report.

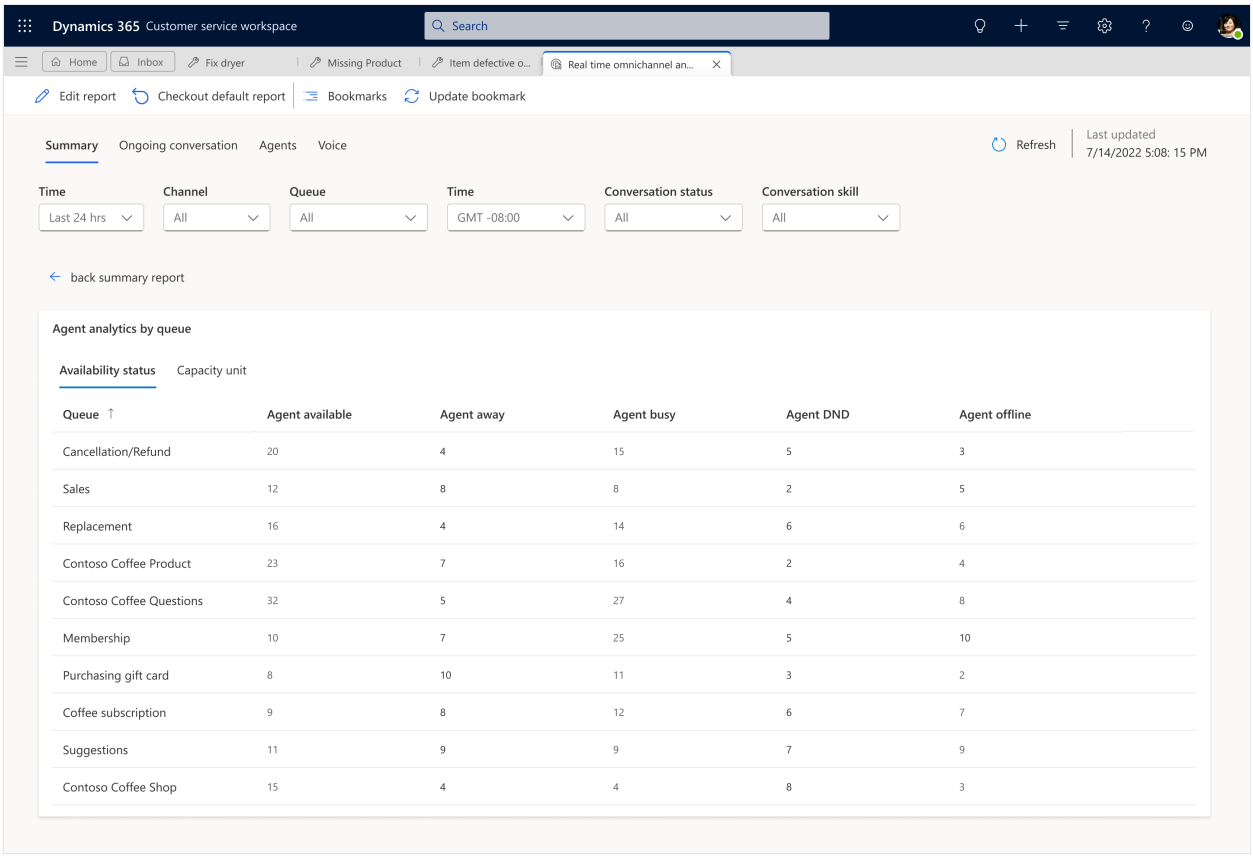
Conversations over time drill-down report

To view conversation analytics, select the **Show more** link on the **Conversations over time** KPI. You can drill through the conversations over time and analyze data by selecting the **Channel** or **Queue** tab.

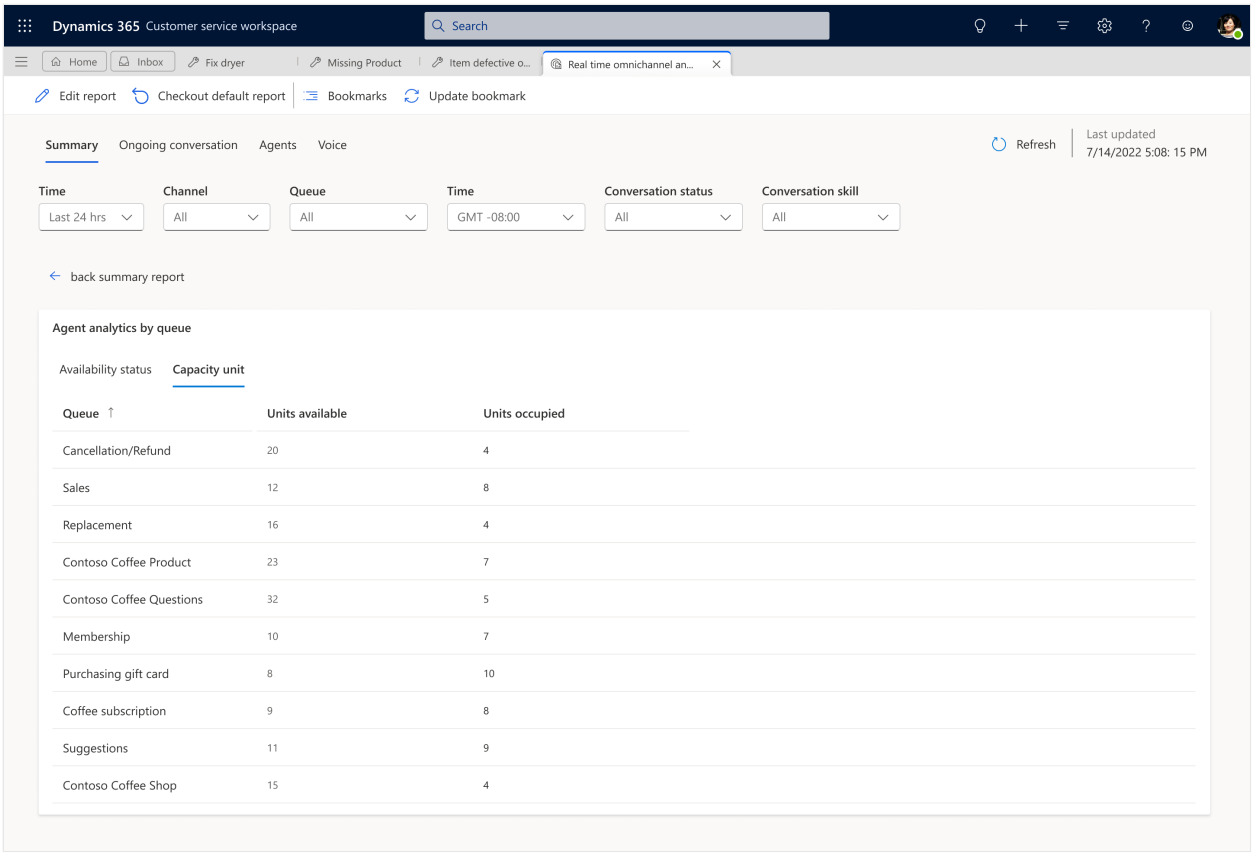
Agent availability status drill-down report

To view more details about agent analytics by queue, select the **Show more** link on the **Agent availability status** KPI. You can drill through agent analytics by:

Availability status



Capacity unit



These tabs will help you effectively manage agent activity in real time.

View and understand the Voice report in Omnichannel real-time analytics

Article • 10/19/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

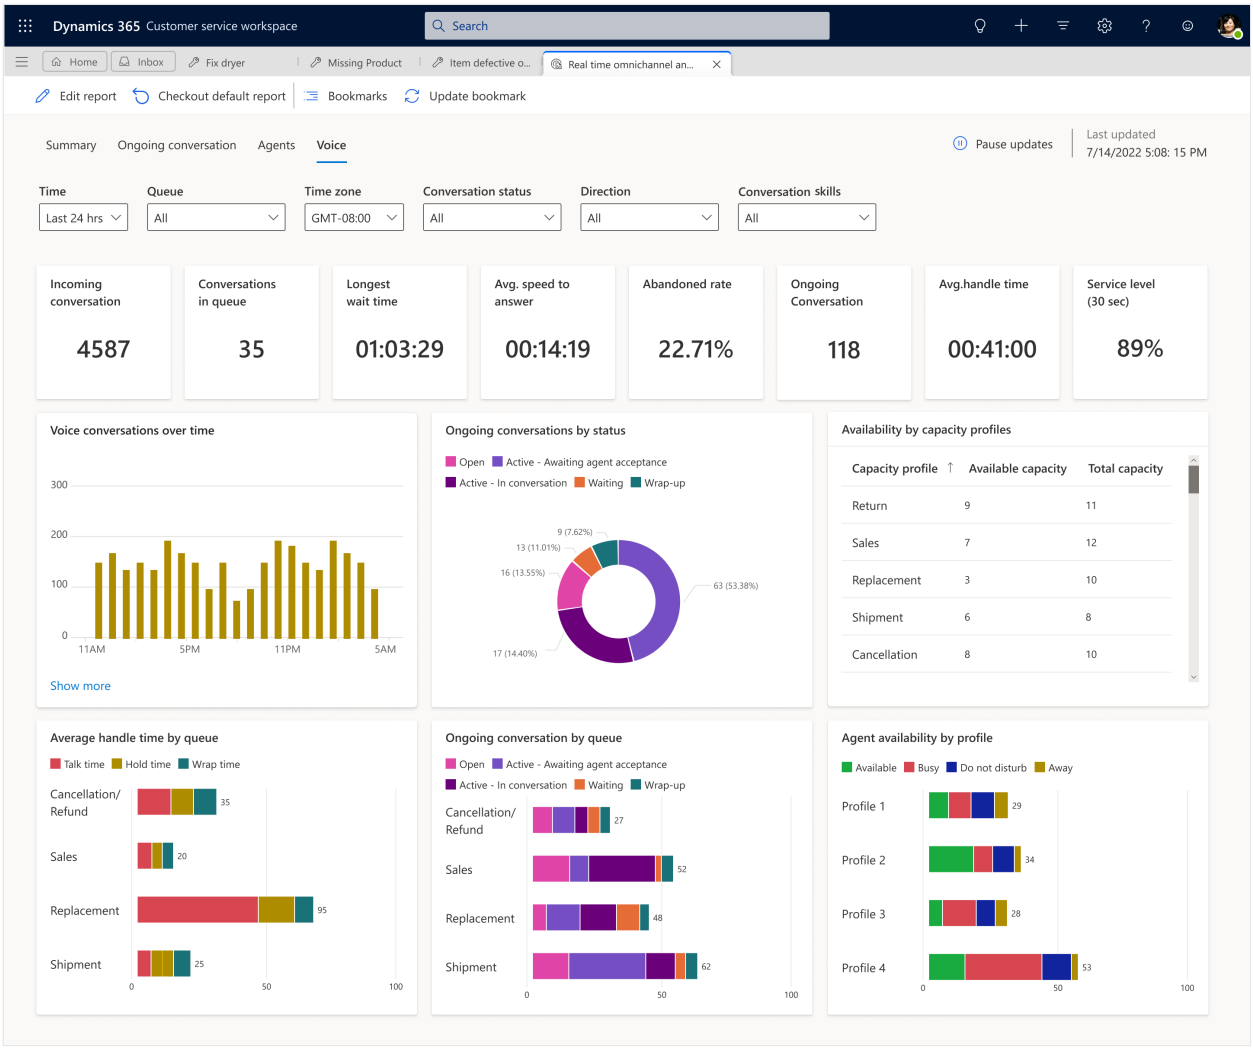
The **Voice** report gives you insights into key metrics across the voice channel. You can filter this report by time, queue, time zone, conversation status, direction, and skills. For more information, go to Overview of the real-time Omnichannel analytics dashboard.

This report is available only if the voice feature is configured for your organization. For more information, go to Manage real-time analytics reports in Omnichannel for Customer Service.

The **Voice** report provides a summary of voice conversations over time, by queue. Voice-specific metrics for the last 24 hours, such as conversations in the queue, average wait time, and average handle time, help you optimize the call flow. You can use these metrics to reduce the conversation hold time. You can assign the right agents based on skills and increase agent efficiency and customer satisfaction.

You can also monitor voice-specific operational metrics such as conversation direction. This metric indicates whether the conversation was started by the customer or a contact center agent. You can use these operational metrics to manage queue distribution.

Learn more about the metrics that are shown in the charts on the Voice report.



Interactive charts

You can view different types of charts on the report, such as bar, horizontal bar, and donut charts. The visual display helps you discern changes and patterns in the data, so that you can act quickly to address the most important issues.

When you select a component in a chart, the data is filtered accordingly. In this way, you can view only data that is related to the selected component. For example, if you select the **Busy** component in the **Agent availability status** chart, the dashboard is refreshed and shows only the agents who are currently in the **Busy** state.

Drill-down report

Drill down to sections of a report to find the data that interests you the most. To view voice conversation analytics, select the **Show more** link on the **Voice conversations over time** KPI. You can drill through voice conversations analytics and analyze data by queue.

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

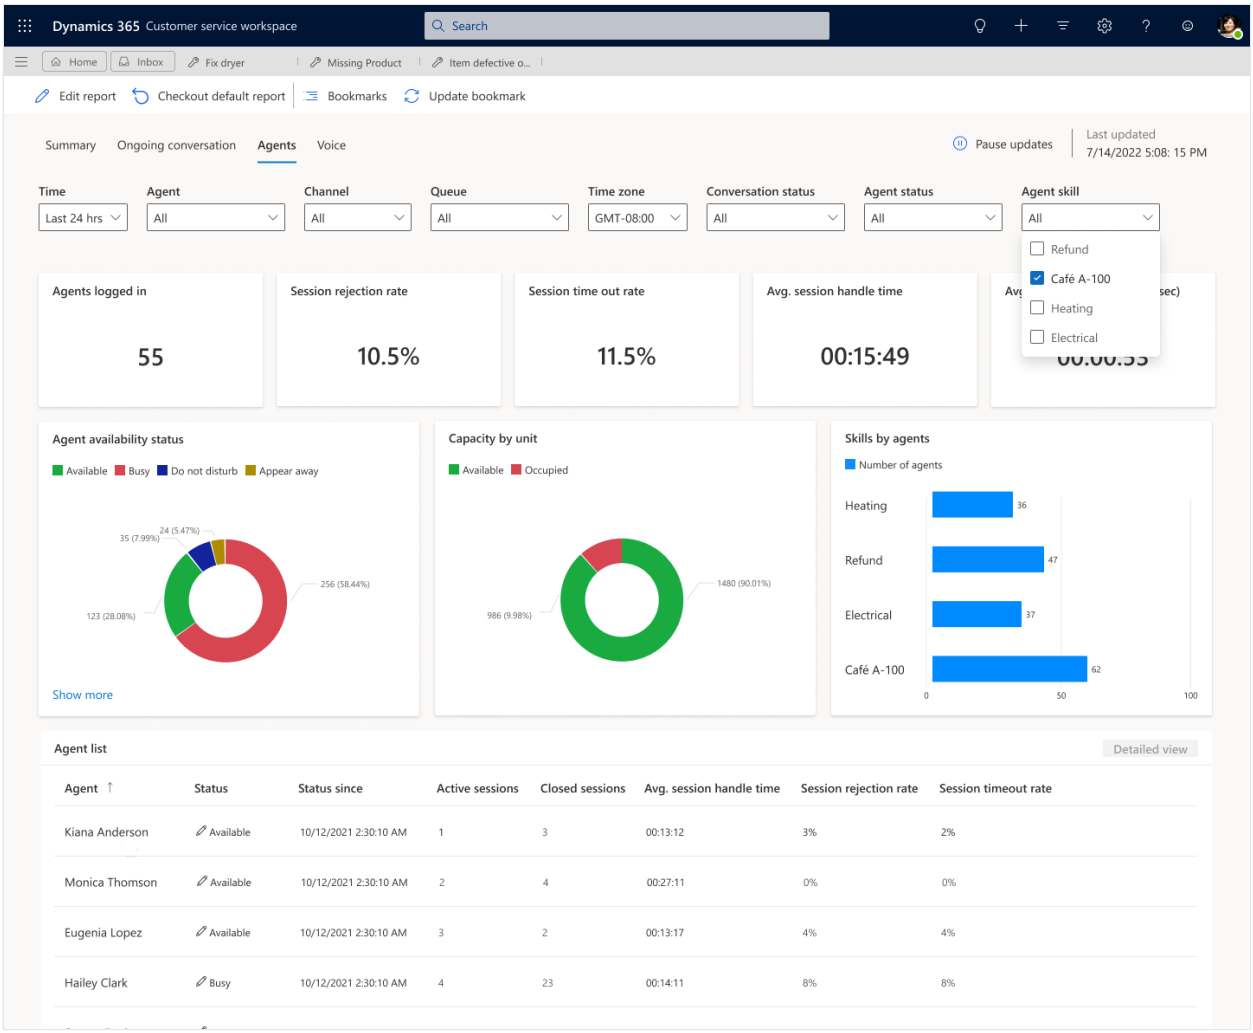
The **Agents** report consists of metrics that provide an overview of agent performance to help contact center managers optimize agent allocation in real time. This capability is crucial for ensuring that customers receive the best possible support.

The **Agents** report provides information about agent capacity and status for the last 24 hours. By drilling down to view details such as capacity at each agent level, you can quickly identify and allocate resources to address any staffing shortages. In this way, you help ensure that customers receive support when they need it.

You can also sort agents by skills by using the **Skills** filter. In the Agent list section, when you hover over an agent name, the skill set and proficiency of the agent appears. You can review the skills and then assign the best agent required to solve the issue at hand.

You can select the **All** filter to view agent performance across all channels. Alternatively, you can select a channel to view channel-specific agent performance. You can also filter areas by time, queue, time zone, and conversation status. For more information, go to Overview of Omnichannel Real-time analytics dashboards.

Learn more about the metrics that are shown on the Agents report.



Interactive charts

You can view different types of charts on the report, such as donut charts. The visual display helps you discern changes and patterns in the data, so that you can act quickly to address the most important issues.

When you select a component in a chart, the data is filtered accordingly. In this way, you can view only data that is related to the selected component. For example, if you select the **Busy** component in the **Agent availability status** chart, the dashboard is refreshed and shows only the agents who are currently in the **Busy** state.

Agent details drill-down

> **Note**
>
> If you don't see all the listed agents from the report as logged in, work with your administrator to make sure your agents have the **Omnichannel agent** role, or that custom roles have the **Read** privilege on the msdyn_agentstatus entity reference.

You can drill down from the **Agent list** section on the dashboard to key metrics about agent details and view specific insights about individual agents' performance. Select an agent name in the **Agent list** grid, and then select **Detailed view**. Agent details are shown on a new page.

On the agent details page, you can view agent skills by proficiency, and agent availability by units and capacity profiles.

You can drill down further through **Conversations** and track how a conversation progressed and the customer sentiment that is associated with it. Through **Agent presence history**, you can view agent presence in real time.

Learn more about the metrics in the Agent list grid and on the agent details page.

View and understand the Ongoing conversation report in Omnichannel real-time analytics

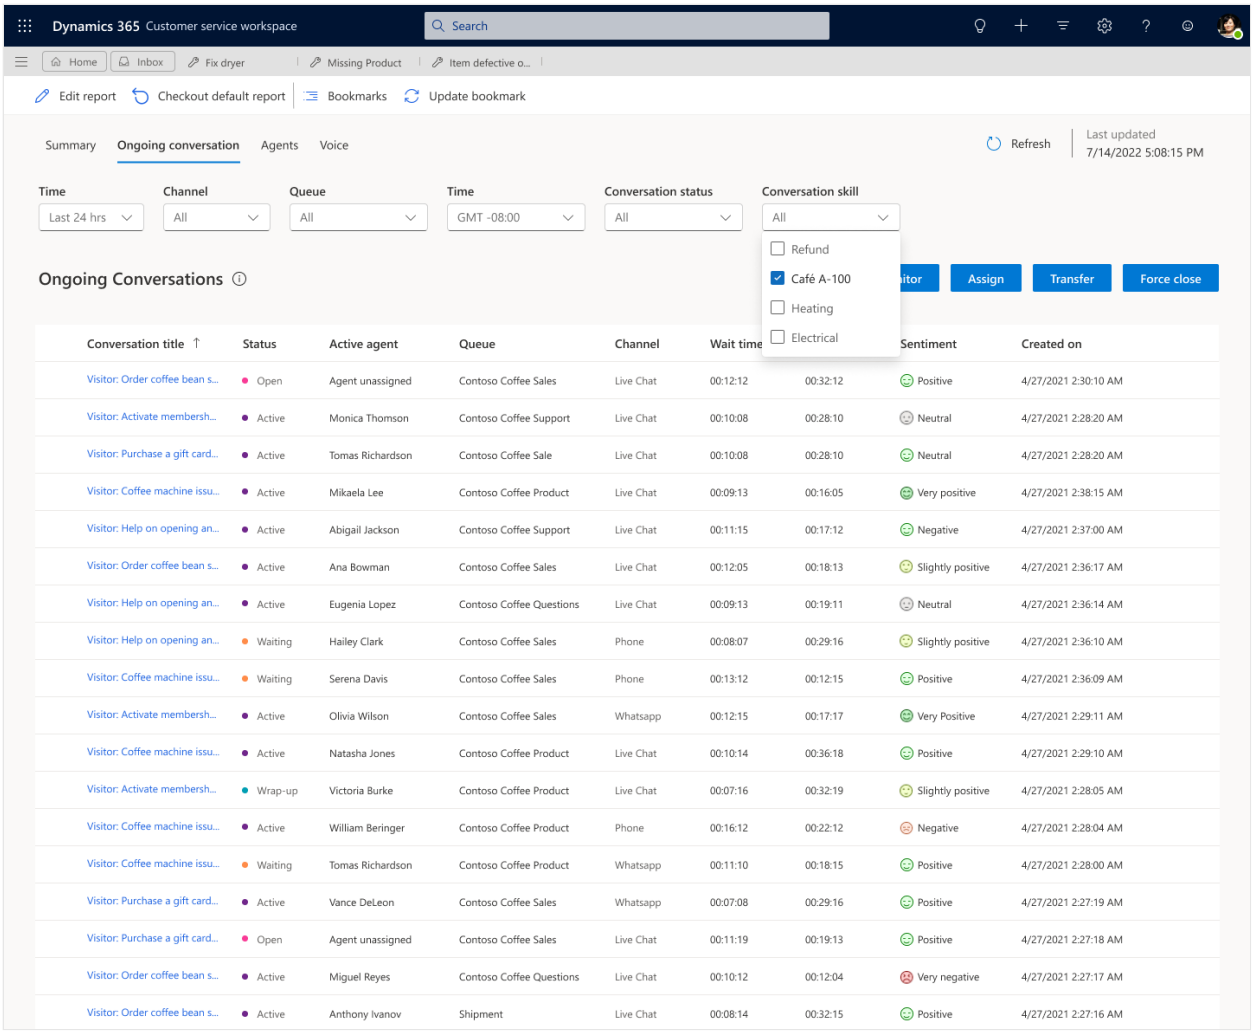
Article • 10/19/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

The **Ongoing conversation** report provides information about the status of conversations that are currently being handled by agents in your organization, and that aren't yet closed. The conversation status can be open, active, wrap-up, or waiting.

This report provides a holistic view of the conversations in real time. It includes details such as the subject, status, active agent details, queue, channel, wait time, handle time, and customer sentiment. For more information, go to Overview of Omnichannel real-time analytics dashboards.

Learn more about the metrics that are shown on the Ongoing conversation report.



The conversation list shows current ongoing conversations from the last 24 hours. Therefore, managers have a real-time view of the interactions between agents and customers. You can also select an agent and then use the following buttons to perform different actions on conversations:

- **Assign**: Assign an incoming or unassigned conversation filtered by either a queue or an agent, after reviewing the skill set and capacity profile of agents.
- **Transfer**: Transfer an ongoing conversation from one agent to another after reviewing the skill set and capacity profile of an agent.
- **Monitor**: Listen to an ongoing conversation. When you select **Monitor**, you receive a message that states that monitoring has begun. This action is applicable only to active conversations with agent acceptance, conversations that are in a wrap-up state, and conversations that are in a waiting state.
- **Force close**: Forcibly close a conversation by closing the work item. When you select **Force close**, a confirmation message box appears. You must select **Proceed** to close the work item. When you forcibly close a conversation, the conversation immediately ends for the customer too. We recommend that you use this action with caution.

Customer Service dashboards

Article • 03/31/2023

The insights dashboards for Customer Service contain various charts and metrics to help you understand the factors that can improve customer service for your organization. Key performance indicators and visual breakdowns of your organization's support cases are coupled with AI-generated insights on cases and topics that contribute to overall trends.

The Customer Service dashboards give you a performance summary and detailed reports on cases, agents, and topics. You can make changes to the visual display of the dashboards and also save your personalized views as bookmarks.

Manage dashboards

To manage the dashboards, go to: Manage historical analytics reports in Customer Service.

Customer Service historical analytics reports

The following dashboard reports are available for Customer Service historical analytics:

Summary

The Summary dashboard gives you a broad overview of the customer service experience in your organization. It uses AI technology to show you topics that are generating the highest volume and emerging topics with the highest rate of change in volume. More information: Summary dashboard

Agent

The Agent dashboard shows charts and KPIs for individual agents and overall agent performance. More information: Agent dashboard

Case Topics

The Case Topics dashboard shows a detailed breakdown of cases and their assigned topics. More information: Topics dashboard

Information that you need to know about the analytics reports

About this report

About this report is a link that you can select to view the corresponding documentation.

Reports refresh, data retention

The reports refresh shows the following information.

- **Data refresh:** Occurs every 24 hours. The reports are available during the refresh process. The **Last updated** timestamp in the report pages indicates when the latest data was included in the report, and the time reflects the time zone that's set in your user preferences.
- **Custom refresh:** Isn't available.
- **Data refresh for inactive environments:** Data refresh is paused if the reports aren't used continuously for two weeks. When you access a report after a lengthy period of inactivity, the report will be refreshed in the next refresh cycle.
- **Data retention:** Data is stored for 24 months.

Supported tables

The following tables are used for Customer Service historical analytics:

- incident
- incidentresolution
- appmodule
- organization
- msfp_surveyresponse
- msfp_question
- msfp_questionresponse
- msdyn_casetopic
- msdyn_casetopic_incident
- msdyn_casetopicsetting
- Queue
- QueueItem
- Subject
- SystemUser

> **Note**
>
> A report might be blank if you've customized any of the listed entities or are using out-of-the-box entities.

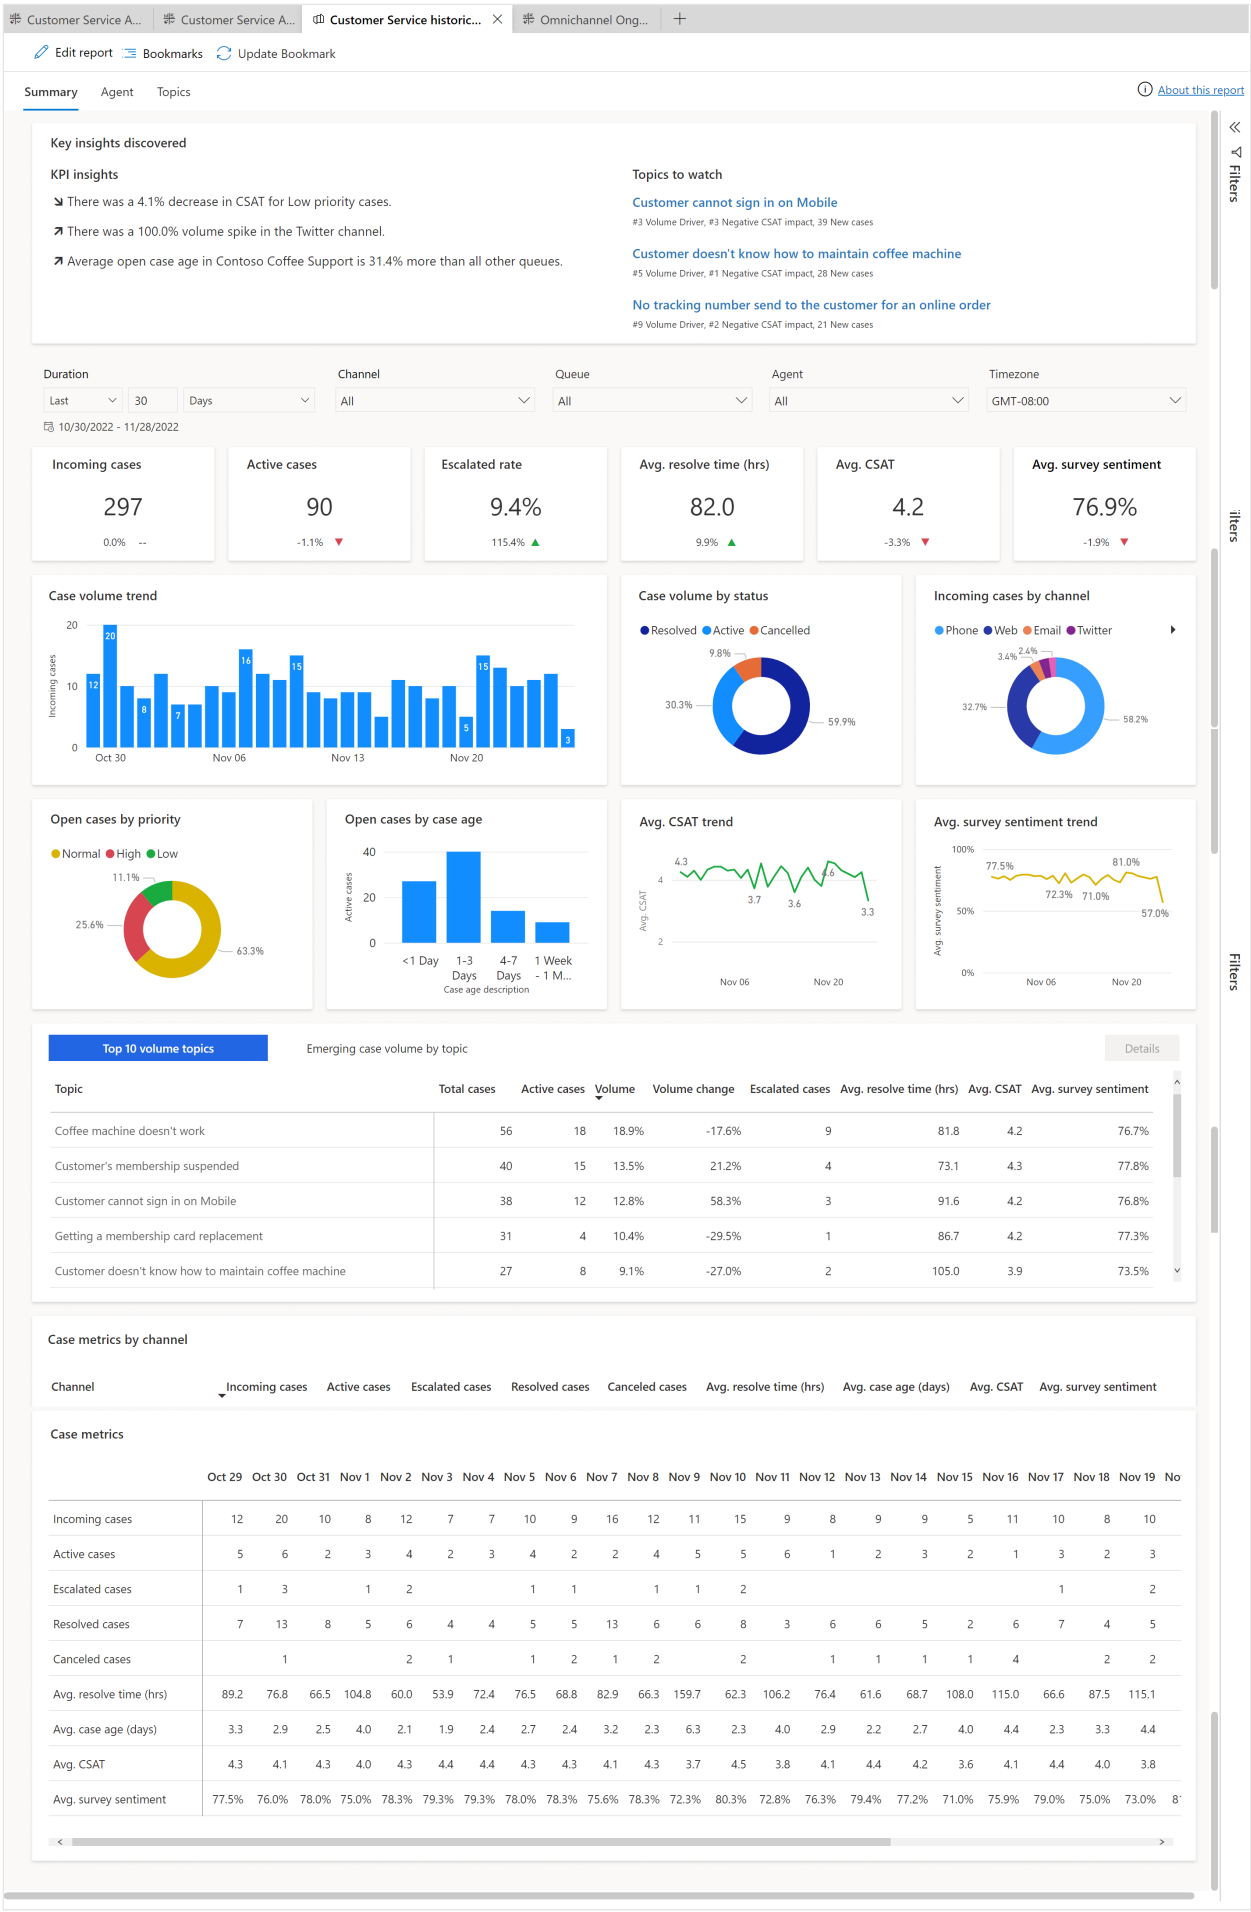
Summary dashboard

Article • 12/10/2022

The Summary dashboard gives you a broad overview of the customer service experience in your organization. It uses AI to provide insights into topics that are generating the highest volume and which topics that are emerging with the highest rate of change in volume.

The summary dashboard includes a variety of charts with graphical views of key performance indicators in Customer Service.



The case volume drivers and emerging case volume by topic charts use natural language understanding to group support cases as topics that are a collection of related cases.

These charts show you the customer support topics that are generating the most volume and emerging topics with the highest rate of change in volume, helping you identify areas for improvement that can have the greatest impact on system performance.

By default, the dashboard shows you KPIs for the past month and for all channels, queues, and agents in your system. The data filtering options allow you to select data for specific time periods, channels, queues, and agents. To filter data by duration, channel, queue, or agent, select a value from the respective dropdown list.

> ⓘ **Note**
>
> If you switch to a different dashboard, the filter you specify persists and is applied to the data on all dashboards.

Access the Summary dashboard

In the Customer Service workspace or Omnichannel for Customer Service app, do one of the following to view the dashboard:

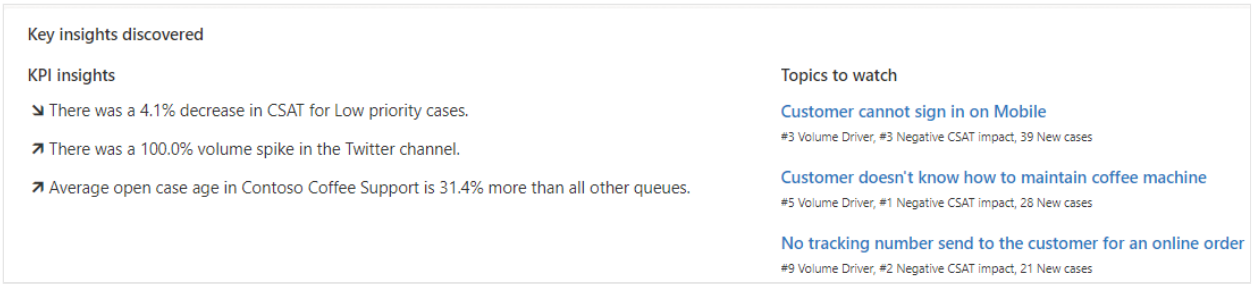
- In the default view, select the plus (+) icon, and then select **Customer Service historical analytics**.
- If the enhanced multisession workspace view is enabled, select the site map and then select **Customer Service historical analytics**.

On the page that appears, select the dashboard.

Key Insights discovered

The Key Insights discovered section has two areas:

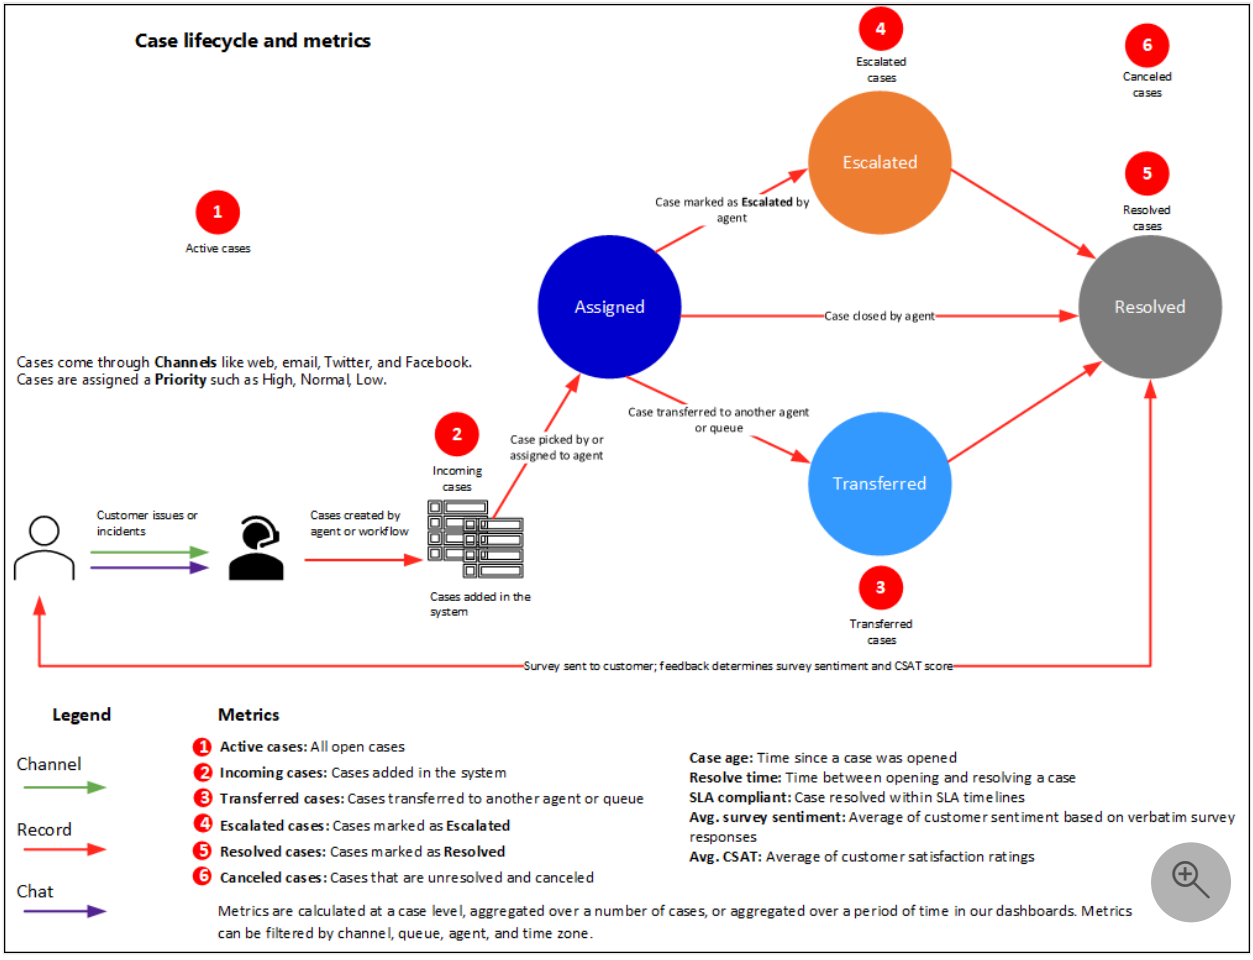
- **KPI insights**: Important subjects that impact performance, such as CSAT pertaining to priority, volume pertaining to channel, and open cases pertaining to queues.
- **Topics to watch**: Topics that rank high across the three key areas to make it easier for customer service managers to discover top issues.



Report details

The KPI summary charts summarize the key performance indicators for the specified time period and the percent change over the period. You can filter these areas by duration, channel, queue, and agent.

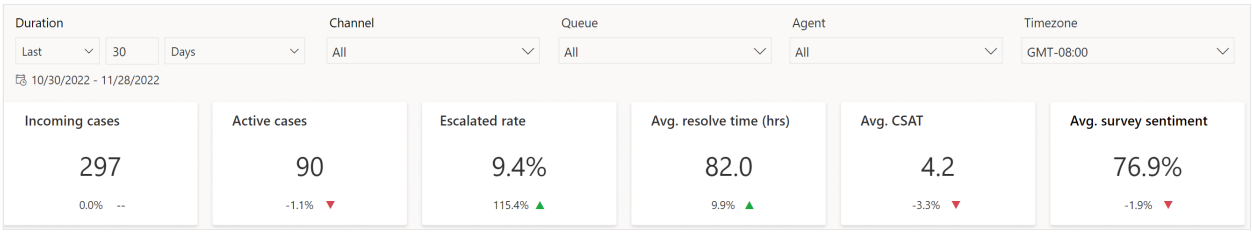
The case lifecycle and the metrics that can be derived in the different statuses is represented in the following diagram.



The following table shows the key performance indicators that are displayed in the report.

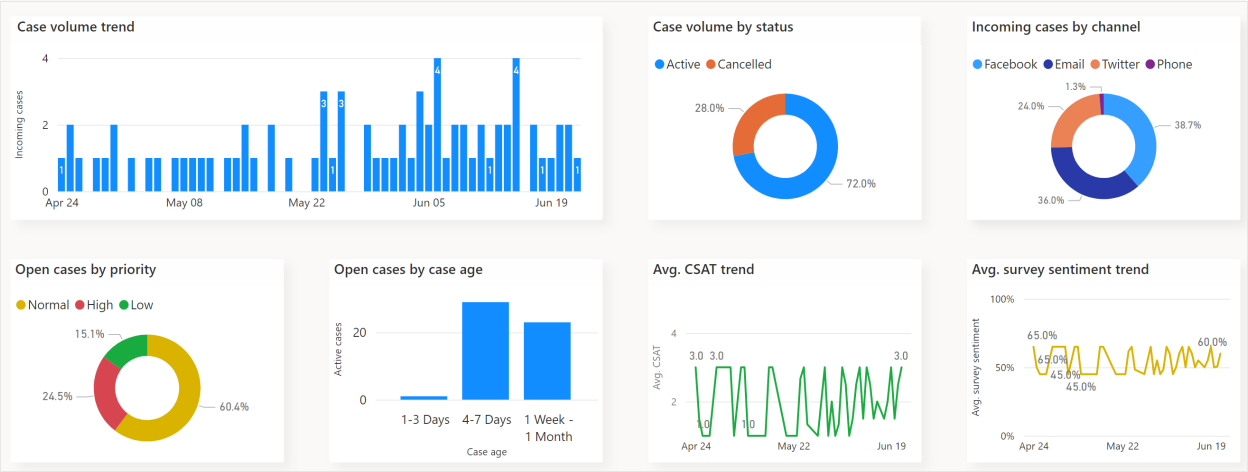
KPI	Description
Incoming cases	The number of cases created to support customers.

KPI	Description
Active cases	The number of cases that are currently open.
Escalated rate	The percentage of cases that have been escalated.
Avg. resolve time (hrs)	The average length of time taken by an agent to resolve the case.
Avg. CSAT	The average customer satisfaction score, based on Customer Voice survey submitted by the customer.
Avg. survey sentiment	The average sentiment score, based on Customer Voice survey written feedback submitted by the customer.



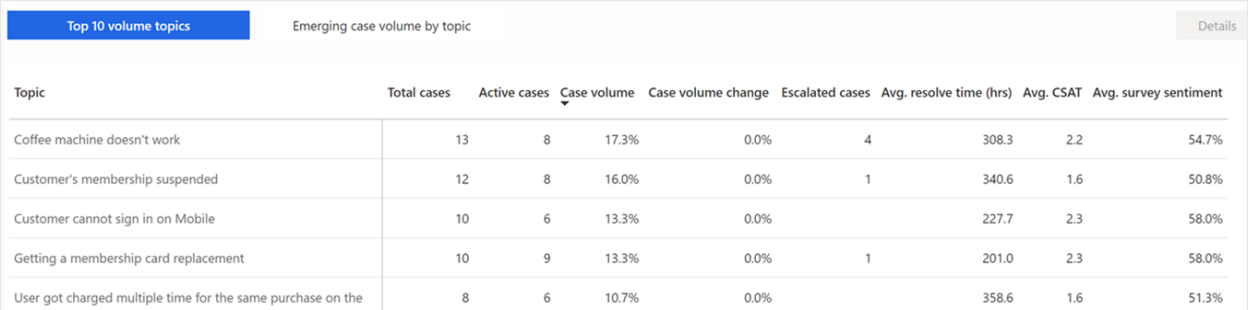
The following metrics are displayed in the charts.

Chart	Description
Case volume by status	A breakdown of case volume by status.
Open cases by priority	A case breakdown by priority level.
Incoming cases by channel	A case breakdown by channel.
Open cases by case age	A breakdown of cases by the amount of time in an open state.
Avg. CSAT trend	The year-over-year trend of case volume.
Avg. survey sentiment trend	The year-over-year trend of CSAT from Customer Voice survey responses.



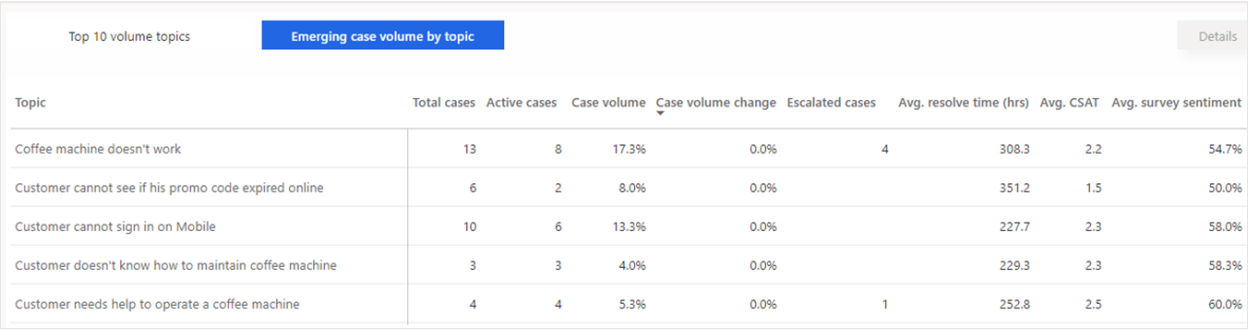
A blue up-and-down indicator next to the value indicates the percent change in a positive direction. A red indicator indicates the percent change in a negative direction.

On the **Top 10 volume topics** tab, you can view the top 10 AI-discovered topics by case volume.



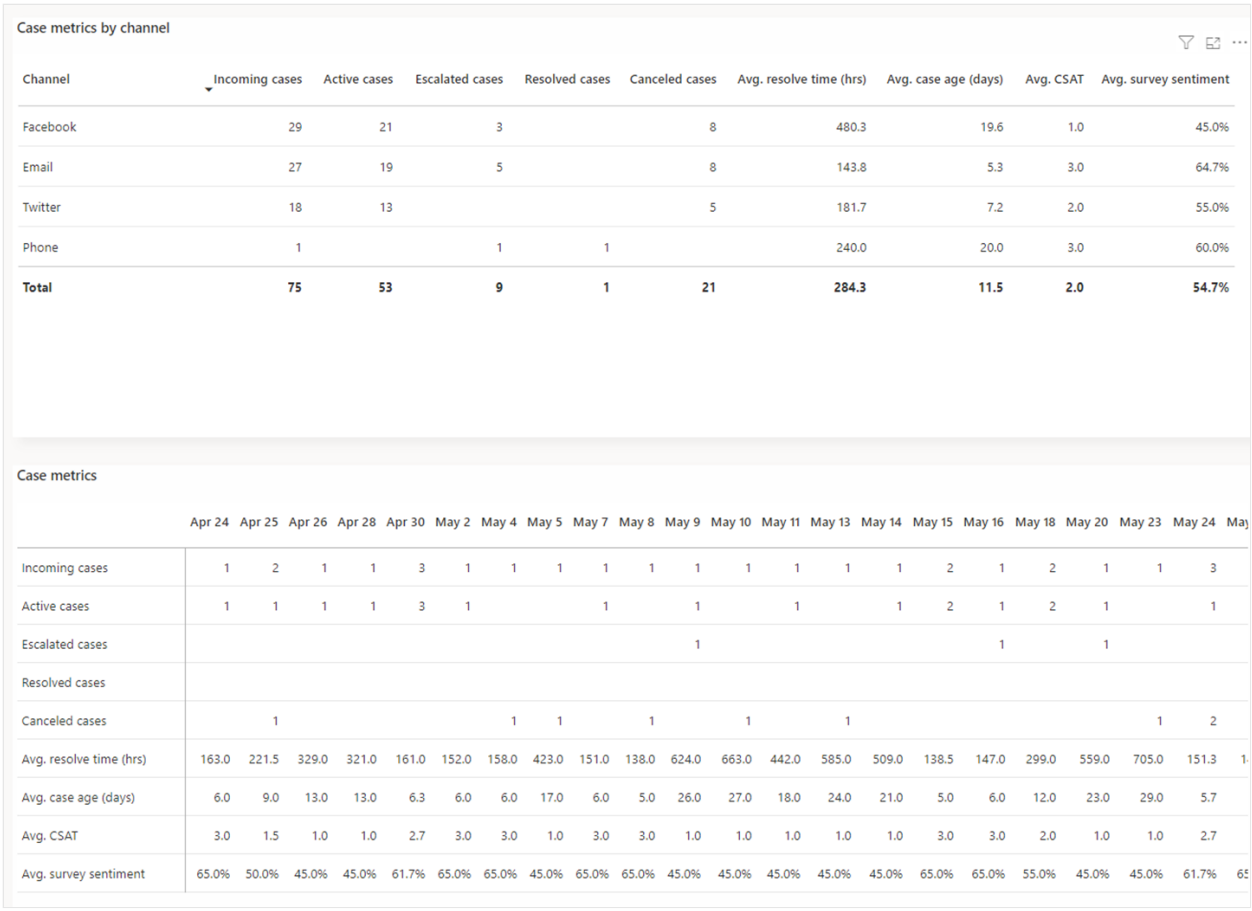
Topic	Total cases	Active cases	Case volume	Case volume change	Escalated cases	Avg. resolve time (hrs)	Avg. CSAT	Avg. survey sentiment
Coffee machine doesn't work	13	8	17.3%	0.0%	4	308.3	2.2	54.7%
Customer's membership suspended	12	8	16.0%	0.0%	1	340.6	1.6	50.8%
Customer cannot sign in on Mobile	10	6	13.3%	0.0%		227.7	2.3	58.0%
Getting a membership card replacement	10	9	13.3%	0.0%	1	201.0	2.3	58.0%
User got charged multiple time for the same purchase on the	8	6	10.7%	0.0%		358.6	1.6	51.3%

On the **Emerging case volume by topic** tab, you can view the the top emerging AI discovered topics based on increase in case volume.



Topic	Total cases	Active cases	Case volume	Case volume change	Escalated cases	Avg. resolve time (hrs)	Avg. CSAT	Avg. survey sentiment
Coffee machine doesn't work	13	8	17.3%	0.0%	4	308.3	2.2	54.7%
Customer cannot see if his promo code expired online	6	2	8.0%	0.0%		351.2	1.5	50.0%
Customer cannot sign in on Mobile	10	6	13.3%	0.0%		227.7	2.3	58.0%
Customer doesn't know how to maintain coffee machine	3	3	4.0%	0.0%		229.3	2.3	58.3%
Customer needs help to operate a coffee machine	4	4	5.3%	0.0%	1	252.8	2.5	60.0%

You can view the core case metrics by channel or core case metrics in relation to other metrics and date.



Case metrics by channel

Channel	Incoming cases	Active cases	Escalated cases	Resolved cases	Canceled cases	Avg. resolve time (hrs)	Avg. case age (days)	Avg. CSAT	Avg. survey sentiment

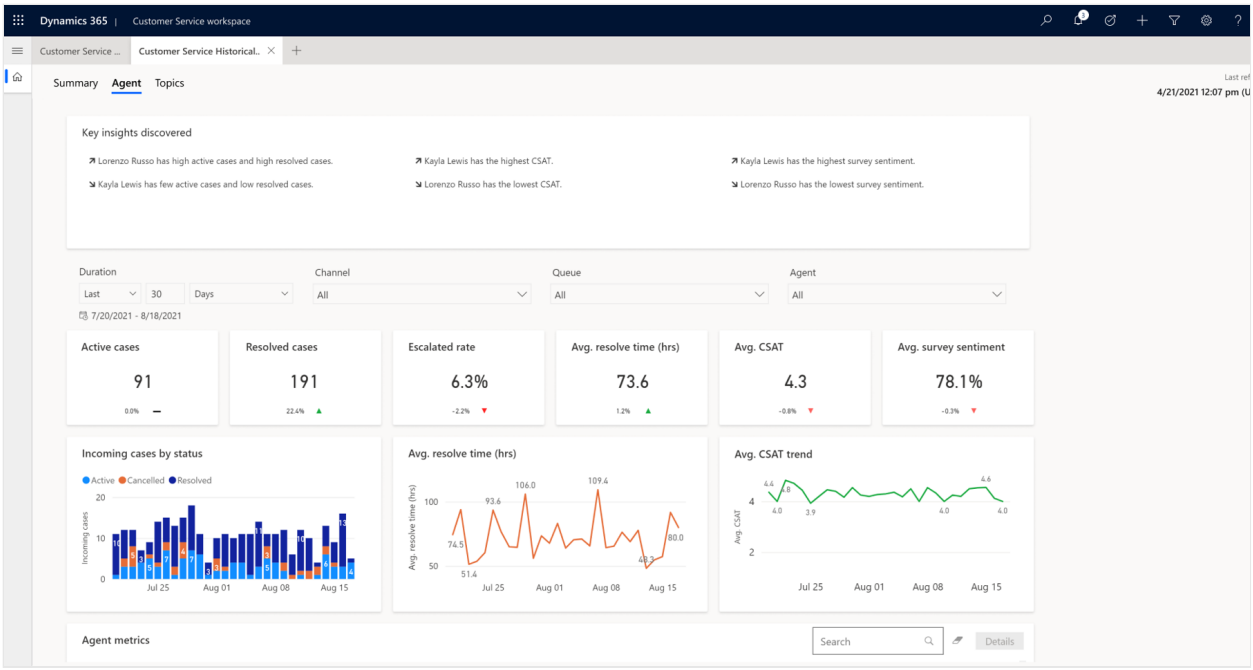
Agent dashboard in historical analytics

Article • 10/12/2022

> **Important**
>
> This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making, and should not be used to make, decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using Dynamics 365 Customer Service, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

The Agent dashboard shows charts and KPIs that you can use to guide agents and understand overall agent performance.

To view the Agent dashboard, go to Customer Service historical analytics and select **Agent** at the top of the workspace. The dashboard shows charts and KPIs for individual agents and overall agent performance, and includes the following insights:



Access the Agent dashboard

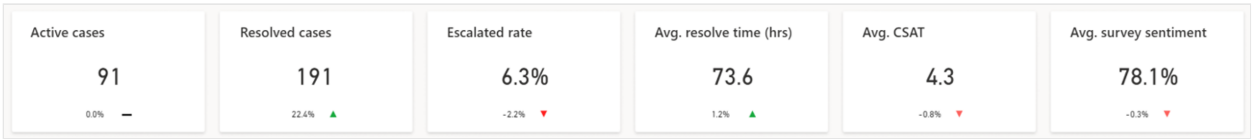
In the Customer Service workspace or Omnichannel for Customer Service app, do one of the following to view the dashboard:

- In the default view, select the plus (+) icon, and then select **Customer Service historical analytics**.
- If the enhanced multisession workspace view is enabled, select the site map and then select **Customer Service historical analytics**.

On the page that appears, select the dashboard.

Report details

The reports summarize the key performance indicators for the specified time period and the percent change over the period. You can filter these areas by duration, channel, queue, agent conversation and timezone. The KPIs for the dashboard are displayed as seen in the following screenshot.



The following table displays the key performance indicators in the agent report.

KPI	Description
Active cases	The number of cases that are currently open.

KPI	Description
Resolved cases	The number of cases that have been closed by an agent.
Escalated cases	The percentage of cases that have been escalated.
Average resolve time	The average time taken by an agent to resolve the case.
Average CSAT	The average customer satisfaction score, based on written feedback submitted by the customer in the Customer Voice survey.
Average survey sentiment	The average sentiment score, based on written feedback submitted by the customer in the Customer Voice survey.

The agent dashboard has charts that have the following metrics.

KPI	Description
Case volume over duration	Day-over-day trend of case volume.
Average resolve time	Month-over-month trend of case resolution time in minutes.
CSAT and survey sentiment by agent	Agent-focused view comparing CSAT and sentiment from Customer Voice survey responses.
Agent metrics	Overview of core agent metrics in relation to other metrics and date.

Agent drill down view

The Agent drill down view provides supervisors with a holistic look into individual agent performance on metrics and can be valuable in training scenarios for agents.

To access the drill down report, select any metric value for the required agent, and then select **Details**.

Topics dashboard

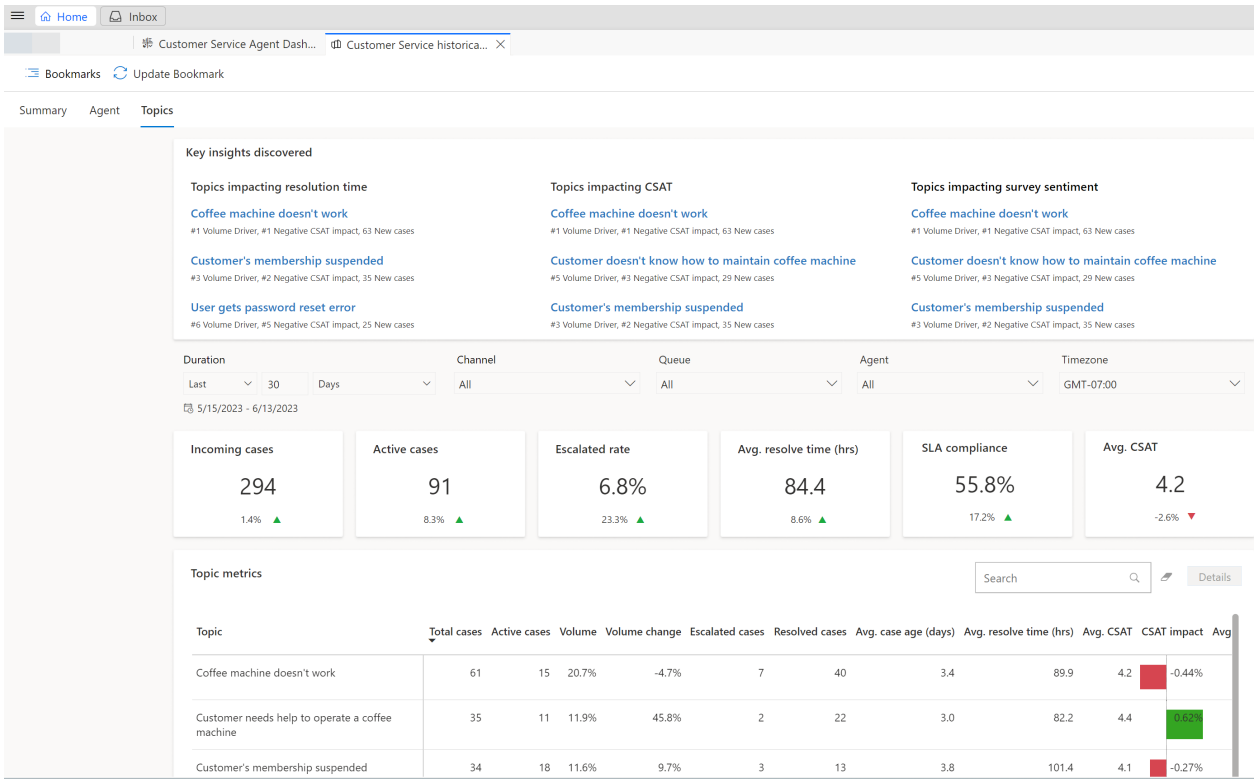
Article • 06/21/2023

The Topics dashboard shows a detailed breakdown of cases and their assigned topics. Customer Service Insights uses AI-generated topics and natural language understanding to automatically group your cases to help you better understand how different case types and topic areas are impacting your organization's support performance.



To view the Topics dashboard, go to customer service historical analytics and select **Topics** at the top of the workspace.

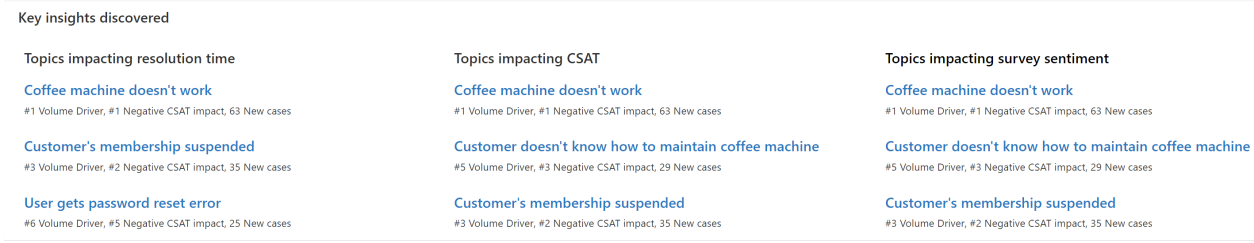
Access the Topics dashboard

In the Customer Service workspace app, do one of the following to view the dashboard:

- In the default view, select the plus (+) icon, and then select Customer Service historical analytics.
- If the enhanced multisession workspace view is enabled, select the site map and then select Customer Service historical analytics.

On the page that appears, select the dashboard.

Key insights card



The Key insights discovered card has three areas:

- Topics to watch
- Topics impacting CSAT
- Topics impacting resolution time

Report details

The key performance indicator (KPI) summary charts summarize the KPIs for the specified time period and the percentage of change over the period. You can filter these areas by duration, channel, queue, and agent.

The topics dashboard report has the following KPIs.

KPI	Description
Total cases	The number of cases created to support customers.
Active cases	The number of cases that are currently opened.
Escalated rate	The percentage of cases that have been escalated.
Avg. resolve time (hrs)	The average time an agent took to resolve the case.
Average CSAT	The average customer satisfaction score, based on written feedback submitted by the customer in the Customer Voice survey.
Average sentiment	The average sentiment score, based on written feedback submitted by the customer in the Customer Voice survey.

The topic metrics chart has the following metrics displayed:

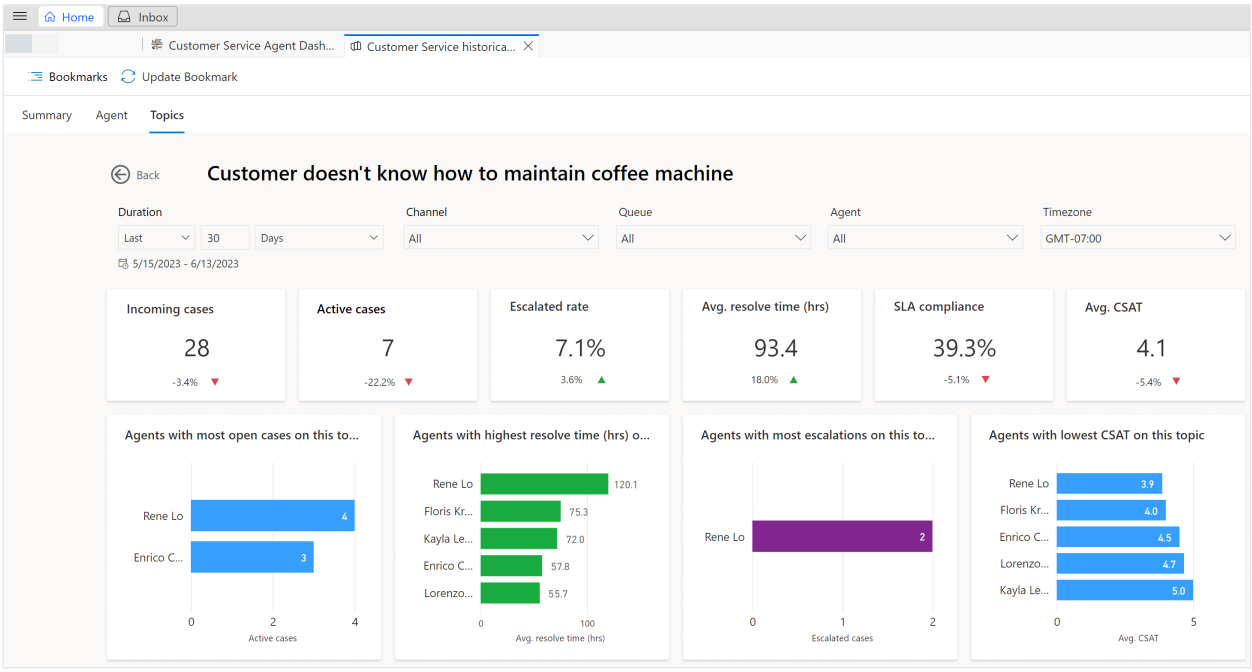
Chart	Description
Total cases	The number of cases created to support customers.
Occurrence by topic	Percentage of cases classified to each given topic.

Chart	Description
Average resolution time	Month over month trend of case resolution time in minutes.
Average CSAT	The average customer satisfaction score, based on Customer Voice survey submitted by the customer.
CSAT impact	The amount that the given topic is driving the overall CSAT trend for the organization.
Avg. survey sentiment	The average sentiment score, based on Customer Voice survey written feedback submitted by the customer.
Survey sentiment impact	The amount that the given topic is driving the overall sentiment trend for the organization.

Case topics drill-down view

The case topics drill-down view provides supervisors with a holistic look into individual topics in reference to key business metrics, and can be valuable in understanding why end customers are contacting support.

To access the case topics drill down, select any metric value for the required topic, and then select **Details**.



Language availability for topics

The topics capability in the Customer Service historical analytics reports comes with a natural language understanding model that can understand the text semantics and

intent in the following languages:

- English
- French
- German
- Italian
- Japanese
- Portuguese
- Simplified Chinese
- Spanish

> **Note**
>
> While topic discovery isn't prevented and is still possible in languages that aren't listed above, there may be differences in what users experience if they leverage topics in unsupported languages.

Historical analytics for unified routing in Customer Service

Article • 03/08/2023

With the introduction of unified routing, an advanced and elaborate set of capabilities are available for organizations to enhance their routing configurations. Supervisors and business administrators need metrics to track how these advanced routing capabilities are helping their businesses serve their customers.

In Customer Service, the report displays metrics pertaining to only those records that are routed using unified routing.

Unified routing report in Customer Service historical analytics

The Unified routing report provides routing-specific KPIs and metrics that can be used by supervisors and administrators to track the success of their routing strategy. They can also track the incorrectly routed work items and configurations and correct them to improve the routing effectiveness and thereby customer satisfaction.

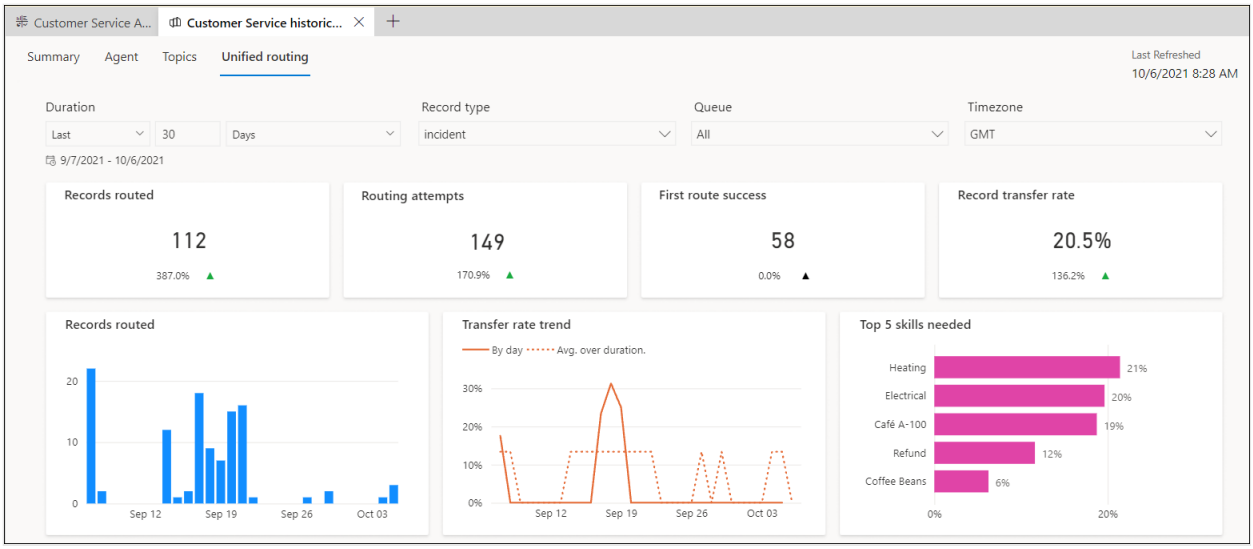
The report appears as a tab in the Customer Service historical analytics report if your administrator has enabled the corresponding setting on the **Insights** page in Customer Service Hub. You can access the report in Service. In the site map, select **Customer Service historical analytics**, and then select **Unified routing**.

Access the Unified routing dashboard

In the Customer Service workspace or Omnichannel for Customer Service app, do one of the following to view the dashboard:

- In the default view, select the plus (+) icon, and then select **Customer Service historical analytics**.
- If the enhanced multisession workspace view is enabled, select the site map and then select **Customer Service historical analytics**.

On the page that appears, select the dashboard.



The report can be filtered on the following:

- **Duration**: Filters the data by the selected value of day, week, or month.
- **Record type**: Filters the data for the selected record, such as a case, lead, or custom record. By default, the report is filtered on incident (case).
- **Queue**: Filters the data for the selected queue that's enabled for unified routing.
- **Time zone**: Filters the data for the selected time zone.

The unified routing report displays the following metrics.

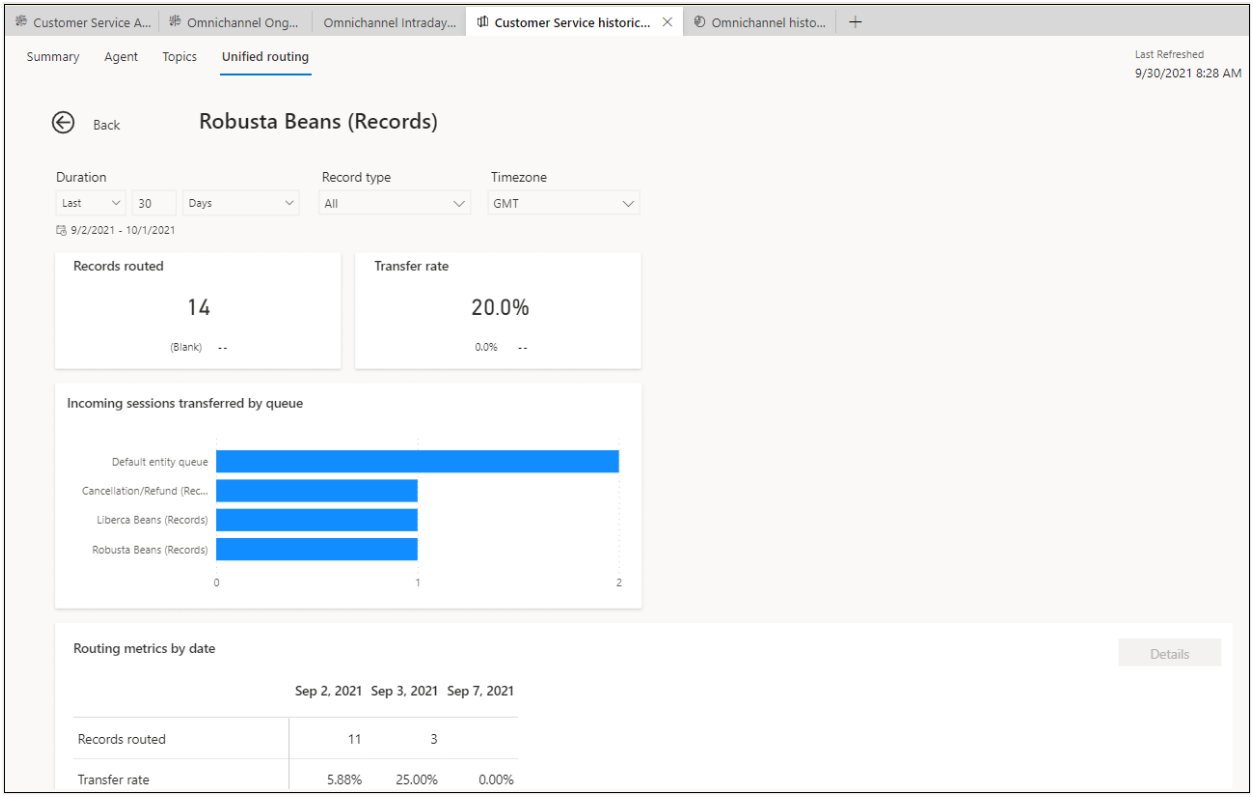
Metric	Description	Derivation
Records routed	Number of records that were routed.	Only records routed using unified routing are considered.
Routing attempts	Number of routing attempts across records that were routed.	Records that were attempted for routing using the "Save and Route" action will be considered as an attempt.
First route success	Number of records that were successfully routed in the first attempt.	Success for a push workstream is when the record is assigned to an agent. Success for a pick workstream is when the record is routed to a queue.
Records transfer rate	The percentage of records that were transferred to another agent or queue.	
Records routed	Day wise view of records that have been routed.	
Transfer rate trend	Percentage of sessions transferred out of the total sessions for the records routed.	

Metric	Description	Derivation
Top 5 skills needed	Top five skills required by the routed records.	

Queue drill-down view

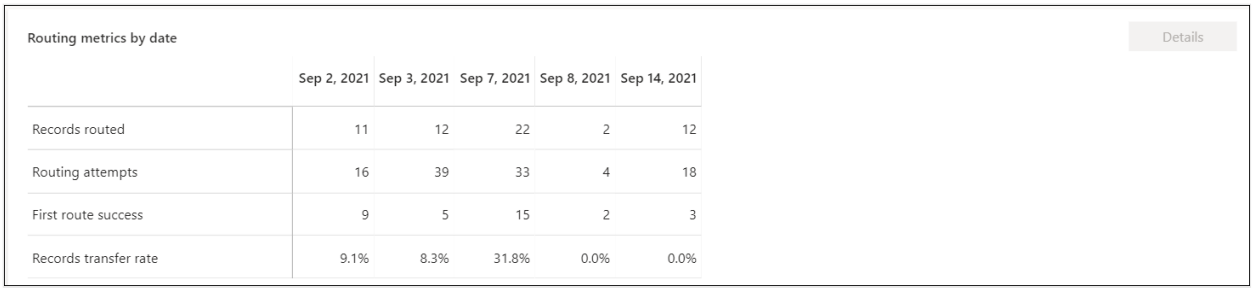
On the **Unified routing** report page, in **Routing metrics by queue**, select a queue, and then select **Details** to view the queue drill-down view. This view displays information about the records that were routed and the transfer rate for the items that were transferred to other queues.

The **Incoming sessions transferred by queue** metric displays the incoming sessions that were transferred from the selected queue to other queues.



Hourly drill-down view

On the **Unified routing** report page, the **Routing metrics by date** table displays the day wise data for the KPIs and the selected period in the **Duration** filter.



Routing metrics by date

Details

	Sep 2, 2021	Sep 3, 2021	Sep 7, 2021	Sep 8, 2021	Sep 14, 2021
Records routed	11	12	22	2	12
Routing attempts	16	39	33	4	18
First route success	9	5	15	2	3
Records transfer rate	9.1%	8.3%	31.8%	0.0%	0.0%

You can select a date, and then select **Details** to view the routing metrics by the hour.

Omnichannel for Customer Service dashboards

Article • 03/31/2023

The insights dashboards in Omnichannel for Customer Service contain various charts and metrics to help you understand the factors that can improve customer service for your organization. Key performance indicators and visual breakdowns of your organization's support cases are coupled with AI-generated insights on cases, agents, and topics that contribute to overall trends. The dashboards provide a view into the support operation across the various channels.

You can make changes to the visual display of the dashboards and also save your personalized views as bookmarks.

Manage dashboards

To manage the dashboards, go to: Manage historical analytics reports in Omnichannel for Customer Service.

Omnichannel historical analytics reports

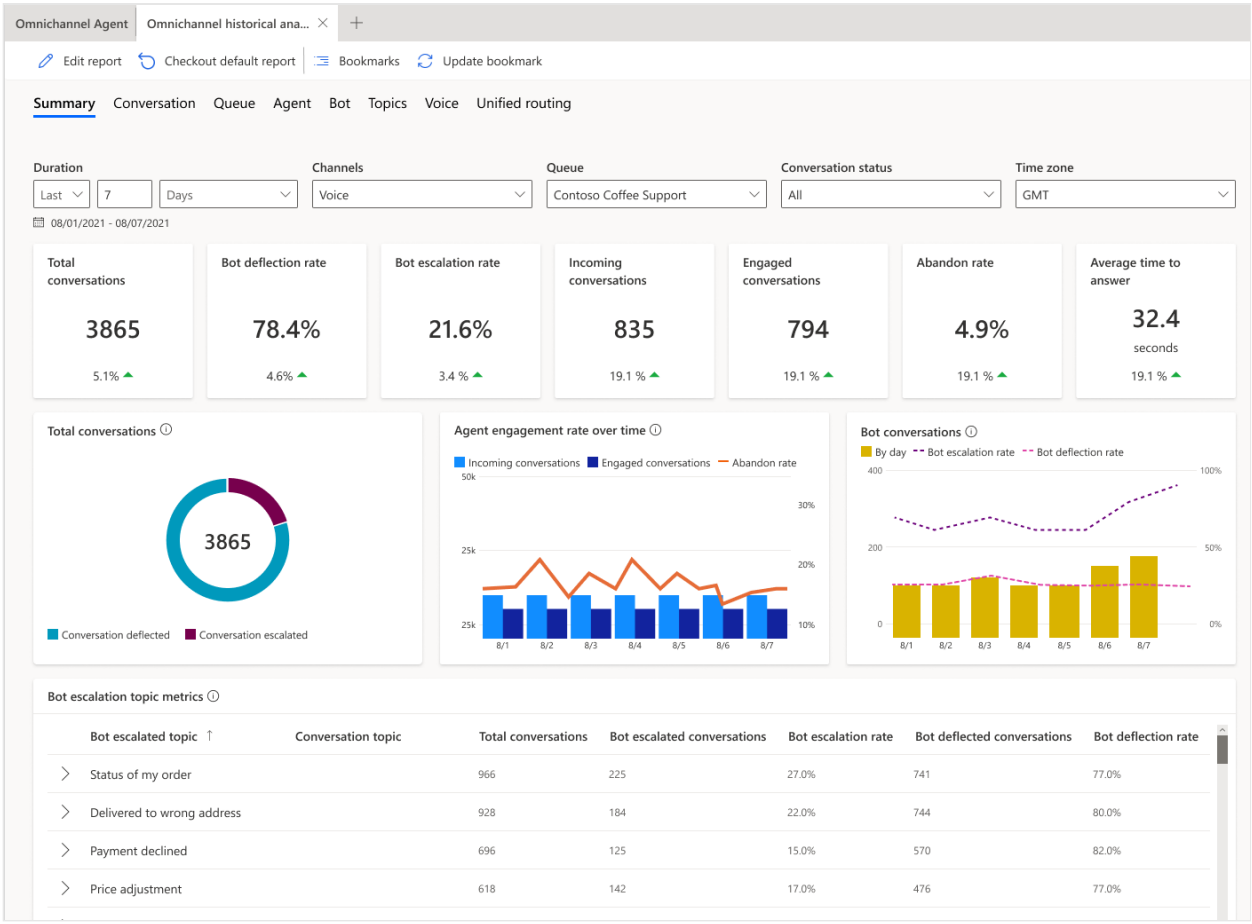
Omnichannel Summary dashboard

Article • 11/21/2022

The **Summary** dashboard provides a seamless end-to-end reporting of metrics across the customer service journey. This integrated analytics report aligns key metrics in Power Virtual Agents and Omnichannel for Customer Service.

With the Summary dashboard, Customer Service Managers or Supervisors can:

- Use the Power Virtual Agents bot metrics, such as escalation and deflection rate and agent metrics like engagement rate and abandon rate to get an overview of how customers interact with bots and bot performance.
- Evaluate how different bot topic areas and their corresponding agent conversation topics impact your organization's support performance.
- Get actionable insights to handle bot escalations and customer requests effectively, thereby improving customer satisfaction and decreasing costs.



Access the Summary dashboard

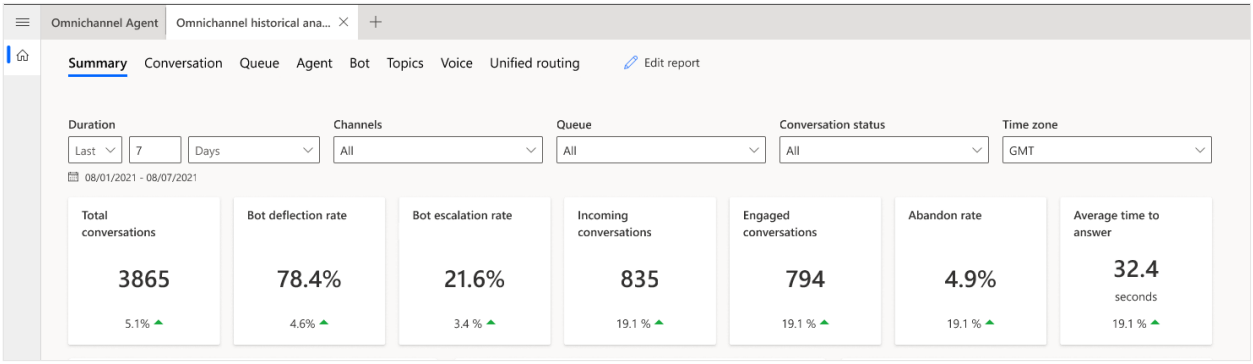
In the Customer Service workspace or Omnichannel for Customer Service app, do one of the following to view the dashboard:

- In the default view, select the plus (+) icon, and then select **Omnichannel historical analytics**.
- If the enhanced multisession workspace view is enabled, select the site map and then select **Omnichannel historical analytics**.

On the page that appears, select the dashboard.

Report details

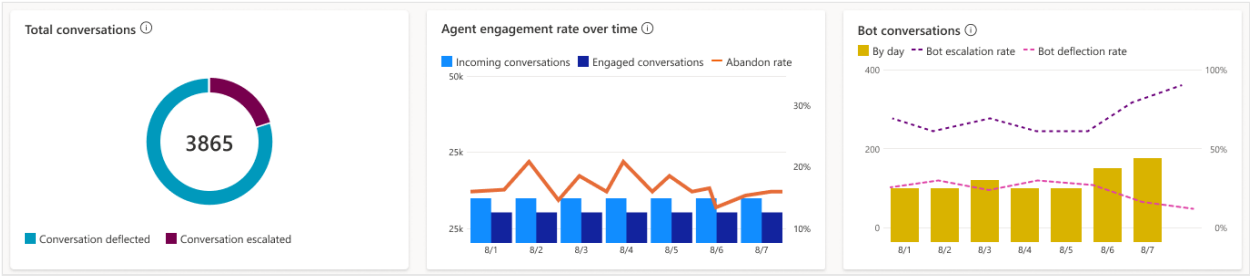
The report summarizes the KPIs for the specified time period and the percentage change over that period. You can filter these areas by duration, channel, queue, or conversation status.



KPI	Description
Total conversations	The number of conversations that were initiated by customers.
Bot deflection rate	The percentage of conversations engaged by bots that were resolved.
Bot escalation rate	The percentage of conversations engaged by bots that were escalated to a human agent.
Incoming conversations	The total number of conversations that are initiated by the customer and are presented to a human agent. Conversation escalated by the Power Virtual Agents bots is also included.
Engaged conversations	Offered conversations that are engaged by an agent. Customer-to-agent communication begins at this point.
Abandon rate	The percentage of conversations that are in a human agent's queue but aren't engaged by agents.
Average time to answer	The average time customers waited in the queue before being connected to an agent.

An up-and-down indicator below the value indicates the percent change in either a positive or negative direction.

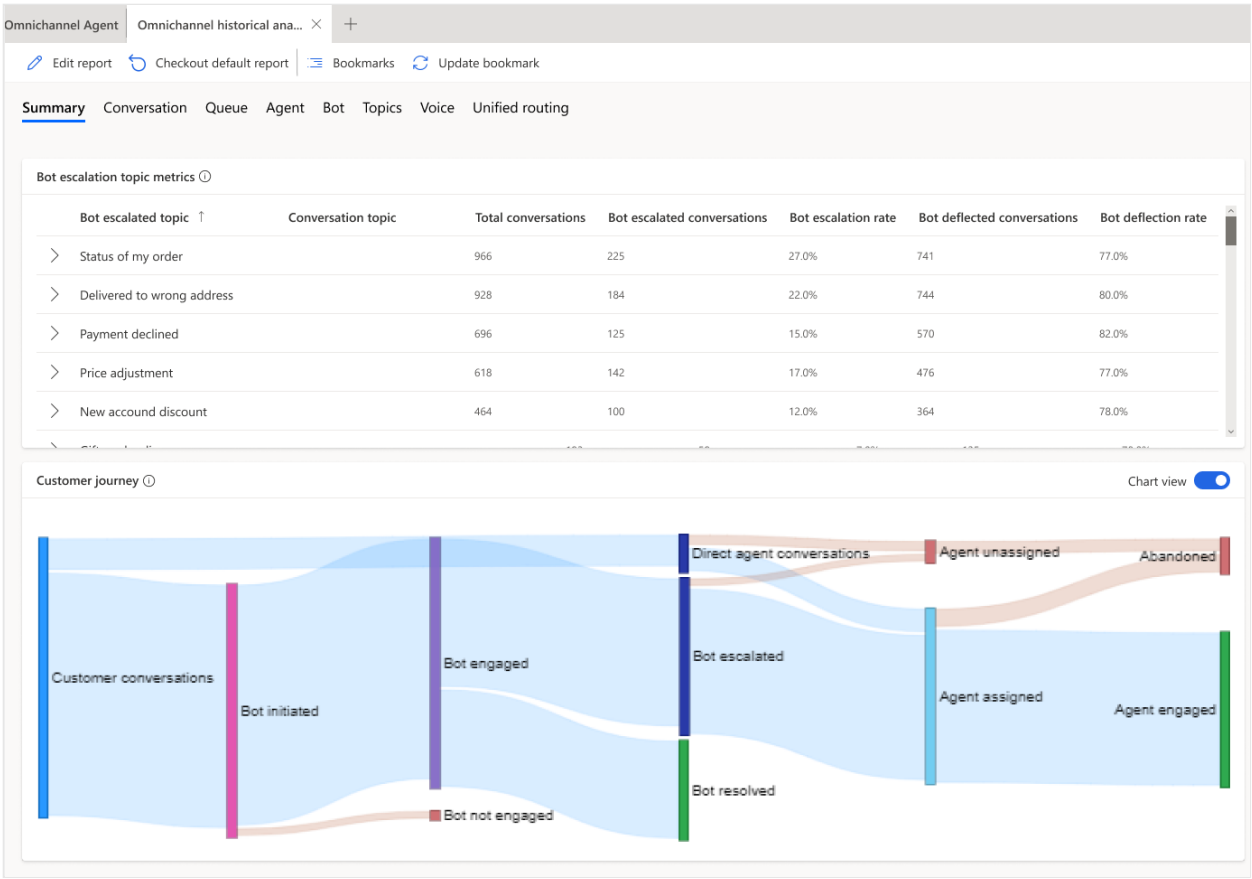
The following charts are displayed in the Summary dashboard.



Title	Description
Total conversations	A graphical view of the conversations that were initiated by the customer and were connected to a human agent directly, resolved by the Power Virtual Agents bot, or escalated by a bot to the human agent.
Agent engagement rate over time	A graphical view of the daily incoming conversations, conversations engaged by an agent, and abandoned conversations over time.
Bot conversations	A graphical view of the daily deflection and escalation rate and abandon rate over the specified time period.

Bot escalation topic metrics

The **Bot escalation topic metrics** section provides insights into the performance of individual bot topics and their key business metrics. Supervisors can drill down into a topic to view the corresponding agent conversation topics and analyze how a bot is resolving a topic versus how an agent is resolving an escalated conversation topic. This helps them better understand how different topic areas impact your organization's support performance.



To view further bot topics and their related metrics, go to Bot dashboard.

Language availability for topics

The topics capability in the Customer Service historical analytics reports comes with a natural language understanding model that can understand text semantics and intent in the following languages:

- English
- French
- German
- Italian
- Japanese
- Portuguese
- Simplified Chinese
- Spanish

> **Note**
>
> While topic discovery is enabled and still possible in languages that are not listed above, there may be differences in experience for users who leverage topics in unsupported languages.

Conversation dashboard

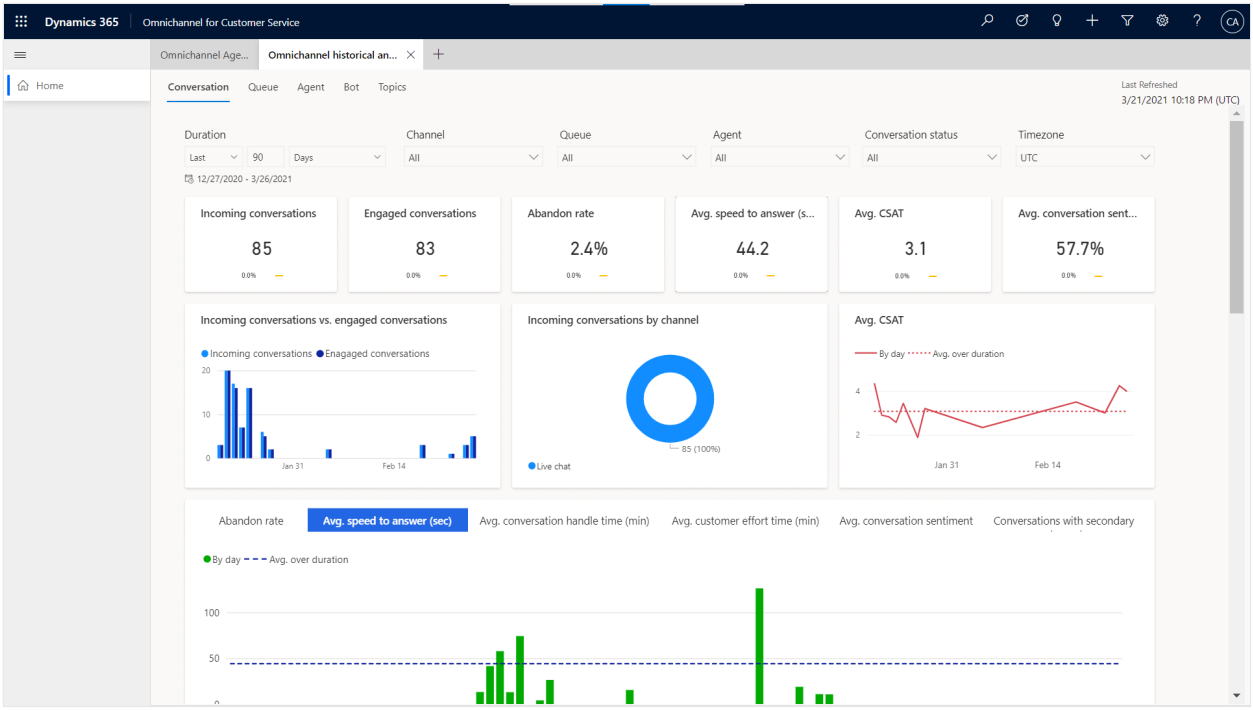
Article • 11/24/2022

The Conversation dashboard gives you a broad overview of the customer service experience in your organization. It uses AI to surface insights into the topics that generate the highest volume and the topics that're emerging with the fastest increase in volume.



The dashboard includes a variety of charts with graphical views of your organization's key performance indicators (KPIs).

The charts for conversation volume drivers and emerging conversation volume by topic charts use natural language understanding to group support conversations as topics that are a collection of related conversations. These charts display the customer support topics that are generating the most volume and emerging topics that are increasing rapidly in volume, helping you identify areas for improvement that can have the greatest impact on support performance.

By default, the dashboard shows you KPIs for the past month and for all channels, queues, and agents in your system. You can use the data filtering options to select data for specific time periods, channels, queues, agents, conversation status, and timezones.

> **Note**
>
> If you switch to a different dashboard, the filter you specified will persist, and be applied to the data on all dashboards.

Access the Conversation dashboard

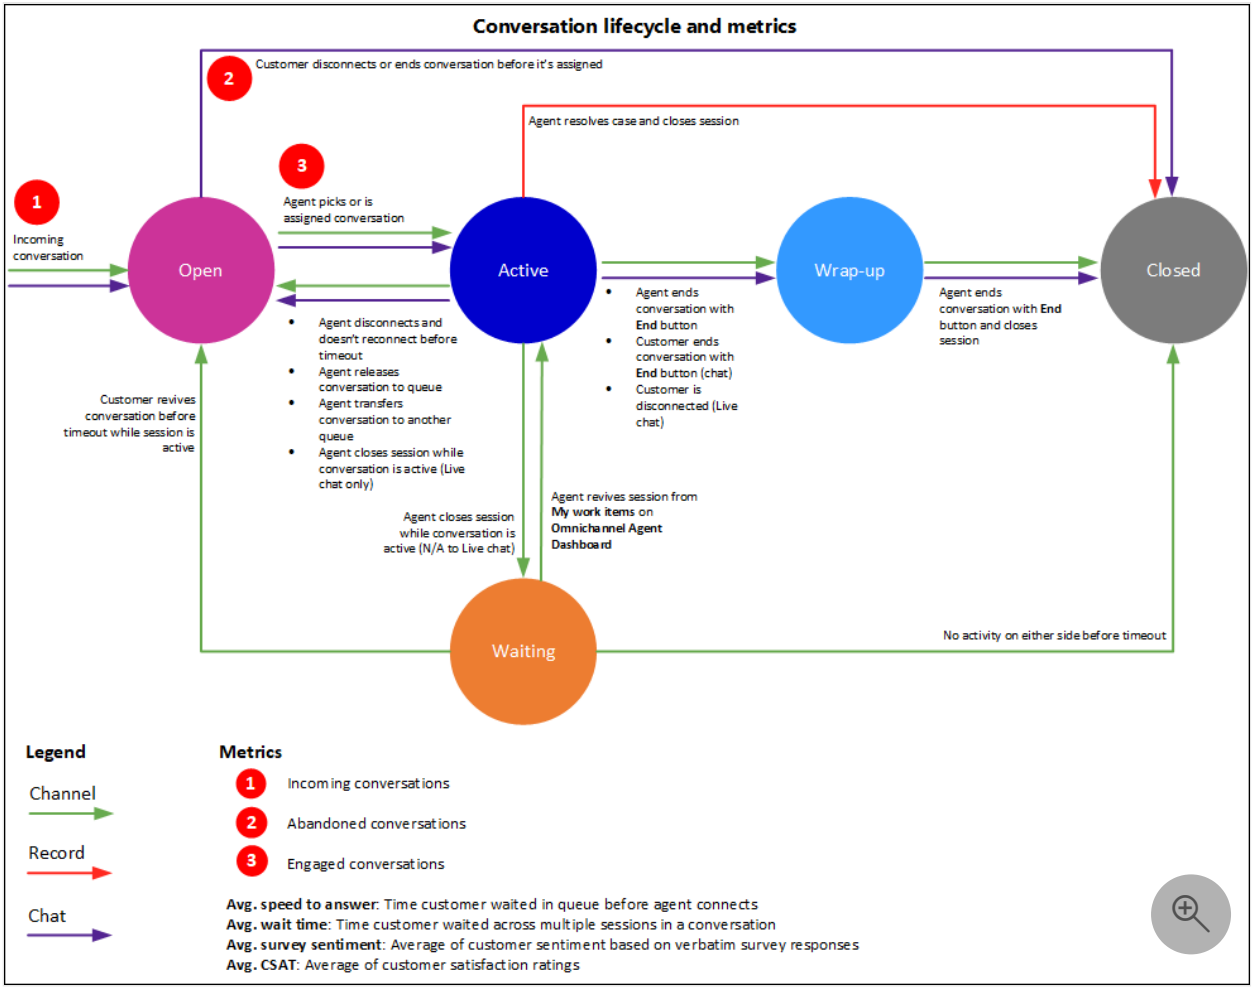
In the Customer Service workspace or Omnichannel for Customer Service app, do one of the following to view the dashboard:

- In the default view, select the plus (+) icon, and then select **Omnichannel historical analytics**.
- If the enhanced multisession workspace view is enabled, select the site map and then select **Omnichannel historical analytics**.

On the page that appears, select the dashboard.

Report details

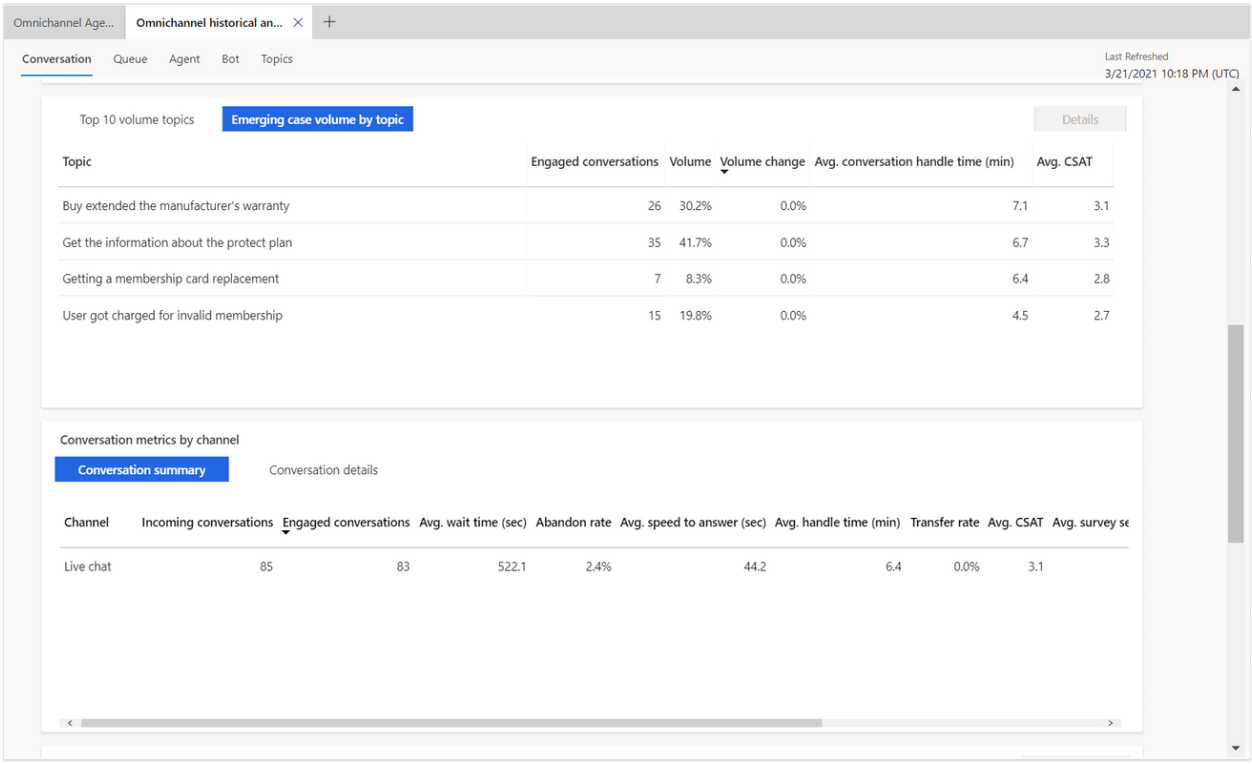
The conversation lifecycle and the metrics that can be derived in the different statuses is represented in the following diagram.



The following table lists the KPIs in the Conversation dashboard.

Metric	Description	Derivation

Metric	Description	Derivation
Incoming conversations	The number of conversations initiated by the customer that can be presented to a human agent.	All conversations are considered, except bot conversations.
Engaged conversations	Offered conversations that are engaged by an agent. Customer-to-agent communication can begin at this point.	All conversations are considered.
Abandon rate	The percentage of conversations that aren't engaged by agents.	All conversations are considered.
Avg. speed to answer (seconds)	The average time customers waited in the queue before connecting to an agent. (time for acceptance)	Conversations engaged and conversations that are in the closed state are considered.
Avg. CSAT	The average of the customer satisfaction ratings provided by customers. Only available if Dynamics 365 Customer Voice has been configured as a post-conversation survey tool.	
Avg. conversation sentiment	The average sentiment score based on the customer's conversation experience. For information on how the sentiment data is derived, see Monitor real-time customer sentiment.	



Conversation charts are displayed as shown in the following image.

	ın 21, 2021	Jan 22, 2021	Jan 23, 2021	Jan 24, 2021	Jan 25, 2021	Jan 27, 2021	Jan 28, 2021	Feb 5, 2021	Feb 18, 2021	Feb 22, 2021	Feb 24, 2021	Feb 25, 2021
Incoming conversations	3	20	17	7	16	6	2	2	3	1	3	5
Engaged conversations	3	20	16	7	16	5	2	2	3	1	3	5
Avg. wait time (sec)	23.0	41.6	63.6	135.3	86.4	689.8	528.5	15.5	126.3	19.0	11.0	10.8
Abandon rate	0.0%	0.0%	5.9%	0.0%	0.0%	16.7%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%
Avg. speed to answer (sec)	13.3	41.6	57.9	13.1	74.3	4.2	26.5	15.5	126.3	19.0	11.0	10.8
Avg. handle time (min)	2.1	9.1	6.0	5.6	7.4	7.8	3.4	1.6	1.1	2.6	0.9	6.3
Transfer rate	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%
Avg. CSAT	4.3	2.9	2.8	2.6	3.4	1.7	2.0	2.0	3.3	4.0	4.0	3.6
Avg. survey sentiment	47.7%	61.7%	53.8%	61.4%	46.8%	53.0%	71.5%	53.0%	54.3%	70.0%	54.0%	39.6%
Avg. conversation sentiment	50.0%	55.2%	50.0%	54.1%	48.9%	66.9%	50.0%	83.3%	64.2%	26.0%	71.2%	71.6%
Avg. customer effort time (min)	2.3	9.6	7.1	7.7	8.7	9.7	6.8	1.7	1.9	2.6	1.5	6.3

The KPIs in the conversation chart are as follows.

Title	Description
Incoming conversations vs. engaged conversations	The number of conversations initiated by the customer versus the number of conversations that are accepted and engaged in by agents.
Incoming conversations by channel	The number of conversations initiated by the customer and presented to an agent, sorted by channel.
Avg. CSAT	The average of the customer satisfaction ratings provided by customers. Only available if Dynamics 365 Customer Voice has been configured as a post-conversation survey tool.
Abandon rate	The trend in percentage of conversations that aren't engaged by agents, by day.
Avg. speed to answer (sec)	The average time customers waited in the queue before connecting to an agent. (time for acceptance).
Avg. conversation handle time (min)	The average total conversation active time across engaged conversations.
Avg. customer effort time (min)	The average time from the start of a conversation to the start of the conversation wrap-up time.

Title	Description
Avg. conversation sentiment	The average of predicted customer sentiment in a given timeframe for a set queue or agent, which indicates the degree of positive sentiment expressed by customers at the end of their interaction.
Conversations with secondary channel	The breakdown of conversations across secondary channels.
Top 10 volume topics	The top 10 AI-discovered topics from conversation data sorted by conversation volume.
Emerging conversation volume by topic	The top emerging AI-discovered topics, from conversation data that featured the greatest increase in volume over the duration being evaluated.

	ın 21, 2021	Jan 22, 2021	Jan 23, 2021	Jan 24, 2021	Jan 25, 2021	Jan 27, 2021	Jan 28, 2021	Feb 5, 2021	Feb 18, 2021	Feb 22, 2021	Feb 24, 2021	Feb 25, 2021
Incoming conversations	3	20	17	7	16	6	2	2	3	1	3	5
Engaged conversations	3	20	16	7	16	5	2	2	3	1	3	5

Avg. handle time (min)	2.1	9.1	6.0	5.6	7.4	7.8	3.4	1.6	1.1	2.6	0.9	6.3
Transfer rate	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%
Avg. CSAT	4.3	2.9	2.8	2.6	3.4	1.7	2.0	2.0	3.3	4.0	4.0	3.6
Avg. survey sentiment	47.7%	61.7%	53.8%	61.4%	46.8%	53.0%	71.5%	53.0%	54.3%	70.0%	54.0%	39.6%
Avg. conversation sentiment	50.0%	55.2%	50.0%	54.1%	48.9%	66.9%	50.0%	83.3%	64.2%	26.0%	71.2%	71.6%
Avg. customer effort time (min)	2.3	9.6	7.1	7.7	8.7	9.7	6.8	1.7	1.9	2.6	1.5	6.3

The KPIs for the conversation summary are as follows.

Conversation summary	Description
Incoming conversations	The number of conversations initiated by the customer and can be presented to a human agent
Engaged conversations	Offered conversations that are engaged by an agent. Customer-to-agent communication can begin at this point

Conversation summary	Description
Avg. wait time (sec)	The average time customers waited before connecting to agents. This is similar to “speed to answer” but it includes wait time from each session within a conversation.
Abandon rate	The percentage of conversations that aren't engaged by agents.
Avg. speed to answer (sec)	The average time customers waited in the queue before connecting to an agent (time for acceptance).
Avg. handle time (min)	The average total conversation active time across engaged conversations.
Transfer rate	The percentage of conversations that are transferred to another agent or queue.
Avg. CSAT	The average of customer satisfaction ratings provided by customers. Only available if Dynamics 365 Customer Voice has been configured as a post-conversation survey tool.
Avg. survey sentiment	The average of customer sentiment based on verbatim provided in survey responses. Only available if Dynamics 365 Customer Voice has been configured as a post-conversation survey tool.
Avg. conversation sentiment	The average of predicted customer sentiment in each timeframe for a set queue or agent, which indicates the degree of positive sentiment expressed by customers at the end of their interaction.
Avg. customer effort time (min)	The average time from the start of the conversation to the start of the conversation wrap up time.

This following table displays the conversation details and their descriptions.

Conversation details	Description
Avg. session per conversation	The average number of sessions in each conversation
Avg. conversation time (min)	The average total time to complete conversations across engaged conversations.
Avg. time for first response (min)	The average total time for first responses across engaged conversations.

Conversation details	Description
Avg. response time (min)	The average total time for first responses on conversations.
Avg. conversation active time (min)	The average time that conversations remain active across engaged conversations.
Avg. conversation inactive time (min)	The average time that conversations remain inactive across engaged conversations.
Avg. conversation wrap-up time (min)	The average time that conversations take to wrap up across engaged conversations.
Avg. incoming messages	The average of the total number of messages sent by customers
Avg. outgoing messages	Average of the total number of messages sent as a response from an agent. This doesn't include any consult/monitoring messages a supervisor/team lead has sent to an agent.
Incoming messages	The average of the total number of messages sent by customers
Outgoing messages	The average of the total number of messages sent as a response from an agent. This doesn't include any consult or monitoring messages that a supervisor or team lead has sent to an agent.

Conversation hourly details drill down view

The Conversation hourly details drill down view provides more granular insight into the hour-by-hour breakdown of key conversation metrics within the contact center. The metrics for conversation summary and conversation details metrics are the same as the day-by-day view, ensuring that supervisors can consistently analyze their contact center operation regardless of desired duration granularity.

To view the drill-down, select any single metric value on the day you're interested in, and then select **Hourly details**.

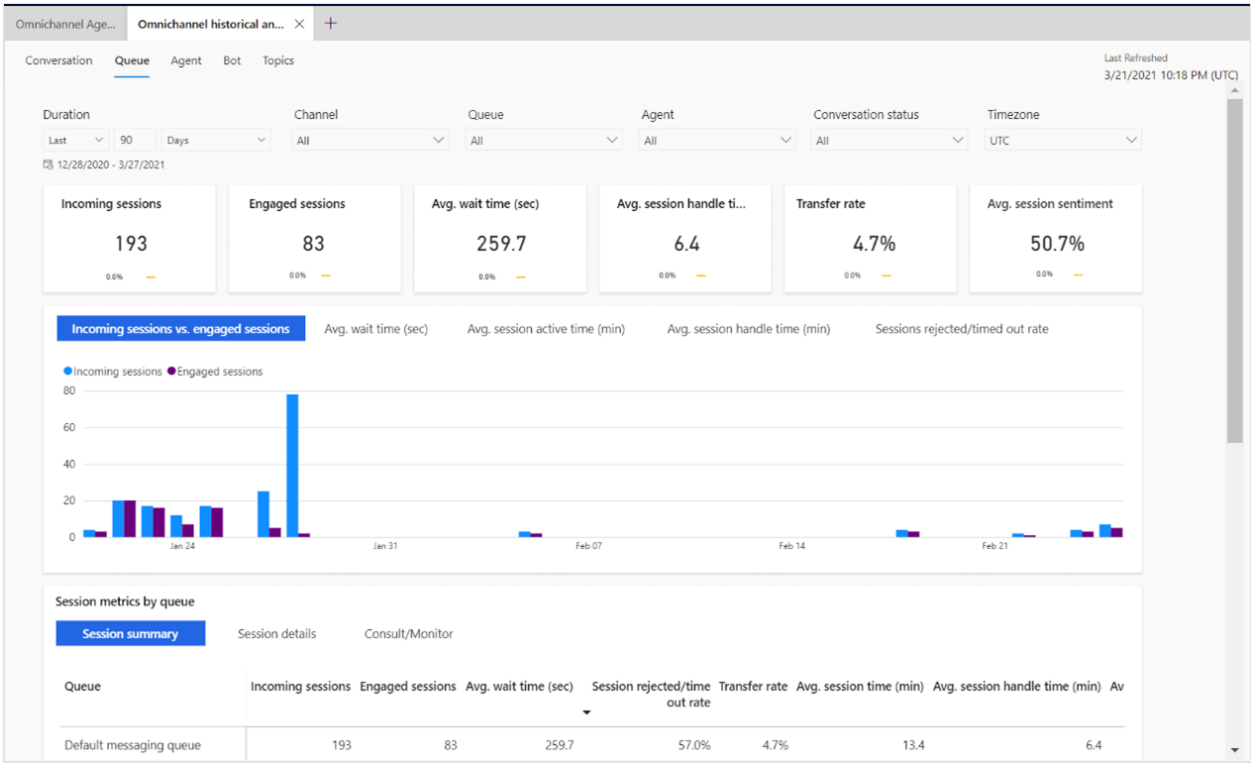
Queue dashboard

Article • 10/12/2022

The Queue dashboard gives you a broad overview of the customer service experience in your organization by providing insights into how specific queues are operating.



By default, the dashboard shows key performance indicators (KPIs) for the past month and for all channels, queues, and agents in your system. You can use the data filtering options to select data for specific time periods, channels, queues, agents, conversation status, and time zone. To filter data by duration, channel, queue, agent, conversation status, or time zone, select a value from the respective dropdown list.

> **Note**
>
> If you switch to a different dashboard, the filter you specified will persist and be applied to the data on all dashboards.

Access the Queue dashboard

In the Customer Service workspace or Omnichannel for Customer Service app, do one of the following to view the dashboard:

- In the default view, select the plus (+) icon, and then select **Omnichannel historical analytics**.

- If the enhanced multisession workspace view is enabled, select the site map and then select **Omnichannel historical analytics**.

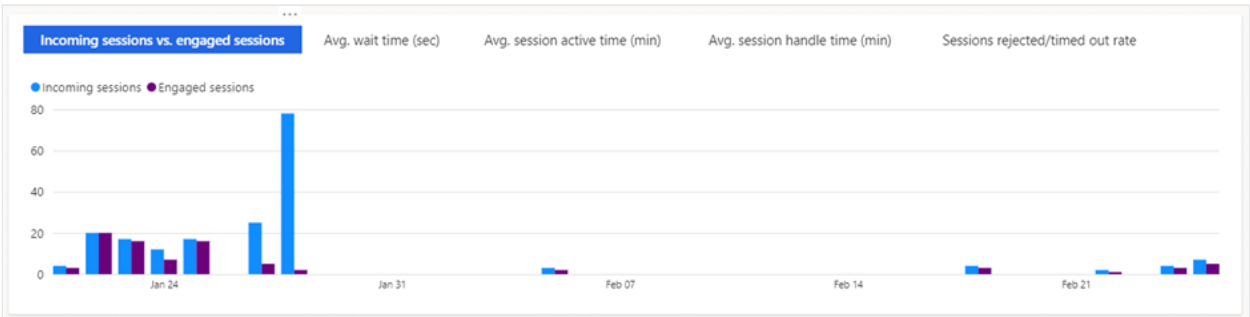
On the page that appears, select the dashboard.

Report details

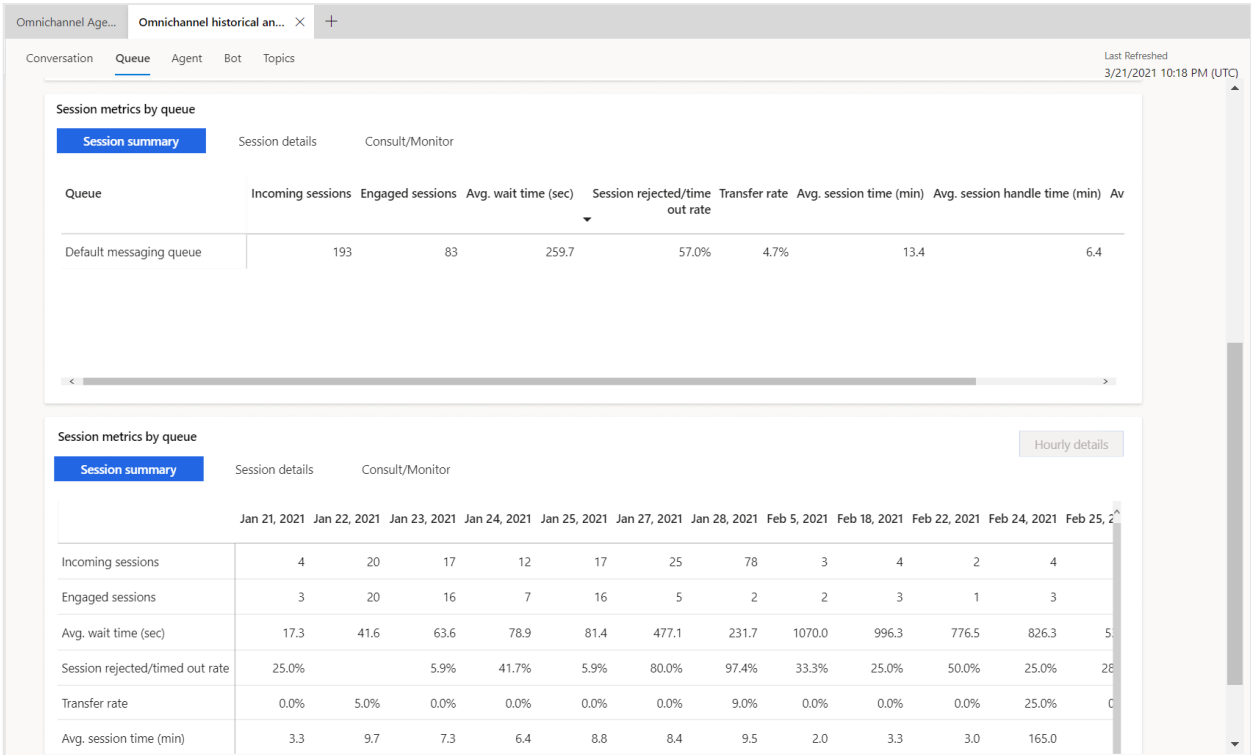
The following KPIs are displayed in the Queue dashboard.

KPI	Description
Incoming sessions	The total number of sessions initiated by customers.
Engaged sessions	The number of sessions presented to an agent that were accepted.
Avg. wait time (sec)	The average time customers waited before connecting to an agent. It's similar to "speed to answer," but this metric includes the wait time from each session within a conversation.
Avg. session handle time	The total session active time across engaged sessions.
Transfer rate	The percentage of conversations that were transferred to another agent or queue.
Avg. session sentiment	The average predicted customer sentiment for a given session.

The following charts are displayed in the Queue dashboard.



Title	Description
Incoming session vs engaged session	The total number of sessions initiated by customers versus the number of sessions initiated and accepted by an agent.
Avg. wait time (sec)	The average time customers waited before connecting to an agent. It's similar to "speed to answer," but this metric includes wait time from each session within a conversation.
Avg. session active time (min)	The average total session active time across engaged conversations.
Avg. session handle time (min)	The average total session handle time across engaged conversations.
Sessions rejected/timed out rate	The number of sessions presented to an agent that weren't accepted.



Session summary	Description
Incoming sessions	The number of sessions initiated by a customer

Session summary	Description
Engaged sessions	The number of sessions accepted by an agent.
Avg. wait time (sec)	The average time customers waited before connecting to agents. This is similar to "speed to answer," but it includes wait time from each session within a conversation.
Session rejected/timed out rate	The number of sessions presented to an agent that weren't accepted.
Transfer rate	The percentage of conversations that were transferred to another agent or queue.
Avg. session time (min)	The average time, from session start to end, for engaged sessions.
Avg. session handle time (min)	The average of the total session active time across engaged sessions.
Avg. session sentiment	The average predicted customer sentiment for a given session.

Session details	Description
Avg. session active time (min)	The average total session active time across engaged conversations.
Avg. session inactive time (min)	The average total session inactive time across engaged sessions.
Avg. incoming messages	The average total number of incoming messages from the customer, per session.
Avg. outgoing messages	The average total number of outgoing messages from the customer, per session.
Incoming messages	The total incoming messages from the customer, per session.
Outgoing messages	The total outgoing messages per session from customer, per session.

Consult/ Monitor	Descriptions
Consult sessions	Number of sessions where the agent has participated in consult mode.
Avg consult time (min)	Average time an agent spent during a session in consult mode.

Consult/ Monitor	Descriptions
Monitor sessions	Number of sessions where the agent has participated in monitor mode
Avg monitor time (min)	Average time agent spent on a session in monitoring mode

A blue upward triangle next to the value indicates that the percentage has changed in a positive direction. A red downward triangle indicates that the percentage has changed in a negative direction.

Queue hourly details drill-down view

The "queue hourly details drill-down" view provides a more granular insight into the hour-by-hour breakdown of key conversation metrics within the contact center. Metrics for the conversation summary and conversation details are the same as the day-by-day view, ensuring that supervisors can consistently analyze their contact center operation regardless of duration granularity.

To view the drill-down report, select any single metric value on the required day, then select **Hourly details**.

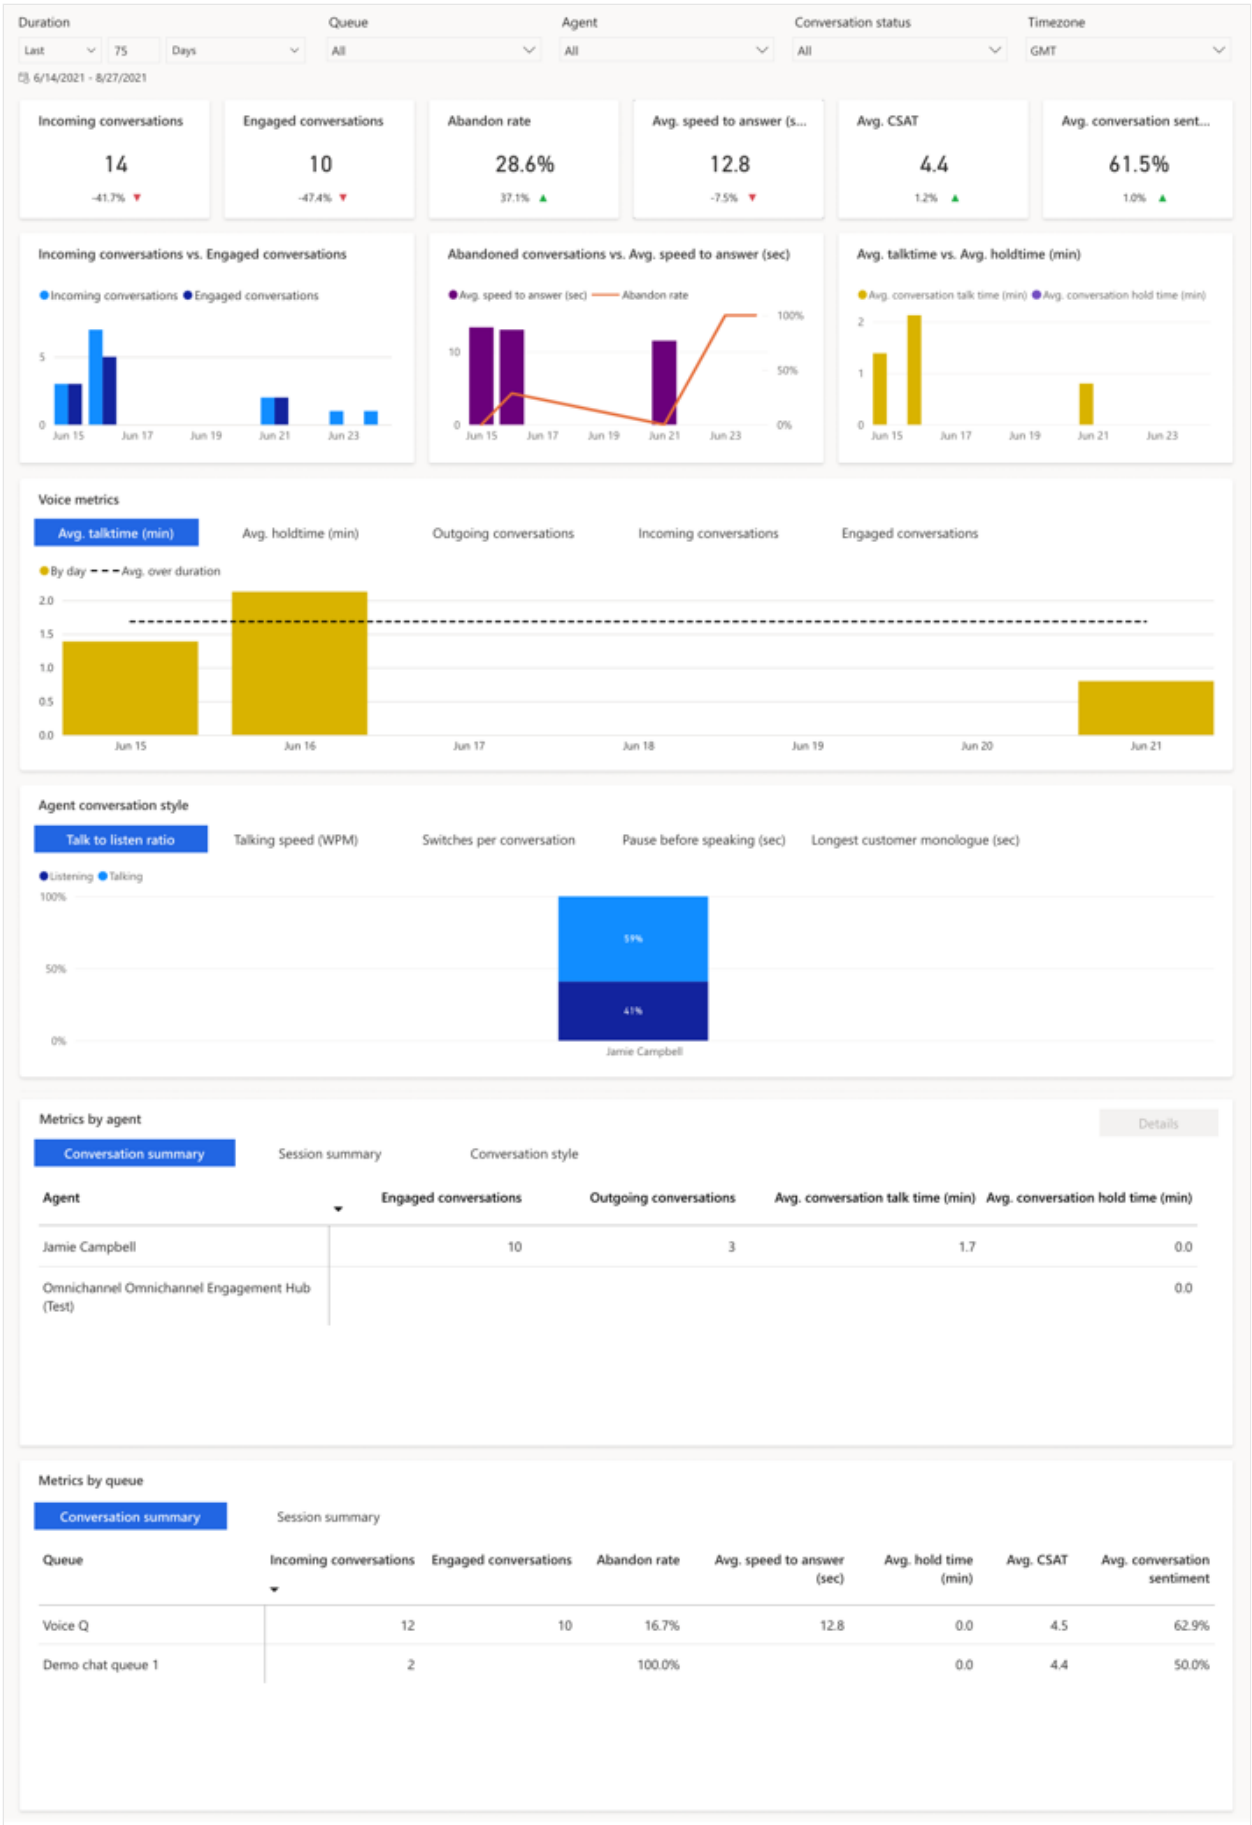
Voice channel historical analytics, reports, and call insights

Article • 04/26/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making, and should not be used to make, decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using Dynamics 365 Customer Service, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

The Voice analytics report provides comprehensive information on the overall performance of customer support across the voice channel. The reports provide administrators and supervisors with a visualization and ability to filter across channels, queues, agents, and date ranges to help better understand performance and troubleshoot problem areas.



Access the Voice dashboard

In the Customer Service workspace or Omnichannel for Customer Service app, do one of the following to view the dashboard:

- In the default view, select the plus (+) icon, and then select **Omnichannel historical analytics**.
- If the enhanced multisession workspace view is enabled, select the site map and then select **Omnichannel historical analytics**.

On the page that appears, select the dashboard.

Report details

The following KPIs are displayed in the Voice dashboard.

Metric	**Definition (historical)**
Incoming conversations	The number of conversations initiated by the customer and can be presented to a human agent.
Engaged conversations	The conversations that the agent was engaged in. Customer-to-agent communication can begin at this point.
Abandon rate	Percentage of conversations that are not engaged by agents.
Average wait time	The average time customers waited before connecting to agents. Similar to "speed to answer", but includes time waited on each session within a conversation.
Average Speed to answer (sec)	The average time customers waited in the queue before connecting to an agent (the time for acceptance).
Avg. CSAT **Note:** Currently unavailable.	The average of customer satisfaction ratings provided by customers.
Avg. Conversation sentiment	The average sentiment score based on the verbatim provided in customer voice survey.
Avg. handle time	The average time that an agent spent on a conversation.
Transfer rate	The percentage of times a conversation was transferred from one agent to another agent.
Avg. customer effort	The time that a customer spent on a conversation to get their issue resolved.

Metric	Definition (historical)
Avg. sessions per conversation	The average sessions created and engaged for each conversation engaged.

The following report includes conversation intelligence, which uses analytics and data science to gather data from agent call recordings and Omnichannel for Customer Service. Conversation intelligence analyzes the data to provide you with the information and insights to intelligently manage your support team and proactively coach agents.

Avg. session talktime (min)	107.7	2.4	0.2	0.5
Avg. session holdtime (min)	0.6	0.8	0.0	0.0
Avg. session sentiment	63.5%	65.7%		50.0%

The following metrics are available for the agent conversation style.

Metric	Definition
Talk to listen ratio	The average listen and talk ratio of agent in conversations with customers.
Talking speed (WPM)	The average number of words used per minute by agent.
Switches per conversation	The average exchanges between an agent and a customer in a conversation; the number of times the conversation switched from one person to another. This is a sign of engagement during conversations.
Pause before speaking (sec)	The milliseconds the agent paused before responding to customer queries; indicates agent's patience.
Longest customer monologue (sec)	The longest monologue by the customer with an agent; indicates that the agent is asking good questions and understanding customer needs.

Call insights

Supervisors can look into each topic, and view the CSAT and sentiment to see coaching opportunities. Supervisors can view details of a conversation by drilling through the topics and selecting a conversation title.

Supervisors can also see entire transcripts to understand the conversation style and get precise verbatim used so that they can make informed decisions about training requirements for the agent.

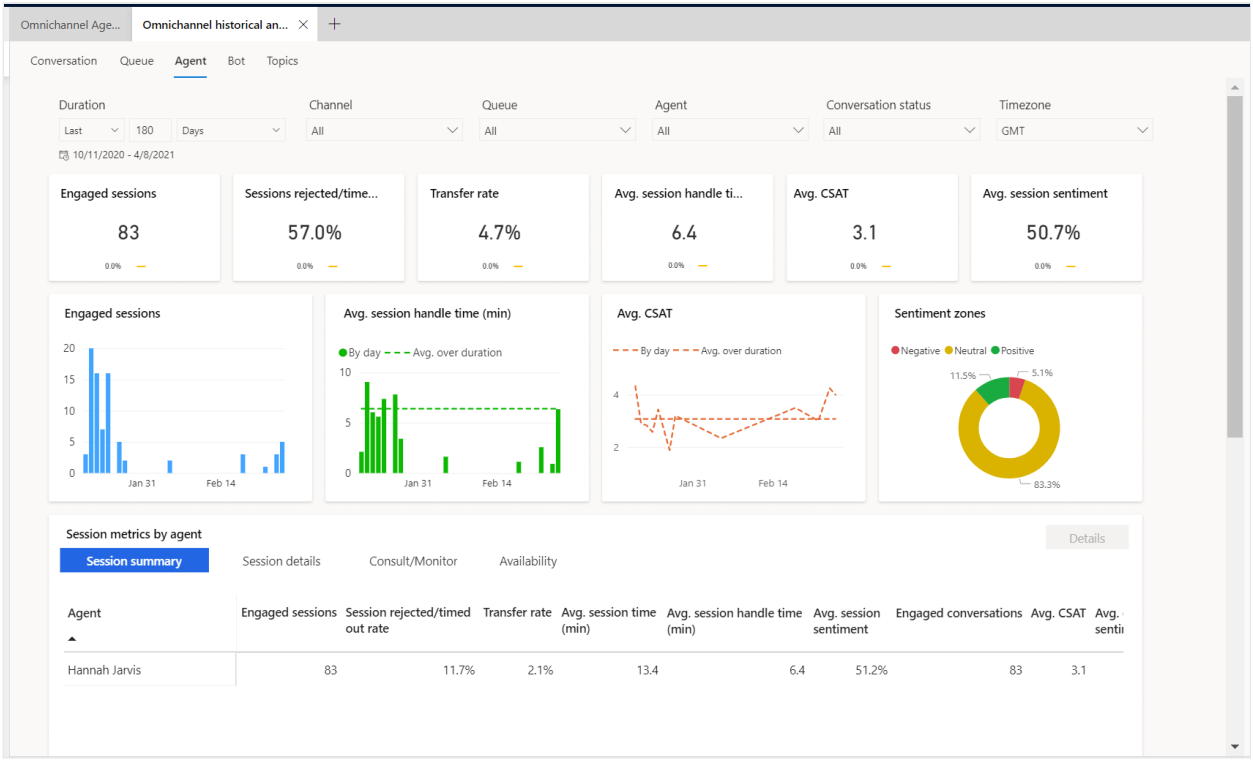
Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

The Agent dashboard shows charts and KPIs that you can use to guide agents and understand overall agent performance.



Access the Agent dashboard

In the Customer Service workspace or Omnichannel for Customer Service app, do one of the following to view the dashboard:

- In the default view, select the plus (+) icon, and then select **Omnichannel historical analytics**.
- If the enhanced multisession workspace view is enabled, select the site map and then select **Omnichannel historical analytics**.

On the page that appears, select the dashboard.

Report details

The reports summarize the KPIs for the specified time period and percentage change over a period of time. You can filter these areas by duration, channel, queue, agent, conversation status, and time zone.

KPI	Description
Engaged sessions	The number of sessions accepted by an agent.
Rejected/ timed-out sessions rate	The number of sessions presented to an agent and not accepted.
Transfer rate	The percentage of conversations that are transferred to another agent/queue.
Avg. session handle time	The average total session active time across engaged sessions.
Avg. CSAT	The average of customer satisfaction ratings provided by customers. Only available if Dynamics 365 Customer Voice has been configured as a post conversation survey tool.
Avg session sentiment	The average predicted sentiment of a customer based on the conversation transcript from the session. For information on how the sentiment data is derived, see Monitor real-time customer sentiment.

The charts display the following metrics.

Title	Description
Engaged sessions	The number of sessions accepted by an agent, by day

Title	Description
Avg. session handle time	The average amount of time an agent actively spends on a session, by day.
Avg. CSAT	The customer CSAT trend, based on Dynamics 365 Customer Voice survey responses.
Sentiment zones	The breakdown of customer sentiment across sessions by level.

	Jan 21, 2021	Jan 22, 2021	Jan 23, 2021	Jan 24, 2021	Jan 25, 2021	Jan 27, 2021	Jan 28, 2021	Feb 5, 2021	Feb 18, 2021	Feb 22, 2021	Feb 24, 2021

Session summary	Description
Engaged sessions	The number of sessions presented to an agent and accepted.
Session rejected/timed out rate	The number of sessions presented to an agent and not accepted.
Transfer rate	The number of sessions transferred by an agent.
Avg. session time (min)	The average time of the total session duration across engaged sessions.
Avg. session handle time (min)	The average of the total session active time across engaged sessions.
Avg. session sentiment	The average predicted sentiment of the customer across engaged sessions.

Session summary	Description
Engaged conversations	The number of conversations presented to an agent and accepted.
Avg. CSAT	The average CSAT score provided by customers from Customer Voice survey responses.
Avg. conversation sentiment	The average predicted sentiment of the customer across engaged conversations.
Avg. wait time (sec)	The average time customers waited before connecting to agents. This is similar to “speed to answer” but it includes wait time from each session within a conversation.

Session details	Description
Avg. session active time (min)	The average total session active time across engaged conversations.
Avg. session inactive time (min)	The average total session inactive time across engaged sessions.
Avg. incoming messages	The average total number of incoming messages from a customer per session.
Avg. outgoing messages	The average total number of outgoing messages from an agent per session.
Incoming messages	Total incoming messages from the customer, per session.
Outgoing messages	Total outgoing messages from an agent, per session.

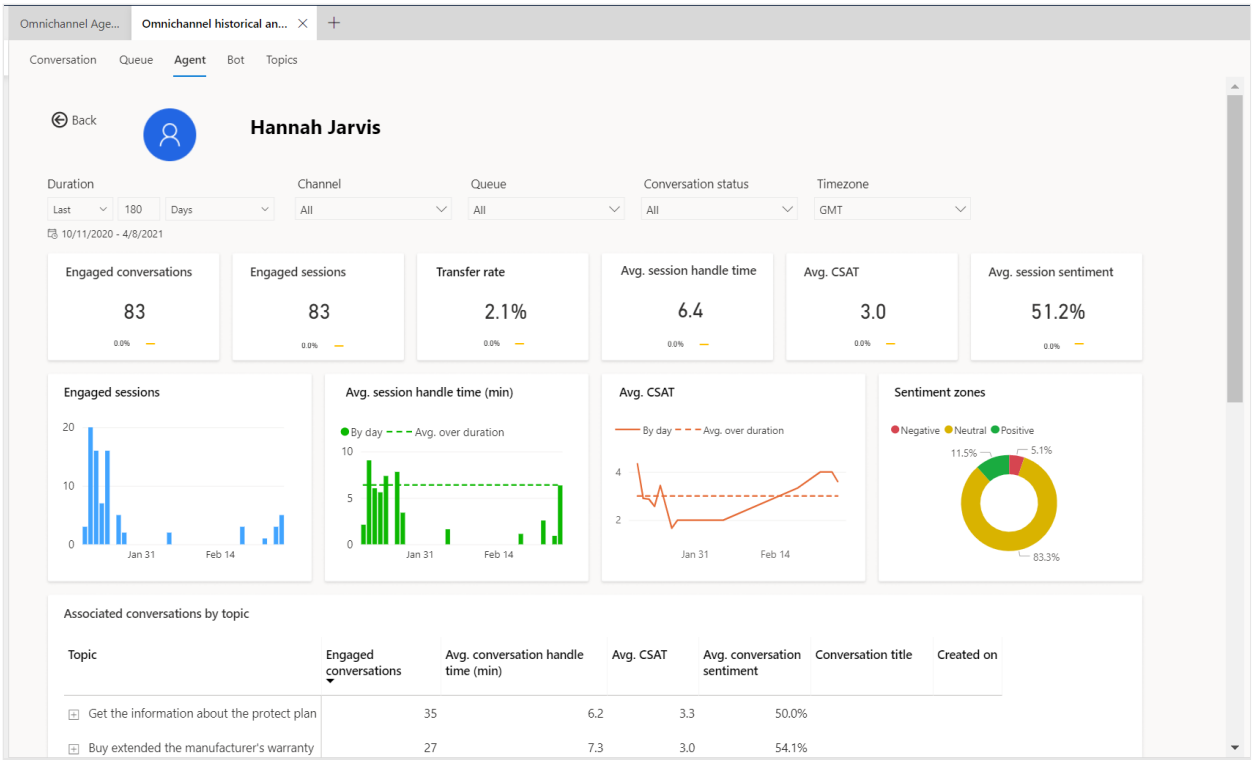
Consult/Monitor	Description
Consult sessions	The number of sessions where the agent has participated in consult mode.
Avg. consult time (min)	The average time an agent spent during a session in consult mode.
Monitor sessions	The number of sessions where the agent has participated in monitor mode.
Avg. monitor time (min)	The average time an agent spent on a session in monitoring mode.

Availability	Description
Agent total login time (hrs)	The time an agent is logged into Omnichannel for Customer Service.
Agent available duration (hrs)	The time an agent is in the available state in Omnichannel for Customer Service.
Agent busy duration (hrs)	The time an agent is in the busy state in Omnichannel for Customer Service.
Agent busy (DND) duration (hrs)	The time an agent is in the busy do not disturb (DND) state in Omnichannel for Customer Service.
Agent away duration (hrs)	The time an agent is in the away state in Omnichannel for Customer Service.
Agent offline duration (hrs)	The time an agent is signed out of Omnichannel for Customer Service.

Agent drill-down view

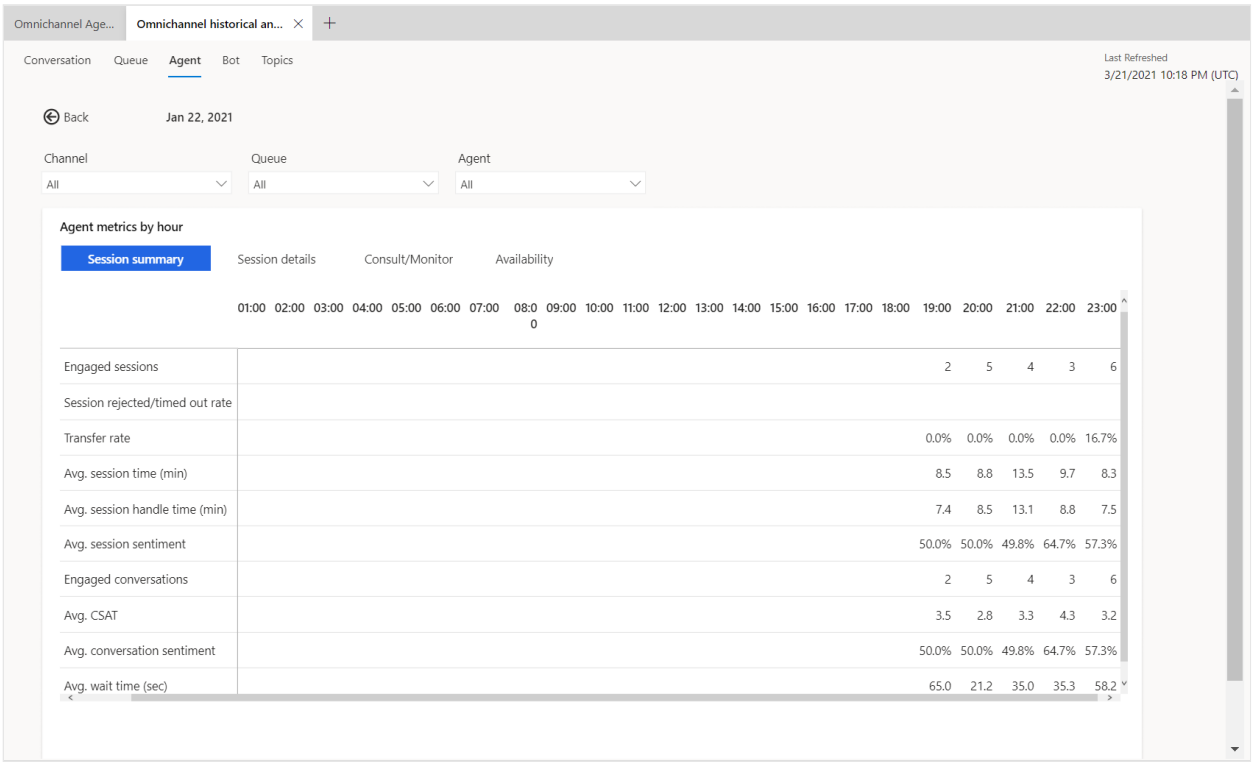
The Agent drill-down view provides supervisors with a holistic look into individual agent performance on metrics and can be valuable in training or coaching scenarios for agents.

To access the drill-down view, select any metric value for the agent you're interested in, and then select **Details**. Use the **Back** button to come back to the main view from a details view. The **Details** button and **Hourly** button are in disabled mode by default and get enabled only when a metric is selected.



Drill down view of agent hourly details

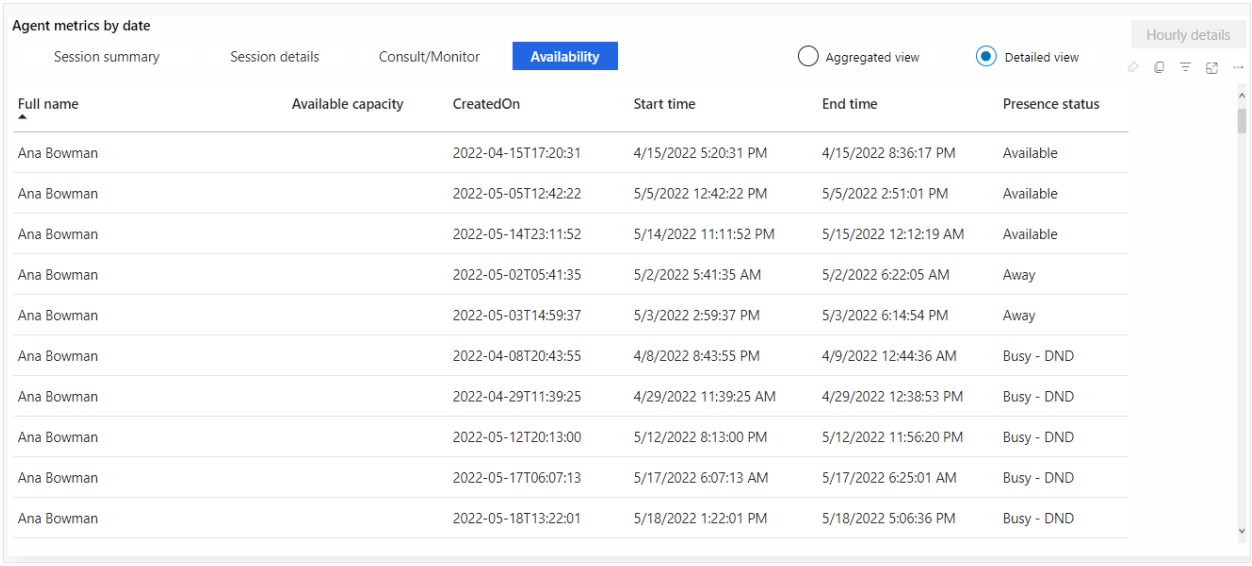
The Agent hourly details drill-down view provides granular insight into the hour-by-hour breakdown of key conversation metrics within the contact center. The metrics for Session summary, Session details, Consult/Monitor, and Availability are the same as in the day-by-day view, ensuring that supervisors can consistently analyze their contact center operation regardless of duration granularity. To view the drill-down view, select any single metric value on the required day, then select **Hourly details**.



Drill down view of agent presence statuses

The agent presence status drill-down view shows the start time and end time of all the presence statuses for agents during their work hours. This data helps you derive the duration of each presence status for the agent.

Select the **Availability** tab. In **Aggregated view**, the duration of the presence status is displayed for each hour. In **Detailed view**, the start and end times of the presence status are displayed for each agent, over a month.



Agent metrics by date

Session summary | Session details | Consult/Monitor | Availability | Aggregated view | Detailed view | Hourly details

Ana Bowman		2022-05-18T13:22:01	5/18/2022 1:22:01 PM	5/18/2022 5:06:36 PM	Busy - DND

Drill down view of agent custom presence

The agent custom presence drill-down view provides insight into the out-of-the-box presence status metrics and custom presence metrics.

Select the **Availability** tab and then select **Aggregated view** to view the hourly details of the various statuses. The **Presence status** column shows metrics for both out-of-the-box and custom-state metrics. For example, on April 5, 2022, the specific agent spent 0.7h in the custom state of **Inactive** and 0.6h in the out-of-the-box status of **Busy - DND**.

Agent metrics by date

Session summary | Session details | Consult/Monitor | Availability | Aggregated view | Detailed view | Hourly details

Presence status	Mar 28, 2022	Mar 29, 2022	Mar 30, 2022	Apr 2, 2022	Apr 3, 2022	Apr 4, 2022	Apr 5, 2022	Apr 6, 2022	Apr 7, 2022	Apr 8, 2022	Apr 9, 2022	Apr 12, 2022	Apr 14, 2022
Available	0.7				1.7						1.6	1.1

Bot dashboard

Article • 10/12/2022

In Omnichannel for Customer Service, you can integrate both Azure and Power Virtual Agents bots to perform tasks like starting a conversation with the customer, providing automated responses, and then transferring the conversation to a human agent, as required. The bot dashboard shows key performance indicators (KPIs) and charts that you can use to understand how bots are performing in a support organization.

If your administrator has enabled **Add historical analytics for bots** in Customer Service admin center, then the dashboard displays the metrics, KPIs, and charts specific to the type of bots integrated with the application.

Access the Bot dashboard

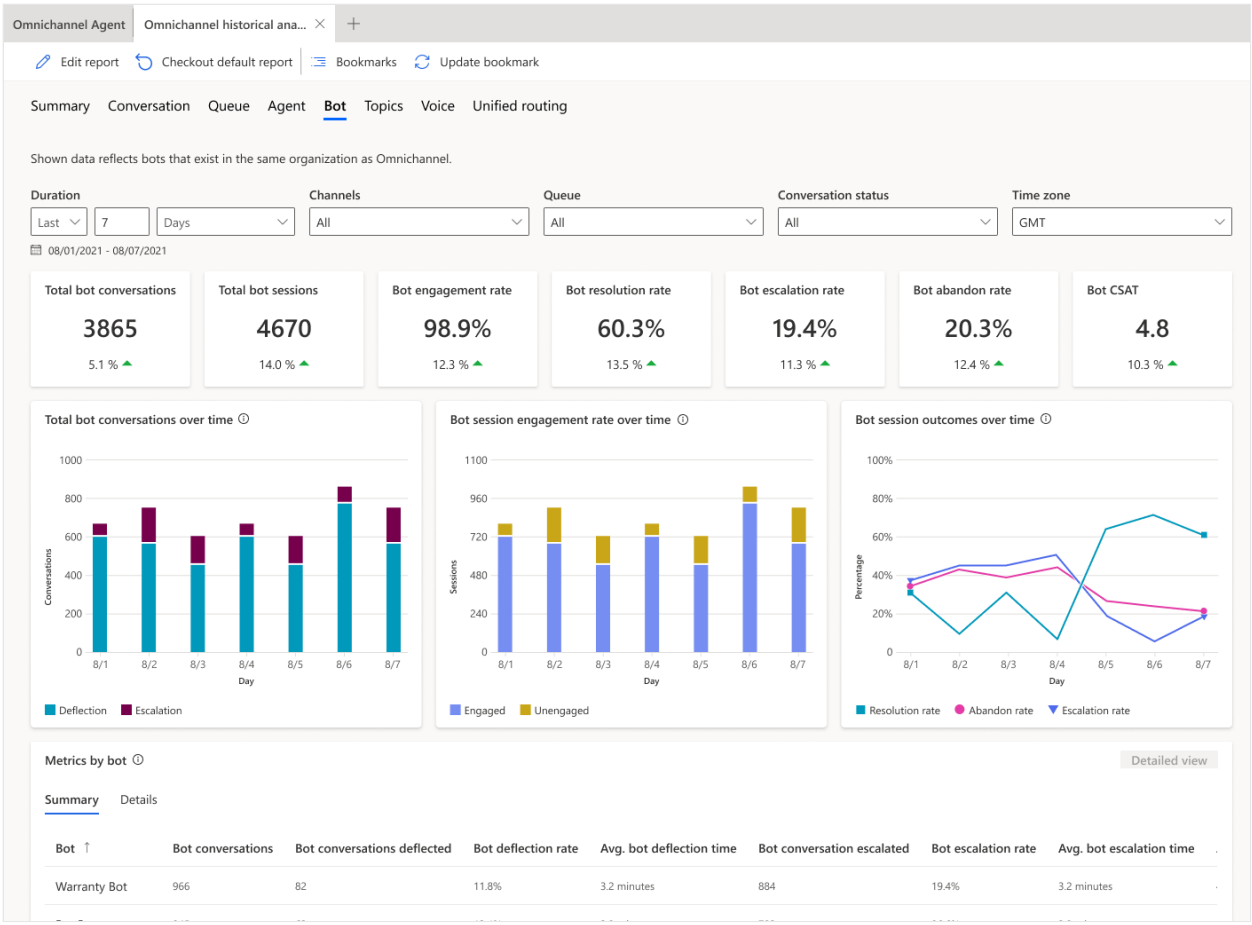
In the Customer Service workspace or Omnichannel for Customer Service app, do one of the following to view the dashboard:

- In the default view, select the plus (+) icon, and then select **Omnichannel historical analytics**.
- If the enhanced multisession workspace view is enabled, select the site map and then select **Omnichannel historical analytics**.

On the page that appears, select the dashboard.

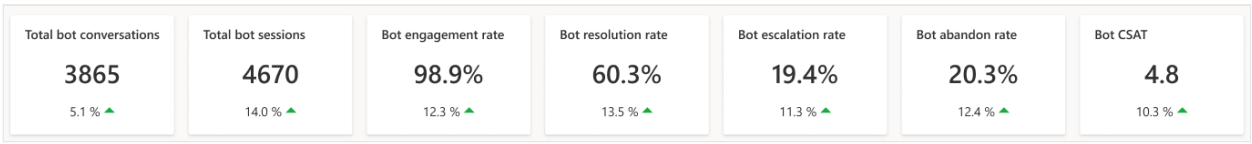
Power Virtual Agents bot dashboard

The bot dashboard displays metrics specific to Power Virtual Agents bots only if Power Virtual Agents bots are integrated with Omnichannel for Customer Service and the **Add historical analytics for bots** checkbox in Customer Service admin center is enabled.



Report details

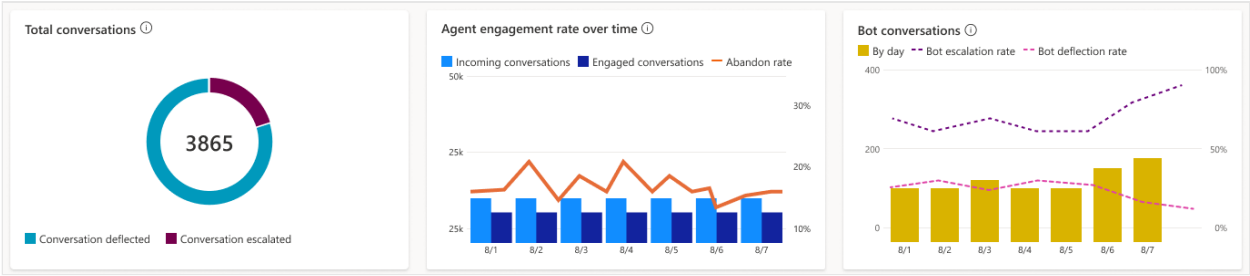
The report summarizes KPIs for the specified time period and the percentage change over that period. These metrics are specific to Power Virtual Agents bots. You can filter these areas by duration, channel, queue, or agent.



KPI	Description
Total bot conversations	The number of conversations initiated by the customer and engaged by a bot.
Bot escalation rate	The percentage of bot sessions that were escalated by a bot to a human agent.
Total bot sessions	The total number of sessions within the specified time period. A bot session is defined as a conversation in which a bot is invoked. The bot can be invoked at the beginning, during, or end of a conversation.

KPI	Description
Bot engagement rate	The percentage of total sessions that are engaged sessions. An engaged session is a session in which a user-created topic (as opposed to a system topic) is triggered, or the session ends in escalation. Engaged sessions can have one of three outcomes: they're either resolved, escalated, or abandoned.
Bot resolution rate	The percentage of sessions that were closed by interacting with a bot out of all the sessions engaged by a bot.
Bot abandon rate	The percentage of engaged sessions that are abandoned. An abandoned session is an engaged session that isn't resolved or escalated after one hour from the beginning of the session.
Bot CSAT	The graphical view of the average of customer satisfaction (CSAT) scores for sessions in which customers respond to an end-of-session request to take the survey.

The following table shows the bot KPI chart metrics.



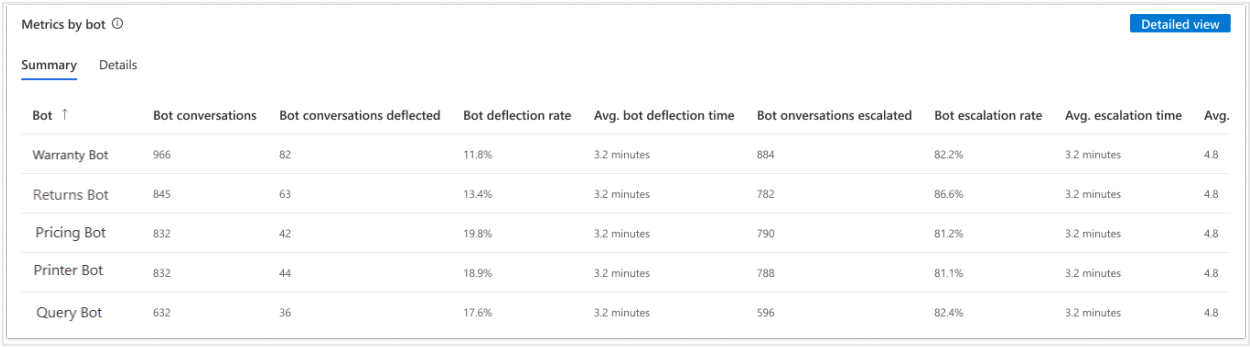
Title	Description
Total conversations	A graphical view of the total number of bot conversations with the number of escalated and deflected conversations over time.
Engagement over time	A graphical view of the number of engaged and unengaged sessions over time. An engaged session is a session in which a user-created topic is triggered or the session ends in escalation.
Session outcomes over time	A graphical view of the daily resolution rate, escalation rate, and abandon rate over the specified time period.

Metrics by bot

The **Metrics by bot** section displays a comprehensive set of analytics that show you the key performance indicators. You can also view the trends and usage for your bot's topics at a granular level, highlighting the topics that have the greatest impact on your bot's performance.

Summary

The **Summary** tab gives you a broad overview of your bot's performance.



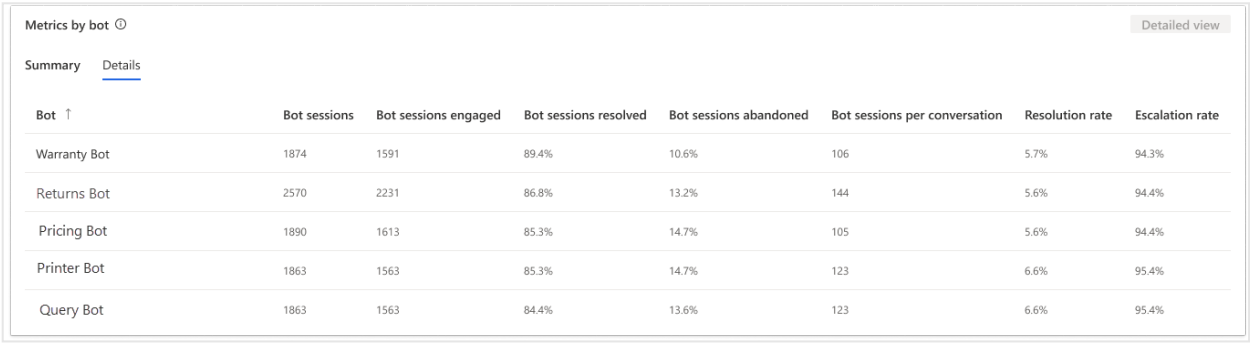
Bot	Bot conversations	Bot conversations deflected	Bot deflection rate	Avg. bot deflection time	Bot onversations escalated	Bot escalation rate	Avg. escalation time	Avg.
Warranty Bot	966	82	11.8%	3.2 minutes	884	82.2%	3.2 minutes	4.8
Returns Bot	845	63	13.4%	3.2 minutes	782	86.6%	3.2 minutes	4.8
Pricing Bot	832	42	19.8%	3.2 minutes	790	81.2%	3.2 minutes	4.8
Printer Bot	832	44	18.9%	3.2 minutes	788	81.1%	3.2 minutes	4.8
Query Bot	632	36	17.6%	3.2 minutes	596	82.4%	3.2 minutes	4.8

KPIs for the following areas are displayed.

Title	Description
Bot conversations	The number of conversations initiated by the customer and engaged by a bot.
Bot resolution rate	The percentage of conversations that were closed by interacting with a bot, out of all conversations engaged by a bot.
Bot resolution time	The length of time, in minutes, for which a customer interacted with a bot before the conversation was closed.
Bot escalation rate	The percentage of conversations that were escalated by a bot to a human agent.
Bot escalation time (min)	The length of time, in minutes, during which a customer interacted with a bot before the conversation was escalated to a human agent.

Details

The **Details** tab gives you an insight into the bot sessions.



Bot	Bot sessions	Bot sessions engaged	Bot sessions resolved	Bot sessions abandoned	Bot sessions per conversation	Resolution rate	Escalation rate
Warranty Bot	1874	1591	89.4%	10.6%	106	5.7%	94.3%
Returns Bot	2570	2231	86.8%	13.2%	144	5.6%	94.4%
Pricing Bot	1890	1613	85.3%	14.7%	105	5.6%	94.4%
Printer Bot	1863	1563	85.3%	14.7%	123	6.6%	95.4%
Query Bot	1863	1563	84.4%	13.6%	123	6.6%	95.4%

KPIs for the following areas are displayed.

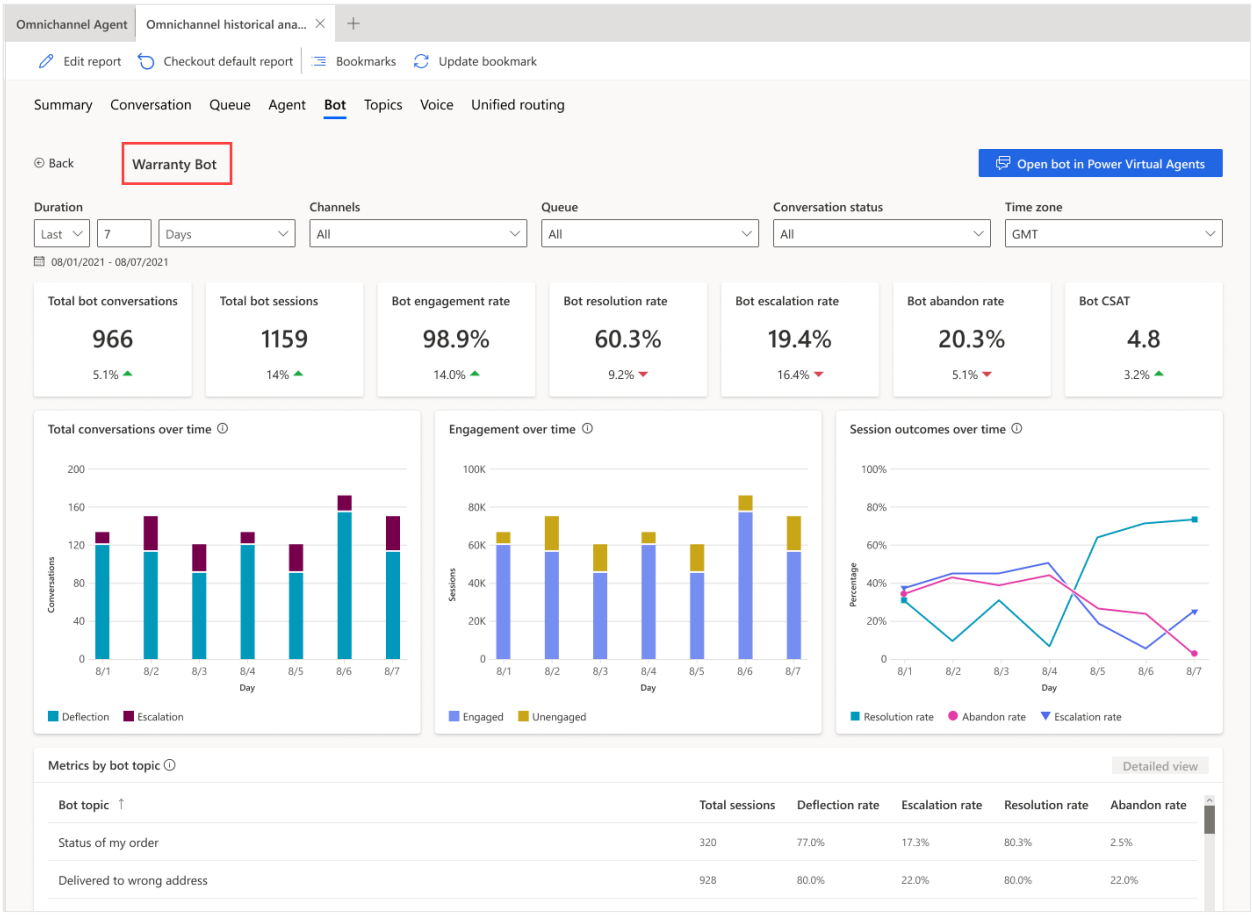
Title	Description
Total sessions	The total number of sessions within the specified time period.
Bot sessions engaged	The number of sessions the bot is engaged in within the specified time period.
Bot sessions resolved	The number of engaged sessions that are resolved by the bot.
Bot sessions abandoned	The number of engaged sessions that are abandoned. An abandoned session is an engaged session that is not resolved or escalated after one hour from the beginning of the session.
Bot sessions per conversation	The average number of Power Virtual Agents bot sessions per conversation.
Session resolved rate	The percentage of total sessions that were resolved by the bot within the specified time period.
Sessions escalated rate	The percentage of total sessions that were escalated by the bot to a human agent within the specified time period.

Bot drill-down view

In the **Metrics by bot** section, you can select a Power Virtual Agents bot to view the individual bot's performance on the bot drill-down view. Bot topics and their corresponding metrics are also displayed, giving supervisors further insights into individual topic performance.

To access the drill-down view, select the bot that you're interested in, and then select **Detailed view**.

The application displays the key performance metrics and charts for the individual bot.



Title	Description
Total conversations	The number of conversations initiated by the customer and engaged by the bot.
Total sessions	The total number of sessions within the specified time period. A bot session is defined as a conversation in which a bot is invoked. The bot can be invoked at the beginning, during, or end of a conversation.
Engagement rate	The percentage of total sessions that are engaged by the bot. An engaged session is a session in which a user-created topic (as opposed to a system topic) is triggered, or the session ends in escalation. Engaged sessions can have one of three outcomes—they're either resolved, escalated, or abandoned.
Resolution rate	The percentage of engaged sessions that are resolved. A resolved session is an engaged session in which the user receives an end-of-conversation survey that asks the question "Did that answer your question?" and the user either doesn't respond or responds **Yes**.
Escalation rate	The percentage of engaged sessions that are escalated by the bot. An escalated session is an engaged session that is escalated to a human agent.
Abandon rate	The percentage of engaged sessions that are abandoned. An abandoned session is an engaged session that isn't resolved or escalated after one hour from the beginning of the session.

Title	Description
Bot CSAT	The average of customer satisfaction (CSAT) scores for sessions in which customers respond to an end-of-session request to take the survey.

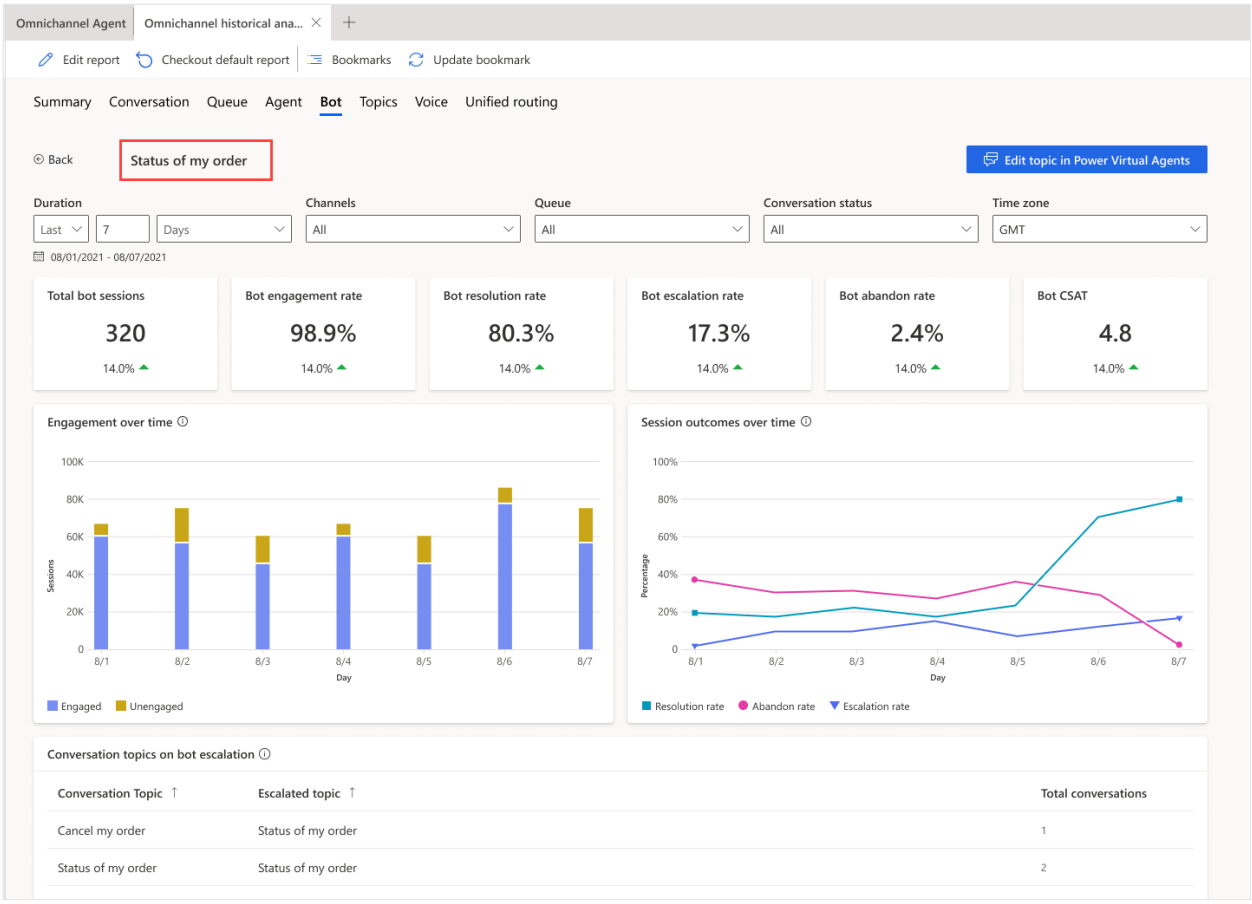
The following charts are displayed:

Title	Description
Total conversations over time	The number of conversations initiated by the customer and engaged by the bot that were either escalated or deflected.
Engagement over time	Provides a graphical view of the number of engaged and unengaged sessions over time. An engaged session is a session in which a user-created topic is triggered or the session ends in escalation.
Session outcomes over time	Provides a graphical view of the daily resolution rate, escalation rate, and abandon rate over the specified time period.

Metrics by bot topic

The **Metrics by bot topic** section provides insights into the performance of individual bot topics and their key business metrics. The metrics give the supervisor an overview of which topics the bot was able to deflect or escalate.

You can also select a topic and drill down into the individual topic performance and metrics. The topic-level metrics help supervisors further analyze how the bot is handling the topic.

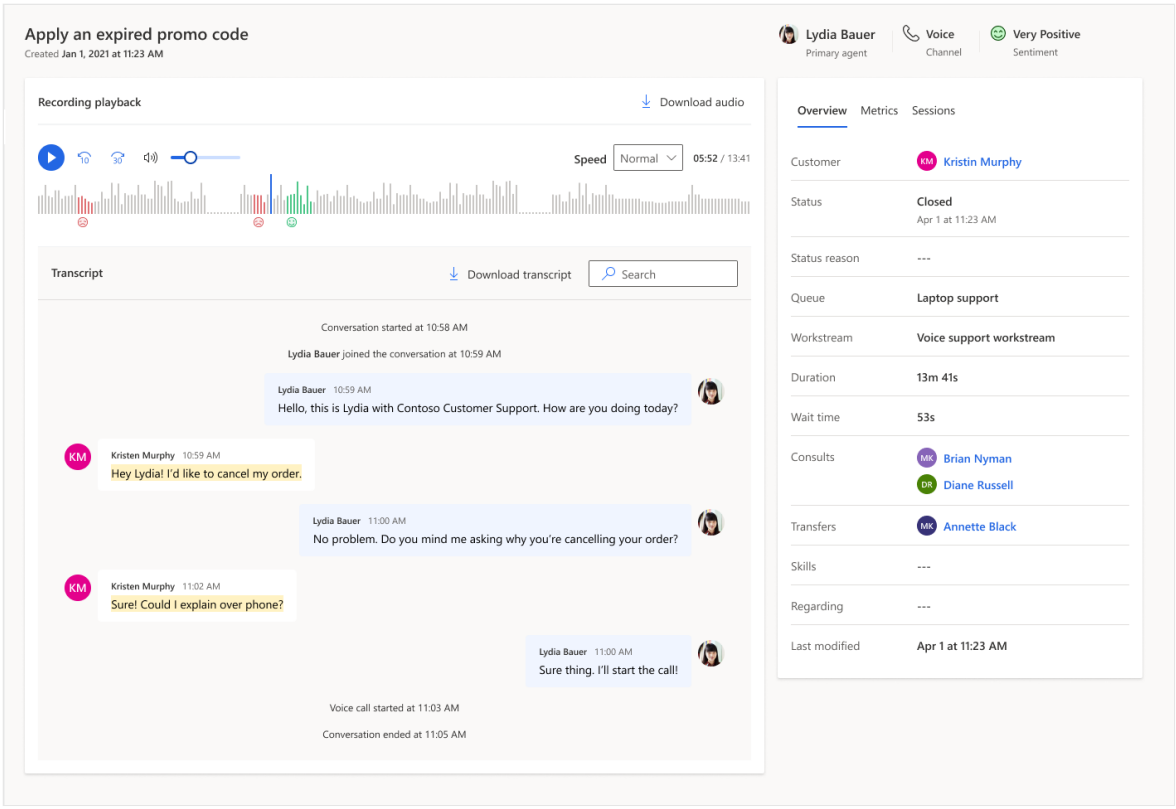


The **Bot conversation metrics** section provides the topic transcripts, allowing supervisors to go through the bot's interactions for the topic and take corrective measures.

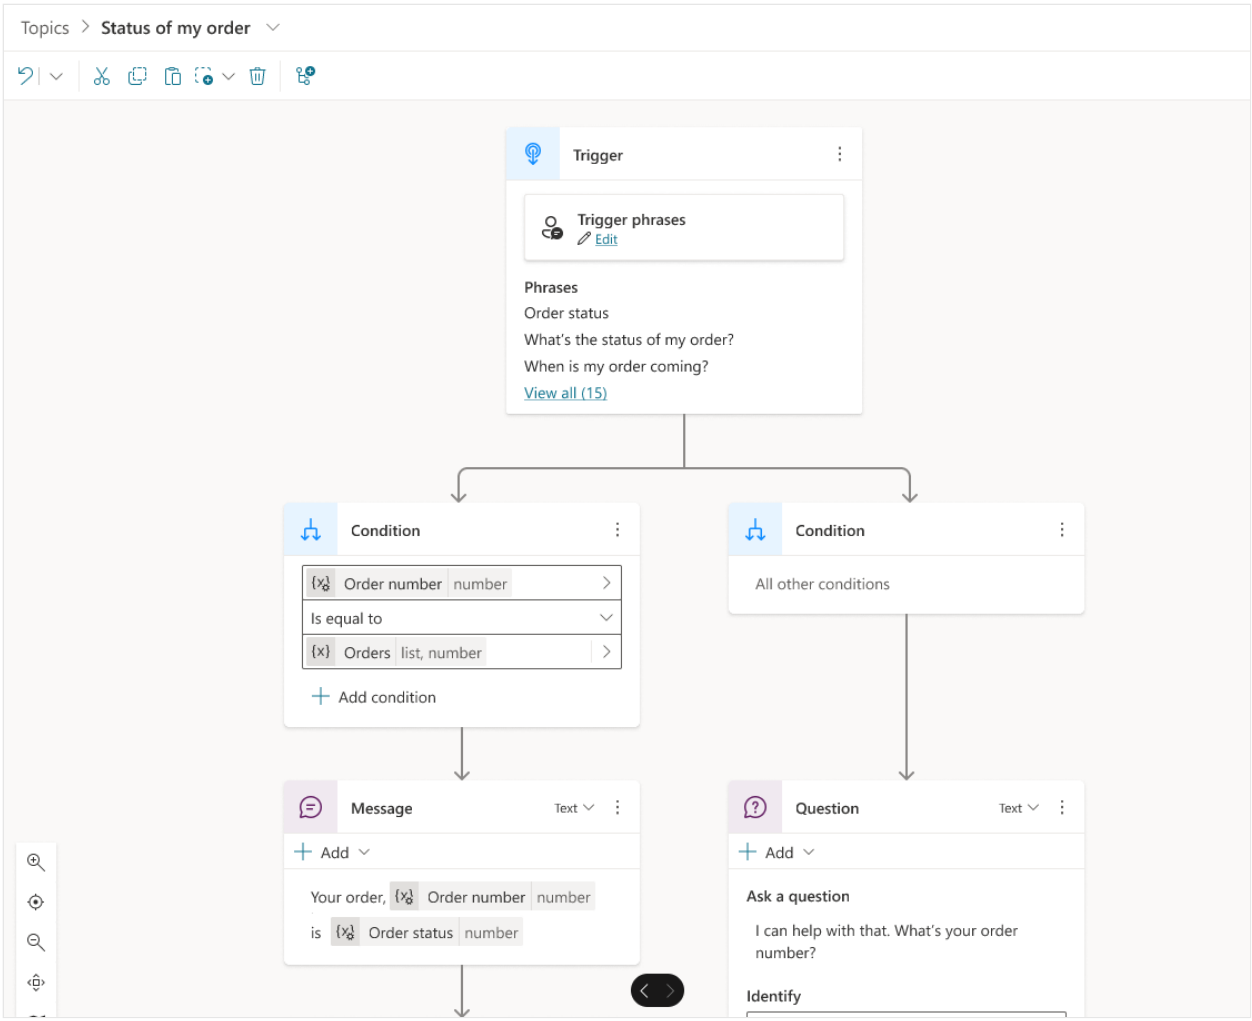
View and improve bot topics

You can view and improve the performance of individual topics associated with a Power Virtual Agents bot by performing the following steps:

1. On the bot drill-down page, for a bot, select the topic to view the topic-specific metrics. You can also view and download up to seven days of bot conversation transcript sessions from the past 30 days.

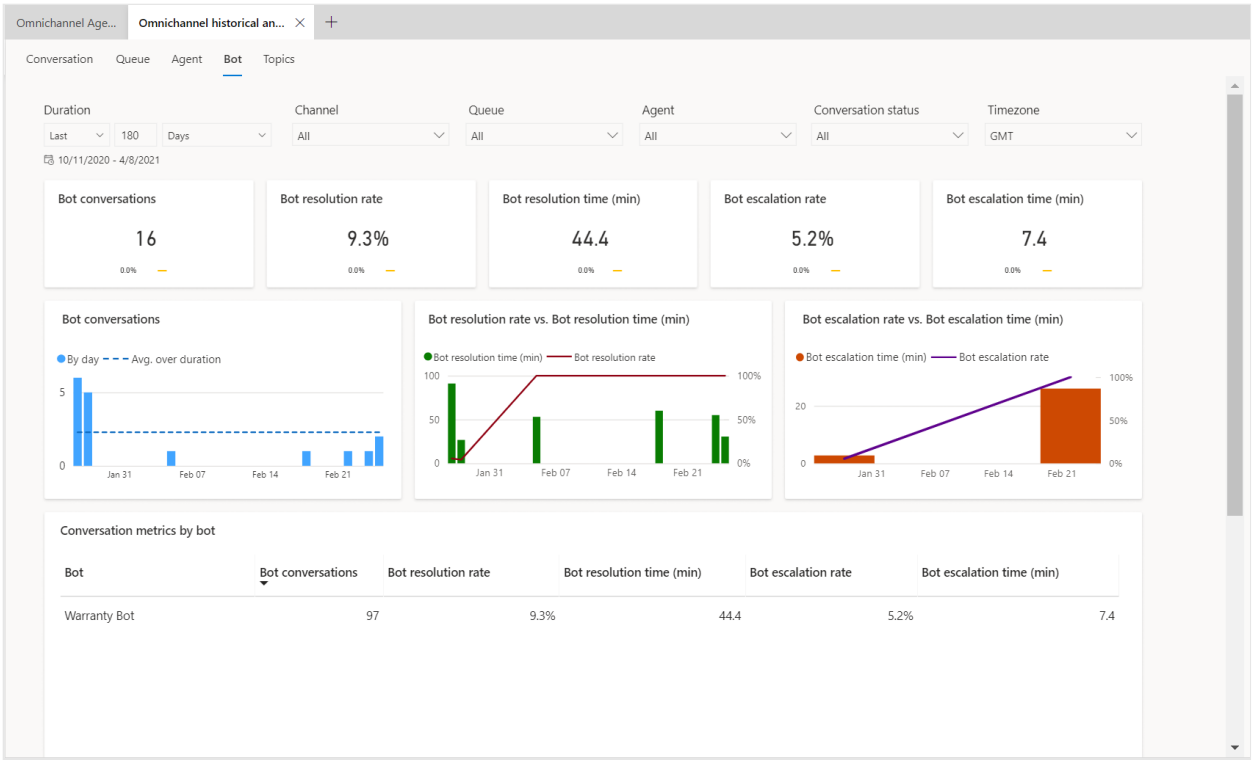


2. To edit the bot responses to a topic, select **Edit Power Virtual Agents** on the Topics metrics grid. This opens the corresponding Power Virtual Agents bot. You can modify both the topic name and trigger phrases, and for trigger phrases, you can add more.



Dashboard for all bots

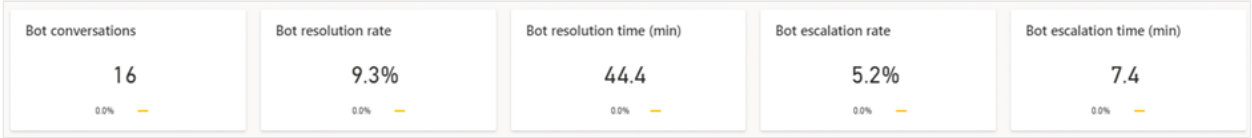
The **bot** dashboard summarizes the KPIs for all the bots integrated with Omnichannel for Customer Service for the specified time period and percent change over a period. The application displays this view only if your administrator has disabled the **Add historical analytics for bots** checkbox in Customer Service admin center. You can filter these areas by duration, channel, queue, or agent.



Report details

KPIs for the following areas are displayed.

KPI	Description
Bot conversations	The number of conversations initiated by the customer and engaged by a bot.
Bot resolution rate	The percentage of conversations that were closed by interacting with a bot out of all conversations engaged by a bot.
Bot resolution time (min)	The time in minutes for which a customer interacted with a bot before the conversation was closed.
Bot escalation rate	The percentage of conversations that were escalated by a bot to a human agent.
Bot escalation time (min)	The time in minutes for which a customer interacted with a bot before the conversation was escalated to a human agent.



The following table explains the bot KPI chart metrics.

Title	Description

Title	Description
Bot conversations	The total number of bot conversations occurring per day.
Bot resolution rate versus Bot resolution time (min)	The number of customer issues resolved by a bot versus the amount of time it took to resolve them.
Bot escalation rate versus Bot escalation time (min)	The number of customer sessions escalated by a bot to human agent versus the amount of time the bot was engaging before escalation.

Title	Description
Bot conversations	The number of conversations initiated by the customer and engaged by a bot.
Bot resolution rate	The percentage of conversations that were closed by interacting with a bot out of all conversations engaged by a bot.
Bot resolution time	The time in minutes for which a customer interacted with a bot before the conversation was closed.
Bot escalation rate	The percentage of conversations that were escalated by a bot to a human agent.
Bot escalation time (min)	The time in minutes for which a customer interacted with a bot before the conversation was escalated to a human agent.

Bot hourly detail drill-down view

The **Bot metrics by hour** drill-down view provides more granular insight into the hour-by-hour breakdown of key conversation metrics within the contact center. The metrics are the same as the day-by-day view ensuring that supervisors can consistently analyze their contact center operation regardless of desired duration granularity. To view the bot metrics by hour in the drill-down view, select any single metric value on the desired day, then select **Hourly details**.

Conversation Topics dashboard

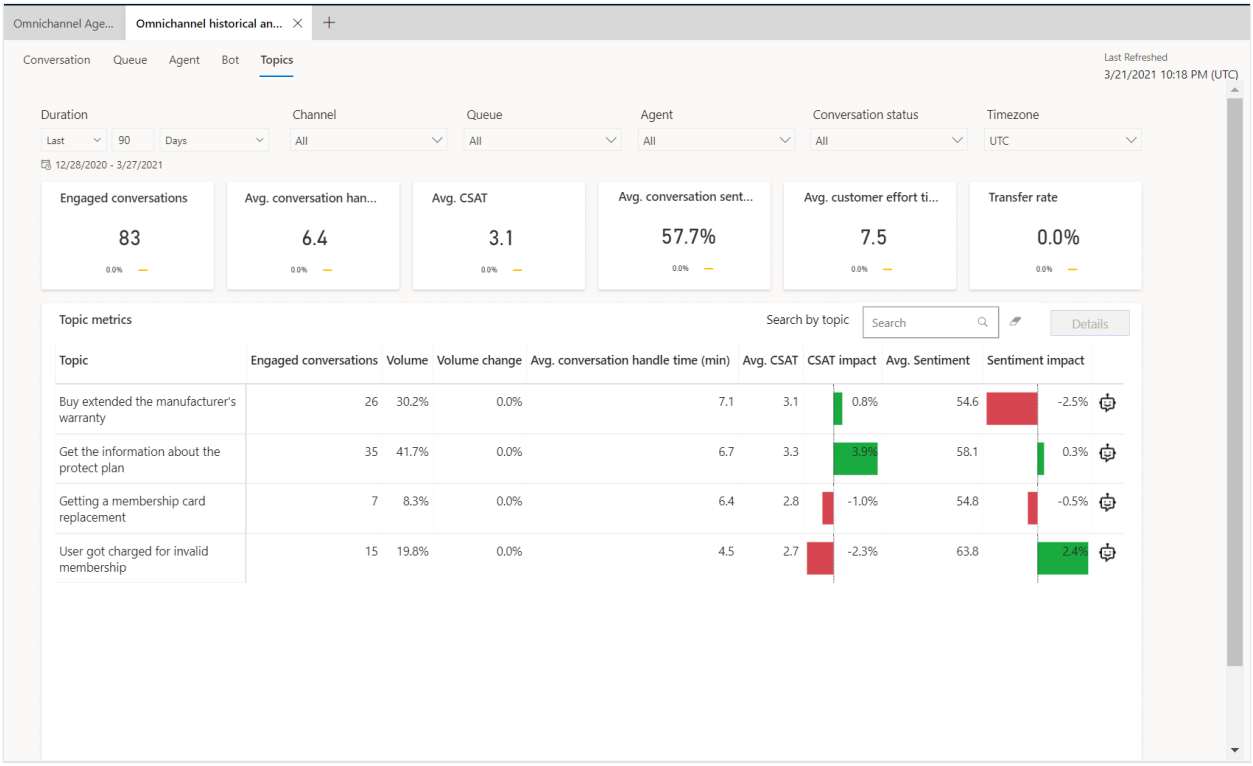
Article • 01/27/2023

The Topics dashboard shows a detailed breakdown of conversations and their assigned topics. Customer Service Insights uses AI-generated topics and natural language understanding to automatically group your conversations to help you better understand how different topic areas are impacting your organization's support performance.



Access the Topics dashboard

In the Customer Service workspace or Omnichannel for Customer Service app, do one of the following to view the dashboard:

- In the default view, select the plus (+) icon, and then select **Omnichannel historical analytics**.
- If the enhanced multisession workspace view is enabled, select the site map and then select **Omnichannel historical analytics**.

On the page that appears, select the dashboard.

Report Details

The key performance indicator summary charts summarize the KPIs for the specified time and the percent change over the period. You can filter these areas by duration,

channel, queue, agent, conversation status, and time zone.

KPIs for the following areas are displayed:

KPI	Description
Engaged conversations	Offered conversations that are engaged by an agent. Customer-to-agent communication can begin at this point.
Avg. conversation handle time (min)	The average total conversation active time across engaged conversations.
Avg. CSAT	The average CSAT score provided by customers from Dynamics 365 Customer Voice survey responses.
Avg. conversation sentiment	The average predicted sentiment of the customer across engaged conversations.
Avg. customer effort time (min)	The average time from the start of conversation to the start of the conversation wrap-up time.
Transfer rate	The number of sessions transferred by an agent.

The topics metrics chart displays the following metrics.

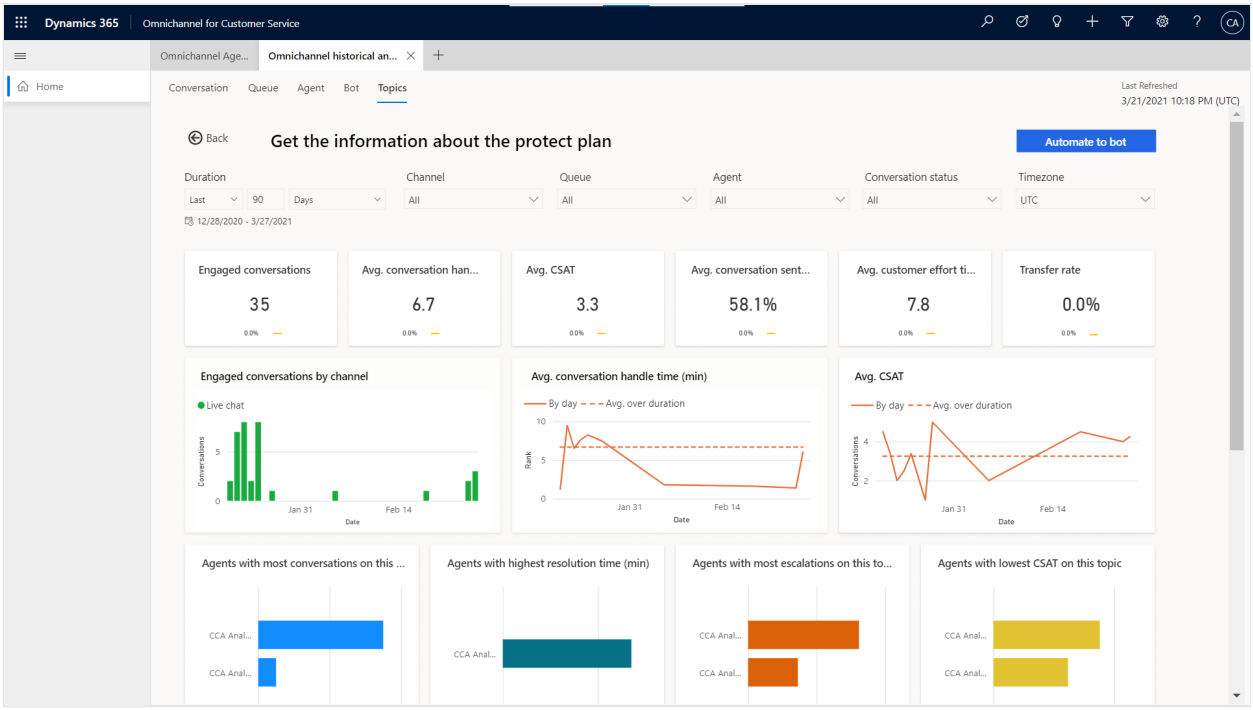
KPI	Description
Engaged conversations	Offered conversations that are engaged by an agent. Customer-to-agent communication can begin at this point.
Volume	The total conversation volume from customers.
Volume change	The change in conversation volume from customers over the specified duration.
Avg. conversation handle time (min)	The average total conversation active time across engaged conversations.
Avg. CSAT	The average CSAT score provided by customers from Customer Voice survey responses. This is only available if Dynamics 365 Customer Voice has been configured as a post-conversation survey tool.
CSAT impact	The impact (downward or upward) that the conversations in the selected topic group are driving the overall organization CSAT.
Avg. sentiment	The average of customer sentiment based on verbatim provided in survey responses. Only available if Customer Voice has been configured as a post conversation survey tool.

KPI	Description
Sentiment impact	The impact (downward or upward) that the conversations in the selected topic group are driving the overall organization sentiment.
Power Virtual Agents icon	Supervisors can use this icon to select the topic for automation to Power Virtual Agents.

Conversation Topics drill-down view

The Topics drill-down view provides supervisors with a holistic look into individual topics in reference to key business metrics, and can be valuable in understanding why customers are contacting support.

To access the drill-down, select any metric value for the topic you're interested in, and then select **Details**.



Topic automation to Power Virtual Agents

AI-discovered topics in Omnichannel Historical Analytics are often prime candidates as topics for automation in Power Virtual Agents bots. If Power Virtual Agents is available in the region that your Customer Service organization is in, the feature can be enabled by your organization's administrator.

After a topic is identified as a good automation candidate, the automation workflow can be triggered by selecting Power Virtual Agents on the **Topics** metrics grid or by selecting

Details and then **Automate to Bot** in the drill -down view. This will open the topic editing form.

Suggested trigger phrases and the topics related to the case title are provided. The first step is to select the Power Virtual Agents bot that's ideal for adding the topic to. If no bot exists, select **Create Bot**. You'll be redirected to the Power Virtual Agents application for bot creation. You can modify both the topic name and trigger phrases, and in the case of trigger phrases; you can add additional ones. After this step is complete, select **Automate Continue** . The Power Virtual Agents topic will redirect to Power Virtual Agents for completion of authoring.

> ⓘ **Note**
>
> Bots created through the Microsoft Teams channel won't be listed in the bot selection list.

Language availability for topics

The topics capability in the Customer Service historical analytics reports comes with a natural language understanding model that can understand the text semantics and intent in the following languages:

- English
- French
- German
- Italian
- Japanese
- Portuguese
- Simplified Chinese
- Spanish

> ⓘ **Note**
>
> While topic discovery is not prevented and still possible in languages that are not listed above, there may be differences in experience for users who leverage topics in unsupported languages.

Voicemail dashboard

Article • 02/02/2023

The Voicemail dashboard provides a view of the voicemails with details, such as the voicemail status and the number of voicemails per queue and agent.

Access the Voicemail dashboard

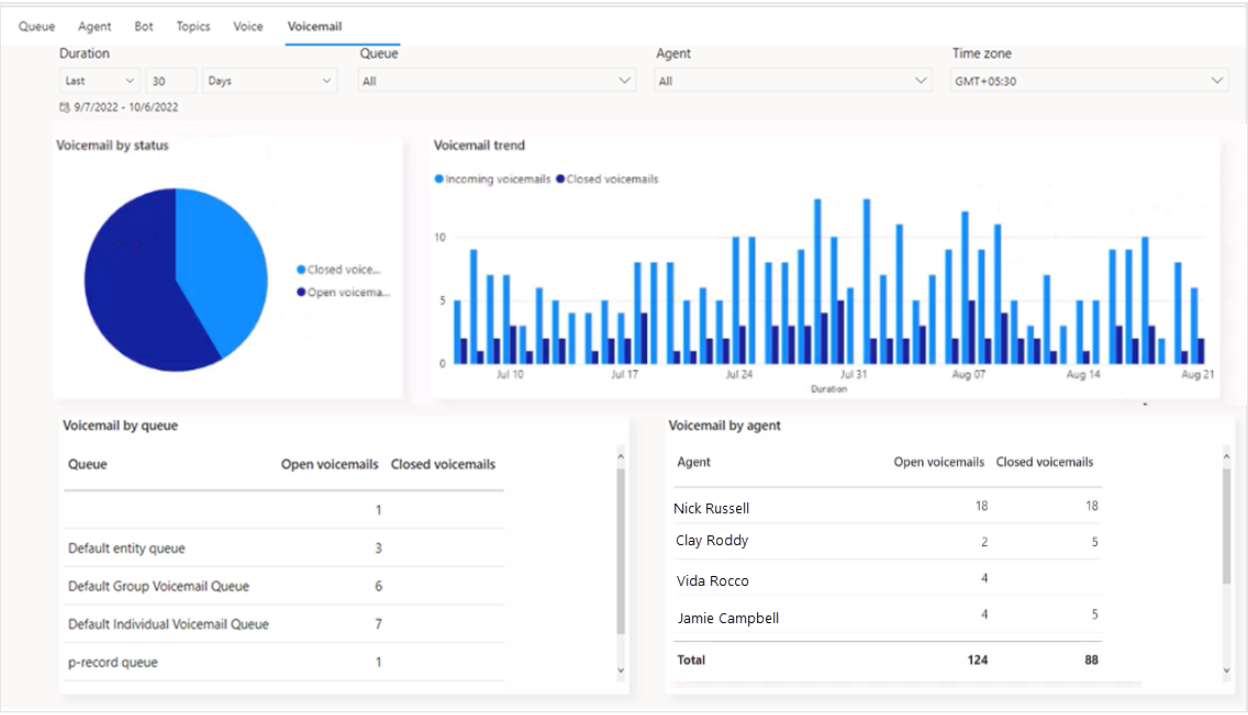
In the Customer Service workspace or Omnichannel for Customer Service app, do one of the following to view the dashboard:

- In the default view, select the plus (+) icon, and then select **Omnichannel historical analytics**.
- If the enhanced multisession workspace view is enabled, select the site map and then select **Omnichannel historical analytics**.

On the page that appears, select the dashboard.

Report details

The reports summarize the KPIs for the specified time and percentage change over a period of time. You can filter these areas by duration, queue, agent, and time zone. The charts display the following metrics.



KPI	Description

KPI	Description
Voicemail by status	The number of voicemails that were initiated by the customer with the status open or close.
Voicemail trend	The number of incoming and closed voicemails per day, for the specified duration.
Voicemail by queue	The number of voicemails by queue.
Voicemail by agent	The number of voicemails assigned to an agent.

Historical analytics for unified routing in Omnichannel for Customer Service

Article • 10/12/2022

With the introduction of unified routing, an advanced and elaborate set of capabilities are available for organizations to enhance their routing configurations. Supervisors and business administrators need metrics to track how these advanced routing capabilities are helping their businesses serve their customers.

Access the Unified routing dashboard

In the Customer Service workspace or Omnichannel for Customer Service app, do one of the following to view the dashboard:

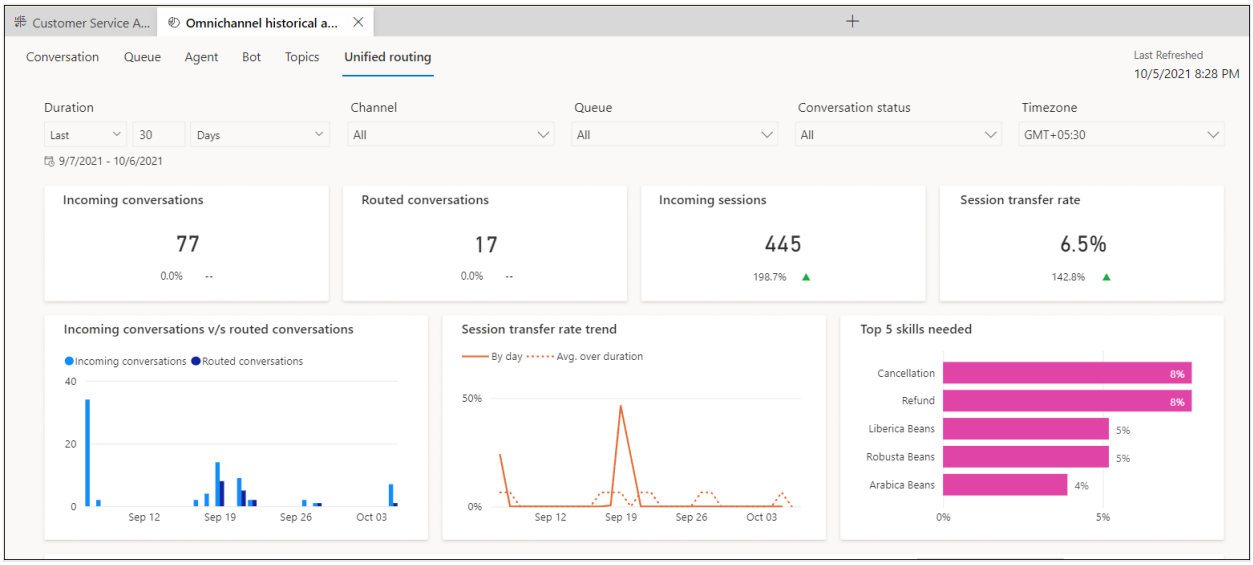
- In the default view, select the plus (+) icon, and then select **Omnichannel historical analytics**.
- If the enhanced multisession workspace view is enabled, select the site map and then select **Omnichannel historical analytics**.

On the page that appears, select the dashboard.

Unified routing report in Omnichannel historical analytics

The Unified routing report provides routing-specific KPIs and metrics that can be used by supervisors and administrators to track the success of their routing strategy. They can also track the incorrectly routed work items and configurations and correct them to improve the routing effectiveness and thereby customer satisfaction.

The report appears as a tab in the Omnichannel historical analytics report if your administrator has enabled the corresponding setting on the **Insights** page in Omnichannel admin center.



The report can be filtered on the following:

- **Duration**: Filters the data by the selected value of day, week, or month.
- **Channel**: Filters the data for the selected channel.
- **Queue**: Filters the data for the selected queue.
- **Conversation status**: Filters the data for the selected status.
- **Time zone**: Filters the data for the selected time zone.

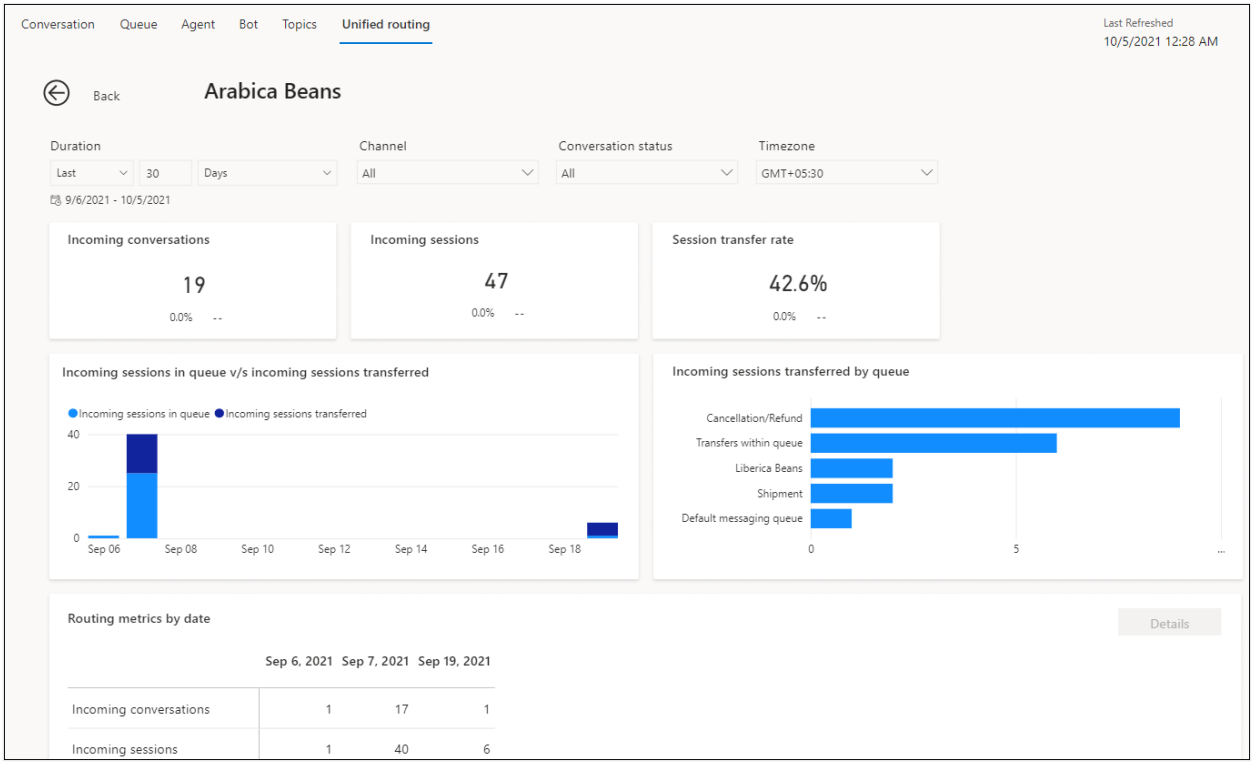
The unified routing report displays the following metrics for the selected filters. The percentage value for each KPI denotes the comparative data with the previous period.

Metric	Description	Derivation
Incoming conversations	The number of conversations initiated by the customer that can be presented to a human agent.	All conversations, except bot conversations, are considered.
Routed conversations	The total number of incoming conversations that have been routed successfully. **Note:** A conversation routed to a fallback queue is not considered in the calculation of the metric.	
Incoming sessions	The total number of sessions that were created.	
Session transfer rate	The percentage of incoming sessions that were transferred to another agent or queue.	
Incoming conversations v/s routed conversations	The number of conversations initiated by the customer versus the number of conversations that were routed successfully.	

Metric	Description	Derivation
Session transfer rate trend	The day wise trend of session transfer rate.	
Top 5 Skills demanded	The top five skills required by the incoming conversations.	

Queue drill-down view

On the **Unified routing** report page, in the **Routing metrics by queue** table, select a queue, and then select **Details** to view the detailed KPIs for it. You can view data on incoming conversations, incoming sessions, and session transfer rate for the queue.

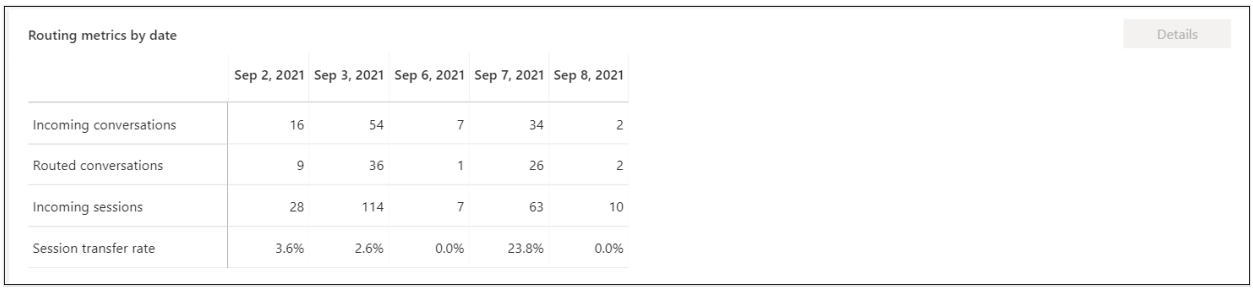


The queue drill-down view displays the following KPIs.

Metric	Description
Incoming sessions in queue vs incoming sessions transferred	The day-wise view of incoming sessions in the selected queue that are still in the queue versus sessions that have been transferred to other queues.
Incoming session transferred by queue	The queues to which sessions from the selected queue have been transferred.

Hourly drill-down view

On the **Unified routing** report page, the **Routing metrics by date** table displays the day wise data for the KPIs for the selected period in the **Duration** filter.



Routing metrics by date

Details

	Sep 2, 2021	Sep 3, 2021	Sep 6, 2021	Sep 7, 2021	Sep 8, 2021
Incoming conversations	16	54	7	34	2
Routed conversations	9	36	1	26	2
Incoming sessions	28	114	7	63	10
Session transfer rate	3.6%	2.6%	0.0%	23.8%	0.0%

You can select a date, and then select **Details** to view the routing metrics by the hour.

Introduction to knowledge analytics

Article • 10/03/2022

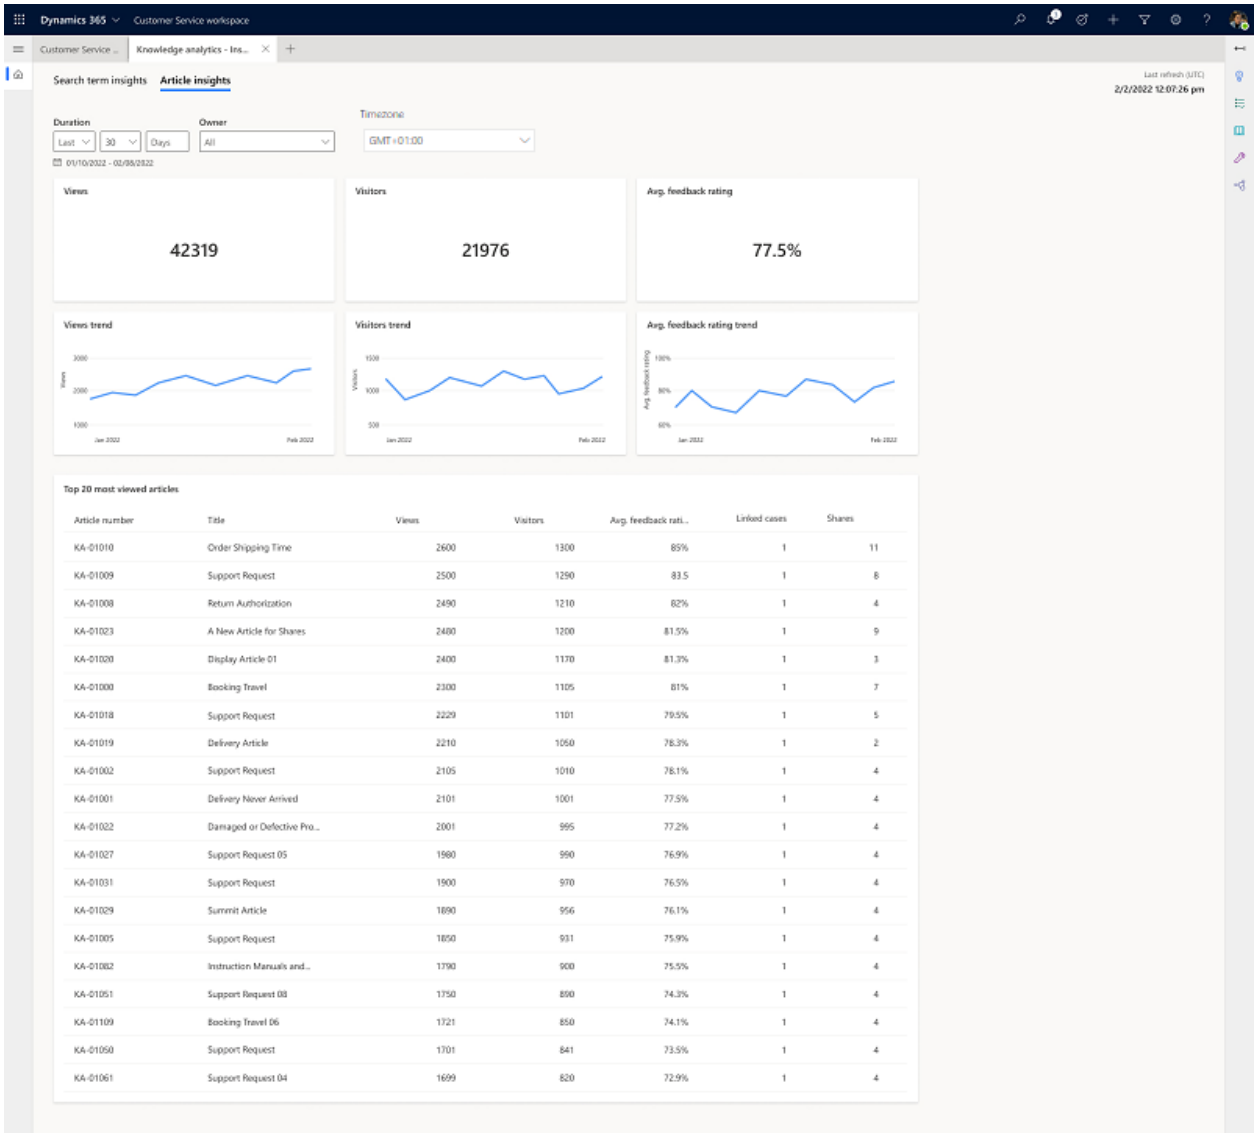
Knowledge analytics helps provide knowledge workers and supervisors with valuable insights about how knowledge articles are being used and searched. Supervisors can use these insights to improve their knowledge management system.

Knowledge analytics includes the following features:

- Article insights
- Search term insights

Article insights

The Article insights dashboard can help your organization's knowledge workers to understand the impact that knowledge management is making on the overall support experience. The insights include details about articles that are shared.



Metrics in Article insights dashboard

The Articles insights dashboard represents the following metrics.

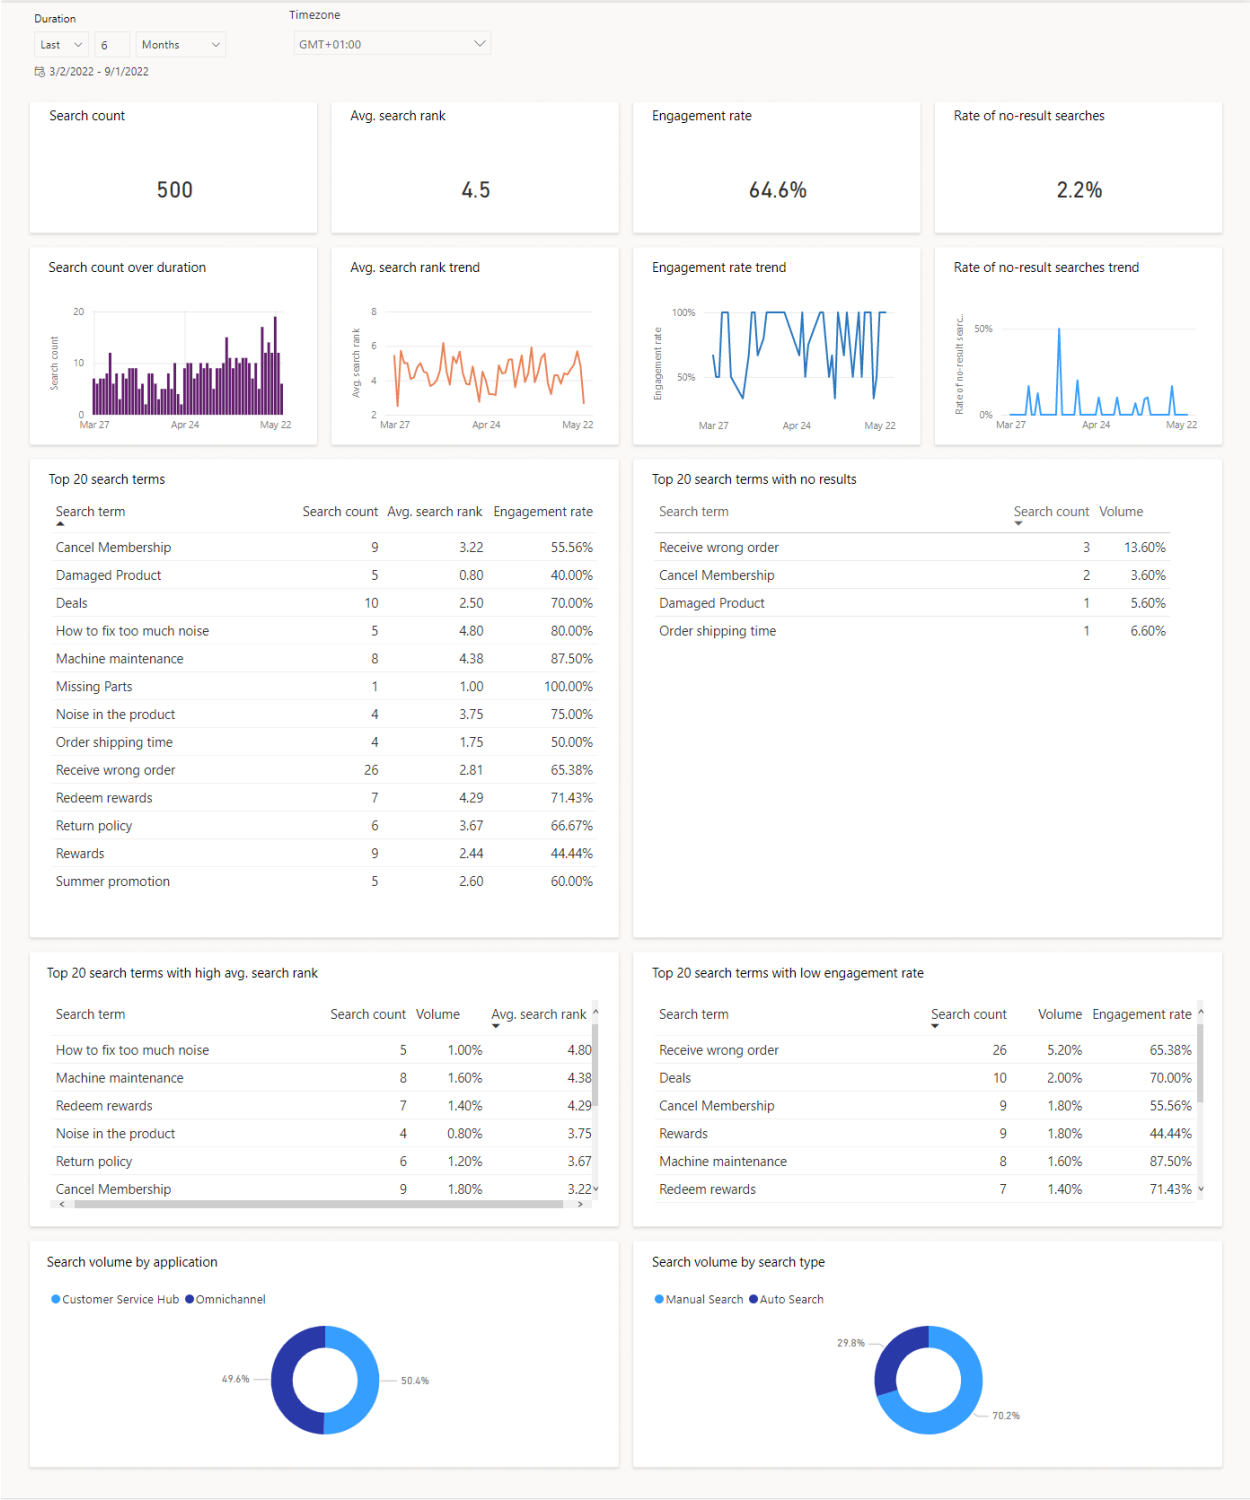
Metrics or chart	Definition
Duration	The duration for which you want to see the report.
Owner	The owner of the knowledge article.
Timezone	The time information according to the time zone that you specify.
Views	The total number of views on the knowledge articles.
Visitors	The total number of unique visitors who viewed the knowledge articles.
Avg. feedback rating trend	The average feedback rating provided by the consumers of the knowledge articles.
Most viewed articles	The top 20 articles used, along with visitors, average feedback rating, linked cases and shares metrics.
Linked cases	The total number of cases that were linked to the articles.
Shares	The total number of the article that were shared by the support representative.

Search term insights

The Search term insights dashboard is designed to provide supervisors and knowledge workers with valuable insights into how agents find and use knowledge articles.

Your administrator must enable the dashboard for you to access it. More information: Configure Knowledge search insights.

> **Note**
>
> Knowledge search term insights won't provide information about customer search behavior. Data is from internal knowledge searches only.



As a knowledge manager, it's your responsibility to maintain and improve your organization's overall knowledge base article offerings. By identifying searches that have low success or return no results, the knowledge Search term insights dashboard can help you identify knowledge gaps, improve search results, and surface the most relevant articles.

Metrics in knowledge Search term insights dashboard

The knowledge Search term insights dashboard represents the following metrics.

KPIs or chart	Definition
Search count	The total number of searches completed within a given period.
Search count over duration	The number of searches completed within a certain amount of time.
Avg. search rank	The average position of the link selected by a user when presented within search results.
Avg. search rate trend	The day-by-day trend of the average list position of the link selected by a user when presented with search results.
Engagement rate	The percentage of events where a user interacted with the search results compared to the search events presented with results.
Engagement rate trend	The day-by-day trend of the percentage of events where a user interacted with the search results compared to the search events presented with results.
Rate of no-result searches	Percentage of instances where the searched term displayed no results.
Rate of no-result searches trend	The day-by-day trend of the percentage of search instances that displayed "no results".
Top 20 search terms	The top 20 terms being searched, showing the number of times searched, the average search rate, and engagement rate.
Top 20 search terms with no results	The top 20 search terms that returned no results when searched.
Top 20 search terms with high avg. search rank	The top 20 search topics by volume with an average click position of greater than five.
Top 20 search terms with low engagement rate	The top 20 search topics by volume with engagement rate of less than 40 percent.
Search volume by application	The percentage of searches across multiple applications.
Search volume by search type	The percentage of searches based on whether they were manual or automatic searches.

View reports in different time zones

Use the Timezone option available in the reports to view the time information according to the time zone that you specify. You can save your preferred time zone settings for

reports as bookmarks. The bookmarks allow you to switch between reports in various time zones, without having to set the time zone. More information: Manage bookmarks for reports

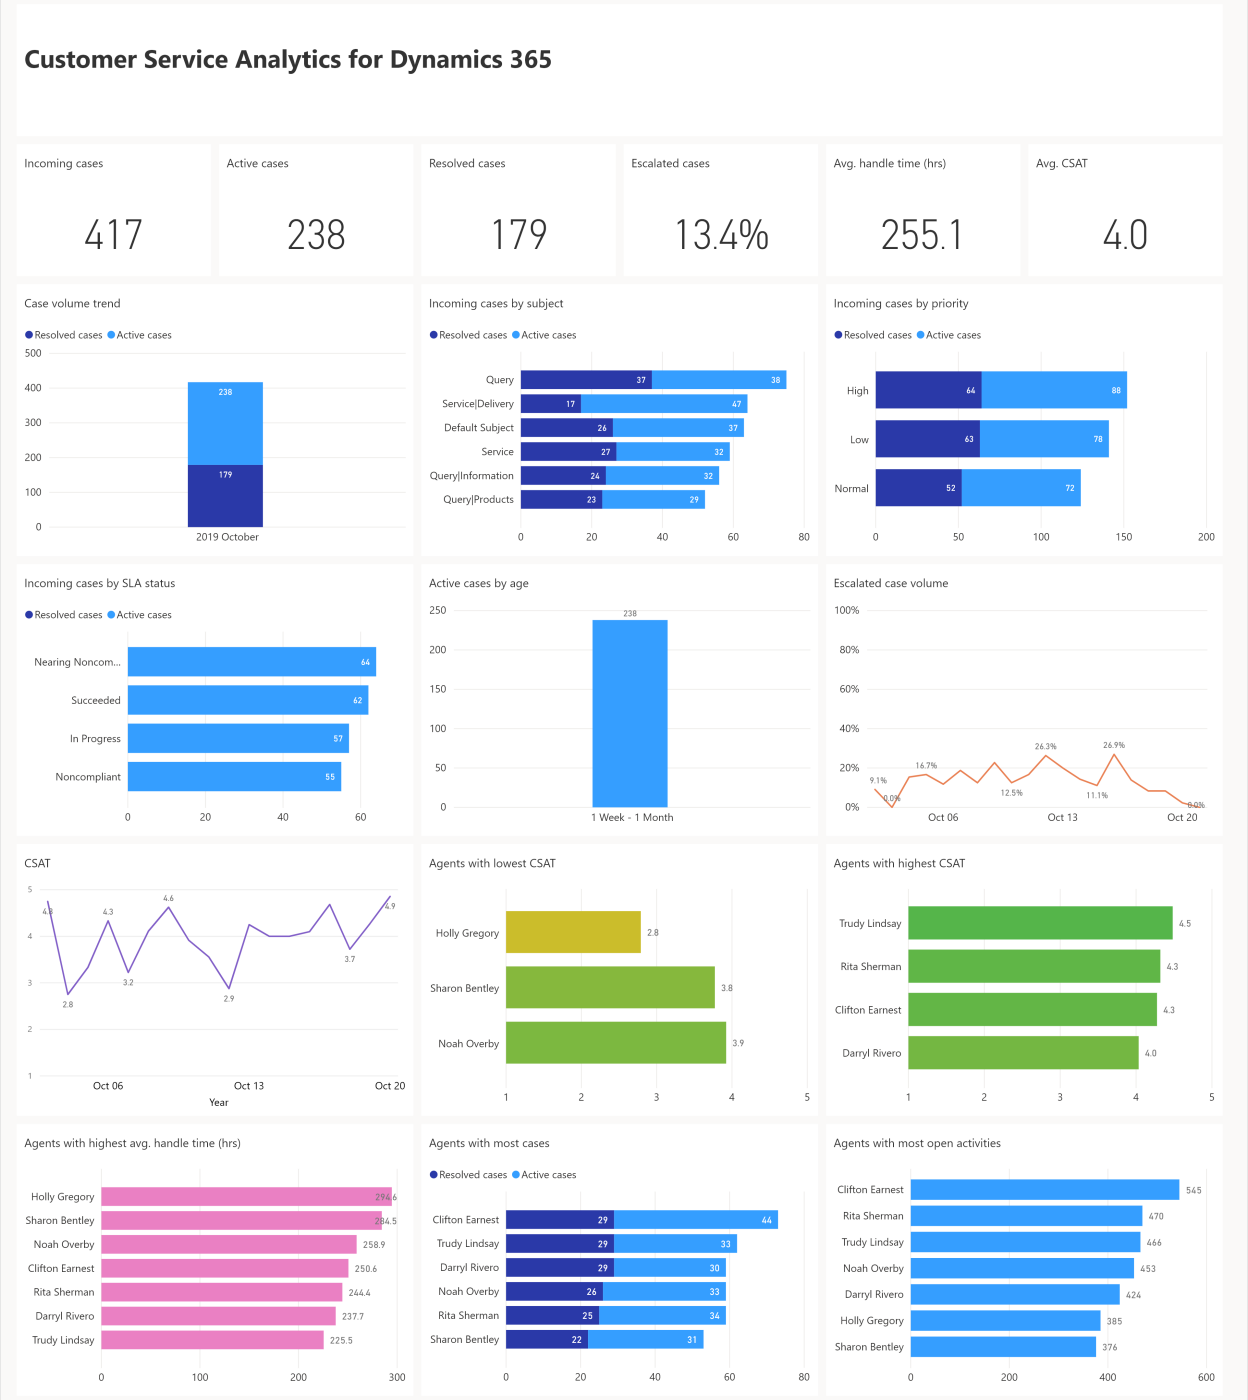
View and understand Customer Service Analytics

Article • 07/14/2021

Customer Service Analytics dashboard

The Customer Service Analytics dashboard that's created in Power BI provides information about the historical operational metrics and key performance indicators (KPIs) to effectively manage contact centers.

The following is an example of the Customer Service Analytics overview dashboard:



This view includes the following KPIs:

KPI	Description
Total cases	The number of cases created to support customers.
Active cases	The number of cases that are currently open.
Resolved cases	The number of cases that have been closed by an agent.
Escalated cases %	The percentage of cases that have been escalated.
Average handle time (hrs)	The average length of time taken by an agent to resolve the case.

KPI	Description
Avg. CSAT	The average customer satisfaction score, based on the survey submitted by the customer.
Case age	The average time the case was in an open state.
Total activities	The total number of activities that were created by agents

This view also includes the following filters:

Filters / Dimensions	Description
Duration	Filters the reporting date range.
Queue	Lets you filter the queue you'd like to drill down to and see all metrics related to that queue.
Agent	Lets you filter the report to show all the agents who report to you, to understand how each is performing and help you develop coaching and training plans.
Priority	Filters the reporting to the selected priority of the case (high, normal, or low).
Subject	Filters the reporting to the selected subject of the case.
Channel	Filters the reporting to the selected Omnichannel for Customer Service channels, such as chat, SMS, or Facebook.

Customer Service Analytics reports

The Customer Service Analytics report detail view has three views:

- Summary
- Agent/queue
- Case/activity list

1. Summary

This view provides KPIs and metrics across Customer Service and gives supervisors the ability to filter the view.

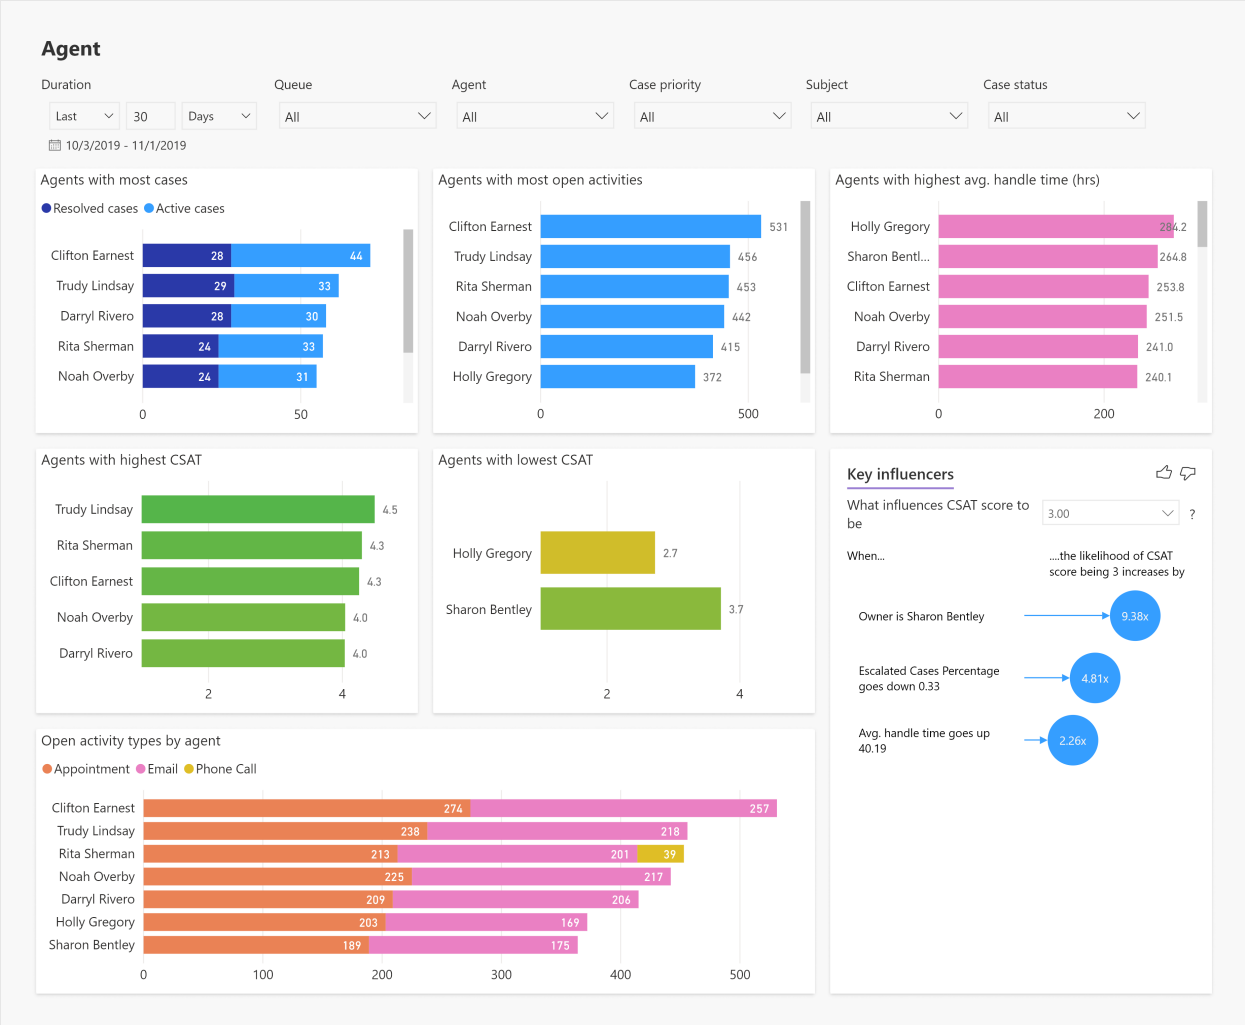
This view contains the following visuals or KPIs:

Visual / KPI	Description
Incoming cases by channel	The volume of cases created in each of the support channels.
Incoming cases by priority	The volume of active and resolved cases, by priority.
Incoming cases by subject	The active and resolved cases, by subject. This considers the last node in the subject hierarchy.

Visual / KPI	Description
Incoming cases by SLA status	The volume of active and resolved cases, by SLA status.
Case volume trend	The trend of active and resolved cases, based on the time the case was created.
Case by age	The cases that are currently open, grouped by the number of days, weeks, and months they've been open.
Escalated case trend	The trend of cases escalated over the period selected.
CSAT trend	The CSAT trend over the period selected.

2. Agent and queue

This view provides KPIs and metrics across Customer Service and gives supervisors the ability to filter the view.



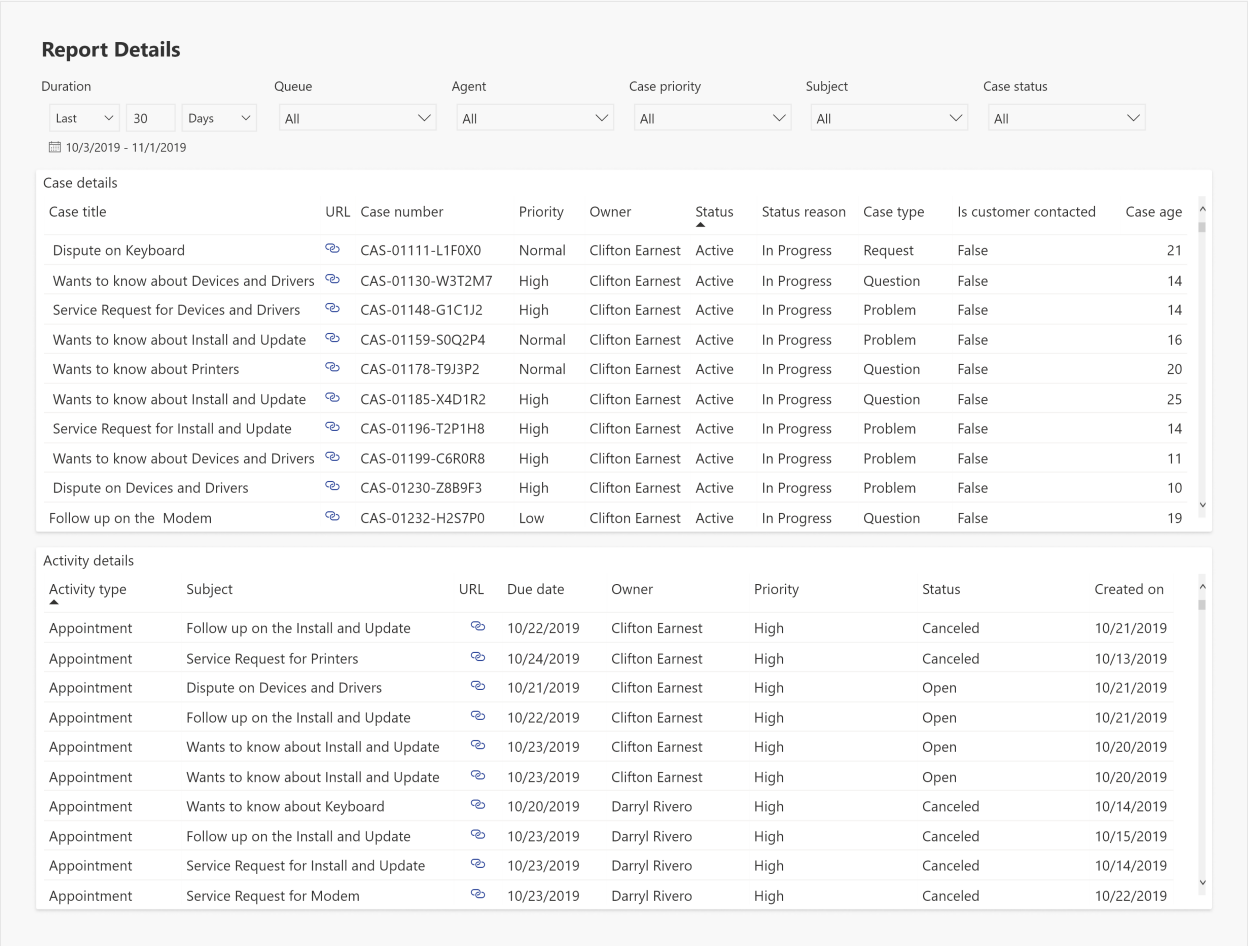
This view contains the following visuals or KPIs:

Visual / KPI	Description
Agents with most cases	Shows the top agents who have handled the most cases, along with the state of those cases.
Agents with most open activities	Shows the agents with the most open activities. This helps you enable agents to clear the backlog.
Agents with highest avg. handle time	Shows the agents with the highest average handle time.
Agents with highest CSAT	Shows the agents with the highest CSAT.
Agents with lowest CSAT	Shows the agents with the lowest CSAT. You can use this information to train agents and improve overall customer satisfaction.
Key influencers for CSAT	Shows the factors that drive the CSAT metric. It analyzes data, ranks the factors that matter, and displays them as key influencers.
Open activities by agent	Shows the number of open activities by agent and type of activity.

3. Case and activity list

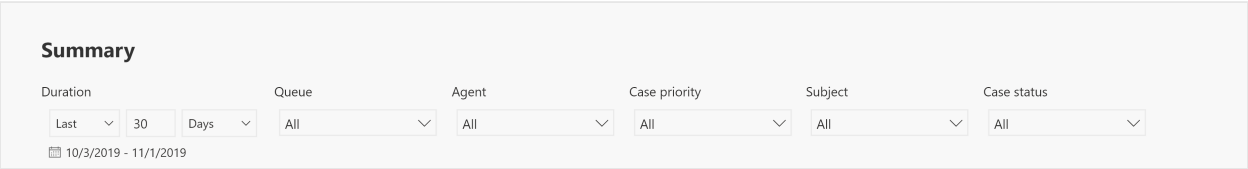
This section provides a detailed view of cases and activities that you can use to drill down to each case or activity to help resolve customer issues. The link in this report directs you to the Customer Service Hub app or Customer Service app.

> ⓘ **Note**
>
> Prerequisite for the link to work: you must have either a Customer Service Hub app or Customer Service app installed from AppSource.



View and filter report

Filter information by viewing the reports and selecting from Duration, Queue, Agent, Case priority, Subject, and Case status.



Select the subject you're interested in, and information is filtered according to your selection. This helps to quickly analyze KPIs and take necessary steps to improve outcomes.

Introduction to Omnichannel Insights dashboard

Article • 07/13/2021

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making, and should not be used to make, decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using Dynamics 365 Customer Service, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

Customer service managers or supervisors are responsible for managing the agents who work to resolve customer queries every day through various service channels, including Chat for Dynamics 365 Customer Service. They need to know key operational metrics to ensure that their agents are providing quality support. Supervisors can see trends in these metrics over a period of time to understand how agents and queues are performing, so that they can take corrective measures, provide appropriate guidance to agents, and improve the customer support experience.

Supervisors can use Omnichannel Insights to perform the following tasks:

- Monitor operational metrics across channels, queues, and agents.

- Monitor support quality via sentiment analysis across channels, queues, and agents.

> **Note**
>
> Contact your system administrator for configuration errors or if you are unable to view the dashboards. To learn more, see **Configure Omnichannel Insights dashboards**.

Prerequisites

Verify the following prerequisites before you use the Omnichannel Chat and Sentiment Analysis dashboards:

- Omnichannel supervisor role is assigned. To learn more, see Assign roles and enable users for Omnichannel for Customer Service.
- A user is added in a supervisor configuration. To learn more, see Add users to supervisor configuration.

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Omnichannel Insights

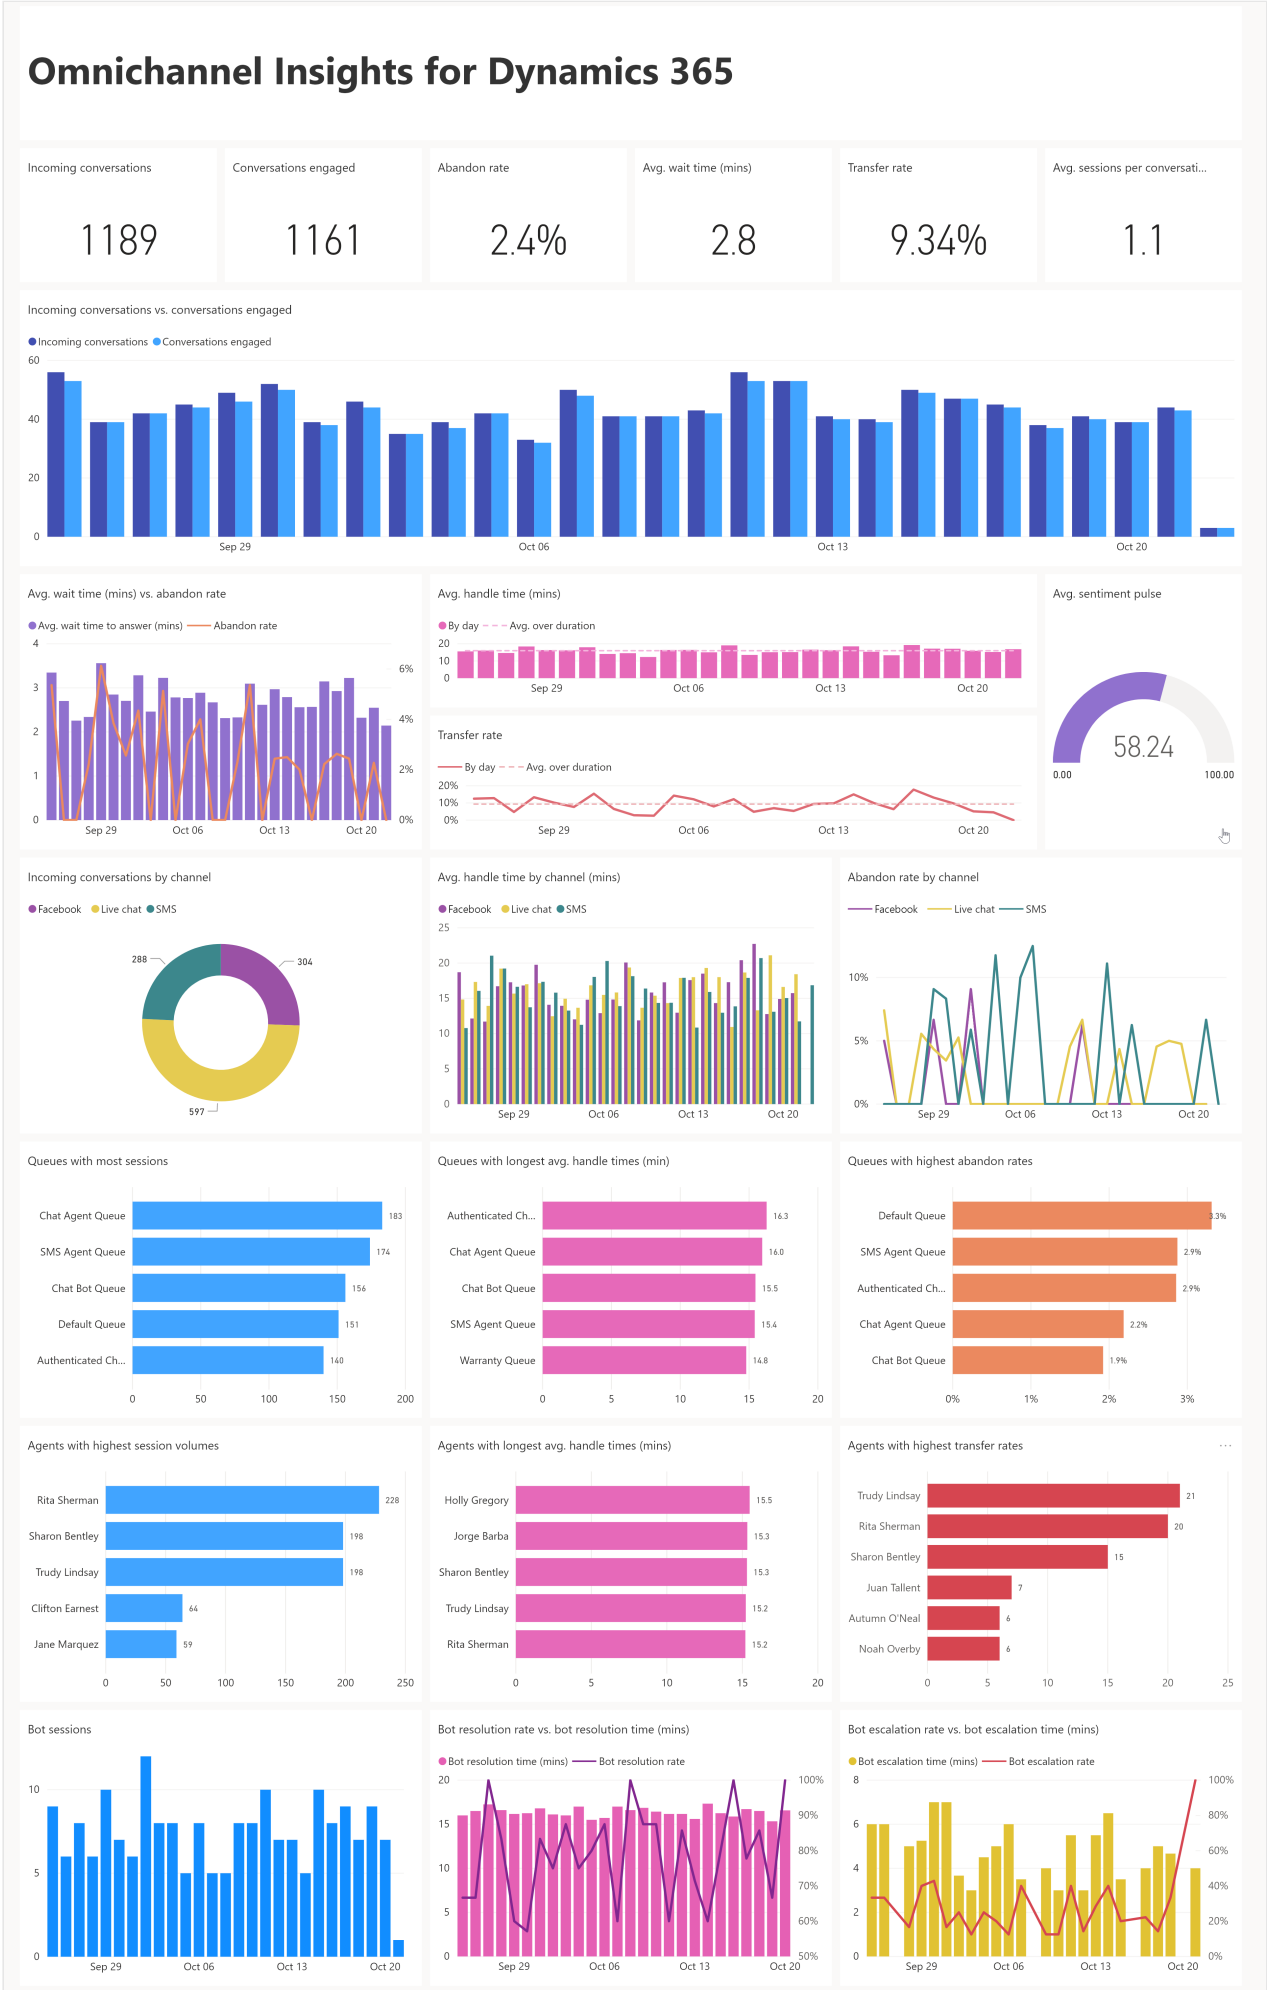
The Omnichannel Insights dashboard provides KPIs and trends for supervisors to understand the overall state of the support experience at a glance. It also provides insights on the customer sentiments derived using support-specific machine learning algorithms with an ability to slice through different levels in the organizational hierarchy. Supervisors can rely on the information to improve the overall customer support experience.

The overview dashboard is divided into two sections:

- Omnichannel Insights dashboard
- Omnichannel Sentiment Analysis dashboard

Omnichannel Insights dashboard

The following illustration is an example of the Omnichannel Insights for Dynamics 365 dashboard.



The following table describes the conversation KPIs.

KPI	Description
Incoming conversations	The number of conversations initiated by the customer.
Conversations engaged	Offered conversations that are engaged by an agent. Customer-to-agent communication can begin at this point.
Average wait time (mins)	The length of time, in minutes, a customer is waiting in a queue.
Average wait time	Total length of time (in minutes) / Offered
Abandon Rate	The percentage of conversations that aren't engaged by agents.
Average Handle Time (mins)	Average length of time an agent takes to complete a conversation with a customer. This time considers the time spent by one or more agents to help the customer.
Transfer rate	The percentage of conversations that are transferred to another agent/queue.
Average Customer Sentiment Pulse (CSP)	The predicted customer sentiment in a given timeframe for a set queue or agent, which indicates the degree of positive sentiment expressed by customers at the end of their interactions.
Average customer effort time	Average length of time a customer takes to contact support and complete a conversation with an agent. Only the conversations engaged by an agent are considered for this metric.

Omnichannel Insights for Dynamics 365

Omnichannel Insights reports provide comprehensive information on how overall support is performing across channels. The reports provide administrators and supervisors with a rich visualization and ability to filter across channels, queues, agents, and date ranges to better understand performance and troubleshoot problem areas.

The reporting structure consists of the following sections:

- Conversations and channels
- Queue and agents
- Bot insights

Conversations and channels

This section provides historical visibility into the overall support operations across various conversations and channels.

Conversation

Duration: Last 30 Days | 9/16/2020 - 10/15/2020

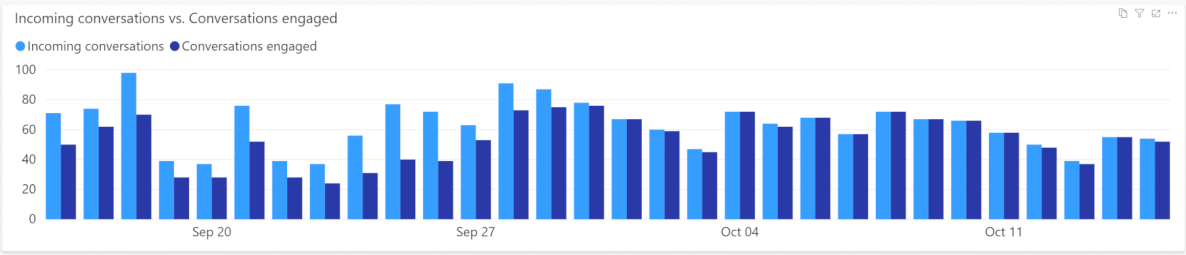
Channel: All

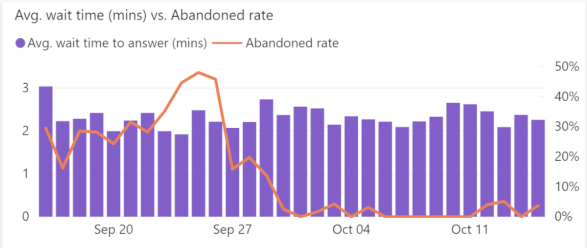
Queue: All

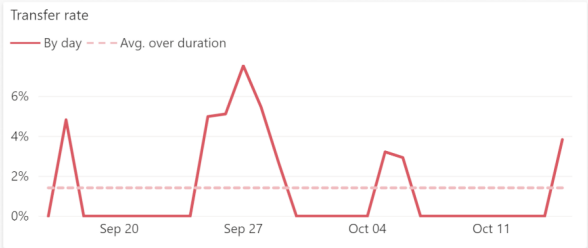
Agent: All

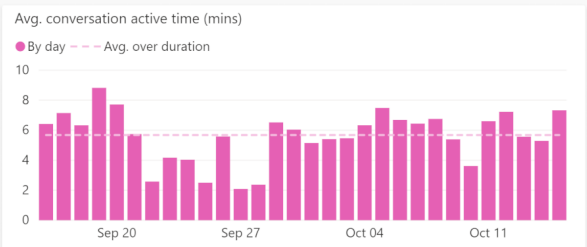
Conversation status: All

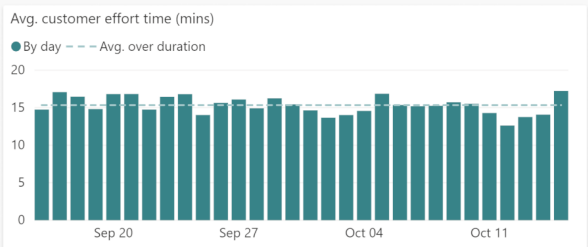
Incoming conversations	Conversations engaged	Abandon rate	Avg. wait time (mins)	Transfer rate	Avg. sessions per convers...
1891	1614	14.6%	2.3	1.4%	1.0







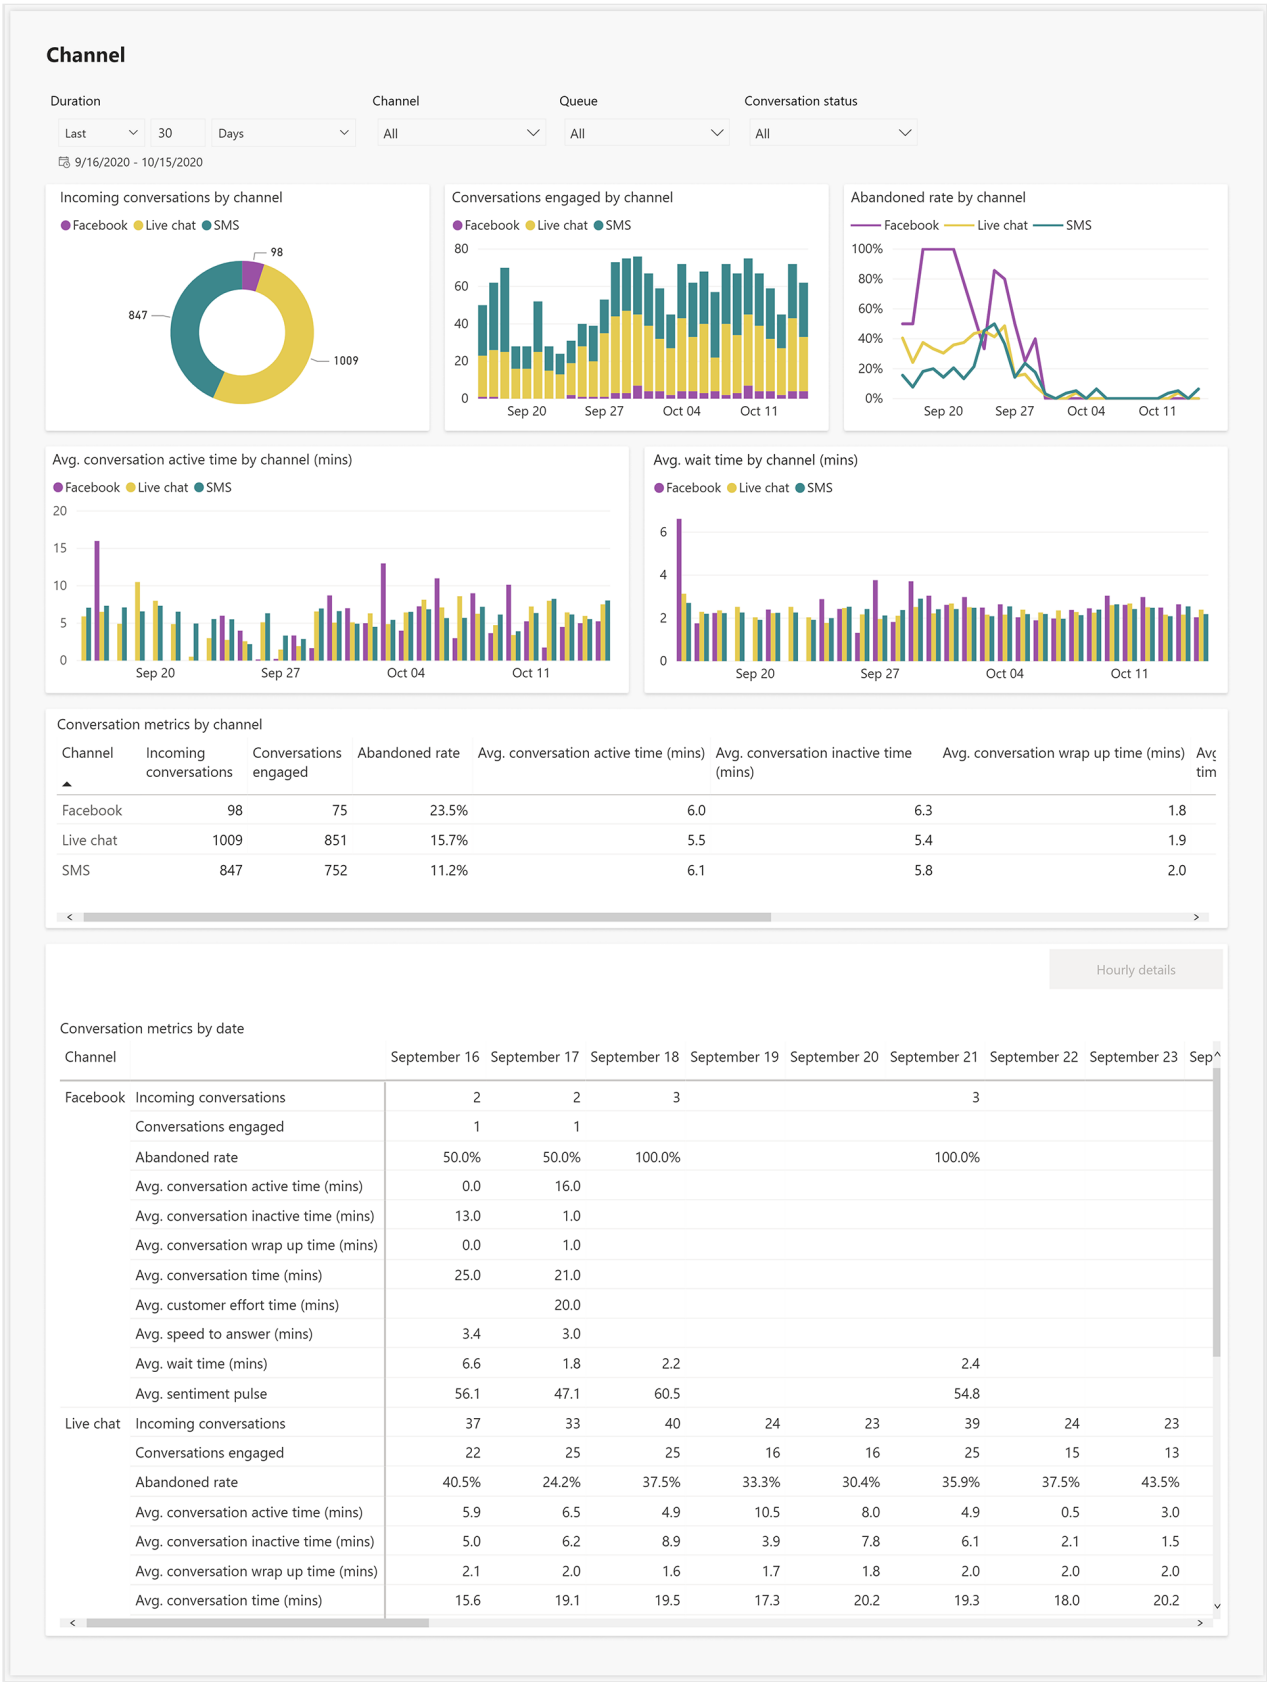




Hourly details

Conversation metrics

	October 4	October 5	October 6	October 7	October 8	October 9	October 10	October 11	October 12	October 13	October 14	Octob
Incoming conversations	72	64	68	57	72	67	66	58	50	39	55	
Conversations engaged	72	62	68	57	72	67	66	58	48	37	55	
Abandoned rate	0.0%	3.1%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	4.0%	5.1%	0.0%	
Transfer rate	0.0%	3.2%	2.9%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	
Avg. conversation active time (mins)	6.3	7.5	6.7	6.4	6.8	5.4	3.6	6.6	7.2	5.6	5.3	
Avg. conversation inactive time (mins)	5.8	6.0	6.8	6.1	5.7	5.6	3.7	5.3	5.6	6.2	5.9	



The KPIs for conversations and channels are listed in the following table. For conversations, these KPIs are applicable to scenarios in which bots escalate to agents or agents directly handle customer calls. The KPIs for channels represent support operations by each channel to help supervisors easily understand how each support channel is performing, and take appropriate actions to improve the overall support experience for customers.

KPI	Description	Derivation	Measure
Incoming conversations	The number of conversations initiated by the customers that can be presented to agents.	All conversations are considered.	FactConversation[InComingConversationCount]
Conversations engaged	Offered conversations that are engaged by an agent. Customer-to-agent communication can begin at this point.	All conversations are considered.	FactConversation[Engaged]
Abandon rate	The percentage of conversations that aren't engaged by agents.	All conversations are considered.	FactConversation[AbandonedRate]
Transfer rate	The percentage of conversations that are transferred to another agent or queue.	Conversations engaged and conversations that are in the closed state are considered.	FactConversation[TransferRate]
Conversation active time	Cumulative session active time for a conversation.	Conversations engaged and conversations that are in the closed state are considered.	FactConversation[ConversationActiveTime]
Conversation inactive time	Cumulative session inactive time for a conversation.	Conversations engaged and conversations that are in the closed state are considered.	FactConversation[ConversationInactiveTime]

KPI	Description	Derivation	Measure
Conversation wrap time	Cumulative time from the conversation wrap-up start time until the conversation close time.	Conversations engaged and conversations that are in the closed state are considered.	FactConversationFirstAgentParticipant[ConversationWrapupTime]
Conversation handle time	Cumulative session active time for a conversation.	Conversations engaged and conversations that are in the closed state are considered.	FactConversation[ConversationActiveTime]
Average Conversation active time	Total conversation active time divided by the number of conversations handled.	Conversations engaged and conversations that are in the closed state are considered.	FactConversation[AvgActiveTime(mins)]
Average Conversation inactive time	Total conversation inactive time divided by the number of conversations handled.	Conversations engaged and conversations that are in the closed state are considered.	FactConversation[AverageConversationInactiveTime]
Average Conversation wrap time	Total conversation wrap time divided by the number of conversations handled.	Conversations engaged and conversations that are in the closed state are considered.	FactConversation[AverageConversationWrapupTime)]
Average Conversation handle time	Total Conversation active time divided by the number of conversations handled.	Conversations engaged and conversations that are in the closed state are considered.	FactConversation[AvgConversationTime]

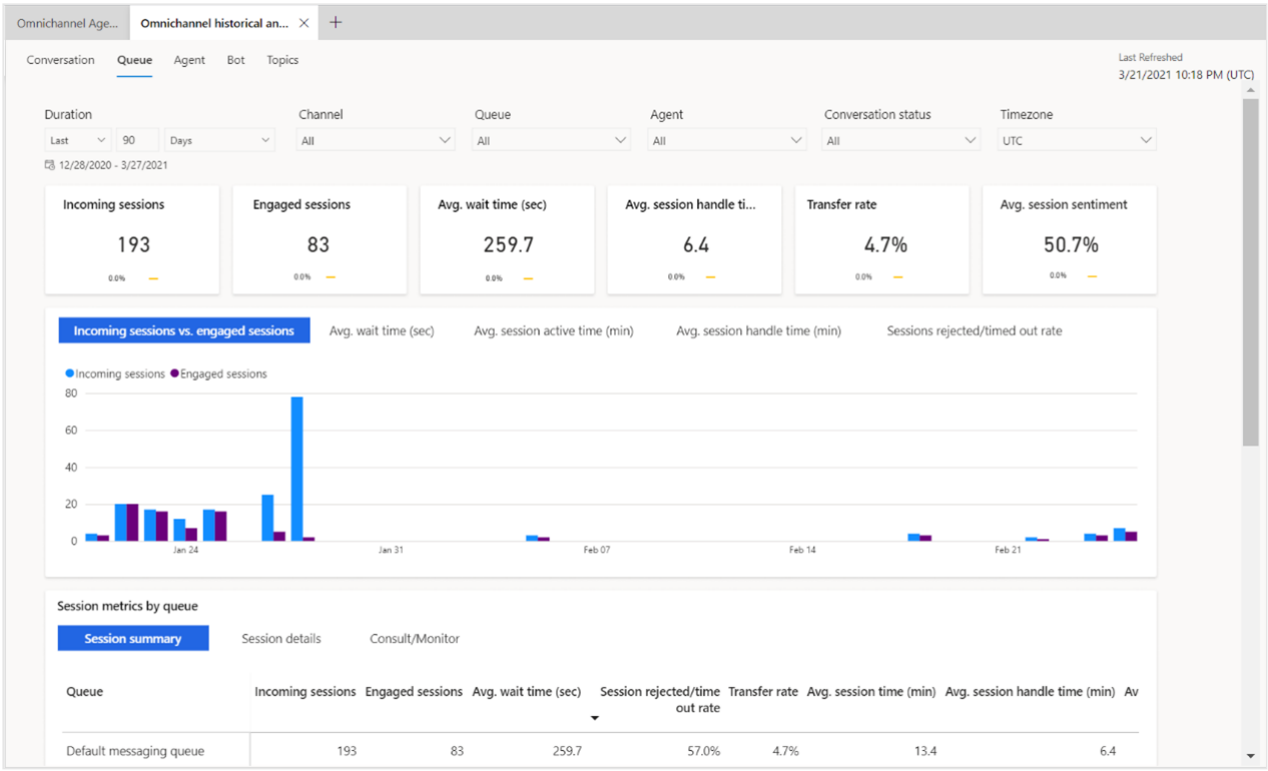
KPI	Description	Derivation	Measure
Average Conversation time	Average time from the conversation start to conversation end.	Conversations engaged and conversations that are in the closed state are considered.	FactConversation[AvgConversationTime]
Average Customer Effort time	Average time from the conversation start to the conversation wrap-up start time.	Conversations engaged and conversations that are in the closed state are considered.	FactConversation[AvgCustomerEffort]
Speed to answer	The average time customers have waited in the queue before connecting to an agent.	Conversations engaged and conversations that are in the closed state are considered.	FactConversation[AvgSpeedtoAnswer]
SLA - Speed to answer	Number of SLAs met divided by the number of conversations handled. For example, if the Speed to answer is less than 180 seconds, then this is considered met. Otherwise, it isn't met.	Conversations engaged and conversations that are in the closed state are considered.	FactMessage[SLASpeedtoAnswer]

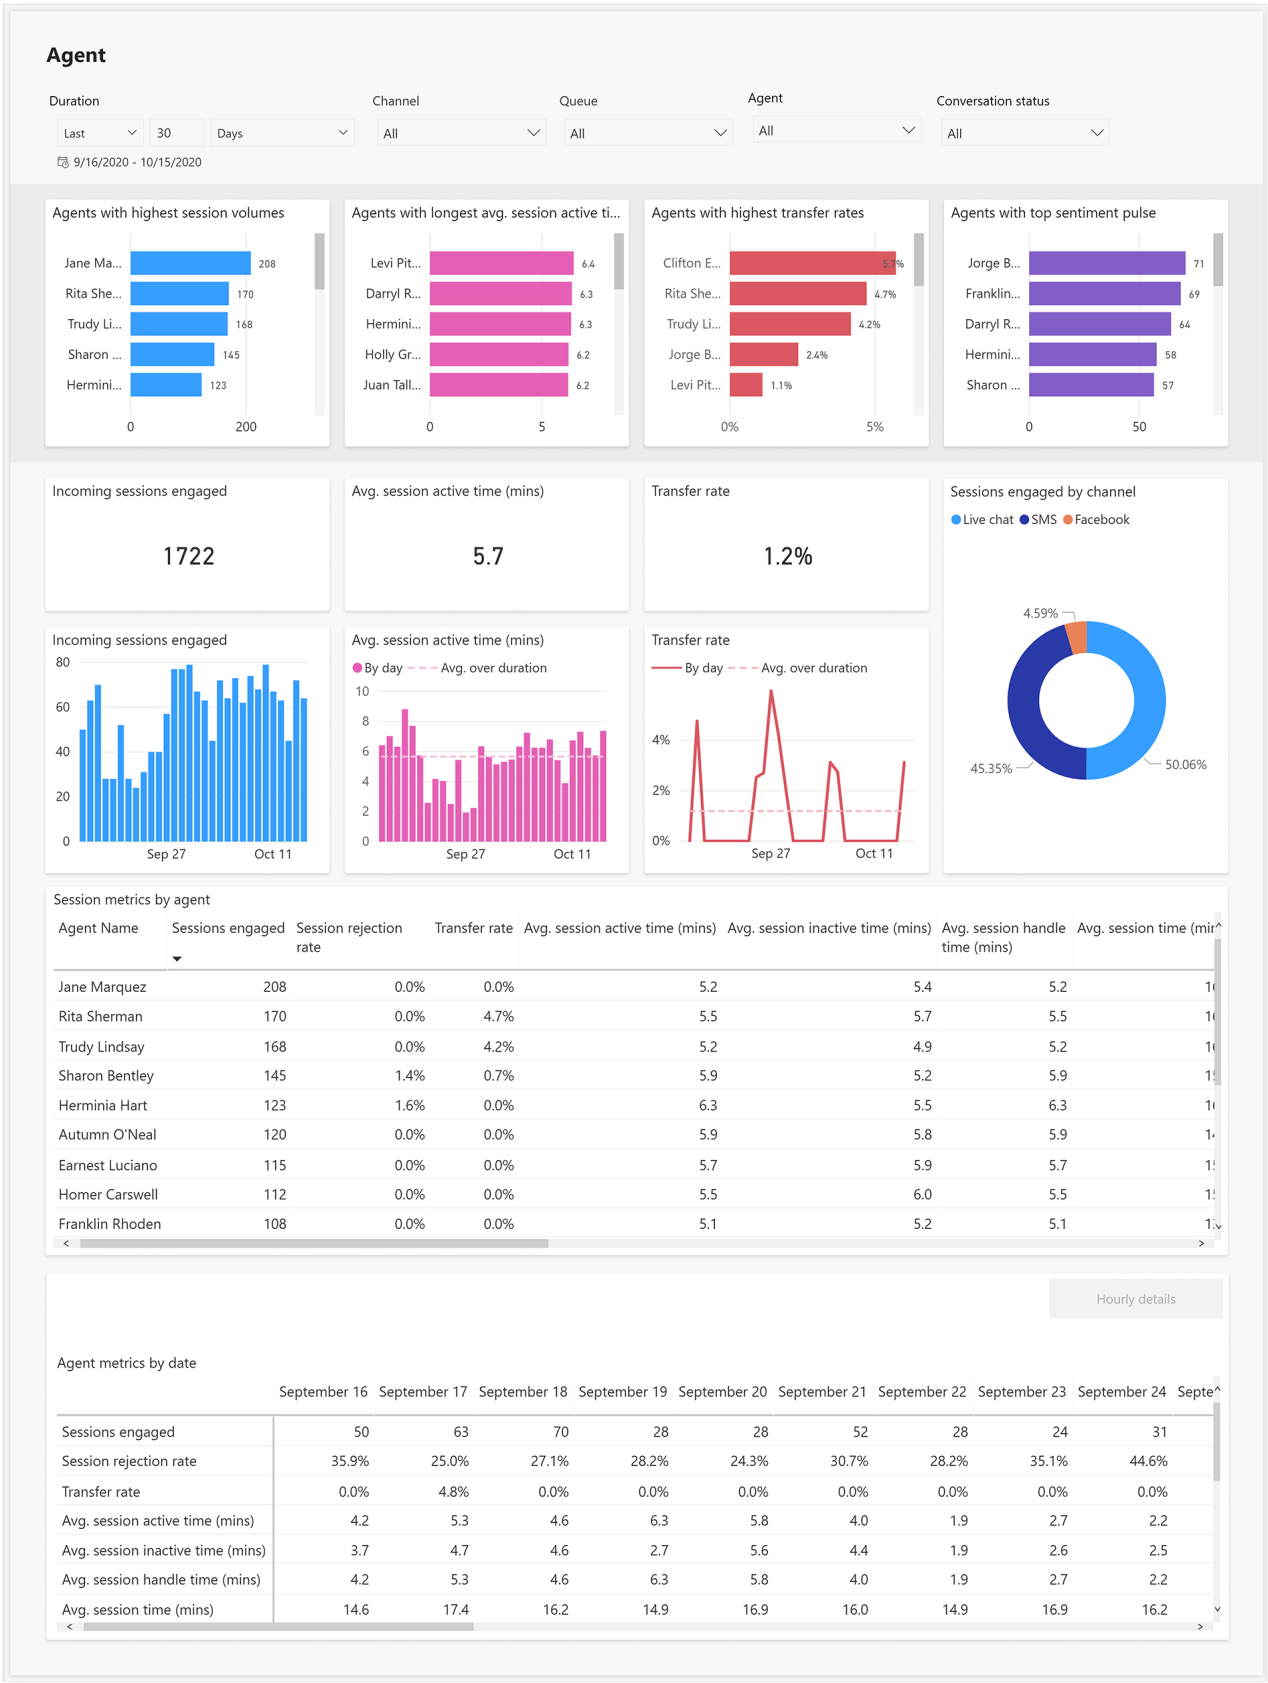
KPI	Description	Derivation	Measure
Customer wait time	The average time customers have waited before connecting to agents. This is similar to "Speed to answer" but includes the time waited on each session within a conversation.	Conversations engaged are considered.	FactConversationParticipant[AvgWaittime(mins)]
Total consult time	The time spent on the consult from when the agent joined to when they left in session participant.	Only consult sessions are considered as a denominator.	
Average consult time	Total consult time divided by the total consult sessions.	Only consult sessions are considered as a denominator.	FactSessionParticipant[AvgConsultTime]
Total monitor time	The time spent on the monitor from when the agent joined to when they left in session participant.	Only monitor sessions are considered as a denominator.	
Average monitor time	The total monitor time divided by the total of monitor sessions.	Only monitor sessions are considered as a denominator.	FactSessionParticipant[AvgMonitorTime]

KPI	Description	Derivation	Measure
Average Customer sentiment pulse (CSP)	The predicted customer sentiment in a given timeframe for a set queue or agent, which indicates the degree of positive sentiment expressed by customers at the end of their interactions.	Conversations engaged are considered.	Average of FactConversationSentiment[msdyn_sentimentpulse]

Queue and agents

The Queue and Agent sections provide historical visibility into how each queue and agent is performing across different channels and queues so that supervisors can take appropriate steps to improve the support experience for the customer.





The KPIs for queues and agents are listed in the following table. Metrics in this section are computed based on the session granularity. Each customer contact is defined as a conversation. Each conversation is defined as a session and can be handled by one or more agents.

KPI	Description	Derivation	Measure

KPI	Description	Derivation	Measure
Consult sessions	The number of sessions accepted by a user in mode = consult.	Only consult sessions are considered as a denominator	
Total consult time	The time spent on the consult from when the agent joined to when they left in session participant.	Only consult sessions are considered as a denominator.	
Average consult time	The total consult time divided by the total consult sessions.	Only consult sessions are considered as a denominator.	FactSessionParticipant[AvgConsultTime]
Monitor sessions	The number of sessions accepted by a user in mode = monitor.	Only monitor sessions are considered as a denominator.	
Total monitor time	The time spent on the monitor from when the agent joined to when they left in session participant.	Only monitor sessions are considered as a denominator.	
Average monitor time	The total monitor time divided by the total of monitor sessions.	Only monitor sessions are considered as a denominator.	FactSessionParticipant[AvgMonitorTime]

KPI	Description	Derivation	Measure
Sessions engaged	# Sessions presented to an agent and accepted by an agent	Conversations engaged are considered and all conversation states are considered.	FactSession[EngagedByAgentSessionCount]
Session rejection rate	The number of sessions presented to an agent and aren't accepted by an agent.	Conversations engaged are considered and all conversation state are considered.	FactSession[SessionRejectionRate]
Transfer rate	The number of sessions transferred by an agent.	Conversations engaged are considered and all conversation states are considered.	FactSession[QueueTransferRate]
Consult sessions	The number of sessions where the agent has participated in consult mode.	Conversations engaged are considered and all conversation states are considered.	FactSessionParticipant[ConsultSessionCount]
Monitor sessions	The number of sessions where the agent has participated in monitor mode.	Conversations engaged are considered and all conversation states are considered.	FactSessionParticipant[MonitorSessionCount]
Average Session active time	The total session active time divided by the number of sessions engaged (primary).	Conversations engaged are considered and all conversation states are considered.	FactSession[AvgActivetime]

KPI	Description	Derivation	Measure
Average Session inactive time	the total session inactive time divided by the number of sessions engaged (primary).	Conversations engaged are considered and all conversation states are considered.	FactConversationFirstAgentParticipant[AverageSessionInactiveTime]
Average Session handle time	The total session active time divided by the number of sessions engaged (primary).	Conversations engaged are considered and all conversation states are considered.	FactSession[AvgSessionHandleTime]
Average Session time	The average time from the session start to session end for sessions engaged divided by the sessions engaged (primary).	Conversations engaged are considered and all conversation states are considered.	FactConversationFirstAgentParticipant[AvgSessionTime]
Average consult time	The average time the agent spent on a session in consulting mode.	The sum of consult time divided by consult sessions.	FactSessionParticipant[AvgConsultTime]
Average monitor time	The session level average time the agent spent on a session in monitoring mode.	The sum of monitor time divided by monitor sessions.	FactSessionParticipant[AvgMonitorTime]

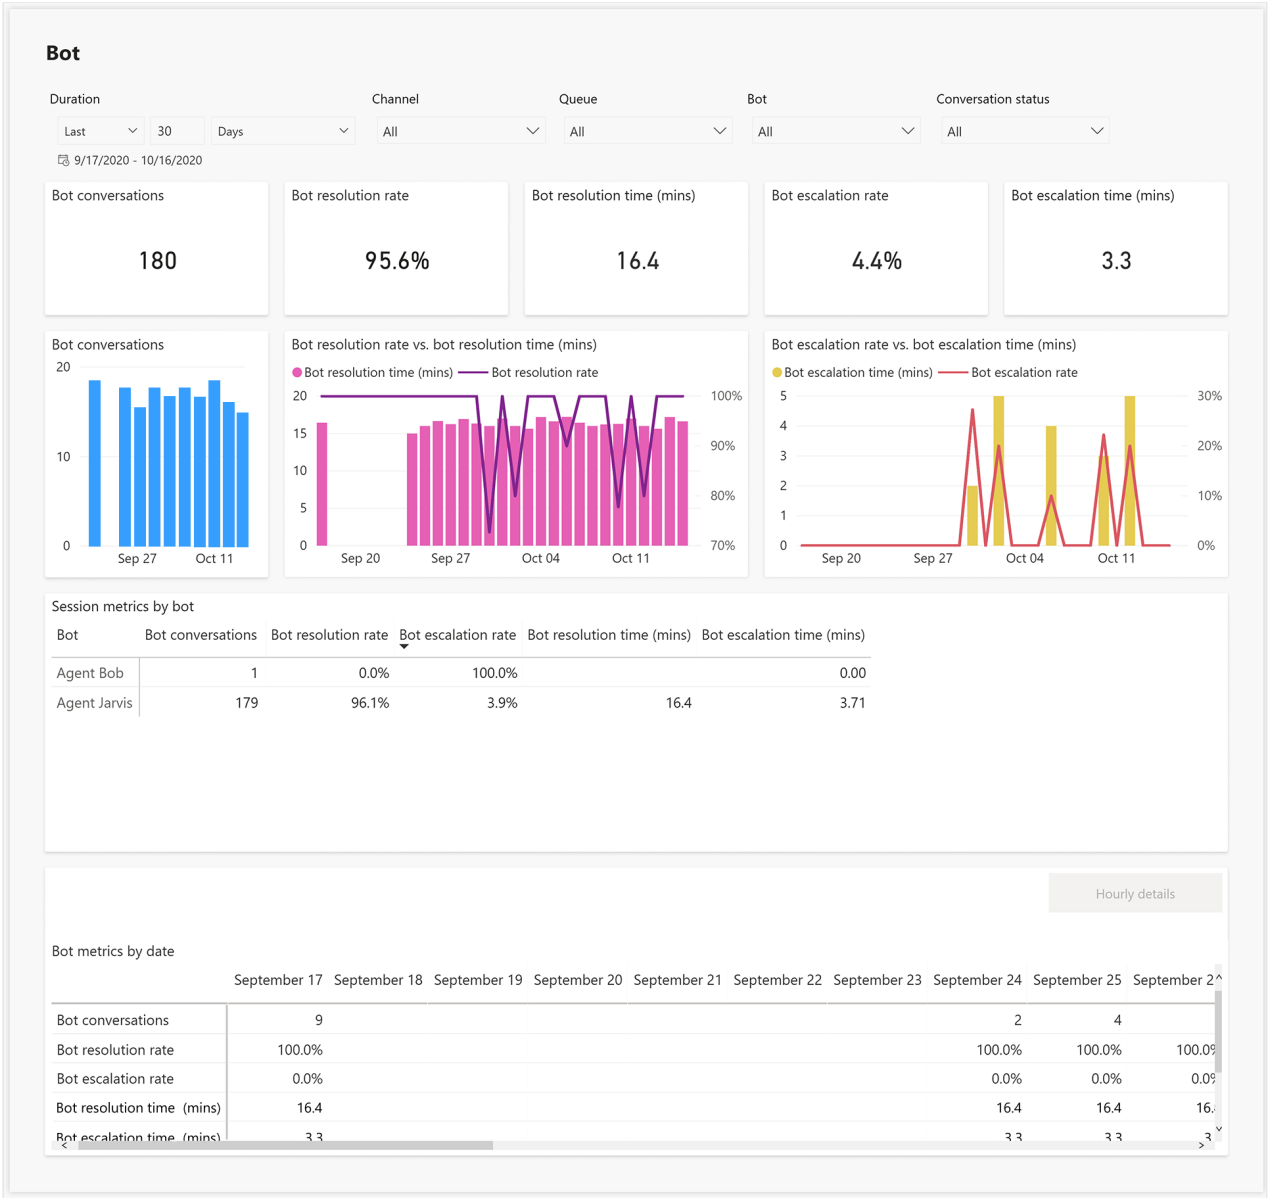
KPI	Description	Derivation	Measure
Session active time	The time an agent actively spent on a session.	Conversations engaged are considered and all conversation states are considered.	
Session inactive time.	The time an agent isn't actively working on a session.	Conversations engaged are considered and all conversation states are considered.	
Session handle time	the time an agent actively spent on a session.	Conversations engaged are considered and all conversation states are considered.	
Agent total login time	The total time the agent is signed in. Note: This metric isn't sliced in any dimension other than from Date and Agent.	This is based on the agent sign in and sign out timestamp, and isn't sliced by any other metrics other than from Date and Agent.	FactAgentStatusHistory[AgentTotalLoginTime(hrs)]
Agent Total Login Time (hrs)	The time an agent is signed in to the Omnichannel application.	This is based on the agent sign in and sign out timestamp, and isn't sliced by any other metrics other than from Date and Agent.	FactAgentStatusHistory[AgentTotalLoginTime(hrs)]

KPI	Description	Derivation	Measure
Agent Available Duration (hrs)	The time an agent is in the available state in the Omnichannel application.	This is based on the agent sign in and sign out timestamp, and isn't sliced by any other metrics other than from Date and Agent.	FactAgentStatusHistory[AgentAvailableDuration(hrs)]
Agent Busy Duration (hrs)	Time an agent in the busy state in Omnichannel application.	This is based on the agent sign in and sign out timestamp, and isn't sliced by any other metrics other than from Date and Agent.	FactAgentStatusHistory[AgentBusyDuration(hrs))]
Agent Busy DND Duration (hrs)	The time an agent is in the Busy DND state in the Omnichannel application.	This is based on the agent sign in and sign out timestamp, and isn't sliced by any other metrics other than from Date and Agent.	FactAgentStatusHistory[AgentBusyDNDDuration(hrs)]
Agent Away Duration (hrs)	The time an agent is in the Away state in the Omnichannel application	This is based on the agent sign in and sign out timestamp, and isn't sliced by any other metrics other than from Date and Agent.	FactAgentStatusHistory[AgentAwayDuration(hrs))]

KPI	Description	Derivation	Measure
Agent Offline Duration (hrs)	The time an agent signed out of the Omnichannel application.	This is based on the agent sign in and sign out timestamp, and isn't sliced by any other metrics other than from Date and Agent.	FactAgentStatusHistory[AgentOfflineDuration(hrs))]

Bot insights

This section provides historical visibility into how bots are performing to help resolve customer support issues.



The KPIs for bots are listed in the following table.

KPI	Description	Derivation	Measure
Bot conversations	The number of conversations initiated by the customer and handled by a bot.	All conversations are considered.	FactSession[QueueSessions]
Bot resolution rate	The percentage of conversations that were closed by interacting with a bot out of all conversations handled by a bot.	All conversations are considered.	FactSession[BOTResolutionRate]
Bot resolution time (mins)	The length of time, in minutes, a customer interacted with a bot before the conversation was closed.	All conversations are considered.	FactSession[AvgResolutionTime]
Bot escalation rate	The percentage of conversations that are escalated by a bot to a human agent.	All conversations are considered.	FactSession[BotEscalationRate]
Bot escalation time (mins)	The length of time, in minutes, a customer interacted with a bot before the conversation was escalated to a human agent.	All conversations are considered.	FactSession[BotEscalationTime]

Omnichannel Sentiment Analysis dashboard

The Omnichannel Sentiment Analysis dashboard provides an overview of important KPIs and trends related to the sentiment analysis of conversations.

Omnichannel Insights – Sentiment Analysis report

The following table provides a detailed view of the Omnichannel Sentiment Analysis report.

KPI	Description
Average Sentiment Pulse	The predicted customer sentiment in a given timeframe for a set queue or agent that indicates the degree of positive sentiment expressed by customers at the end of their interactions. For channel and queue, it provides the overall customer sentiment of the conversation. For agent, it provides the customer sentiment specific to the sessions handled by the agent in the conversation.
% Positive Sentiment	Count of positive sentiment zone conversations divided by total sessions.
% Neutral Sentiment	Count of neutral sentiment zone conversations divided by total sessions.

KPI	Description
% Negative Sentiment	Count of negative sentiment zone conversations divided by total sessions.
Conversations with Sentiment prediction	Count of conversations to predict the customer sentiment metrics.

Sentiment zones

Positive sentiment

Positive sentiment is expressed by the customer writing messages that they're happy, pleased, or positive as a result of the support interaction. Positive sentiment requires the positive words to convey positive feeling beyond simple pleasantries or politeness.

For example, when a customer writes "thank you," that's just being polite—it doesn't necessarily mean they're pleased or happy. However, if a customer writes "I can't thank you enough" or "thank you very much," that portrays clear positive feeling. Other examples of simple pleasantries or politeness that shouldn't be mischaracterized as positive are "Please help" and "Yes."

Negative sentiment

Negative sentiment is expressed by the customer when they're disappointed with the support interaction. These can be cases where the customer is describing a problem and is frustrated or unhappy because of how it's currently affecting them. For something to be scored with negative sentiment, the words need to clearly convey that the user is unhappy, disappointed, or frustrated.

Neutral sentiment

Neutral sentiment is represented when a customer's sentiment was neither positive nor negative. A customer's problem statement isn't to be scored as negative; rather, it should be scored neutral unless it contains words that denote emotion. This is true regardless of how severe the user's problem is. Messages with non-specific pleasantries or politeness are scored as neutral and not as positive.

View and filter reports

You can filter the information presented in the reports by selecting **Duration**, **Channel**, **Queue,** and **Agent**.

Analyze real-time customer sentiment

Monitor, assign, transfer, and forcibly end conversations

Article • 11/17/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making, and should not be used to make decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using Dynamics 365 Customer Service, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

As a supervisor, you can monitor, assign, transfer, or end conversations that are being handled by your agents by using the **Omnichannel Ongoing Conversations** dashboard. More information: Omnichannel Ongoing Conversations dashboard

When you monitor conversations, you can understand how they're being handled by your agents and also check whether any conversation needs your immediate attention. You can also view customer sentiment and agent responses.

To be able to monitor, assign, transfer, or close conversations, your administrator must enable the respective settings–**Supervisor Monitor**, **Supervisor Assign**, **Supervisor**

Transfer, or **Force Close**–in the admin app. More information: Enable your supervisors to monitor, assign, transfer, and forcibly end conversations

Monitor and join conversations

As a supervisor, you can monitor or assign conversations that are configured for all channels except records. You can monitor all conversations that are in the **Active** or **Wrap-up** states. By joining the conversation, you provide necessary details to both the agent and customer in the communication panel.

You can't monitor conversations that are assigned to you.

1. Sign in to Dynamics 365 and go to the Customer Service workspace or Omnichannel for Customer Service app.
2. From the dashboard view selector, select the **Omnichannel Ongoing Conversations** dashboard. The list of conversations currently being handled by your agents is displayed.
3. Select a conversation that you want to monitor, and select **Monitor**. The conversation page opens.
4. Optionally, to join a conversation, select **Join chat** in the communication panel.

   When you join the conversation, both the agent and the customer receive notifications that you've joined. Depending on your requirements, you can consult with the agent and customer. For more information, go to View communication panel.

Assign conversations

To manually assign a conversation, the conversation should be in an open state and not assigned to any agent. As a supervisor, you can override the agent's presence and allocated capacity when assigning conversations to them. When you override agent capacity, the number of units by which their capacity is exceeded is displayed.

1. From the dashboard view selector in Omnichannel for Customer Service, select the **Omnichannel Ongoing Conversations** dashboard.
2. Select a conversation in an **Open** state, and then select **Assign**.
3. In the **Assign conversations** dialog box, select **Agent** or **Queue**.

> If you select **Agent**, only those agents whose presence matches with one of the allowed presence values in the workstream configuration are displayed. If you select **Queue**, all other queues—except the one to which the conversation is currently assigned—are displayed.

4. Select **Assign**.

The conversation is now assigned to the agent or queue that you selected.

> ⓘ **Note**
>
> If you're unable to assign conversations successfully, verify that the **Omnichannel API access** role isn't assigned to you.

Transfer conversations

You can transfer ongoing conversations that are in the **Active** or **Waiting** states. You can transfer all conversations that take place on messaging channels such as Live Chat, SMS, or WhatsApp. However, if and when these conversations switch from the text mode to elevated voice or video modes, you can't transfer them across agents.

You can transfer conversations to and from agents only, not bots.

1. From the dashboard view selector in Omnichannel for Customer Service, select the **Omnichannel Ongoing Conversations** dashboard.
2. Select a conversation in the **Active** or **Waiting** state, and then select **Transfer**.
3. In the **Transfer conversations** dialog box, select an agent from the list of agents that appears.

   A list of agents belonging to the same queue and whose presence matches with one of the allowed presence values in the workstream configuration is displayed.
4. Select **Transfer**. The selected conversation is transferred to the agent.

When you transfer an **Active** conversation from one agent to another, the first agent is added as a consultant to the conversation that's now being managed by the second agent. The conversation is successfully transferred when the second agent acknowledges the notification by selecting **Accept** or **Reject**. Refresh the dashboard if you don't get an updated status as a result of network issues or delays in acknowledgment.

End conversations forcibly

> ⊗ **Caution**
>
> We recommend that you use this feature judiciously to end agent conversations.

End voice calls and conversations that take place on the voice and messaging channels. After the conversation ends, its status is set to **Closed**.

1. From the dashboard view selector in Omnichannel for Customer Service, select the **Omnichannel Ongoing Conversations** dashboard.
2. Select a conversation and then select **Force Close**.

The participants receive a notification that their conversation was ended by a supervisor.

Sentiment monitoring

Article • 07/07/2021

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Note**
>
> Supervisor and agent sentiment notifications are not available in Omnichannel for Customer Service on Unified Service Desk.

Sentiment analysis enables agents and supervisors to understand real-time and historical customer sentiment across channels to improve customer service. Omnichannel for Customer Service uses natural language processing (NLP) and machine learning (ML) algorithms to understand customer sentiments.

Sentiment intensity indicators are displayed based on the previous six customer messages received in a conversation. Sentiment intensity is scored in one of seven gradients: three positive, three negative, and one neutral.

Sentiment	Icon
Very positive	Positive	
Slightly positive	Neutral	Slightly negative	
Sentiment	Icon
Negative	Very negative	
Omnichannel for Customer Service sentiment analysis supports multiple languages. Using Microsoft Azure Text Translator API, conversations in more than 40 languages now receive sentiment scores.

> ⓘ **Note**
>
> - Non-English conversations are translated to English, then scored.
> - Unsupported languages don't receive a sentiment score.
> - If profanity is detected in English, the sentiment shows as Negative or Very negative.

To learn more, see Explore Text Translator API.

Personas

The multi-language sentiment feature (preview) supports the following personas: administrator, supervisor (team lead), and agent.

- If you're an administrator:
  - You can configure sentiment for English only and non-English languages.

    > ⓘ **Note**
    >
    > Sentiment is enabled in Omnichannel for Customer Service by default.

- If you're a supervisor (team lead):
  - You can track agents' performance and engage in real time to continuously improve the support quality.

    Example: Identifying negative sentiment events, including English profanity, in conversations between agents and customers.

    - When you identify negative sentiment, you can provide timely inputs to help an agent resolve an issue.

      Example: Monitor and join the conversation.

    - You can identify which chat and text sessions are going well, and which might require monitoring.

- If you're an agent:

    - You want to know customers' sentiments in real time and see customer satisfaction levels instantly as you communicate.

    - You can be responsible for handling multiple customer engagements at any given time.

    - You can engage directly with the customer to solve the customer's issue.

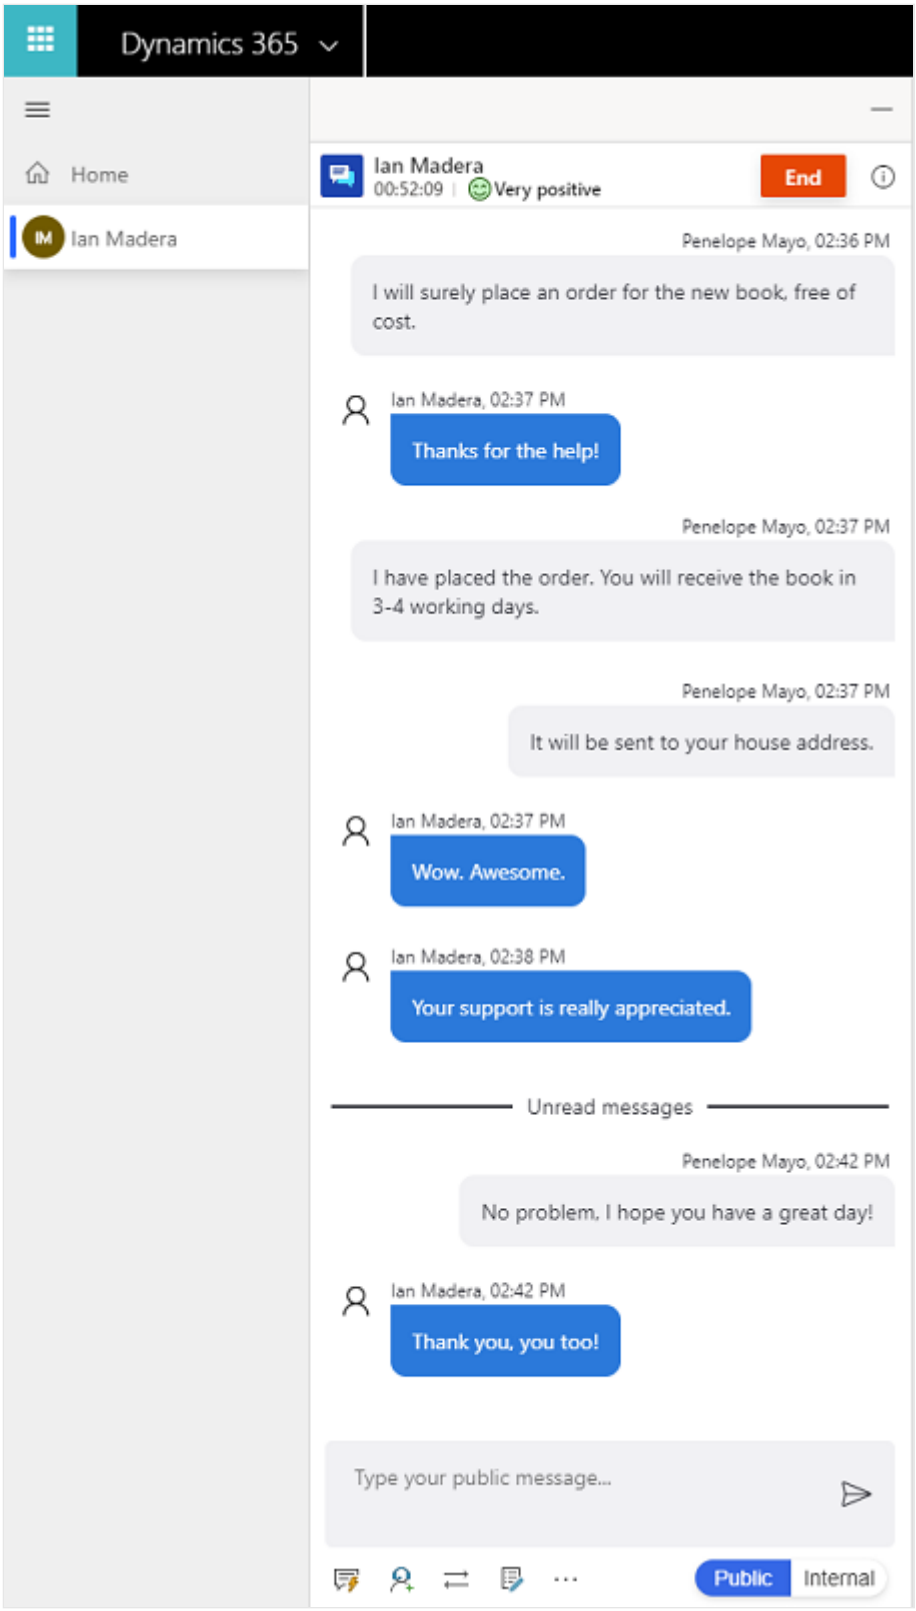
    - You can use analysis of customer sentiment to understand the severity of the problem, and take action.

Sentiment intensity indicators

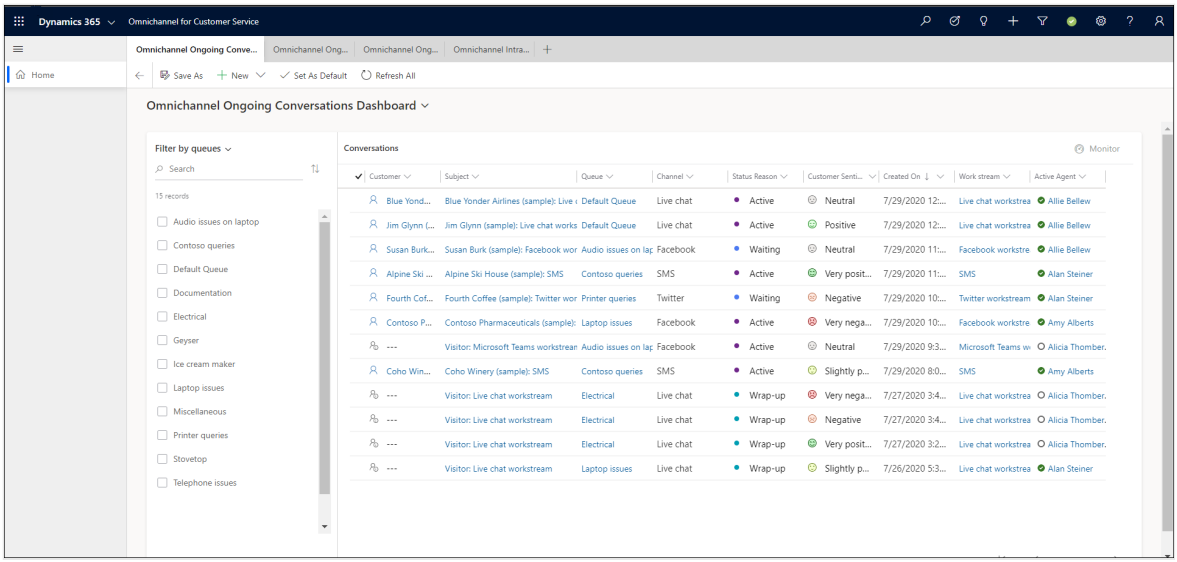
Omnichannel for Customer Service sentiment intensity indicators are an automatic and unbiased measurement of a customer's satisfaction level in real time. These indicators show agents and supervisors how a conversation is trending, and give supervisors a real-time gauge they can use to decide when they need to step in and assist.

- For agents:

  Sentiment intensity indicators at the top of the communication panel help you understand the customer’s sentiment.



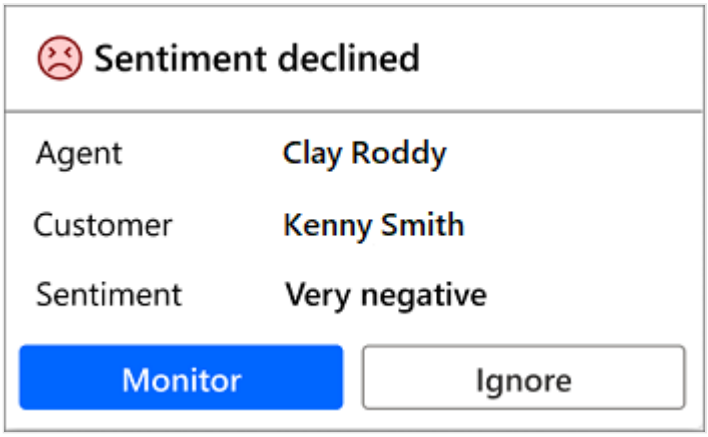
- For supervisors:
  - Sentiment intensity indicators identify ongoing chat sessions that need your attention, so that you can better assess and apply your time where it's most valuable.
  - Using sentiment intensity indicators on the Omnichannel Ongoing Conversations dashboard allows you to easily identify ongoing customer support chat sessions that aren't going well.



Low sentiment notification alert

While an agent is communicating with the customer, and if the customer's sentiment decreases to or below a threshold level, you will get a notification. The notification displays the following details:

- Agent name
- Customer
- Sentiment
- Monitor button
- Ignore button



You can select the **Monitor** button to see the **Active Conversation** and the communication panel. If the agent requires help, you can join the conversation.

For example:

Administrator has set the threshold value as **Very negative**. When the customer's sentiment reaches **Very negative** or any other sentiment value below the threshold value, the notification is displayed to you.

Multi-language sentiment limitations

Sentiment analysis relies on the initial customer messages in any conversation to detect the language of the conversation.

Expect the following system behavior:

- If a customer's initial messages are detected as English, the system assumes that subsequent messages will be in English as well. If your customer switches away from English after these initial messages, the system doesn't perform language re-detection. In this situation, you'll most often see a neutral sentiment score throughout the rest of the non-English conversation.
- If a customer's initial messages are detected as non-English, the system performs re-detection and scoring for subsequent messages. If any following message is detected as non-English, its subsequent message will be re-detected and scored according to its detected language.

Requirements

Your environment must have the latest version of Omnichannel for Customer Service. To learn more, see Upgrade Omnichannel for Customer Service.

Install and configure

After you've signed up, see step 4 of Enable sentiment analysis to configure sentiment analysis.

Policy notice

This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making, and should not be used to make, decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using this feature, and any associated feature or service in compliance with all applicable laws, including laws

relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

This feature is not intended for use in making, and should not be used to make, decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using Dynamics 365, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

Customer service managers or supervisors are responsible for managing the agents who work with customers to resolve queries every day through various service channels.

Omnichannel for Dynamics 365 Customer Service provides dashboards that help supervisors keep track of the work that their agents do. As a supervisor, you can use these dashboards to perform these tasks:

- Monitor key performance indicators (KPIs)
- Monitor quality and workload of agent
- Monitor unassigned workload
- Manage agent and customer escalations

As a supervisor, you see the following tabs when you open the Omnichannel for Customer Service app:

- **My dashboard**: This tab provides information about the conversations that you're directly connected and engaged with customers as an agent, such as your ongoing conversations, items that are available for you to pick, and closed conversations. To learn more, see Introduction to the agent interface.
- **Omnichannel intraday insights dashboard**: This tab provides an overview of information about the health and KPIs of agents in your organization. The information in this dashboard is displayed based on the last 24 hours conversations. To learn more, see Omnichannel intraday insights dashboard. If you're unable to view the dashboards, contact your system administrator. More information: Configure to view intraday insights dashboard. The intraday insights reports are available only in the English language, out of the box. You'll need to customize the reports to make them available in a language of your choice.

  This tab also displays all the reports and dashboards configured in the corresponding Power BI workspace.
- **Ongoing Conversations dashboard**: This tab provides information about the conversations that agents are handling and are in active, open, wrap up, and waiting status reason. To learn more, see Ongoing Conversations dashboard.

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Note**
>
> Intraday insights reports for Omnichannel for Customer Service are deprecated as of May 1, 2023. We recommend that you use **real-time analytics reports**, our latest analytics capability, which provide real-time information about the health and key performance indicators of your organization. For more information on the deprecation, go to **Intraday insights for Omnichannel for customer service are deprecated**.

Introduction

The **Omnichannel intraday insights** dashboards provide information about the health and key performance indicators (KPIs) for your organization. Omnichannel intraday insights consists of the following reports.

- IntradayMonitoring
- Conversation insights
- Agents insights

The information displayed in these reports is based on the conversations that were started or closed within the last 24 hours. The report fetches the latest data and is generated in real time when a supervisor accesses it. If the report in a customer configured workspace is kept open, it's automatically refreshed after 15 minutes. In a pre-configured Power BI workspace, the report auto refreshes after every 5 minutes.

> **Important**

- The intraday insights reports are available only in the English language, out of the box. You'll need to customize the reports to make them available in a language of your choice.
- In a BI workspace that's custom configured, you can perform the following customizations for the out-of-the-box reports:
  - Change visualizations for KPIs displayed on the report
  - Add visualizations for existing measures, KPIs, or fields to the report
- To help ensure that the most accurate and up-to-date data is displayed on the dashboard, be sure to follow **best practices for using Omnichannel for Customer Service**.

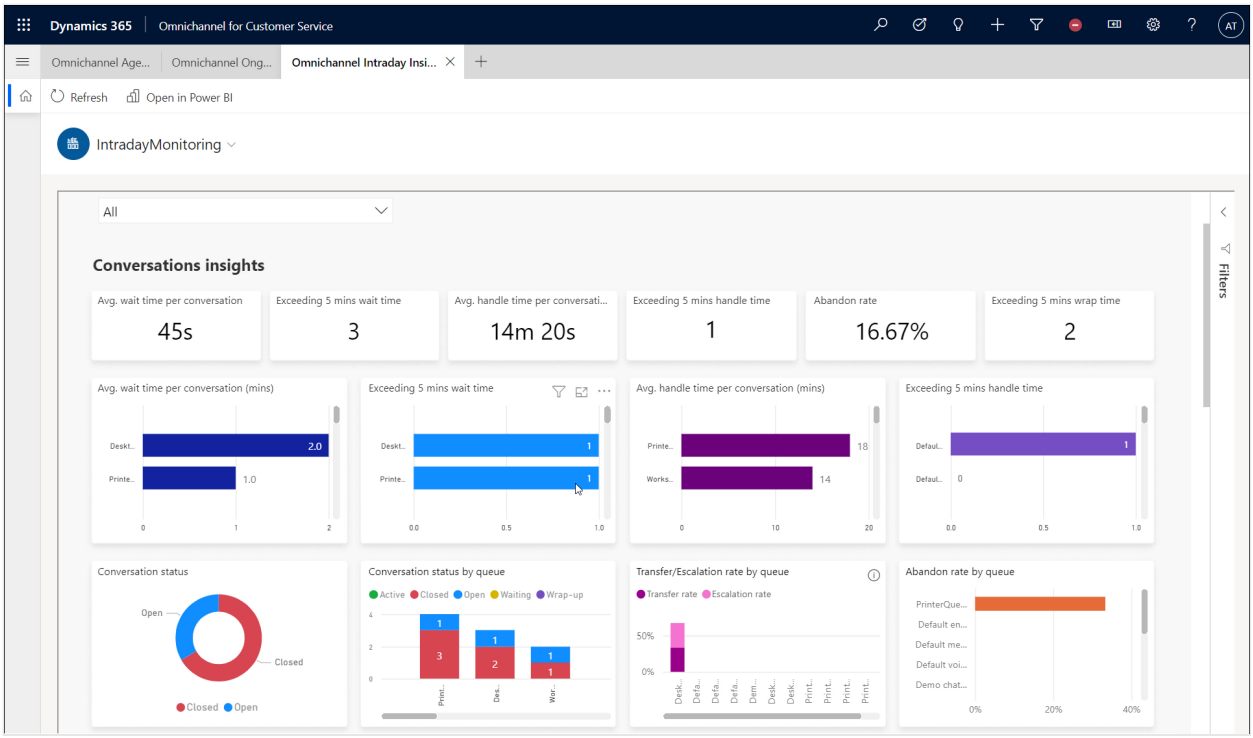
The IntradayMonitoring report

The IntradayMonitoring report deals with the overall contact center health and has relevant metrics to help understand it. This report contains two sections:

- The Conversation insights section provides metrics on the customer side, such as Customers waiting in queue and wait times.
- The Agent insights section contains metrics pertaining to agents such as agents logged in and handle times.

Conversations insights

The **Conversations insights** section provides metrics from a customer standpoint. A sample view of the metrics in **Conversations insights** is as follows.



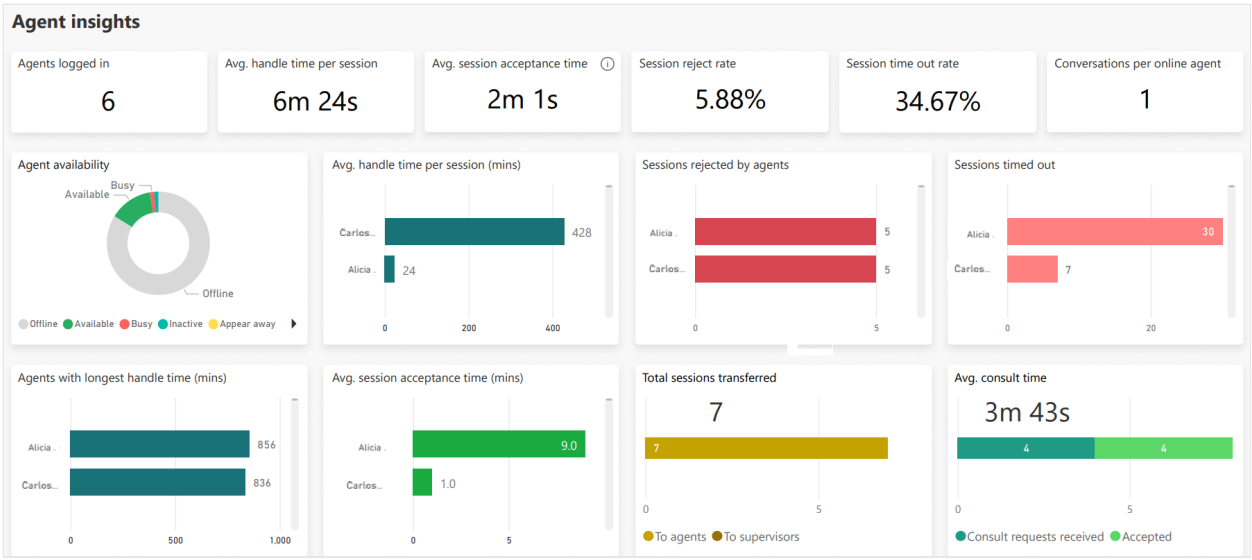
The KPIs for conversations in the IntradayMonitoring report are as follows.

Metric	Description	Availability
Avg. wait time per conversation	For a conversation, wait time is defined as the cumulative wait time of its individual sessions. This KPI is calculated as an average that considers only closed conversations. Session wait time is defined as the elapsed time between the creation of a session until the time an agent accepts it. If the agent rejects the chat or lets the notification time out, the amount of time it took for the agent to reject the chat or timeout is added and the time it takes for the subsequent session to be accepted by the agent is factored into the wait time. The average wait time is computed for only closed conversations and is also displayed on a per-queue basis. Only the conversations that are directly handled by an agent or escalated by a bot to an agent are considered. Conversations that are handled and closed by the bot are excluded.	Live chat, Digital messaging, Voice
Exceeding 5 mins wait time	The number of conversations that are open and have exceeded the threshold wait time of five minutes. This metric is also displayed on a per-queue basis.	Live chat, Digital messaging, Voice
Exceeding 5 mins wrap time	The number of conversations that are open and have exceeded the threshold wrap time of five minutes.	Live chat, Digital messaging, Voice

Metric	Description	Availability
Abandon rate	The percentage of conversations abandoned by customers before connecting to an agent. This metric is also displayed on a per-queue basis.	Live chat, Voice
Average handle time per conversation	The average handle time is calculated as the average of all the handle times of the sessions handled by the agent. The session handle time is the total duration the agent spent on the session when it is in focus in the session panel until an agent closes the session. The handle time is paused when the agent switches to another session and is resumed when the agent returns to the session. Average handle time is also displayed on a per-queue basis. Only the conversations that are directly handled by an agent or escalated by a bot to an agent are considered; conversations handled and closed by the bot are excluded. More information: Average handle time.	Live chat, Digital messaging
Exceeding 5 mins handle time	The number of active conversations that are exceeding the handle time threshold of five minutes. This metric is also displayed on a per-queue basis.	Live chat, Digital messaging, Voice
Conversation status	The distribution of the status of conversations across **Open**, **Active**, **Waiting**, **Wrap up**, and **Closed**.	Live chat, Digital messaging, Voice
Conversation status by queue	The distribution of the status of conversations across different queues.	Live chat, Digital messaging, Voice
Transfer/Escalation rate by queue	The transfer rate is the percentage of conversations in a queue that was transferred at least once. Escalation rate is the percentage of the conversations within a queue escalated to a supervisor.	Live chat, Digital messaging, Voice

Agent insights

The **Agent insights** section provides information about the health of the queues and the status of agents in a day. The agent insights section consolidates sessions across all channels. A sample view of the **Agent insights** section is as follows.



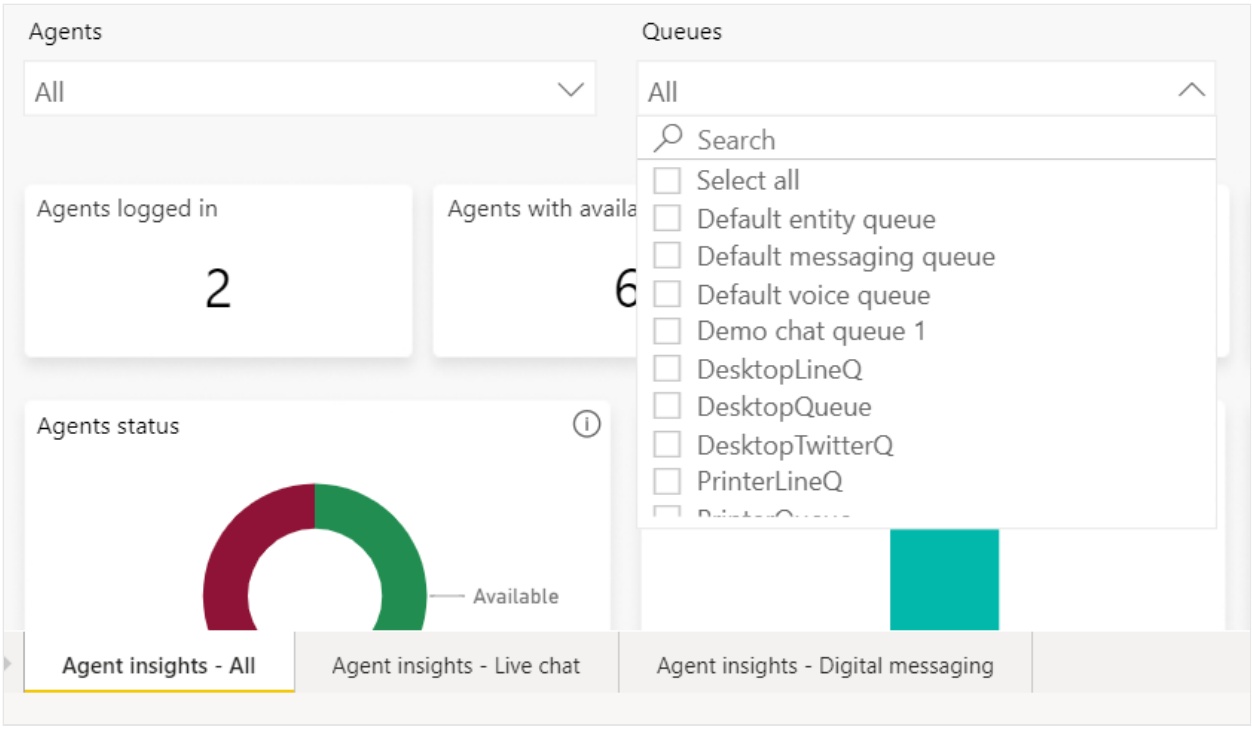
This section consists of the following performance indicators.

Metric	Description	Availability
Agents logged in	The number of agents who are signed in.	Live chat, Digital messaging, Voice
Average handle time per session	The average handle time is derived as the total session handle times by the number of sessions handled by the agents. The session handle time is the total duration an agent spent on the session when it is in focus in the session panel until an agent closes the session. The handle time is paused when the agent switches to another session and is resumed when the agent returns to the session.	Live chat, Digital messaging, Voice
Average session acceptance time	The average time an agent takes to accept an incoming conversation.	Live chat, Digital messaging, Voice
Session reject rate	The percentage of sessions rejected by the agents out of the total sessions assigned to them.	Live chat, Digital messaging, Voice
Session time out rate	The rate of sessions that were timed out	Live chat, Digital messaging, Voice
Sessions rejected by agents	The percentage of sessions rejected out of the total sessions assigned per agent.	Live chat, Digital messaging, Voice

Metric	Description	Availability
Sessions timed out	The rate of sessions that were timed out per agent.	Live chat, Digital messaging, Voice
Conversations per online agent	The number of conversations that are handled by each agent.	Live chat, Digital messaging, Voice
Agent availability	The distribution of agents presence.	Live chat, Digital messaging, Voice
Agents with longest handle time	The number of agents with the longest time to accept a conversation and resolve it.	Live chat, Digital messaging, Voice
Total sessions transferred	The number of sessions that were transferred to other agents or supervisors.	Live chat, Digital messaging, Voice
Average consult time	The average time spent by agents consulting with other agents or supervisors.	Live chat, Digital messaging, Voice

View and filter reports

You can filter information by selecting the queues that have been defined for your organization. From the **Omnichannel queues** dropdown list, select the queues you want, and the information will be filtered according to your selection. This helps you quickly analyze the KPIs and take any necessary steps to improve outcomes.



Average handle time

The average handle time is calculated as the average of all the handle times of the sessions handled by the agent. The session handle time is the total duration the agent spent on the session when it is in focus in the session panel until an agent closes the session. The handle time is paused when the agent switches to another session and is resumed when the agent returns to the session. This includes the time the agent takes to wrap up the conversation. When an agent concurrently handles multiple customers and switches sessions, the active time for the previous session is paused and the active time for the current session resumes.

The conversations handled by bots and closed by bots aren't considered in the calculation of the average handle time.

If the agent spends time providing consultation, it's included in the agent's average handle time. Similarly, for supervisors, the monitor time is included in the supervisor's average handle time.

When a conversation is transferred, the app calculates the handle time for the conversation by summing up the active time spent by all agents who are involved.

Average handle time is accurately calculated if you ensure the following:

- Agents close the sessions by selecting the **Close** button at the end of their shift. More information: Conversation in waiting status.
- Agents don't change the computer time.

- Agents don't use incognito mode in Google Chrome or private browsing in Microsoft Edge.

When an agent steps away from the desk during an ongoing session and doesn't interact with the customer, the system counts this time as active and calculates a higher value for the handle time. For a more realistic report of the active time that agents spend in the session, you can configure the idle time threshold. If no agent activity is detected after the idle time threshold is reached, the handle time computation is paused. The computation resumes if any mouse, touch, or keyboard activity is detected. By default, the idle time threshold isn't enabled out of the box. More information: Set the idle time threshold.

Saved views for Intraday reports

You can save the filters that you used for the reports as bookmarks. The bookmarks allow you to access the filters easily and repeatedly, without having to apply the filters every time. You can switch between the multiple bookmarks when you're managing different reports and teams. The saved views allow you to save the queues and agents pertaining to different teams and lets you switch between the filters to view the metrics for each team.

You can create personal bookmarks that are visible only to you. Bookmarks that are created by Power BI administrators can be shared with all users in a read-only mode.

More information:

- Create bookmarks in Power BI Desktop to share insights and build stories
- Create personal bookmarks

View reports in different time zones

Use the Timezone option available in the reports to view the date and time information according to the time zone that you specify. You must save the changes to view the report in the selected time zone the next time you access it. For a customized intraday insights report, the app automatically saves the selected time zone after a minute.

You can save your preferred time zone settings for reports as bookmarks. The bookmarks allow you to switch between reports in various time zones, without having to set the time zone.

Slice metrics by time

The **Duration** option that's available in all reports lets you filter the report details. The filter helps you look at the metrics for the shift the supervisor is handling out of the entire 24 hours duration. The filter lets you report the data within the last four, eight, or 12 hours duration or apply a custom value as well. The metrics within the reports are calculated based on the conversations created in the selected time duration.

> **Note**
>
> When you use the **Duration** filter, irrespective of the **Time zone** setting, the report is always displayed in the UTC time zone. This is due to a Power BI limitation. More information: **Power BI Considerations and limitations**.

Let's look at an example to understand the data refresh of the reports.

The following conversations were started and closed on day 1:

- Conversation 1: closed at 9:30 AM
- Conversation 2: closed at 10:14 AM
- Conversation 3: started on 11:00 PM
- Conversation 3: closed at 11:15 PM

If the supervisor accesses the report on day 2 at 10:00 AM and doesn't use the **Duration** filter, the report fetches the data corresponding to conversations 2 and 3. Conversation 1 isn't displayed, because it was closed 24.5 hours prior to the time the report is accessed. When the report refreshes automatically at 10:15 AM, the data corresponding to only conversation 3 is displayed on the report.

If you access the report on day 2 at 10:00 AM and set the **Duration** to 12 hours, the report only displays the data corresponding to conversation 3.

We recommend that you use **real-time analytics reports**, our latest analytics capability, which provide real-time information about the health and key performance indicators of your organization. For more information on the deprecation, go to **Intraday insights for Omnichannel for customer service are deprecated**.

Introduction

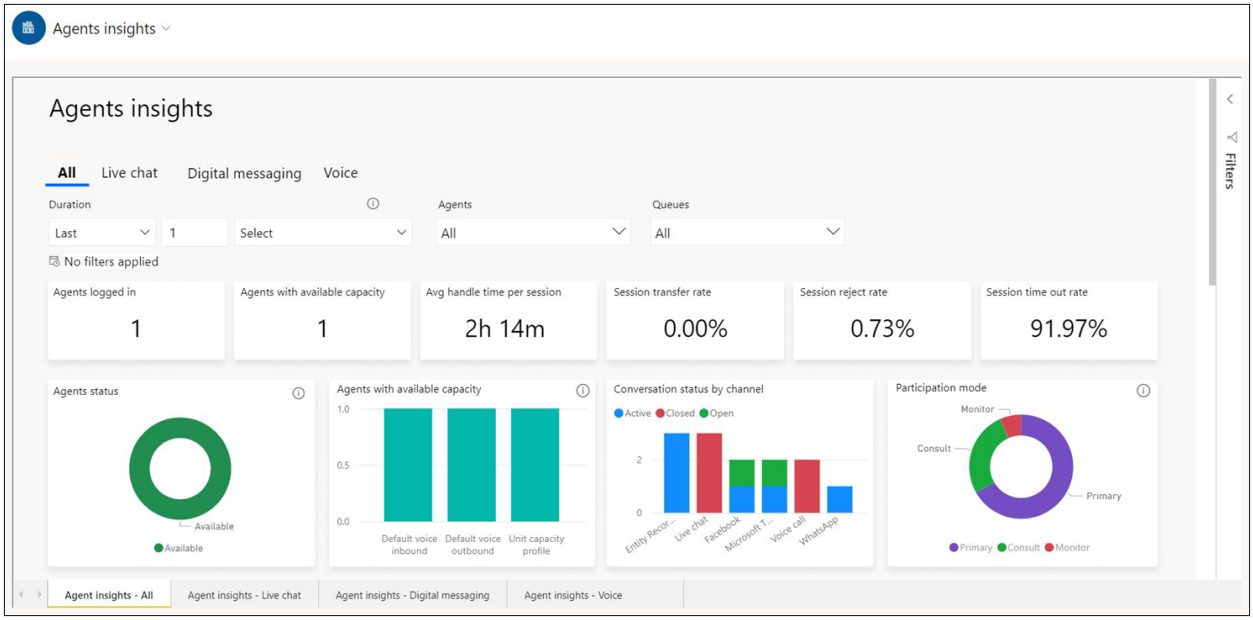
The Omnichannel intraday insights dashboard contains the Agents insights report that helps provide an overview of agent performance.

The Agents insights report

The **Agents insights** report consists of metrics from an agent's standpoint. The report shows all-up agent metrics across all channels or channel-wise agent performance. Supervisors can select the **All** tab to view agent performance across all channels, or select the **Live chat**, **Digital messaging**, or **Voice** tabs to view the agent performance for the corresponding channel.

The Digital messaging report includes metrics from the social channels, SMS, Microsoft Teams, entity records, and custom messaging channels.

You can view specific insights about the performance of individual agents or groups of agents, such as their availability, average length of time in conversations, and average response time per session.



The agents insights report consists of the following metrics.

Metric	Description	Availability
Agents logged in	The number of agents who are signed in.	Live chat, Digital messaging, Voice
Agents with available capacity	The number of signed-in agents who can accept incoming conversation requests as well as their available capacity across all capacity profiles. Unit-based capacity is accounted against the unit capacity profile.	Live chat, Digital messaging, Voice
Average handle time per session	The average handle time is derived as the total session handle times by the number of sessions handled by the agents. The session handle time is the total duration an agent spent on the session when it is in focus in the session panel until an agent closes the session. The handle time is paused when the	Live chat, Digital messaging, Voice

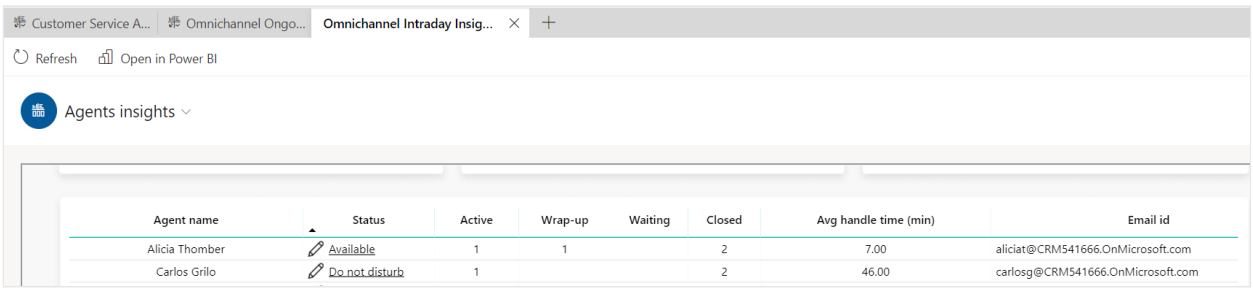
Metric	Description	Availability
	agent switches to another session and is resumed when the agent returns to the session.	
Session reject rate	The percentage of sessions rejected by the agents out of the total sessions assigned to them.	Live chat, Digital messaging, Voice
Session time out rate	The percentage of sessions that were timed out, out of the total sessions assigned.	Live chat, Digital messaging, Voice
Session transfer rate	The percentage of sessions that were transferred to another agent or queue.	Live chat, Digital messaging, Voice
Agent status	The presence status of an agent.	Live chat, Digital messaging, Voice
Chat status	Displays the number of chat conversations that are in the different statuses.	Live chat
Conversation status by channel	The distribution of the different conversations statuses across different channels.	Digital messaging
Call status	Displays the number of calls that are in the different statuses.	Voice
Participation mode	The distribution of the sessions across various participation types - Primary indicates the agent who's assigned the session, Consult indicates agents who are engaged in a consulting session and Monitor indicates an ongoing Supervisor's monitor session.	Live chat, Digital messaging, Voice
Transfer rate by agent	The percentage of sessions transferred by the agent to another agent or queue.	Live chat, Digital messaging, Voice
Transfer rate by queue	The percentage of sessions within a queue that were transferred to another agent or queue.	Live chat, Digital messaging, Voice
Consult acceptance	The percentage of consult requests accepted by an agent out of the total requests received.	Live chat, Digital

Metric	Description	Availability
Avg. talk time (min)	The average time an agent spent talking with a customer over a voice call.	Voice
Avg. hold time (min)	The average time an agent put a customer on hold over a voice call.	Voice

You can filter on a specific queue or set of queues to view more specific information about an agent or group of agents. You can also hover over an agent's name and a pop-up window will appear, showing details such as the agent's presence, current conversations, and the sentiments of those conversations, as well as an agent's available capacity across different capacity profiles. Unit-based capacity is accounted against Unit capacity profile.

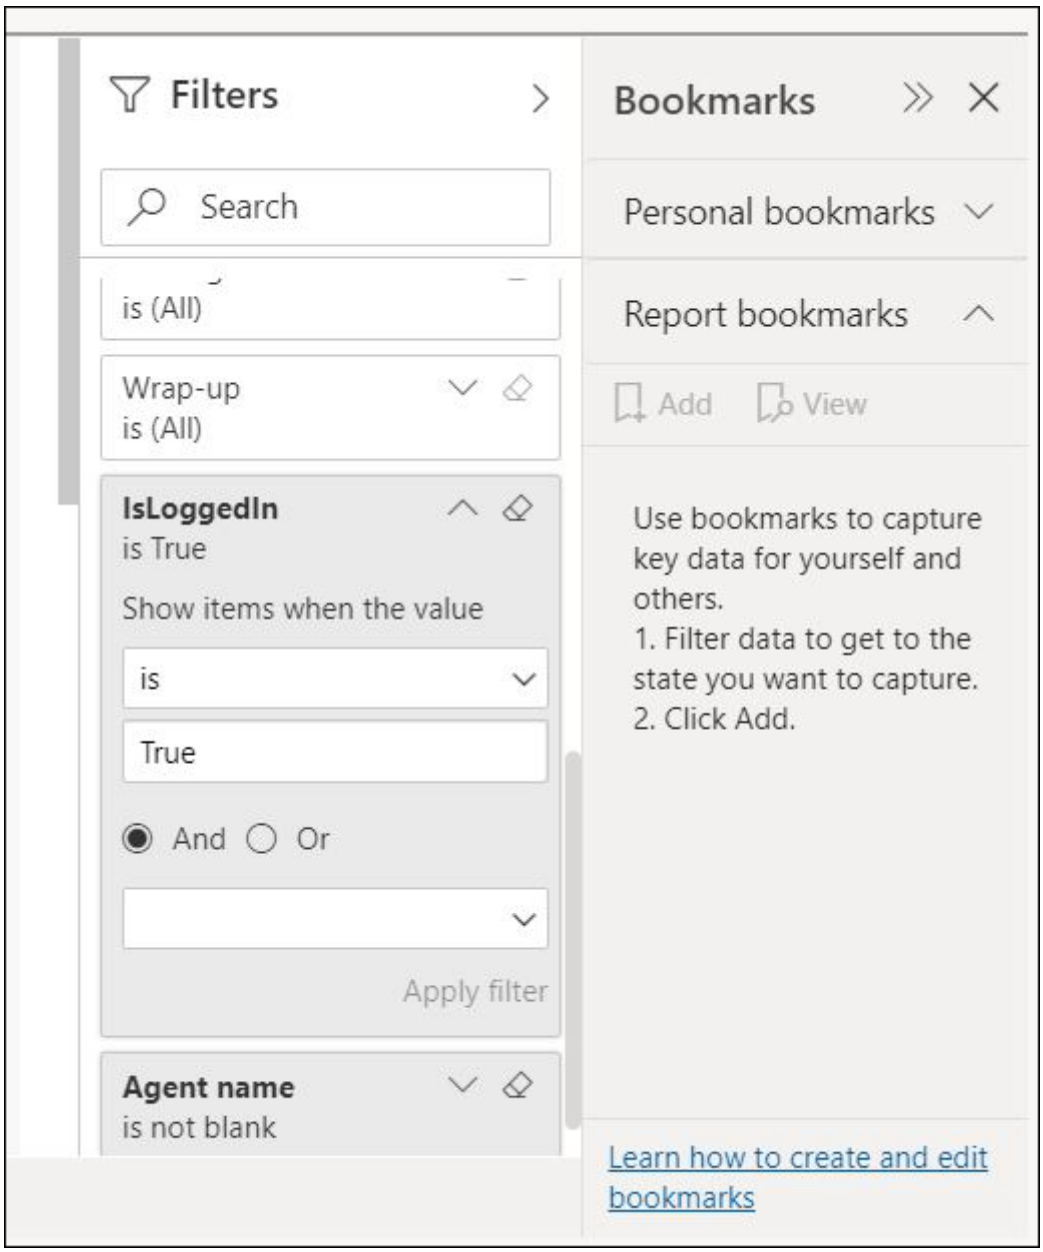
The table in the **Agent insights** report displays the following information.

Agent details	Description
Agent name	A list of the agent names for the queue.
Status	The current presence of the agent: **Available**, **Offline**, **Do not disturb**, or **Busy**.
Active	The number of conversations that are active.
Waiting	The total number of conversations waiting to be picked up by an agent.
Wrap-up	The total number of conversations in the wrap-up stage.
Closed	The number of conversations that are closed.
Avg handle time (min)	The average of an individual agent's handle time in minutes for all closed conversations that the agent is involved in. More information: Average handle time.
Email ID	The email address of the agent handling the conversation; the email address should be unique so that the agent filter works as expected.



You can use the filters pane on the right to see only the signed-in agents in the table. Do the following:

1. Select the agent table.
2. Select the filter pane, and set **IsLoggedIn** field to **True**.



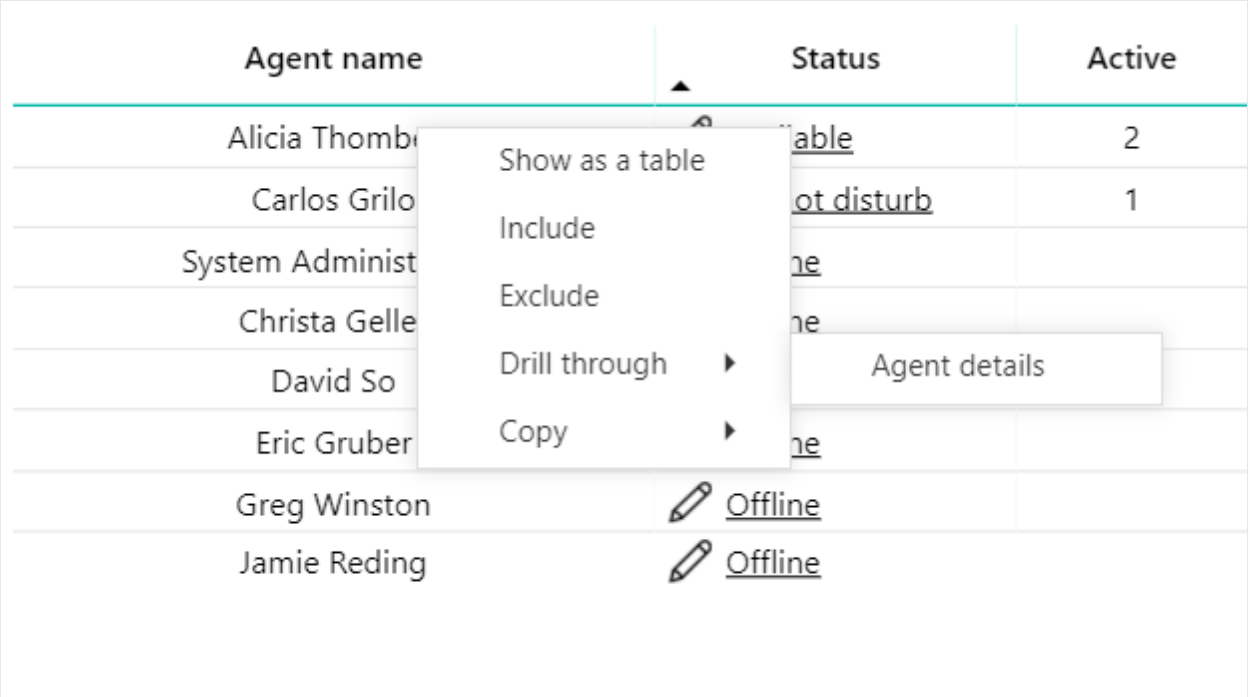
To get agent capacity information and monitor it, use the following entities to create a custom report or customize an existing report according to your business requirements.

- The agent status entity for the latest capacity profile and presence status of an agent.
- The status history entity for the history or audit trail of the presence and capacity profile changes for an agent.

Agent details

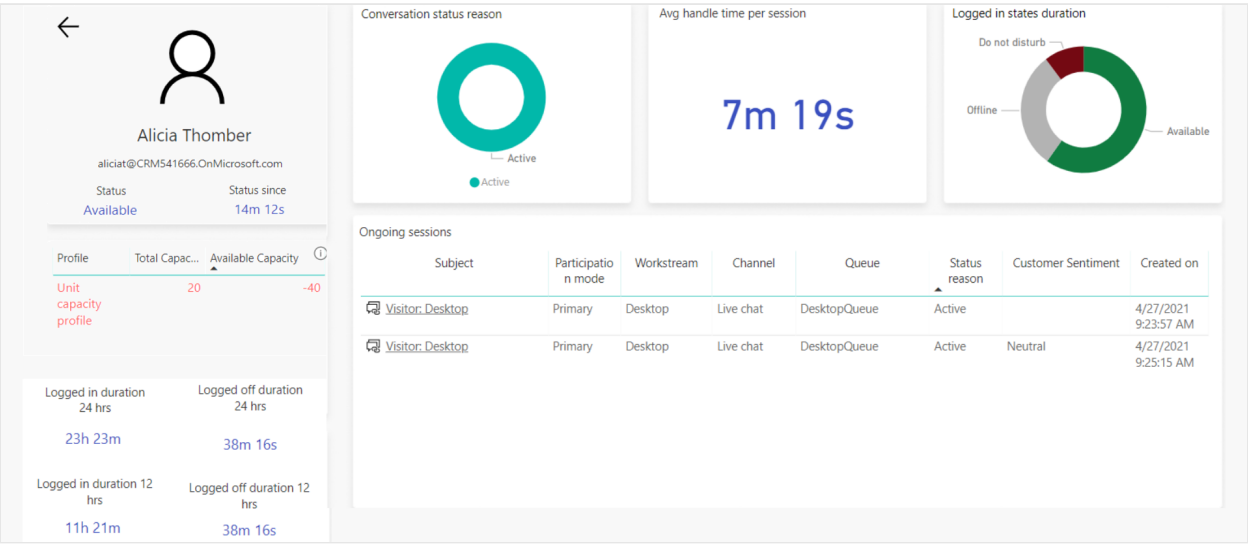
You can also view details about a specific agent by right-clicking the agent's name and then selecting **Drill through** > **Agent details** on the shortcut menu, as shown in the

following image.



> **Note**
>
> The **Drill through** feature isn't supported outside of Omnichannel for Customer Service.

Details about the agent are displayed as shown in the following image.



This section displays the following details.

Detail	Description
Profile	The capacity profiles that are assigned to an agent. If a profile is force assigned, it is displayed in red.
Total capacity	The total capacity as configured in the profile.
Available capacity	The current available capacity. Available capacity can be displayed as negative due to supervisor assigns.
Status	The agent's current presence : **Available**, **Offline**, **Do not disturb**, or **Busy**.
Status since	The amount of time that the agent's presence has been in its current state.
Logged in duration 24 hrs	The total duration for which the agent has been signed in during the past 24 hours.
Logged off duration 24 hrs	The total duration for which the agent has been signed out during the past 24 hours.
Logged in duration 12 hrs	The total duration for which the agent has been signed in during the past 12 hours.
Logged off duration 12 hrs	The total duration for which the agent has been signed out during the past 12 hours.
Queues	The queues that the agent is mapped to.
Skills	The skills that are assigned to the agent.
Conversation status reason	The status of the latest conversation between the agent and a customer.
Avg handle time per session	The average handle time per session is calculated as the average of all the handle times of the sessions handled by the agent. The session handle time is the total duration an agent spent on the session when it is in focus in the session panel until an agent closes the session. The handle time is paused when the agent switches to another session and is resumed when the agent returns to the session. This includes the time the agent takes to wrap up the conversation. More information: Average handle time.
Logged in states duration	The agent's presence when the agent is signed in.
Subject	For an identified customer, the customer's name is displayed with the subject. For unidentified customers, static text is displayed with the label **Visitor**. More

Detail	Description
	information: Automatically identify customers.
Participation mode	**Primary** indicates that the agent is engaged in a session. **Consult** means that the agent is engaged in a consulting session with another agent. **Monitor** means that this agent is monitoring the session.
Work stream	The work stream that the conversation is assigned to.
Channel	The channel that the conversation was created from.
Queue	The queue that the conversation is currently part of.
Status reason	The current conversation status.
Customer sentiment	The current sentiment.
Created on	The conversation creation time.
Capacity and status timeline	Every change in capacity or status is plotted on the timeline. Negative capacity is displayed if a supervisor assigns a conversation to an agent that's beyond the agent's available capacity.

Change agent status

You can select the **Status** field to modify the presence indicator for an agent. The agent has to be signed in for you to change the agent status.

Introduction

The Omnichannel intraday insights dashboard contains the Conversation insights report that helps provide an overview of the conversations across the different channels.

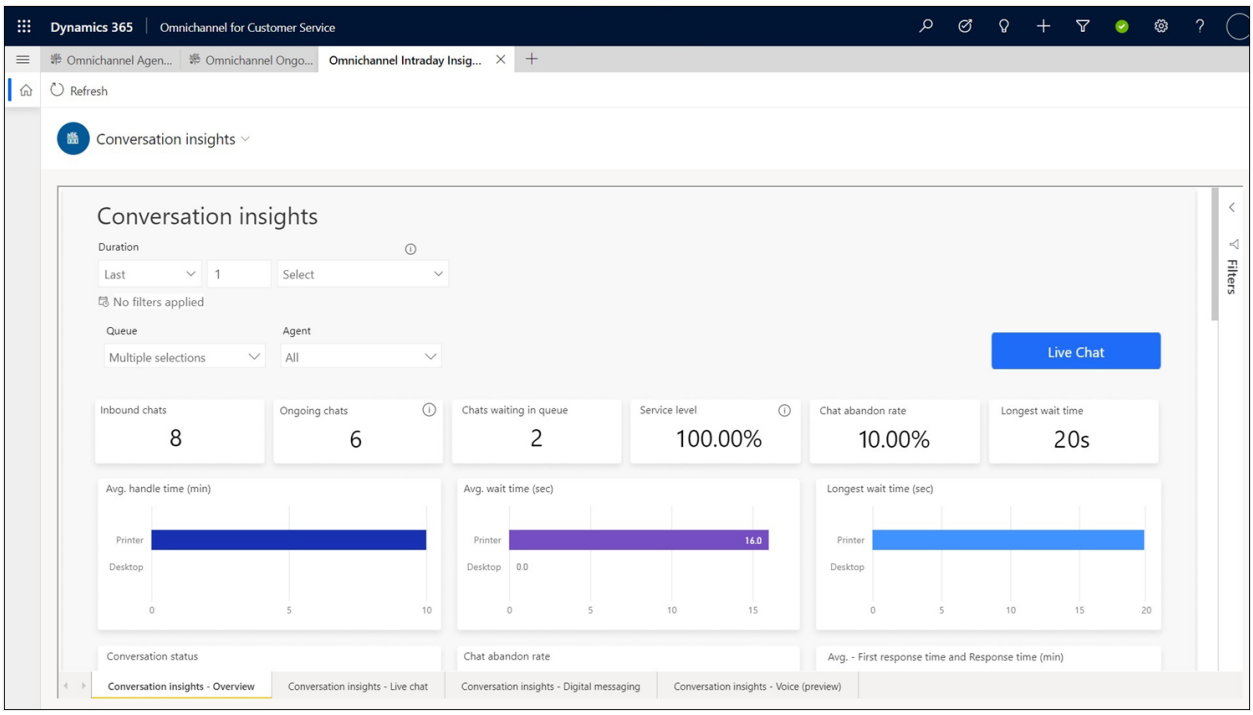
The Conversation insights report

The **Conversation insights** report is arranged in the following tabs:

- Conversation insights - Overview
- Conversation insights - Live chat
- Conversation insights - Digital messaging
- Conversation insights - Voice

The overview section provides the most important metrics across Live Chat, Digital messaging, and Voice. Supervisors can drill through to the detailed metrics for the respective channel type by selecting the Live chat, Digital Messaging, or Voice buttons.

The Digital messaging report includes metrics from the social channels, SMS, Microsoft Teams, entity records, and custom messaging channels.



The **Conversation insights** report displays the following metrics about conversations.

Metric	Description	Availability
Inbound chats/Inbound conversations/Inbound calls	The number of chat, conversations, or calls that were started, closed, within the last 24 hours by a bot or an agent.	Live chat, Digital messaging, Voice
Ongoing chats/Ongoing conversations/Ongoing calls	The number of chat, conversations, or calls by a bot or an agent in active, waiting, and wrap-up statuses.	Live chat, Digital messaging, Voice
Service level	The percentage of chats that were accepted by an agent within 30 seconds. The threshold of 30 seconds can be modified to suit your business needs. More information: Modify thresholds. Only the conversations that are directly handled by the agent or escalated by the bot to the agent are considered; conversations handled and closed by the bot are excluded.	Live chat
Chats waiting in queue/Conversations waiting in queue/Calls waiting in queue	The number of conversations that are waiting in the queue to be accepted by the bot or agent.	Live chat, Digital messaging, Voice

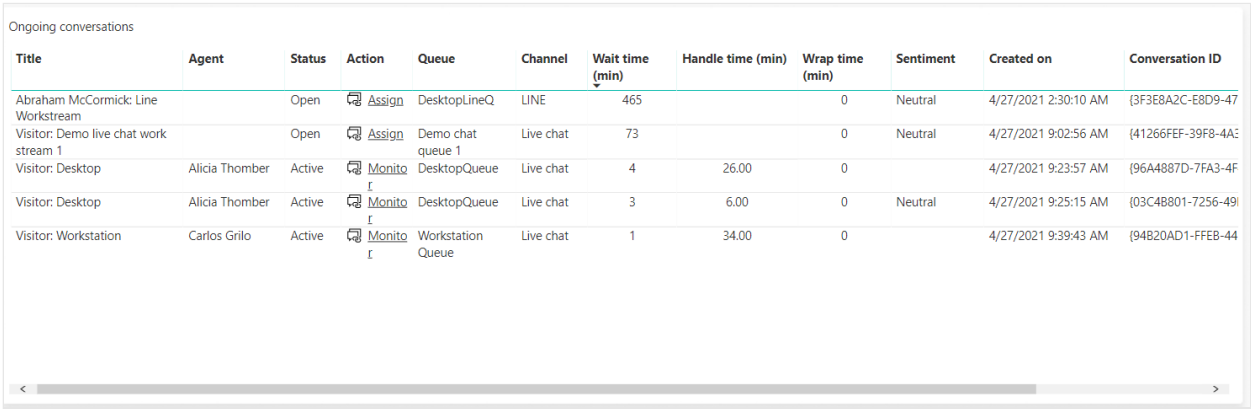
Metric	Description	Availability
Closed chats/Closed conversations/Closed calls	The number of conversations closed in the last 24 hours by the bot or agent.	Live chat, Digital messaging, Voice
Longest wait time	The longest time that an open conversation is waiting in queue to be accepted by an agent.	Live chat, Digital messaging, Voice
Average handle time	The average handle time is calculated as the average of all the handle times of the sessions handled by the agent. The session handle time is the total duration the agent spent on the session when it is in focus in the session panel until an agent closes the session. The handle time is paused when the agent switches to another session and is resumed when the agent returns to the session. More information: Average handle time. Only the conversations that are directly handled by an agent or escalated by a bot to an agent are considered; conversations handled and closed by the bot are excluded.	Live chat, Digital messaging, Voice
Average wait time (min)	For a conversation, wait time is defined as the cumulative wait time of its individual sessions. Session wait time is defined as the elapsed time between the creation of a session and the time that an agent accepts it. If the agent rejects the chat or lets the notification time out, the amount of time it took for the agent to reject the chat or timeout is added and the time it takes for the subsequent session to be accepted by the agent is factored into the wait time. The average wait time is computed for only closed conversations and is also displayed on a per-queue basis. Is derived as the total wait time by total number of conversations, excluding the abandoned ones. Only the conversations that are directly handled by an agent or escalated by a bot to an agent are considered; conversations handled and closed by the bot are excluded.	Live chat, Digital messaging
Average wrap time (min)	The average time taken to wrap up conversations. Is derived as the total wrap time by total number of conversations, excluding abandoned ones. Only the conversations that are directly handled by an agent or escalated by a bot to an agent are considered; conversations handled and closed by the bot are excluded.	Live chat, Digital messaging

Metric	Description	Availability
Conversation status	The distribution of the status of conversations across **Open**, **Active**, **Waiting**, **Wrap up**, and **Closed**.	Live chat, Digital messaging, Voice
Chat abandon rate/Call abandon rate	The percentage of conversations in which customers left before an agent accepted it. After escalation by a bot, when a customer leaves before an agent accepts it, it's also considered as abandoned. Is derived as the number of abandoned conversations or calls by number of chats or calls.	Live chat, Voice
Transfer rate by queue	The percentage of sessions within a queue that were transferred to another agent or queue. Is derived as the number of sessions transferred by total sessions. This includes any sessions created by a bot and escalated to an agent.	Live chat, Digital messaging
SLA - First response time	The percentage of conversations wherein the customer received the first response from the agent within 1 minute. The threshold of one minute can be modified to suit your business needs. See Modify thresholds. Only the conversations that are directly handled by an agent or escalated by a bot to an agent are considered; conversations handled and closed by the bot are excluded.	Available for only digital messaging channels; not available in Government Community Cloud (GCC).
SLA - Response time	The percentage of messages wherein the customer received a response within 1 minute from the agent. The threshold of one minute can be modified to suit your business needs. Only the conversations that are directly handled by an agent or escalated by a bot to an agent are considered; conversations handled and closed by the bot are excluded.	Available for only digital messaging channels; not available in GCC.
Avg - First response time (min)	The average time that a customer waited to receive the first response from agents. First response time is the difference between the first message from the customer and first response from the agent in a conversation, when there are multiple messages and responses exchanged between the customer and agent in quick succession. Is derived as the total first response time by the total number of conversations, excluding the abandoned ones. For a conversation escalated by the bot, the first response time is the difference between the agent's first response and escalation time.	Live chat, Digital messaging; not available in GCC.

Metric	Description	Availability
Avg - Response time (min)	The average time that a customer waited to receive responses from agents. Is derived as the total response time by the total number of such responses. Response time is the difference between the earliest message from the customer and the earliest response from the agent when there are multiple messages and responses exchanged between the customer and agent in quick succession. This excludes any responses from the bot to customer, and considers only the responses from the agent, excluding the first response, after escalation by the bot	Live chat, Digital messaging; not available in GCC.
Service level - Speed to answer	The percentage of voice calls that were answered within 30 seconds by the agent. The threshold of 30 seconds can be modified to suit your business needs. See Modify thresholds. Only the calls that are directly handled by an agent or escalated by the bot to agent are considered; calls handled and closed by the bot are excluded.	Voice
Avg. talk time (min)	The average time the agent spent talking with a customer over a voice call. Only the calls that are directly handled by the agent or escalated by the bot to agent are considered; calls handled and closed by the bot are excluded.	Voice
Avg. hold time (min)	The average time the agent put a customer on hold over a voice call. Is derived as the total hold time by total calls put on hold by the agent.	Voice
Avg. after call work time	The average time an agent took to wrap up a voice call. Is derived as the total after call work time by number of calls, excluding the abandoned ones. Only the calls that are directly handled by the agent or escalated by the bot to agent are considered; calls handled and closed by the bot are excluded.	Voice
Avg. speed to answer	The average time it took for a customer call to be answered. Is derived as the total time to accept by the number of calls accepted, excluding the abandoned ones. Only the calls that are directly handled by the agent or escalated by the bot to agent are considered; calls handled and closed by the bot are excluded.	Voice
Customer Sentiment	An automatic and unbiased measurement of satisfaction levels of the customer in real time. More information: Understand real-time customer sentiment	Voice

Ongoing and closed conversations

The **Ongoing conversations** table provides information about the status of the conversations that are not yet closed. The table also displays information about the channel through which the conversation came in, with the time and date that the conversation was picked up.



Ongoing conversations

Title	Agent	Status	Action	Queue	Channel	Wait time (min)	Handle time (min)	Wrap time (min)	Sentiment	Created on	Conversation ID
Abraham McCormick: Line Workstream		Open	Assign	DesktopLineQ	LINE	465		0	Neutral	4/27/2021 2:30:10 AM	{3F3E8A2C-E8D9-47
Visitor: Demo live chat work stream 1		Open	Assign	Demo chat queue 1	Live chat	73		0	Neutral	4/27/2021 9:02:56 AM	{41266FEF-39F8-4A3

The **Ongoing conversations** table displays the following metrics based on the channels through which the conversations are being held.

Title	Description
Agent	Name of the agent
Status	The status of the conversation, that is, open, active, waiting, wrap up, and closed.
Action	The action that can be taken on the conversation, that is, assign, monitor, or view the conversation.
Queue	The name of the queue that the conversation is a part of.
Channel	The name of the channel that the conversation came through.
Workstream	The workstream that the conversation is a part of.
First response time (min)	After sending the message, the time the customer waited for the first response from the agent. Not available in GCC.
Avg. response time (min)	The average time the customer waited for the agent to respond to their messages. Not available in GCC.
Total response time (min)	The total time the customer waited for the agent to respond to their messages. Not available in GCC.
Transfers	The total number of transfers made if the conversation is routed to another agent.

Title	Description
Escalations	The total number of escalations made. It does not include escalation from the bot to agent.
Speed to answer (sec)	**For voice channel**: The time it took for a customer call to be answered.
Talk time (min)	**For voice channel**: The total time spent by the customer and agent talking on the voice call. It's the difference between the handle time and cumulative time in hold and after call work time.
Hold time (min)	**For voice channel**: The total time an agent has put a customer on hold.
After call work time (min)	**For voice channel**: The time spent by an agent in wrapping up a voice call.
Wait time (min)	For a conversation, wait time is defined as the cumulative wait time of its individual sessions. Session wait time is defined as the elapsed time between the creation of a session and the time that an agent accepts it.
Handle time (min)	Total time taken to accept and close the conversation.
Wrap time (min)	Total time in which the conversation was in the wrap stage.
Sentiment	An automatic and unbiased measurement of satisfaction levels of the customer in real time.
Created on	The date on which the conversation was created on. The date and time is displayed in the UTC time zone.
Conversation ID	The conversation's ID.

The **Closed conversations** table provides information related to all the conversations that have been closed.

You can also assign a conversation to an agent or route it to another queue. More information: Monitor and assign conversations.

Factors that affect response time

First response time is calculated as the difference between the first message from the customer and the first response from the agent in a conversation that might contain

more than one message or response.

Response time is the difference between the earliest message from the customer and the earliest response from the agent, excluding the first message and response from the customer and agent respectively.

The successive exchange of messages will not be counted towards the calculation of the first response time and response time.

For example, a customer sends a message "Hello" at 2:20 PM and another message "I have a problem" at 2:21 PM. The agent responds as "Hello, sorry for the inconvenience." at 2:22 PM and "What is the issue you are facing?" at 2:23 PM. The first response time will be the difference between 2:20 PM and 2:22 PM, which is two minutes. Then the customer sends a message "My coffee machine has stopped working" at 2:24 PM and another message "I checked everything" at 2:25 PM. The agent responds "Let me help you with that" at 2:27 PM and "Are you near the coffee machine now?" at 2:28 PM. The response time will be the difference between 2:24 PM and 2:27 PM, which is three minutes.

The first response time and response time is calculated by keeping different factors into account. If operating hours are defined on the queue, the wait period of the out-of-operating hours is not considered in the response time. For example, an organization's operating hours are from 9:00 AM to 5:00 PM. When a chat is initiated by a customer at 8:55 AM, and agent responds at 9:03 AM. The response time will be the difference between 9:00 AM and 9:03 AM, which is three minutes. The metric doesn't consider the five minutes that are outside of the operating hours.

If a conversation is transferred from one queue to another, the messages exchanged in the currently assigned queue and its operating hours are taken into account for calculating the response time.

If the operating hours of the queue are updated to a new schedule, the latest operating hours are considered in calculating the response time for messages exchanged post the change.

Modify thresholds

In a BI workspace that's custom configured, you can update the thresholds for the metrics that are displayed in the out-of-the-box reports. However, you can't modify the thresholds in a preconfigured BI workspace.

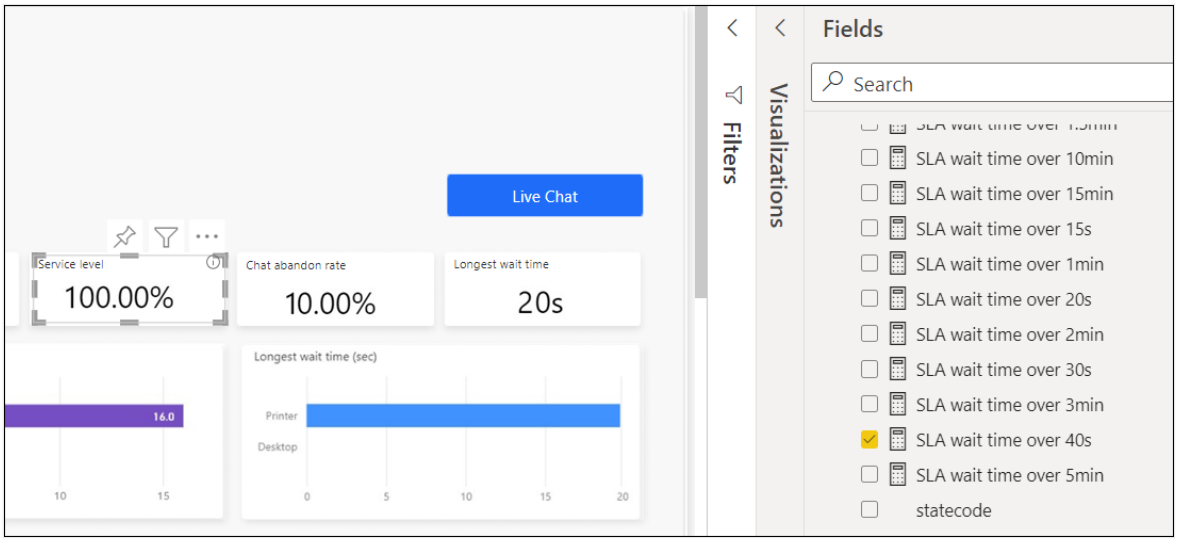
1. Open the report in Power BI.

2. On the report page, on the command menu, select **Edit**, and then select the KPI for which you want to change the threshold. The **Fields** pane appears on the right.

3. Expand the field on which the KPI is based, and scroll down to the fields that denote the time.

4. Clear the current selection, and then select the time field whose value meets your requirement.

   A sample change of threshold is as follows.



5. Save the changes.

Set the idle time threshold for average handle time

Article • 02/17/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

You can configure the idle time threshold to pause the handle time computation of an agent for an ongoing session when the agent is idle. More information: Average handle time.

How to set the idle time threshold

In the Omnichannel Administration app, select the **F12** key to open the command prompt, and then run the following:

JavaScript

```
let entityName = "msdyn_channelprovider"
let attributeName = "msdyn_channelurl"
let primaryAttributeName = "msdyn_channelproviderid"
let threshold = "60"

Xrm.WebApi.retrieveMultipleRecords(entityName, "").then((result) => {
    result.entities.forEach ((entity) => {
        console.log(entity);
        if(entity[attributeName].toString().indexOf("&idleTimeThreshold") ==
-1) {
            console.log("modify data");
        var data = {};
        data[attributeName] = entity[attributeName] + "&idleTimeThreshold="
+ threshold;
            Xrm.WebApi.updateRecord(entityName,
entity[primaryAttributeName], data).then((result) => {
            console.log(result);
                return Promise.resolve();
            }, (error) => {
            console.log(error);
                return Promise.reject();
            });
        }
```

```
    });
    return Promise.resolve(result.entities);
}, (error) => {
            console.log(error);
    return Promise.reject();
});
```

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

The **Omnichannel Ongoing Conversations** dashboard provides information on the conversations that are handled by agents and are in the active, open, wrap up, and waiting status in your organization. This dashboard provides a holistic view of the conversations with details, such as customer, agent assigned, subject, queue, and activity status. The data in the dashboard is auto refreshed in near real time.

Further, you can filter the conversations using the **Filter by queues** or **Filter by agents** option to create a personalized view of the queues or the group of agents you want to monitor or track. Select the queues or agents for which you want to view the conversations and then select **Apply**. The filter is applied, and conversations are displayed based on the selection. Select **Save** to set this filter as default and when you sign in to Omnichannel for Customer Service, you view conversations based on your saved filter.

> ⓘ **Note**
>
> - The **Ongoing Conversations dashboard** is view only and you can't perform any actions such as open, edit, or delete on this dashboard.
> - The status icon in the **Active Agent** column of the dashboard does not pertain to an agent's online presence in Omnichannel. The status is displayed based on your Microsoft Teams or Skype for Business integration settings with Microsoft Dynamics 365. The administrator can turn off the presence in the system settings for Dynamics 365.

View Omnichannel Ongoing Conversations dashboard

The **Omnichannel Ongoing Conversations** dashboard is available in:

- Unified Service Desk
- Omnichannel for Customer Service

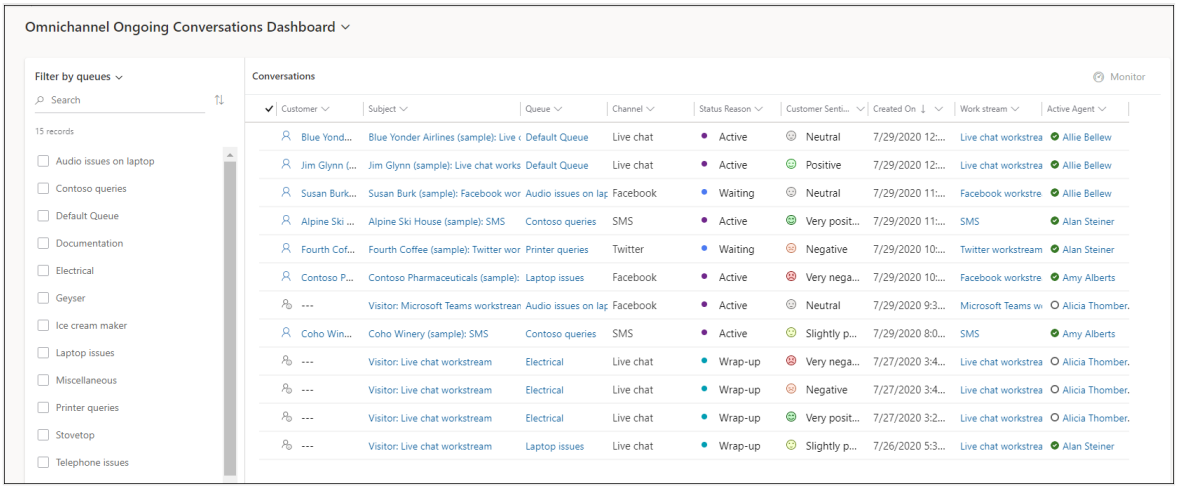
Unified Service Desk

1. Open the **Unified Service Desk** client application.
2. Sign in with your supervisor credentials.

   > **Note**
   >
   > To learn more, see **Sign in to Unified Service Desk – Omnichannel for Customer Service**.

3. Select the **Conversations** tab.

   The **Omnichannel Ongoing Conversations** dashboard displays the list of conversations that you and agents are handling.



Omnichannel for Customer Service

1. Go to *https://**YourOrganization**.dynamics.com/apps* and select **Omnichannel for Customer Service**.
2. Select the **Omnichannel Ongoing Conversations Dashboard** tab.

   The Omnichannel Ongoing Conversations dashboard displays the list of conversations that you and agents are handling.

Use Omnichannel for Customer Service metrics

Article • 10/19/2023

This article describes the different metrics that help you analyze key performance indicators (KPIs) as you work with agents in your contact center. Use metrics to do a quantitative assessment of the data that is shown on the Omnichannel for Customer Service dashboards. Metrics can also help you make strategic decisions, and track and improve customer satisfaction.

Understand the Omnichannel analytics data model

Omnichannel for Customer Service provides an out-of-box data model that consists of fact and dimension tables.

- Facts, also known as metrics, represent the observational or event data that you want to analyze. Fact tables logically organize KPIs. For example, the `FactConversation` table has conversation metrics such as average handle time, whereas the `FactAgent` table has agent metrics.
- Dimensions represent the attributes of the facts. You can use them to break down the data for further analysis.

You can use facts and dimensions to visualize data according to your organizational requirements. For example, if you want to understand how average handle time varies by queue, you can filter the Average handle time fact by the Queue name dimension.

Fact tables are larger than dimension tables because numerous events, such as individual customer requests, occur in them. Dimension tables are typically smaller because you're limited to the number of items that you can filter on and group. For example, the number of queues is a limited set.

Understand the Omnichannel for Customer Service workflow

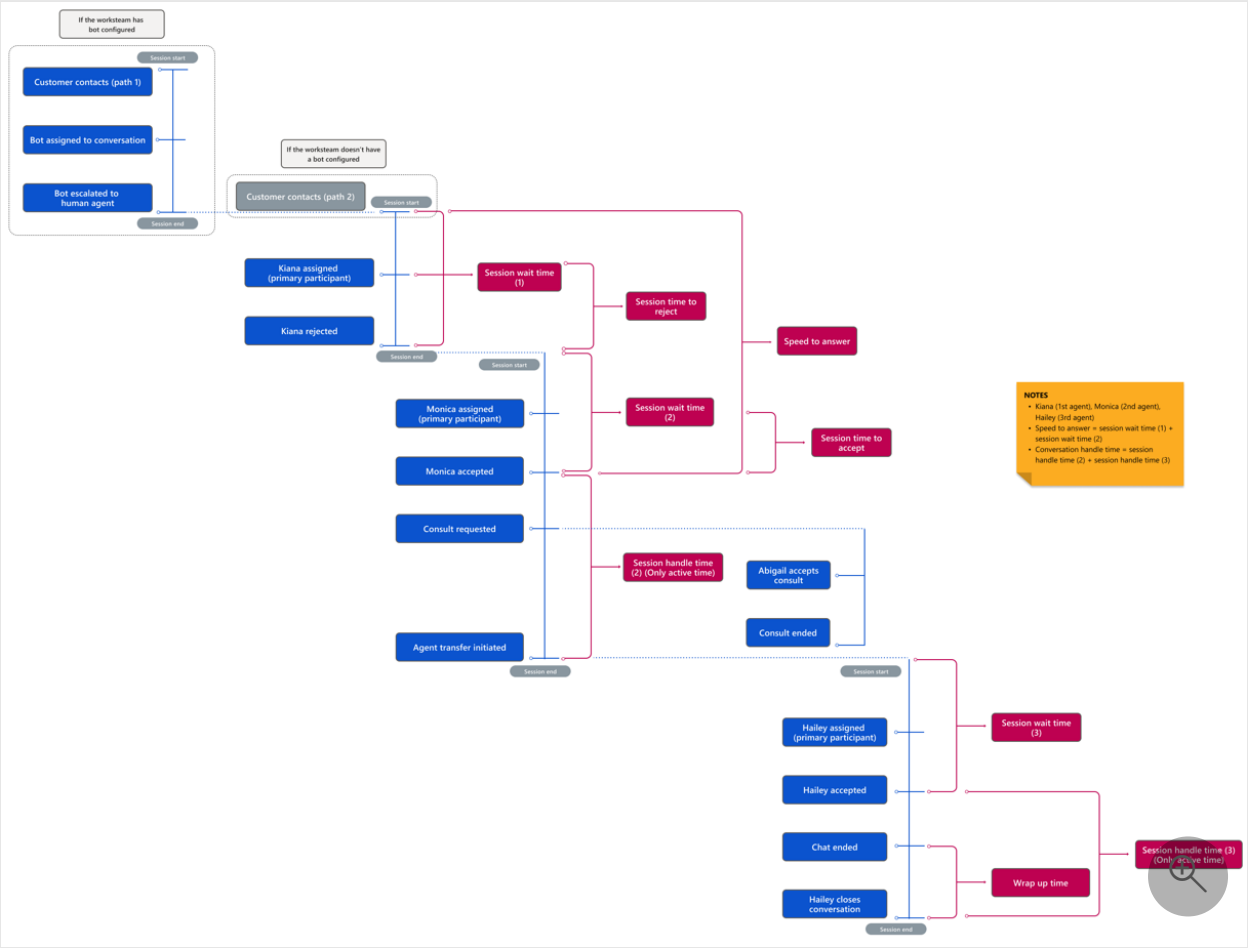
Here is a brief description of the workflow.

When a customer raises a request through a channel such as voice, messaging, or chat, a conversation is created. A conversation represents an entire end-to-end interaction

with a customer. A conversation can also be created when an agent calls a customer. A conversation typically originates in a workstream on a specific channel. It's then routed to a queue, based on your organizational rule settings. A conversation entity holds metrics about your customer's experience with the contact center. These metrics include the current status, wait time, handle time, and current customer sentiment.

A conversation can end during a single session, or it can extend to multiple sessions. A session is created when the system identifies an agent to work on a conversation. New sessions are created for different reasons. For example, a conversation might be transferred to a different queue, or an agent might reject a conversation request or let it time out. From this entity, you can get KPIs and metrics that describe queue performance and agent performance. Examples include the number of requests that landed in a queue, the number of requests that agents rejected, and agent handle time.

The workflow in the following diagram represents a single conversation where multiple sessions are created. The first session is created when the conversation is created and assigned to a bot. When the bot escalates the conversation to a human agent, the second session is created, and the first session is automatically closed. In the second session, the system identifies and assigns the best agent to work on the customer request. If that agent rejects the request, a new session is created, and the process of identifying another agent begins.



For every agent who is identified to work on a conversation and associated with the latest session, a session participant entry is created. A single session can have multiple participants. Every session has one primary participant: the agent who has the assigned work item. A session might then have many other participants who monitor the conversation or help with the consultation. Alternatively, the session might have no other participants. From this entity, you can get KPIs and metrics about consultations that agents provide and monitored conversations.

Dimensions

This section describes the different dimensions of the out-of-box omnichannel real-time analytics metrics.

For information about how you can use these metrics to customize the visual display of your reports, go to Customize visual display.

Skills

Skills that have been assigned to agents.

Proficiency

Agent's proficiency level for assigned skills.

Capacity profile name

This dimension represents the name of the capacity profile.

Conversation direction

This dimension applies only to voice conversations. It indicates whether the customer or an agent in the contact center initiated the conversation.

If a contact center agent initiates the conversation (and the customer receives it), it's considered outbound. If the customer initiates the conversation (and the contact center receives it), it's considered inbound.

Conversation status

This dimension represents the current state of a customer interaction. The following status values are available:

- **Open**: The conversation is currently awaiting agent assignment.
- **Active**: Either the conversation has had an agent assigned and is awaiting acceptance, or an agent is in contact with the customer.
- **Waiting**: The conversation is currently awaiting either a customer response or an agent response. This option applies to asynchronous conversation modes, such as messages.
- **Wrap-up**: The agent is performing post–customer interaction activities such as adding notes or updates to the case after the end of a customer conversation.
- **Closed**: The conversation is currently closed.

Queue name

This dimension represents the name of the queue.

Agent presence

This dimension represents the statuses that are available for agents. The out-of-box options include *Online*, *Away*, *Busy*, *Offline*, and *Do Not Disturb*. The status options that are available to you depend on your organization's configuration and include any other custom presence statuses that have been configured for your organization.

Date hour

This dimension represents the hour of the day in 24-hour format.

Time range

The following time-based filter options are available on real-time dashboards:

- **Today**: View all conversations that have begun since 12 AM in the selected time zone, in any state or province.
- **Last 24 hours**: View all conversations that have begun in the last 24 hours, in any state or province.
- **Include open conversations beyond 24 hours**: View all conversations that have begun in the last 24 hours, in any state or province. In addition, view all conversations that have begun in the last three days and that are still open.

Time zone

This dimension represents the time zone that is used to calculate and show metrics across the dashboards. The available options are standard time zones.

Agent name

This dimension represents the name of the omnichannel agent.

Agent participation mode

The following agent participation modes are available:

- **Primary**: Agent participation mode is *Primary*.
- **Consult**: Agent participation mode is *Consult*.
- **Monitor**: Supervisor participation mode is *Monitor*. This option applies only to users who have the Omnichannel supervisor role.

Workstream name

This dimension represents the name of the omnichannel workstream where the conversation originated.

Channel name

This dimension represents the name of the channel.

Metrics

Average consult time

This metric represents the average time agents spend helping other agents on consult requests. It's calculated by dividing the total time spent by agents on these requests by the total number of consult requests accepted. You can display the average consult time in seconds or in the hh:mm:ss format.

Related metrics

- **Consult time**: The time taken by agents to help other agents on consult requests. This metric can be viewed in seconds and in *hh:mm:ss* formats.

Consult requests accepted

This metric represents the total number of consult requests accepted by the agents.

Related metrics

- **Consult acceptance rate**: The rate at which agents accept consult requests. It's calculated by dividing the total number of consult requests that were accepted by the total number of agents.
- **Consults requested**: The total number of consult requests sent to agents.
- **Consult requested not accepted**: The total number of consult requests that weren't accepted by the agents. This includes rejected and timed-out requests.

Conversation first wait time

This metric is a measure of the time, in seconds, before a human agent responds to a customer's request. In other words, it represents the amount of time that the customer spends waiting for the first response from a human agent. Agent availability, a high volume of requests, and increased handle time are some factors that can affect customer wait time. A shorter wait time indicates that customers get faster issue resolution and have a better support experience.

If a bot or interactive voice response (IVR) handles the customer before it escalates the issue to a human agent, the calculation is based on the time between the point when the bot or IVR escalates the incoming conversation to a human agent and the point when the agent accepts the conversation. If the customer abandons the conversation, the calculation is based on the time between the point when the bot or IVR escalates the conversation to a human agent and the point when the customer disconnects the conversation.

If the customer reaches a human agent queue directly, the calculation is based on the time between the point when the customer creates the request and the point when a human agent accepts the conversation. If the customer abandons the conversation, the calculation is based on the time between the point when the customer creates the request and the point when the customer disconnects the conversation.

This metric is available in two formats: seconds and *hh:mm:ss*.

Related metrics

- **Average conversation first wait time**: This metric is calculated by dividing the total wait time for customers who are waiting in the queue by the total number of customers who were served.
- **Longest wait time**: This metric is a measure of the longest first wait time among incoming conversations that an agent hasn't yet accepted.
- **Conversations in queue**: This metric is a count of customer requests that are currently awaiting agent assistance, or conversations that have had an agent assigned but are awaiting agent acceptance.

For information about metrics that are related to the time that customers wait in individual queues if they are transferred from one agent to another, go to the Session wait time section.

Average speed to answer

This metric measures how quickly the customer service team responds to a customer's request. It's calculated by dividing the total wait time for customers who are waiting in the queue (after their issue has been escalated from a bot to a human agent) by the total number of customers who were served. Average speed to answer reflects the efficiency and availability of the agents. A lower average speed to answer indicates that customers can get their issues resolved more quickly and have a better experience with the service.

If a bot or IVR handles the customer before it escalates the issue to a human agent, the calculation is based on the time between the point when the bot or IVR escalates the incoming conversation to a human agent and the point when the agent accepts the conversation.

If the customer reaches a human agent queue directly, the calculation is based on the time between the point when the customer creates the request and the point when a human agent accepts the conversation.

This metric is available in two formats: seconds and *hh:mm:ss*.

Related metrics

- **Service level (10 seconds)**: This metric is a measure of the percentage of customer conversations where the speed to answer is less than or equal to 10 seconds.
- **Service level (20 seconds)**: This metric is a measure of the percentage of customer conversations where the speed to answer is less than or equal to 20 seconds.
- **Service level (30 seconds)**: This metric is a measure of the percentage of customer conversations where the speed to answer is less than or equal to 30 seconds.

- **Service level (40 seconds)**: This metric is a measure of the percentage of customer conversations where the speed to answer is less than or equal to 40 seconds.
- **Service level (60 seconds)**: This metric is a measure of the percentage of customer conversations where the speed to answer is less than or equal to 60 seconds.
- **Service level (120 seconds)**: This metric is a measure of the percentage of customer conversations where the speed to answer is less than or equal to 120 seconds.
- **Speed to answer**: This metric is a measure of the time before a customer request is accepted.

For information about metrics that are related to how quickly an agent accepts a request, go to the Average speed to answer section.

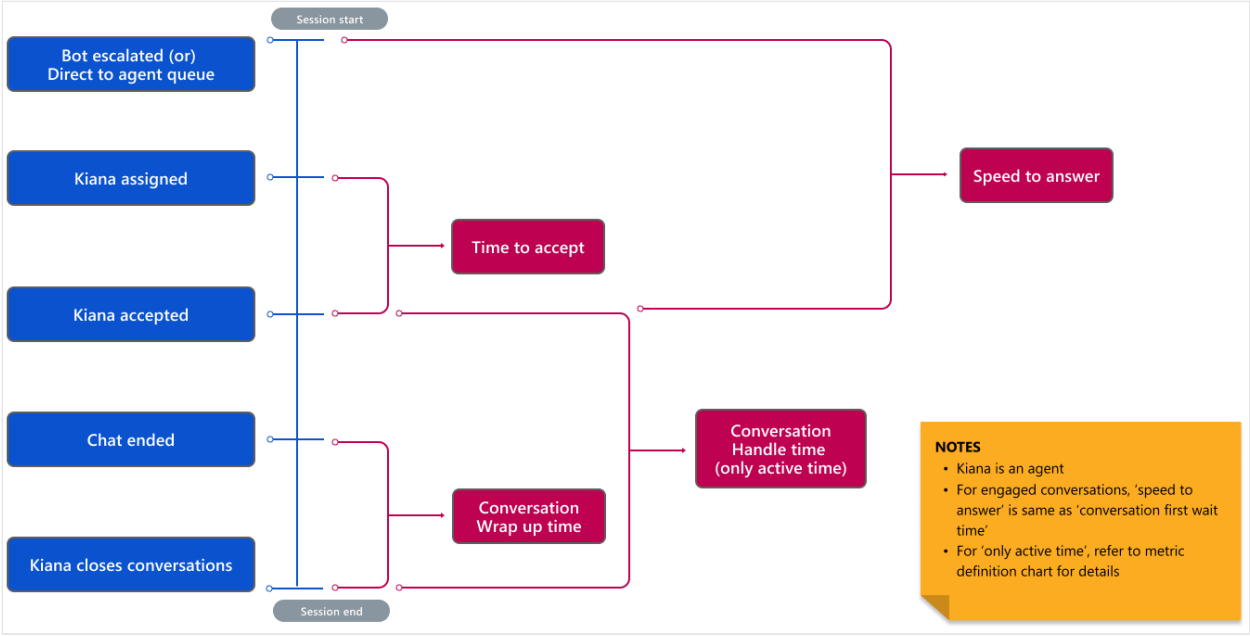
Conversation handle time

This metric is a measure of the time that human agents spend actively helping customers and resolving their issues. If multiple agents handle a conversation, the time that all the agents spend is aggregated. This metric also includes time that agents spend wrapping up the conversation after the customer disconnects, and the time that they spend updating notes or contact details. However, it excludes time that subject matter experts or other agents spend consulting with agents who are assigned to work on customer conversations.

An agent is considered actively working on a conversation if they have the conversation open in the Customer Service Workspace app. If an agent is handling multiple conversations, including conversations that they are currently wrapping up, only the time that the agent spends on the conversation on an open tab is counted toward that conversation's handle time.

A long average handle time might indicate that agents are taking too long to resolve customer issues, and that they need more training or support to help them work better. In addition, a long average handle time might suggest that customers aren't receiving the level of service or support that they need to resolve their issues. Therefore, it might lead to customer dissatisfaction.

This metric can be viewed in two formats: seconds and *hh:mm:ss*.



Related metric

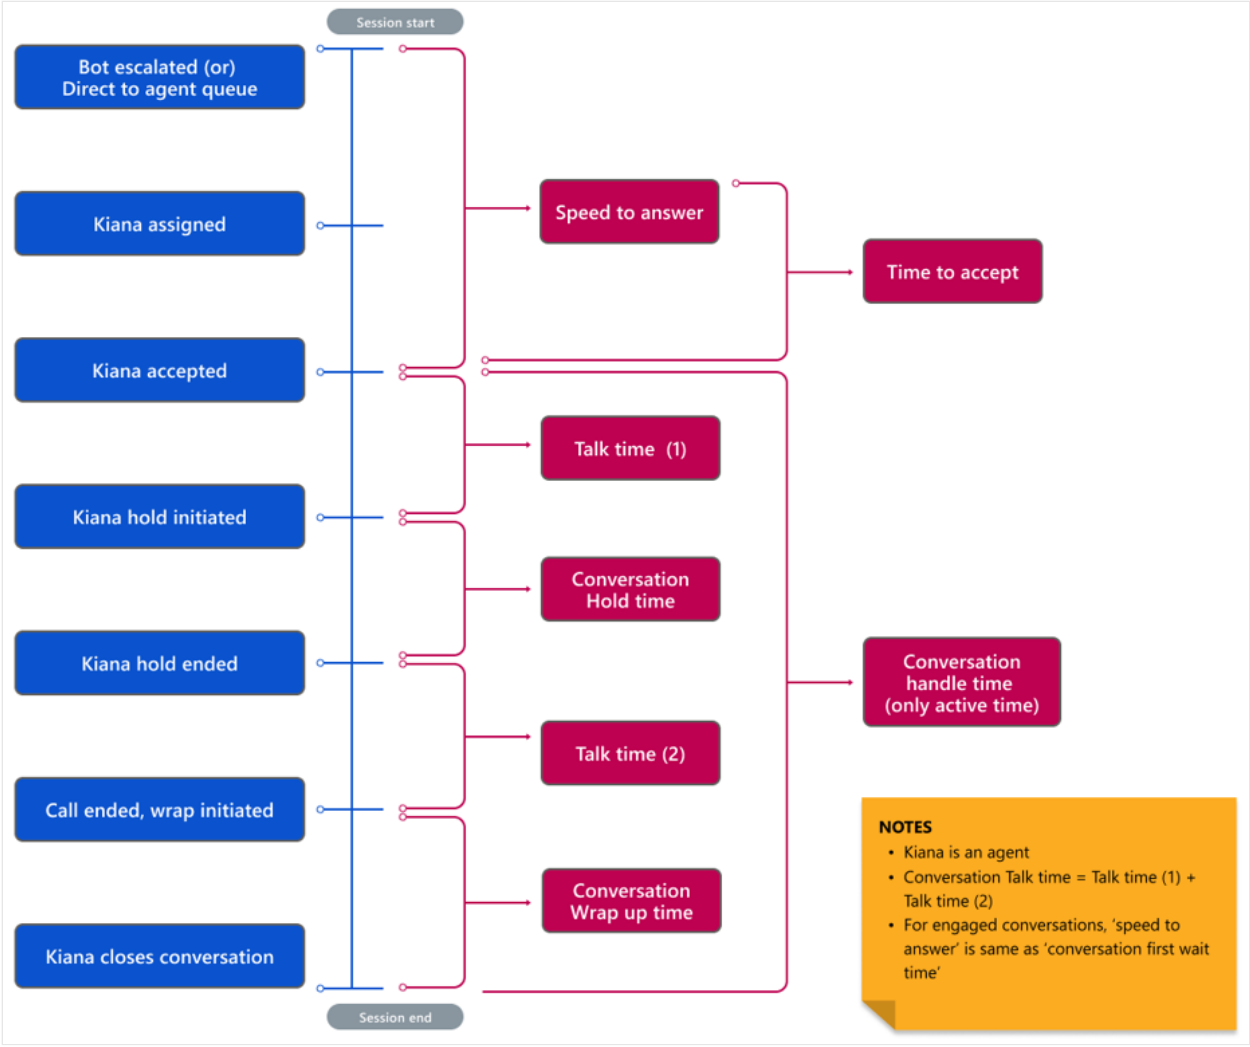
- **Average handle time**: This metric is calculated by dividing the total handle time of all the customer requests by the total number of customers who were served.

For information about metrics that are related to the time that individual agents spend when multiple agents handle conversations, go to the Average session handle time section.

Average conversation hold time

This metric is a measure of the average time, in seconds, that the human agents who handled a conversation had the customer on hold. If multiple agents handled the conversation, the hold time across all the agents is aggregated. This metric is calculated by dividing the total hold time for all customer requests by the total number of customers who were served.

There are several reasons why an agent might put a customer on hold. For example, the agent might have to gather more information or research an issue, perform tasks that don't require interaction (for example, entering data into a system), or work on an offline task. A long hold time can cause customer frustration and might lead to a poor customer experience.



Average conversation talk time

This metric is a measure of the average time, in seconds, that human agents spent actively conversing with customers on the phone for voice conversations. If multiple agents handled the conversation, the conversation talk time is aggregated across all the agents. This metric is calculated by dividing the total talk time for all customer requests by the total number of customers who were served.

Related metric

- **Conversation talk time**: This metric is calculated based on the total talk time across all customer requests.

Average conversation time

This metric is a measure of the average time, in seconds, that a customer who was seeking help from the contact center spent with a human agent. It includes the time that the customer spent waiting for agents to work with them.

Related metric

- **Conversation time**: This metric is calculated as the time between the point when the customer initiated the request and the point when the agent wrapped up the conversation.

Average conversation wrap-up time

This metric is a measure of the average time that an agent spends completing any necessary tasks after the customer disconnects. These tasks might include documenting the conversation, updating notes, or updating the customer's information. The calculation is based on the time between the beginning of the wrap-up and the point when the agent closes the conversation. If multiple agents handled a conversation, this metric applies only to the time that the last agent who worked with the customer spent.

This metric can be viewed in two formats: seconds and *hh:mm:ss*.

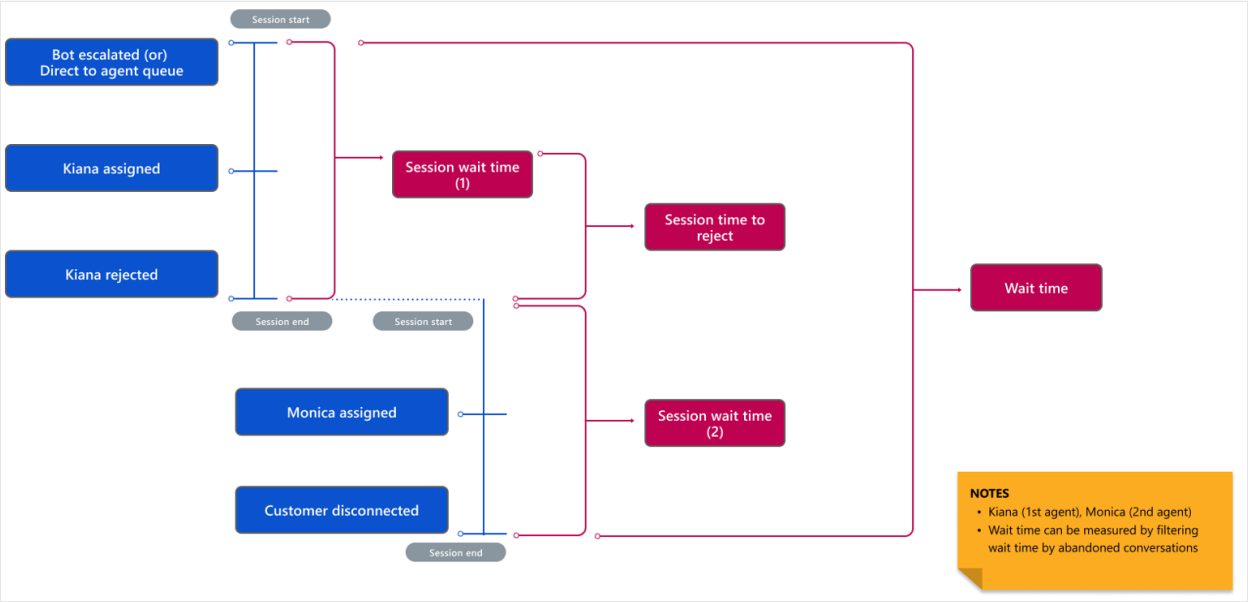
Abandoned conversations

A conversation can be abandoned for multiple reasons. For example, a customer might be disconnected or might cancel the call because of a long waiting period, supervisors might forcibly close requests, or automatic system actions might be configured to respond to handle overflow. Abandoned conversations can lead to customer dissatisfaction because of a lack of assistance from the contact center. A high abandonment rate might require further investigation into operational metrics such as agent availability and queue distribution.

If a bot or IVR handles the customer before it escalates the request to a human agent, this metric is calculated as the number of conversations that were abandoned while customers were waiting for a human agent after the bot escalated the request. If a conversation is abandoned before a bot can be assigned, the conversation is considered abandoned.

If the customer reaches a human agent queue directly, this metric is calculated as the number of incoming conversations that were abandoned.

The conversation direction is *Incoming*. The channels that the conversation came in through are *Messaging* and *Voice*.



Related metric

- **Abandoned rate**: This metric is a measure of the percentage of incoming conversation requests that ended before customers were connected to a human agent. It's calculated by dividing the number of abandoned conversations by the number of bot-escalated conversations.

Active conversations awaiting agent acceptance

This metric is a count of conversation requests from customers that have had agents assigned but that are currently waiting for an agent to accept them and join the conversation. The conversations revert to an *Open* state if the agent rejects or responds to the request.

Active conversations with agent acceptance

This metric is a count of conversations where an agent has been assigned and is actively in contact with the customer. Supervisors can monitor these conversations, track sentiment to ensure customer satisfaction, and intervene as needed.

Waiting conversations

This metric is a count of conversations that are currently in a *Waiting* state. A conversation is moved to a *Waiting* state when the agent closes the session without ending the conversation (that is, without selecting the **End** button on the communication panel), or when the customer closes the browser window without closing the chat widget. If there are asynchronous messaging channels, a *Waiting* state

indicates conversations that are waiting for an agent to respond. For more information, go to Understand conversation states.

Wrap-up conversations

This metric is a count of conversations that are currently in a *Wrap-up* state. A conversation is moved to a *Wrap-up* state when the agent ends the conversation, or when the customer leaves the conversation either by ending it on their side or by being disconnected. For more information, go to Understand conversation states.

Total conversations

This metric is a measure of the total number of customer conversations. For more information, go to Understand conversation states.

Incoming conversation

This metric is a measure of the total number of conversation requests that were initiated by customers across all channels and received by the contact center. For more information, go to Understand conversation states.

Sentiment

The metric is a measure of the current sentiment of customer. It's powered by Omnichannel for Customer Service sentiment analysis.

Average session handle time

This metric is like conversation handle time, but it's granular and is calculated for every agent who works on the conversation. This metric is relevant to conversations that multiple agents handled. If multiple agents were assigned to work on a customer request for any reason (for example, transfers or escalations), this metric measures the average time that each agent who worked with the customer spent. Conversation handle time is a measure of the aggregated session handle time for all the associated sessions.

Related metric

- **Session handle time**: This metric is a measure of the time that agents spend helping customers on assigned customer requests.

Customer sentiment

This metric is a measure of the current sentiment of the customer. It's powered by Omnichannel for Customer Service sentiment analysis.

Is handled by external participant (session)

A customer request might be handled by multiple agents, including a combination of internal contact center agents and external agents. For example, your contact center can engage external agents through transfers to an external phone number or through a Microsoft Teams voice call. This metric is used to identify the portion of a customer request that agents outside Dynamics 365 Customer Service handled. It indicates the sessions that were assigned to and handled by external agents only.

For information about metrics that are related to consultations with external agents, go to the Is handled by external participant (session) section.

Session transfer rate

This metric is a measure of the rate at which agents transfer work that is assigned to them, or the rate at which supervisors transfer work in the queue that they monitor from one agent to another or to another queue. It's calculated by dividing the total number of sessions that were transferred by the total number of sessions that were handled.

Related metrics

- **Is Transferred Out**: This metric indicates whether the conversation and the underlying session were transferred out of a queue.
- **Transferred sessions**: This metric is a measure of the total number of sessions that were transferred.

Session rejection rate

This metric is a measure of the rate at which agents reject work that is assigned to them. It's calculated by dividing the total number of sessions that agents rejected by the total number of sessions that were assigned to them.

Related metrics

- **Rejected sessions**: This metric is a measure of the total number of times that agents rejected work that was assigned to them.

- **Session time to reject**: This metric is a measure of the average time that agents take to reject work that is assigned to them. The calculation is based on the time between the point when a customer request is assigned to an agent and the point when the agent rejects the request.

Session time to accept

This metric is a measure of the average time that agents take to accept work that is assigned to them. The calculation is based on the time between the point when a customer request is assigned to an agent and the point when the agent accepts the request.

Related metric

- **Engaged sessions**: This metric is a measure of the total number of sessions that agents accepted.

Session timeout rate

This metric is a measure of the rate at which sessions time out because of agent inactivity. The agent didn't accept or reject the customer requests. This metric is calculated by dividing the total number of requests where the agent didn't provide any response by the total number of sessions that were assigned to them.

Related metric

- **Timeout sessions**: This metric is a measure of the total number of times that agents didn't respond to the work that was assigned to them.

Session wait time

This metric is a measure of the time, in seconds, that a customer spends waiting in a specific queue before an agent accepts their request. If the customer abandons the request, or if the conversation is transferred to another queue, the calculation is based on the time between the point when the customer request arrives in the queue and the point when the request is closed.

Active sessions

This metric is a count of sessions that are currently in progress. A session is considered active if no agent has yet been assigned to it, it's awaiting agent acceptance, or agents are actively helping customers.

Closed sessions

This metric is a count of sessions that are currently closed.

Total sessions

This metric is a measure of the total number of sessions that were presented to or handled by agents.

Is handled by external participant

A customer request might be handled by multiple agents, including a combination of internal contact center agents and external agents. For example, your contact center can engage external agents through transfers to an external phone number or through a Microsoft Teams voice call. This metric is used to identify the portion of a customer request that agents outside Dynamics 365 Customer Service handled.

Related metrics

- **External participant channel**: This metric helps identify the channels that external agents were engaged through. For example, an external agent can help customers with requests by calling them directly at their phone number or via a Microsoft Teams Public Switched Telephone Network (PSTN) call.
- **External participant channel type**: This metric represents the details of the external agent, such as the phone number.

Session participant count

This metric is a measure of the total number of agents who were involved in helping a customer. These agents include the primary agent who was assigned to work on the session and any subject matter experts who were consulted. You can use the SessionParticipationType dimension to analyze this metric and get further statistics.

Average first response time

Whereas speed to answer provides insights into how quickly an agent was connected with a customer, first response time provides insights into how quickly the agent responded to the customer. First response time is a measure of the time that customers spend waiting for a first response from a human agent. The time is adjusted based on operating hours. The calculation is based on the time between the point when a customer initiates a conversation (or, in the case of a bot-escalated conversation, the point when the bot escalates it) and the point when the agent accepts the request and responds to the customer. For messaging conversations, this time represents how soon the agent sent the first response to customer.

Average first response time is calculated by dividing the total first response time across all engaged conversations by the number of engaged conversations.

The time can be viewed in two formats: seconds and *hh:mm:ss*.

Average agent response time

Agent response time is a measure of the average time that customers who have sent a message must wait to get a response from a human agent. The time is adjusted based on operating hours. Average agent response time is calculated by dividing the total response time by the number of exchanges between customers and agents across all engaged conversations. A longer response time indicates that more time passes between messages as customers wait for an agent to respond and provide updates. A longer response time negatively affects the customer experience.

The time can be viewed in two formats: seconds and *hh:mm:ss*.

First response service level

This metric is a measure of the percentage of customer conversations that have an agent response time of less than 60 seconds.

Agent response service level

This metric is a measure of the percentage of customer messages that have an agent response time of less than 60 seconds.

Assigned capacity profile count

This metric is a count of capacity profiles that are assigned to agents.

Total available work item capacity

This metric is a measure of the maximum number of more work items that can be assigned.

Total work item capacity in use

This metric is a measure of the work items that are currently being handled.

Total work item capacity

This metric is a measure of the maximum work items that are allowed, based on the configuration of the capacity profile.

Logged in agents

This metric is a count of omnichannel agents who are currently signed in.

Total agents

This metric is a measure of the total number of omnichannel agents.

Total available capacity units

This metric is a measure of the capacity units that are available to handle conversations.

Total capacity units

This metric is a measure of the maximum capacity units that are assigned. It applies only to organizations that use capacity units.

Total occupied capacity units

This metric is a measure of the capacity units that are currently occupied.

Status duration

This metric is a measure of the time that an agent spent in a presence status.

Omnichannel for Customer Service dashboards

Overview of Omnichannel real-time analytics dashboards

Report filters and groups

Article • 03/17/2023

In Dynamics 365 Customer Service and Omnichannel for Customer Service, historical analytics reports are grouped into categories.

Omnichannel historical analytics reports:

- **Summary** and **Bot** tabs
- **Conversation**, **Queue**, and **Agent** tabs
- **Topics** tab
- **Voice** tab
- **Unified routing** tab

Customer Service historical analytics reports:

- **Summary**, **Agent**, and **Topics** tabs

Knowledge analytics reports:

- **Search Term Insights** tab
- **Article Insights** tab

When you set one or more filters on a report, the filters are applied to the entire report group. Say, for example, that you've set the "channel" filter to display records related to the live chat channel in the **Conversation** tab of the Omnichannel historical report. This filter is automatically applied to other tabs of the report group—**Queue** and **Agent**—but not to the **Bot**, **Summary**, **Topics**, **Voice**, or **Unified routing** tabs.

Next steps

Manage report bookmarks

See also

Configure analytics and insights dashboards

Manage bookmarks for reports

Article • 05/26/2023

A bookmark captures the state of a report page, including changes that you've made to the filters. Personalize your reports and save the time and effort required to reapply the filters every time you want to view specific data. Use bookmark options to select a saved view, update or delete a bookmark, and set a bookmark as your default view.

A bookmark that you create for a report group saves a personalized view using that group's filters. For example, if you create a bookmark in the Omnichannel historical report's **Conversation** tab, the bookmark applies to the **Conversation**, **Queue**, and **Agent** tabs, and doesn't include filters for the other tabs.

You can use bookmarks in all the out-of-the-box reports—Customer Service historical analytics, Omnichannel historical analytics, Omnichannel real-time analytics, and knowledge analytics reports.

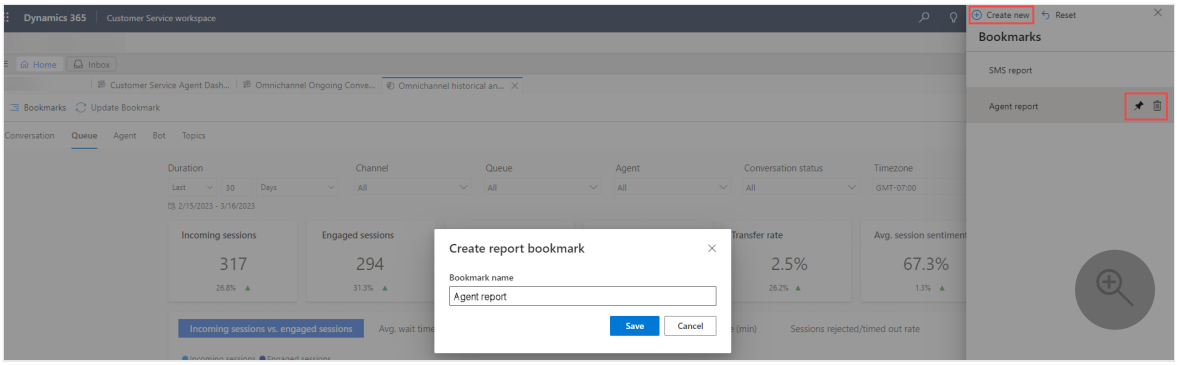
Prerequisites

Grant **Create**, **Read**, **Write**, and **Delete** privileges to applicable security roles for the **Report Bookmark** custom entity. Configure user access to analytics and dashboards.

Create bookmarks

> **Tip**
>
> Images that include an icon that looks like this: may be expanded to show more detail. Select the image to expand it. To close it, press the Esc key.

1. In Customer Service workspace, open one of the following reports, **Customer Service historical analytics**, **Omnichannel historical analytics**, **Omnichannel real-time analytics**, or **Knowledge analytics**.
2. On the report page, select a tab, such as **Queue**.
3. Use the report filters to customize the data in your view.
4. Select **Bookmarks**, and then select **Create new**.
5. Enter a name for the bookmark, and then save it.



Manage bookmarks

Select **Bookmarks**, and then on the **Bookmarks** menu:

- To delete a bookmark, select the delete icon.
- To set a bookmark as the default view for the report, select the pin icon. The report always opens to the pinned view.
- To reset the bookmarked view of a report, select **Reset**.

To modify a saved view, adjust the report filters as needed. Then select **Bookmarks** > **Update Bookmark**.

Forecast case and conversation volumes, and agents for conversations (preview)

Article • 04/06/2023

ⓘ Important

To use this feature, it must be turned on and the license terms must be accepted. **What are Preview features and how do I enable them?**

A preview feature is a feature that is not complete, but is made available before it's officially in a release so customers can get early access and provide feedback. Preview features aren't meant for production use and may have limited or restricted functionality.

We expect changes to this feature, so you shouldn't use it in production. Use it only in test and development environments.

Microsoft doesn't provide support for this preview feature. Microsoft Dynamics 365 Technical Support won't be able to help you with issues or questions. Preview features aren't meant for production use and are subject to a separate **supplemental terms of use**.

Introduction

ⓘ Important

This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making, and should not be used to make, decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using Dynamics 365 Customer Service, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to

inform their agents that their communications with end users may be monitored, recorded, or stored.

Customer service supervisors need to be able to ensure they have an adequate number of agents available to serve their customers. Overcapacity results in higher costs, while under capacity results in longer customer wait times, which in turn can negatively impact customer satisfaction.

As a supervisor, you can use the forecast reports to help plan the right level of staffing for your business based on the predicted volume of cases and conversations, along with the predicted agent demand for conversations.

You can use the forecast reports for agent, case, and conversation volumes in the following ways:

- Forecast upcoming case and conversation volumes based on historical traffic and the number of agents needed to meet the forecasted conversation volume. For conversation volume forecasting, if your administrator has set up chatbots for your conversational channels, the system excludes conversations that chatbots handle without a human agent joined, so that you can rely on the predicted conversation volumes for human agent staffing.
- Visualize forecasted volumes and agent demand on a daily basis, for a time range up to six months depending on how many days of cases or conversations were created in the past. This forecast can be used to plan agent resourcing and recruitment, to meet future demand.
- Visualize forecast volumes and agent demand on a 15-minute interval basis, for a time range up to six weeks, depending on how many days of cases or conversations were created in the past. This forecast can be used to schedule agents to meet the near-term demand.
- Slice forecasted volumes and agent demand by channel and queue.
- View a rollup of actual and forecasted volume by an hourly, daily, weekly, monthly and yearly basis. For the agent demand report, you can select the type of rollup from maximum, minimum, average and sum.
- Automatically detect seasonality from historical traffic with the settings option to import your holiday calendar. This helps the forecasting model to accurately predict case or conversation volumes during special, seasonal events.

For details about how the forecast models work for this feature, see How agent forecasting for conversation works and How case volume forecasting works.

> **Note**
>
> Be aware of the following when using the Forecast report:
>
> - Forecasts might misstate volume estimates for many reasons, including unanticipated trends or business developments.
> - The Forecast report is currently available in certain geographical locations. More information: **Regional availability and Service limits for Customer Service**

Prerequisites

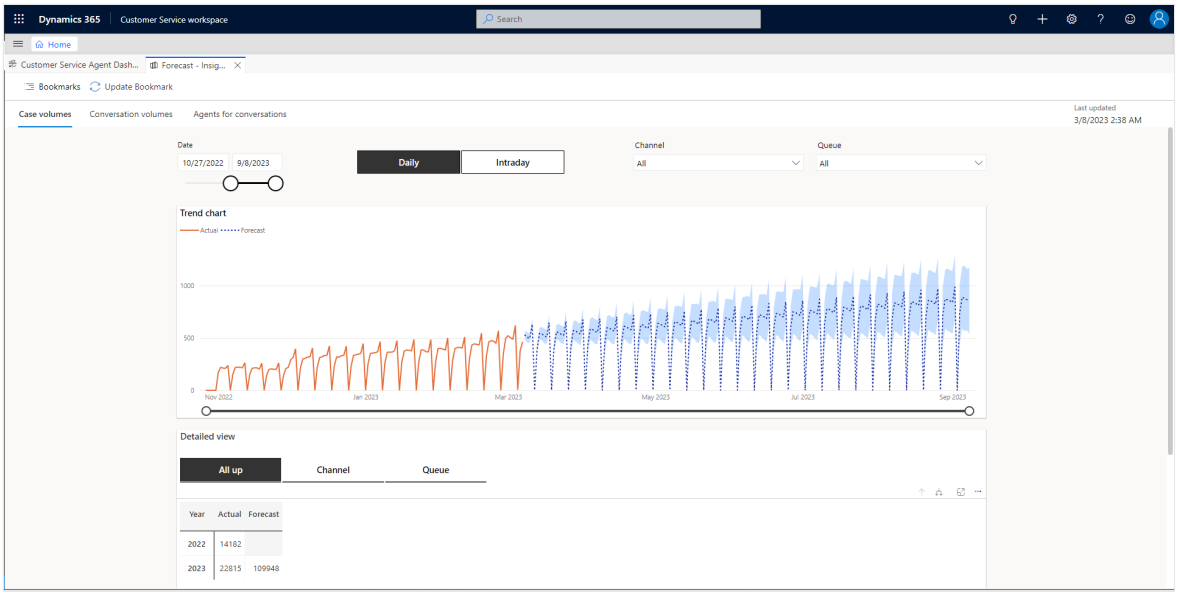
Before you can use the forecast reports, ensure that your administrator has assigned a role to you that has **Read** privileges on the **msdyn_dataanalyticsreport_forecast** table. More information: Configure case volume forecasting (preview) and Configure agents for conversations forecasting (preview).

View the Forecast reports in Customer Service

Navigation

You can view the forecast reports in the Customer Service workspace or Omnichannel for Customer Service apps. You can navigate to the **Forecast (preview)** dashboard as follows:

- In the default view, select the plus (+) icon, and then select **Forecast (preview)**.
- If the enhanced multisession workspace view is enabled, select **Forecast (preview)** on the site map.



Switch report mode

The forecast reports support two modes:

- **Daily**: This mode displays the actual and predicted case and conversation volumes and agent demand per day, for a time range of up to six months, depending on how many days of cases or conversations were created in the past. This forecast can be used to plan agent resourcing and recruitment to meet future demand.
- **Intraday**: This mode displays the actual and predicted case and conversation volumes and agent demand in intervals of 15 minutes, for a time range of up to six weeks, depending on how many days of cases or conversations were created in the past. This forecast can be used to schedule agents to meet the near-term demand.

To change the report mode, select the **Daily** or **Intraday** toggle button on the report, depending on which mode you want to view the report in.

Filters for case, conversation, and agents for conversations forecasting

The **Case volumes**, **Conversation volumes** and **Agents for conversations** tabs of the forecast report display visual and numeric metrics for the filters you select. The difference between the tabs is based on the input data source. Case data is based on the case entity, whereas conversation data is based on the omnichannel conversations, such as live chat, digital messages, the voice channel, and so forth.

Report data is refreshed on a monthly basis. Your administrator can configure which day of the month the report will be refreshed. More information: Configure case volume forecasting (preview) and Configure agents for conversations forecasting (preview).

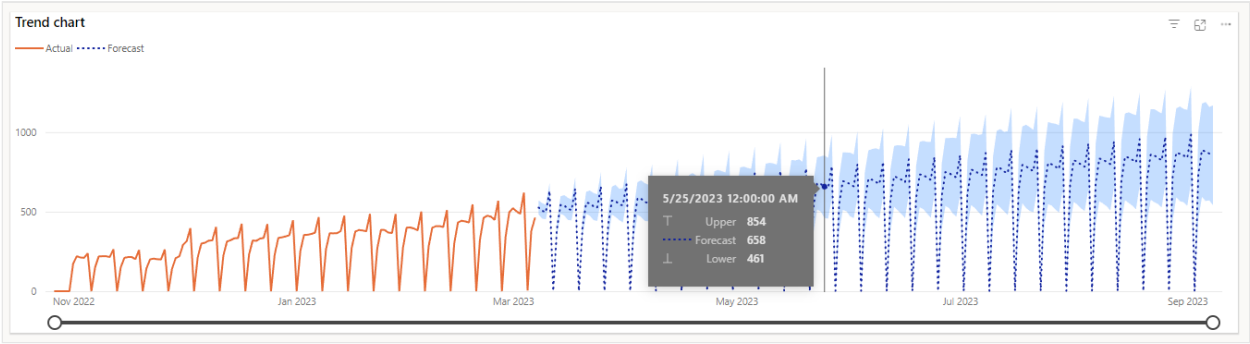
You can filter the data on each of the tabs by using any of the following options:

Filter	Description
Duration	Input the date range or use the sliders to set the dates.
Channel	Select the channel(s) for which you want data displayed.
Queue	Select the queue(s) for which you want data displayed.

Data visualization

The forecasting section on each tab of the report displays a visual trend from historical volumes from the past to the predicted volume in the future. The forecast is based on actual case, conversation, and agent records created in the past.

The **Confidence level** for the forecasted data is displayed on the right-hand side in blue, indicating the level of confidence in the predicted volume. The narrowest part of the blue area indicates higher confidence. You can hover on the report to display the forecast based on data for specific dates.



Hover on the future side (dash line) of the report to show a range that includes an upper- and lower-bound confidence range, which indicates the amount of possible variance that could occur from the predicted volume number.

View volume forecasting by numbers

The number grid at the bottom of the report shows the actual and predicted number of cases, conversations, or agent demand across different date and time hierarchies.

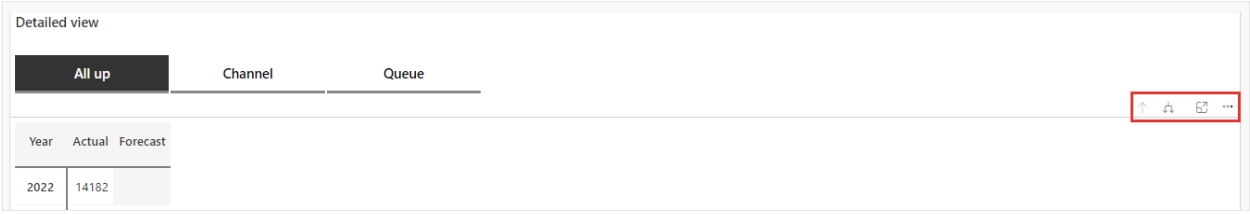
You can filter the data by selecting from the following options:

Filter	Description
All up	Displays the actual and forecasted numbers across all channels and queues. You can use the drill up and down buttons to drill to specific levels in the hierarchy.

Filter	Description
Channel	Displays the actual and forecasted numbers, sliced by each channel. You can use the drill up and down buttons to drill to specific levels in the hierarchy.
Queue	Displays the actual and forecasted numbers, sliced by each queue. You can use the drill up and down buttons to drill to specific levels in the hierarchy.

Filter data by drilling up or down

You can drill into the report data table by using the up or down arrows at the top-right side of the number grid to display data by day, week, month, or year for **Daily**, and by minute, hour, day, week, month, or year for **Intraday**.



You can drill down the hierarchy by selecting the drill down hierarchy button. Each time you select the drill down button, the data will drill down one level in the hierarchy. To drill up to the previous level, select the drill up button.

Select rollup mode (Agents for conversations report only)

The Agents for conversations report allows you to select the rollup method that will be used in the number grid. The selected method is used to roll up data at higher levels in the date and time hierarchy. The following rollup methods are available:

- **Average**: This method averages the available data at a level in the date and time hierarchy to roll up to the next higher level in the hierarchy.
- **Maximum**: This method picks the maximum from the available data at a level in the date and time hierarchy to roll up to the next higher level in the hierarchy. *This is the default rollup that's selected when you access the report for the first time.*
- **Minimum**: This method picks the minimum from the available data at a level in the date and time hierarchy to roll up to the next higher level in the hierarchy.
- **Sum**: This method sums the available data at a level in the date and time hierarchy to roll up to the next higher level in the hierarchy.

> ⓘ Note

Average, **Maximum**, and **Minimum** rollup methods in the **All up** view work differently than the regular rollup using the same methods. In the regular rollup, the rollup method is applied to the aggregate data across channels and queues. However, in the **Agents for conversations** report, the data at a particular level in the date and time hierarchy is the sum of the applied rollup method to the data for each unique channel and queue combination at the immediate lower level in the hierarchy.

For example, the data at the **Month** level will be calculated by summing up the selected rollup method to the data at the **Week** level for each unique combination of channel and queue.

Export data

You can export the report data by selecting **Export** on the command bar.

Customize visual display

Article • 05/26/2023

Dynamics 365 Customer Service provides out-of-the-box analytics reports that help you visualize key performance indicators (KPIs) and trends for standard contact center workflows. You can use an embedded Power BI editor to customize the out-of-the-box reports to meet your organization's needs:

- Reveal out-of-the-box metrics that may be more relevant to your organization.
- Modify how the data is displayed; for example, change a tabular view to a graphic that displays the trend over time.
- Add new pivots and pages; for example, create a pivot or page that's dedicated to a specific queue with queue-level metrics.
- Rearrange out-of-the-box report layouts and change themes.

You can customize Customer Service historical, Omnichannel historical, and Omnichannel real-time analytics reports in Customer Service workspace. You can't customize unified routing and knowledge analytics reports.

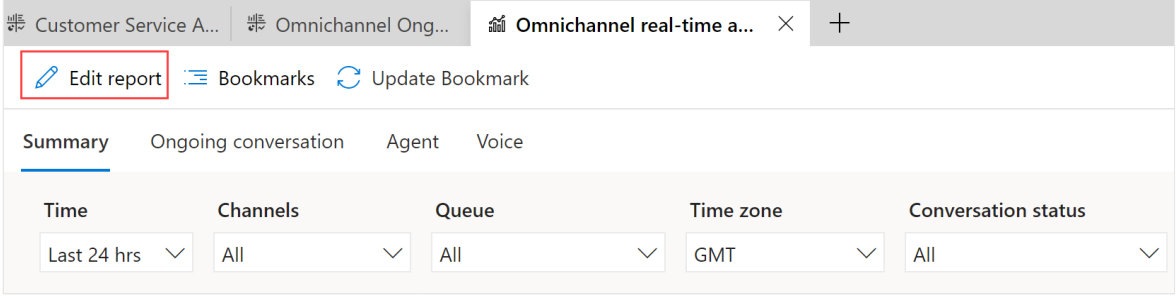
Prerequisites

To edit analytics reports, users must have the **Analytics Report Author** role. Assign roles to users.

Customize the display of analytics reports

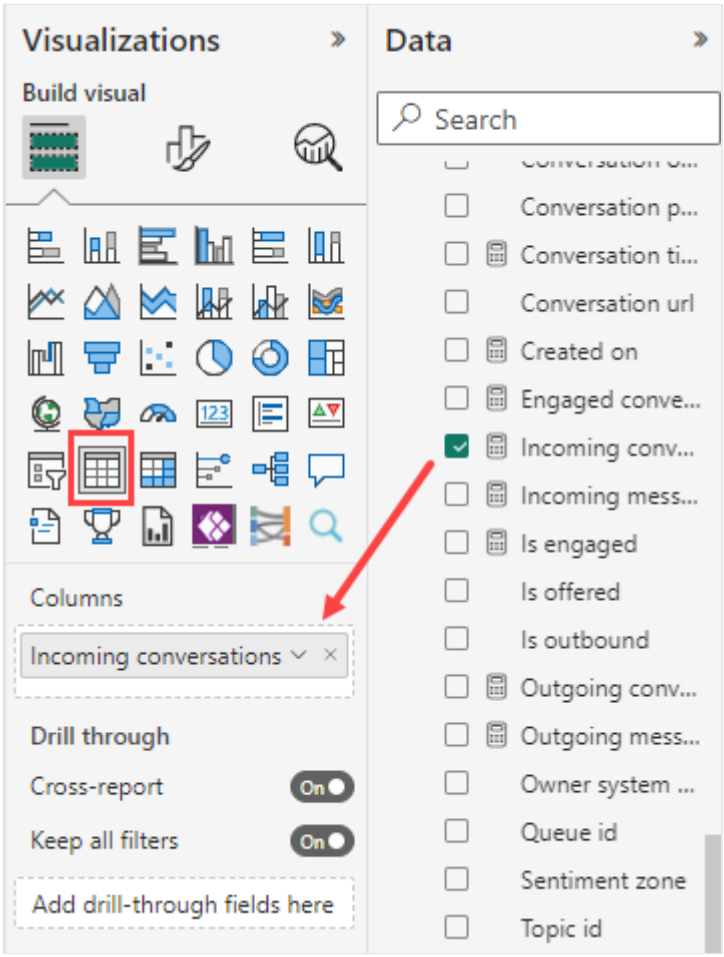
1. In Customer Service workspace, open the **Omnichannel real-time analytics**, **Omnichannel historical analytics**, or **Customer Service historical analytics** report.

2. Select **Edit report** to open the embedded Power BI editor.

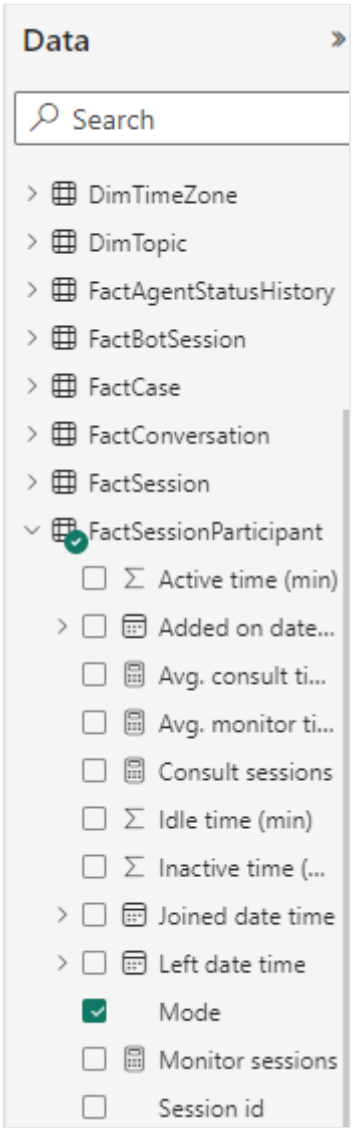


3. Use the following panes to customize the report:

- **Visualizations**: Select the visualizations you want in your report. You can delete a currently displayed visualization and add the one you prefer. For example, you can show **Incoming conversations over time** as a table instead of the default bar chart.



- **Data**: Select the KPIs, measures, dimensions, and attributes you want to show in your report. The list includes all the metrics that are available for use, not just the ones that are displayed in the out-of-the-box reports. For example, you can use the **Participation Mode** metric in **FactSessionParticipant** to count the number of times a subject matter expert accepted a consult request. Understand the out-of-the-box data model.



4. When you're done selecting the customizations you want for your report, select **Save** and then **Publish**.

After you publish the report, all customizations become visible to all users in your organization.

To revert all your changes to the original report settings, select **Edit report** > **Checkout default report** > **Reset**.

> **Important**
>
> If you select **Reset**, any customizations you've made are permanently removed.

To continue editing the report after you've published it, select **Resume editing**.

> **Note**

Don't add more than 20 metrics or tiles to a report because it affects the report's performance. If you need more metrics, consider creating more pages and provide links to the extra pages from the existing pages.

Understand the out-of-the-box data model

The out-of-the-box data model consists of *facts* and *dimensions*. Facts represent the data you want to analyze. Dimensions represent the attributes of the data that you want to break down to explore further.

Fact tables organize key KPIs logically. For example, **FactConversation** has conversation metrics like **Average handle time**, while **FactAgent** has **Agent metrics**.

You can use facts and dimensions to visualize data according to your organizational requirements. If you'd like to understand how average handle time varies by queue, create a visualization like a bar chart, and divide the fact **FactConversation** > **Average Handle Time** by the dimension **DimQueue** > **Queue Name**.

Future data model updates

If you've customized your reports and Microsoft changes the default data model for a report, the data model updates don't overwrite your customizations. However, if the naming conventions in the Power BI embedded editing experience change, those changes are reflected in the respective list. You may need to reselect the metric with the new name. Learn more about data models and report mappings for historical analytics reports in Customer Service.

Overview of data model customization

Article • 07/19/2023

Data model customization helps you customize the out-of-the-box standard reports and add your own KPIs (key performance indicators) and custom metrics, so that you can use the data that's most relevant to your organization.

As new features are added, metric definitions and calculations continually need to be updated to account for additional workflows that are enabled by new features. Using the out-of-the-box model and creating only those metrics that are unique to your organization reduces the risk of metric definitions becoming outdated.

What is data model customization?

Dynamics 365 Customer Service provides a suite of out-of-the-box analytic dashboards that are built on Power BI. These analytic solutions provide industry standard KPIs and metrics that can help you monitor and improve the performance of your contact center. Power BI solutions deploy two components: a data model (sometimes referred as a dataset) and a report. The data model houses the KPIs, while reports help visualize this data for supervisors.

Every organization that has analytics enabled gets the analytics solution deployed and available only to them. Dynamics 365 leverages the data from Dataverse, performs transformation logic for each of the KPIs, and makes these KPIs available for you within these data model, which also means they can't be edited.

However, the reports that are deployed for your organization can be edited and customized. With visual customization, you can edit the reports to present the available data as per your organizational requirements. For example, Dynamics 365 reads all the required data, performs the logic required to calculate the average handle time, and makes it available for you in the data model. You can choose to edit and present this as a chart or a table as required, and drill down to see the average handle time for a queue or user. Visual customizations also give you the ability to leverage out-of-the-box metrics that aren't directly exposed, create new pivots, and analyze data with additional dimensions.

At times, you might have scenarios where you'd like to modify the data that's available in the dataset or the logic used to calculate the metrics in the dataset. The following section describes scenarios where you might need to modify the available data or the logic used to calculate the metrics in the dataset. These scenarios are typically driven by processes that are unique to your organization.

Scenario-based use cases

- **Scenario 1**: You need to create variants of the default metrics provided in the dataset that are similar but use a different logic. For example, while service-level metrics for 10, 20, 30, 40, 60, and 120 seconds are provided in the Omnichannel real-time reports, you have a team that works on service levels of 150 seconds and wants to see that metric on the reports.

- **Scenario 2**: Your organization calculates a metric that's provided differently by default, but would like to compute it based on your organization's logic. For example, only the time spent by the primary agent (active agent who owns and is assigned to the conversation) is considered when calculating average handle time. For more information on metrics, go to: Use Omnichannel for Customer Service metrics. Time spent by SMEs consulting is offered as a separate metric. Your organization wants to include this time in the handle time.

- **Scenario 3**: Your organization has customized attributes on the out-of-the-box Dynamics 365 entities, or has custom entities to support your workflows and process and would like to include those attributes, or has metrics built on those attributes in the reports. In addition, your organization wants to report on out-of-the-box attributes that aren't included by default in the reports or the dataset. For example, your organization has a customized user entity to include a region attribute and would like to get a drill-down of the resolution time by region.

- **Scenario 4**: Your organization wants to build a custom dashboard that brings data from multiple applications that your organization uses. For example, you might have an existing Power BI dashboard that brings operational data from your workforce management systems, and you'd like to show Dynamics 365 data, like agent presence, on this dashboard.

How data model customization helps you

Data model customization helps you with scenarios and more. Data model customization deploys a copy of the dataset used by out-of-the-box reports into your organization's Power BI workspace, allowing you to build composite models.

For the historical data model, the dataset connects to the Azure Data Lake that hosts the transformed historical Dynamics 365 data and exposes the metrics. For a real-time data model, the dataset uses TDS connectors to connect directly to your Dynamics 365 database and executes the logic required to compute the real-time metrics.

By creating a local model within your workspace that connects to the Dynamics 365 data model, you can create new metrics while retaining all the out-of-the-box metrics, thus saving time and effort. You can add the Dynamics 365 data model to existing reports without having to rebuild them.

By leveraging the model and not recreating metrics that are available in out-of-the-box model, you also ensure that the logic used to calculate these metrics always stay updated.

How data model customization works

Data model customization requires your organization to have a paid Power BI service, and uses two workspaces within your Power BI service.

Managed workspace

This workspace is provisioned and maintained by Dynamics 365 Customer Service. The Dynamics 365 datasets are deployed into this workspace.

- For real-time data model configuration, a workspace named **Omnichannel Managed Workspace_(GUID)** is created. The real-time data model is hosted within this workspace. It uses TDS connector to extract data from Dynamics 365 continually and to calculate real-time metrics.
- For historical data model configuration, a workspace named **Customer Service Managed Workspace__(GUID)** is created. The historical data model is hosted in this workspace. This data model is refreshed daily with the latest data from the Azure Data Lake. Historical data from the last two years is processed daily and transformed into KPI stored in the data lake.

> ⓘ **Note**
>
> This single data model supports both case and conversation analytics. Knowledge analytics and unified routing analytics aren't available for customization.

Each time the out-of-the-box data model is updated because of newer release versions, the data model deployed to the managed workspace is also updated to ensure that your organization gets the latest updates, which includes newer metrics, updates to logic of existing metrics, and bug fixes.

> ⓘ **Note**

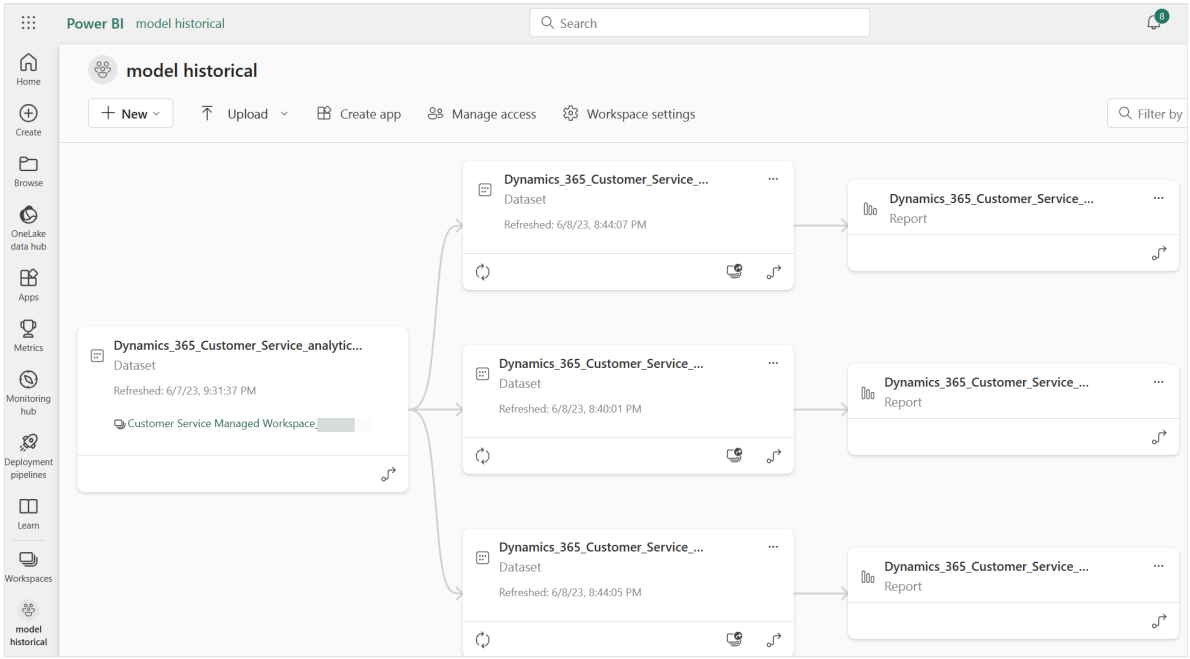
We recommend treating the dataset in the managed workspace as read-only. We recommend that you don't make changes to this dataset, as it might lead to report malfunction. Any changes made to the data model in the managed workspace will be overwritten whenever a newer version is released.

Customer workspace

A copy of the out-of-the-box reports are created in this workspace. During the configuration, you can either create a new workspace or can specify an existing workspace.

Depending on the features you've enabled, you may see up to three different reports created in the workspace you selected for historical data model customization and one report in the real-time data model customization.

Historical data model customization



Each report is connected to its own composite dataset, which in turn connects to the data model in the managed workspace.

These report copies can be edited and updated to suit your needs, and are provided as a base for you to build on instead of having to build entire reports from scratch. These reports are created only when the feature is configured, and are never updated. These reports won't be overwritten when out-of-the-box reports are updated.

You can choose to specify the same workspace for both historical and real-time analytics.

Use the out-of-the-box data model in your custom reports

Article • 06/12/2023

This articles describes how you can create a new report that leverages the out-of-the-box data model. You can also extend this report and add new metrics based on the available data within the Dynamics 365 Customer Service dataset.

Prerequisites

- Your administrator must enable data model customization. More information: Enable Power BI data model customization
- You must have the required Power BI permissions.

Create a new report based on Dynamics 365 Customer Service dataset

1. Go to Power BI desktop, and then go to **File** > **New**.
2. Select **Get data** > **Microsoft Fabric (Preview)**, and then from the list, select **Power BI dataset** or **Search for Power BI datasets**.
3. Select the appropriate dataset, depending on whether you require historical or real-time metrics. Make sure you select the data model from managed workspaces.

   The tables and attributes from the managed data model are now available for you to use in your report in the data panel.
4. Select **Connect**.
5. After you're done with your edits, select **File** > **Publish**, to publish the new report back to Power BI.

> **Note**
>
> We recommend that you don't use hidden out-of-the-box facts or dimension fields in your custom reports, as these fields might be modified or deleted in future updates.

Add Dynamics 365 Customer Service dataset to existing reports

- Download a copy of the report. Make sure you download with a live connection to data online.
- If you'd like to edit the out-of-the-box copy of the report, download the report from the customer workspace.

To add Dynamics 365 Customer Service dataset to existing reports:

1. Go to the Power BI service, and then select the report from your custom workspace.
2. Select **File** > **Download this file**.
3. Select the option to download a copy of your report with a live connection to data online.
4. Select **Get data** > **Power BI datasets**.
5. Select the appropriate dataset, depending on whether you require historical or real-time metrics. Make sure you select the data model from managed workspaces.

   The tables and attributes from the managed data model are now available for you to use in your report in the data panel.
6. After you finish your edits, select **File** > **Publish**, to publish the updated report back to Power BI.

Extend the out-of-the-box data model

Add new metrics based on data available in the Dynamics 365 Customer Service dataset

If you need to create a metric within the existing entities (as described in Scenario 1 and Scenario 2, perform the following steps:

1. Go to the Power BI desktop and open the report you want to edit. Make sure you use the steps described in Add Dynamics 365 Customer Service dataset to existing reports, to ensure that your report is connected to the Dynamics 365 Customer Service dataset.
2. Right-click the entity for which you want to create your new metric.

3. Enter the Data Analysis Expressions (DAX) logic for real-time metrics after selecting the required attributes such as name and data type. For more information about DAX, go to DAX function reference.

4. Save your measure and include it in your visualization as required.

5. Publish your newer version to Power BI by selecting **File** > **Publish**.

> **Note**
>
> If you need to rename an existing column, you'll have to create a new local model.

Example

Here's an example that describes how to create a new service level of 150 seconds for real-time reports.

1. Go to the Power BI service, and then select the report from your custom workspace.

2. Download the real-time report with a live connection and open it in Power BI.

3. Right-click the **FactConversation** entity and select **New measure**.

   Refer to the Data model mapping for real-time analytics reports in Omnichannel for Customer Service to get the logic used to calculate the out-of-the-box metrics, which you can use to build your logic.

4. Enter the following code:

```
Service level (150 seconds) =
    DIVIDE (
        SUMX (
            FactConversation,
            IF (
                FactConversation[ConversationFirstWaitTimeInSeconds] <=
150
                    && FactConversation[IsAgentAccepted]
                    && NOT FactConversation[DirectionCode],
                1,
                0
            )
        ),
      SUMX (
            FactConversation,
            IF (
```

```
                FactConversation[IsAgentAccepted]
                    && NOT FactConversation[DirectionCode],
                1,
                0
            )
        ),
        BLANK ()
    )
```

5. Ensure that the format is **Percentage**, and then select **Save**.

6. Replace the **Service level (60 seconds)** on the Summary Report page with the newly created Service level (150 seconds) measure.

7. Select **Save**, and then select **File** > **Publish** to Power BI.

Add new metrics based on Dynamics 365 Customer Service dataset and external data

If you need to get additional data, both from within Dynamics 365 Customer Service as well as external data, as described in Scenario 3 and Scenario 4, perform the following steps:

1. Go to Power BI desktop and open the report you want to edit.

   Make sure you use the steps described in Add Dynamics 365 Customer Service dataset to existing reports to ensure that your report is connected to the dynamics data model.

2. Select the **Modeling** tab, and then select **Make changes to this model**.

   You may be asked to create a local model to bring in additional data sources. This creates a data model within the workspace where the report exists. This local model (for the report) uses a DirectQuery connection to connect to the Dynamics 365 model so you can leverage metrics from the dynamics model while adding your own.

3. Select **Add a local model**.

4. On the **Connect to your data** dialog, select **Submit**.

5. If you need to bring additional attributes from Dynamics, select **Dataverse**. For other applications, use the appropriate source.

6. On the **Navigator** pane, select the entity, and then select **Transform data**.

7. On the **Connection Settings** dialog, select the preferred connection, and then select **OK**.
8. After the local model is created, select **Get data**, and then select the appropriate data source.
9. On the **Modeling** tab, select **Manage relationship** to create relationships between the new entities that you've added with existing entities.
10. Right-click the entity for which you want to create your new metric.
11. Enter the DAX logic after selecting the required attributes such as name and data type.
12. Save your measure and include it in your visualization as required.
13. Publish your newer version to Power BI by selecting **File** > **Publish**.

Example

Here's an example that describes how to filter the out-of-the-box Customer Service historical reports by a user's title.

1. Go to Power BI service, and then select the report from your custom workspace.
2. Download the Customer Service historical analytics report with live connection and open it in Power BI.
3. Create the local model using the steps explained earlier.
4. In the **Navigator** pane, select the appropriate Dynamics Customer Service organization. As the metrics will be based on Dynamics 365 data, Dataverse connector is used.
5. From the list of entities, select the entity (or entities) that you need. Use the **system user** entity.
6. Select **Transform data** to apply the necessary filters and to remove unwanted columns.

   As a best practice, make sure you pull only the data that's necessary to ensure optimal performance and refresh rates. You can choose to use **Import** mode or **DirectQuery** mode, depending on the your needs. In case of real-time reports, you may choose to use **DirectQuery** to help ensure that you get the latest data every time. To prevent any confusion, this entity can be named **UserTitle**.

The new entity, **UserTitle**, and the **Title** attribute are loaded and available for you. To successfully create a relationship between this new entity and existing data, we need the User Id as well.

7. Select the **Modeling** tab, and **Manage relationship** to create a new relationship between **DimAgent** entity and the newly created **UserTitle** entity using the agent Id attribute.

   You can then add this as a filter to the existing report or add newer metrics if required based on this attribute.

8. Select **Save**, and then select **File** > **Publish to Power BI**.

Publish reports back to Dynamics 365 Customer Service

After you've created the new reports, you can enable your Dynamics 365 users to be able to view these reports from the Customer Service workspace app. Work with your administrator to ensure that the viewers have appropriate access to view and embed these reports in Dynamics 365.

Data models and report mappings for historical analytics reports in Customer Service

Article • 06/12/2023

This article lists the out-of-the-box data models and report mappings for historical reports. Use the information to edit the report mappings for the various out-of-the-box reports.

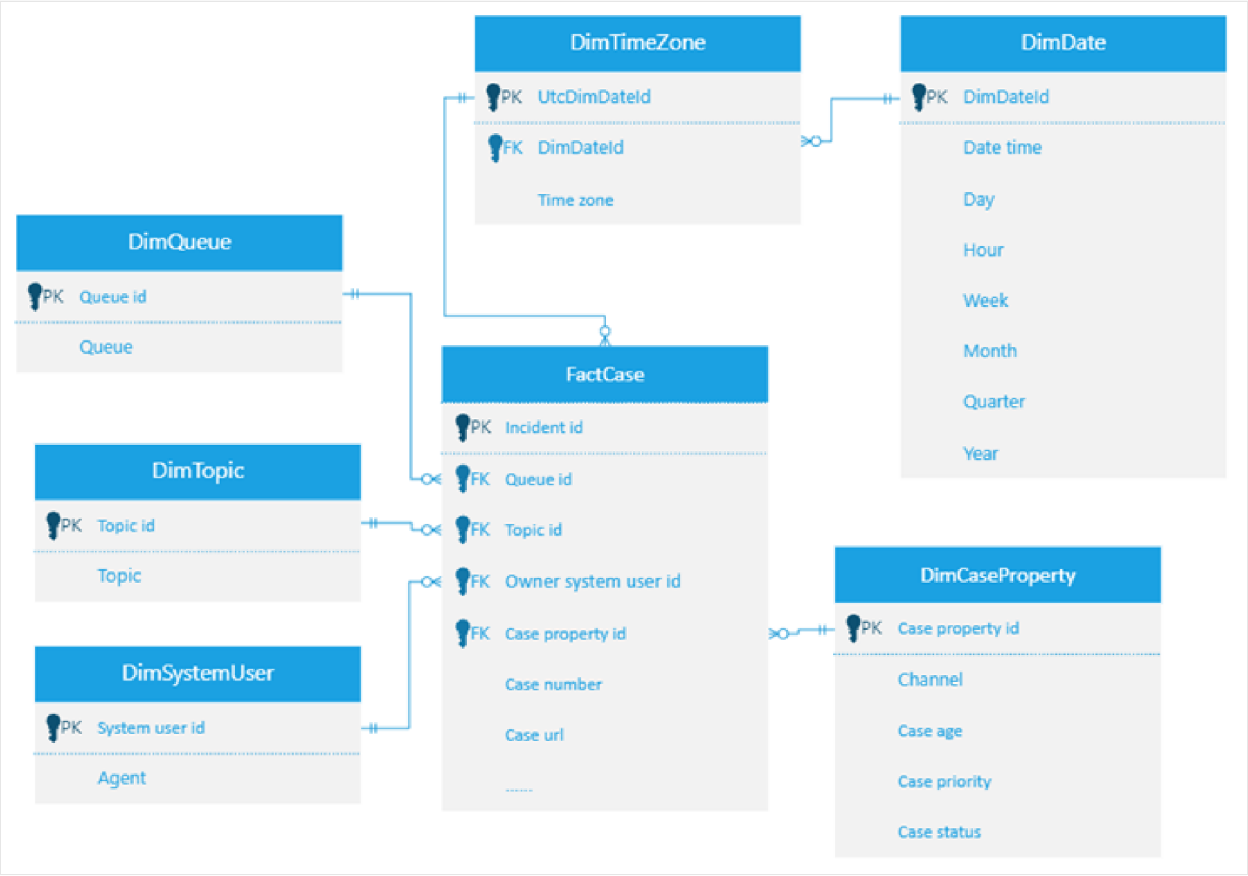
Customer service manager analytics

Edit the report mapping

Use the Dynamics_365_Customer_Service_Omnichannel_analytics.pbix file to edit the following reports:

- Summary
- Agent
- Topics
- Bot

Data model



Data dictionary

Entities	Attributes	Description
DimDate	Date time	Date time. The type is Date/Time.
DimDate	Day	Day name. Example: "Fri".
DimDate	Year	Year number. Example: "2021".
DimDate	Week	Week number. Example: "1".
DimDate	Month	Month name. Example: "Apr 2021"
DimDate	Quarter	Quarter name. Example: "Q1".
DimDate	Hour	Hour. Example: "01:00", "01:30"
FactCase	Incident id	Incident id, Primary key. Type: Guid.
FactCase	Case number	Case number value.
FactCase	Queue id	Queue id. Foreign key to DimQueue.
FactCase	Owner system user id	Owner system user id. Foreign key to DimSystemUser.
FactCase	Case url	URL for case.

Entities	Attributes	Description
FactCase	Case property id	Foreign key to DimCaseProperty.
FactCase	Topic id	Topic id. Foreign key to DimTopic.
FactCase	Case title	Case title.
FactCase	Created on	Date created on.
FactCase	Incoming cases	Incoming cases count.
FactCase	Total cases	Total case count.
FactCase	Resolved cases	Case count when case status is resolved.
FactCase	Active cases	Case count when case status is active.
FactCase	Canceled cases	Case count when case status is canceled.
FactCase	Escalated cases	Case count when case is escalated.
FactCase	Escalated rate	Rate that escalated cases divided by total cases.
FactCase	Case volume	Total case count per topic divided by total cases.
FactCase	Case volume change	Total case count link relative ratio for the same date range filter.
FactCase	Avg. resolve time (hrs	Average time for case handle time.
FactCase	Avg. case age (days)	Average case age
FactCase	First response - SLA %	Total cases when first response sent is false divided by total cases.
FactCase	Avg. CSAT	Average CSAT score.
FactCase	CSAT impact	Change ratio for the CSAT.
FactCase	Avg. survey sentiment	Average survey sentiment.
FactCase	Survey sentiment impact	Change ratio for the sentiment.
DimQueue	Queue	Queue name.
DimQueue	Queue id	Queue ID. Primary key. Type: Guid.
DimSystemUser	Agent	Name of the agent.

Entities	Attributes	Description
DimSystemUser	System user id	System user ID.
DimCaseProperty	Case status	Case status value, Example: Active, Canceled, Resolved.
DimCaseProperty	Case priority	Case priority value, Example: Low, High, Normal.
DimCaseProperty	Channel	Case channel.
DimCaseProperty	Case age	Description for case age, Example: 4-7 Days, <1 Day, 1-3 Days
DimCaseProperty	Case property id	Case property ID. Primary key.
DimTopic	Topic	Topic name.
DimTopic	Topic id	Topic ID. Primary key. Type: Guid.
DimTimeZone	Time zone	Time zone code. Example: GMT +01:00

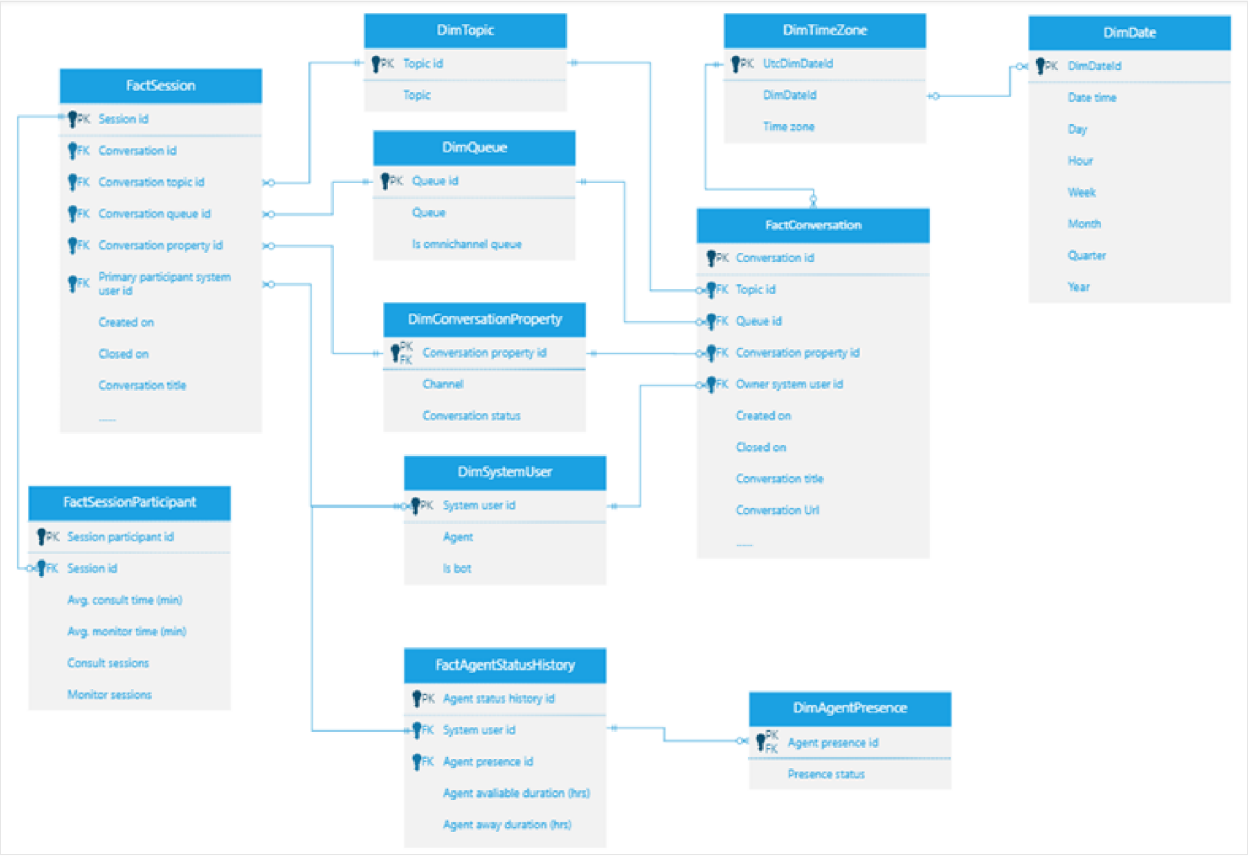
Omnichannel analytics

Edit the report mapping

Use the Dynamics_365_Customer_Service_Omnichannel_analytics.pbix file to edit the following reports:

- Conversation
- Queue
- Agent
- Topics
- Bot

Data model



Data dictionary

Entities	Attributes	Description
DimAgentPresence	Agent presence id	Primary key.
DimAgentPresence	Presence status	Agent presence status. That is, Available, Busy, Busy-DND, Away, or Offline.
DimConversationProperty	Conversation property id	Primary key.
DimConversationProperty	Channel	Channel name. The name of the channel that the conversation came through.
DimConversationProperty	Conversation status	The status of the conversation. That is, open, active, waiting, wrap up, and closed.
DimDate	Date time	Date and time. The type is Date/Time.
DimDate	Day	Day name. Example: "Fri".
DimDate	Hour	Hour. Example: "01:00", "01:30"
DimDate	Month	Month name. Example: "Apr 2021".
DimDate	Quarter	Quarter name. Example: "Q1".

Entities	Attributes	Description
DimDate	Week	Week number. Example: "1".
DimDate	Year	Year number. Example: "2021".
DimQueue	Queue id	Queue ID. Primary key of type GUID.
DimQueue	Is omnichannel queue	Whether the queue is an omnichannel queue. Currently, it's always true.
DimQueue	Queue	Queue name.
DimSystemUser	System user id	System user ID.
DimSystemUser	Agent	Name of the agent.
DimSystemUser	Is bot	Whether the system user is a bot. True or false.
DimTimeZone	Time zone	Time zone code such as GMT +01:00.
DimTopic	Topic id	Topic ID. Primary key of type GUID.
DimTopic	Topic	Topic name.
FactAgentStatusHistory	Agent status history id	Original identifier of the agent status history record from msdyn_agentstatushistory entity. Type: Guid.
FactAgentStatusHistory	System user id	Agent ID. Foreign key to DimSystemUser.
FactAgentStatusHistory	Agent logged in time	The time an agent logged in the omnichannel application per presence status.
FactAgentStatusHistory	Agent presence id	Foreign key to DimAgentPresence.
FactAgentStatusHistory	Agent available duration (hrs)	The time an agent is in the Available state in the omnichannel application.
FactAgentStatusHistory	Agent away duration (hrs)	The time an agent is in the away state in the omnichannel application.
FactAgentStatusHistory	Agent busy (DND) duration (hrs)	The time an agent is in the Busy DND state in the omnichannel application.
FactAgentStatusHistory	Agent busy duration (hrs)	Time an agent in the busy state in omnichannel application.

Entities	Attributes	Description
FactAgentStatusHistory	Agent offline duration (hrs)	The time an agent signed out of the omnichannel application.
FactAgentStatusHistory	Agent total sign-in time (hrs)	The time an agent is in each status. The column is used to calculate other measures like "Agent available duration (hrs)", "Agent away duration (hrs)".
FactConversation Conversation id	Identifier of the conversation record.	Primary key of type GUID.
FactConversation	Conversation title	Conversation title.
FactConversation	Conversation Url	Conversation URL.
FactConversation	Conversation property id	Foreign key to DimConversationProperty.
FactConversation	Owner system user id	Owner system user ID. Foreign key to DimSystemUser.
FactConversation	Queue id	Queue ID. Foreign key to DimQueue.
FactConversation	Topic id	Topic ID. Foreign key to DimTopic.
FactConversation	Is offered	Whether the conversation is initiated by the customer. Bot escalates to an agent or an agent handling customer call directly.
FactConversation	Is conversation date in past	Is conversation data in past.
FactConversation	Is outbound	Is outbound conversation.
FactConversation	Abandon rate	Abandon rate.
FactConversation	Avg. conversation hold time (min)	The total time an agent has put a customer on hold.
FactConversation	Avg. conversation sentiment	Average conversation sentiment.

Entities	Attributes	Description
FactConversation	Avg. conversation talk time (min)	The total time spent by the customer and agent talking on the voice call. It's the difference between the handle time and cumulative time in hold and after call work time.
FactConversation	Avg. conversation time (min)	Average conversation time (min).
FactConversation	Avg. conversation wrap-up time (min)	Average conversation wrap-up time (min).
FactConversation	Avg. CSAT	Avg. CSAT.
FactConversation	Avg. speed to answer (sec)	The time it took for a customer call to be answered.
FactConversation	Conversation volume	Conversation volume that is assigned to a topic.
FactConversation	Conversation volume change	Conversation volume change.
FactConversation	Created on	Date created on.
FactConversation	Closed on	Date closed on.
FactConversation	Engaged conversations	Offered conversations that are engaged by an agent. Customer-to-agent communication can begin at this point.
FactConversation	Incoming conversations	The number of incoming conversations.
FactConversation	Outgoing conversations	The number of outgoing conversations.
FactConversation	Total conversations	The number of total conversations.
FactConversation	Transfer rate	The percentage of conversations that are transferred to another agent or queue.
FactConversation	Sentiment zone	Sentiment zone for the conversation.

Entities	Attributes	Description
FactConversation	Avg. conversation active time (min)	Average time when conversation is active.
FactConversation	Avg. conversation inactive time (min)	Average time when conversation is inactive.
FactConversation	Avg. customer effort time (min)	Average time for customer effort.
FactConversation	Avg. handle time (min)	Average active time for the closed conversation.
FactConversation	Avg. incoming messages	Average incoming messages.
FactConversation	Avg. outgoing messages	Average outgoing messages.
FactConversation	Conversation count	Conversation count.
FactConversation	Avg. response time (min)	Average response time up on response time of each session.
FactConversation	Avg. session per conversation	Average session count per conversation.
FactConversation	Avg. survey sentiment	Average sentiment score.
FactConversation	Avg. time for first response (min)	Average response time for first response time.
FactConversation	Avg. wait time (sec)	Average wait time.
FactConversation	Outgoing messages	Outgoing messages count.
FactConversation	Incoming messages	Incoming messages count.

Entities	Attributes	Description
FactSession	Session id	Identifier of the session record.
FactSession	Conversation id	Foreign key to FactConversation.
FactSession	Conversation title	Conversation title.
FactSession	Conversation Url	Conversation URL.
FactSession	Created on	Date created on.
FactSession	Closed on	Date closed on.
FactSession	Queue id	Queue ID. Foreign key to DimQueue.
FactSession	Topic id	Topic ID. Foreign key to DimTopic.
FactSession	Primary system user id	Primary system user ID. Foreign key to DimSystemUser.
FactSession	Is agent accepted session	Is agent accepted the session or not.
FactSession	Is agent session	Is agent session or not.
FactSession	Avg. conversation handle time (min)	Average conversation handle time (min).
FactSession	Avg. conversation hold time (min)	Average conversation hold time (min).
FactSession	Avg. conversation sentiment	Average sentiment score based on the verbatim provided in customer voice survey.
FactSession	Avg. conversation talk time (min)	Average conversation talk time (min).
FactSession	Avg. CSAT	Average CSAT.

Entities	Attributes	Description
FactSession	Avg. incoming messages	Average incoming messages.
FactSession	Avg. outgoing messages	Average outgoing messages.
FactSession	Avg. session active time (min)	Average session active time (min).
FactSession	Avg. session handle time (min)	Average session handle time (min).
FactSession	Avg. session hold time (min)	Average session hold time (min).
FactSession	Avg. session inactive time (min)	Average session inactive time (min).
FactSession	Avg. session sentiment	Average session sentiment.
FactSession	Avg. session talk time (min)	Average session talk time (min).
FactSession	Avg. session time (min)	Average session time (min).
FactSession	Avg. Speed to answer (sec)	Average speed to answer (sec).
FactSession	Avg. wait time (min)	The average time in minutes customers waited before connecting to agents. Similar to "speed to answer", but includes time waited on each session within a conversation.
FactSession	Avg. wait time (sec)	The average time in seconds customers waited before connecting to agents. Similar to "speed to answer", but includes time waited on each session within a conversation.
FactSession	Engaged conversations	The conversations that the agent was engaged in. Customer-to-agent communication can begin at this point.

Entities	Attributes	Description
FactSession	Engaged sessions	Number of sessions presented to an agent and accepted by an agent.
FactSession	Incoming conversations	Incoming conversations.
FactSession	Incoming messages	Incoming messages.
FactSession	Incoming sessions	Incoming sessions.
FactSession	Outgoing conversations	Outgoing conversations.
FactSession	Outgoing messages	Outgoing messages.
FactSession	Sentiment zone	Sentiment zone.
FactSession	Session rejected/timed out rate	Session rejected/timed out rate.
FactSession	Sessions rejected	Sessions rejected.
FactSession	Transfer rate	The number of sessions transferred by an agent.
FactSession	Bot conversations	The number of conversations handled by bot.
FactSession	Bot escalation rate	The percentage of bot conversations that have been escalated.
FactSession	Bot resolution rate	The percentage of bot conversations that have been resolved.
FactSession	Bot escalation time (min)	The average session time of the escalated bot sessions.
FactSession	Bot resolution time (min)	The average session time of the resolved bot sessions.
FactSession	Bot abandoned rate	The percentage of bot conversations that have been abandoned.

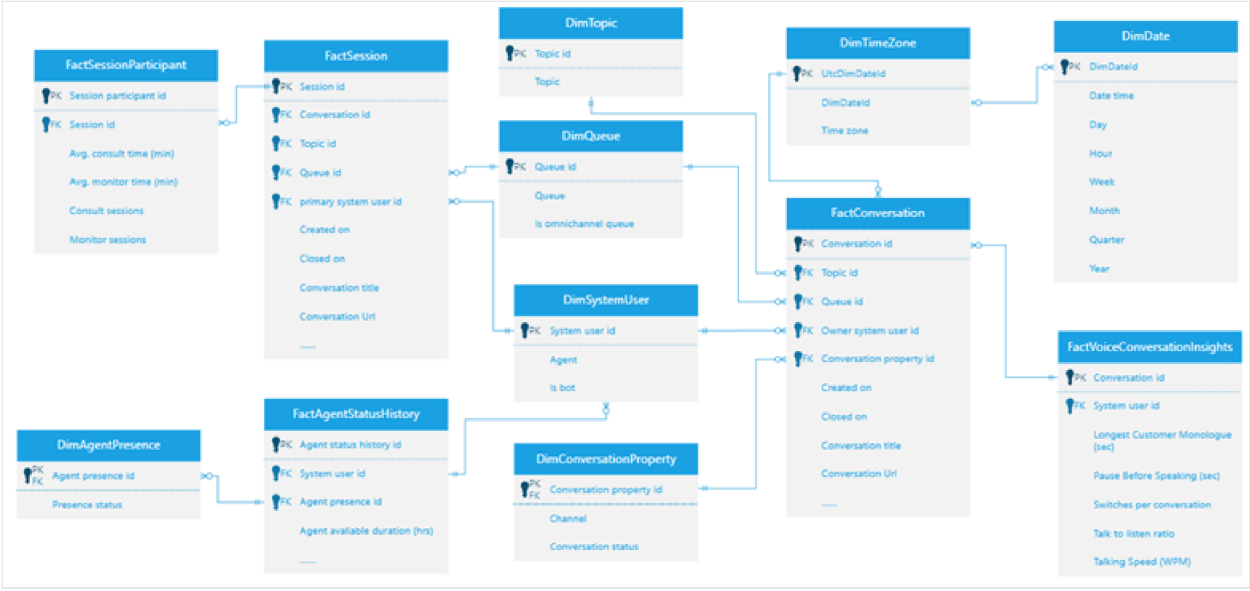
Entities	Attributes	Description
FactSession	Sessions rejected rate	The percentage of sessions that have been rejected.
FactSession	Sessions timeout rate	The percentage of sessions that timed out.
FactSession	Sessions timed out count	Session count when agent is timeout.
FactSession	Bot escalated	Number of bot conversations that have been escalated.
FactSession	Bot resolved	Number of bot conversations that have been resolved.
FactSession	Transfer count	Number of sessions that have been transferred (closure reason in 192350006 or 192350010).
FactSessionParticipant	Session participant id	Identifier of the session participant record.
FactSessionParticipant	Session id	Session ID. Foreign key to FactSession.
FactSessionParticipant	Avg. consult time (min)	The time spent on the consult from when the agent joined to when they left in session participant.
FactSessionParticipant	Avg. monitor time (min)	The time spent on the monitor from when the agent joined to when they left in session participant.
FactSessionParticipant	Consult sessions	The number of sessions accepted by a user in mode = consult.
FactSessionParticipant	Monitor sessions	The number of sessions accepted by a user in mode = monitor.

Omnichannel voice analytics

Edit the report mapping

Use the Dynamics_365_Customer_Service_Omnichannel_voice_analytics.pbix file to edit the Voice report.

Data model



Data dictionary

Entities	Attributes	Description
DimAgentPresence	Agent presence id	Primary key.
DimAgentPresence	Presence status	Agent presence status that could be "Available", "Busy", "Busy - DND", "Away", or "Offline"
DimConversationProperty	Conversation property id	Primary key
DimConversationProperty	Channel name.	The name of the channel that the conversation came through.
DimConversationProperty	Conversation status	The status of the conversation, that is, open, active, waiting, wrap up, and closed.
DimDate	Date time	Date time. The type is Date/Time.
DimDate	Day	Day name. Example: "Fri".
DimDate	Hour	Hour. Example: "01:00", "01:30"
DimDate	Month	Month name. Example: "Apr 2021".
DimDate	Quarter	Quarter name. Example: "Q1".
DimDate	Week	Week number. Example: "1".
DimDate	Year	Year number. Example: "2021".
DimQueue	Queue id	Queue id. Primary key. Type: Guid.

Entities	Attributes	Description
DimQueue	Is omnichannel queue	Currently, it's always true.
DimQueue	Queue	Queue name.
DimSystemUser	System user id	System user ID.
DimSystemUser	Agent	Name of the agent.
DimSystemUser	Is bot	Is bot. True or false.
DimTimeZone	Time zone	Time zone code. Example: GMT +01:00.
DimTopic	Topic id	Topic ID. Primary key. Type: Guid.
DimTopic	Topic	Topic name.
FactAgentStatusHistory	Agent status history id	Identifier of the agent status history record. Primary key of type GUID.
FactAgentStatusHistory	System user id	Agent ID. Foreign key to DimSystemUser.
FactAgentStatusHistory	Agent presence id	Foreign key to DimAgentPresence.
FactAgentStatusHistory	Agent available duration (hrs)	The time an agent is in the Available state in the omnichannel application.
FactAgentStatusHistory	Agent away duration (hrs)	The time an agent is in the Away state in the omnichannel application.
FactAgentStatusHistory	Agent busy (DND) duration (hrs)	The time an agent is in the Busy DND state in the omnichannel application.
FactAgentStatusHistory	Agent busy duration (hrs)	Time an agent in the busy state in omnichannel application.
FactAgentStatusHistory	Agent offline duration (hrs)	The time an agent signed out of the omnichannel application.
FactAgentStatusHistory	Agent total sign-in time (hrs)	The time an agent in each status. The column is used to calculate other measure.
FactConversation	Conversation id	Identifier of the conversation record. Primary key of type GUID.

Entities	Attributes	Description
FactConversation	Conversation title	Conversation title.
FactConversation	Conversation Url	Conversation URL.
FactConversation	Conversation property id	Foreign key to DimConversationProperty.
FactConversation	Owner system user id	Owner system user ID. Foreign key to DimSystemUser.
FactConversation	Queue id	Queue ID. Foreign key to DimQueue.
FactConversation	Topic id	Topic ID. Foreign key to DimTopic.
FactConversation	Is offered	It means whether the conversation is initiated by the customer. Bot escalates to an agent or an agent handling customer call directly
FactConversation	Is conversation date in past	Is conversation date in past.
FactConversation	Is outbound	Is outbound conversation.
FactConversation	Abandon rate	Abandon rate.
FactConversation	Avg. conversation hold time (min)	The total time an agent has put a customer on hold.
FactConversation	Avg. conversation sentiment	Avg. conversation sentiment.
FactConversation	Avg. conversation talk time (min)	The total time spent by the customer and agent talking on the voice call. It's the difference between the handle time and cumulative time in hold and after call work time.
FactConversation	Avg. conversation time (min)	Avg. conversation time (min).

Entities	Attributes	Description
FactConversation	Avg. conversation wrap-up time (min)	Avg. conversation wrap-up time (min).
FactConversation	Avg. CSAT	Avg. CSAT.
FactConversation	Avg. speed to answer (sec)	The time it took for a customer call to be answered.
FactConversation	Conversation volume	Conversation volume that's assigned to a topic.
FactConversation	Conversation volume change	Conversation volume change.
FactConversation	Created on	Date created on.
FactConversation	Closed on	Date closed on.
FactConversation	Engaged conversations	Offered conversations that are engaged by an agent. Customer-to-agent communication can begin at this point.
FactConversation	Incoming conversations	The number of incoming conversations.
FactConversation	Outgoing conversations	The number of outgoing conversations.
FactConversation	Total conversations	The number of total conversations.
FactConversation	Transfer rate	The percentage of conversations that are transferred to another agent/queue.
FactVoiceConversationInsights	Conversation id	Conversation ID. Foreign key to FactConversation.
FactVoiceConversationInsights	System user id	System user ID. Foreign key to DimSystemUser.
FactVoiceConversationInsights	Longest Customer Monologue (sec)	The longest monologue by the customer with an agent; indicates that the agent is asking good questions and understanding customer needs.
FactVoiceConversationInsights	Pause Before Speaking (sec)	The milliseconds the agent paused before responding to customer queries; indicates agent's patience.

Entities	Attributes	Description
FactVoiceConversationInsights	Switches per conversation	The average exchanges between an agent and a customer in a conversation; the number of times the conversation switched from one person to another. It's a sign of engagement during conversations.
FactVoiceConversationInsights	Talk to listen ratio	The average listen and talk ratio of agent in conversations with customers.
FactVoiceConversationInsights	Talking Speed (WPM)	The average number of words used per minute by agent.
FactSession	Session id	Identifier of the session record.
FactSession	Conversation id	Identifier of the conversation record.
FactSession	Conversation title	Conversation title.
FactSession	Conversation Url	Conversation URL.
FactSession	Created on	Date created on.
FactSession	Closed on	Date closed on.
FactSession	Queue id	Queue ID. Foreign key to DimQueue.
FactSession	Topic id	Topic ID. Foreign key to DimTopic.
FactSession	primary system user id	Primary system user ID. Foreign key to DimSystemUser.
FactSession	Is agent accepted session	Has agent accepted the session or not?
FactSession	Is agent session	Is agent session or not.
FactSession	Avg. conversation handle time (min)	Avg. conversation handle time (min)
FactSession	Avg. conversation hold time (min)	Avg. conversation hold time (min)

Entities	Attributes	Description
FactSession	Avg. conversation sentiment	The average sentiment score based on the verbatim provided in customer voice survey.
FactSession	Avg. conversation talk time (min)	Avg. conversation talk time (min)
FactSession	Avg. CSAT	Avg. CSAT
FactSession	Avg. incoming messages	Average incoming messages
FactSession	Avg. outgoing messages	Average outgoing messages
FactSession	Avg. session active time (min)	Average session active time (min)
FactSession	Avg. session handle time (min)	Average session handle time (min)
FactSession	Avg. session hold time (min)	Average session hold time (min)
FactSession	Avg. session inactive time (min)	Average session inactive time (min)
FactSession	Avg. session sentiment	Average session sentiment
FactSession	Avg. session talk time (min)	Average session talk time (min)
FactSession	Avg. session time (min)	Average session time (min)
FactSession	Avg. Speed to answer (sec)	Average Speed to answer (sec)
FactSession	Avg. wait time (min)	The average time in minutes customers waited before connecting to agents. Similar to "speed to answer", but includes time waited on each session within a conversation.

Entities	Attributes	Description
FactSession	Avg. wait time (sec)	The average time in seconds customers waited before connecting to agents. Similar to "speed to answer", but includes time waited on each session within a conversation.
FactSession	Engaged conversations	The conversations that the agent was engaged in. Customer-to-agent communication can begin at this point.
FactSession	Engaged sessions	Sessions presented to an agent and accepted by an agent
FactSession	Incoming conversations	Incoming conversations
FactSession	Incoming messages	Incoming messages
FactSession	Incoming sessions	Incoming sessions
FactSession	Outgoing conversations	Outgoing conversations
FactSession	Outgoing messages	Outgoing messages
FactSession	Sentiment zone	SentimentZone
FactSession	Session rejected/timed out rate	Session rejected or timed out rate
FactSession	Sessions rejected	Sessions rejected
FactSession	Transfer rate	The number of sessions transferred by an agent
FactSessionParticipant	Session participant id	Identifier of the session participant record
FactSessionParticipant	Session id	Session ID. Foreign key to FactSession.
FactSessionParticipant	Avg. consult time (min)	The time spent on the consult from when the agent joined to when they left in session participant.

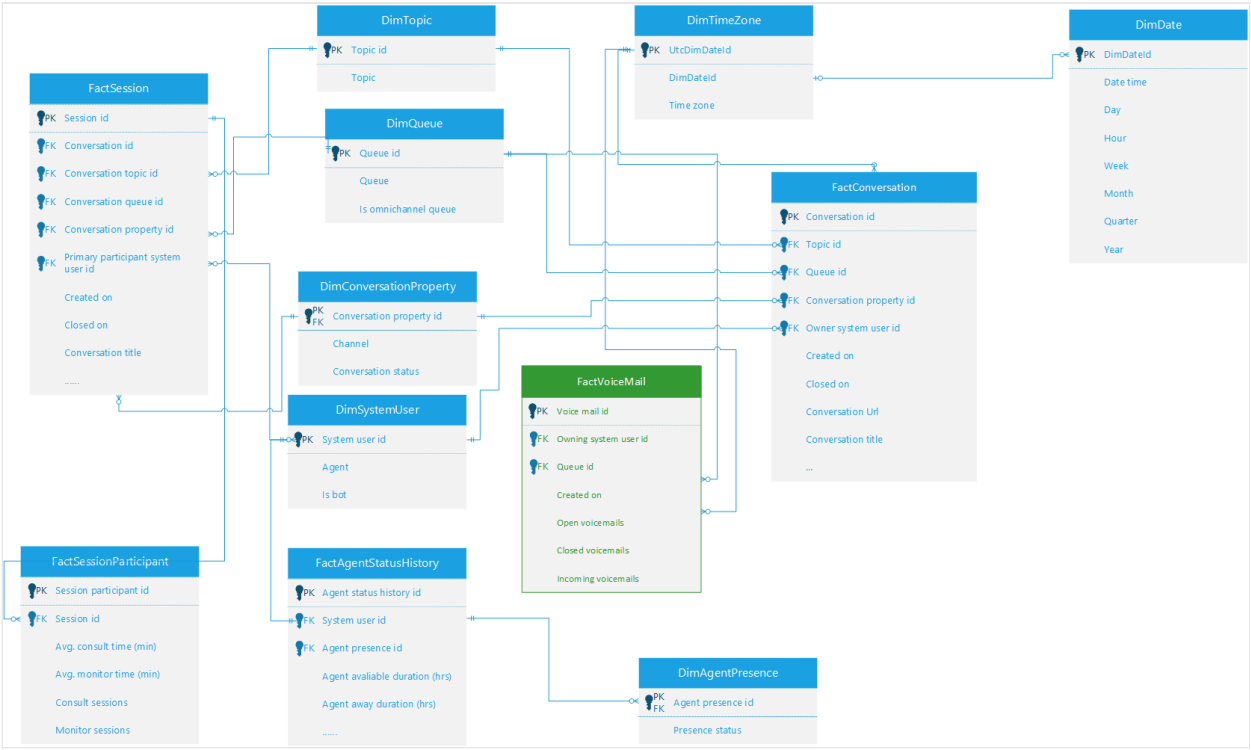
Entities	Attributes	Description
FactSessionParticipant	Avg. monitor time (min)	The time spent on the monitor from when the agent joined to when they left in session participant.
FactSessionParticipant	Consult sessions	The number of sessions accepted by a user in mode = consult.
FactSessionParticipant	Monitor sessions	The number of sessions accepted by a user in mode = monitor.

Voice mail analytics

Edit the report mapping

Use the Dynamics_365_Customer_Service_Omnichannel_Voice_Mail_analytics.pbix file to edit the Voice mail report.

Data model



Data dictionary

Entities	Attributes	Description

Entities	Attributes	Description
FactVoiceMail	Voice mail ID	Primary key.
FactVoiceMail	Owner system user ID	User ID. Foreign key to DimSystemUser.
FactVoiceMail	Queue ID	Queue ID. Foreign key to DimQueue.
FactVoiceMail	Created on	The date and time when the voice mail was created.
FactVoiceMail	Incoming voicemails	Count of the open and closed voice mails.
FactVoiceMail	Closed voicemails	Count of the closed voice mails.
FactVoiceMail	Open voicemails	Count of the open voice mails.

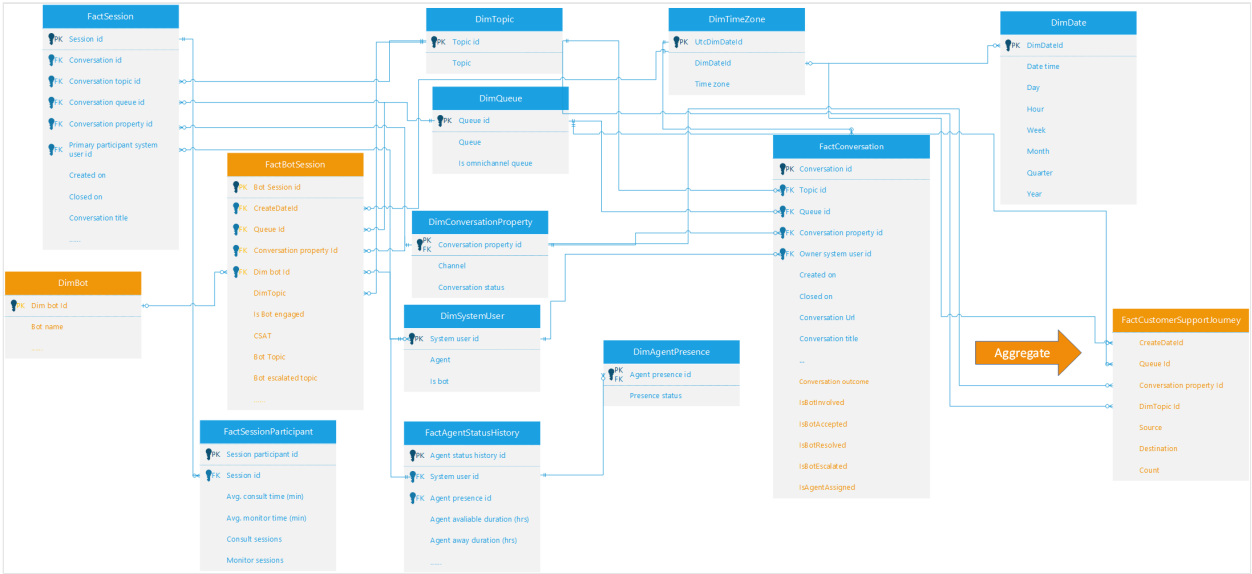
Omnichannel bot analytics

Edit the report mapping

Use the Dynamics_365_Customer_Service_Omnichannel_Bot_analytics.pbix file to edit the following reports:

- Summary
- Bot (the Bot in Dynamic_365_Customer_Service_Omnichannel_analytics will be replaced with this enhanced bot page when you turn on the **Add historical analytics for bots** option in Omnichannel historical analytics).

Data model



Data dictionary

Entities	Attributes	Description
FactConversation	Conversation outcome	Conversation outcome based on the involvement of bot and the human agent. Currently supports "bot escalated", "bot deflected", and "direct agent conversations".
DimBot	Bot ID	Bot ID
DimBot	Bot name	Bot name
FactCustomerSupportJourney	Source	The source of one step on the customer support journey graph. Examples are "interaction", "bot escalated","direct agent connection", and "agent assigned" .
FactCustomerSupportJourney	Destination	The destination of one step on the customer support journey graph.
FactCustomerSupportJourney	Total count	The total count for one step on the customer support journey, from source to destination.
FactCustomerSupportJourney	Topic ID	Topic ID. Foreign key to DimTopic.
DimConversationProperty	Conversation outcome	Conversation outcome based on the involvement of bot and the human agent. Currently supports "bot escalated", "bot deflected", and "direct agent conversations".
FactBotSession	Abandoned session rate	Abandon rate
FactBotSession	Avg. escalation time (min)	The time required by the bot to escalate.
FactBotSession	Avg. deflection time (min)	The time required by the bot deflect.
FactBotSession	Bot CSAT	CSAT score for bot at an average.
FactBotSession	Bot Id	Bot ID, PK to Dimbot
FactBotSession	Bot session ID	Bot session ID, PK
FactBotSession	Bot topic	The topic of this bot session

Entities	Attributes	Description
FactBotSession	Conversation title	The title of the associated conversation
FactBotSession	Conversation deflected	The total conversation was deflected.
FactBotSession	Conversation escalated	The total conversation was escalated.
FactBotSession	Conversation ID	Identifier of the related conversation record.
FactBotSession	Conversation URL	The URI of the related conversation.
FactBotSession	Bot deflection rate	The rate at which the conversations were deflected.
FactBotSession	Engaged sessions rate	The engagement rate of bot sessions.
FactBotSession	Bot escalated topic	The escalated topic of bot conversations.
FactBotSession	Bot escalation rate	The rate at which the conversations were escalated by the bot.
FactBotSession	Escalated sessions rate	Escalation rate based on bot sessions.
FactBotSession	Is bot engaged	Indicate if the bot is engaged in this session.
FactBotSession	Conversation queue id	Queue ID. Foreign key to DimQueue.
FactBotSession	Resolved session rate	Resolution rate based on bot sessions.
FactBotSession	Bot sessions abandoned	Bot session abandoned.
FactBotSession	Bot sessions escalated	Bot session escalated.
FactBotSession	Bot sessions engaged	Bot session engaged.

Entities	Attributes	Description
FactBotSession	Bot sessions resolved	Bot session resolved.
FactBotSession	Session Outcome	Bot session outcome.
FactBotSession	Avg. sessions per conversation	Average number of bot sessions per conversation.
FactBotSession	Bot session unengaged	Bot sessions not engaged.
FactBotSession	Total sessions	Total bot sessions.
FactBotSession	Total conversations	Total conversations associated with bots.
FactBotSession	Session ID	The related Omnichannel session ID.
FactBotSession	Topic ID	Topic ID. Foreign key to DimTopic.

Customize KPIs for intraday insights

Article • 05/18/2023

> **Note**
>
> Intraday insights reports for Omnichannel for Customer Service are deprecated as of May 1, 2023. We recommend that you use **real-time analytics reports**, our latest analytics capability, which provide real-time information about the health and key performance indicators of your organization. For more information on the deprecation, go to **Intraday insights for Omnichannel for customer service are deprecated**.

To cater to your organizational needs, intraday insights allows you to customize KPIs. This allows supervisors to adapt to your organizational parameters that are designed for your organization. Through the Power BI desktop application, you can customize these KPIs.

> **Note**
>
> Do not customize out-of-the-box reports because they will be overwritten when new versions are made available by Microsoft. However, if you do customize them, save them with another name.

The customization of KPIs includes:

- Add custom KPIs
- Edit measures and visuals of existing KPIs

Review prerequisites

Verify the following prerequisites before you add the custom KPIs:

1. Power BI desktop app is installed on your computer.
2. Administrator or equivalent role is assigned to you.
3. Intraday insights dashboard is configured for your organization. To Learn more, see Configure to view intraday insights dashboard

Add custom KPIs

You can add the custom KPIs that are specific to your organization to intraday insights. This allows intraday insights to be more specific and helps supervisors adhere your organizational requirements. To add custom KPIs, follow these steps:

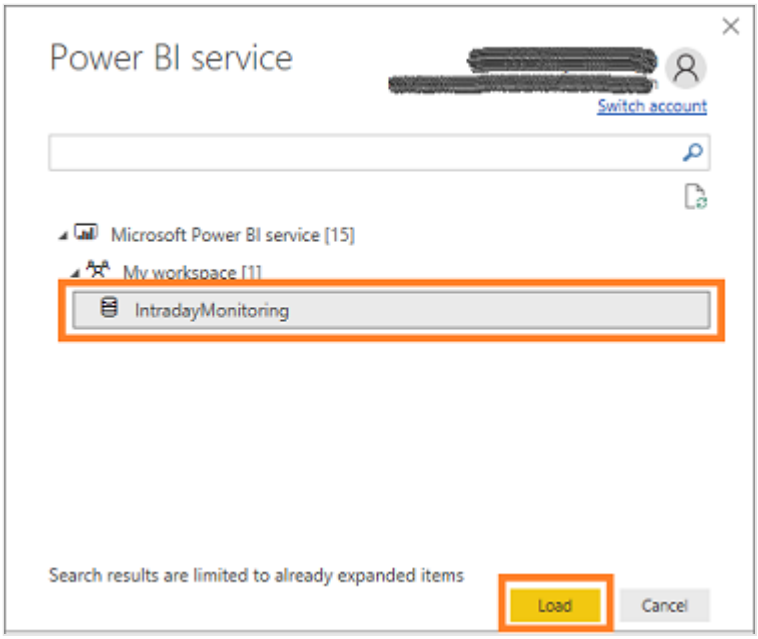
1. Review the prerequisites.

2. Open the Power BI desktop application and sign in with your administrator credentials.

3. From the **Home** menu, select **Get Data** > **Power BI datasets**.

   The dataset selection dialog box opens.

4. Select **IntradayMonitoring** from the workspace that you've created through configuration (Configure Power BI workspace in Omnichannel Administration app), and then select **Load**.



The fields related to intraday insights are loaded.

5. From the field category list, select a category to create a measure and then select **More options** (...) > **New measure**.

   In this example, we're creating a measure for the field category **AgentAvailability**.

   A new measure is created for the field.

6. The formula bar appears along the top of the Report canvas, where you can rename your measure and enter a DAX formula.

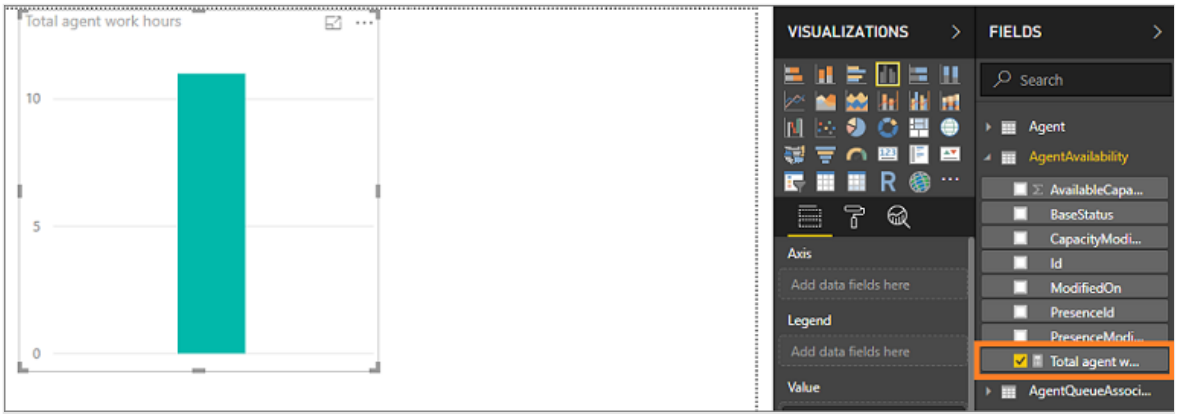
   In this example, we're adding a measure for calculating the total number hours that an agent is working on a work item.

```
```

```
Total agent work hours = Agent[Average Session Handling Time] +
Agent[Average Conversations Per Online Agents]
```

The measure is added.

7. Select the measure and verify that the measure is working as defined.



To learn more about creating measure, see Create a measures.

8. Add the measure to your report. To learn more, see Use your measure in the report.

9. Publish the report.

The custom KPI measure is added to the intraday insights dashboard.

To learn more about how to create custom measures, see Tutorial: Create your own measures in Power BI Desktop.

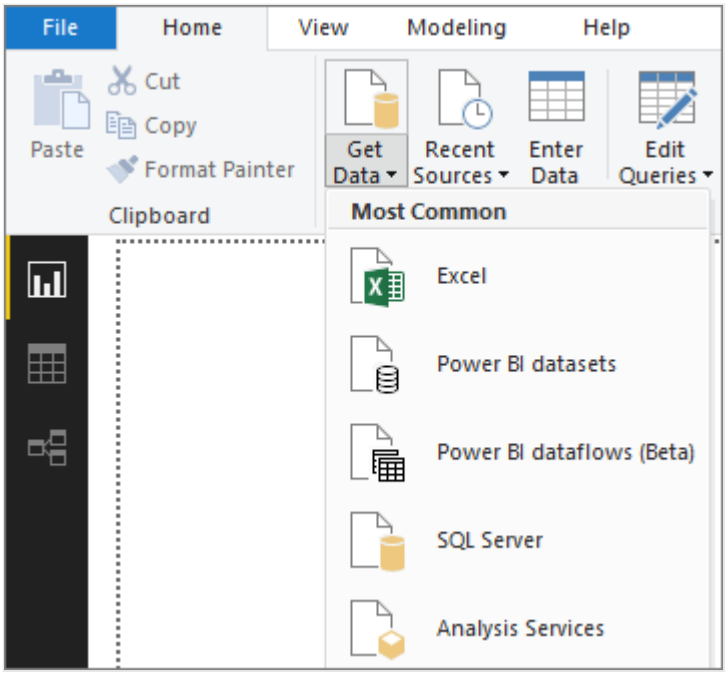
Edit measures and visuals of existing KPIs

You can edit the measures and visuals of existing custom and out-of-the-box KPIs to match your organizational requirements. This helps in reducing the effort of adding a new KPI to the intraday insights. To edit measures of existing KPIs, follow these steps:

1. Review the prerequisites.

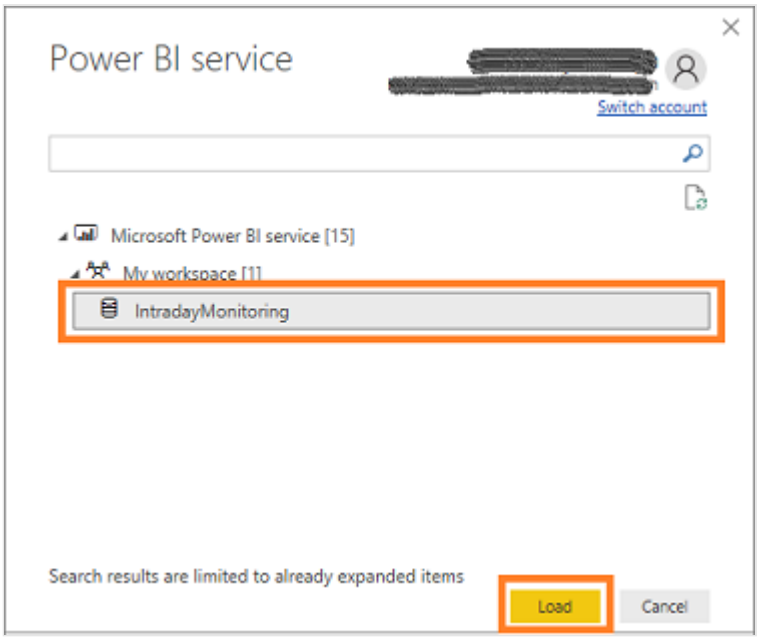
2. Open the Power BI desktop application and sign in with your administrator credentials.

3. From the **Home** menu, select **Get Data** > **Power BI datasets**.



The dataset selection dialog box opens.

4. Select **IntradayMonitoring** from the workspace that you've created through configuration (Configure Power BI workspace in Omnichannel Administration app), and then select **Load**.



The fields related to intraday insights are loaded.

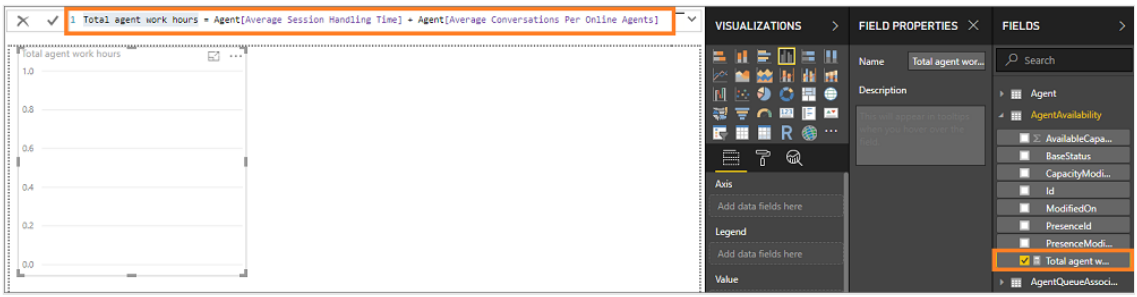
5. To edit a measure:

   a. From the field category list, select a category and then select the field for which you want to change the measure.

> ⓘ Note

Fields with measures are preceded with a calculator icon.

In this example we're selecting **Total agent work hours** field from **AgentAvailability** category. The details of for the field is displayed including its formula bar.



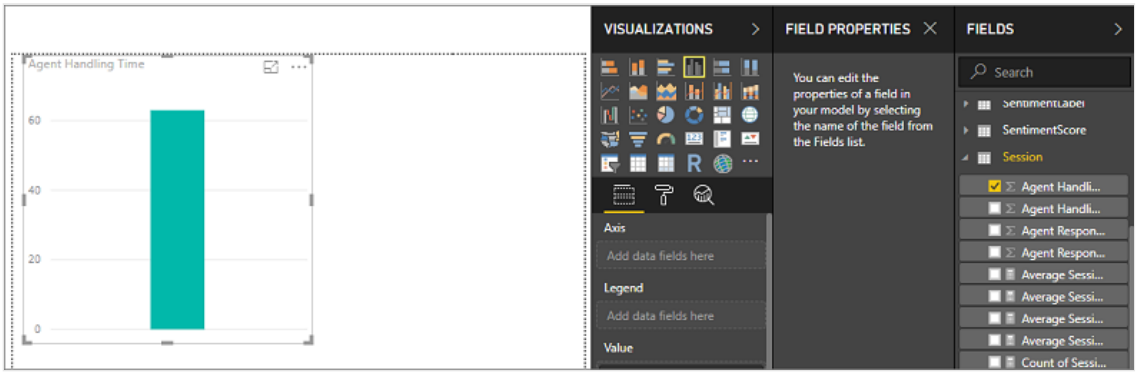
b. From the formula bar, edit the formula as required.

To learn more about change visualizations, see Create and use your own measures.

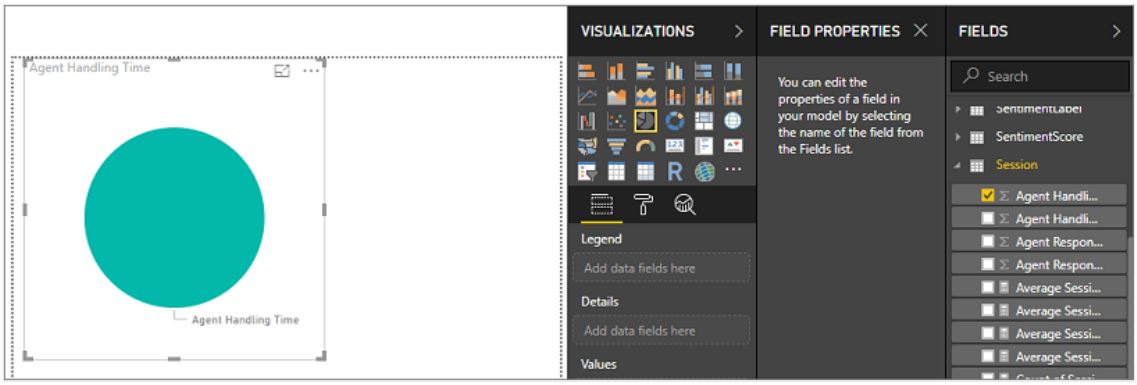
6. To edit a visual:

a. From the field category list, select a category and then select the field for which you want to change the visual.

In this example we're selecting **Agent Handling Time** field from **Session** category. The visual for the field is displayed.



b. From the **VISUALIZATIONS** tab, edit the visualizations of the field as required. In this example, we're changing the chart to a pie chart.



To learn more about change visualizations, see Add visualizations to a Power BI report.

7. Publish the report.

Reference

The tables in the intraday insights dataset consists of entity attributes along with measures and calculated columns. The following are the list of entity that is supported in Intraday insights:

- **Agent**. To learn more about entity attributes for agent, see SystemUser entity.
- **AgentAvailability**. To learn more about entity attributes for agent availability, see SystemUser entity and msdyn_presence.
- **AgentQueueAssociation**. To learn more about entity attributes for agent queue association, see SystemUser entity and Queue Entity.
- **AgentRoleAssociation**. To learn more about entity attributes for agent role association, see SystemUser entity and role EntityType.
- **Presence**. To learn more about entity attributes for presence, see msdyn_presence Entity Reference - Writable attributes.
- **Queue**. To learn more about entity attributes for queue, see Queue Entity.
- **RoleBase**. To learn more about entity attributes for role base, see role EntityType.
- **Session**. To learn more about entity attributes for session, see msdyn_ocsession Entity Reference.
- **SessionParticipant**. To learn more about entity attributes for session participant, see msdyn_sessionparticipant Entity Reference.

- **WorkItem**. To learn more about entity attributes for work item, see msdyn_ocliveworkitem Entity Reference.
- **WorkStream**. To learn more about entity attributes for work stream, see msdyn_liveworkstream Entity Reference.

Configure to view intraday insights dashboard

Customize interactive dashboards that are based on Unified Interface

Article • 03/25/2022

Dashboards overview

Customer Service Hub provides a modern, intuitive, and interactive experience for managing your customer service operations. For service reps, the interactive dashboards are a one-stop workplace to see what's important and take actions.

Dashboards pull together key information, so customer service representatives can focus on what's important to them and get things done faster. The dashboards are fully configurable, security-role based, and deliver workload information across multiple streams.

For more information about dashboards, see Use interactive dashboards to effectively manage service cases in the Customer Service Hub

> ⓘ **Note**
>
> The interactive dashboards are solution aware and can be exported and then imported into a different environment as a solution. However, the queues that the streams and tiles are based on aren't solution aware. Before importing the dashboard solution into the target system, the queues must be manually created in the target system in **Settings** > **Service Management** > **Queues**. After you create the queues, import the dashboard solution to the target system, and then edit the streams or tiles that are based on the queues to assign the newly created queues appropriately.

The illustrations in this article show multistream and single-stream dashboards with the header pane. Below the header you see visual filters and streams. In the single-stream dashboard, you also see tiles. For each dashboard type, you can choose from several different layouts that are also shown. The dashboard header contains the following controls and clickable icons, from left to right: dashboard picker, refresh, visual filter icon, global filter icon, and timeframe filter.

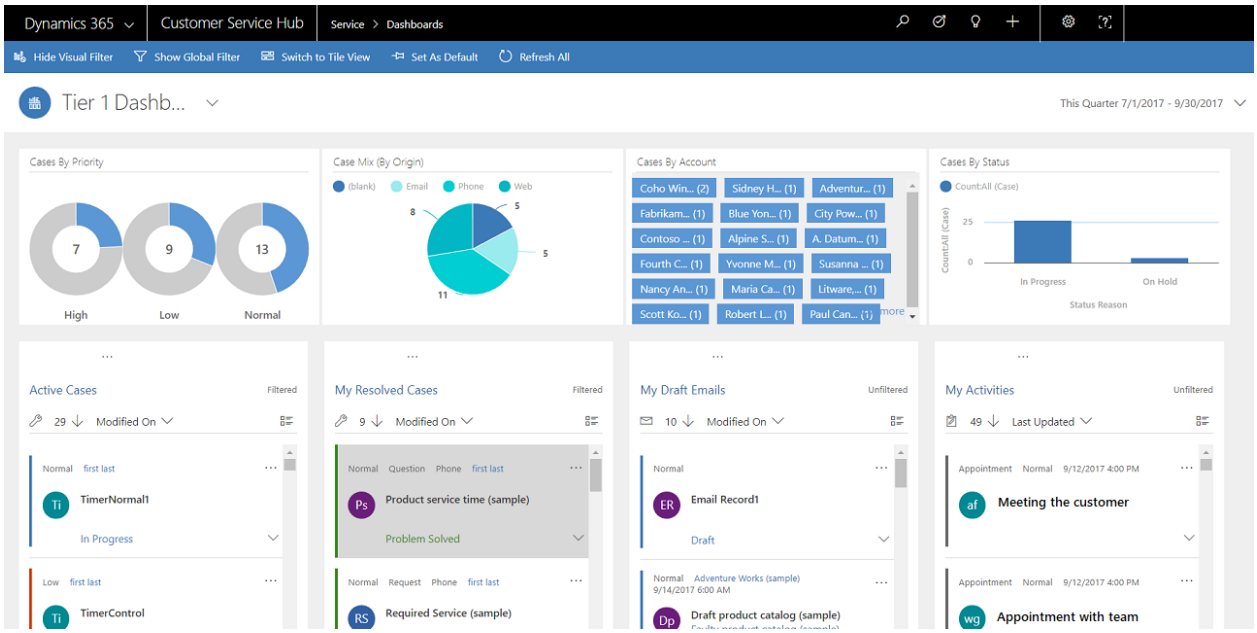
The interactive dashboards come in two flavors:

- Multistream dashboards

- Single-stream dashboards

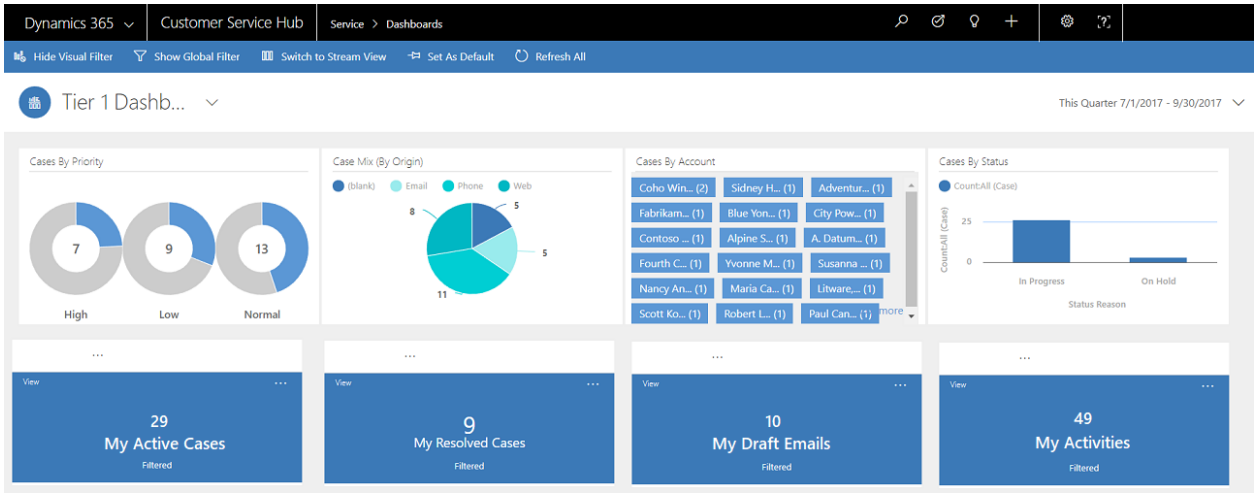
Multistream dashboard standard view

In the multistream dashboard, you see a row of visual filters at the top with the data streams below them.



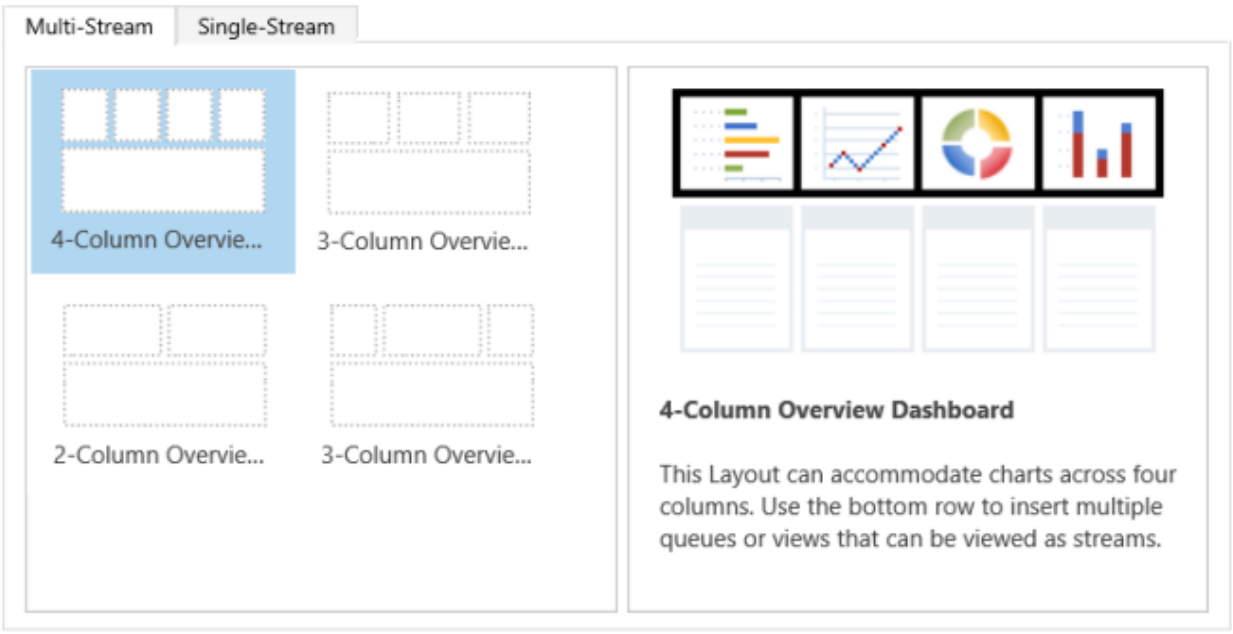
Multistream dashboard tile view

Multistream dashboard in tile view.



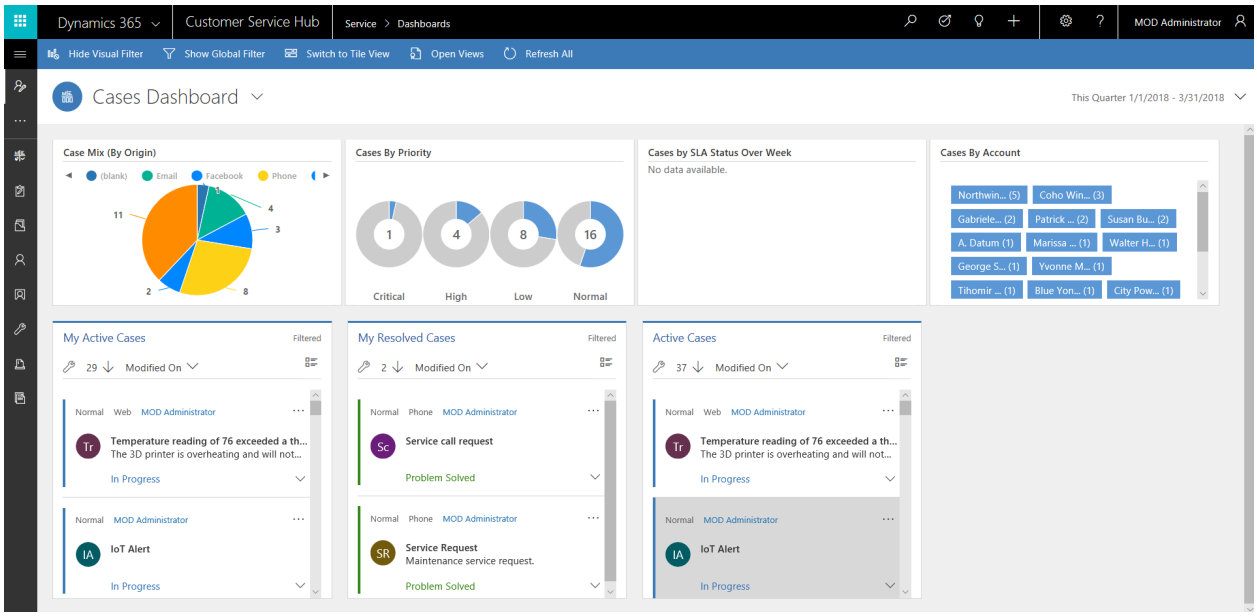
Multistream dashboard layouts

For multistream dashboards, you can choose from four different layouts.



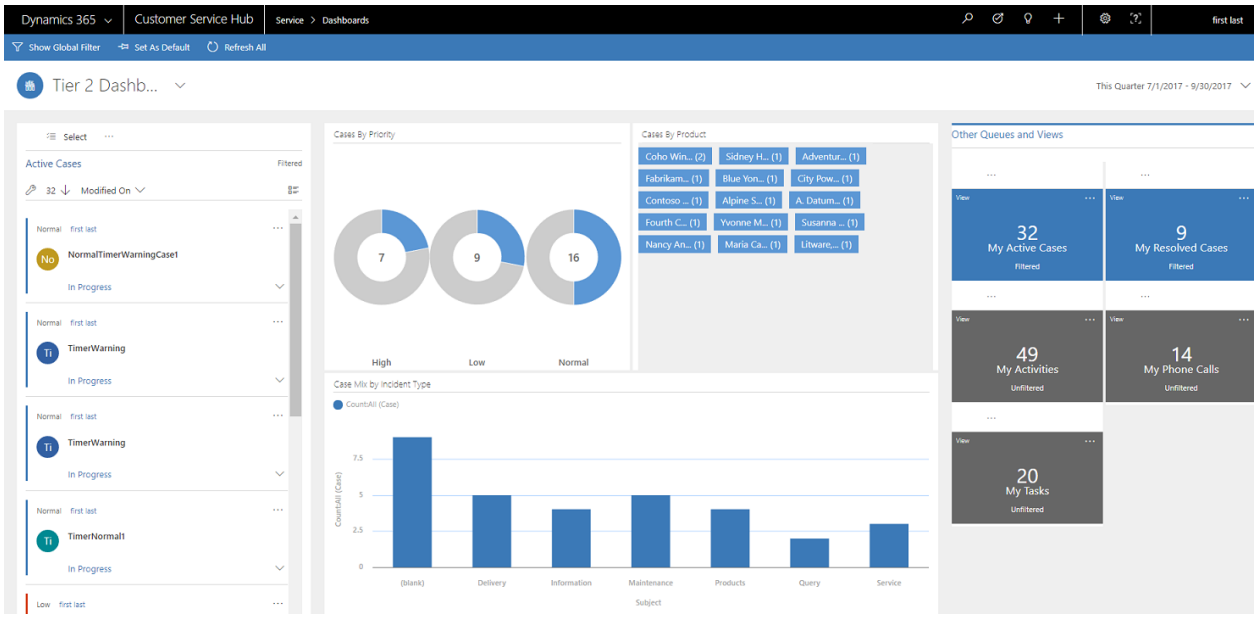
Multistream entity-specific dashboard

The entity-specific dashboard for the **Case** entity is shown here.



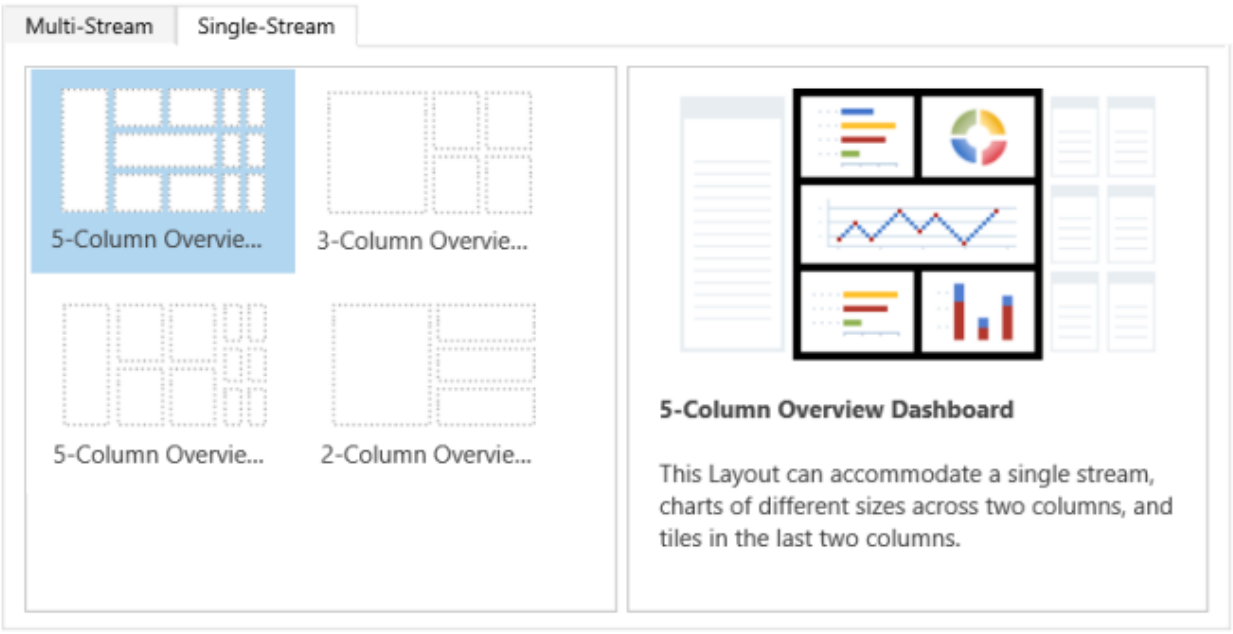
Single-stream dashboard

The single-stream dashboard contains the data stream on the left and visual filters and tiles on the right.



Single-stream dashboard layouts

For single-stream dashboards, you can choose from four different layouts.



Configure filter fields and security roles for the interactive dashboards

When you configure interactive dashboards, your first task is to enable fields and security roles, so that interactive dashboards can be configured for them. Note, that interactive dashboards are now enabled for all entities and custom entities by default.

To know more about how to enable custom entities, see Enable custom entities in the Customer Service Hub.

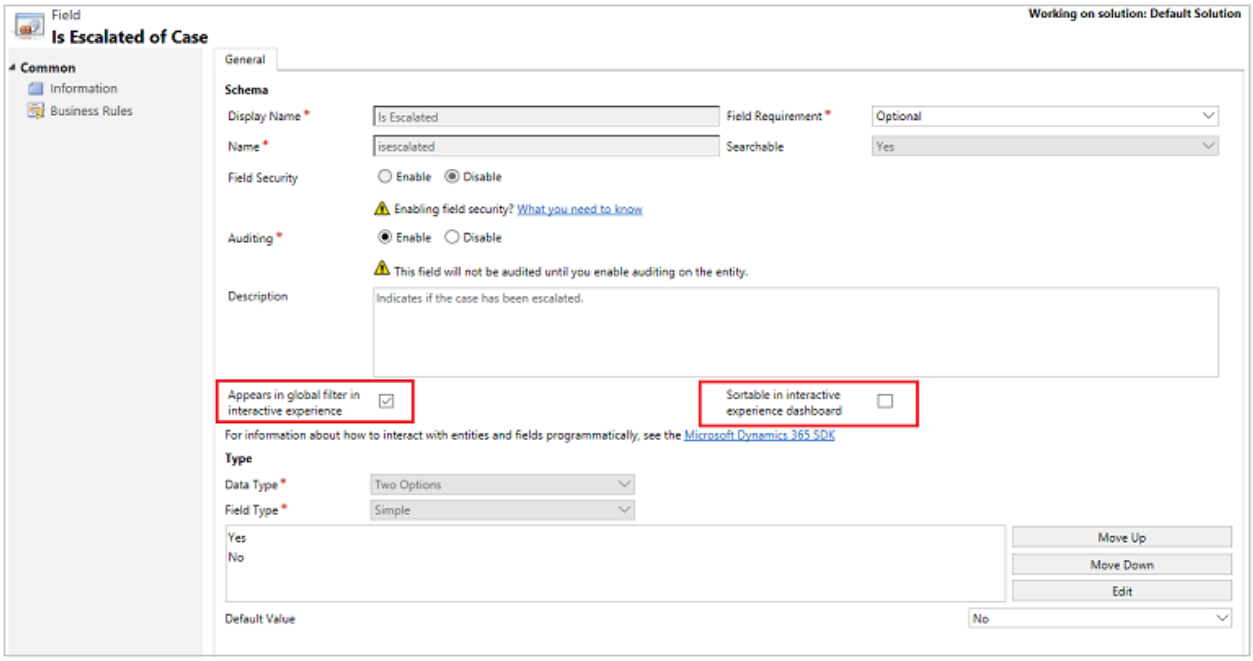
> ⓘ Note
>
> All customization tasks for the Customer Service Hub must be done in Microsoft Dataverse.

Configure filter fields

For a field to appear in the global filter and to be included in the data stream sort, you must set two flags:

- Appears in global filter in interactive experience
- Sortable in interactive experience dashboard

Refer the screen below to see the two flags enabled in the **Case** entity for the **IsEscalated** field:



Configure the flag "Appears in global filter in interactive experience"

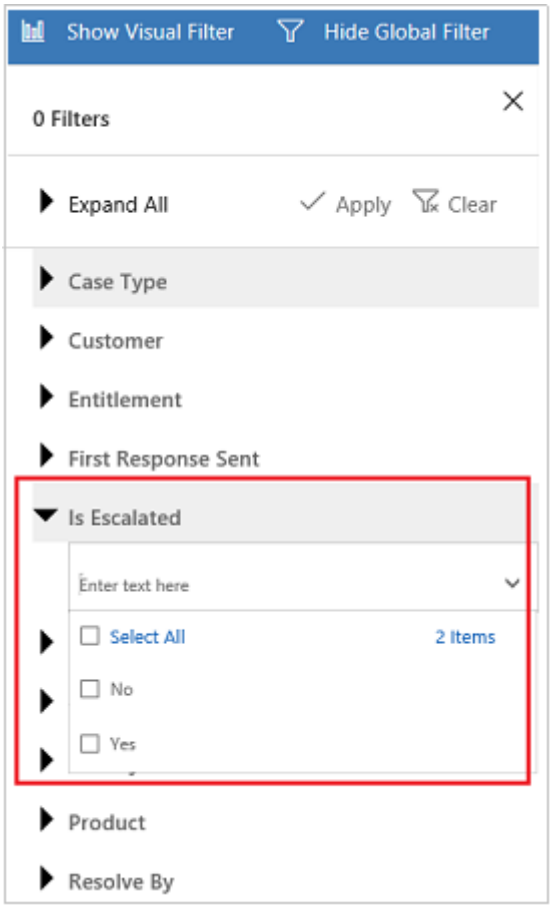
1. Go to **Settings** > **Customizations**.
2. Select **Customize the System**.
3. Under **Components**, expand **Entities**, and then expand the entity you want.
4. In the navigation pane, select **Fields** and in the grid, double-click the field you want to enable.

5. In the **General** tab, select the **Appears in global filter in interactive experience** check box. Select **Save and Close**.

6. Select **Publish All Customizations** for your changes to take effect.

The fields that you configure will appear in the global filter flyout window when the global filter icon is selected from the dashboard header. In the flyout window, the service reps can select the fields on which they want to filter globally, in charts, and also in streams and tiles that are based on the filter entity.

The global filter flyout window is shown here:



> **Tip**
>
> When you configure a visual filter based on the fields like priority or status, a best practice is to also enable these fields (priority, status) to appear in the global filter.

Configure the flag "Sortable in interactive experience dashboard"

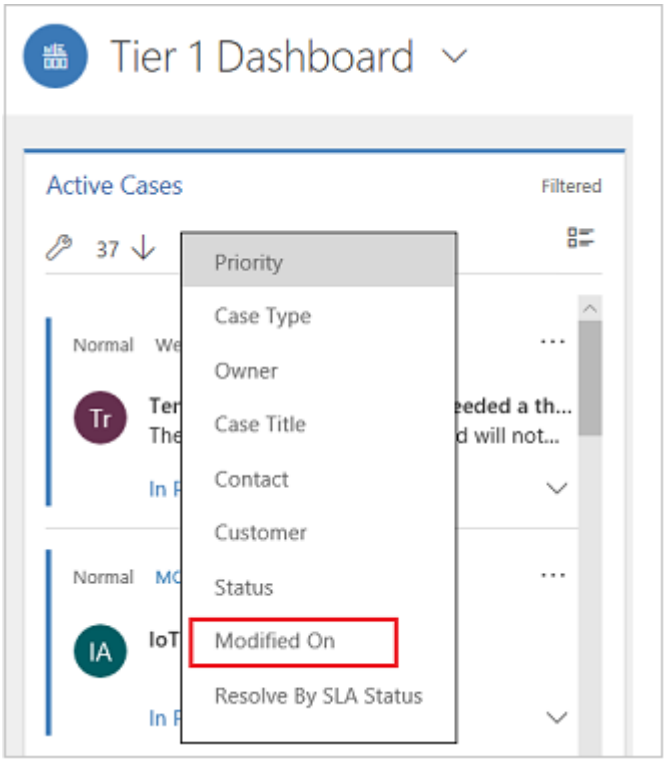
1. Go to **Settings** > **Customizations**.

2. Select **Customize the System**.

3. Under **Components**, expand **Entities**, and then expand the entity you want.
4. In the navigation pane, select **Fields** and in the grid, double-click the field you want to enable.
5. In the **General** tab, select the **Sortable in interactive experience dashboard** check box. Select **Save and Close**.
6. Select **Publish All Customizations** for your changes to take effect.

The fields that you configure for sorting will appear when you select the drop-down list on the stream header.

The following illustration shows the flyout dialog with the list of the available fields for sorting, in the drop-down list. The default sort is always set on the **Modified On** field.



Enable security roles

Select and enable security roles that will be able to view the interactive dashboards.

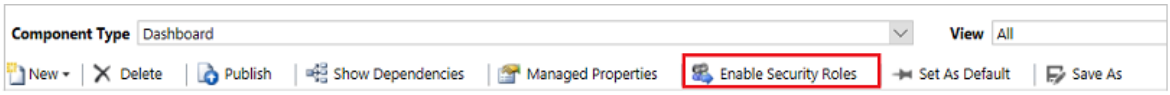
To enable the security roles

1. Go to **Settings** > **Customizations**.
2. Select **Customize the System**.
3. Under **Components**, select **Dashboards**.

4. In the grid, select the interactive dashboard you want and select **Enable Security Roles** on the task bar.

5. In the **Assign Security Roles** dialog, select the **Display only to these selected security roles** option and select the roles that you want to enable. Select **OK**.

6. Select **Publish All Customizations** for your changes to take effect.



Configure interactive dashboards

The following sections describe how to configure various types of interactive dashboards.

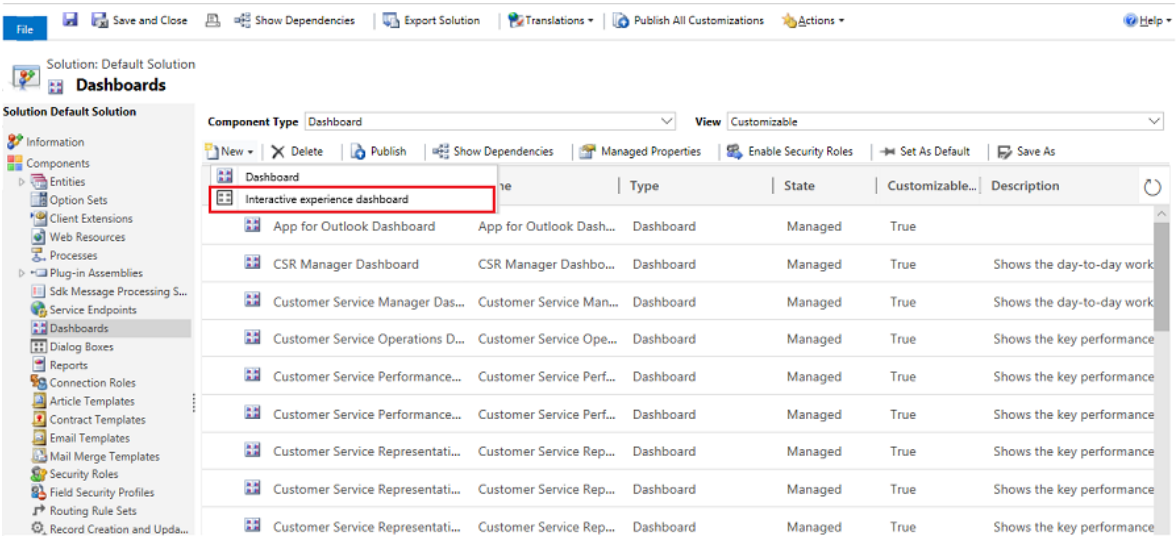
Configure a multistream interactive dashboard using the 4-column layout

1. Go to **Settings** > **Customizations**.

2. Select **Customize the System**.

3. Under **Components**, select **Dashboards**.

4. In the grid, select **New**, and select **Interactive experience dashboard** in the drop-down list, as shown below:



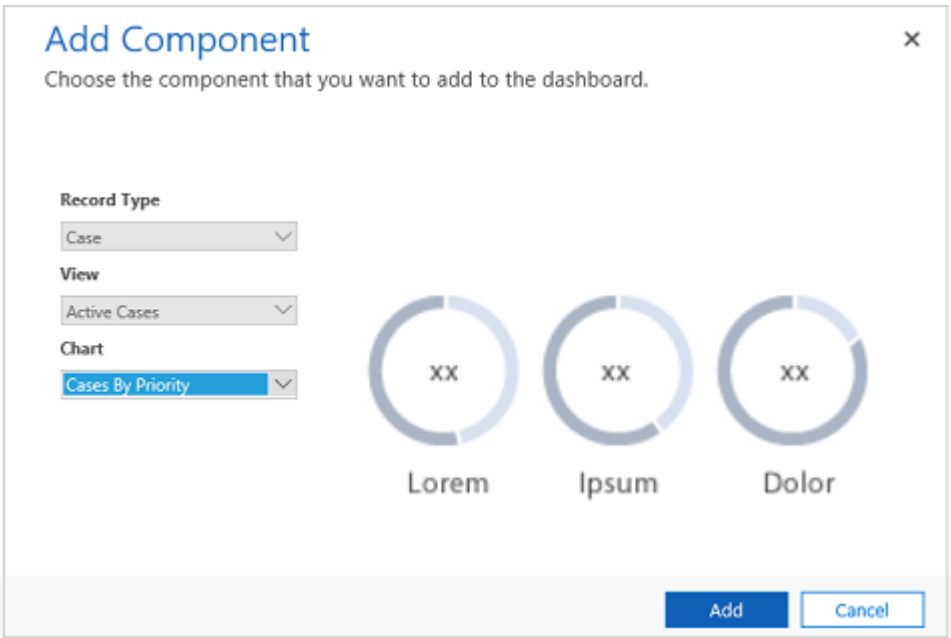
5. Choose the layout and select **Create**.

6. When the dashboard form opens, fill in the filtering information at the top of form, as shown here.

- **Filter Entity**: The visual filters and global filter attributes are based on this entity.
- **Entity View**: The visual filters are based on this view.
- **Filter By**: The field that the time frame filter applies to.
- **Time Frame**: The default time frame filter value for the **Filter By** field.

After you have specified the filtering information, start adding components for the charts and the data streams in the **Visual filters** section . To add a component, simply select the element in the center of the chart or stream, and when the dialog appears, select the required information from the drop-down, as shown in the following illustrations.

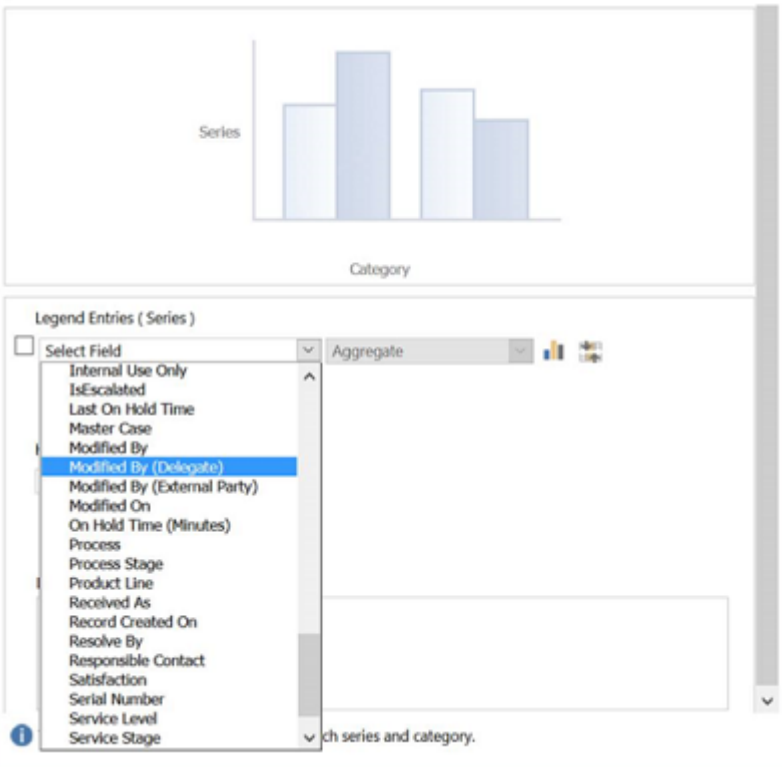
The following shows adding the **Cases By Priority** doughnut chart.



Some charts, such as bar charts or pie charts, render showing the data stored in the system. The doughnut charts and tag charts load as static images and don't show the preview of the actual data.

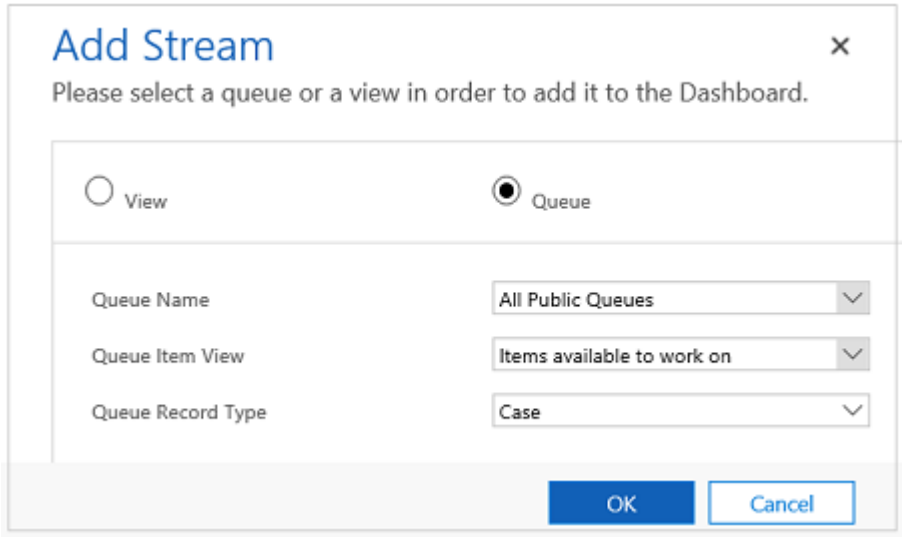
> ⓘ Note

The charts configured for the visual filters can use the fields of the **Filter** entity as well as related entities. When you use charts based on related entity fields, the customer service representatives can filter charts using these related entity fields. The fields that are based on the related entity usually have the following format in the chart configuration window: “field name (entity name)”, such as the **Modified By (Delegate)** field. To create multientity charts, you must add fields of a related entity to any of the views, and then use these fields while creating charts.



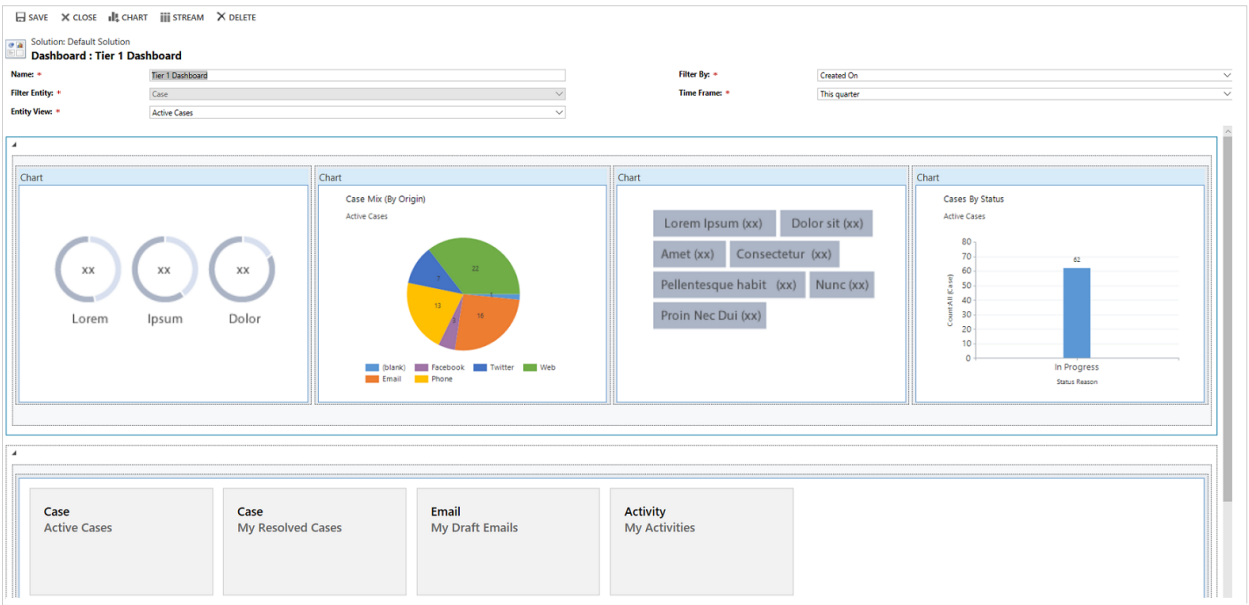
Next, configure the **Streams**. Just like with adding components in the charts, select the element inside the stream panel. When the dialog appears, select **View** or **Queue** depending on what element you want the stream to use. Enter the required information, as shown in the following illustration.

Configure the stream for the **Items available to work on** as shown here:



> **Note**
>
> The **Queue** option is available in the dialog box only for queue-enabled entities. For entity dashboards, if the entity is not queue enabled, you won't see the **Queue** option in the dialog box. You can only use the **View option** in the stream of dashboards for entities that are not queue enabled.

The following illustration is an example of a fully configured chart panel, and stream panel:



After you have completed configuring the dashboard, save it and publish the customizations for your changes to take effect.

Edit or delete individual streams of an existing dashboard

Follow the steps given below to edit individual streams of an existing dashboard:

1. Go to **Settings** > **Customizations**.
2. Select **Customize the System**.
3. Under **Components**, select **Dashboards**.

   -OR-

   If you want to edit the stream of an entity dashboard, then under **Components**, expand **Entities** and select the entity you want. Select **Dashboards** under the entity, in the navigation pane.
4. In the grid, double-click the interactive dashboard that you want to edit, to open it.
5. Select the stream that you want to edit, and then select **Edit Component**.
6. Depending on whether you want to add a view or queue to the stream, select the view or queue details for the stream, and then select **Set**.
7. Select **Save**.

   You can also delete an individual stream from a dashboard. To do this, select the stream, and then on the command bar, select **Delete**.

Configure an entity-specific dashboard

An entity-specific dashboard is a multistream dashboard. Configuring this dashboard is similar to configuring a home page multistream dashboard, but you do it in the different place in the UI and there are other minor differences.

For example, instead of selecting an entity, some fields in the entity-specific dashboard are preset to the entity for which you are creating the dashboard.

1. Go to **Settings** > **Customizations**.
2. Select **Customize the System**.
3. Under **Components**, expand **Entities** and select the entity you want. Select **Dashboards** under the entity, in the navigation pane.
4. In the grid, select **New**, and select **Interactive experience dashboard** in the drop-down list.
5. Choose the layout and select **Create**.

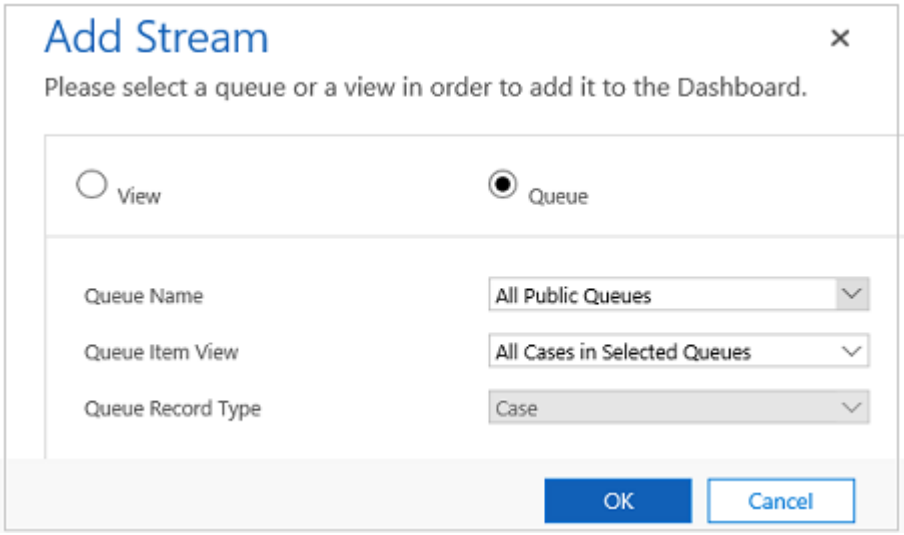
6. When the dashboard form opens, the **Filter Entity** is preset to the entity for which you are creating the dashboard. The **Entity View** drop-down list contains the available views for the entity. Select the view and fill in the rest of the required information on the page.

The rest of the setup is very similar to the home page multistream dashboard setup described in the previous section.

Configure a single-stream dashboard

Configuring a single-stream dashboard is similar to the multistream dashboard. All UI navigation steps are the same as for the multistream dashboard. You can choose a layout that includes tiles or the layout that doesn't include tiles.

If the tiles are included, they are always displayed on the dashboard. To configure a tile, you select on the icon in the center of the tile. When the **Add Tile** window opens, fill in the required data. The following illustration is an example of the tile setup.



Publish the dashboard to the app

1. In your Dynamics 365 instance, go to **Customize the System**.
2. In **Components**, select **Model-driven Apps**.
3. Double-click the app that you want to edit.
4. In the right pane of the **App Designer** window, select the dashboard to add.
5. Save and publish.

Configure dashboard colors

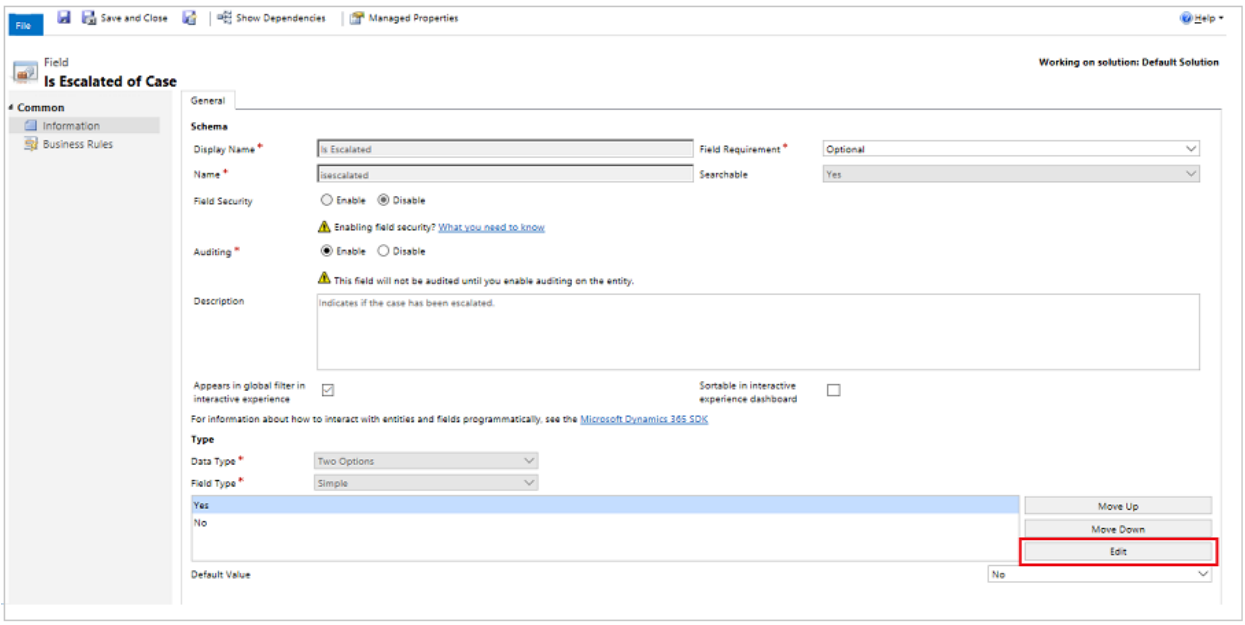
For all **Option Set** and **Two Options** type fields, such as the **Case Type**, **IsEscalated** or **Priority** of the **Case** entity, you can configure a particular color that will appear in the charts and streams for specific field values. For example, high priority cases can be shown in red, medium priority cases in blue, and low priority cases in green in the interactive charts. In the streams, there will be a thin vertical line in color next to the work item description.

> ⓘ **Note**
>
> The color coding isn't available for the tag charts and doughnut charts. These charts appear on the dashboard in white, gray, and black shades.

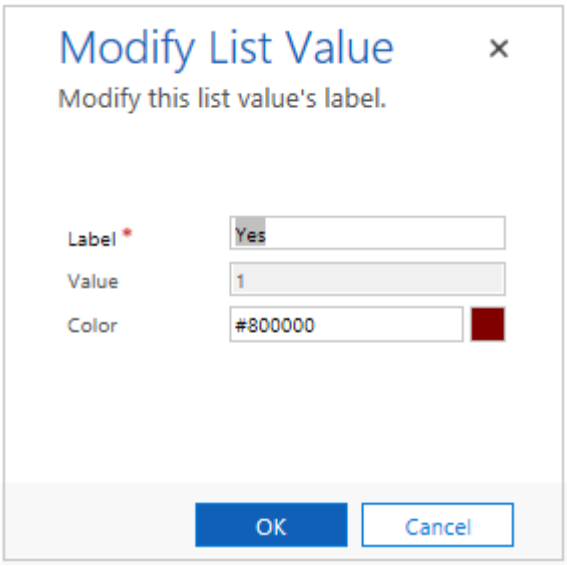
1. Go to **Settings** > **Customizations**.
2. Select **Customize the System**.
3. Under **Components**, expand **Entities**, and then expand the entity you want.
4. In the navigation pane, select **Fields**. In the grid, double-click the field that you want to configure the color for.
5. In the **General** tab, in the **Type** sub-area, select **Yes** and select **Edit**.
6. When the **Modify List Value** dialog appears, set the new value in the **Color** text box. Select **OK**.

   Select **Save and Close**.
7. Select **Publish** for your changes to take effect.

In the following example, we're changing the color for the **IsEscalated** field. Use the **Edit** button to open the **Modify List Value** dialog box:



When the **Modify List Value** dialog box opens, choose the color as shown here:



Similarly, if you go to the **Priority** field to modify the colors of the case priority options, choose the color in the **Options** sub-area of the **General** tab, as shown below:

Overview of Service Scheduling

Article • 09/18/2023

Avoid disruptions in service by making sure that your resources are scheduled optimally and efficiently. Using Scheduling in Customer Service Hub, you can plan and schedule service activities for your customers by bringing together all your resources.

Understand the scheduling experience

Scheduling, which is built on top of **Universal Resource Scheduling (URS)**, provides an efficient way to schedule resources for service activity. It considers the availability of employees, facilities, and equipment to plan schedules accordingly. It also helps customer service organizations with improved service quality by preventing over-scheduling.

Scheduling scenario

The following scenario helps to understand how the scheduling capability lets you manage your service activities seamlessly:

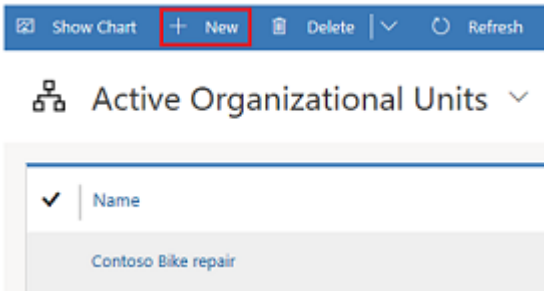
Contoso bike repair schedules repair services for their customers. To facilitate this process, Contoso needs to bring together the following information:

- Geographical locations where they need to offer their services.
- The personnel and equipment they need to perform those services.
- The types of bike repair services they offer.
- Work hours during which they perform their services.
- Capacity and expert level for all personnel.

Contoso can benefit from the scheduling feature by quickly catering to their customers with their repair services. With the various scheduling entities, they can plan service activities for their customers by considering the availability of resources, facilities, and equipment.

Let's see how Contoso accomplishes the task:

Step 1: Create organizational units
Organizational units are the locations where Contoso provides service to their customers. More information: Create and manage organizational units

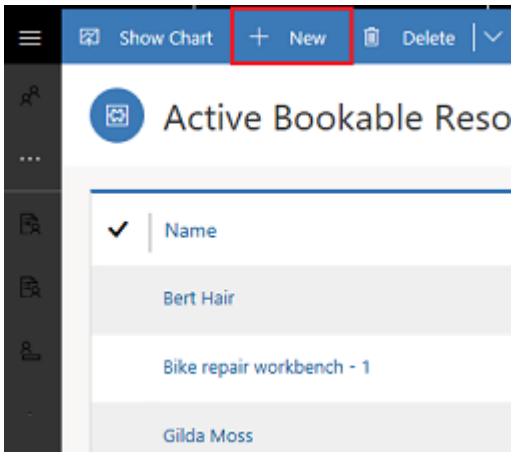


Step 2: Create resources

Contoso lists the resources required to perform the services.

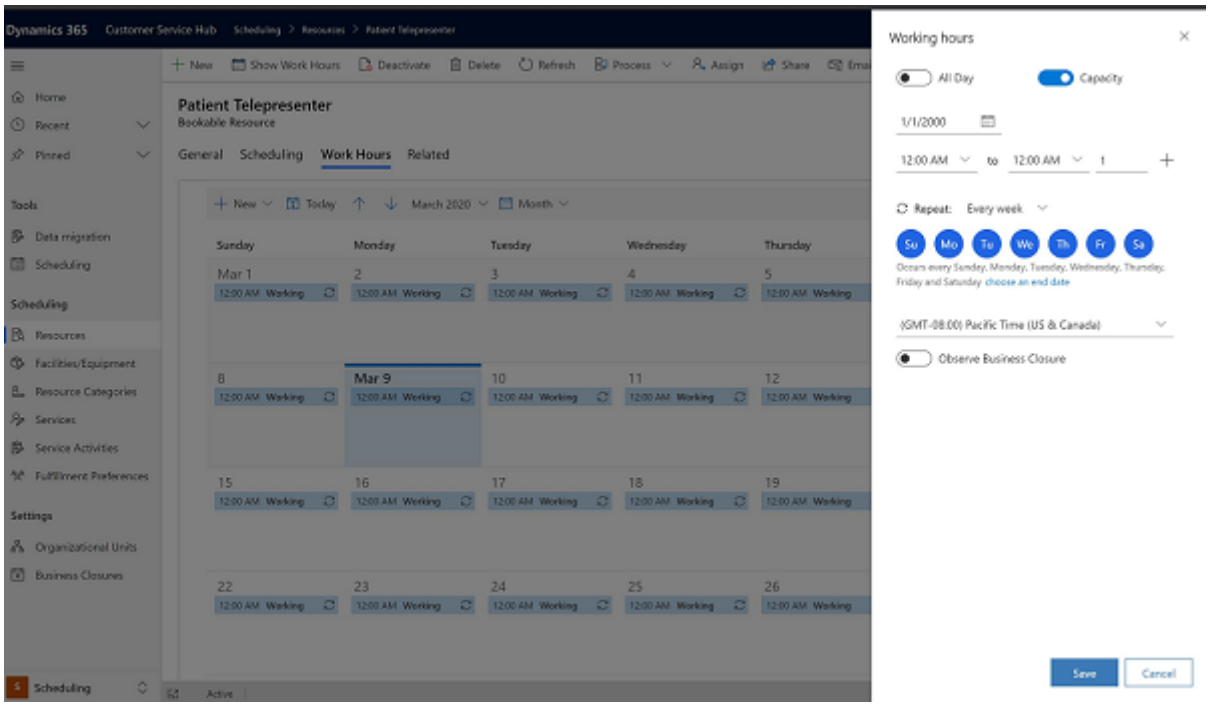
> **Note**
>
> You can create all resource types using the Resource entity.

In this example, two resources (contacts) Bert Hair and Gilda Moss are created. Similarly, two more resources (facility/equipment) are created as Bike repair workbench - 1 and Bike repair workbench - 2, which are required to perform the service. More information: Create and set up bookable resources



Step 3: Set work hours for the resource, resource group or facility/equipment

The availability of the resources is defined in the work hours section. More information: Set work hours for the resources

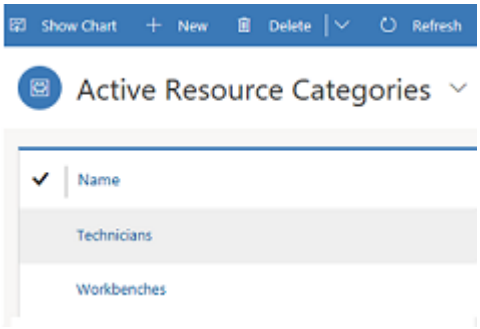


Step 4: Create resource groups

The resources are aligned in resource groups or resource categories.

In the example, Bert Hair and Gilda Moss are grouped as Technicians and Bike repair workbench - 1 and Bike repair workbench - 2 are grouped as Workbenches.

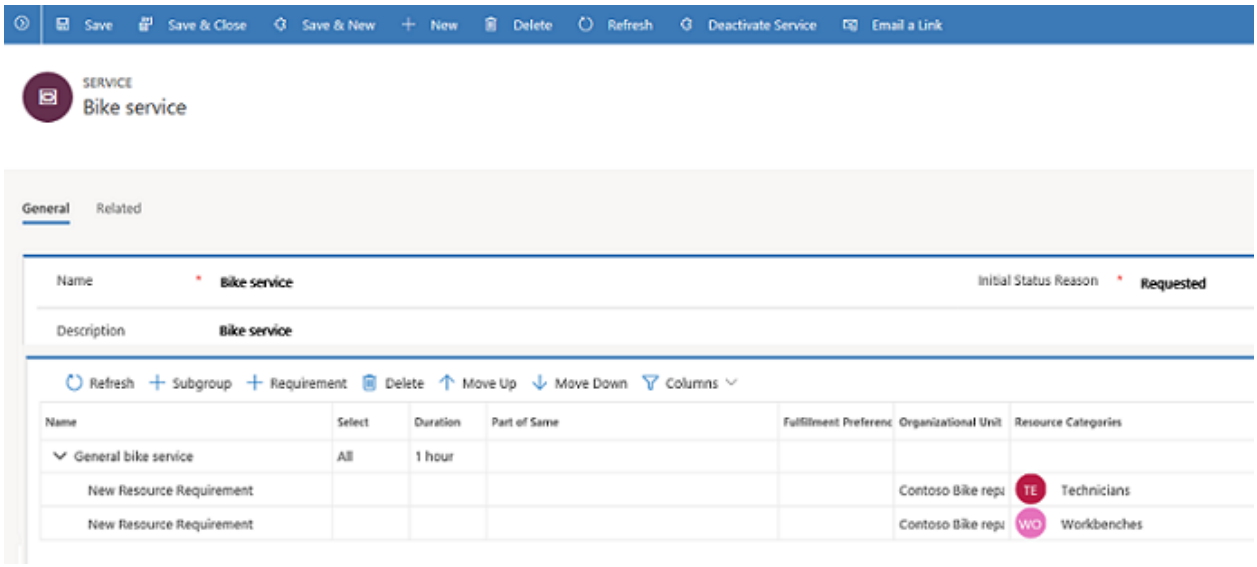
More information: Create and manage resource categories



Step 5: Create a service record

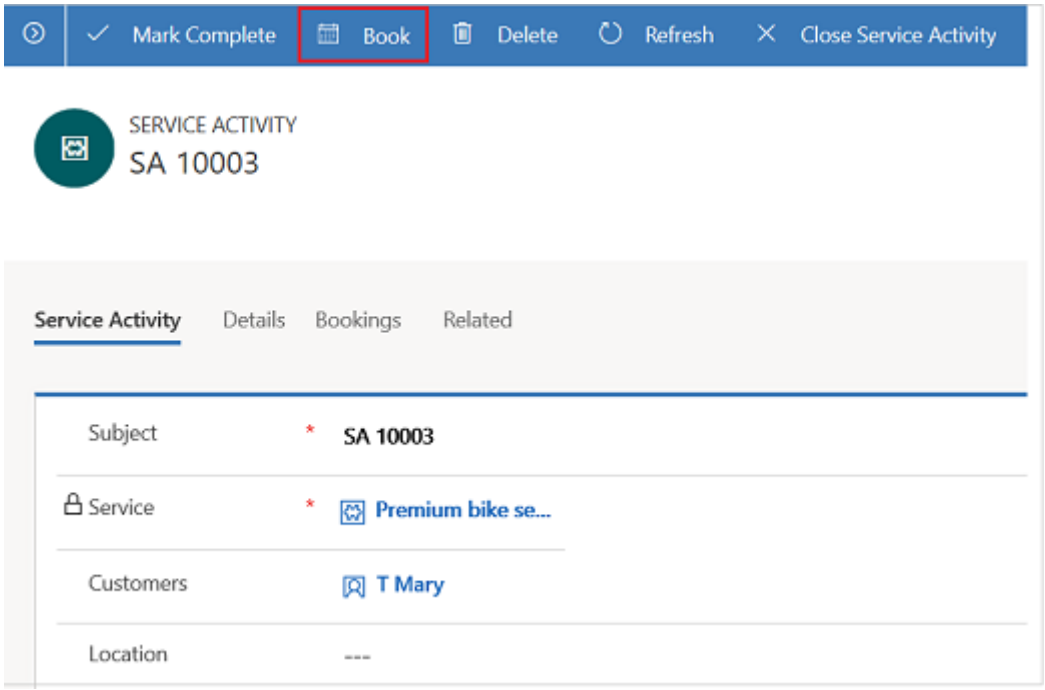
Contoso now collates all the above inputs to create a bike repair service record for the customer. They also specify the resources/resource groups they will need for the service.

More information: Create or edit a service in Service Scheduling



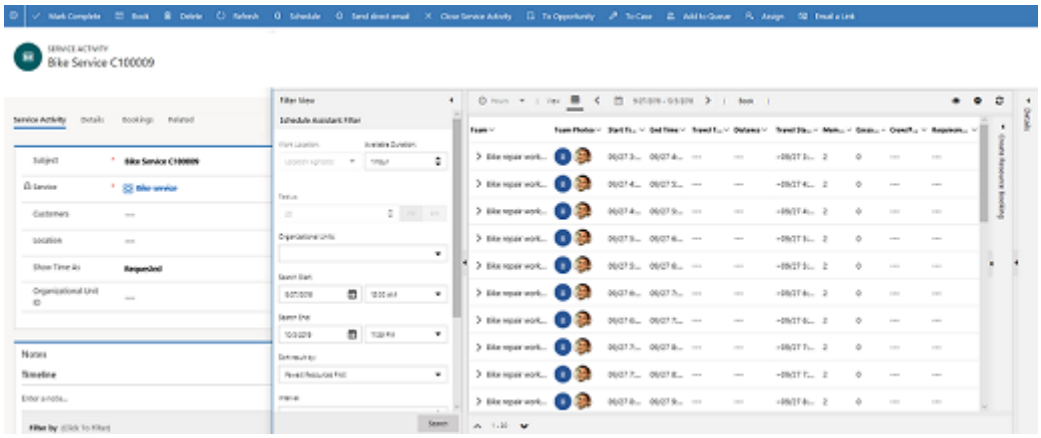
Step 6: Create a service activity

A service activity is defined to look for the next available time slot to schedule the service and align resources as per requirement. More information: Schedule a service activity



Step 7: Book the service in the schedule board

The schedule board displays all the service configurations at one place to quickly schedule a service. More information: Use the schedule board to configure service activity



Set up the Service Scheduling experience

The set up experience is different based on the following scenarios:

- For new or existing organizations, where Core Service Scheduling solutions isn't installed, install Service Scheduling from the Power Platform admin center.
- For existing organizations, where Core Service Scheduling solutions is already installed, install the available updates by checking your app status from the Power Platform admin center.

Prerequisites

- Make sure that you have the required security role or equivalent permissions. More information: Manage security roles in service scheduling
- Ensure your organization has Universal Resource Scheduling 3.2.0.405 or a later version. If your organization has a version prior to 3.2.0.405, then Universal Resource Scheduling installation fails. To check the Unified Resource Scheduling version on your instance, go to **Settings** > **Solutions**.

  More information: Schedule anything with Universal Resource Scheduling (Sales, Customer Service, Field Service, Project Service Automation).

  > ⓘ **Note**
  > - If your organization doesn't have Universal Resource Scheduling, the **Core Service Scheduling** solution installs the latest version of Universal Resource Scheduling.
  > - If Field Service or Project Service is already installed on your organization with Universal Resource Scheduling 3.2.0.405 or later version, then

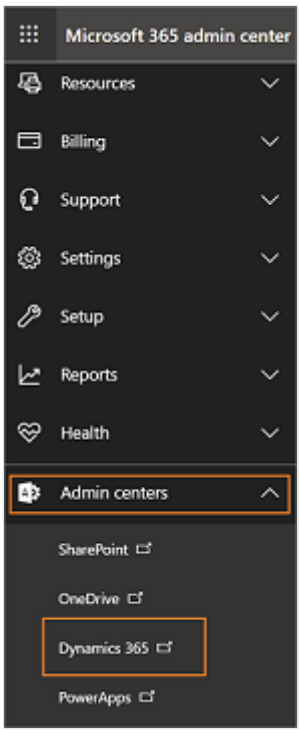
Universal Resource Scheduling will also be upgraded to the latest version. Otherwise, the installation fails.

- The latest version of Universal Resource Scheduling might not be compatible with the older versions of Field Service or Project Service.

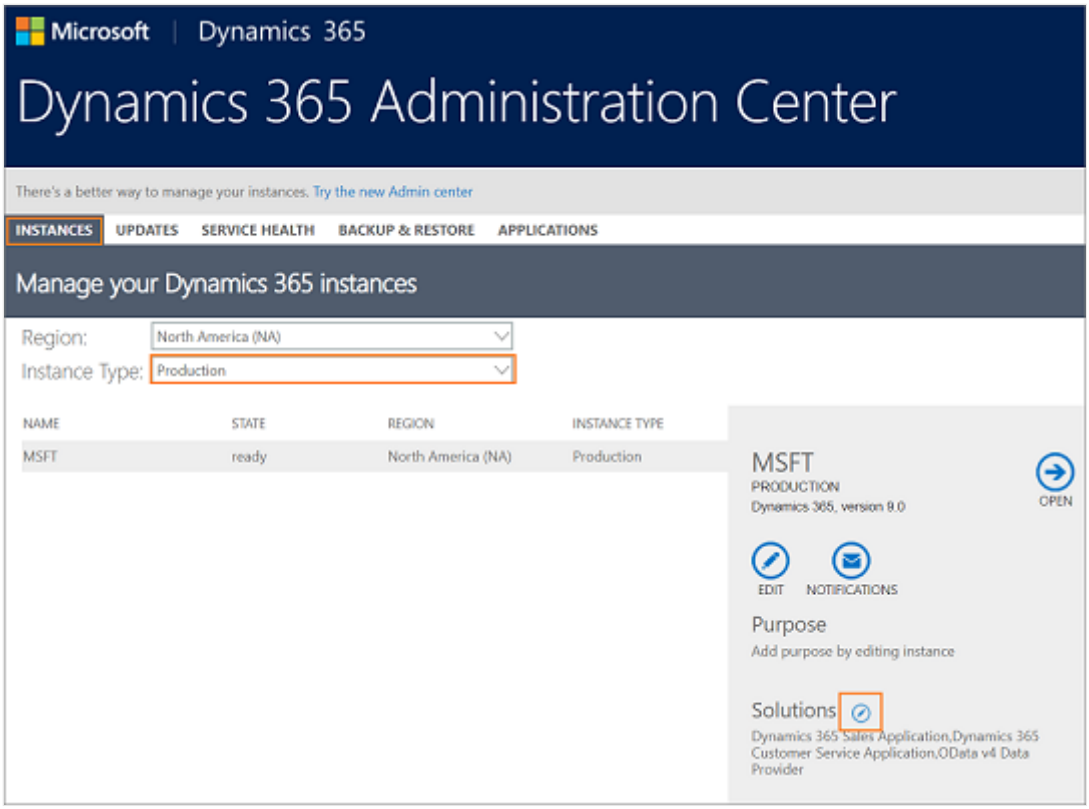
- Ensure your organization has Customer Service Hub application.

Install the Scheduling solutions

1. Go to Microsoft 365 Admin center.
2. Select **... Show all** > **Admin centers** > **Dynamics 365**. Dynamics 365 opens in a new tab.

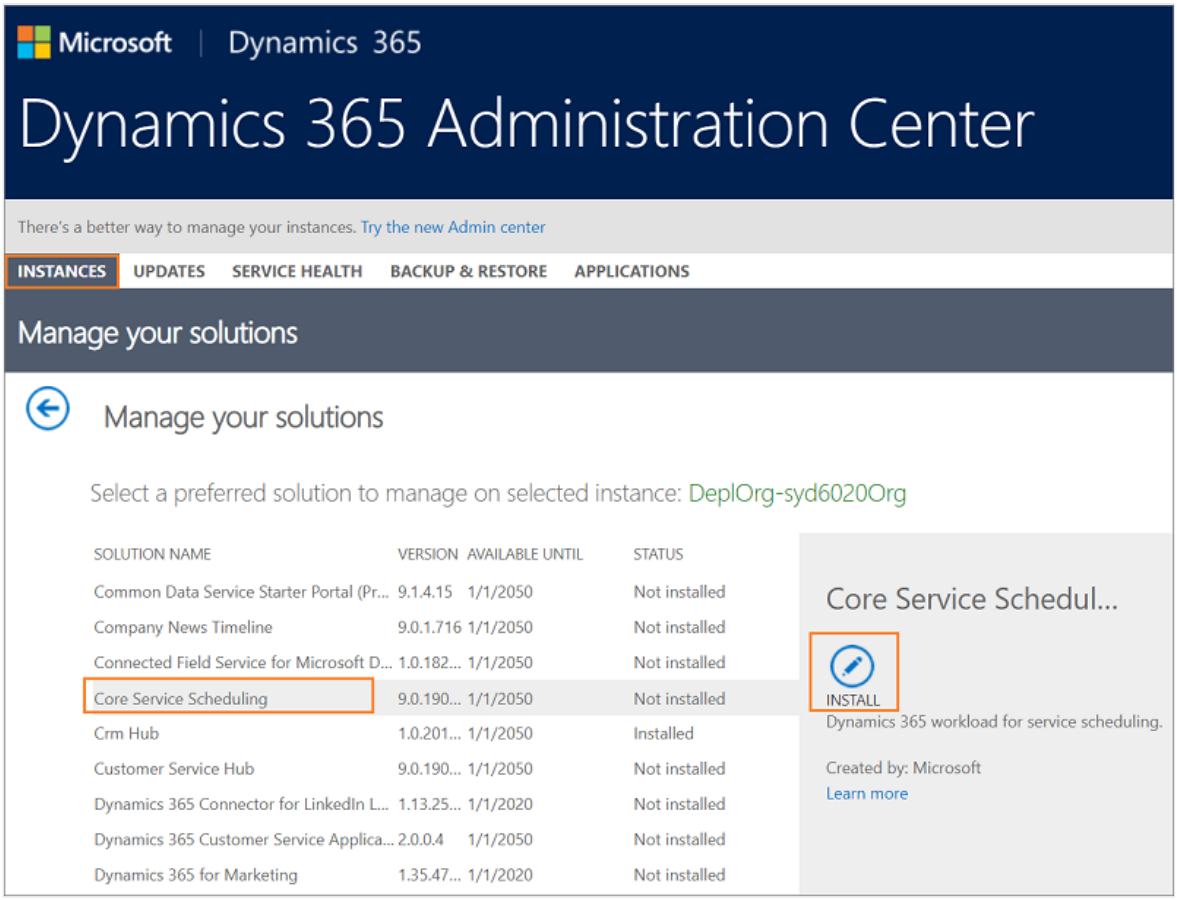


3. In the **Dynamics 365 Administration Center**, under the **Instances** tab, select an instance type from the drop-down.
4. select the edit icon next to solutions. Manage your solutions page appears.



5. In the **Manage your solutions** page, select **Core Service Scheduling**. The status column shows **Not installed**.

6. Select the install icon next on the **Core Service Scheduling** card. The **Terms of service** page appears.



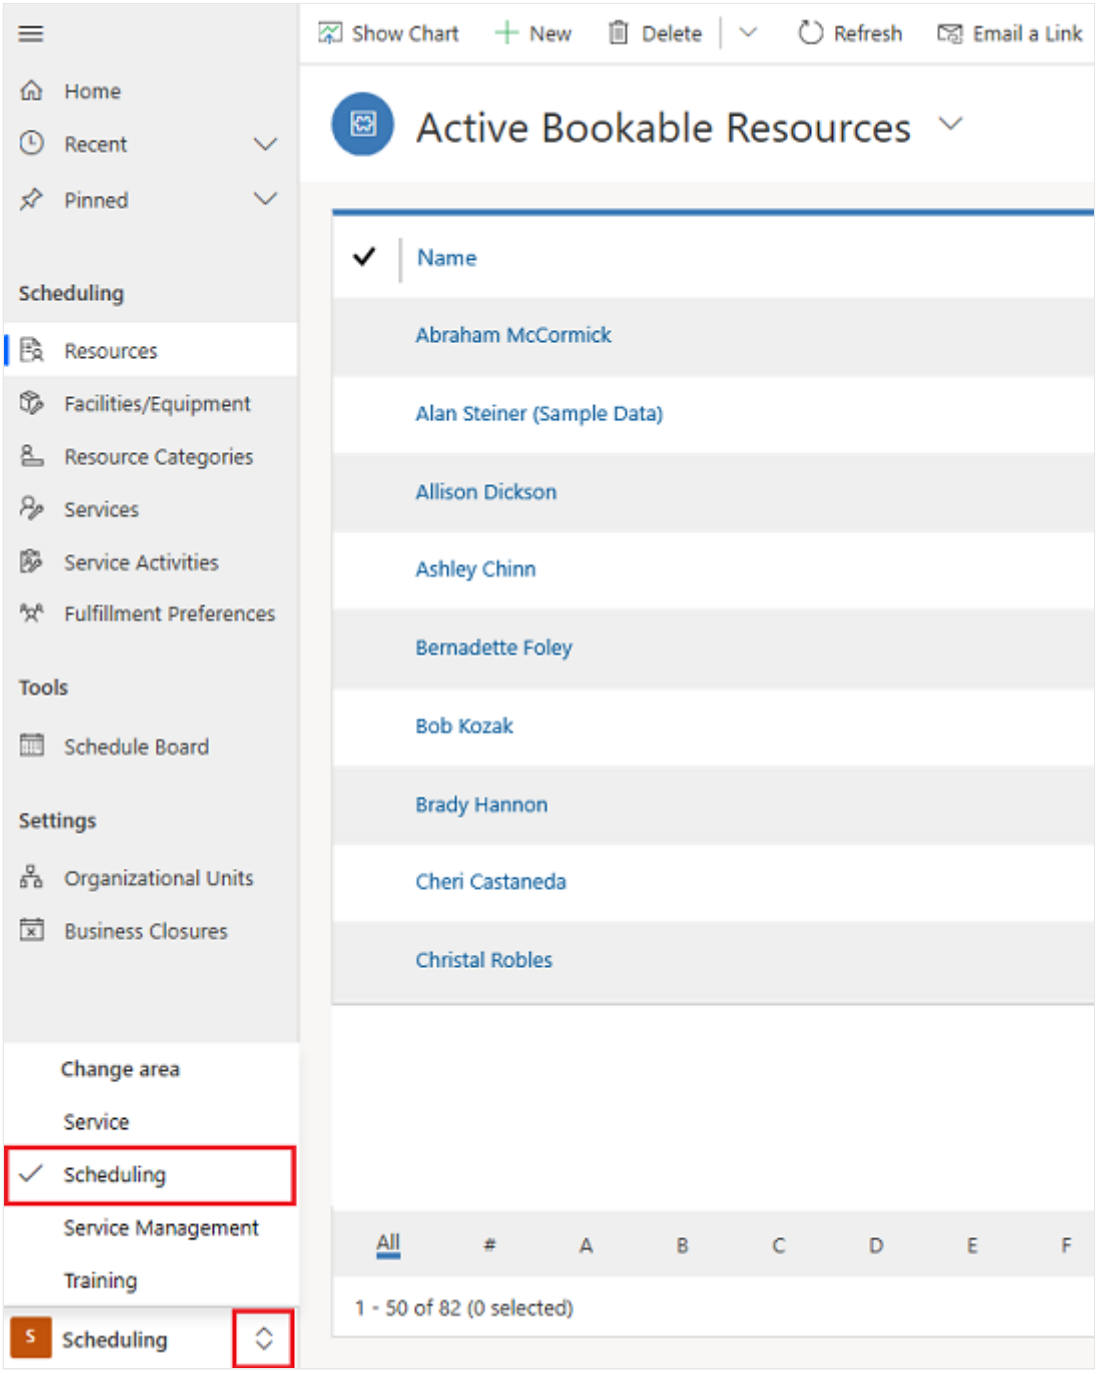
7. In the **Terms of service** page, read the terms and conditions and then select **install**. The installation may take few minutes.

After successful installation, you can access scheduling in the Customer Service Hub sitemap.

Access scheduling in the Customer Service Hub

With the latest release of Dynamics 365 Customer Service, Scheduling is powered by Universal Resource Scheduling, and is available from the Customer Service Hub sitemap.

- Select ⇕ to go to **Scheduling** and access the entity record types.



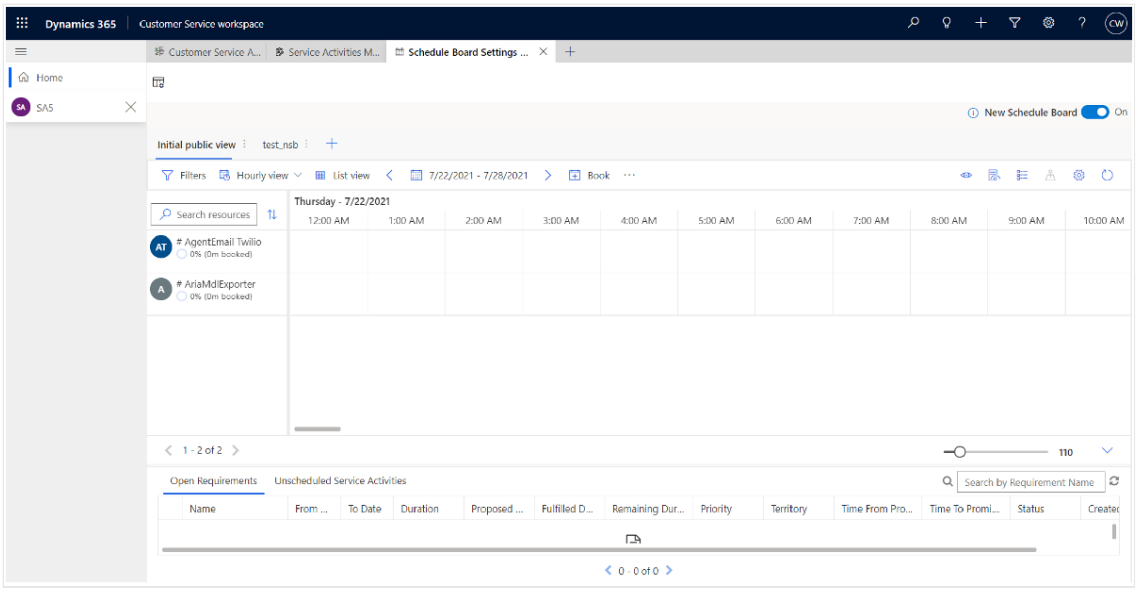
Access scheduling in Customer Service workspace

You can also access Scheduling in the Customer Service workspace app.

- Select the + icon to expand the menu to view a list of forms, views, and activities, and then select either **Service Activities** or **Scheduling** to open the feature in a new tab.

  - **Service Activities**

  - **Scheduling**



Configure entity records in the new scheduling experience

Configure all your entity records in the new experience manually from the user interface.

Make sure that you have the correct security role or equivalent permissions. Know more about security roles: Manage security roles in service scheduling.

> **ⓘ Important**
>
> The admin must follow the order as given in the **Scheduling scenario** while configuring entity records in the new scheduling experience.

> **ⓘ Note**
>
> All entity records can be configured from the user interface except Service Activity.

Understand scheduling entities

Scheduling entities are grouped under the following logical groups:

Scheduling

- **Resources**
  Anything that needs to be scheduled can be termed as **Resources**. This can be personnel, crews, service centers, company assets (equipment), accounts, or contacts.

More information: Create and set up bookable resources

- **Facilities/Equipment**
  Facilities and equipment are resources you'd use to perform services for your customers. Facilities can be physical spaces like service bays or conference rooms and equipment could be tools or other assets.

  More information: Add facilities and equipment to schedule service

- **Resource Categories**
  With Resource categories, you can group your bookable resources by type. For example, you can create categories like technician, supervisor, subcontractor, vehicle, or equipment.

  More information: Create and manage resource categories

- **Services**
  To make scheduling services quick and easy, it's helpful to predefine the specifics of the services you'd provide to customers.

  More information: Create or edit a service

- **Service Activities**
  Create a service activity by finding the next time resources are available for a service.

  More information: Schedule a service activity

- **Fulfillment Preferences**
  Choose and customize how to display schedule assistant results, like with neat hourly appointments or morning and afternoon time windows.

  More information: Fulfillment preferences

Tools

- **Schedule Board**
  The Dynamics 365 Customer Service schedule board provides an overview of resource availability and bookings you can make.

  More information: Use the schedule board to configure service activity

Settings

- **Organizational Units**
  Your company organizes its business by geography, function, or other areas. You

can create organizational units that reflect your business.

More information: Create and manage organizational units

- **Business Closure**
  Prevent scheduling resources on holidays and other non-working days by defining business closures.

  More information: Set when your business is closed

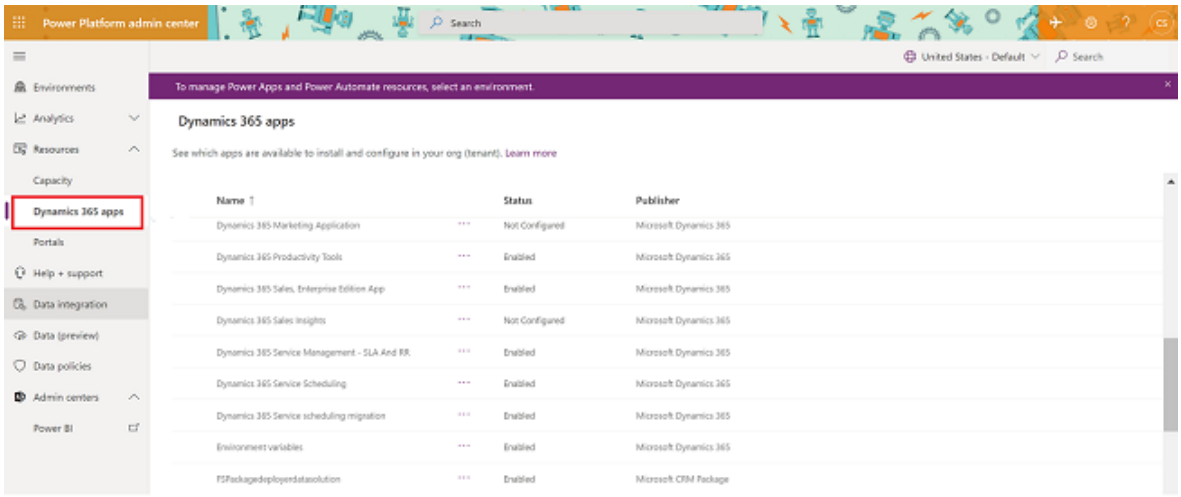
Service Scheduling FAQ

Install Service Scheduling from Power Platform

Article • 07/07/2021

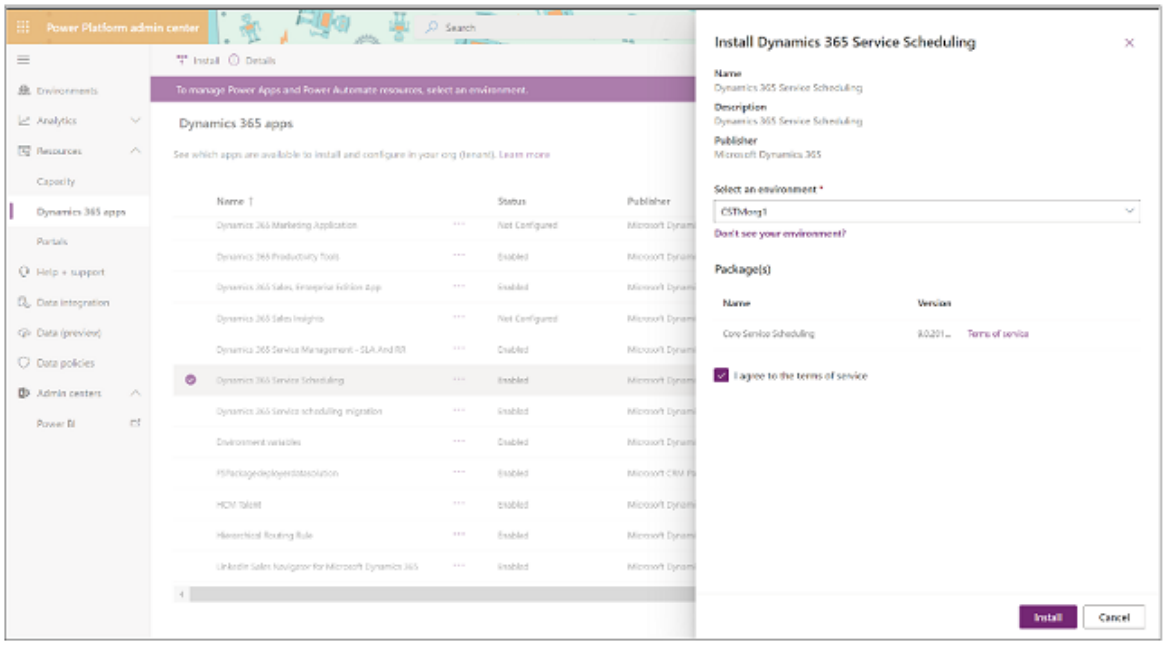
You can install Core Service Scheduling from the Power Platform admin center by using the following steps:

1. Expand **Resources**, and then select **Dynamics 365 apps**.



2. Under the list of application names, select **Dynamics 365 Service Scheduling**, and then select **Install**.

3. Select the environment where you would like to install the latest app (the installation will start with the dev environment. Once the dev instance succeeds, it will change to test and then production.



4. If you agree to the terms and conditions, select the checkbox next to **I agree to the terms of service**, and then select **Install**.

Manage security roles in service scheduling

Article • 07/14/2021

Security roles help to identify the privileges a user can exercise in the system. Security roles also define which entities a user can view or configure. For example, a user may have permission to see accounts but cannot see specific fields of an account.

The following standard security roles are leveraged in service scheduling:

- **Scheduler Manager**. This role can set up the service scheduling experience. This role can access and set up all service scheduling entities in the system:
  - Resources
  - Resource Categories
  - Facilites/Equipment
  - Services
  - Service Activities
  - Schedule Board
  - Organizational Units
  - Business Closure

  However, to ensure that all Scheduler Managers are able to set up the new scheduling experience and access the new scheduling entities, they should also be assigned the **Customer Service Schedule Administrator** and **Schedule Manager** roles.

  To learn more about how to create users and assign roles to them, see Create users and assign security roles.

- **Scheduler**. This role can create and schedule service activities.

  To ensure that all Scheduler users are able to schedule services using the new scheduling experience, they should also be assigned the **Customer Service Scheduler** and **Scheduler** roles.

More information: Security roles and privileges

Understand roles and their privileges

Each role in the scheduling experience is expected to perform a set of actions. Refer the table below to learn more about the privileges of the Schedule Manager and Scheduler

role:

Role	Privileges
Schedule Manager	Can create, access, and perform CRUD operations on Services
	Can create, access, and perform CRUD operations on Service Activities
	Can access Schedule Board
	Can create and access Facilities and Equipment
Scheduler	Can create, access, and perform CRUD operations on Service Activities
	Can access Schedule Board
	Can create and access Facilities and Equipment

Create or edit a security role to manage access

Create and manage organizational units

Article • 04/04/2022

Introduction

Create organizational units to organize and maintain a company's business by geography, function, or other areas. You can create multiple organizational units in Service Scheduling to categorize your business by various areas.

Create a new organizational unit

Make sure that you have the required security role or equivalent permissions.

More information: Manage security roles in service scheduling

You can create a new organizational unit in the Customer Service admin center or Customer Service Hub app.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Service Scheduling** in **Operations**. The **Service Scheduling** page appears.

   b. In the **Organizational units** section, select **Manage**.

      The **Active Organizational Units** view is displayed. You can switch between various system views using the drop-down list.

2. On the command bar, select **New** to create a new organizational unit.

3. In the **General** section, type a **Name** for the organizational unit.

4. In the **Scheduling** section, Provide **Latitude** and **Longitude** for the organizational unit.

5. Select **Save** to save the new organizational unit. The new record is saved and activated by default.

Active organizational units can be edited, assigned, shared, or viewed from the **Active Organizational Units** system view.

Set when your business is closed

Article • 04/04/2022

Introduction

Prevent scheduling resources on holidays and other nonworking days by defining business closures in Dynamics 365 Customer Service. You can set both the days and times that your organization will be closed.

Schedule a new business closure

Make sure that you have the required security role or equivalent permissions.

More information: Manage security roles in service scheduling

You can schedule a business closure in the Customer Service admin center or Customer Service Hub app.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Service Scheduling** in **Operations**. The **Service Scheduling** page appears.
   b. In the **Business closure** section, select **Manage**.

   The **Business Closures** view is displayed. You can switch between various system views using the drop-down list.

2. On the command bar, select **New** to schedule a new business closure.

   You can also select **New** from the business closure grid to create a new business closure record.

   A quick create dialog box is displayed.

3. In the **Schedule a Business Closure** dialog box, type or modify information in the text boxes:

   - In the **Name** box, type a name that describes the purpose of the closure.

The first 12 characters of the name appear on each day of the closure on the calendar view of the affected resource's **Work Hours**.

- If the closure is an all-day event, select the **All Day Event** check box. The application automatically enters the duration of *one day*.
- In the **Start Time** and **End Time** boxes, enter the start and end date and time for the closure.
- If you want to enter duration instead of an end time, select the length of the closure in the **Duration** box. The application automatically calculates the end time for you.

  If you want to enter a specific time period, clear the **All Day Event** check box. You can then specify the hours during which your organization will be closed.

4. To save this business closure, select **OK**.

Enable an entity for resource scheduling

Article • 06/22/2023

Enabling an entity for scheduling allows agents to schedule the requirements related to that entity to the matching resources.

Prerequisites

You must have the System Administrator role to enable an entity for scheduling.

Enable an entity for resource scheduling

1. In **Resource Scheduling**, change to the **Settings** area, and then under **Scheduling**, select **Administration** > **Enable Resource Scheduling for Entities**.
2. In the **Enable New Entity** section, under **Add Entity**, select an entity from the list.

   > **Tip**
   >
   > If the entity you want to enable doesn't show in the list, update the **Can be customized setting** to **True** for the managed property.

3. For **Booking Relationship** and **Requirement Relationship**, select **Create New Relationship**. Select an existing relationship if you've previously created relationships to the bookable resource booking or resource requirement entities.
4. Select **Publish Customization**.

Disable resource scheduling for an enabled entity

To turn off scheduling for a previously enabled entity, select **Deactivate** in the ribbon on the **Booking Setup Metadata** record of the enabled entity.

Edit settings for enabled entities

If you want to change the booking settings for entities you enabled for scheduling, complete the following steps.

1. In **Resource Scheduling**, change to the **Settings** area, and then in **Scheduling**, select **Administration** > **Enable Resource Scheduling for Entities**.

2. In the **Enabled Entities** section, double-click the entity you want to edit. A new tab with the booking setup metadata for the selected entity is opened.

Setting	Effect	Value
Default booking duration	Defines the default duration of a new booking.	Predefined set of duration options.
Default booking committed status	Sets the default value to use when a booking moves into Committed state.	Available booking statuses.
Default requirement active status	Sets the default value to use when a requirement moves into Active state.	Available requirement statuses.
Default requirement canceled status	Sets the default value to use when a requirement moves in Canceled state.	Available requirement statuses.
Resource availability retrieval limit	Defines the maximum number of resources returned as a result of the scheduling assistant.	Number.
Enable quick book	Use the quick book experience on an entity record.	Yes: Use quick book experience. No: Use schedule assistant experience.
Cancel bookings when moving	Cancel bookings moving the booking to a different time slot.	Yes: Cancel booking and create a new one in the updated time slot. No: Keep booking and update start/end time.

Setting	Effect	Value
Default booking canceled status	Sets the default value to use when booking moves into Canceled state.	Available booking statuses.
Disable requirement auto creation for bookings	Defines if the system creates a requirement for a booking	Yes: Disable automated requirement creation. No: Enable automated booking creation.
Default requirement completed status	Sets the default value to use when a requirement moves into Completed status.	Available requirement statuses.
Available duration minimum (%)	Defines the availability of a resource in relation to the booking duration. For example, if the value is 50 and the booking takes four hours. The system only considers resources for the job that have at least two hours available.	0 to 100.

3. In the **Attribute Mapping** section, choose values on the target entity that match with the requirement fields.

4. Save your changes. You've successfully enabled an entity for scheduling when:

    - **Resource Requirements** shows as a related entity. Create them manually or with a custom workflow.
    - The **Book** option appears on the entity record.

Add a requirement view to the schedule board

After you create a requirement for the lead, it will appear in the **Open Requirements** view in the lower pane of the schedule board that shows all open requirements related to any schedulable entity. This is a default view for resource scheduling. However, the views in the lower pane of the schedule board are system views that can be edited and added to. It's common to add custom resource requirement views for schedulable entities.

1. Go to **Advanced Settings** > **Customizations** > **Entities** > **Resource Requirement** > **Views**.
2. Create a new view and add fields to the view that provide details for what you are scheduling.
3. Name the view and edit the filter criteria to show the records you want to see in the view.
4. Select **Save** > **Close & Publish**.

Now that the view is created, edit the schedule board that uses the new view by completing the following steps.

1. Open the board settings, and then in the **Requirement panels** section, add a new panel.
2. Type a **Title**, and then select the view to use.
3. Save your changes.

Overview of service scheduling

Create and set up bookable resources

Article • 04/04/2022

A resource in Service Scheduling is anything that needs to be scheduled. You can set up Generic, Contact, User, Equipment, Account, Crew, Facility, or Pool as bookable resource.

Create a new bookable resource

Make sure that you have the required security role or equivalent permissions.

More information: Manage security roles in service scheduling

You can create a new bookable resource in the Customer Service admin center app or Customer Service Hub app.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Service Scheduling** in **Operations**. The **Service Scheduling** page appears.
   b. In the **Resources** section, select **Manage**.

   The **Active Bookable Resources** view is displayed. You can switch between various system views using the drop-down list.

2. On the command bar, select **New** to create a new bookable resource.

3. In the **General** section:

   - Select a **Resource Type**. You can choose from the following options:
     - Generic
     - Contact
     - User
     - Equipment
     - Account
     - Crew
     - Facility
     - Pool

   - The field name is automatically populated. Look up for the record. You can also create a new record using the **Quick Create** dialog box.

- Select a **Time Zone**.

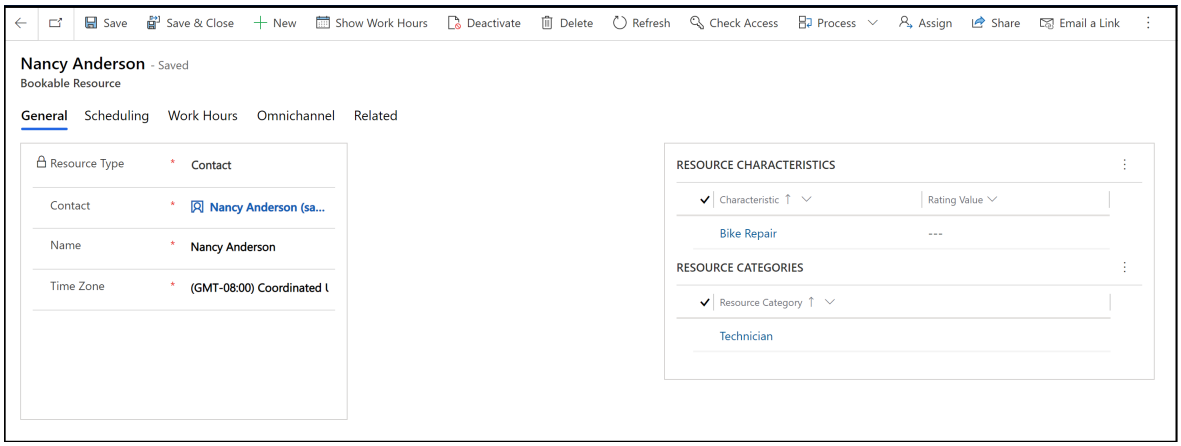
> **Note**
>
> If the Resource Type is Facility or Equipment, the time zone is automatically populated as per the facility's or equipment's time zone and it is not editable.

- Select **Save**. A new resource is created and activated by default.

  Resource Characteristics and **Resource Categories** sections are displayed.

- In the **Resource Characteristics** section, select the ellipses (...) and then select **Add New Bookable Resource Characteristics** to add characteristics.
  - Use the tooltips to help fill in your information and then select **Save**
  - Look up and assign **Rating Value**. You can also create a new rating value.
  - Assign the characteristic to a **Resource**

- In the **Resource Categories** section, select the ellipses (...) and then select **Add New Bookable Resource Category** to add a category.



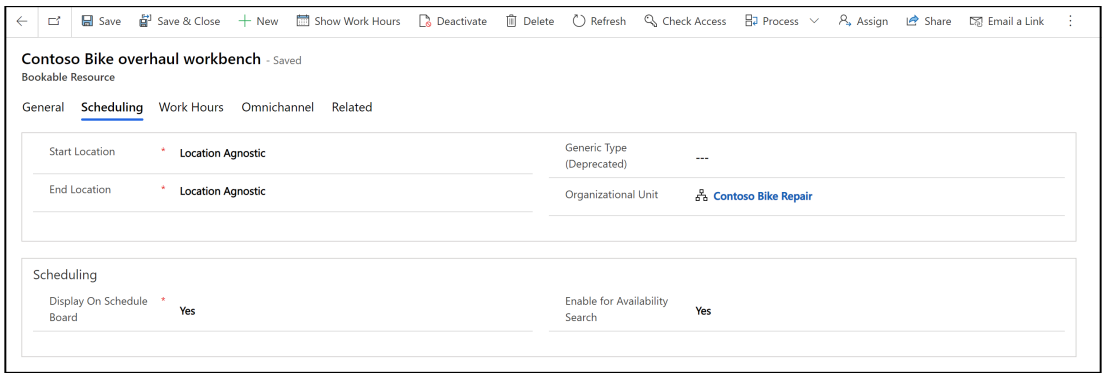
4. In the **Scheduling** section:

- Select the **Start Location** and the **End Location** to specify which location the resource will be at, when starting and ending work.

- Select an **Organizational Unit** for the resource.

> **Note**
>
> If the Resource Type is Facility or Equipment, the organizational unit is automatically populated as per the facility's or equipment's organizational unit and it is not editable.

- Select whether the resource should be displayed on the schedule board in the **Display On Schedule Board** box.
- Select whether you want to enable the resource for availability search in the **Enable for Availability Search** box.



5. Once you're ready, select **Save**.

Set work hours for the resources

You can set work hours for the bookable resources where you can define when the resources will be available to be booked for services in the Customer Service admin center or Customer Service Hub app.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Service scheduling** in **Operations**.
   b. In the **Resources** section, select **Manage**.

   The **Active Bookable Resources** view is displayed.

2. Open the resource record you want to set work hours for.
3. Select **Show Work Hours**.
4. From the **Set up** drop-down list, choose the schedule display as required.

   > **Note**
   >
   > Monthly schedules are the default display; you can choose weekly and daily schedules.

5. Double-click a date on the calendar that is the first day for which you want to set work hours.

6. In the **Edit Schedule** dialog box, select one of the following and then select **OK**.

    - **This date only**

      This option changes only the selected day.

      Skip to step 12.

    - **From <this date> onward**

      This option changes only the schedule going forward.

    - **Entire recurring weekly schedule from start to end**

      This option changes this entire schedule from the start to end date.

      Selecting this option might change past days, which could affect reports regarding hours worked in the past.

7. In the **Weekly Schedule** dialog box, in the **Set the recurring weekly schedule** section, select one of the following:

    - **Are the same each day**

      The new schedule is the same for every day of the week. After you select this option, select the days of the week that the resource is available.

    - **Vary by day**

      The new schedule is different for one or more days of the week. After you select this option, select the days of the week that the resource is available.

    - **None. User is not working**

      The new schedule includes time that the resource isn't working.

    In the **Weekly Schedule** dialog box, you can also do any of the following:

    - If the schedule is for more than one day, select the days of the week this schedule is effective.

    - If the resource doesn't work during business closures, select the **Observe** option.

- Under **Date Range**, in the **Starting on** box, you can change the date the schedule starts.

  You can't change the date the schedule ends. To end a schedule, you must define a new schedule on that date.

8. Choose the work hours link for the schedule you want to modify.

   If work hours haven't been set previously, the link is displayed as "Set Work Hours."

9. In the **Set Work Hours and Service Restrictions** dialog box, complete the following fields, and then select **OK**:

   - **Date**

     Select a date from which the work hours for services are to be considered.

   - **Start**

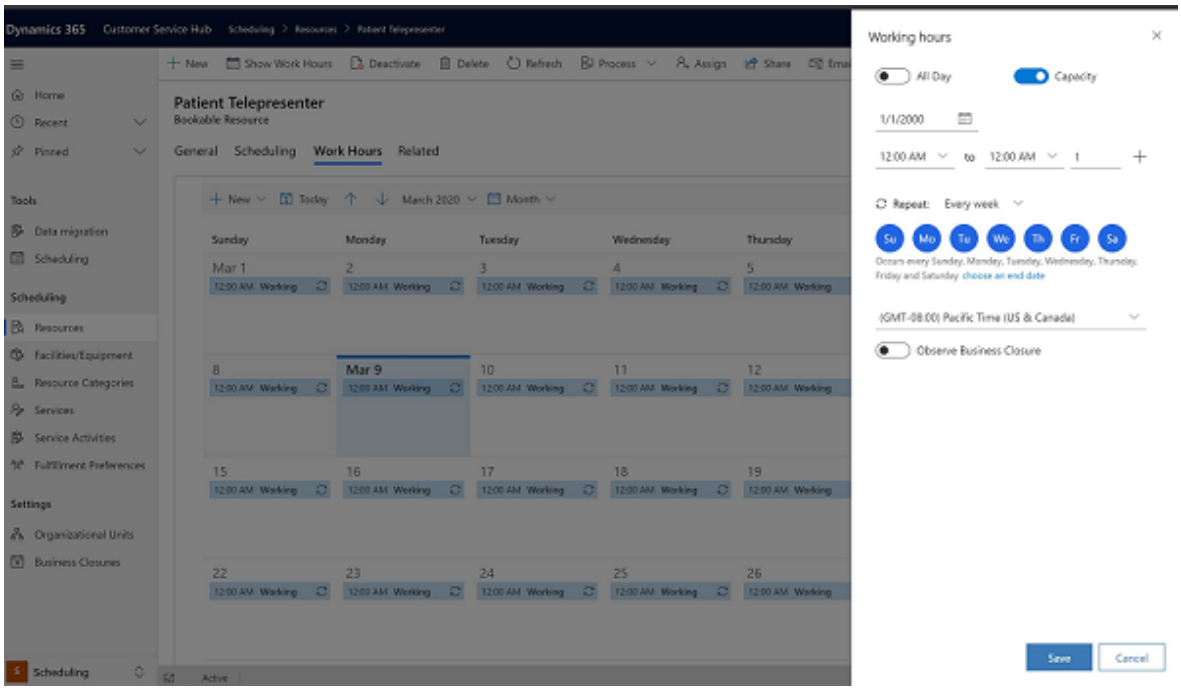
     Select the time the work day starts.

   - **End**

     Select the time the work day ends.

     To add a break in the work hours, such as a lunch break, select **Add Break**, and then select the start and end time of the break.

10. To close the **Weekly Schedule** dialog box, select **Save and Close**.



> ⓘ **Note**

To define a time when a service won't be available, on the **Service Restrictions** tab, select **New**. In the **Edit a Service Restriction** dialog box, select the service, and select the start and end time between which the service will be unavailable, and then select **OK**.

Service Scheduling overview

Add facilities and equipment to schedule service

Article • 04/04/2022

Introduction

Facilities and equipment are resources you use to perform services for your customers. Facilities could be physical spaces like service bays or conference rooms and equipment could be tools or other assets. Add these resources to Dynamics 365 Customer Service to ensure optimal services for your customers.

Create a new facility or equipment record

Make sure that you have the required security role or equivalent permissions.

More information: Manage security roles in service scheduling

You can create a new facility or equipment record in the Customer Service admin center or Omnichannel admin center app.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Service Scheduling** in **Operations**. The **Service Scheduling** page appears.

   b. In the **Facilities & equipment** section, select **Manage**.

      The **Local Facilities/Equipment** view is displayed. You can switch between various system views using the dropdown list.

2. On the command bar, select **New** to create a new record.

3. In the **General** section, fill in the information as required:

   - **Name**. Enter the name of the facility or equipment you want to add for scheduling.

- **Business Unit ID**. Enter a business unit ID. To choose an ID, select the **Lookup** button and then select from the list. You can also create a new business unit ID.
- **Organizational Unit**. Select the location where the facility or equipment is located.
- **Primary Email**. Enter the email address of the site manager or equipment manager. If there are any updates or cancellations related to the schedule, facilities, or equipment, notifications are sent to this email address.
- **Time Zone**. Select the appropriate time zone to determine availability for the facility or equipment. By default, this is set to the time zone you've selected in the **General** tab of the **Set Personal Options** dialog box. More information: Set personal options
- **Description**. Add details about the facility or equipment, such as the numbers, size, make, or model.

4. When you're done, select **Save** or **Save and Close**.

Service Scheduling overview

Create and manage resource categories

Article • 04/04/2022

With bookable resource categories, you can group your bookable resources by type. For example, you can create categories like technician, supervisor, subcontractor, vehicle, or equipment.

More information:: Multi-resource scheduling with requirement groups

Create a new resource category

Make sure that you have the required security role or equivalent permissions.

More information: Manage security roles in service scheduling

You can create a new resource category in the Customer Service admin center or Customer Service Hub app.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Service Scheduling** in **Operations**. The **Service Scheduling** page appears.

   b. In the **Resource categories** section, select **Manage**.

      The **Active Resource Categories** view is displayed. You can switch between various system views using the drop-down list.

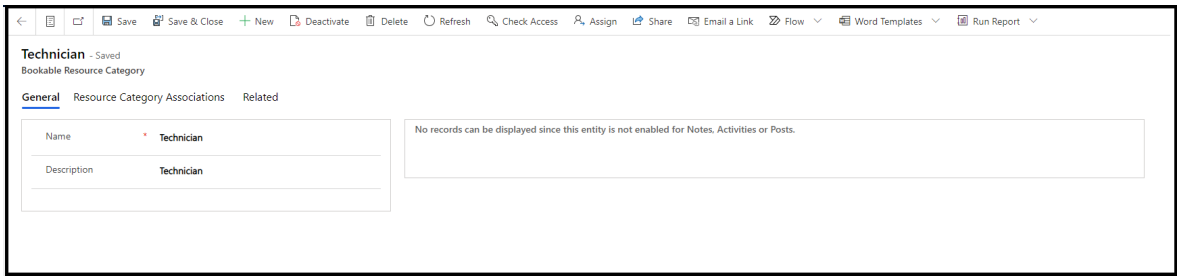
2. On the command bar, select **New** to create a new bookable resource category.

3. In the **General** section:

   - Enter a **Name** and a **Description** for the resource category

4. Select **Save**. A new resource category is created and is activated by default.

5. In the **Related** section, you can view and manage various resource category associations.



Similarly, you can create a new requirement resource category for requirements.

Add resources to a resource category

To assign resources to a resource category:

1. In the **Related** section, go to **Resource Category Associations**.
2. Select **Add New Bookable Resource Category Association**. A resource category is populated.
3. Add a resource to this resource category by selecting a resource in the **Resource** box. You can either lookup for an existing resource or create a new one.

Service Scheduling overview

Create or edit a service in Service Scheduling

Article • 04/04/2022

To make scheduling services quick and easy, it's helpful to predefine the specifics of the services you provide to customers. By using the service records in Dynamics 365 Customer Service, you can define:

- How long a service activity would last.
- What resources are needed for the service activity, like resources, facilities, or equipment.

> **Note**
>
> A service requires at least one selection criteria and one or more resources or resource groups before the service can be scheduled with a service activity.

Create a service

Make sure that you have the required security role or equivalent permissions.

More information: Manage security roles in service scheduling

You can create a service in Customer Service admin center or Customer Service Hub app

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Service Scheduling** in **Operations**. The **Service Scheduling** page appears.

   b. In the **Service** section, select **Manage**.

      The **Active Services** view is displayed. You can switch between various system views using the drop-down list.

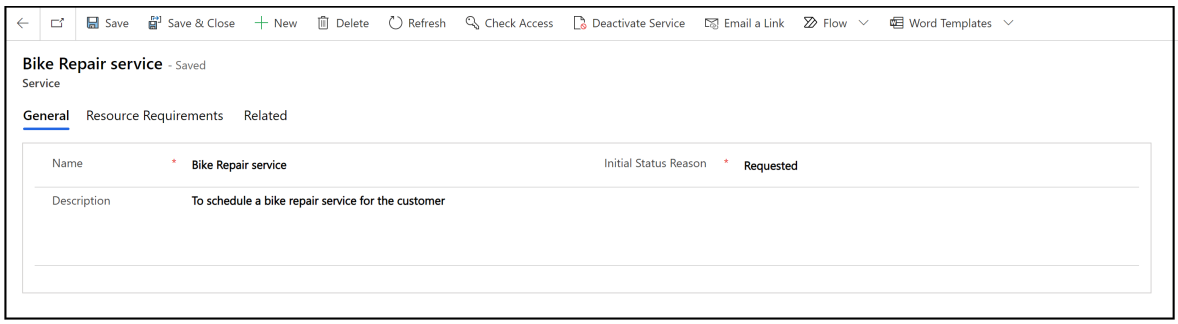
2. On the command bar, select **New** to create a new service. To edit a service, open a service from the list.

3. In the **General** section, enter a **Name** and **Description** to reflect the specifics of the service and describe what the service is.

   Also, specify the initial status of the service activity when it is created. If your organization prefers to approve all service activities before committing them to the schedule, you can select **Requested** or **Tentative**.

   > **Note**
   >
   > The status reason also reflects in the schedule board when you create a booking for the service.

4. Select **Save** to save the service.



5. In the **Resource Requirements** section, define the selection criteria.

   - Here, the new service record forms the root node. In the root node, you can:

   - Select **All** or **Any**. All selects resources for all the underlying requirements and Any selects resources for any one of underlying requirement.

   - Select **Duration**, and enter the duration in minutes to define the duration for which resources are allocated for the service.

     > **Note**
     >
     > The maximum duration of a service activity is 10 days.

- Lookup or quick create a **Fulfillment Preference** to define the start time and end time of the service availability in a day and intervals in which it's provided. You can also choose from a list of fulfillment preferences displayed.

  > ⓘ **Note**
  >
  > When you select create, a **Quick Create** form is displayed where you can quickly create a new fulfillment preference.

After configuring details in the root node:

- Add a new requirement subgroup by selecting **Subgroup**. You can add subgroups inside a subgroup.
- Add a new resource requirement by selecting **Requirement**.
- Choose whether the service is **Part of Same** organizational unit, resource tree or location.
- Choose the **Organizational Unit** to define the unit to which the selected resource should belong to.
- Select **Resource Categories** and choose **Resource Characteristics** to define the categories for the resource.
- Choose **Preferred Resource** to display resource options. When only preferred resources are selected on a requirement, any one of the available resources from the list of preferred resources will be selected as per the time slot. When preferred resources are selected along with the resource category on a requirement, any one of the available resources from the list of preferred resource and which belongs to the resource category will be selected as per the time slot.
- Choose **Sort Option** to sort according to most and least business impact.
- Provide **Effort Required**. While booking, this option helps you view all the resources who satify the minimum effort requirement. For example, if the effort required is defined as 100, only the resources with the capacity value of 100 and more will be displayed in the list while booking the service in the schedule board.

You can add complexity to a rule by adding a subrule to it.

> **Note**
>
> You can save a service without defining a selection criteria, but you won't be able to schedule that service.

6. When you're ready to save your data, select **Save**.

Activate or deactivate a service

You can make a service available or unavailable for scheduling by activating or deactivating it. To do this, in the list of service records, select a service, and then select **Activate** or **Deactivate** in the command bar.

> **Note**
>
> If there are open or scheduled service activities associated with a service, then the service cannot be deactivated.

Schedule a service activity

Article • 09/13/2022

Use service activity to schedule service appointments by finding the next time resources are available for a service. With the help of service activity, you can coordinate and schedule resources for a service required by your customers.

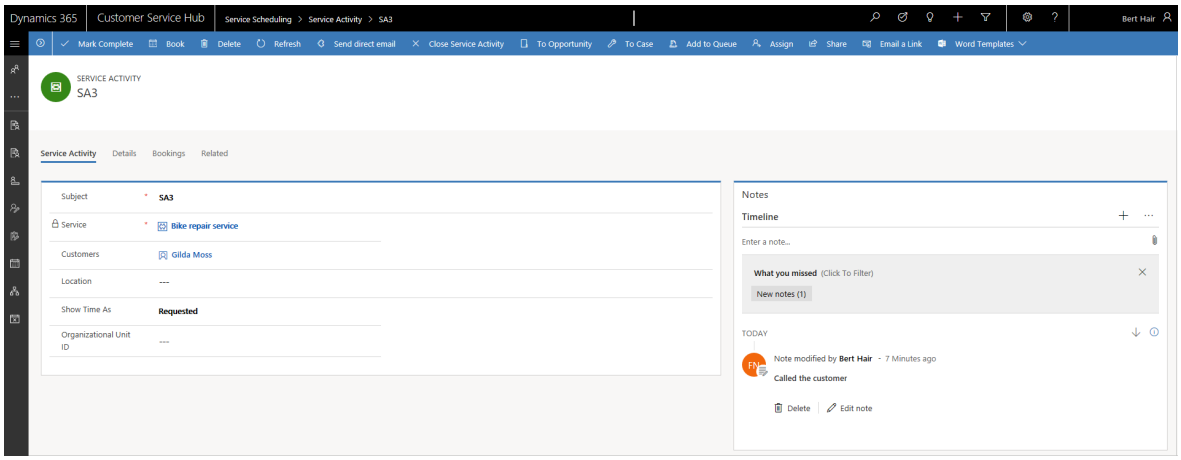
> **Note**
>
> You can't create a recurring service activity. Create individual service activities as needed.

Create a service activity

Make sure that you have the required security role or equivalent permissions.

More information: Manage security roles in service scheduling

1. In the Customer Service Hub sitemap, go to **Scheduling**.
2. From the list of entity records, select **Scheduling** > **Service Activity**.
    - The **My Service Activities** view is displayed. You can switch between various system views using the drop-down menu.
    - Select any existing service activity to see additional options in the command bar.
3. On the command bar, select **Service Activity** to create a new service activity.
4. In the **Service Activity** section:
    - Enter the **Subject** of the service activity.
    - Select the type of service from the **Service** drop-down menu.
    - Select **Customers** to specify the customer who requested the activity.
    - Specify **Location** of the activity.
    - Select **Show Time As** either Requested or Tentative.
    - Provide the **Organizational Business Unit**.



5. Select **Save**.

6. In the **Details** section:

    - Provide the **Owner** and **Priority**.
    - Provide **Category** and **Sub-category** for the activity.

7. In the **Bookings** section:

    - View the bookings that you have scheduled in this section.

8. Select **Book** to schedule a service activity in the calendar.

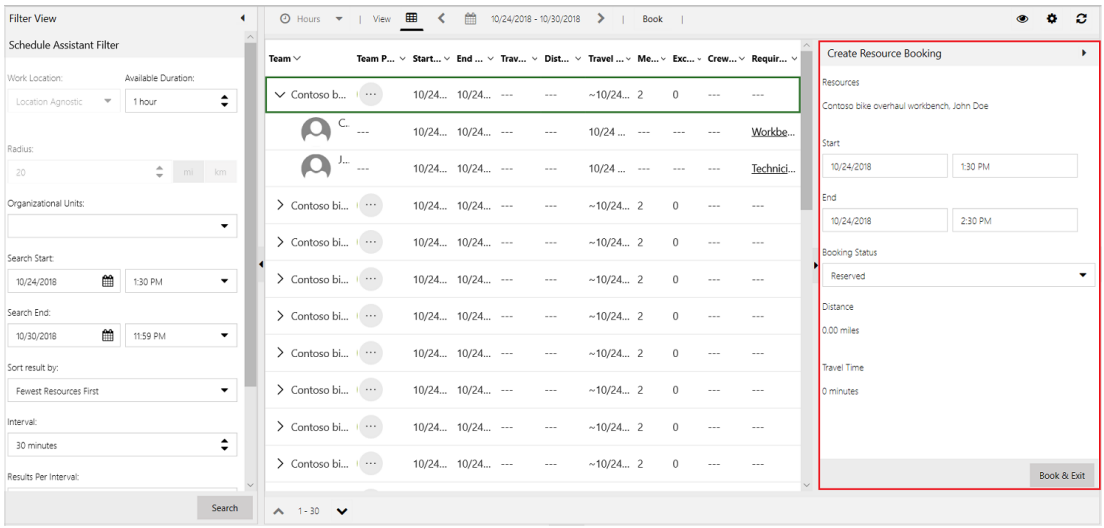
    - The **Schedule Board** is displayed. You can view the list of services and the associated resources.

    - In the **Create Resource Booking** panel, select the service start date and time and end date and time.

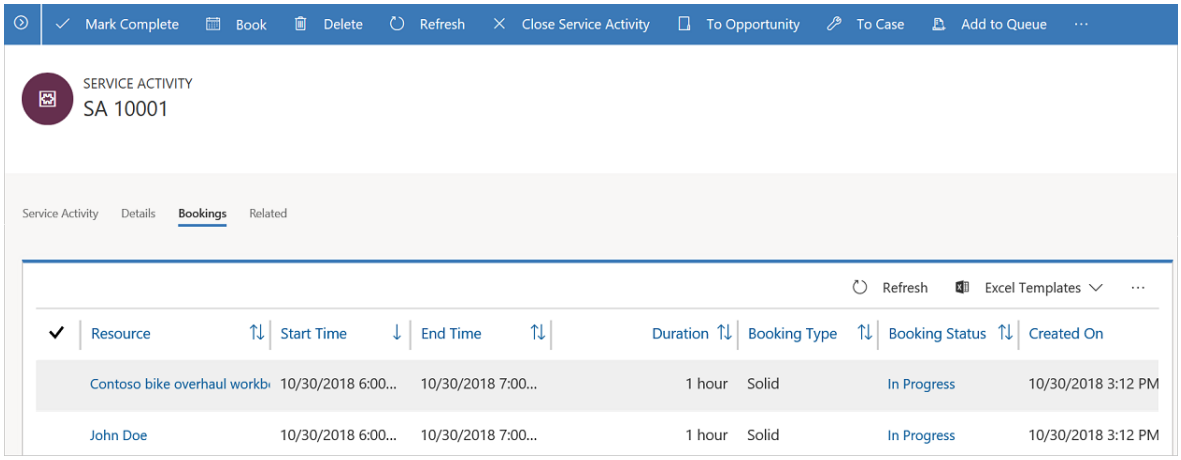
    - Select the **Booking Status** from the drop-down menu.

    - Select **Book** to schedule a service activity. Select **Book and Exit** to schedule and exit the tab.

      More information: Schedule a booking for a service activity



The bookings that you schedule appear in the **Bookings** tab.



You can select an existing booking and edit, activate, or deactivate it from the **Bookings** tab.

> **Note**
>
> - While creating a service activity, manual selection of resources isn't supported in the new scheduling experience in Customer Service Hub.
>
> - Once you've created a booking, the booking status won't be updated until you manually refresh the **Bookings** tab.

9. To close or cancel a service activity, select **Close Service Activity** from the command bar, and then select the status as **Closed or Canceled** in the **Close Service Activity** dialog box.

10. If the service activity has been completed, select **Mark Complete** from the command bar.

Use the schedule board to configure service activity

Set fulfillment preferences to determine how results are displayed in Universal Resource Scheduling

Article • 03/10/2023

Fulfillment preferences customize how the schedule assistant will display results for single-day requirements. By default, the schedule assistant shows results based on resource schedules and the earliest available time. Fulfillment preferences include intervals and time groups, or a combination of them.

Intervals

Intervals define the length of the times slots the schedule assistant results will be displayed in, and the start time for subsequent bookings. For example, with 30-minute intervals, the schedule assistant will display a resource available at 9:27 AM as available at 9:30 AM and will book the start time (arrival time) for 9:30 AM. This includes travel time for onsite requirements and work orders, meaning travel time will begin before 9:30 AM, and a field resource will arrive and start work at 9:30 AM.

Time groups

Time groups enable schedulers to search and view results as blocks of time when using the schedule assistant. Unlike intervals, time groups don't influence the start time of subsequent booking. Unlike intervals, time groups **do not dictate the start time of subsequent bookings**. Time groups organize results, but leave the start time/arrival time as-is, based on the particular resource's schedule.

For example, a heating and cooling company wants to group air-conditioning installations in two blocks. They create morning (8:00 AM to 12:00 PM) and afternoon (1:00 PM to 5:00 PM) blocks, with a 1-hour break for lunch in between. They communicate a morning or afternoon time range to customers for when the installation crew arrives.

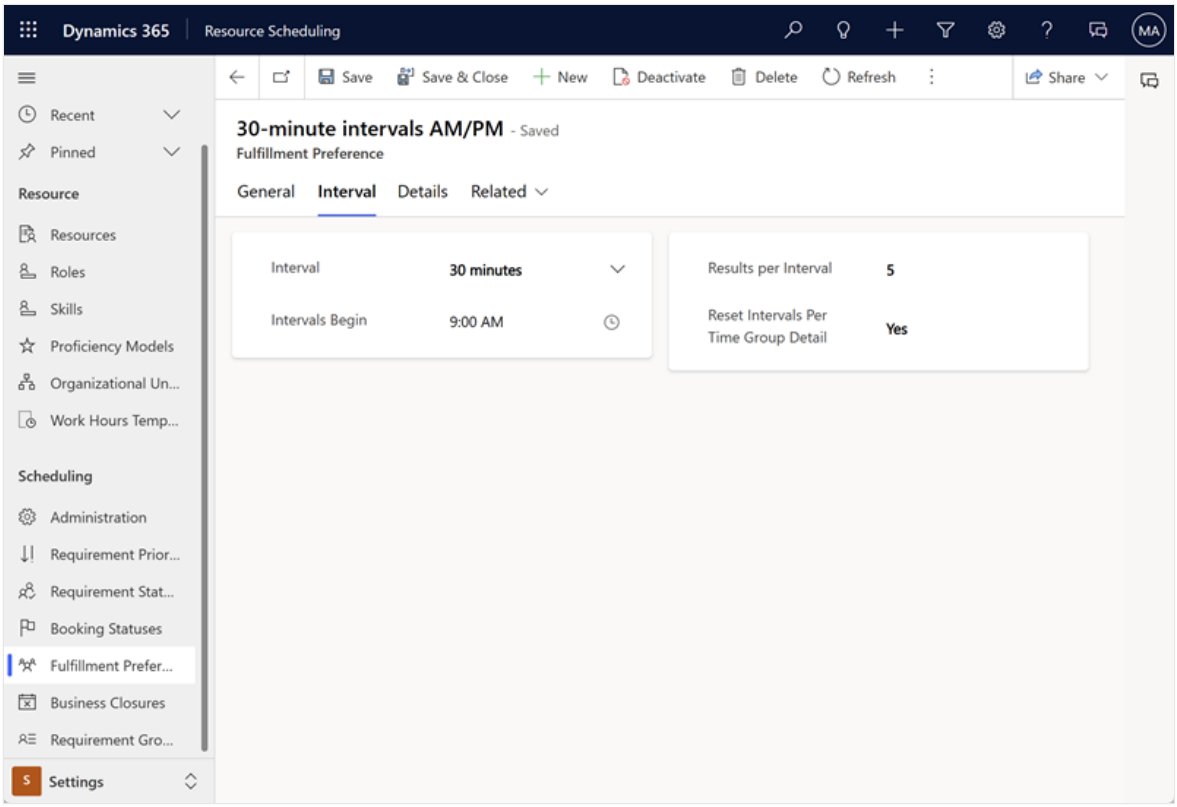
Create a fulfillment preference

1. In Universal Resource Scheduling, open the Settings area. Under **Scheduling**, select **Fulfillment Preferences** and select **New**.

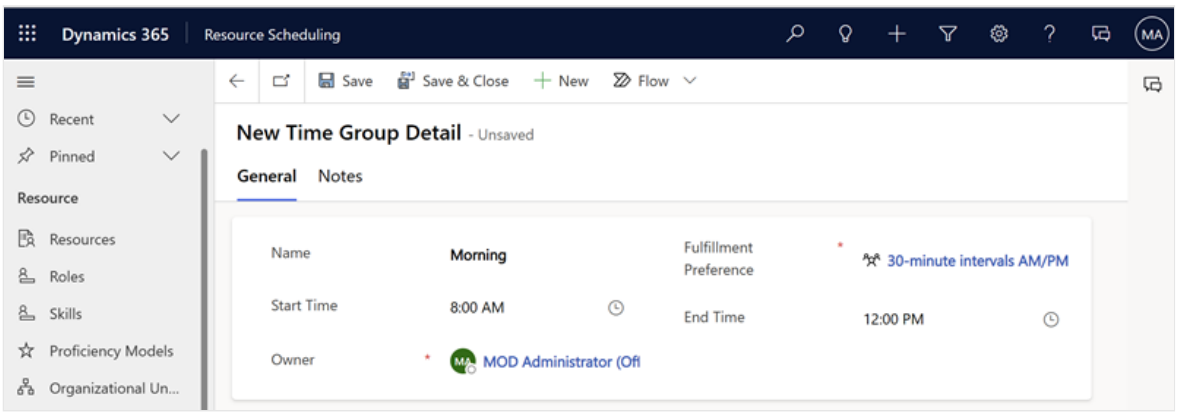
2. Enter a **Name** and **Save** the record.

3. To define an interval, go to the **Interval** tab.

    - Choose an **Interval** to define the duration between two available time slots.
    - Set the time for **Intervals begin** to define the start time for when options are available, depending on resource availability and working hours.
    - Enter the number of **Results per Interval** to limit how many options the system presents for a time slot.



4. To add a time group, go to the **Details** tab and select **New Time Group Detail**. Enter a **Name** and choose a **Start Time** and **End Time**.



Associate fulfillment preference to a requirement or requirement group

Open a requirement and go to the **Schedule** tab to choose the **Fulfillment Preference**. For a requirement groups, you can choose it in the **Fulfillment Preference** column.

Book a requirement

Open a resource requirement and select **Book** to schedule the requirement. You'll notice that the start and end times match the fulfillment preference you defined for the requirement.

Using intervals and time groups together

You can add both an interval and a time group to the same fulfillment preference, but this requires a few important considerations.

- Don't add a value for **Interval Begins**. The interval will begin at the time of the earliest time group.
- If the **Reset Interval per Time Group Detail** option is set to **Yes**, the intervals will reset once a new time group detail overlaps with an interval.

  For example, a business offers appointments every 90 minutes, so intervals are set to 90 minutes. Additionally, they separate into morning and afternoon time groups of 8:00 AM to 12:00 PM and 1:00PM to 5:00 PM, with a 1-hour lunch in between.

  - If the **Reset Interval per Time Group Detail** is set to **No**, the appointments would be:

    8:00 AM, 9:30 AM, 11:00 AM (not 12:30 PM because this is blocked for lunch), 2:00 PM, and 3:30 PM.

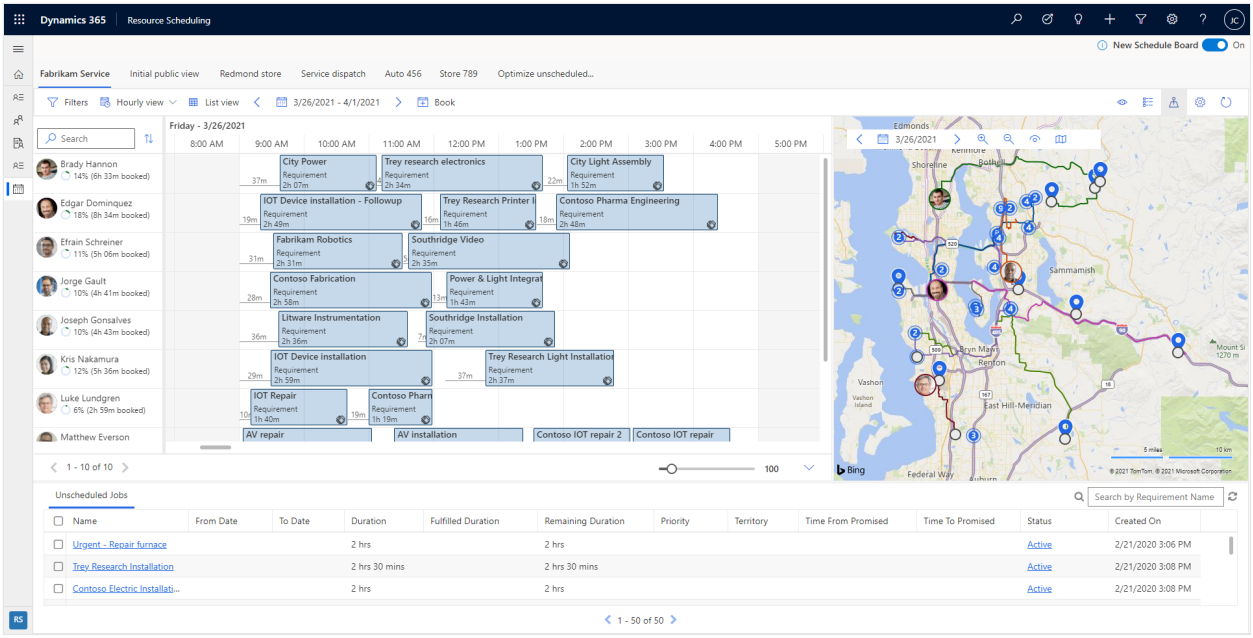
  - If the **Reset Interval per Time Group Detail** is set to **Yes**, the appointments would be:

    8:00 AM, 9:30 AM, 11:00 AM, (not 12:30 PM because this is blocked for lunch), **1:00 PM** (resetting for the next time group detail), 2:30 PM, and 4:00 PM.

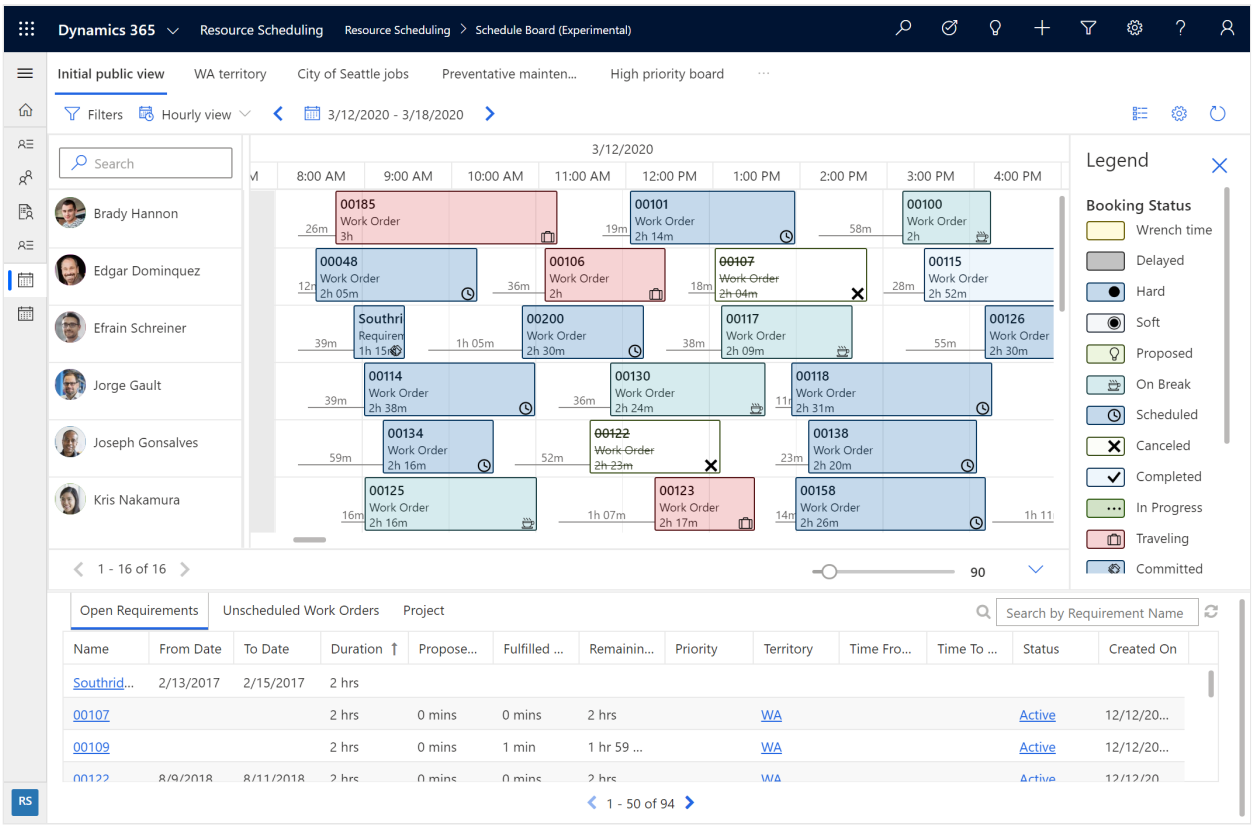
Use the schedule board to configure service activities

Article • 05/23/2022

In this article, we'll take a look at what's new and show you how to switch to the new schedule board in your environment.



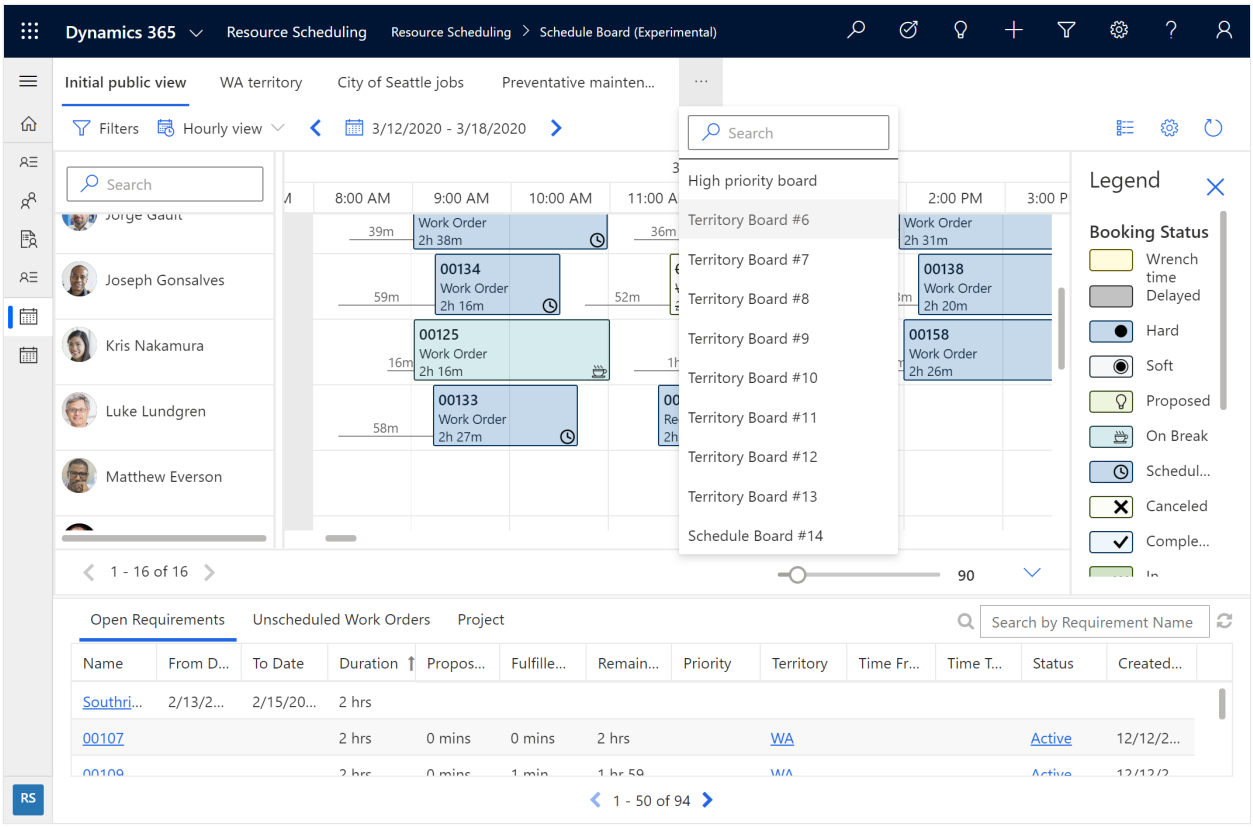
The new schedule board is faster, with better usability, and it lays the foundation for new capabilities for multi-day scheduling and intelligent interactions.



Performance

The new schedule board is faster and more responsive when you do the following tasks:

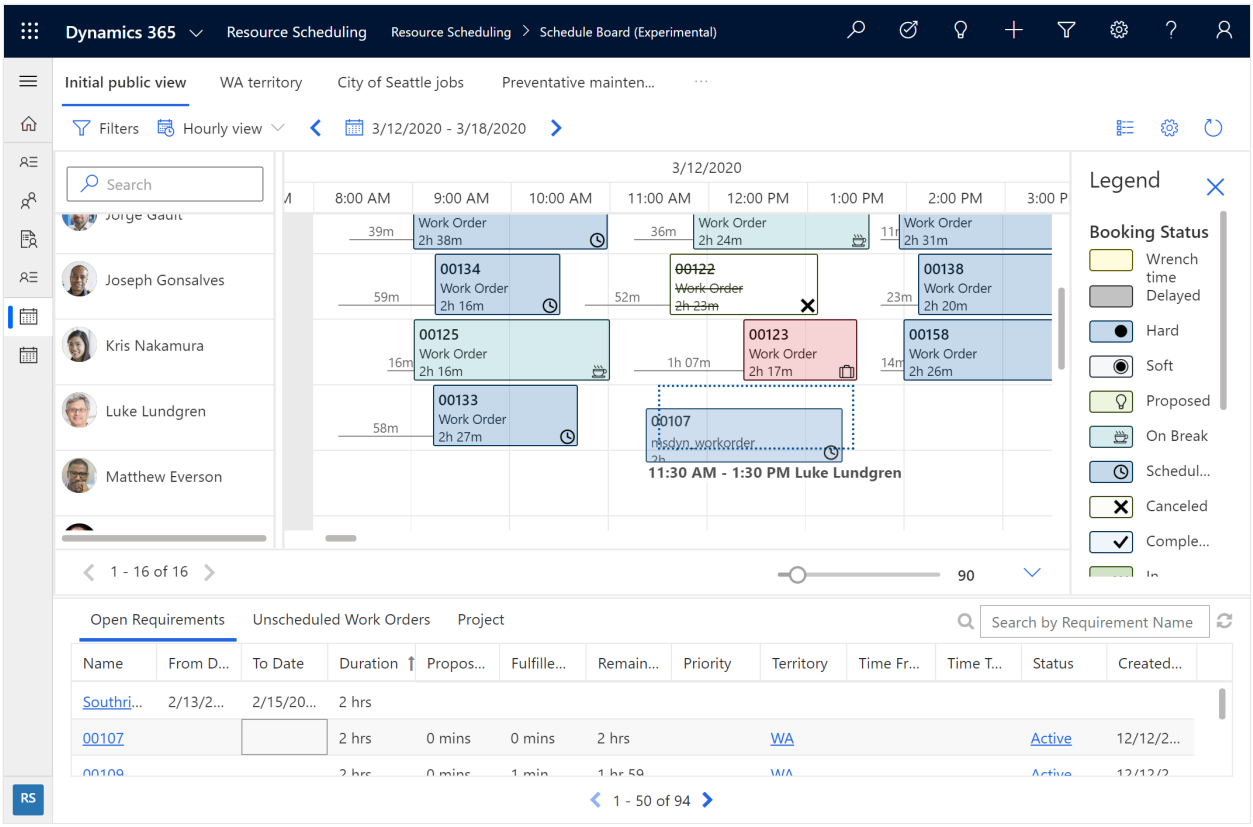
- Load the schedule board
- Select schedule board tabs
- Drag and drop service activities
- Reschedule bookings



Usability and accessibility

The new schedule board is a Power Apps Component Framework (PCF) control that's built on the Unified Client Interface, making it more flexible, supportable, and accessible. The new schedule board works better on different screen sizes and across form factors.

New color schemes and ways of depicting travel time make it easier for schedulers to see statuses and details.



For instance, the previous screenshot shows a new "ghost booking" feature that helps schedulers know if a booking will fit into a schedule before the booking is even scheduled.

Foundation for new capabilities

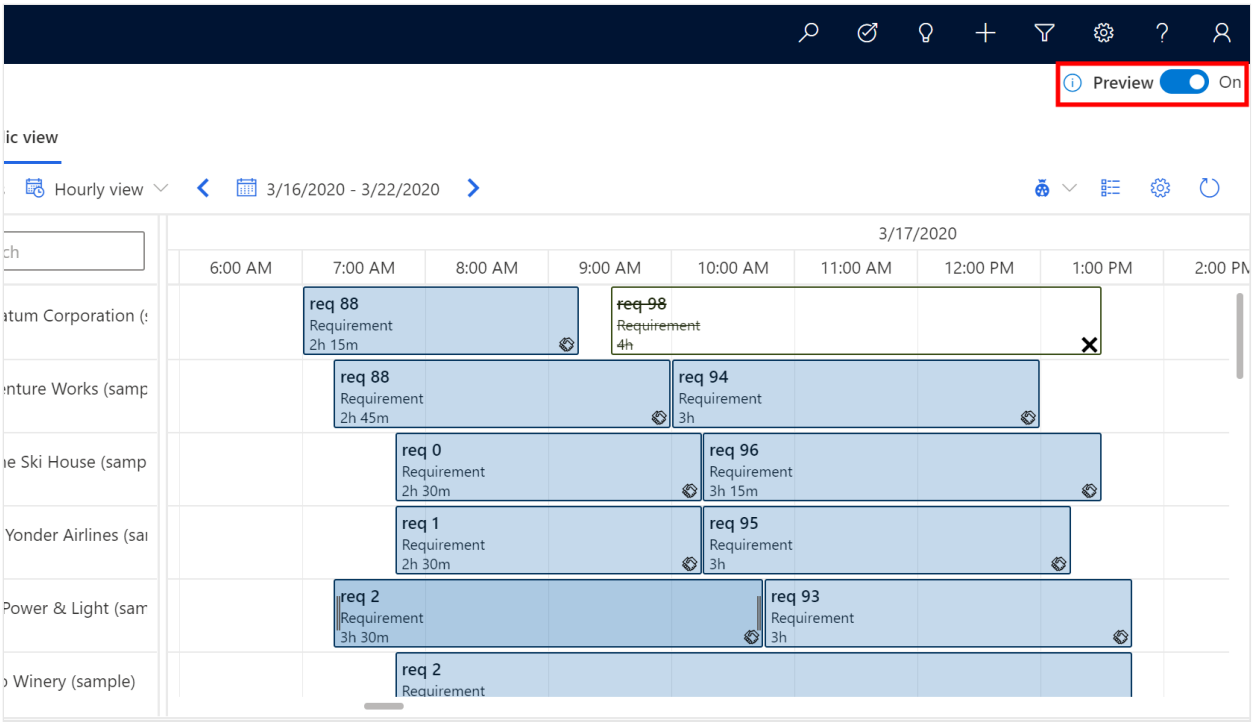
The new schedule board provides the foundation for future releases that will help provide schedulers with insights and recommendations for how to improve schedules.

Prerequisites

The next generation schedule board is generally available and requires that you have Dynamics 365 Customer Service.

Enable new schedule board

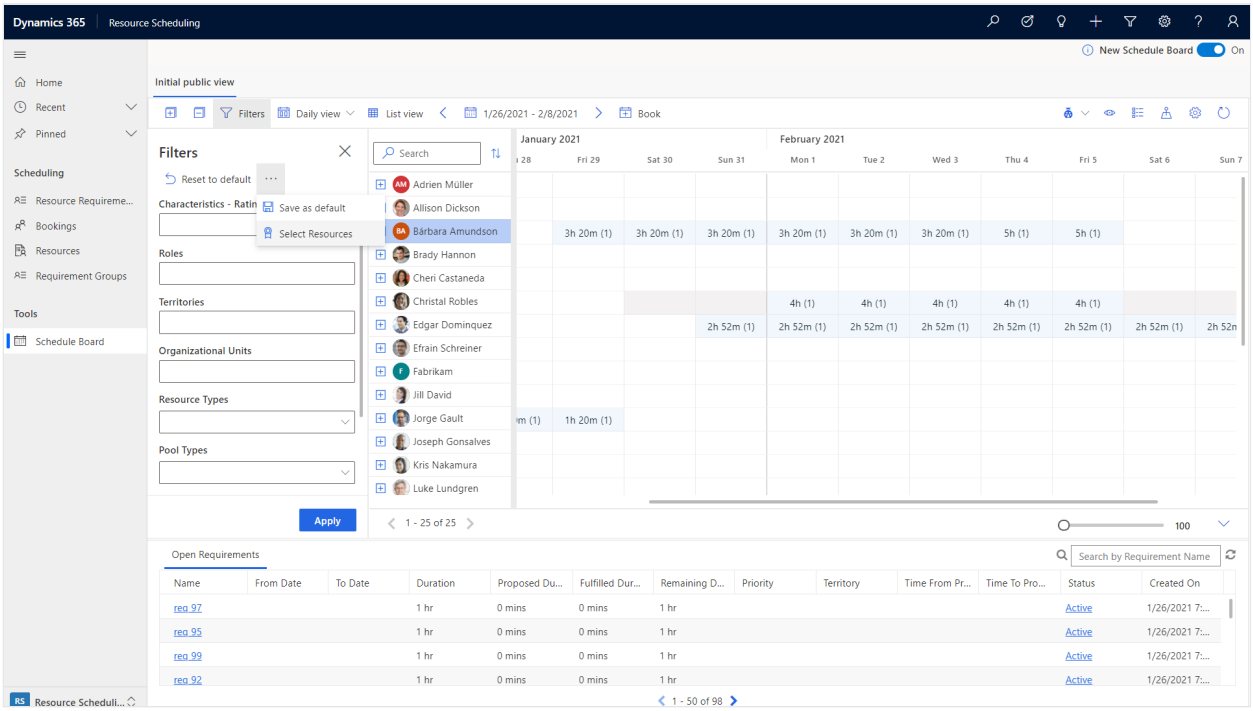
Go to the schedule board and use the toggle button in the top-right side of the schedule board to switch between the current and new schedule boards.



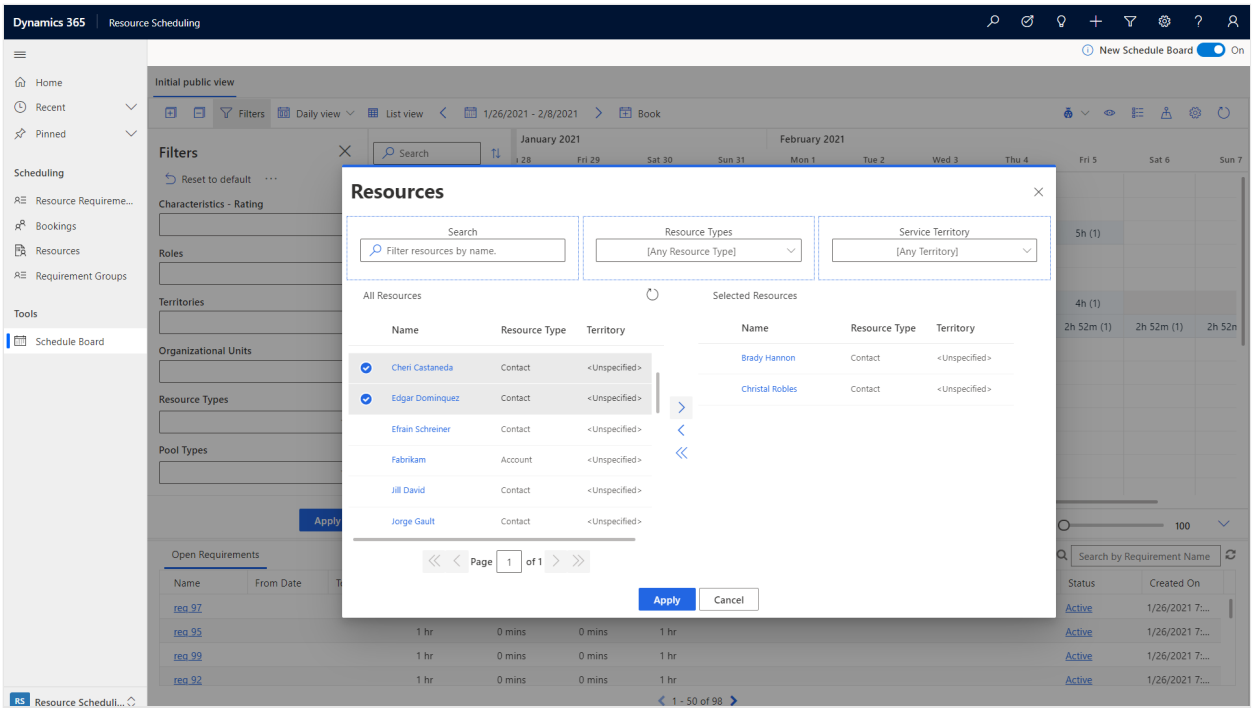
Select and filter resources

Choose which resources should display on each schedule board tab.

1. Expand the filter pane, and then choose **Select Resources**.

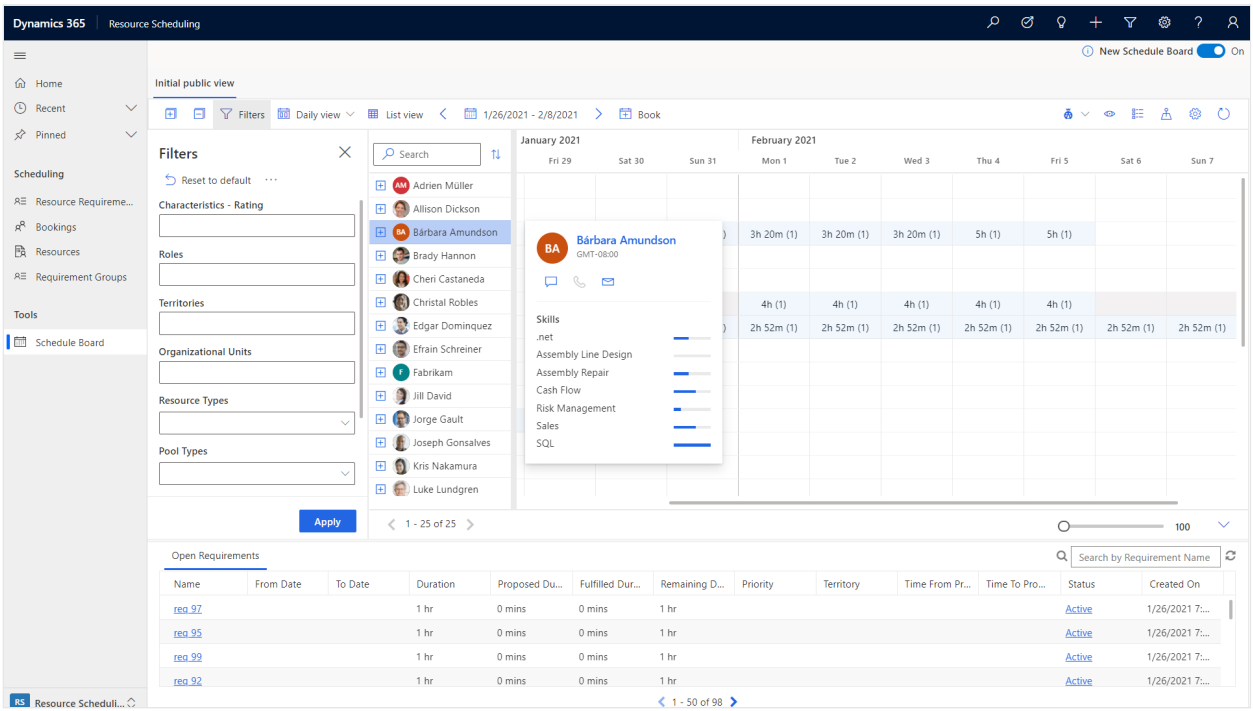


2. From the list of available resources on the left, move the ones you want to display on the schedule board to the right, and then select **Apply**.



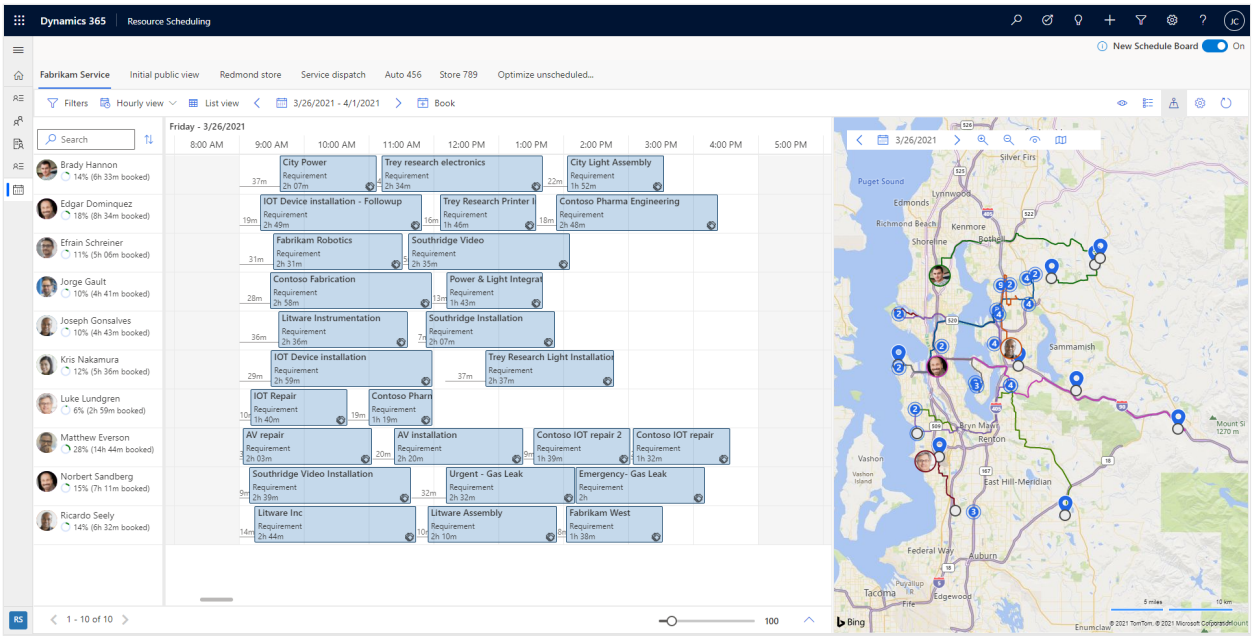
Resource cards

Right-click a resource's name and then choose **View Resource Card** to see more, like the resource's skill set (characteristics) and roles. From here, you can also initiate a message, email, or phone call.

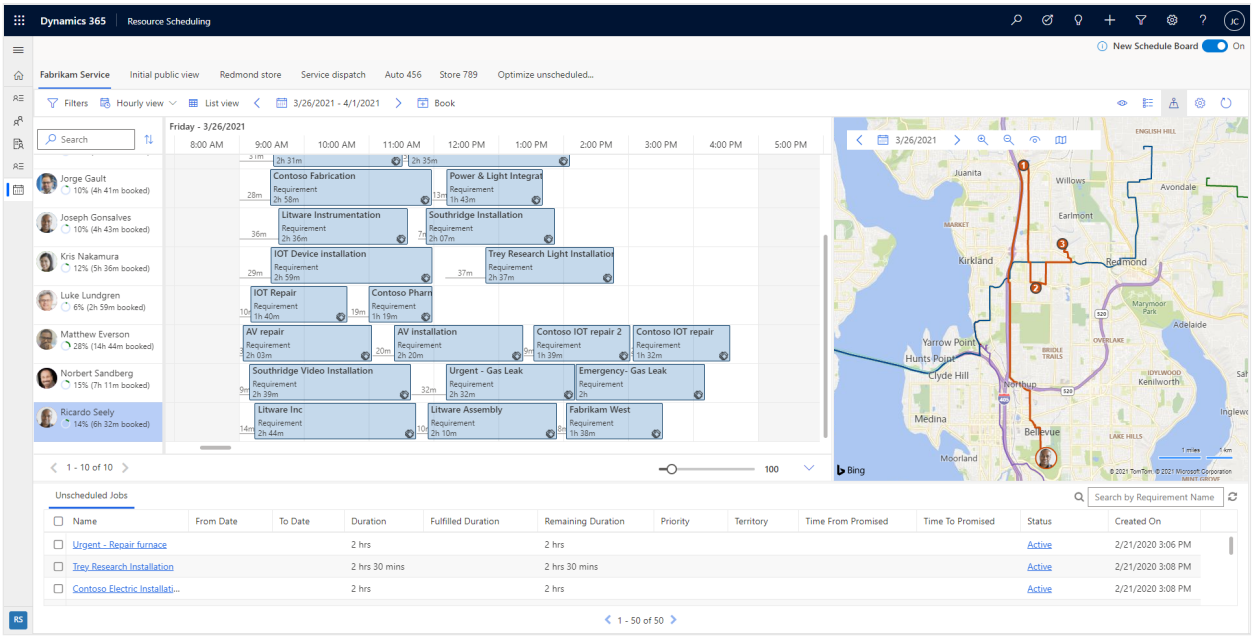


Map view of requirements and resources

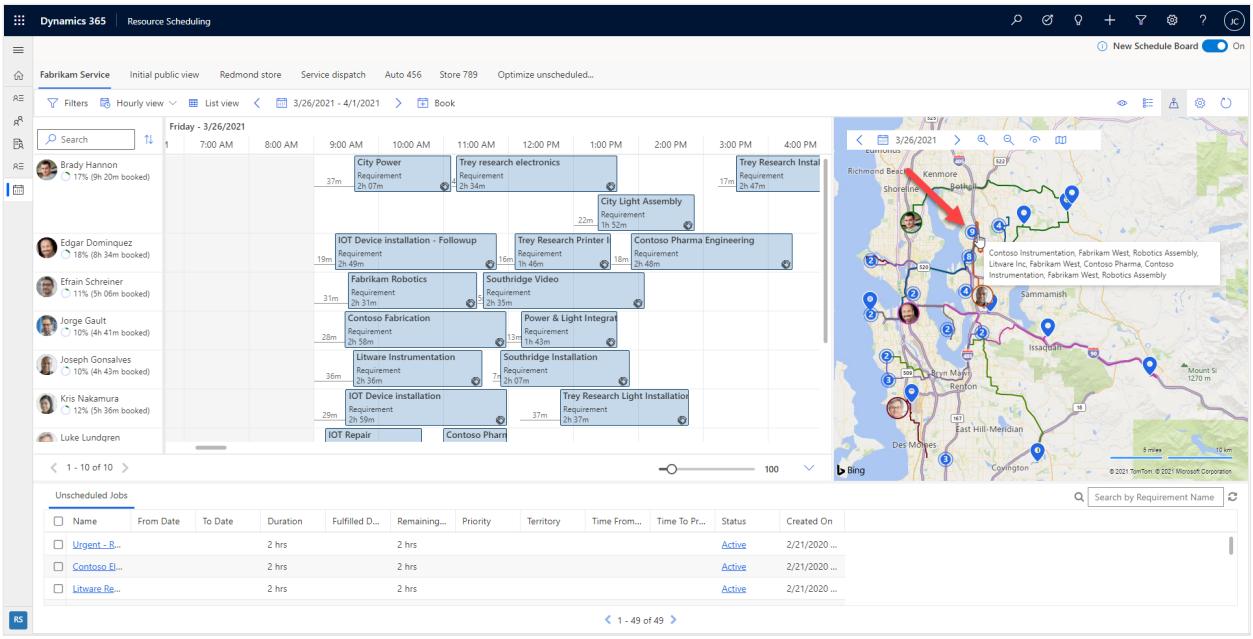
Select the map icon in the upper-right of the schedule board to display the resources and requirements on a map.



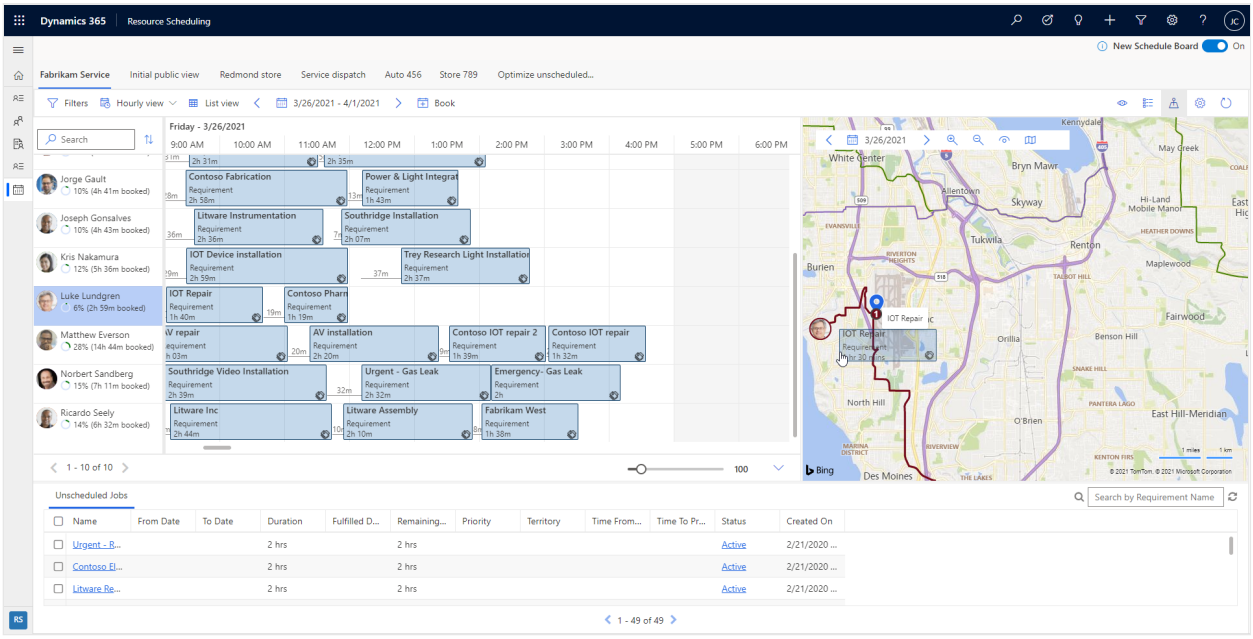
After expanding the map view, select a resource's name to see their route. The numbers indicate the order the resource is scheduled to arrive at each job (requirement) location.

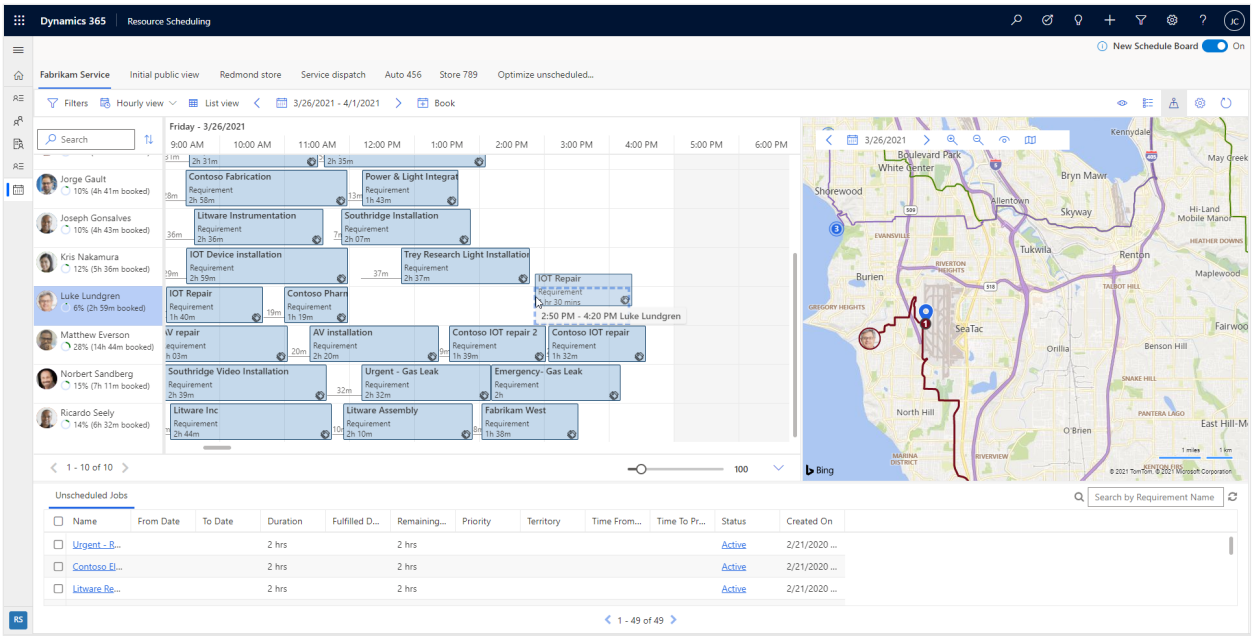


On a zoomed-out view of the map, the requirements and resources are grouped together, and you can see a count of requirements and resources. This count helps you quickly identify a geographical area with more unscheduled jobs, and then start scheduling the jobs to nearest resources.

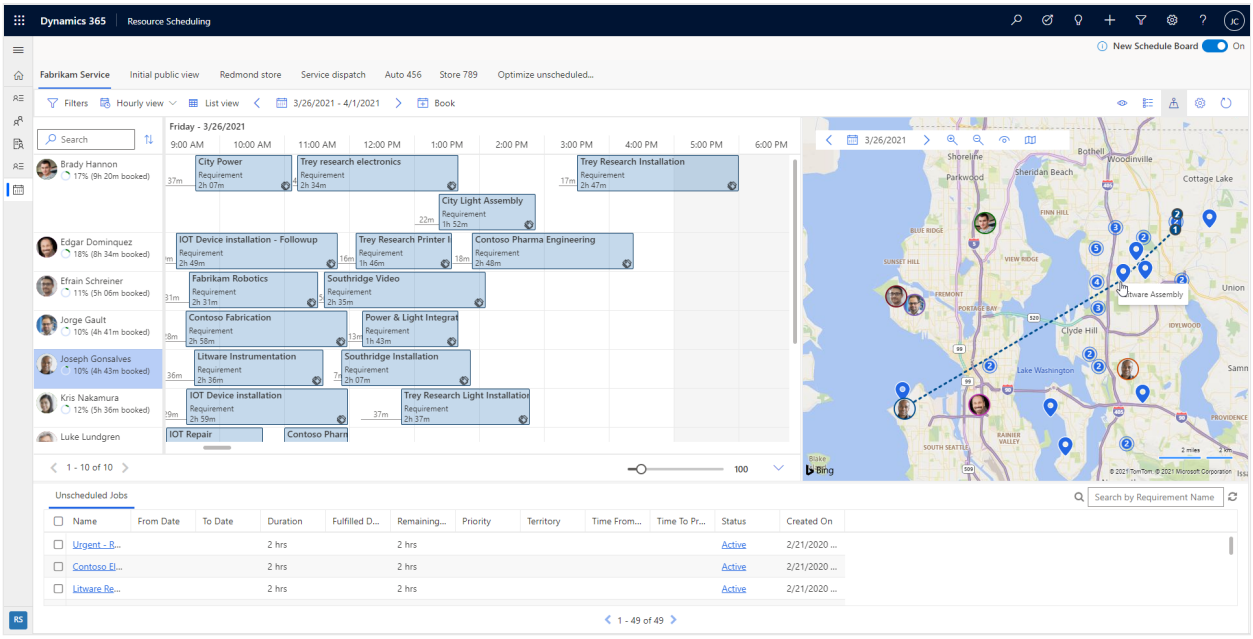


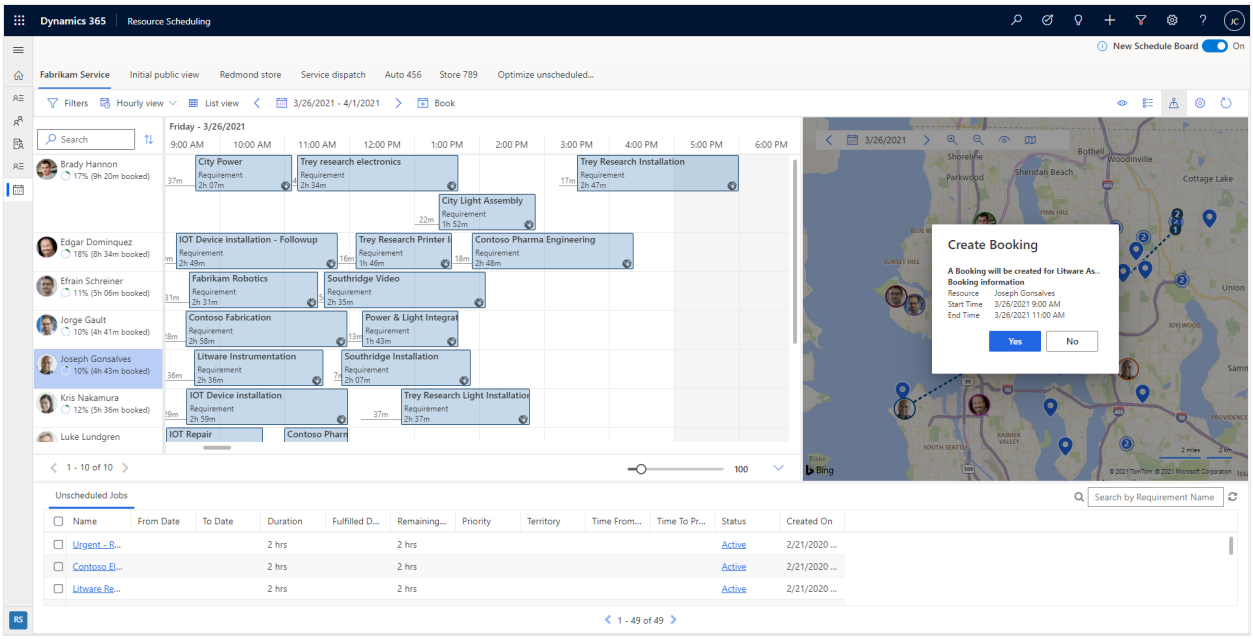
You can drag an unscheduled requirement pin from the map to the resource timeline and schedule it to that resource.





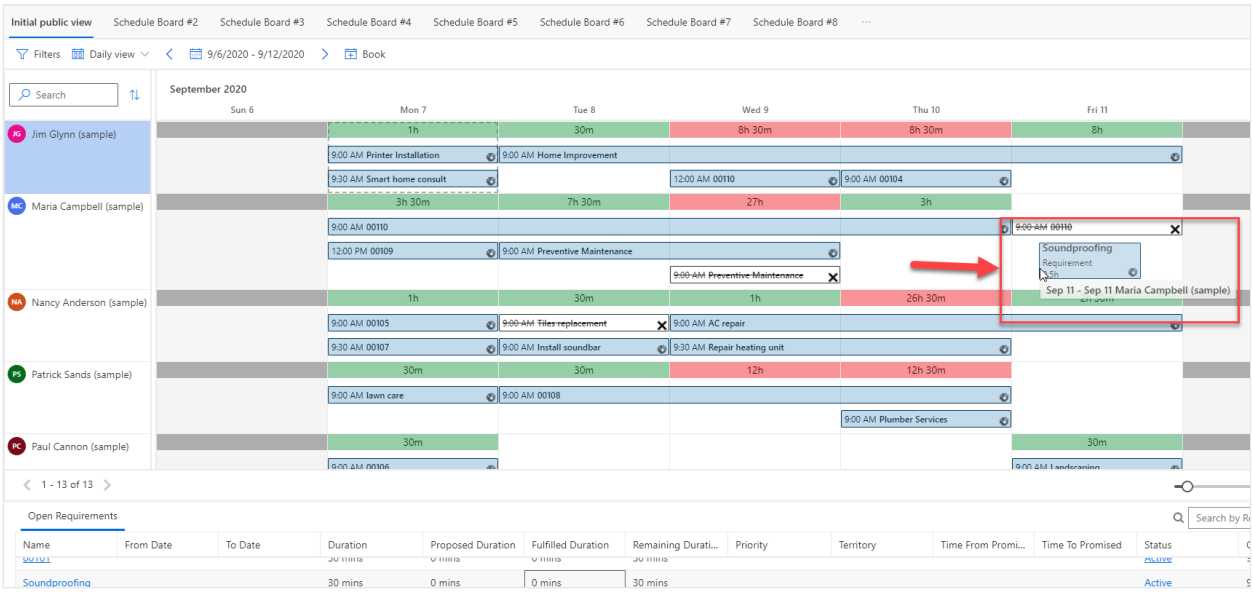
You can also drag the resource route to a nearby unscheduled requirement to schedule it and add it to the resource route.



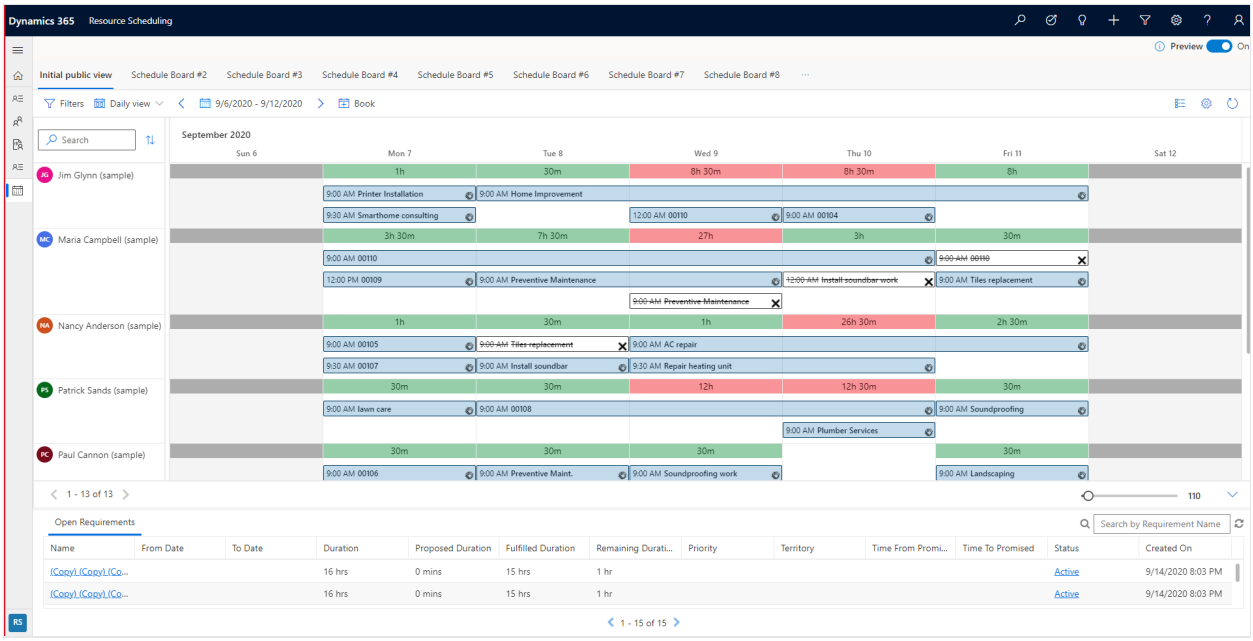


Daily view

The new schedule board supports a daily view of scheduled jobs, and supports dragging-and-dropping to the schedule.

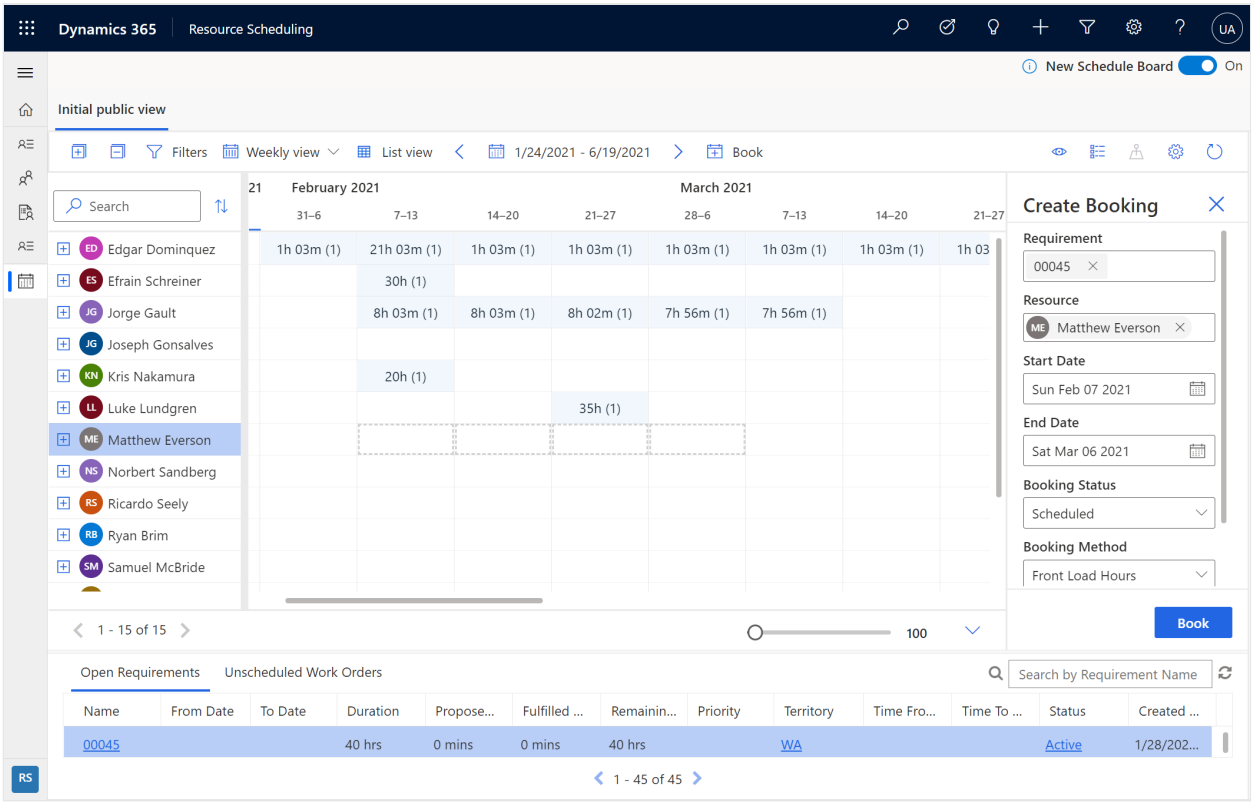


Scheduled requirements with a short duration will display across the entire day to make it easier to view details. Hover over the requirement or double-click it to see the actual duration.



Weekly and monthly views

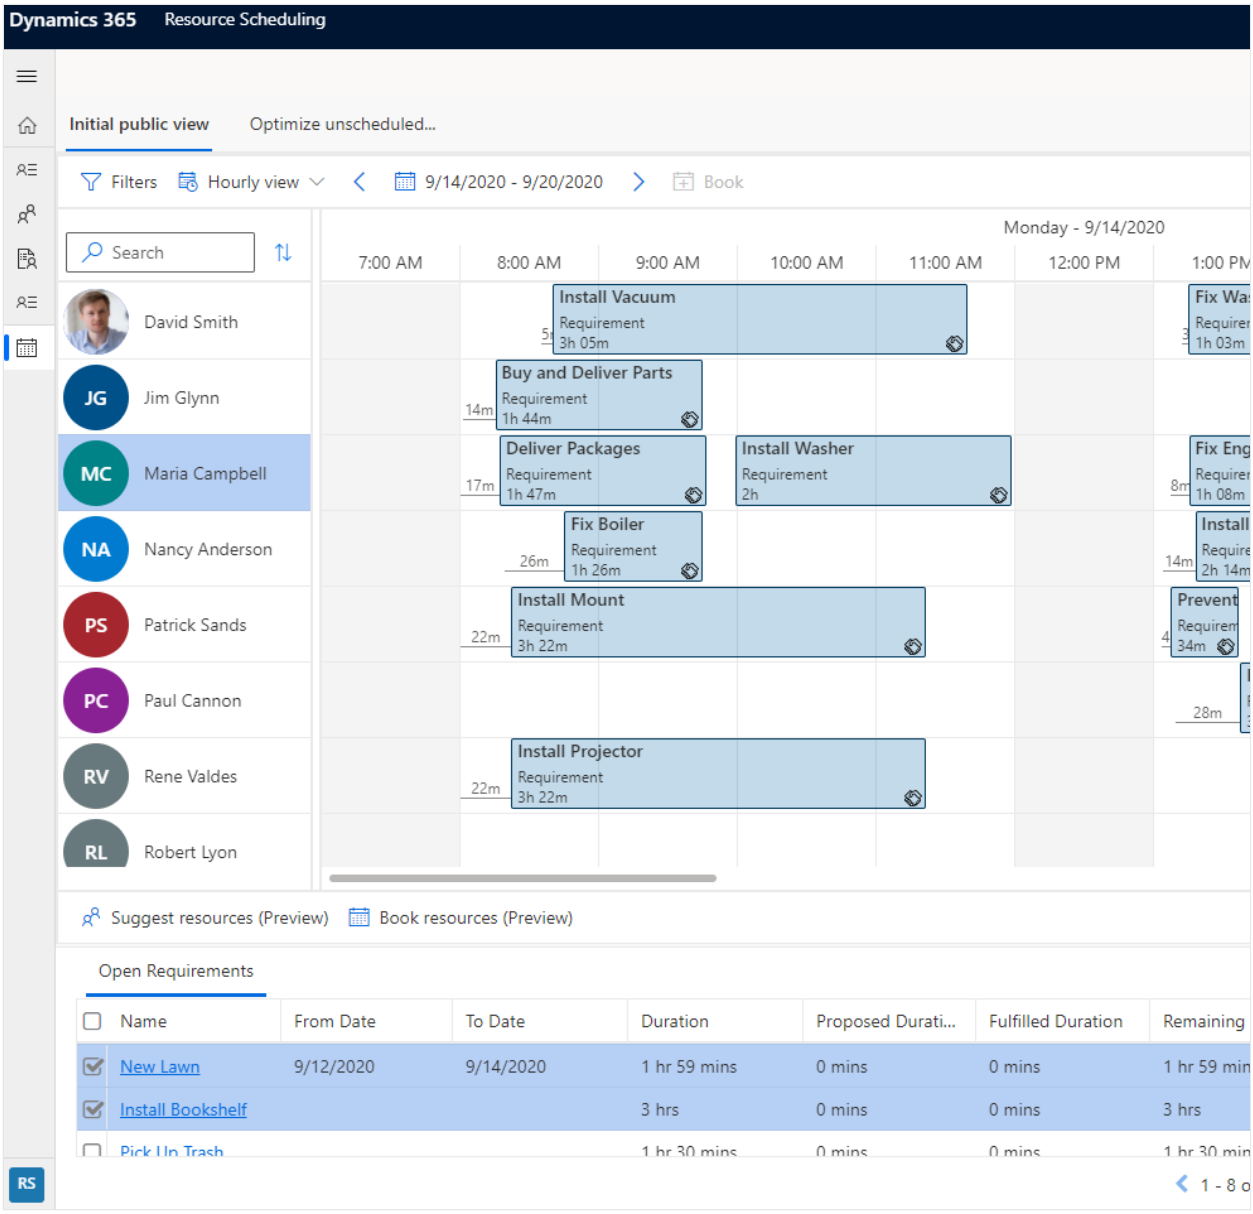
Switch to the weekly or monthly views to see scheduled jobs at a higher level. Select a resource's time slot and a requirement below to trigger the booking panel.



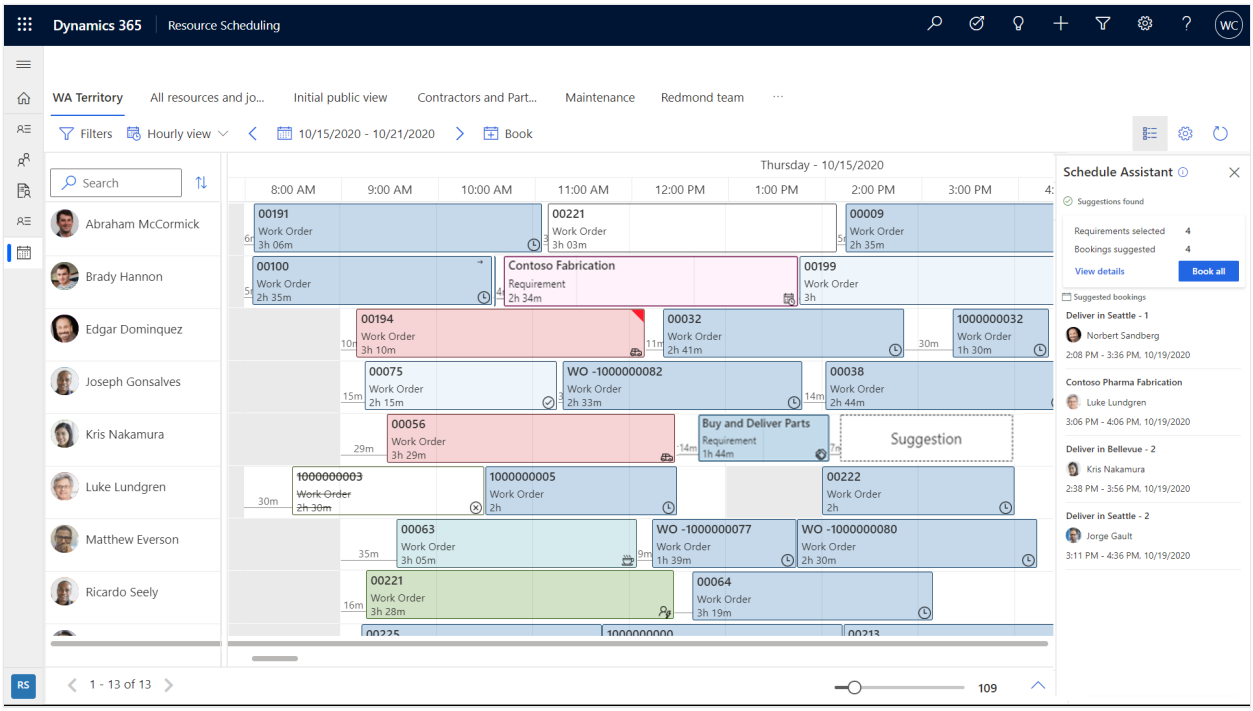
The booking panel will help you schedule a service activity across multiple days and choose how the work should be divided each day.

Schedule resources

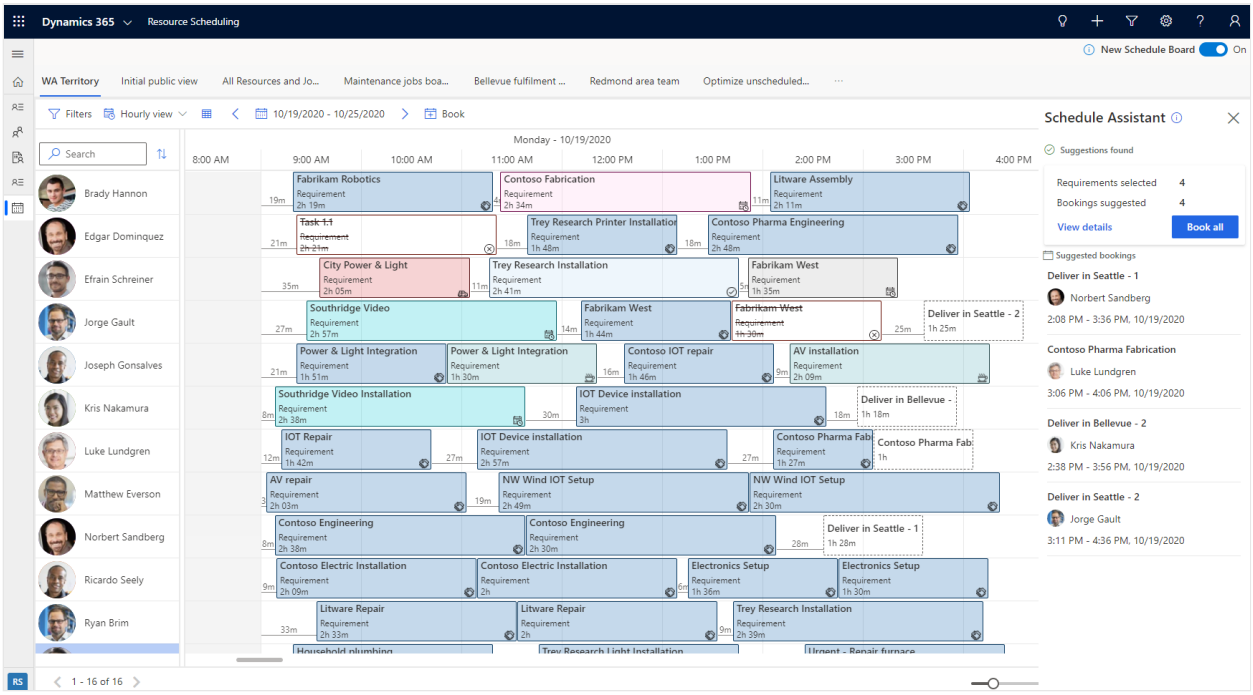
Beyond manual drag-and-drop scheduling, organizations that use resource scheduling optimization can select one or more requirements from the new schedule board and either have the system **Suggest resources** or **Book resources**. This feature is currently in Preview for the organizations that are using Resource Scheduling Optimization.



Selecting **Suggest resources** will display recommended resources in the right panel for the scheduler to book.



Selecting **Book resources** will find the most optimal resources and book them without further actions from the scheduler.



Suggest resources and **Book resource** capabilities on the new schedule board are currently only available for organizations using resource scheduling optimization.

Sometimes you might need to optimize only a single resource's schedule, rather than a set of available resources. Single resource optimization provides a quick way to reoptimize a resource's schedule and travel route after schedule changes have occurred during the day. This functionality is available on the new schedule board. You can right-click a resource from any schedule board view, and then select **Optimize Schedule**.

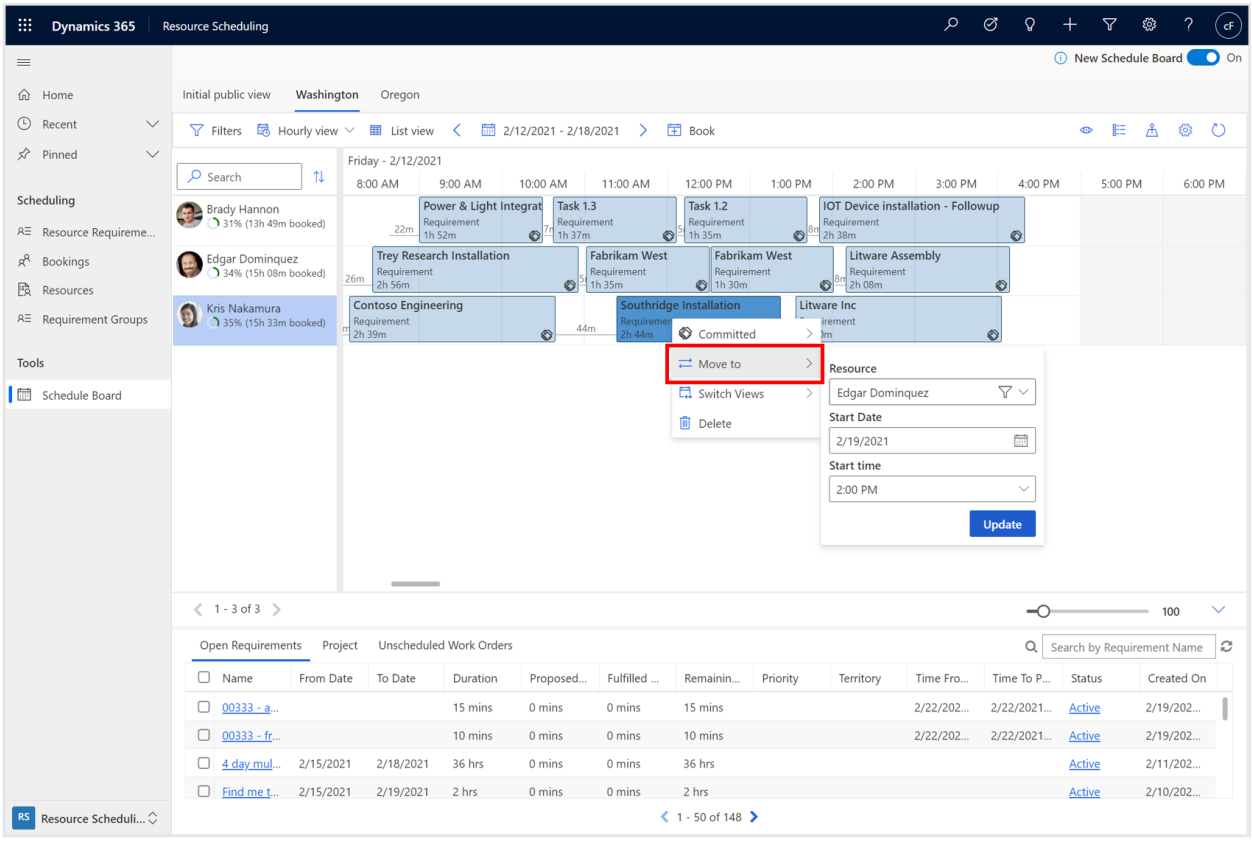
Move bookings to a new resource, a new start date and time, or both

With Customer Service, the new schedule board provides an easy way to reassign and reschedule bookings in the same action. Bookings can be moved to resources on the current schedule board tab, or to resources on other schedule board tabs.

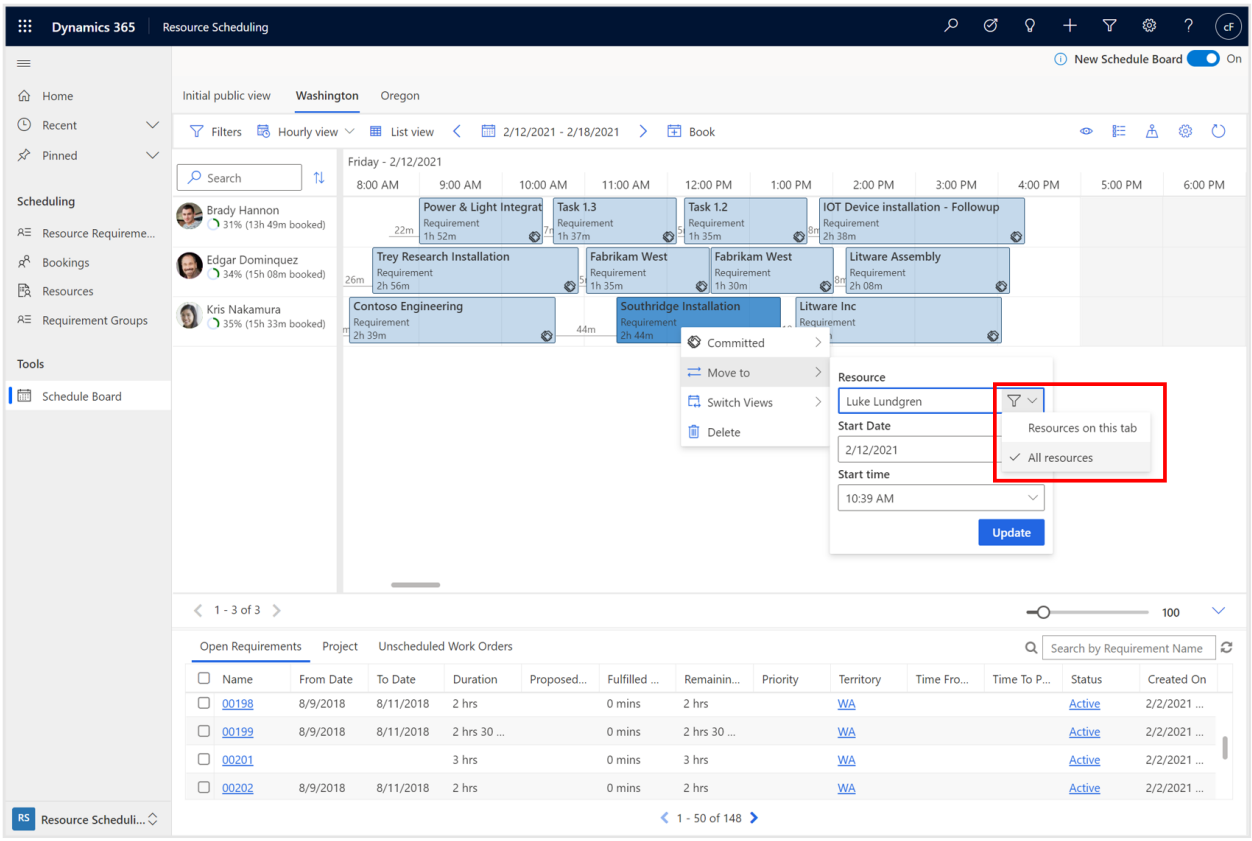
Move a booking to a resource on the current schedule board tab, or change the start date/time, or both

1. Right-click a booking, and then select **Move to**.
2. Reassign the booking to any resource on the current schedule board tab, or change the start date and the start time of the booking.
3. Select **Update** to apply the changes.



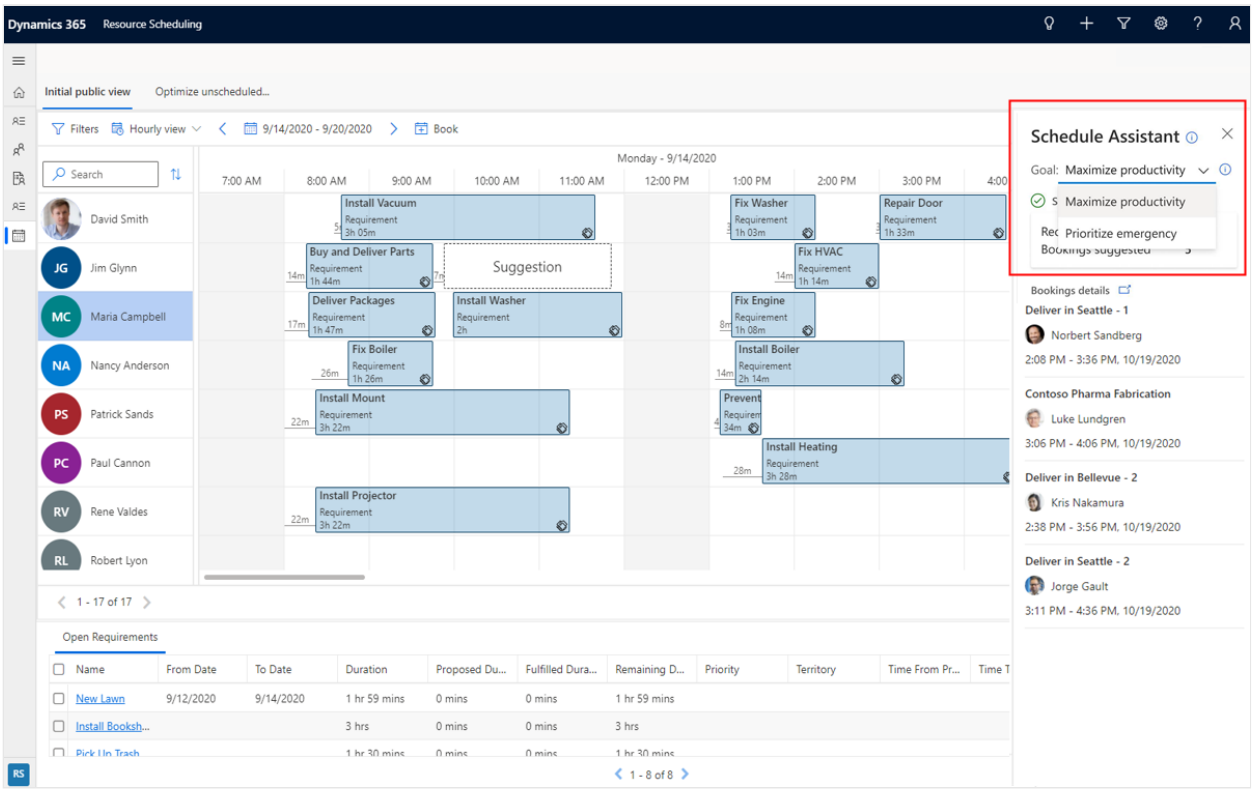
Move a booking to a resource on a different schedule board tab, or change the start date or time, or both

1. Right-click the booking, and then select **Move to**.
2. Select the filter icon in the resource field, and then change the filter from **Resources on this tab** to **All resources**. Now, you can reassign this booking to any resource on any tab, and change the start date and start time of the booking.
3. Select **Update** to apply the changes.



Automatic scheduling with optimization goals

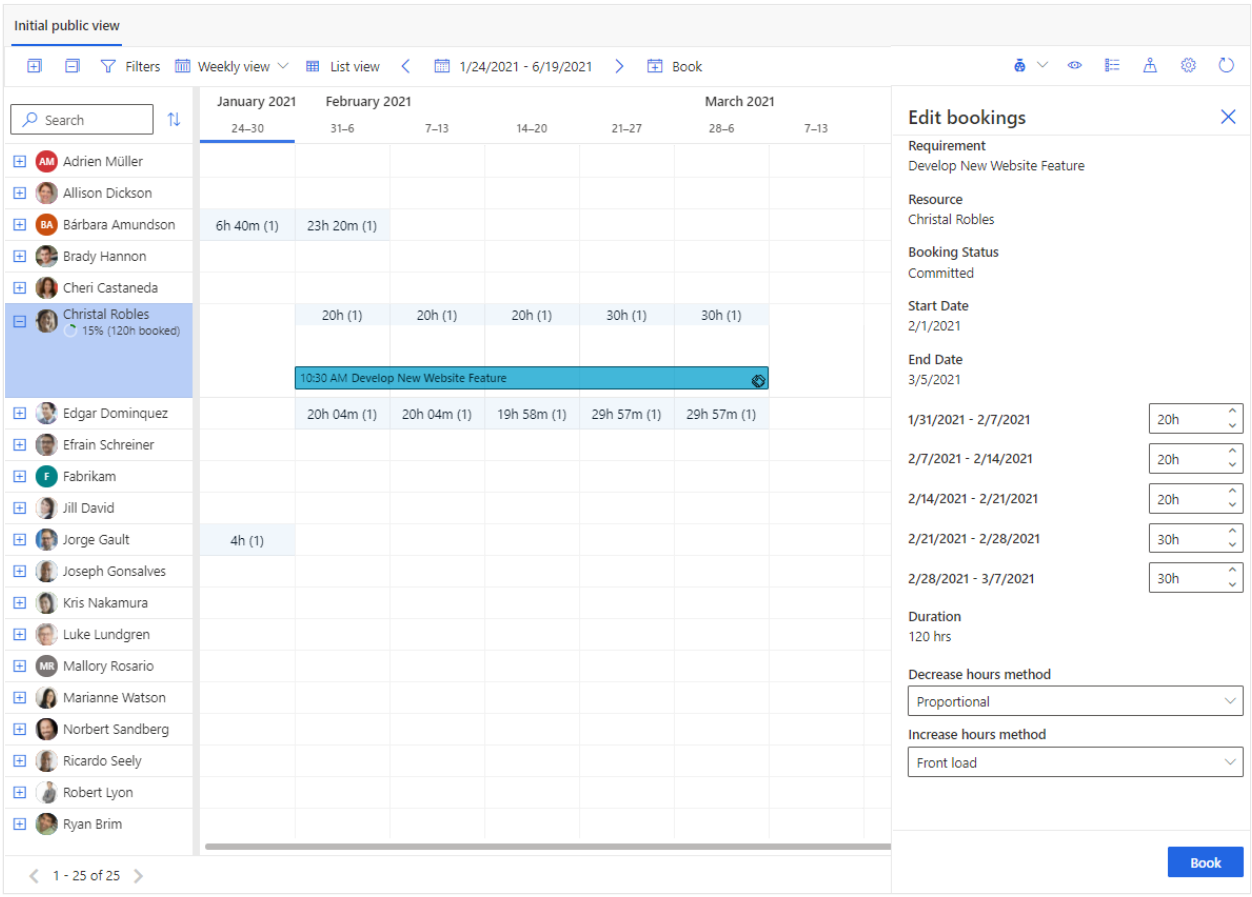
The schedule board supports optimization goals. After selecting suggested resources, schedulers can edit the optimization goal, which dictates how resources are recommended.



There's a default optimization goal that applies to the entire system and serves as the default for optimization requests. Schedulers can also edit the default optimization goal for each schedule board. Finally, schedulers can edit the optimization goal for a single optimization request by selecting **Suggest Resources**.

Edit multi-day bookings

After you've created a multi-day booking across multiple days, weeks, or months, you can right-click the booking, select edit, and change how many hours are assigned for each day, week, or month via the booking panel on the right.



Use the appointments feature in resource scheduling

Organizations often use appointments in Dynamics 365. For example, an agent might create a service appointment to help a customer with an issue. Other examples include organizations creating appointments because of integrations with other systems.

Dynamics 365 Appointments (Microsoft Dataverse appointments) can be displayed on the Customer Service schedule board alongside bookings, and can be considered during scheduling to understand whether an agent or bookable resource is available.

For information on how to configure and use appointment scheduling, see Include appointments in scheduling.

Configuration considerations

- The new schedule board is currently supported on Microsoft Edge, Chrome, and Firefox browsers.

When to use the new versus current schedule board

The new schedule board is recommended for manual scheduling scenarios and for organizations that want to get up and running with a scheduling solution for schedulers. The new schedule board is designed and built to deliver improved performance and usability. Users who perform drag-and-drop scheduling or users who only need to see the schedule board can use the new schedule board during preview. Also, organizations using resource scheduling optimization should consider using the new schedule board because the resource scheduling optimization capabilities are embedded.

The in-market schedule board is recommended for more complex scheduling scenarios like assisted scheduling, multi-resource scheduling, using requirement groups, and so on.

Use the following feature comparison table to understand which version of the schedule board is right for your business.

Feature	Category	New schedule board	Old schedule board	Details
Manual scheduling	Scheduler	Yes	Yes	Scheduler can manually select a resource and create a booking for an unscheduled requirement by interactions like dragging and dropping the requirements, selecting an open timeslot, and using booking panel.
Assisted scheduling	Scheduler	2021 release wave 2	Yes	Scheduler can select an unscheduled requirement on the requirement panel and select "Find Availability," which opens up the schedule assistant view, and shows the available timeslots for the available resources. Scheduler can choose a timeslot and create a booking.

Feature	Category	New schedule board	Old schedule board	Details
Automated scheduling	Scheduler	For existing resource scheduling optimization customers, public preview is available.	No	The default capabilities of resource scheduling optimizer functionality are made available in the schedule board, enabling schedulers to manage schedules from a requirement's or resources point of view with the organization's business goals applied automatically by the optimizer.
Auto update travel time	Scheduler	Yes	Yes	When a booking is manually scheduled or rescheduled via drag-and-drop, the travel time from the resource's previous location is automatically calculated and displayed in the front of the booking.
View modes - Hourly, daily	Scheduler	Yes	Yes	Show the resources and their bookings on the hourly and daily views of the schedule board.
View modes - Weekly, monthly	Scheduler	Yes	Yes	Show the resources and their bookings on the weekly and monthly views of the schedule board.
View types - List view	Scheduler	Yes	Yes	List view is a simple view, in which bookings of the resources are shown as a simple list. This list view provides accessible view to the Users to browse and create Bookings
View types - Map view	Scheduler	Yes	Yes	
View types - Details view	Scheduler	2021 release wave 2	Yes	Details view is a configurable view, to show and add details of a resource, requirement, or a booking record.
Multi-resource scheduling	Scheduler	2021 release wave 2	Yes	Requirement groups allow you to define groups of resources that would be appropriate for a job and to then schedule all those resources with a single search. With requirement groups, you can mix and match the different types of resources—such as individual field technicians, a whole crew, equipment, or facilities—needed for a job

Feature	Category	New schedule board	Old schedule board	Details
Multi-day assisted scheduling	Scheduler	2021 release wave 2	Yes	Service activities and scheduling requirements can be scheduled across multiple days and weeks. A common example is scheduling a 40-hour service activity across an entire work week where the field technician is expected to perform more detailed work at the same location each day.
Multi-day manual scheduling	Scheduler	Yes	Yes	Service activities and scheduling requirements can be scheduled across multiple days and weeks. A common example is scheduling a 40-hour service activity across an entire work week where the field technician is expected to perform more detailed work at the same location each day.
Pools and crews	Scheduler	2021 release wave 2	Yes	Resource pool scheduling allows you to assemble groups of similar resources to manage capacity and give schedulers the option to assign specific resources at a later time. Resource crews allow schedulers to search and schedule multiple resources at once. Crews can include a group of employees, subcontractors, equipment, facilities, or any combination thereof who will perform the same work during a period of time. Crews speed up and simplify the scheduling process and allow team members to work together more consistently.
Configuration	Admin	2021 release wave 2	Yes	Admin can create new tabs on the schedule board and configure changes on the board, tab settings, and scheduler settings

Feature	Category	New schedule board	Old schedule board	Details
Extensibility	Admin	2021 release wave 2	Yes	Admin can extend the schedule board and use extensibility on some of features like Custom Booking template (Hours) - HTML Custom Booking alerts - HTML Custom Resource Cell Template - HTML Custom Filter Layout - Universal FetchXML SB/SA Retrieve Resources Query - Universal FetchXML SB/SA Retrieve Constraints query - Universal FetchXML Custom Web resource support Client Extensions (support for JavaScript, style sheets, and Localizations files) Booking Rules (Support for custom business logic via JavaScript on the booking creation)

Continue to use the current schedule board for common functions like:

- Creating and deleting schedule board tabs.
- Schedule board tab settings.
- Schedule board configurations like number of days in a view or applying filter territories.

Add new schedule board to custom sitemap area

When using a custom sitemap or an app module, you'll need to update the sitemap to consume the new schedule board preview.

The following snippet is what it looks like before:

```
<SubArea Id="msdyn_ScheduleBoardSubArea" ResourceId="SitemapDesigner.NewSubArea"
VectorIcon="$webresource:msdyn_/Icons/SVG/Calendar.svg"

```
msdyn_scheduleboardtoggle
```

Additional notes

- The schedule board is only supported in Unified Interface web, and not on tablets or phones.
- The booking status colors that appear on the schedule board have lower opacity than the defined booking status colors. This behavior is similar to the Outlook calendar. When a booking is selected on the schedule board, the booking color will appear with normal opacity.

Uninstall the schedule board

To uninstall the new schedule board solution ("Resource Scheduling Controls"), perform the following steps.

1. Go to the **Schedule Board Settings** entity customization form.
2. Remove the new schedule board preview control from the grid.
3. Save and publish the changes.
4. Go to the resource scheduling app, clear the browser's cache, and reload schedule board. The old schedule board will load without the toggle in the top-right side of the screen.
5. Once the solution is uninstalled, the new schedule board won't be available for the environment until you upgrade your Customer Service app to the latest available version.

Schedule a service activity

Service scheduling overview

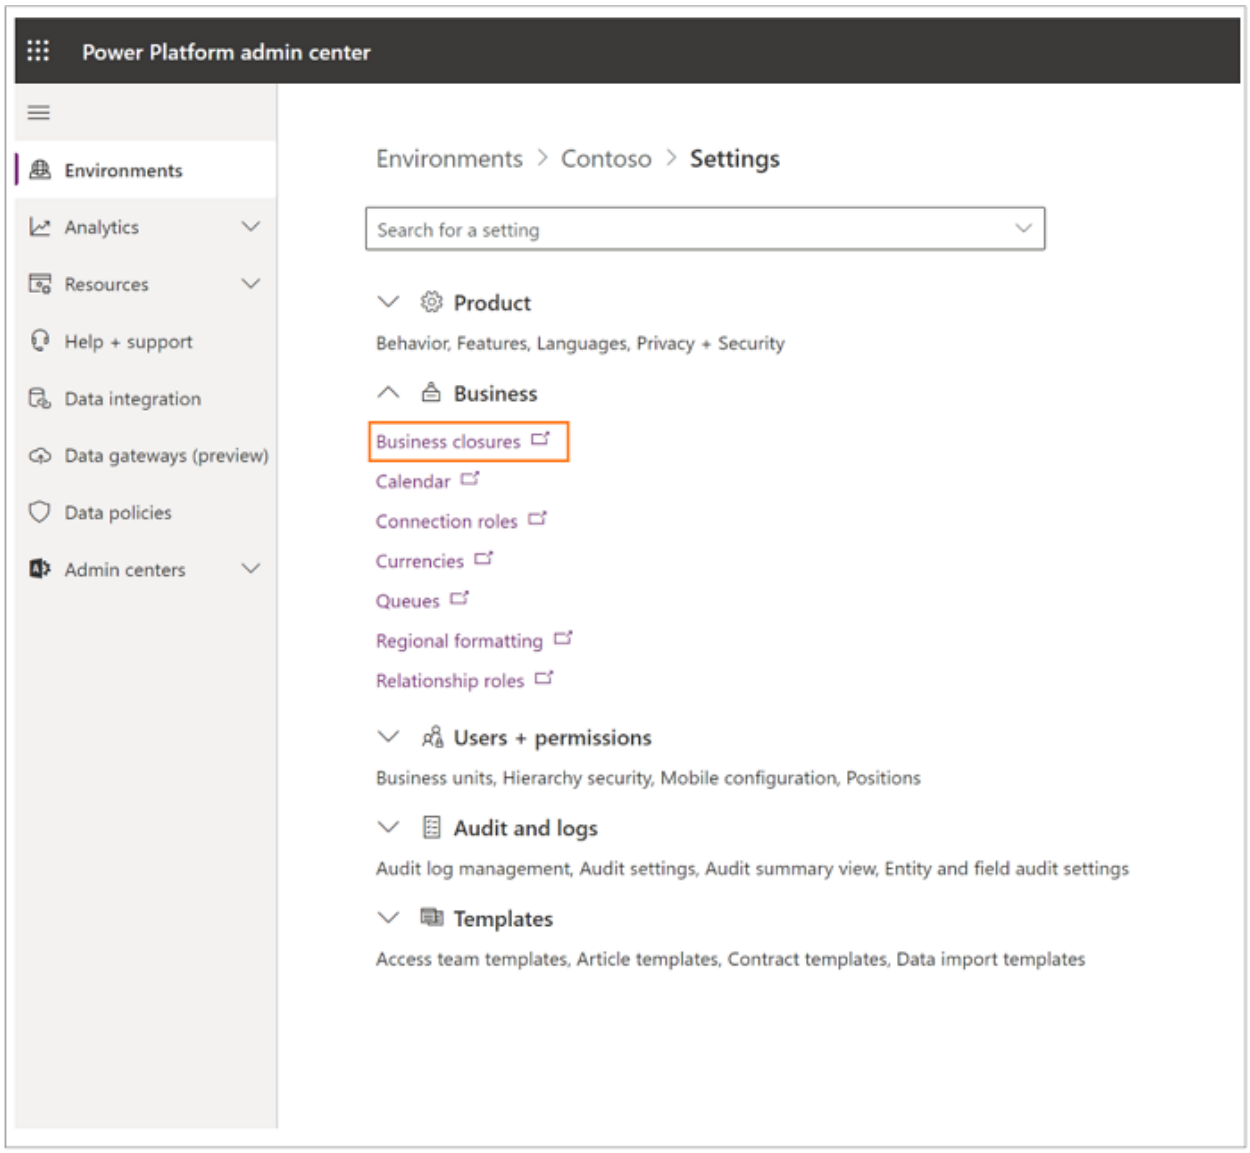
Article • 04/01/2022

Unified Interface-based service scheduling has replaced the legacy service scheduling experience.

The following topics contain information about legacy service scheduling features:

- Create or change a service
- Schedule a service activity
- Add facilities and equipment
- Create resource groups
- Use sites to manage your service locations
- Navigate to the Service Calendar
- Set up a business closure

> **Note**
>
> To set up a business closure, navigate to the **Admin portal**, as shown in the following screen.

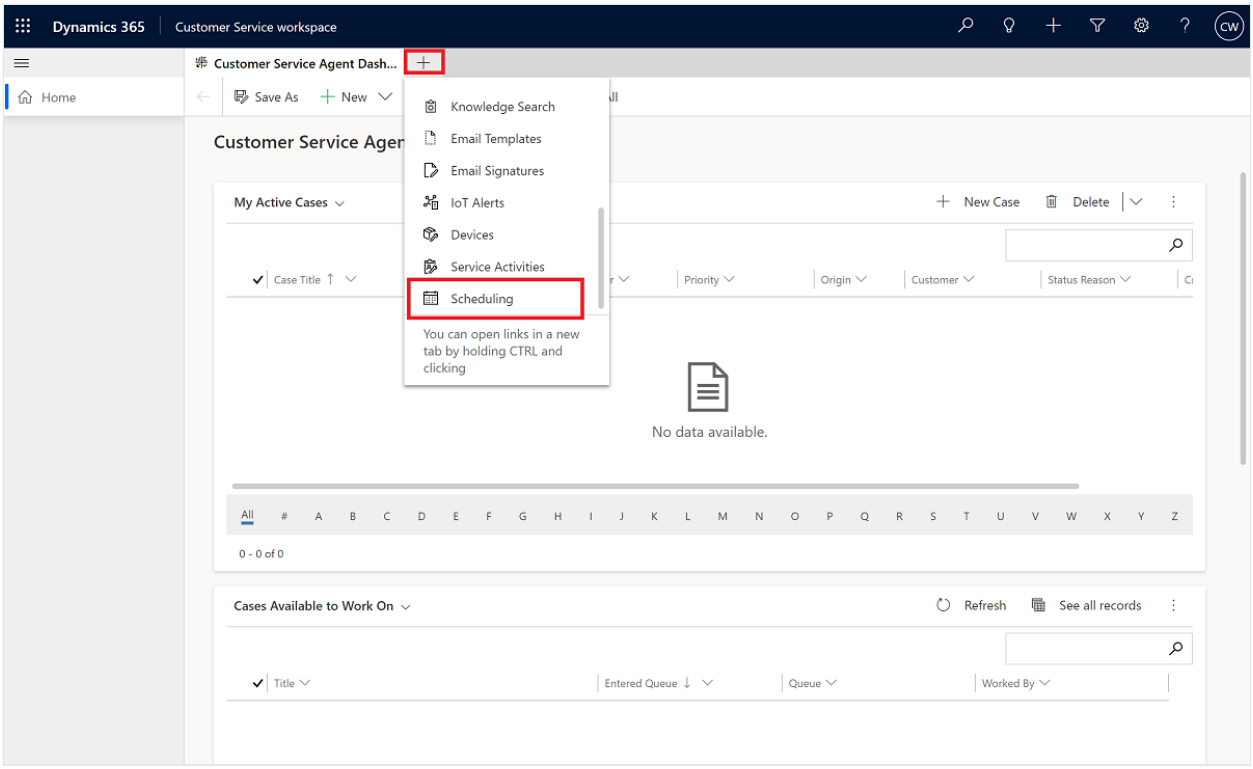


You can also set up service scheduling in Dynamics 365 Customer Engagement (on-premises) 9.1. More information: New features in Dynamics 365 Customer Engagement (on-premises)

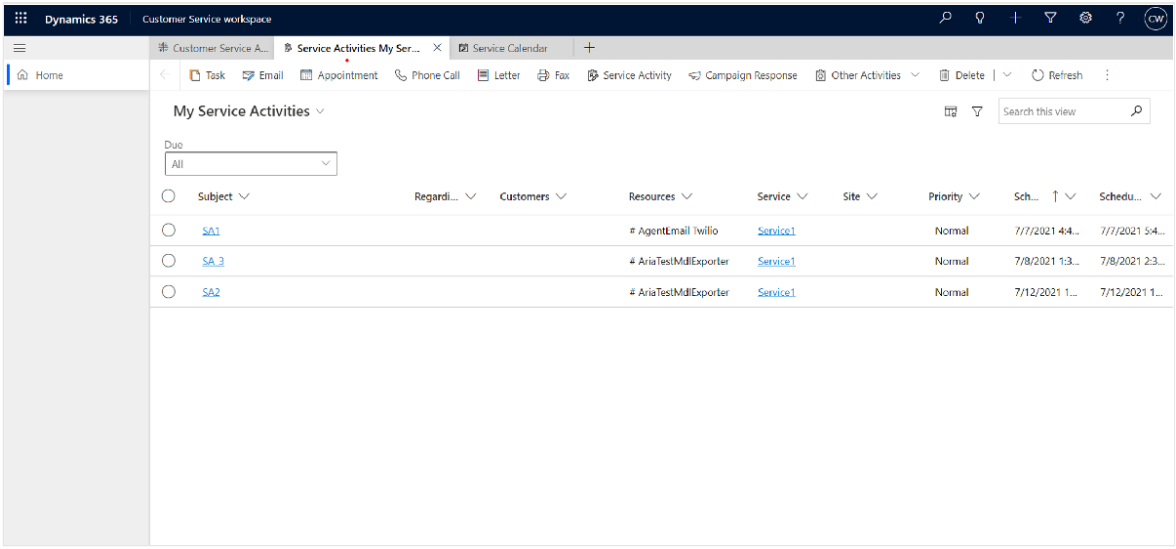
Access service scheduling in Customer Service workspace

Service scheduling is available in the Customer Service workspace app.

- Select the + icon to expand the menu to view a list of forms, views, and activities, and then select either **Service Activities** or **Scheduling** to open the feature in a new tab.



- Service Activities



- Scheduling

Create or edit a service

Article • 04/04/2022

To make scheduling services quick and easy, it's helpful to predefine the specifics of the services you'd provide to customers. By using the service records in Dynamics 365 Customer Service, you can define:

- How long a service activity lasts
- What resources are available for the service activity, like users, facilities, or equipment

A service requires at least one selection rule and one or more resources, resource groups, or teams before the service can be scheduled with a service activity.

Create or change a service

1. Make sure that you have the Manager, Vice President, CEO-Business Manager, System Administrator, or System Customizer security role or equivalent permissions.
2. Navigate to the Customer Service admin center or Customer Service Hub app, and perform the following steps:

   Customer Service admin center

   a. In the site map, select **Service Scheduling** in **Operations**. The **Service Scheduling** page appears.

   b. In the **Service** section, select **Manage**.

   The **Active Services** view is displayed. You can switch between various system views using the drop-down list.

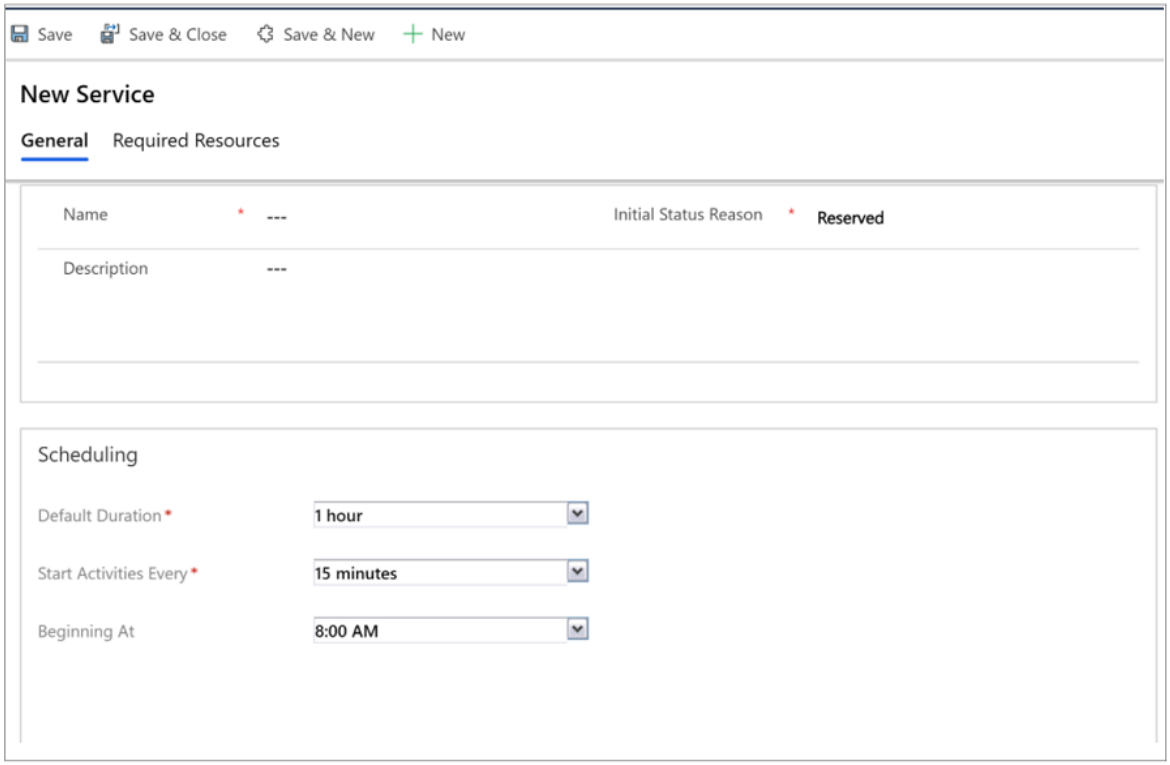
3. Do one of the following:
   - To create a new service, select **New**.
   - To edit a service, open a service from the list.
4. Type or modify information in the text boxes.

a. Under **General**, enter a name and description to reflect the specifics of the service and describes what the service is. Also, specify the initial status of the service activity when it is created. If your organization prefers to approve all service activities before committing them to the schedule, you can select **Requested** or **Tentative**.

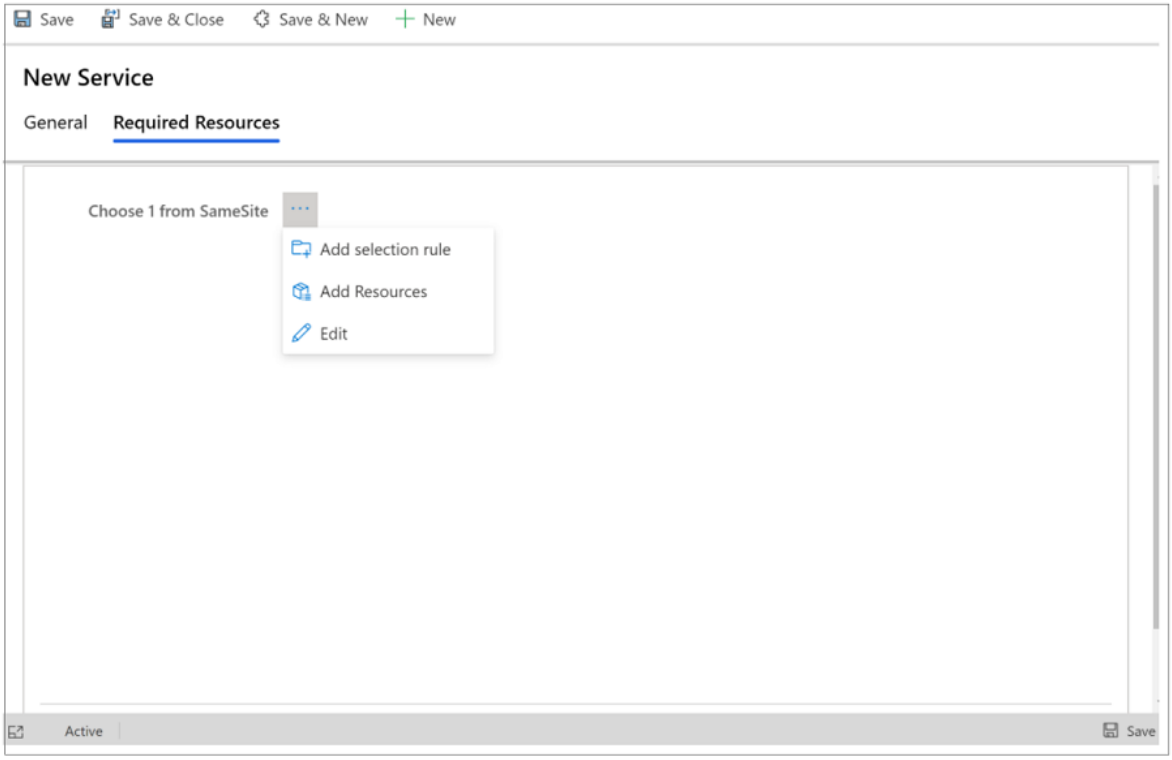
b. Under **Scheduling**, in **Default Duration**, select how long the service lasts. This can be changed when the service activity is created. The maximum duration of an appointment or service activity is 10 days.

c. In **Start Activities Every**, select how often service activities can start. This allows the start times of service activities to be staggered.

d. In **Beginning At**, select the time when the service activities must begin.



5. On the **Required Resources** tab, define a selection rule.



Option	Description
Add a Selection Rule	You can add complexity to a rule by adding a subrule to it.
Add Resources	Add users, facilities, equipment, or teams as resources to a selection rule.
Add Resource Groups	Resource groups are users, facilities, or equipment that can be scheduled interchangeably.

> **Note**
>
> You can save a service without defining a selection rule, but you won't be able to schedule that service.

6. When you're ready to save your data, select **Save**.

Activate or deactivate a service

You can make a service available or unavailable for scheduling by activating or deactivating it.

Add facilities and equipment resources

Article • 04/04/2022

Introduction

Facilities and equipment are resources you use to perform services for your customers. Facilities can be physical spaces like service bays or conference rooms, and equipment could be tools or other assets. Add these resources to Dynamics 365 Customer Service to ensure optimal services to your customers.

Add facilities or resources

Before you begin, make sure you have the **System Administrator** security role or equivalent permissions in Microsoft Dynamics 365.

1. Navigate to the Customer Service admin center or Customer Service Hub app, and perform the following steps:

   Customer Service admin center

   a. In the site map, select **Service Scheduling** in **Operations**. The **Service Scheduling** page appears.

   b. In the **Facilities/Equipment** section, select **Manage**.

      The **Local Facilities/Equipment** view is displayed. You can switch between various system views using the drop-down list.

2. Select **New**.

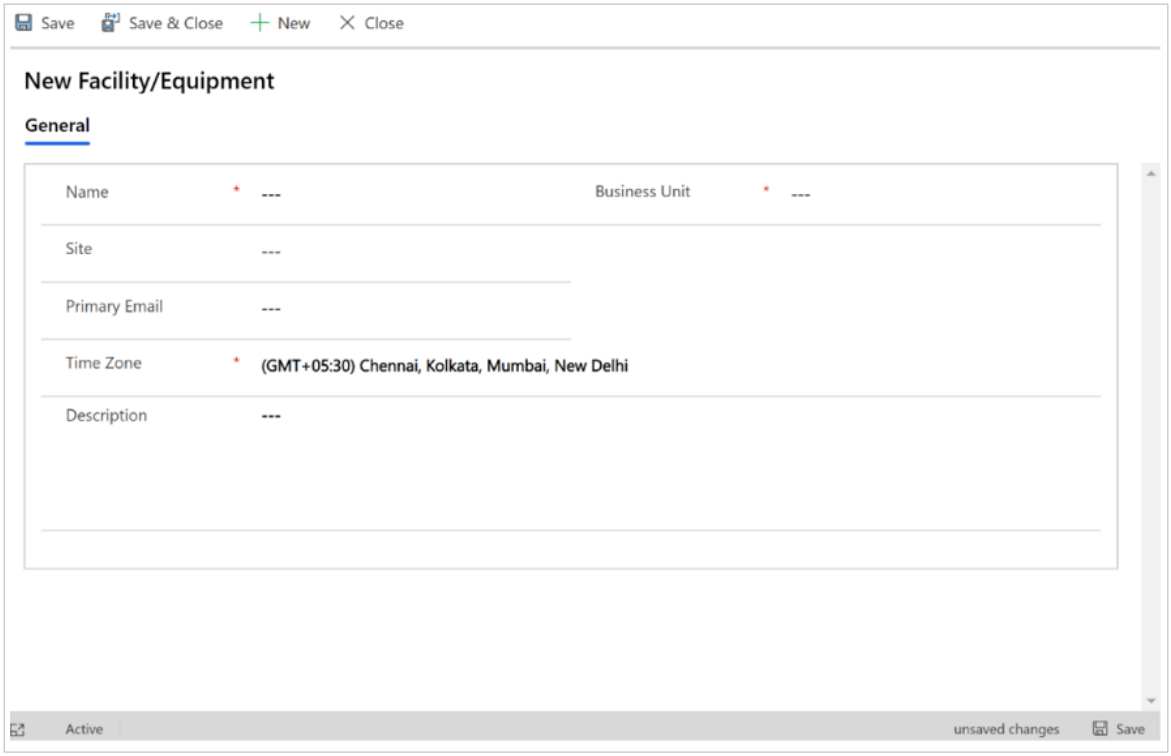
3. Fill in the information as required:

   - **Name**: Enter the name of the facility or equipment you want to add for service scheduling.
   - **Business Unit**: Dynamics 365 Customer Service enters the business unit automatically. To select a different business unit, select the **Lookup** button, and then select the business unit from the list.
   - **Site**. Select the location where the facility or equipment is located.

> **Note**
>
> Make sure the site and customer are in the same location. Resources for a given service activity should also be located at the same site.

- **Primary Email**: Enter the email address of the site manager or equipment manager. If there are any updates or cancellations related to the schedule, facilities, or equipment, notifications are sent to this email address.
- **Time Zone**: Select the appropriate time zone to determine availability for the facility or equipment. By default, this is set to the time zone you've selected in the **General** tab of the **Set Personal Options** page. More information: Set personal options
- **Description**: Add details about the facility or equipment, such as the numbers, size, make, or model.

4. When you're finished entering details, select **Save** or **Save & Close**.



5. Set up the work hour calendar.

Use the Service Schedule Activity form to schedule a service activity

Article • 11/30/2021

Use this form to search for an available time for a service activity. You can either search for an open time using search criteria that, at a minimum, includes selecting a service, or you can define a more complex set of criteria. You can also create a service activity without checking for conflicts in the scheduled service. The service activity appears as a color block on the service calendar.

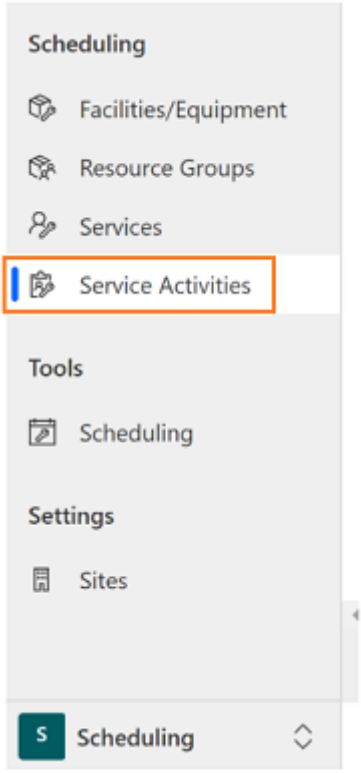
> ⓘ **Note**
>
> You can't create a recurring service activity. Individual activities are recommended.

Create a service activity

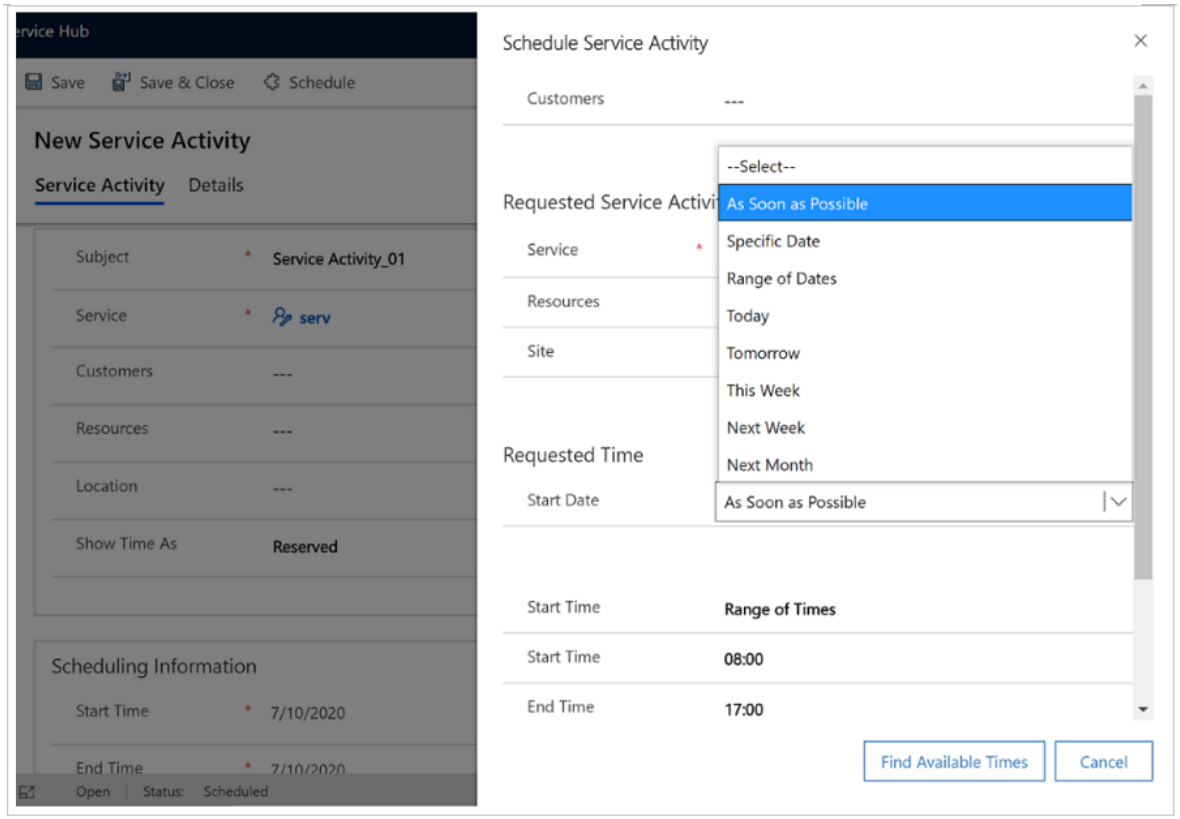
Avoid conflicts while scheduling services by finding the time the resources are available beforehand.

Before beginning to create a service activity, make sure you have the Scheduler role or equivalent permissions.

1. Navigate to **Customer Service Hub** > **Scheduling** tab.
2. Select **Service Activities**.



3. On the **Schedule Service Activity** form, select **Schedule**.



4. Under **Requested Time**, select criteria for the times you want:

- To search for a time on a specific date, in Start Date, select **Specific Date**, and then enter the date you want.

- To search within a range of dates, select **Range of Dates**, and then enter the **On or After** and **On or Before** dates. You can also select specific days of the week.
- You can also search for times based on dates relative to the current date, such as **Today**, **Tomorrow**, **This Week**, **Next Week**, or **Next Month**.
- Similarly, to search within specific range of time, in **Start Time**, select **Specific Time**, **Range of Times**, or **Morning, Evening, Afternoon**.
- Do not clear the **Use Default Duration** check box or change the duration unless you want to schedule more time than the default duration of the service. The maximum duration of a service activity is 10 days.

5. Select **Find Available Times**. The next available times are shown.
6. Under **Available Times**, select the time for which you want to schedule the service activity, and then select **Schedule**.

   The Schedule Service Activity form closes, and the application fills in the information from the selected time in the Service Activity form.
7. Type or modify information in other text boxes, as required.
8. When you're ready to save your data, select **Save**.

   The service activity appears as a color block on the Service calendar.

Create resource groups

Article • 04/04/2022

Use resource groups to group users, facilities, and equipment as part of the selection rules for a service.

Create a resource group

Before you begin, make sure you have the Scheduler Manager role or equivalent permissions.

1. Navigate to the Customer Service admin center or Customer Service Hub app, and perform the following steps:

   Customer Service admin center

   a. In the site map, select **Service Scheduling** in **Operations**. The **Service Scheduling** page appears.

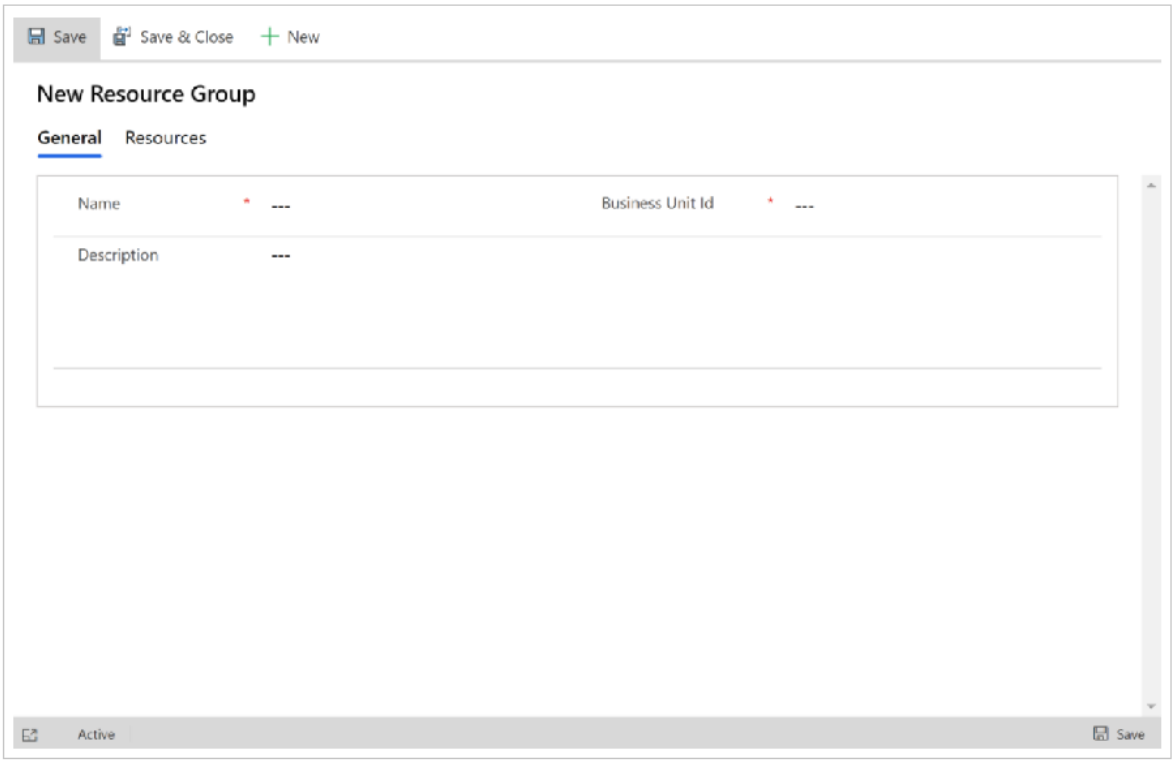
   b. In the **Resource group** section, select **Manage**.

      The **Local Resource Groups** view is displayed. You can switch between various system views using the drop-down list.

2. Select **New**.

3. In the Resource Groups form, enter information in the following fields:

   - **Name**: You must enter a name for the resource group. The application does not check that the name is unique.
   - **Business Unit**: To locate and select a business unit, select the Lookup button.
   - **Description**: You can add a detailed description of this resource group, including the criteria that you used to determine which resources to add to the resource group.

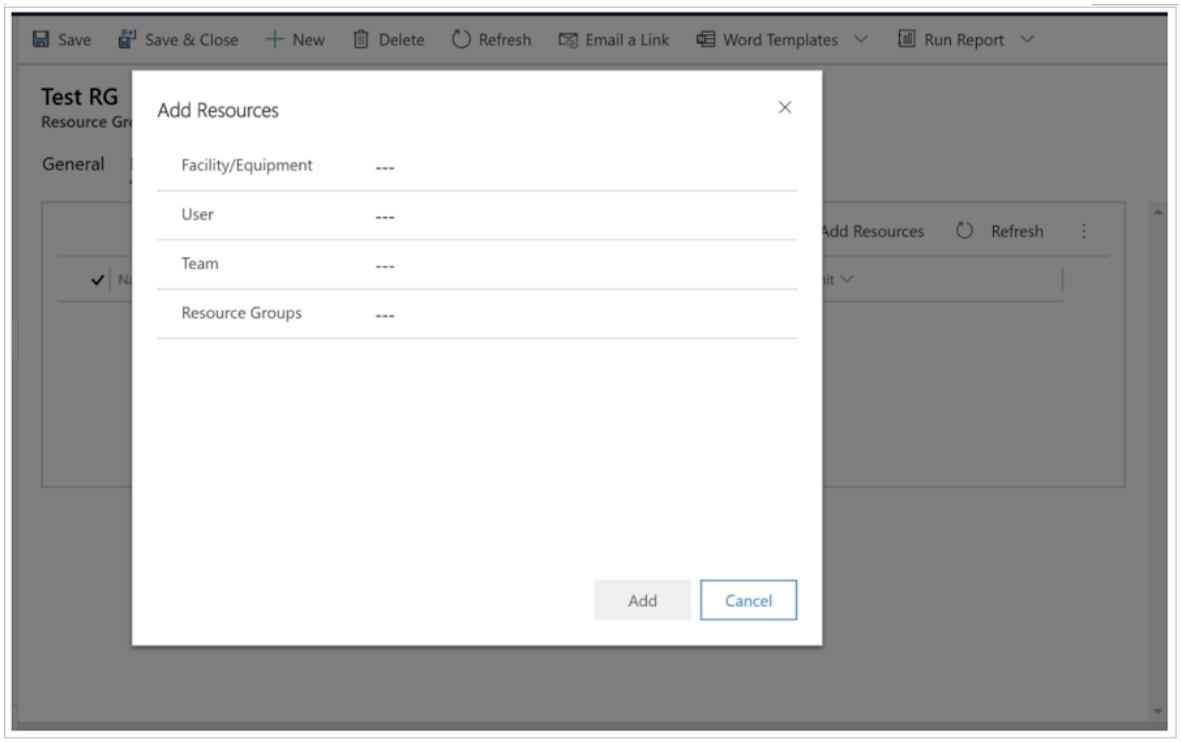


4. Select **Save**. After you save the record, **Resources** appears under **Common**.

5. Select **Resources**, and then on the **Actions** toolbar, select **Add Resources**.

6. In the **Look Up** dialog box, select the users, facilities/equipment, teams, or other resource groups to add to this resource group.

   Adding other resource groups to a resource group is a good way to manage large numbers of resources. For example, you could add the resource groups of "senior technicians" and "junior technicians" to a resource group of "technicians."



7. Select **OK** to add the selected resources to the resource group.

8. Select **Save** or **Save and Close**.

Edit a resource group

1. Navigate to either on the Customer Service Hub or on Customer Service admin center app. Depending on your app, perform the following steps:

   Customer Service admin center

   a. In the site map, select **Service scheduling** in **Operations**.

   b. In the **Resource group** section, select **Manage**.

      The **Local Resource Groups** view is displayed. You can switch between various system views using the drop-down list.

2. Open the resource group you want to change, and then in the **Resource Groups** form, change the information.

3. Select **Save** or **Save and Close**.

Navigate the service calendar

Article • 06/28/2022

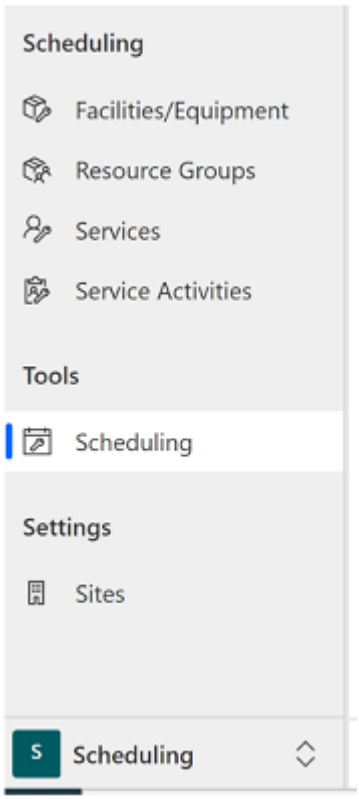
In the Service calendar, you can do the following tasks and activities:

- View your organization's hourly schedule of appointments and service activities.
- View work schedules and service activity schedules for a variety of resources.
- Create new appointments and schedule service activities.
- Change the status of an existing service activity.
- Search for conflicts in the schedule.

You can't customize the service calendar or change the default view with the application. However, you can ask your system administrator to change the colors of the time blocks.

View resources in the service calendar

1. Navigate to **Customer Service Hub** > **Scheduling** tab.

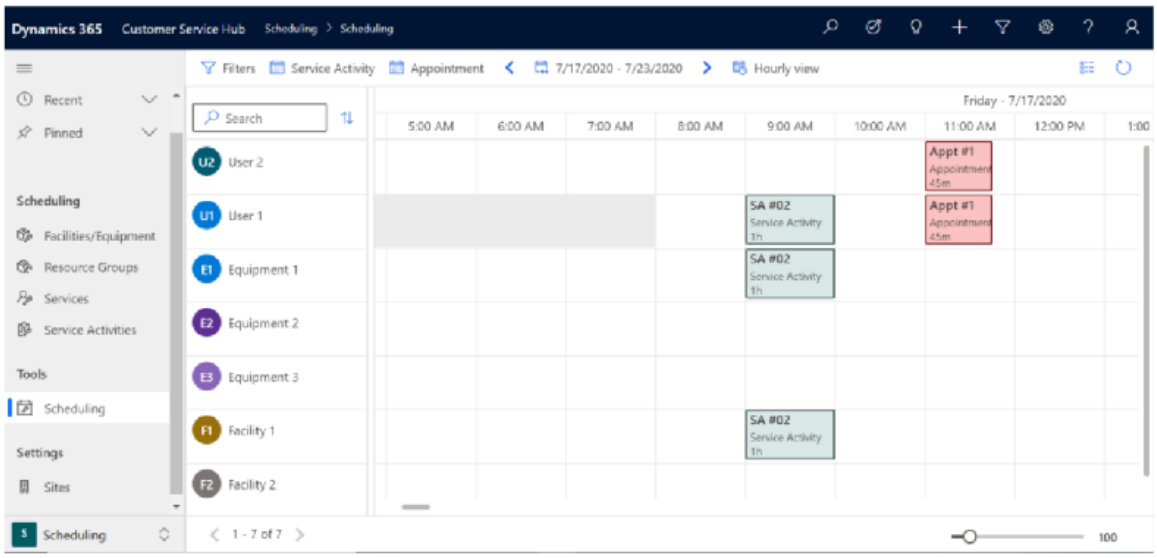


2. Under the Tools section, select the service calendar. A list of resources opens in alphabetical order on the left side of the calendar.

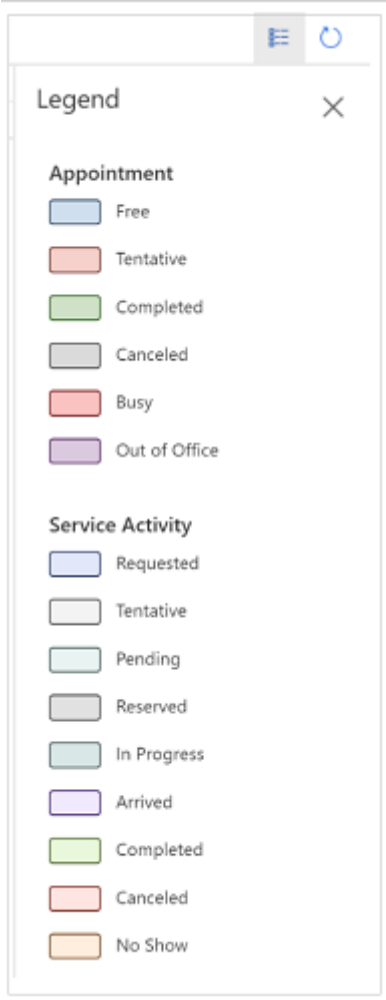
3. To view the resources, appointments, and service activities for anyone in your organization, in the **Type** list, select **Resource**, and then in the **View** list, select the resource view.

4. To find a specific resource, in the **Search** field, enter the first few letters of a name.

5. To change how much of the calendar is available to view, use the **Zoom** scale.



Calendar legend of colors and statuses



View resources in a list view (Preview)

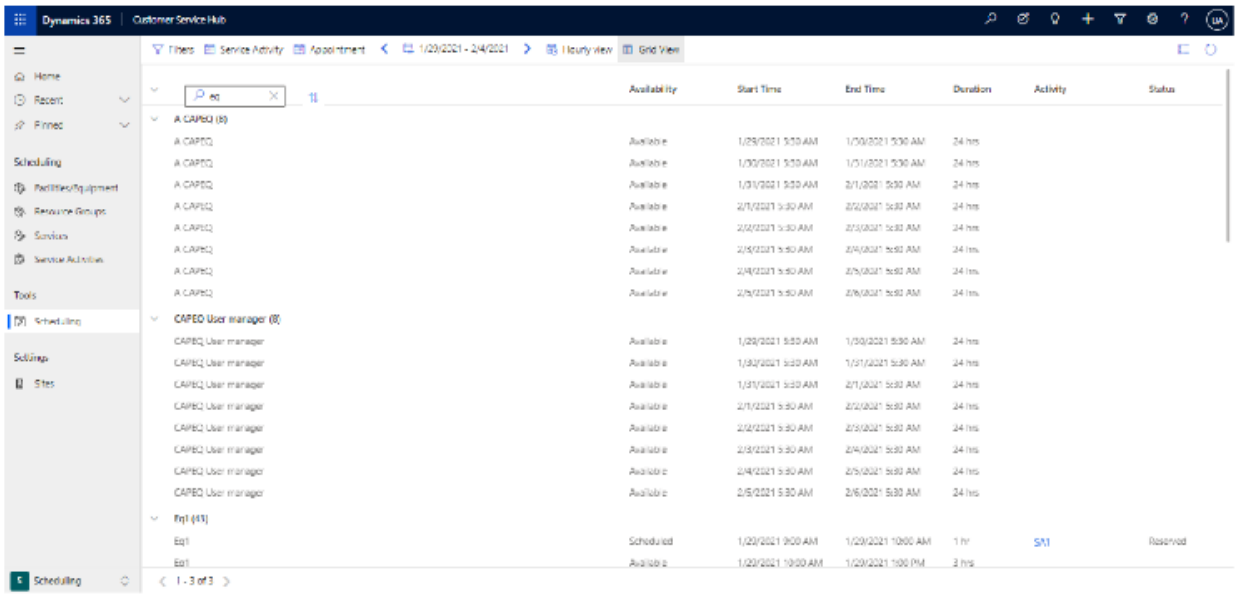
Important

- This topic is pre-release documentation and is subject to change.
- A preview is a feature that is not complete, as it may employ reduced privacy, security, and/or compliance commitments, but is made available before it is officially released for general availability so customers can get early access and provide feedback. Previews are provided "as-is," "with all faults," "as available," and without warranty.
- This preview feature does not come with technical support and Microsoft Dynamics 365 Technical Support won't be able to help you with issues or questions. If Microsoft does elect to provide any type of support, such support is provided "as is," "with all faults," and without warranty, and may be discontinued at any time.
- Previews are not meant for production use, especially to process Personal Data or other data that is subject to heightened compliance requirements,

and any use of "live" or production data is at your sole risk. All previews are subject to separate **Terms and Conditions**.

You can view the number of records in a list by selecting **List view**.

Users who use keyboard shortcuts or a screen reader can access the information in **List view**. Switch to **List view** to see the availabile resources and bookings in a list format.



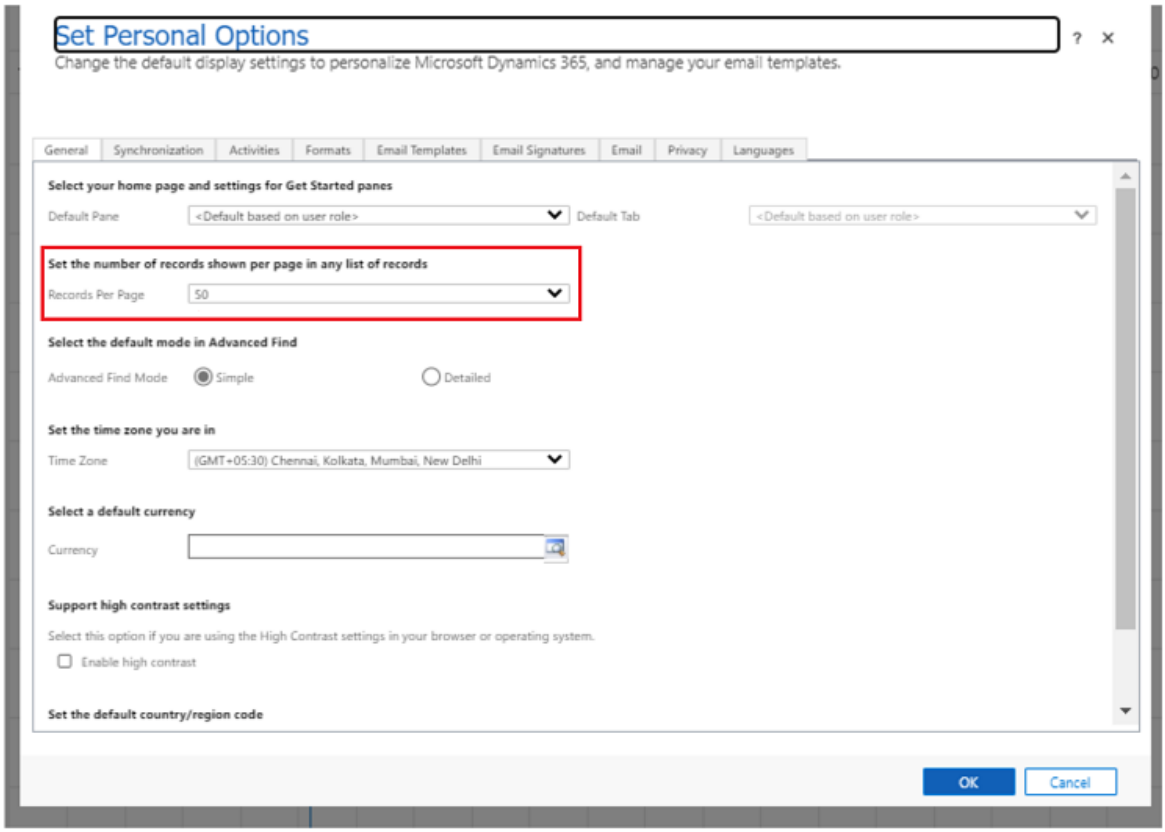
Configure the number of records shown (Preview)

> **ⓘ Important**
>
> This topic is pre-release documentation and is subject to change.

Administrators can configure the number of records that are listed in the resources view as follows:

1. In Dynamics 365 Customer Service, select the **Settings** icon in the upper-right corner of the page.

2. Select **Options**, and then on the **General** tab, set **Records per page** to the maximum value you want to show on the page. The value can be set from 50 to 250 records.



3. When you're done, select **OK**.

   The selected number of records is listed for the user.

Service Scheduling features for legacy users

Article • 08/09/2022

The legacy Service Scheduling experience is currently being deprecated in alignment with the expected Unified Interface transition date of 12/01/2020. More information: Legacy web client is deprecated. Because of this change, there are currently two approaches you can take to transition to a new scheduling experience. More information: Overview of Service Scheduling migration options.

The following topics contain information about legacy Service Scheduling features:

Set up business closure
Set work hours to define availability
Create or change a service
Schedule a service activity
Add facilities and equipment for Service Scheduling
Create resource groups
Use sites to manage your service locations

Set when your business is closed (Customer Service app)

Article • 08/13/2022

Prevent scheduling resources on holidays and other nonworking days by defining business closures in Dynamics 365 Customer Service. You can set both the days and times that your organization will be closed.

> **ⓘ Important**
>
> With the latest release of Dynamics 365 Customer Service app, the new Service Scheduling is now available in the Customer Service Hub sitemap. We recommend that you set business closures using the new experience. More information: **Set when your business is closed**

1. Make sure you have the Schedule Manager Security role or equivalent permissions to update the business closures.

   ### Check your security role

   - Follow the steps in View your user profile.
   - Don't have the correct permissions? Contact your system administrator.

2. go to **Settings** > **Service Management**
3. Select **Business Closure**.
4. To create a new business closure, on the command bar, select **New**.

   -OR-

   To edit an existing business closure record, open it from the list.

5. In the **Schedule a Business Closure** dialog box, type or modify information in the text boxes:

   a. In the **Name** box, type a name that describes the purpose of the closure.

      The first 12 characters of the name appear on each day of the closure on the calendar view of the affected resource's **Work Hours**.

b. In the **Start Time** and **End Time** boxes, enter the start and end date for the closure.

c. If you want to enter duration instead of an end time, select the length of the closure in the **Duration** box. The application automatically calculates the end time for you.

d. If the closure is an all-day event, select the **All Day Event** check box. The application automatically enters the duration of *1 day*.

   If you want to enter a specific time period, clear the **All Day Event** check box. You can then specify the hours during which your organization will be closed.

6. To save this business closure, select **OK**.

Set work hours to define availability (Customer Service app)

Article • 06/02/2021

You can set up and define the hours a resource is available. By default, the resources are set up for a 7-days-a-week, 24-hour schedule.

> **ⓘ Important**
>
> In the new scheduling experience, you can set work hours for resource types in the **Resources** entity. To know more about setting up work hours, see **Set work hours for the resources**.

Set work hours for a facility or equipment

Make sure that you have the required security role or equivalent permissions.

More information: Manage security roles in service scheduling

1. Go to **Settings** > **Business Management**.
2. Select **Facilities/Equipment**. In the list, open the resource record you want modify.
3. Select **Work Hours**.
4. On the **Monthly View** tab, double-click a date on the calendar that is the first day you want the new schedule to start, or any date that will be affected by the new schedule.
5. In the **Edit Schedule** dialog box, select one of the following, and then select **OK**.
    - **This date only**

      This option changes only the date selected.

      Skip to step 10.
    - **From <this date> onward**

      This option changes only the schedule going forward.
    - **Entire recurring weekly schedule from start to end**

This option changes this entire schedule from the start to end date.

Selecting this option might change past days, which could affect reports regarding hours worked in the past.

6. In the **Weekly Schedule** dialog box, in the **Set the recurring weekly schedule** section, select one of the following:

   - **Are the same each day**

     The new schedule is the same for every day of the week. After you select this option, select the days of the week that the resource is available.

   - **Vary by day**

     The new schedule is different for one or more days of the week. After you select this option, select the days of the week that the resource is available.

   - **None. Resource is not working**

     The new schedule includes time that the resource is not working.

   In the **Weekly Schedule** dialog box, you can also do any of the following:

   - If the schedule is for more than one day, select the days of the week that this schedule is effective.

   - If the resource does not work during business closures, select the **Observe** option.

   - Under **Date Range**, in the **Starting on** box, you can change the date the schedule starts.

     You cannot change the date the schedule ends. To end a schedule, you must define a new schedule on that date.

7. Choose the work hours link for the schedule you want to modify.

   If work hours have not been set previously, the link is displayed as "Set Work Hours."

8. In the **Set Work Hours and Service Restrictions** dialog box, complete the following fields, and then select **OK**:

   - **Date**

     Select a date from which the work hours for services are to be considered.

- **Start**

  Select the time the work day starts.

- **End**

  Select the time the work day ends.

  To add a break in the work hours, such as a lunch break, select **Add Break**, and then select the start and end time of the break.

9. To define a time when a service will not be available, on the **Service Restrictions** tab, select **New**. In the **Edit a Service Restriction** dialog box, select the service, and select the start and end time between which the service will be unavailable, and then select **OK**.

10. Select **Save and Close** to close the **Weekly Schedule** dialog box.

> **Note**
>
> - You can set the work hours for a single day by double-clicking the day, and then in the **Edit Schedule** dialog box, select **This date only**, then select **OK**. Then, perform step 10 in the procedure.
> - All of the options may not be available to you for selecting how much of the schedule you want to edit. The available options are based on the schedules that are already set up.

Article • 08/13/2022

To make scheduling services quick and easy, it's helpful to predefine the specifics of the services you'd provide to customers. By using the service records in Dynamics 365 Customer Service, you can define:

- How long a service activity would last
- What resources are available for the service activity, like users, facilities, or equipment

A service requires at least one selection rule and one or more resources, resource groups, or teams before the service can be scheduled with a service activity.

> **ⓘ Important**
>
> With the latest release of Dynamics 365 Customer Service app, the new Service Scheduling is now available in the Customer Service Hub sitemap. We recommend that you create services using the new experience. More information: **Create or change a service**

Create or change a service

1. Make sure that you have the Manager, Vice President, CEO-Business Manager, System Administrator, or System Customizer security role or equivalent permissions.
2. Go to **Settings** > **Business Management**.
3. Select **Services**.
4. To create a new service, select **New**.

   -OR-

   To edit a service, open a service from the list.
5. Type or modify information in the text boxes.

a. Under **General**, enter a name and description to reflect the specifics of the service and describe what the service is. Also, specify the initial status of the service activity when it is created. If your organization prefers to approve all service activities before committing them to the schedule, you can select **Requested** or **Tentative**.

b. Under **Scheduling**, in **Default Duration**, select how long the service lasts. This can be changed when the service activity is created. The maximum duration of an appointment or service activity is 10 days.

c. In **Start Activities Every**, select how often service activities can start. This allows the start times of service activities to be staggered.

d. In **Beginning At**, select the time when the service activities must begin.

6. In the **Required Resources** area, define a selection rule:

   a. Select a selection rule in the right-hand pane.

      Selection rules appear in the tree beside the **Selection Rule** button .

   b. Select one of the items under **Common Tasks** to define the selection rule by indicating how many resources are required and in what combination.

Add a Selection Rule

You can add complexity to a rule by adding a subrule to it.

Add Resources

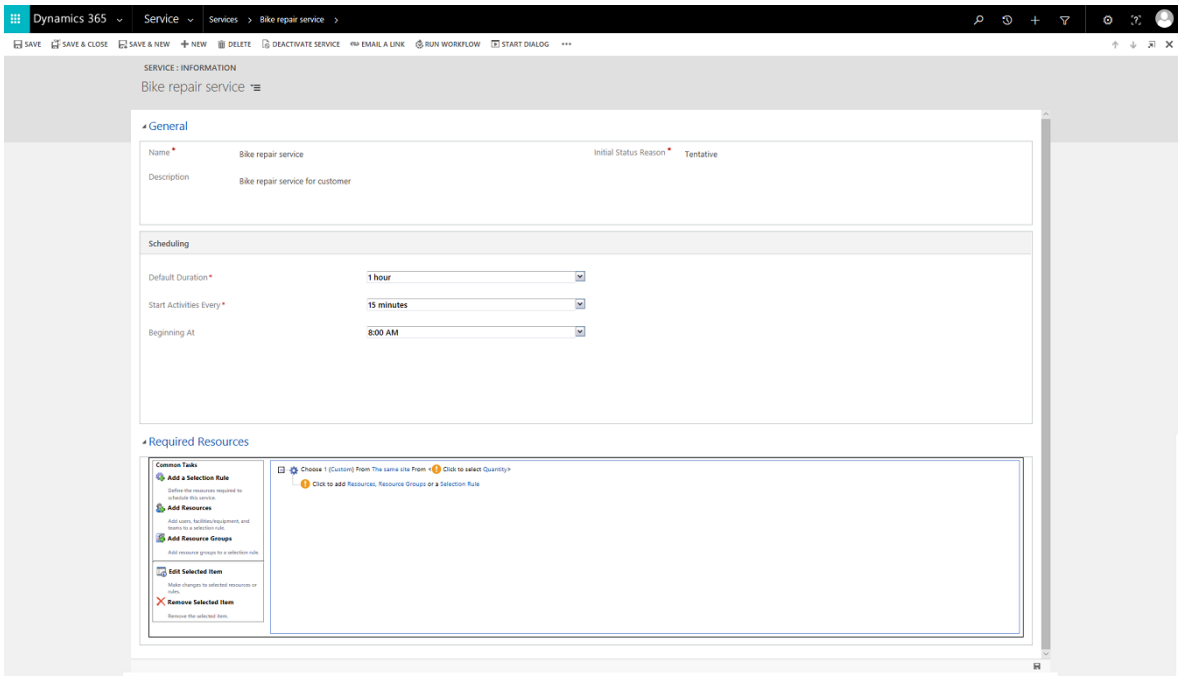
Add users, facilities, equipment, or teams as resources to a selection rule.

Add Resource Groups

Resource groups are users, facilities, or equipment that can be scheduled interchangeably.

> ⓘ **Note**
>
> You can save a service without defining a selection rule, but you won't be able to schedule that service.
> More information: **Create or edit a selection rule**

7. When you're ready to save your data, select **Save**.



Activate or deactivate a service

You can make a service available on unavailable for scheduling by activating or deactivating it. To do this, in the list of service records, select a service, then select **More Actions** > **Activate** or **More actions** > **Deactivate**.

Schedule a service activity (Customer Service app)

Article • 06/02/2021

Use this form to search for an available time for a service activity. You can either search for an open time using search criteria that, at a minimum, includes selecting a service, or you can define a more complex set of criteria. You can also create a service activity without checking for conflicts in the scheduled service. The service activity appears as a color block on the service calendar

> **Note**
>
> With the latest release of Dynamics 365 Customer Service app, the new Service Scheduling is now available in the Customer Service Hub sitemap. We recommend that you create service activities using the new experience. More information: **Schedule a service activity**

You can't create a recurring service activity and it is recommended to create individual service activities as per requirement.

> **Important**
>
> While creating a service activity, when you select resources manually and the system is unable to find a correct selection rule for the selected resources, you see the following error:
>
> Can't determine the correct selection rule for one or more selected resources.
>
> In that case, you can either reselect the resources from the selection rule or ignore the error and select Save. If you choose to save, 1 unit of capacity is depleted for the unresolved resources.

Use the following links to learn more about service scheduling using service activity:

Navigate the service calendar
Find the next available time before creating a service activity
Force an activity into a time slot
Create a selection rule to determine how resources are selected for service activities (Customer Service app)

Add facilities and equipment for service scheduling (Customer Service app)

Article • 03/14/2022

Facilities and equipment are resources you'd use to perform services for your customers. Facilities can be physical spaces like service bays or conference rooms and equipment could be tools or other assets. Add these resources to Dynamics 365 Customer Service to ensure optimal services to your customers.

> **Important**
>
> With the latest version of Dynamics 365 Customer Service app release, the new Service Scheduling is now available in the Customer Service Hub sitemap. We recommend that you create facilities and equipments using the new experience. More information: **Add facilities and equipments to schedule service**

Add a facility or equipment

1. Make sure you have the System Administrator security role or equivalent permissions in Microsoft Dynamics 365.

   ### Check your security role

   - Follow the steps in View your user profile.
   - Don't have the correct permissions? Contact your system administrator.

2. go to **Settings** > **Service Management**

   -OR-

   Go to **Settings** > **Business Management**.

3. Select **Facilities/Equipment**.

4. On the command bar, select **New**.

5. Fill in the information as required:

   - **Name**. Enter the name of the facility or equipment you want to add for service scheduling.

- **Business Unit**. Dynamics 365 Customer Service enters the business unit automatically. To select a different business unit, select the **Lookup** button and then select from the list.
- **Site**. Select the location where the facility or equipment is located.

  > **Tip**
  >
  > Make sure the site and the customer are in the same location. Resources for a given service activity should also be located at the same site.

- **Primary Email**. Enter the email address of the site manager or equipment manager. If there are any updates or cancellations related to the schedule, facilities, or equipment, notifications are sent to this email address.
- **Time Zone**. Select the appropriate time zone to determine availability for the facility or equipment. By default, this is set to the time zone you've selected in the **General** tab of the **Set Personal Options** dialog box. More information: Set personal options
- **Description**. Add details about the facility or equipment, such as the numbers, size, make, or model.

6. When you're done, select **Save** or **Save and Close**.

Basics of service and service scheduling

Create or change a resource group (Customer Service app)

Article • 08/13/2022

Use resource groups to group users, facilities, and equipment as part of the selection rules for a service.

> **Note**
>
> With the latest release of Service Scheduling, Resource Groups are referred as Resource Categories. More information: **Create and manage resource categories**

1. Go to **Settings** > **Business Management**.
2. Select **Resource Groups**.
3. On the Actions toolbar, select **New**.
4. In the **Resource Groups** form, enter information in the following fields:
    - **Name**

      You must enter a name for the resource group. The application does not check that the name is unique.
    - **Business Unit**

      To locate and select a business unit, select the **Lookup** button .
    - **Description**

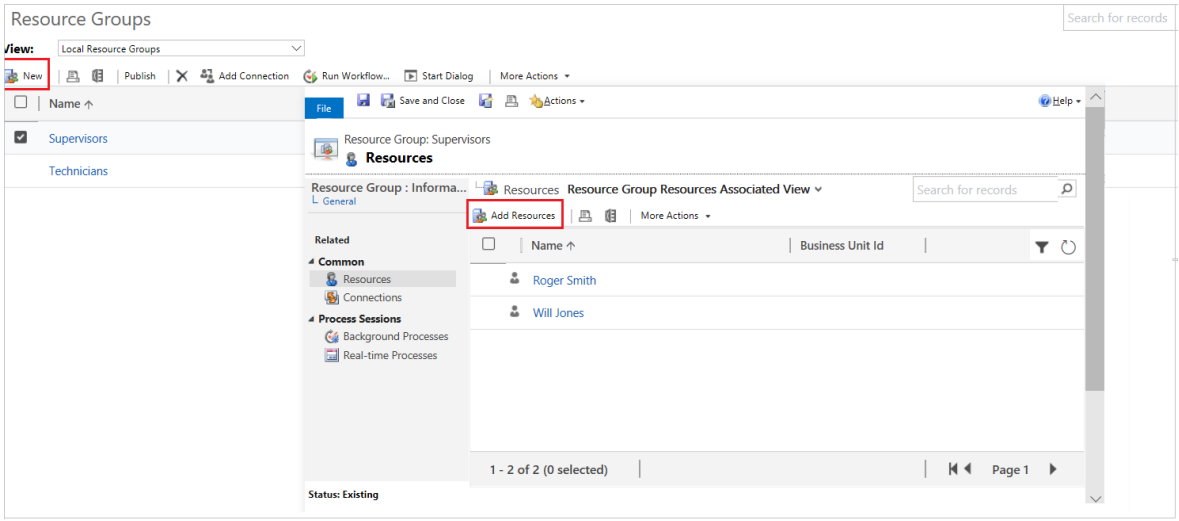
      You can add a detailed description of this resource group, including the criteria that you used to determine which resources to add to the resource group.
5. Select **Save**.

   After you save the record, **Resources** appears under **Common**.
6. Select **Resources**, and then on the Actions toolbar, select **Add Resources**.
7. In the **Look Up** dialog box, select the users, facilities/equipment, teams, or other resource groups to add to this resource group.

Adding other resource groups to a resource group is a good way to manage large numbers of resources. For example, you could add the resource groups of "senior technicians" and "junior technicians" to a resource group of "technicians."

8. Select **OK** to add the selected resources to the resource group.

9. Select **Save** or **Save and Close**.



Edit a resource group

1. Go to **Settings** > **Business Management**.

2. Select **Resource Groups**.

3. Open the resource group you want to change.

4. In the **Resource Groups** form, change the information.

5. Select **Save** or **Save and Close**.

> **Note**
>
> Resource groups are published automatically when you save and close the form. If the new resource group doesn't appear in the list of available resource groups for a service, or if changes are not appearing, you can manually publish the change by selecting **Publish** on the **Resource Groups** page.
>
> To remove a resource, select the resource you want to remove from the resource group. On the Actions toolbar, select **More Actions**, and then select **Remove Resources**.

Installing a solution or publishing customizations can interfere with normal system operation. We recommend that you schedule a solution import when it's least disruptive to users.

Use sites to manage your service locations (Customer Service app)

Article • 08/13/2022

Create sites to define the locations where you provide service to your customers. When you're scheduling resources, you can define which resources will work on which site.

> **ⓘ Important**
>
> With the latest release of Dynamics 365 Customer Service app, the new Service Scheduling is now available in the Customer Service Hub sitemap. We recommend that you create using the new experience. More information: **Create and manage organizational units**

1. Make sure that you have the System Administrator or System Customizer security role or equivalent permissions.
2. Go to **Settings** > **Business Management**.
3. Select **Sites**.
4. On the Actions toolbar, select **New**.
5. Fill in your information. Use the handy tooltips as a guide.
6. Select **Save**.
7. To add resources, under Common, select **Resources**, and then select **Add Resources**.
8. In the **Look Up Records** dialog box, in the **Look For** drop-down list, you can add facilities/equipment or users as resources.
9. From the list of records, double-click a resource, and select **Add**.
10. Select **Save and Close**.

Service scheduling FAQ

Article • 06/02/2021

Read this topic to find answers to some common questions regarding service scheduling, its legacy experience and new experience, setup, and other key concepts.

What licenses do I need to enable service scheduling for my org?

The new scheduling experience is available to you if you have one of the following licenses:

- D365_ENTERPRISE_P1 – Customer Engagement
- D365_ENTEPRISE_CS – Customer Service
- D365_ENTERPRISE_CM – Case Management

Is the new scheduling experience automatically available with the next Dynamics 365 Customer Service upgrade?

Scheduling in the Customer Service Hub is a customer-driven update. You need to avail and enable the service scheduling package, which also includes the Universal Resource Scheduling (URS) functionality.

More information: Set up the scheduling experience

Is manual selection of resources supported in a service activity in the new scheduling experience?

While creating a service activity, manual selection of resources is not supported in the new scheduling experience in Customer Service Hub.

How do I install Core Service Scheduling from the Power Platform admin center?

For steps on how to install Core Service Scheduling from the Power Platform admin center, see Install Service Scheduling from Power Platform.

Service Scheduling Guide

Search resource availability and create bookings for requirement groups

Article • 10/07/2022

Use the Search Resource Availability for Requirement Group API and the Create Requirement Group Bookings API to book the resources that meet the needs you identify in your requirement groups.

- The Search Resource Availability for Requirement Group API returns available time slots for resources when you search by using requirement groups.
- The Create Requirement Group Bookings API uses the available time slots for resources to generate booking records for your requirement groups.

You pass the details of a requirement group in your API calls and retrieve a list of available resources and their open time slots. This is helpful for self-scheduling scenarios, where a user wants to view the availability of resources, or for portal scheduling scenarios where a customer wants to view resource availability from a website or app.

Prerequisites

- Dynamics 365 version 9.0 or above with Universal Resource Scheduling version 3.12.x.x

Search Resource Availability for Requirement Group API

Use the following input and output parameters for the Search Resource Availability for Requirement Group (**msdyn_SearchResourceAvailabilityForRequirementGroup**) API.

Parameters

Name	Type	Required	Description
Version	String	Yes	The version number of the API. The version number identifies the version of the API that should be invoked. The version number is a semantic version number of the format major.minor.patch. The request does not have to contain the complete version number.
RequirementGroup		Yes	An entity reference to the requirement group entity.
RequirementSpecification	Integer	No	If left null, respects the targeting requirement group duration by default.
Settings	`Entity<InputSettings>`	No	Sets the settings for the request.

Inputsettings

Name	Type	Required	Description
ConsiderSlotsWithLessThanRequiredDuration	Boolean	No	Specifies if a time slot with less than the required remaining duration should be considered when computing potential time slots. It is false by default.
ConsiderSlotsWithOverlappingBooking	Boolean	No	Specifies if time slots with overlapping bookings should be considered when computing potential time slots. It is false by default.
ConsiderSlotsWithProposedBooking	Boolean	No	Specifies if time slots with proposed bookings should be considered when computing potential time slots. It is false by default.
MaxResourceTravelRadius	Distance	No	Specifies the maximum travel radius for resources when computing available time slots.
SortOrder	Integer	No	Specifies the requirement group order for the response.
PageSize	Integer	No	Numbers of item returned in a page. It is 20 by default.
PagingCookie	String	No	Paging cookie retrieved from previous searching result.

Name	Type	Required	Description
OrganizationUnits	List<Guid>	No	A collection of organization unit IDs. A qualified resource must be a member of one of the specified organization units.
MustChooseFromResources	List<Guid>	No	Evaluate and select results from resources in this list.
RequiredResources	List<Guid>	No	Evaluate all resources, filter the results based on this list. In general, use MustChooseFromResources instead for improved performance.
IgnoreTimeSlots	Boolean	No	Specifies if the returned time slots should be ignored. When true list of time slots returned will be empty. It is false by default.
ConsiderAppointments	Boolean	Set this to True for search resource availability API to respect existing Dataverse appointments as bookings on the resource, provided the organization and resource level settings have been set. Appointments with Busy or Completed statuses will be considered as unavailable for scheduling operations.	

Output

Returns	Name(Type)	Description
TimeSlots (List<OutputTimeSlot>)	StartTime (DateTime)	The start time.
	EndTime (DateTime)	The end time.
	ArrivalTime (DateTime)	The arrival time.
	Travel(OutputTimeSlotTravel) OutputTimeSlotTravel • Distance (Double) • TravelTime (Double) • DistanceFromStartLocation (Double) • TravelTimeToEndLocation (Double)	The time slot travel information. Will only be present if the resource requirement contains values for latitude and longitude.
	Effort (Double)	The effort/capacity.
	IsDuplicate (Boolean)	A Boolean value indicating if the time slot is a duplicate.

Returns	Name(Type)	Description
	Resource(OutputResource) OutputResource • Resource (BookableResource) • TotalAvailableTime (Double)	The Resource entity as explained below.

	Location(OutputTimeSlotLocation)
	
	OutputTimeSlotLocation:
	
	• WorkLocation (Enum):
	  ◦ Onsite (0)
	  ◦ Facility (1)
	  ◦ Location agnostic (2)
	
	• LocationSourceSlot (Enum):
	  ◦ Common (1)
	  ◦ Custom GPS entity (2)
	  ◦ Mobile audit (3)
		The entity contains details about the location of a time slot. For more details, see TimeSlotLocation below.

	TimeGroup(TimeSlotTimeGroup) OutputTimeSlotTimeGroup: • TimeGroupId (Guid) • TimeGroupDetail (EntityReference) • TimeGroupDetailStartTime (DateTime) • TimeGroupDetailEndTime (DateTime)	The entity contains details about a time group. For more details, see TimeSlotTimeGroup below.
	AvailableIntervals (`List<<Guide>OutputTimeSlot>`)	A collection of available intervals.
Resources (List<OutputResource>)	Resource (EntityReference)	An entity reference to the bookable resource.
	BusinessUnit (EntityReference)	An entity reference to the bookable resource group.
	OrganizationalUnit (EntityReference)	An entity reference to the organizational unit.
	ResourceType (Int)	The resource type. See the resourcetype attribute on the BookableResource entity for possible values.
	PoolId (Guid)	The Id of the pool that the resource is a member of for the duration of the time slot.
	CrewId (Guid)	The Id of the crew that the resource is a member of for the duration of the time slot.
	Email (String)	The resource's email address.
	Phone (String)	The resource's phone number.
	ImagePath (String)	The path to the resource's image.
Requirements (List<OutputRequirements>)	Requirement (EntityReference)	An entity reference to the Resource Requirement record.
	ConstraintBag (String)	Requirement constraint in ufx bag(internal)
	Resources (`List<<EntityReference>EntityReference>`)	Entity reference list of resource that is available to the requirements.
ProposalResourceAssignmentSets (List<OutputProposalResourceAssignmentSet>)	IntervalStart (DateTime)	Start time for each proposal resource assignment set.

Returns	Name(Type)	Description
	ProposalResourceAssignments (List<OutputProposalResourceAssignments> OutputProposalResourceAssignments: • RequirementId (Guid) • ResourceId (Guid)	List of Resources assigned to Requirement.
PagingInfos (OutputPagingInfo)	MoreResults (Boolean)	If there are more results or not.
	PagingCookie (String)	Paging cookie that can be used in the future search.

Example

HTTP

```
{
  "RequestName": "msdyn_SearchResourceAvailabilityForRequirementGroup",
  "Parameters": [
    {
      "Key": "Version",
      "Value": "1.0.0"
    },
    {
      "Key": "RequirementGroup",
      "Value": {
        "Id": "6927721a-0137-42be-8092-26995625a9d9",
        "LogicalName": "msdyn_requirementgroup",
        "Name": null,
        "KeyAttributes": [],
        "RowVersion": null
      }
    }
  ],
  "RequestId": null
}
```

Response

JSON

```
{
  "ResponseName": "msdyn_SearchResourceAvailabilityForRequirementGroup",
  "Results": [
    {
      "Key": "TimeSlots",
      "Value": {....}
    },
    {
      "Key": "Requirements",
      "Value": {....}
    },
    {
      "Key": "ProposalResourceAssignmentSets",
      "Value": {....}
    },
    {
      "Key": "PagingInfos",
      "Value": {....}
    }]
}
```

Create Requirement Group Bookings API

Use the following input and output parameters for the Create Requirement Group Bookings (**msdyn_CreateRequirementGroupBookings**) API.

Parameters

Name	Type	Required	Description
Version	String	Yes	The version number of the API. The version number identifies the version of the API that should be invoked. The version number is a semantic version number of the format major.minor.patch. The request does not have to contain the complete version number.
RequirementGroup	EntityReference	Yes	An entity reference to the requirement group entity, usually is a GUID, as shown in the below sample.
Start	DateTime	Yes	Start time of the Timeslot.
Duration	Integer	Yes	The Duration of the Booking to be created.
ResourceAssignments	EntityCollection	Yes	It is an entity collection of the Resource Assignments that are to be made for the Bookings to be created. Look at the Resource Assignment entity table for more details

Resource Assignments

Name	Type	Required	Description
RequirementId	Guid	Yes	The resource requirement Id of the Requirement for which the booking record is to be created.
ResourceId	Guid	Yes	The bookable resource Id of the Resource for which you want to create the booking.
BookingStatusId	Guid	Yes	The booking status Id of the booking to be created.
Effort	Integer	No	The capacity of the Bookable Resource that is consumed by this booking.
TravelTime	Integer	No	The travel time in minutes.

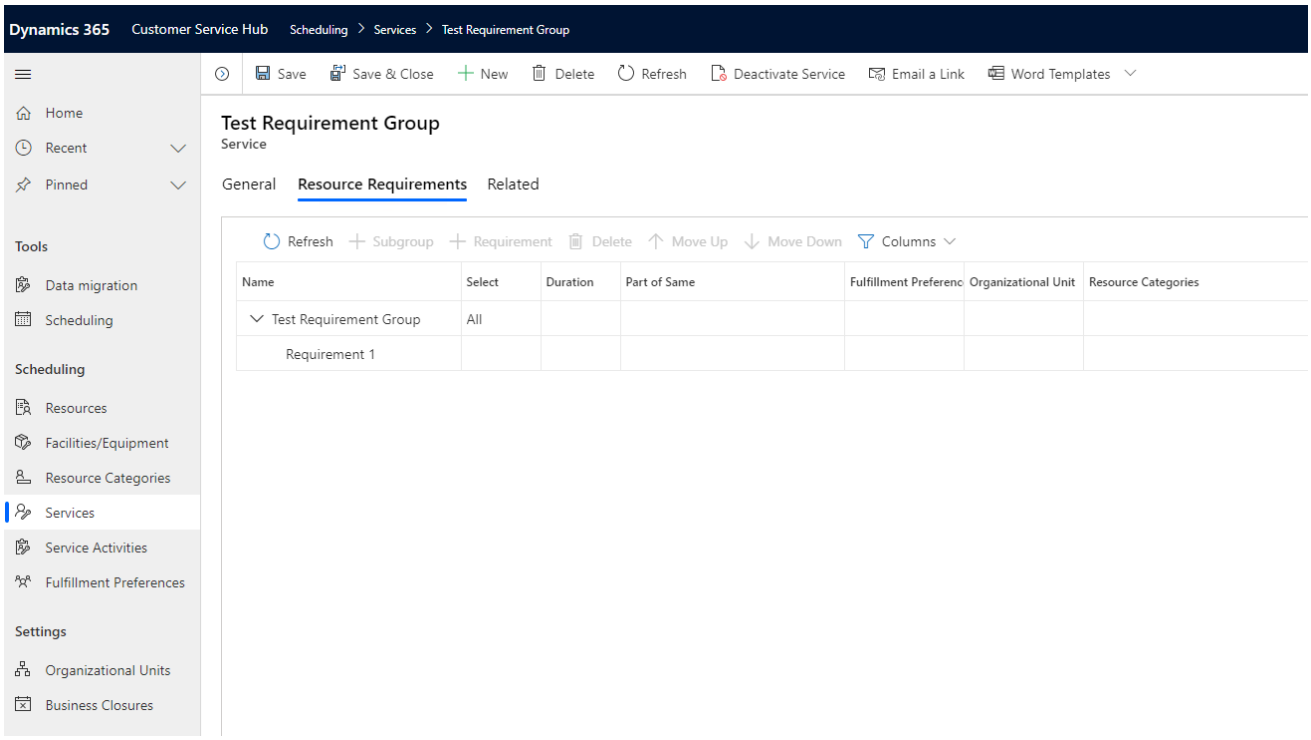
Output

Returns `HandlerExecuted` value which is of Boolean type.

Using the Requirement Group API

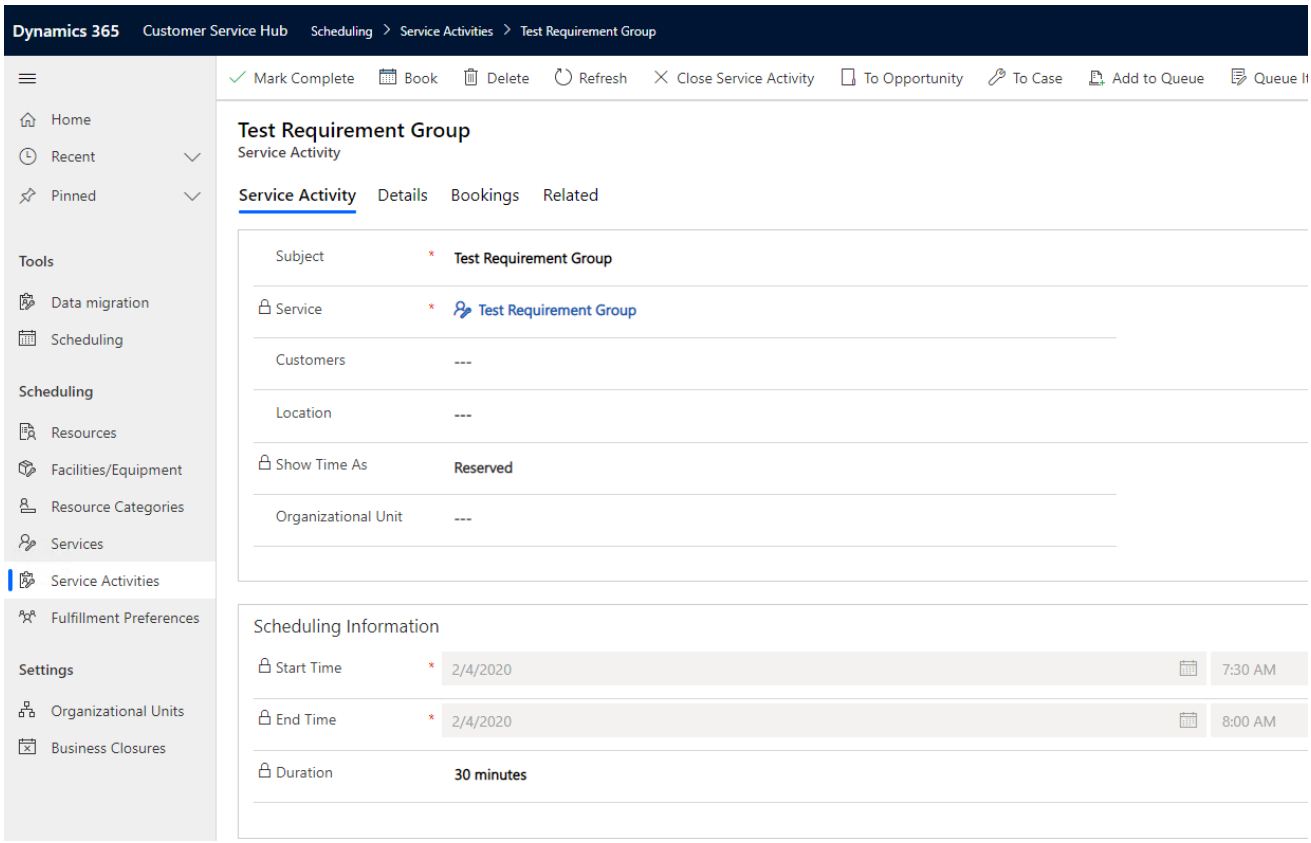
In the following scenario, you schedule a requirement group via API. You'll need a service created with resources before you can schedule a booking. Follow these steps to create a service activity.

Service configuration



1. In the site map, under **Scheduling**, select **Service**.
2. Go to **Resource Requirements**.
3. Create a service activity. For this example, we've created **Test Requirement Group**.

Service Activity configuration



1. In the site map, under **Scheduling**, select **Service Activities**.
2. Go to **Service Activities**.
3. For **Subject**, select **Test Requirement Group**.
4. For **Service**, select **Test Requirement Group**.

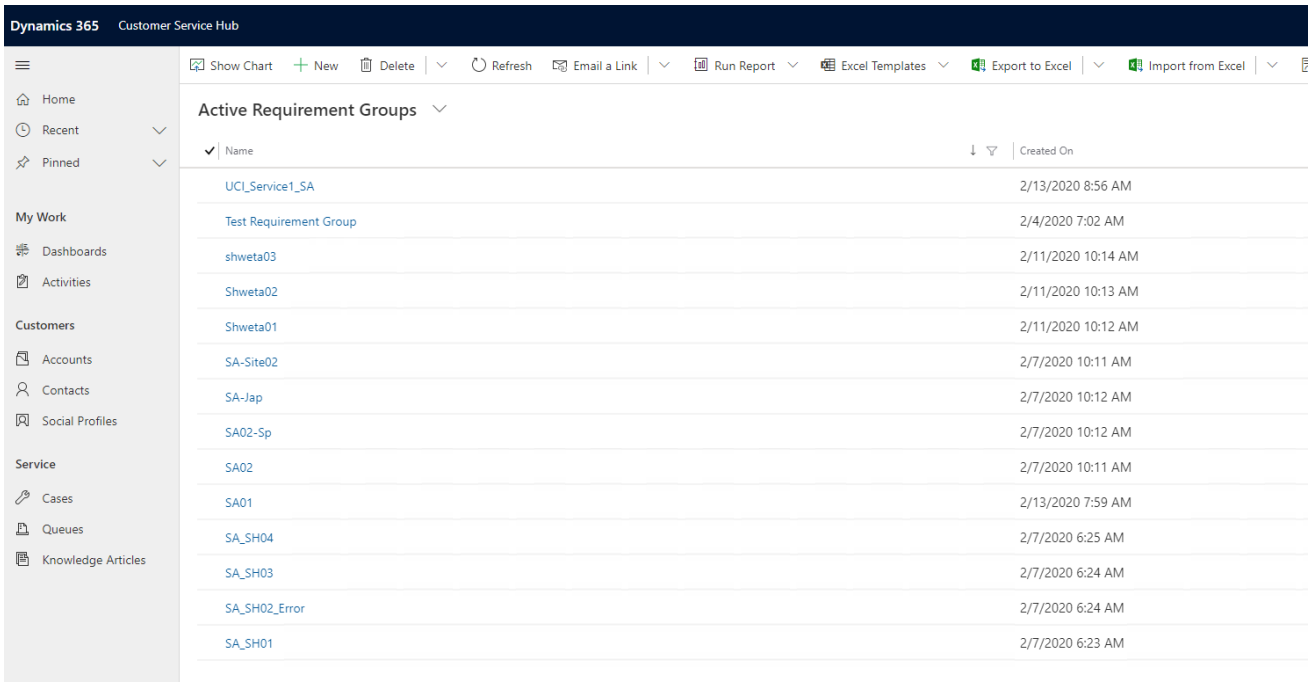
> ⓘ Note

This automatically creates a resource requirement group that has the same name as the service activity.

Now you have a requirement group automatically created that has one technician (resource) to be scheduled to perform service at your customer's location.

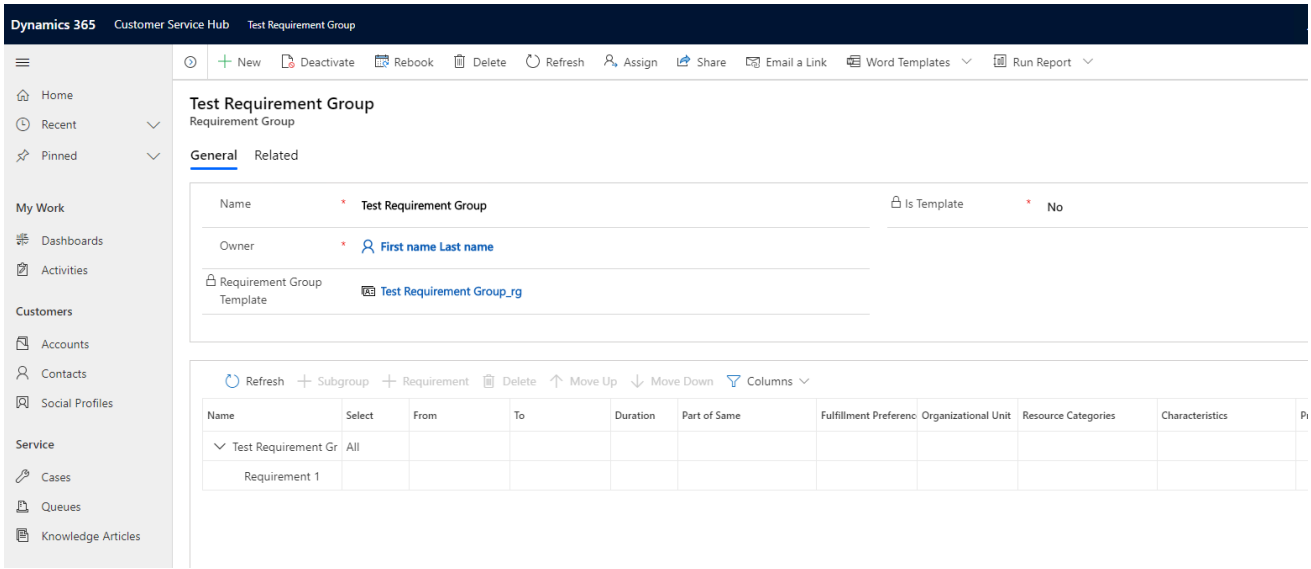
Resource Requirement Group grid

The following image is an example configuration of the Resource Requirement Group page.



> **Note**
>
> To access the **Requirement Group** page from the Customer Service Hub app, you need to navigate there via a URL.

> **Important**
>
> Use the following URL to reach the **Resource Requirements Group** page: `<<YourOrgURL>YourOrgURL>?appid=guid&pagetype=entitylist&etn=msdyn_requirementgroupr`.



3. Go to **General**.
4. Name field **Test Requirement Group**.

5. Enter name in **Owner** field.
6. Template field.
7. Template Required, select **No**.

Search against your organization

In this next scenario, we show how to pass values for a specific requirement group (Entity Reference - GUID), Required Resources to complete work and match the resource to the organizational unit.

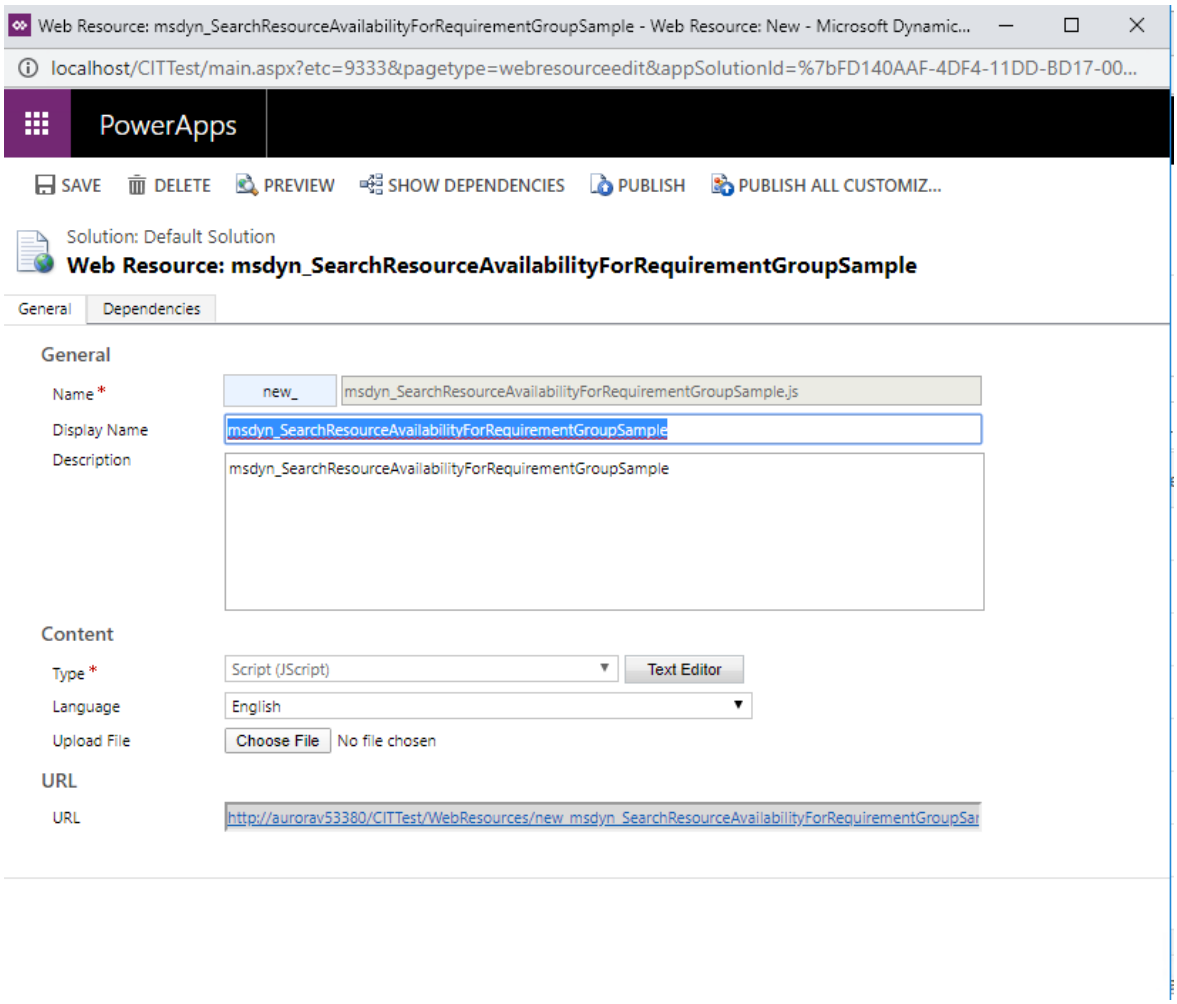
> **Important**
>
> - To run the Requirement Group API, you need GUIDs for:
>   - Requirement group
>   - Bookable resources
>   - Organizational unit (which can be retrieved by using the **Web API**)
> - If the API is called from a client (browser or canvas app) based on JavaScript, you need to have the extended SOAP SDK. The extended SOAP SDK is not an official Microsoft release, but you can is provided in the downloadable sample files for guidance.
> - We recommend that you test this search in your development or test environments to validate your scenarios and results before running it in your production environment.
> - This API uses the complex object type in the input and output, so it only supports the SOAP endpoint. It does not support the OData endpoint.

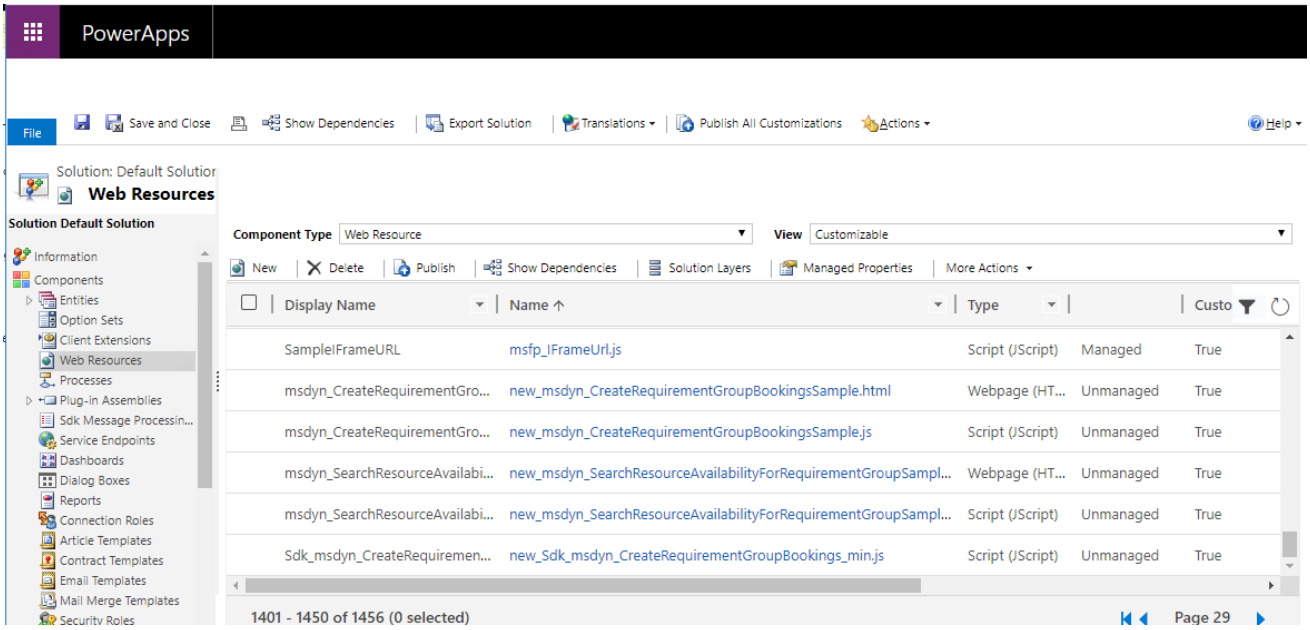
To execute this search against your organization, you need to download the sample files, and then follow the steps below:

1. Modify the hard-coded input parameters in the msdyn_SearchResourceAvailabilityForRequirementGroupSample.js file to reflect the GUIDs of records in your org. (Example: requirement group, resources, organizational unit).

Sample Search Requirement Group

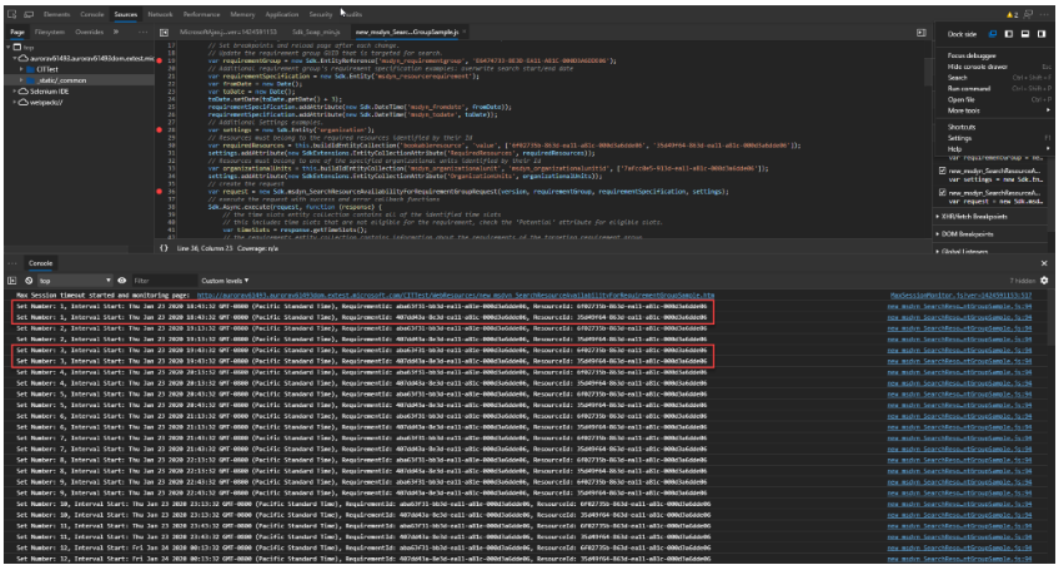
2. Add the files in the sample folder as web resources in your organization





3. Navigate to the newly added new_msdyn_SearchResourceAvailabilityForRequirementGroupSample.htm page. Example: `<<YourOrgURL>>//WebResources/new_msdyn_SearchResourceAvailabilityForRequirementGroupSample.htm`

4. Open the browser's developer tools by using the F12 function key. Set breakpoints as needed, and inspect the request/responses in the developer tool's console.



We can see there are multiple sets of time slots that are returned with each Set corresponding to a matching available Resource mapped to the underlying Requirement of the Requirement Group.

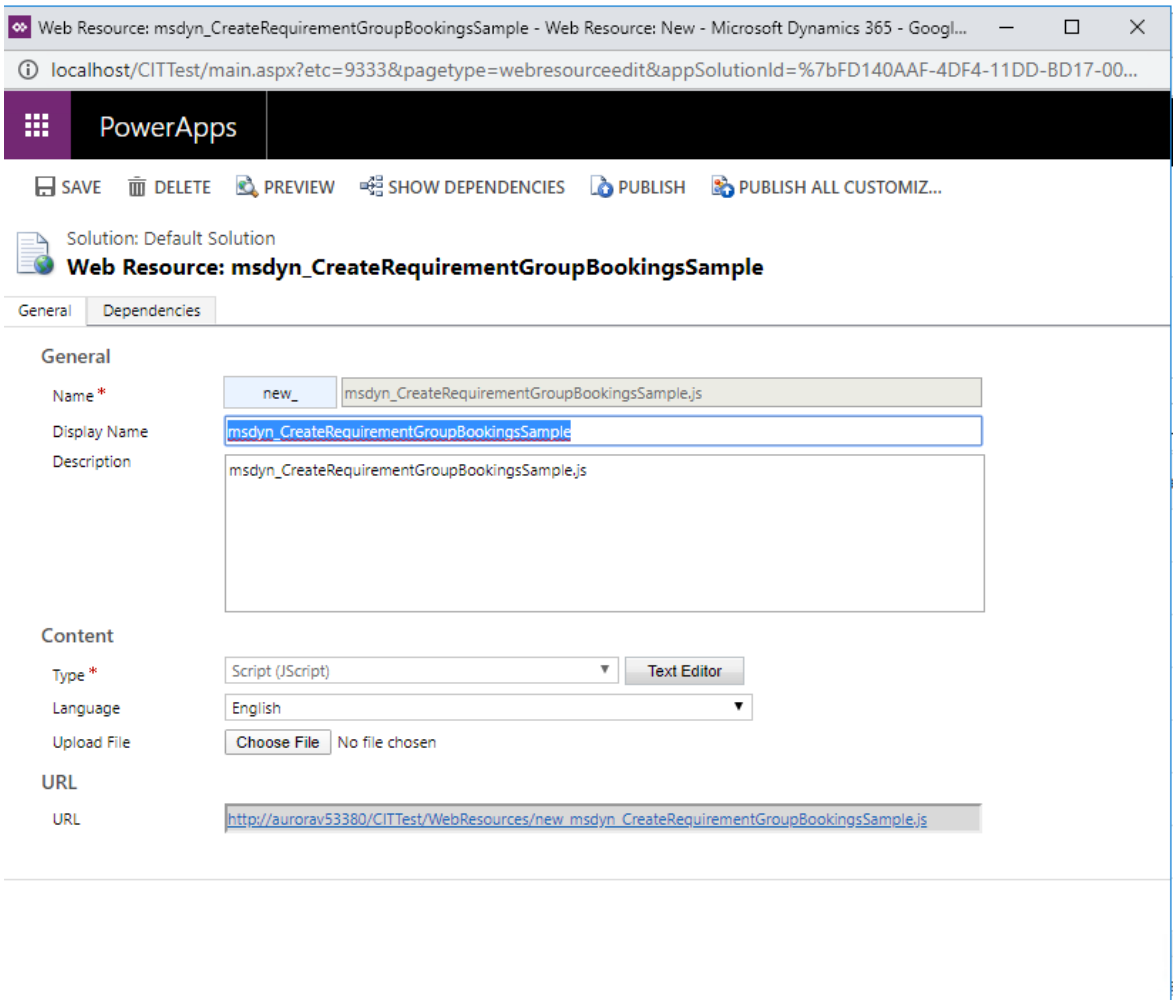
After the time slot Sets are returned by the API, you can display them on your custom web portal, app, or a Power App (model/canvas).

5. After you choose a specific time slot set (Set number 1 in this example), update your new_msdyn_CreateRequirementGroupBookingsSample.js web resource in your org to pass the Resource Assignments (Requirement guid, Resource guid) and the Requirement Group as shown in the example below:

```
"use strict";
/* tslint:disable:no-console */
var SampleCreateRequirementGroupBookings = /** @class */ (function () {
    function SampleCreateRequirementGroupBookings() {
    }
    /**
     * Sends a msdyn_CreateRequirementGroupBookings request and logs output to the console.
     */
    SampleCreateRequirementGroupBookings.prototype.sendRequest = function () {
        // enable the extended behavior that allows nested entities to be present in the SOAP payload.
        SdkExtensions.Mode.enableNestedEntities(true);
        // version is a required parameter
        var version = '1';
        // Update the Guid identifiers to match identifiers in your dev/test organization.
        // Selectively change or comment/uncomment some of the below values to see the impact on the results.
        // Set breakpoints and reload page after each change.
        // Update the requirement group GUID that is targeted for search.
        var requirementGroup = new Sdk.EntityReference('msdyn_requirementgroup', 'D4D0E0B7-0216-EA11-A81C-000D3AC4134D');
        // update the bookings start time.
        var start = new Date(Date.now());
        // update the bookings duration.
        var duration = 60;
        // update the resource assginments for each requirement in the requirement group
        var resourceAssignmentscollection = new Sdk.EntityCollection();
        this.addResourceAssignments('DBD0E0B7-0216-EA11-A81C-000D3AC4134D', '68DA7A1C-F6FE-4C48-BA54-D1C26E49CB90', resourceAssignmentscollection);
        this.addResourceAssignments('D6D0E0B7-0216-EA11-A81C-000D3AC4134D', '13E393FB-5153-4E92-BA9B-EA90066383FE', resourceAssignmentscollection);
        // create the request
        var request = new Sdk.msdyn_CreateRequirementGroupBookingsRequest(version, start, duration, resourceAssignmentscollection, requirementGroup);
        // execute the request with success and error callback functions
        Sdk.Async.execute(request, function (response) {
            // the time slots entity collection contains all of the identified time slots
            // this includes time slots that are not eligible for the requirement, check the 'Potential' attribute for eligible slots.
            var handlerExecuted = response.getHandlerExecuted();
            console.log("Handler Executed: " + handlerExecuted);
        }, function (error) {
            console.log(error.message);
        });
    };
    /**
     * Creates an entity collection of mappings of requirment and resource assignments.
     * @param requirementId The requirement Id.
     * @param resourceId The resource Id.
     * @param resourceAssignmentscollection the resource assignments for each requirement in the requirement group.
     */
    SampleCreateRequirementGroupBookings.prototype.addResourceAssignments = function (requirementId, resourceId, resourceAssignmentscollection) {
        var assignment = new Sdk.Entity('organization');
        assignment.addAttribute(new Sdk.Guid('RequirementId', requirementId));
        assignment.addAttribute(new Sdk.Guid('ResourceId', resourceId));
        resourceAssignmentscollection.addEntity(assignment);
    };
    return SampleCreateRequirementGroupBookings;
}());
// execute the request now
```

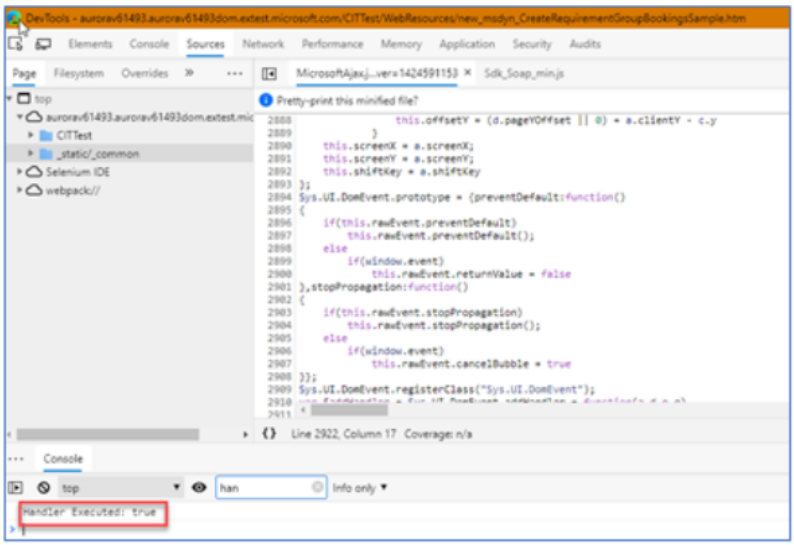
> **Important**

Find the complete sample code here: **Create Requirement Group**.

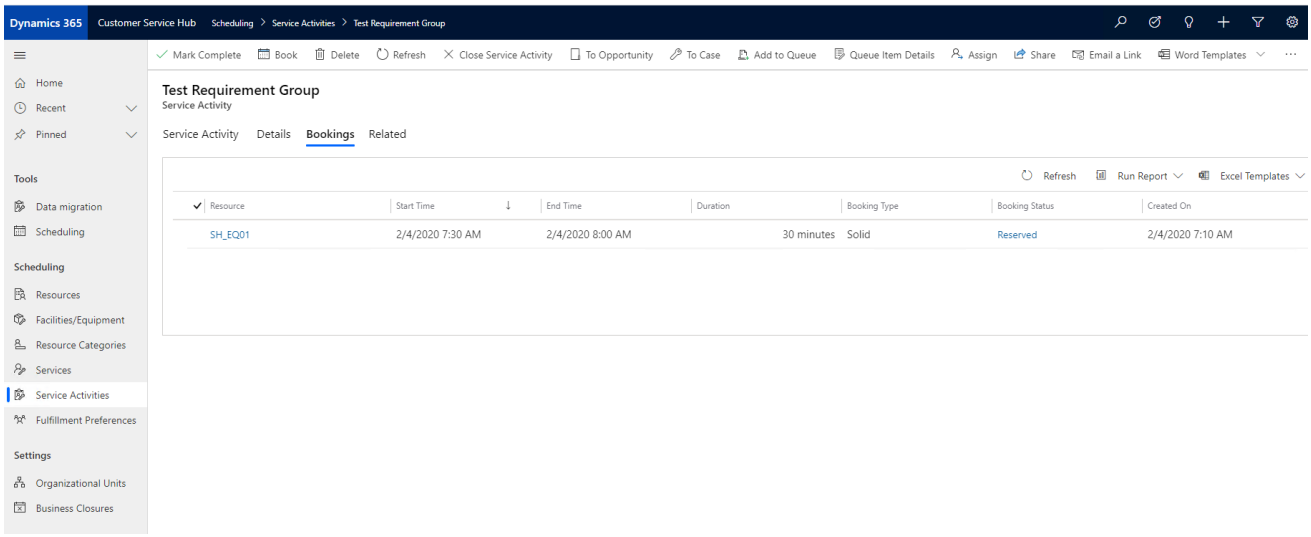


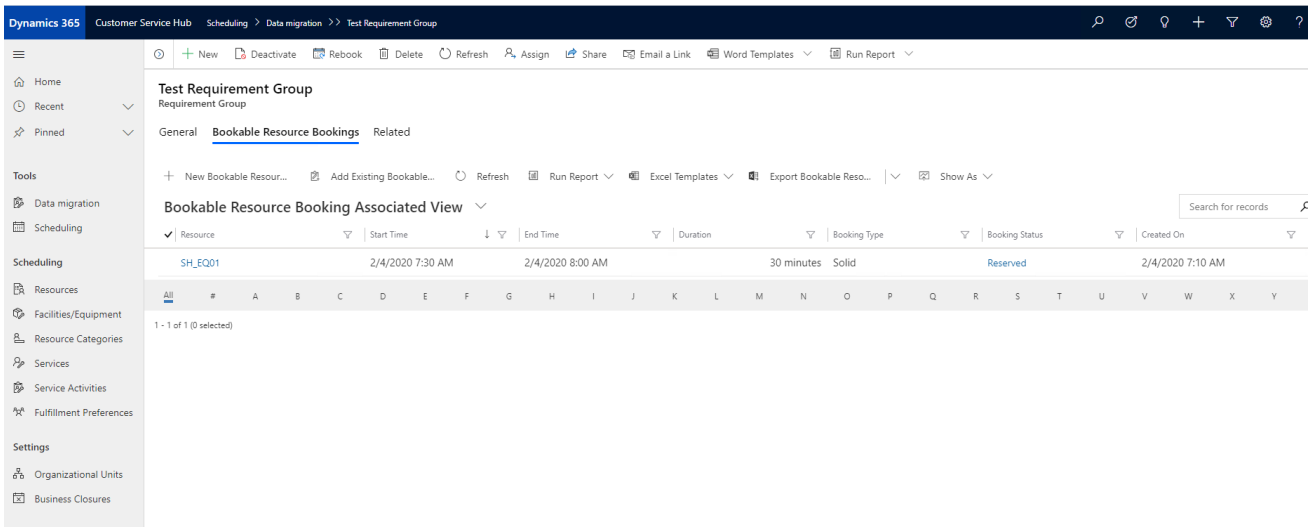
6. Navigate to the newly added new_ msdyn_CreateRequirementGroupBookingsSample.htm page. (Example: `<<YourOrgURL>>//WebResources/new_msdyn_CreateRequirementGroupBookingsSample.htm`) to invoke a call to the Booking API and create the booking.

7. Open the browser's developer tools by using the F12 function key. Here you'll see that the Handler executed value is set to True, indicating that the bookings were created successfully.



We can also verify this by going back into the organization and checking the associated bookings of the Service/Requirement group we created, as shown in the following illustrations.





Other possible scenarios that might leverage these APIs are:

- Build a custom web app or a Dynamics 365 portal to provide appointment scheduling for users. The app will show available time slots for the service or product being offered by using multiresource requirements (requirement groups).
- Build a Power Apps canvas app to support self-scheduling scenarios for line-of-business apps.

See the Additional resources section for links to additional help resources.

Sample code

The following sample code shows how to implement `msdyn_SearchResourceAvailabilityForRequirementGroup` message.

static

```
        {
            // Authentication
            String machineName = "contoso?????";
            String orgName = "?????";
            String domain = $"{machineName}dom.extest.microsoft.com";
            String uri = $"http://{machineName}.{domain}/{orgName}/XRMServices/2011/Organization.svc";
            String username = "?????";
            String password = "?????";

            OrganizationServiceManager osm = new
            OrganizationServiceManager(new Uri(@uri), username, password, domain);
            _serviceProxy = osm.GetProxy();
            _service = (IOrganizationService)_serviceProxy;
            searchResourceAvailabilityForRequirementGroup();
            createRequirementGroupBookings();
```

```
        }

        static void searchResourceAvailabilityForRequirementGroup()
        {
            var req = new OrganizationRequest()
            {
                RequestName = "msdyn_SearchResourceAvailabilityForRequirementGroup"
            };

            //Version
            req["Version"] = "1.0.0";
            req["RequirementGroup"] = new EntityReference("msdyn_requirementgroup", Guid.Parse("e5e4f033-150d-
eb11-a822-000d3aaf102a"));

            Entity requirementSpecification = new Entity();
            requirementSpecification.Attributes.Add("msdyn_fromdate", DateTime.Today.AddDays(1));
            requirementSpecification.Attributes.Add("msdyn_todate", DateTime.Today.AddDays(3));
            req["RequirementSpecification"] = requirementSpecification;

            try
            {
                var response = _service.Execute(req);
                Console.WriteLine("Response from search: {0}", JsonConvert.SerializeObject(response));
            }
            catch (Exception e)
            {

                Console.WriteLine("msdyn_SearchResourceAvailabilityForRequirementGroup failed with the following
error: {0}", e.Message);
            }
        }

        static void createRequirementGroupBookings()
        {
            var req = new OrganizationRequest()
            {
                RequestName = "msdyn_createRequirementGroupBookings"
            };

            req["Version"] = "1.0.0";
            req["RequirementGroup"] = new EntityReference("msdyn_requirementgroup",
            Guid.Parse("d74260ee-180d-eb11-a822-000d3aaf102a"));
            req["Start"] = DateTime.Today.AddDays(1);
            req["Duration"] = 60;
            EntityCollection resourceAssignment = new EntityCollection();
            var entity = new Entity();
            entity["RequirementId"] = Guid.Parse("df4260ee-180d-eb11-a822-000d3aaf102a");
            entity["ResourceId"] = Guid.Parse("268e3d0d-5e0c-eb11-a822-000d3aaf102a");
            entity["BookingStatusId"] = Guid.Parse("10de5842-cf5e-4092-9006-d0aa9f9c1f74");
            resourceAssignment.Entities.Add(entity);
            req["ResourceAssignments"] = resourceAssignment;

            try
            {
                var response = _service.Execute(req);
                Console.WriteLine("Response JSON : " + JsonConvert.SerializeObject(response));
            }
            catch (Exception e)
            {
                Console.WriteLine("msdyn_createRequirementGroupBookings request failed with the following
exception: {0}", e.Message);
            }
            Console.ReadKey();
        }
```

How to migrate from the legacy API to Universal Resource Scheduling

To migrate from the legacy Search API and Book API to the Universal Resource Scheduling API, use the following required input and output fields to map the APIs.

Input mapping data for the Search API

Legacy input	Universal Resource Scheduling input	Description
ServiceId	Requirement group	Service/requirement group GUID
SearchWindowStart	Start date	Start date for the appointment search
SearchWindowEnd	End date	End date for the appointment search
Duration	Duration	Appointment duration
No of results	Page size	Total number of proposals or number of appointments on a page
Sites	OrganizationUnits	Site/OU GUID
RequiredResource	Preferred Resources	Resources the customer prefers to schedule
Constraints	Constraints	Customer entity(ufx)
RecurrenceDuration		In a recurrence appointment search, the duration of the appointment
RecurrenceTimeZoneCode		Time zone for a recurring request
SearchDirection		Forward or backward search for slots, based on the dates given
AnchorOffSet		Offset in hours from midnight
UserTimeZoneCode		Time zone that's been set for the user
SearchRecurrenceRule		Frequency, interval, count and so on
	Resource Types	Type of resource
	Restricted Resources	Restricted for scheduling the appointment

Output mapping for the Search API

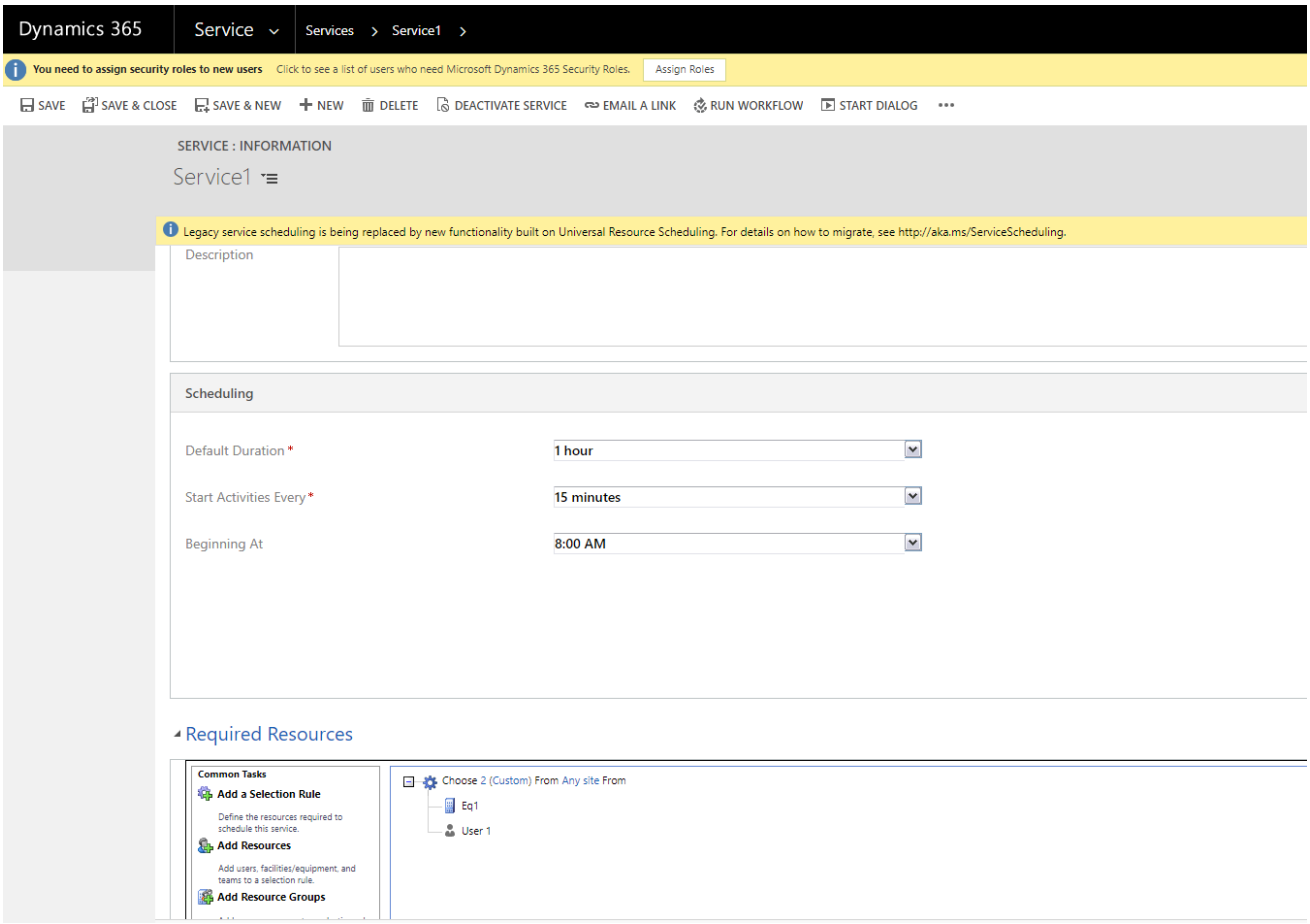
Legacy output	Universal Resource Scheduling output
Appointment proposals	ProposalsResourceAssignmentSet
TraceInfo	
ExtensionDataObject	
	Time Slots
	Requirements(constraintbag)
	PagingInfos

Example scenarios for migrating from the legacy scheduling API to Universal Resource Scheduling

The scenario-based examples in this section add more details about mapping from the legacy API to the new Universal Resource Scheduling API.

Scenario 1: Get two resources for each schedule proposal

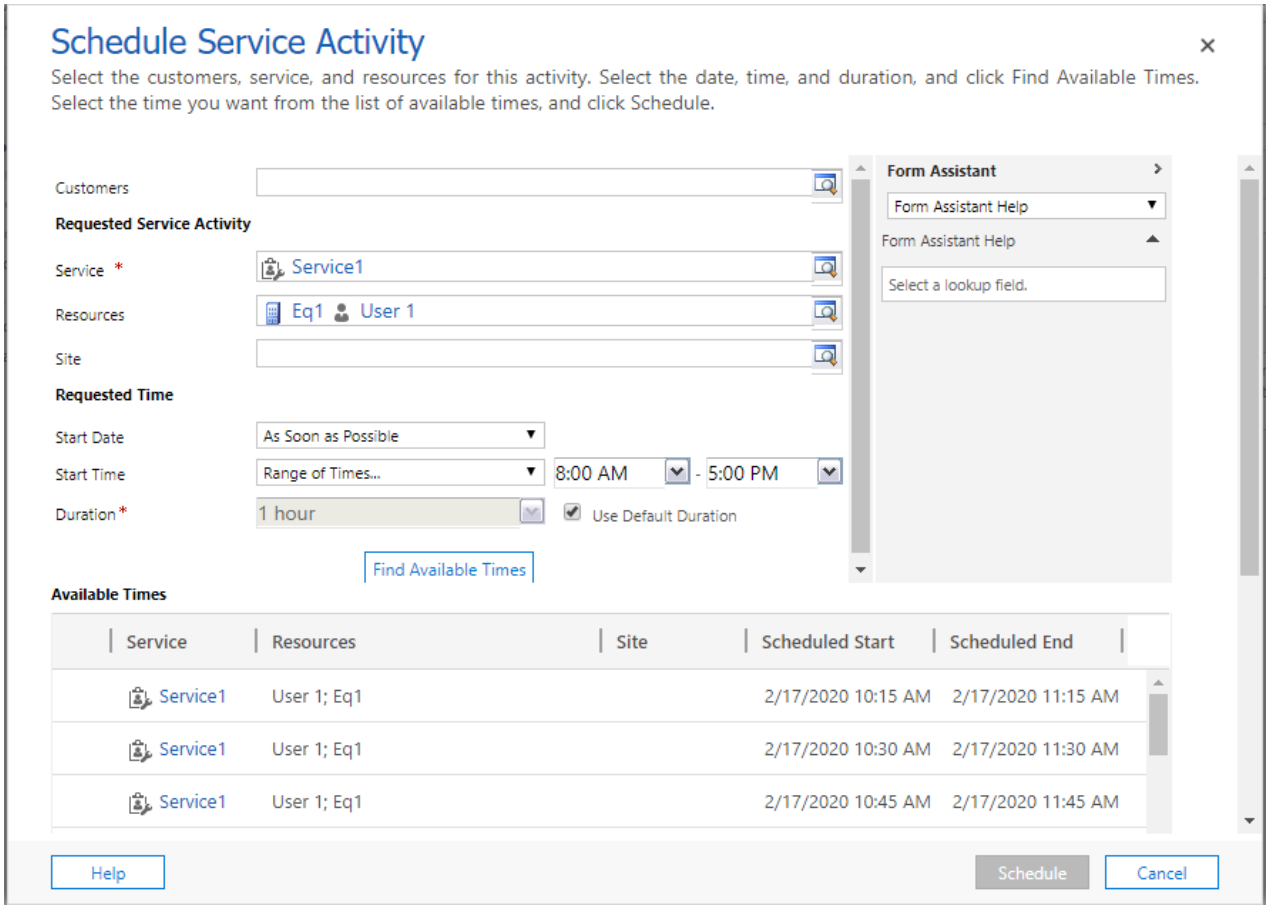
The following screenshot from the legacy API is provided for reference in this scenario.



1. Create one site (**Site1**), one user (**User1**), and one equipment resource (**Facility/Equipment** tab), with the name **Eq1**, with the site set to **Site1**.

2. Create the business closure and work hours for the user (8:00 AM to 6:00 PM) and the equipment (8:00 AM to 6:00 PM).

3. Create a new service (**Service1**), and then add **required resources** as **Choose 2** from User1, Eq1. Save and close the service.



4. Go to the homepage and schedule a service activity and then, select **Service1**, and then select **Schedule** > **Find available slots**.

5. Verify that two resources are returned for each proposal in accordance with the criteria you set.

Universal Resource Scheduling API code for scenario 1

C#

```
void searchRequirementgroup(Microsoft.Pfe.Xrm.OrganizationServiceManager osm)
{
var req = new Microsoft.Xrm.Sdk.OrganizationRequest()
{
RequestName = "msdyn_SearchResourceAvailabilityForRequirementGroup"
};

  req["Version"] = "1.0.0";
  Entity requirementSpecification = new Entity();

  //Setting from date

  requirementSpecification.Attributes.Add("msdyn_fromdate", DateTime.Parse("2019-12-
  26T18:30:00.000Z"));

  //Setting to date

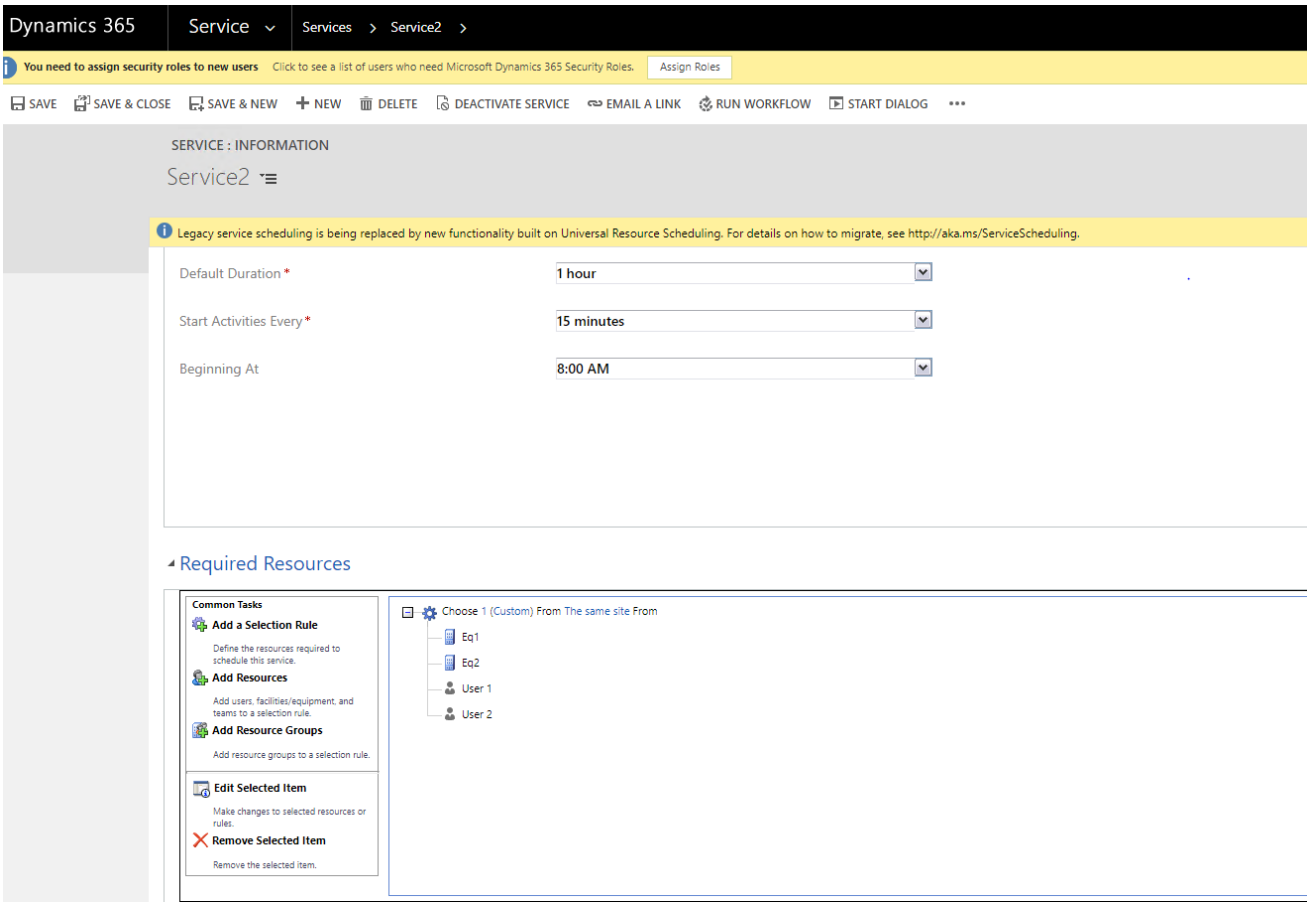
  requirementSpecification.Attributes.Add("msdyn_todate", DateTime.Parse("2019-12-
  27T18:29:00.000Z"));

  //Requirement group GUID
  req["RequirementSpecification"] = requirementSpecification;
  req["RequirementGroup"] = new
  Microsoft.Xrm.Sdk.EntityReference("msdyn_requirementgroup", Guid.Parse("XXXXXXXX"));

  //Executing the request and getting response
  var response = osm.GetProxy().Execute(req);
  response.ToString();
  response.Dump();
}
```

Scenario 2: Verify that search results are correct for scheduling

The following screenshot from the legacy API is provided for reference in this scenario.

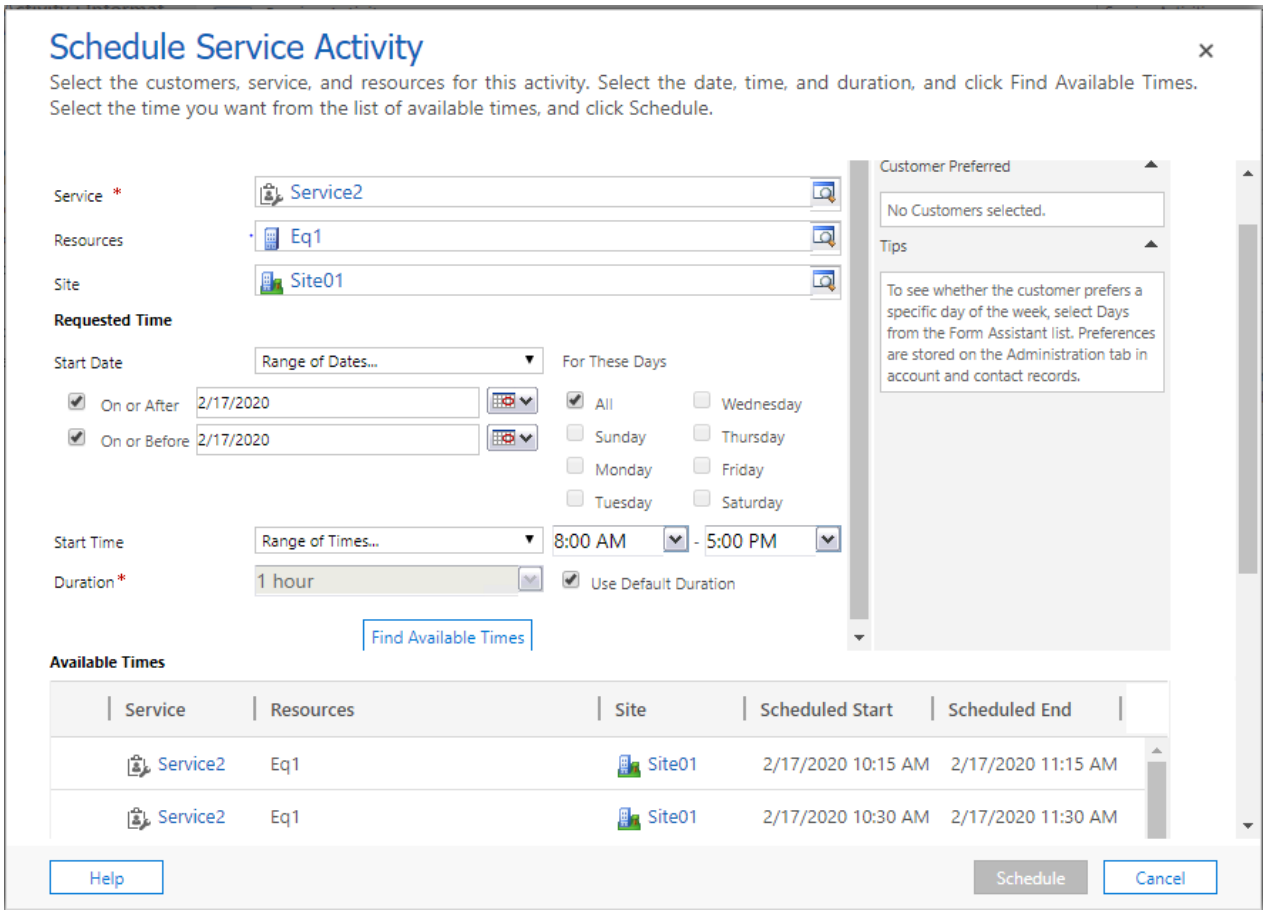


1. Create the following:

- Two sites: Micr0s0ftSite1 and Site2
- Two users: User1 and User2 (Site2)
- Go to **Settings**> **Service management** tab and create a site(with the name `Site1`), two resources on the **Facility/Equipment** tab (namely, Eq1 and Eq2) and go to setting> Security and create a user(User1). Two equipment resources on the **Facility/Equipment** tab (Eq1, Eq2), where Eq1 belongs to Site1 and Eq2 belongs to Site2

2. Create the business closure and work hours for the user (8:00 AM to 6:00 PM) and the equipment (8:00 AM to 6:00 PM).

3. Create a new service with status **Reserved** and required resources as **Choose 2** from **same site** from User1, User2, Eq1, Eq2. Save and close the service.



4. Go to the homepage > **Service Activity** > **Schedule**, and then select the service you created in step 3. Select the site as **Site1**, and then click on **Find available time**.

5. Verify that the search results that are returned are correct for the site selected in the search criteria.

Universal Resource Scheduling API code for scenario 2

C#

```
void searchRequirementgroup(Microsoft.Pfe.Xrm.OrganizationServiceManager osm)
{
  var req = new Microsoft.Xrm.Sdk.OrganizationRequest()
  {
  RequestName = "msdyn_SearchResourceAvailabilityForRequirementGroup"
  };
req["Version"] = "1.0.0";
Entity requirementSpecification = new Entity();

//Setting from date
requirementSpecification.Attributes.Add("msdyn_fromdate", DateTime.Parse("2019-12-26T18:30:00.000Z"));

//Setting to date
requirementSpecification.Attributes.Add("msdyn_todate", DateTime.Parse("2019-12-27T18:29:00.000Z"));

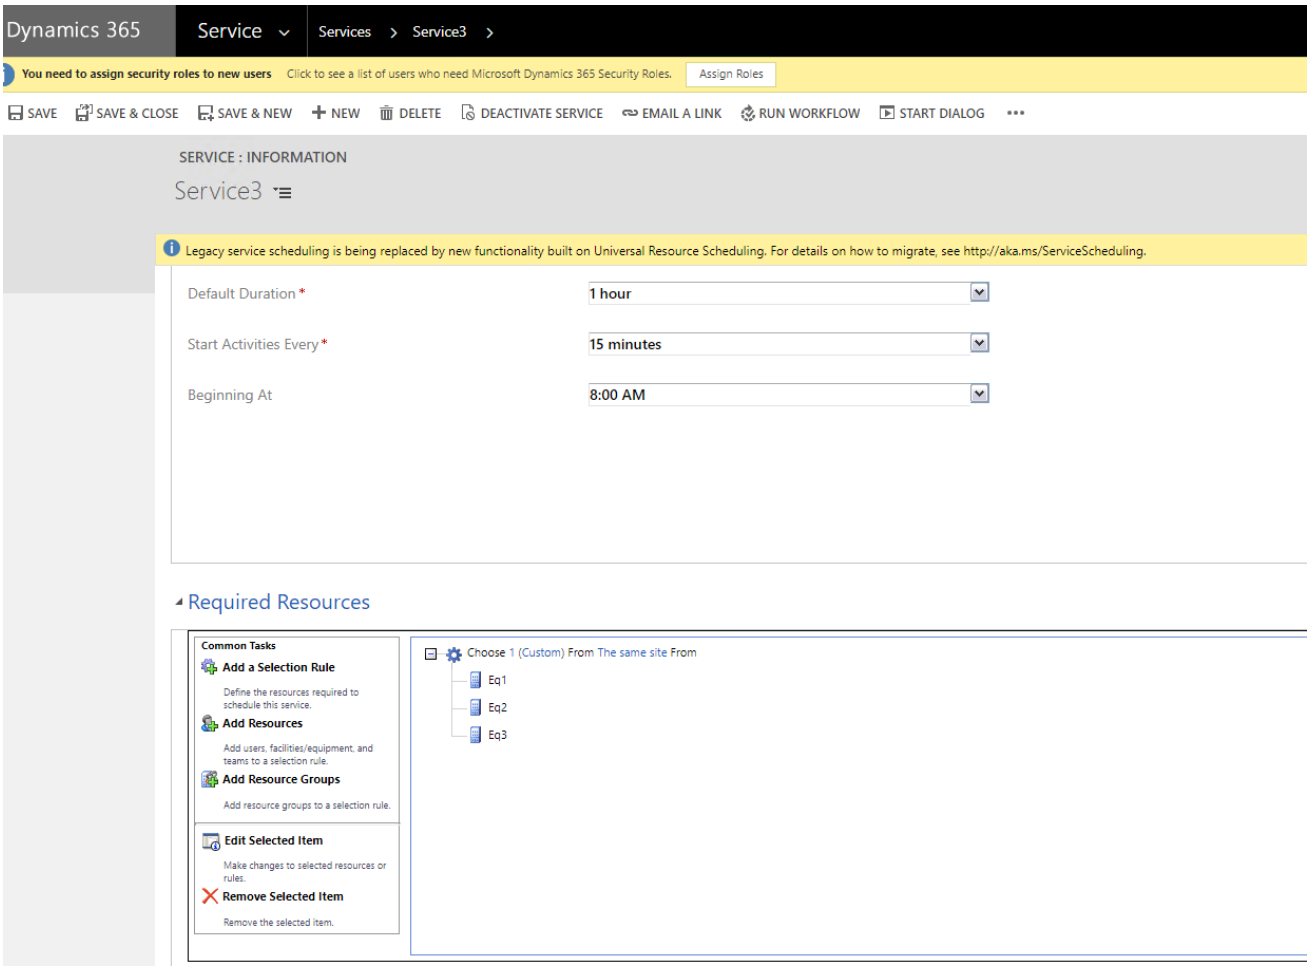
req["RequirementSpecification"] = requirementSpecification;

//Requirement group GUID
req["RequirementGroup"] = new EntityReference("msdyn_requirementgroup", Guid.Parse("XXXXXX"));

var response = osm.GetProxy().Execute(req);
response.ToString();
response.Dump();

}
```

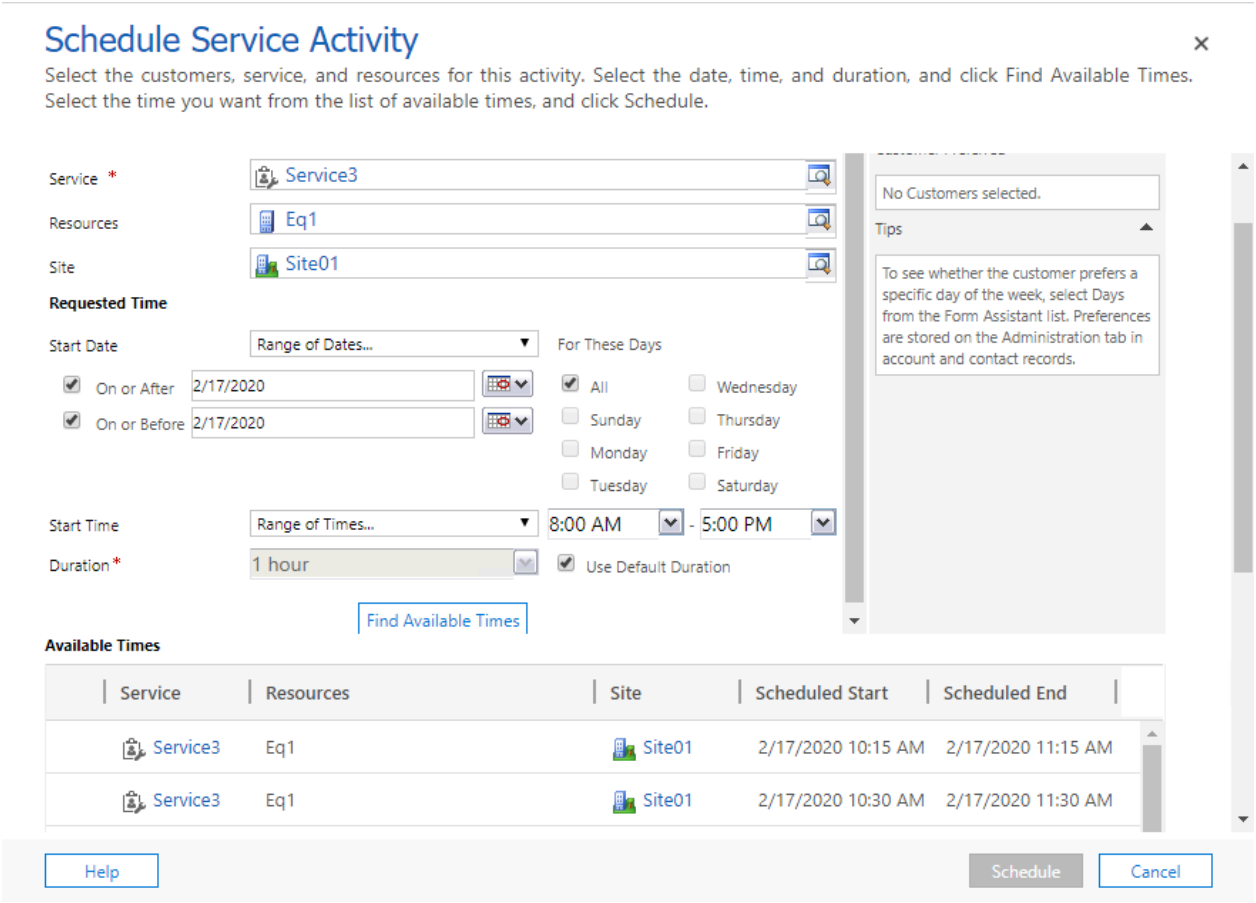
Scenario 3: Get proposed schedules that occur within the working hours for an equipment resource



1. Create two sites (Site1, Site2), and then create three equipment resources (Eq1, Eq2, Eq3).

2. Create the business closure and work hours for all equipment (3:00 PM to 6:00 PM).

3. Create a new service (**Service1**) Choose 1 from (Random) Eq1, Eq2, #q3.



4. In the **Schedule Service Activity** dialog box, search for proposals for Service1 by adding a required resource as **Eq1** for a specific date range.

5. Verify that the proposed schedules that are returned occur within the working hours of the equipment for that date.

Universal Resource Scheduling API code for scenario 3

C#

```
void searchRequirementgroup(Microsoft.Pfe.Xrm.OrganizationServiceManager osm)
{
var req = new Microsoft.Xrm.Sdk.OrganizationRequest()
{
RequestName = "msdyn_SearchResourceAvailabilityForRequirementGroup"
};
req["Version"] = "1.0.0";
Entity requirementSpecification = new Entity();

//Setting start date
requirementSpecification.Attributes.Add("msdyn_fromdate", DateTime.Parse("2019-12-26T18:30:00.000Z"));
//Setting end date
requirementSpecification.Attributes.Add("msdyn_todate", DateTime.Parse("2019-12-27T18:29:00.000Z"));

//Setting the eq1 as required resource

requirementSpecification.Attributes.Add("msdyn_resourcerequirementid",Guid.Parse("XXXXXX"));
req["RequirementSpecification"] = requirementSpecification;

//Setting the requirement group GUID
req["RequirementGroup"] = new EntityReference("msdyn_requirementgroup", Guid.Parse("XXXXX"));

//Executing the request and getting response.
var response = osm.GetProxy().Execute(req);
response.ToString();
response.Dump();
}
```

Connected Customer Service - Overview

Article • 01/15/2022

Connected Customer Service enables organizations to transform their service model into a proactive and predictive service model with the availability of IoT diagnostics, IoT device update, and case management on one platform. Agents using Customer Service Hub can diagnose and fix issues remotely, which leads to cost savings and improved customer satisfaction.

Key benefits of Connected Customer Service:

- Reduce downtime by connecting to IoT devices to diagnose problems before customers are aware of an issue
- Address issues faster by remotely monitoring and updating devices and keeping customers in the loop

There are two ways you can connect IoT-enabled devices to the Customer Service solution:

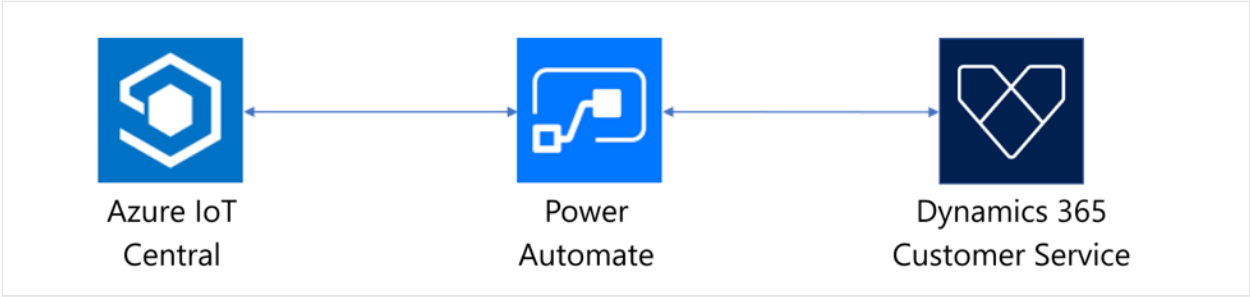
- Connected Customer Service for Azure IoT Central
- Connected Customer Service for Azure IoT Hub

The following sections describe the differences between these solutions.

Connected Customer Service for Azure IoT Central

Connected Customer Service for IoT Central provides a direct integration of Dynamics 365 Customer Service with Microsoft Azure IoT Central, a fully managed IoT software-as-a-service (SaaS) solution.

Microsoft Azure IoT Central enables builders to configure rules and actions. Based on those actions, IoT alerts will be created in Connected Customer Service. Also, based on service activities in Connected Customer Service, information can be sent back to IoT Central. This is accomplished by using Power Automate, a SaaS offering for automating workflows across applications and services.



The below end-to-end integration processes can be easily implemented based on a pure configuration experience:

- Azure IoT Central can send information about device anomalies to Connected Customer Service (as an IoT Alert) for diagnosis
- Connected Customer Service can create cases or work orders triggered from device anomalies

Azure IoT Central requires no extensive cloud development or coding skills to get an IoT solution up and running.

With Power Automate templates, users can connect their accounts, take advantage of our pre-built templates, and customize their own flows.

Check out our Connected Customer Service for IoT Central tutorial to get started.

Connected Customer Service for Azure IoT Hub

Connected Customer Service for Azure IoT Hub is an add-on solution that brings Azure IoT platform-as-a-service (PaaS) offering into Dynamics365 for Customer Service. With this offering, you can run a deployment app to put all of the Azure IoT services and Dynamics puzzles together. All Azure IoT services run in your own Azure cloud subscription. Additionally, we provide an enterprise-ready template that you can customize for each Azure IoT service.

Privacy details for Connected Customer Service

After you install Connected Customer Service for Dynamics 365 and provide your Azure subscription information, the Azure resources are deployed. Your Customer Engagement instance will send data such as commands, to Azure to enable IoT–enabled scenarios that register devices. Then, commands will be sent to and received from the registered devices.

The Azure components and services that are involved with Connected Customer Service functionality are described in the following sections.

Service bus queue

This provides a queue for both inbound and outbound messages (commands) flowing between Dynamics 365 for Customer Engagement and Azure. When an IoT alert is sent to Dynamics 365 for Customer Engagement, or a command is sent from Dynamics 365 for Customer Engagement to the IoT hub, it will be queued here.

Logic Apps

This provides an orchestration service that uses a Customer Engagement connector and a Queue connector. Dynamics 365 for Customer Engagement connectors are used to construct entities that are specific to Customer Engagement and Queue connectors are used for polling the queue.

Stream analytics

This provides a fully managed, real-time event processing engine that helps to unlock deep insights from data. Stream Analytics makes it easy to set up real-time analytic computations on data streaming from devices, sensors, web sites, social media, applications, infrastructure systems, and more. It is functioning as a funnel to send selective IoT alerts to Dynamics 365 for Customer Engagement.

IoT Hub

Connected Customer Services uses the IoT Hub to manage the state of registered devices. In addition, the IoT Hub sends commands and notifications to connected devices—and tracks message delivery with acknowledgment receipts. Device messages are sent in a durable way to accommodate intermittently connected devices.

Simulator

This is a test web app for emulating the device that is sending commands or receiving commands from the IoT hub.

Azure SQL Database

Connected Customer Service uses SQL Azure to store device heartbeat messages for later use by Power BI to show the status of devices in Dynamics 365 for Customer Engagement.

Azure Blob Storage

Queries that Stream Analytics uses are stored to Azure Blob storage.

- Connected Customer Service Device Readings (Preview) uses Azure Time Series Insight (Preview) to store, process, and query IoT devices measurements from IoT

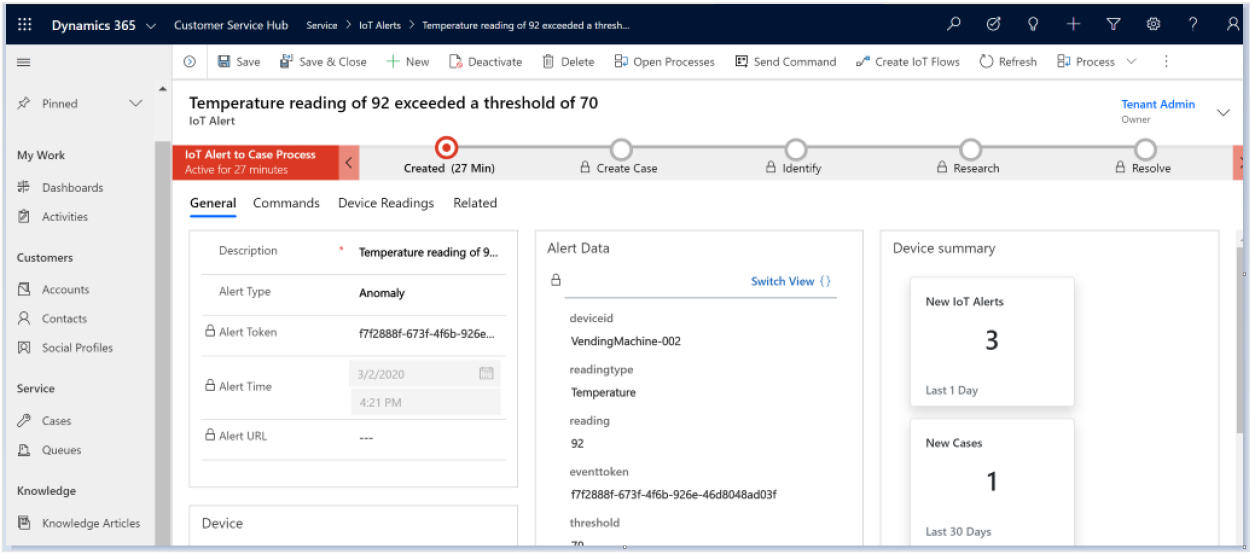
Hub.

> **Note**
>
> For more information about additional Azure service offerings, see the **Microsoft Azure Trust Center**.

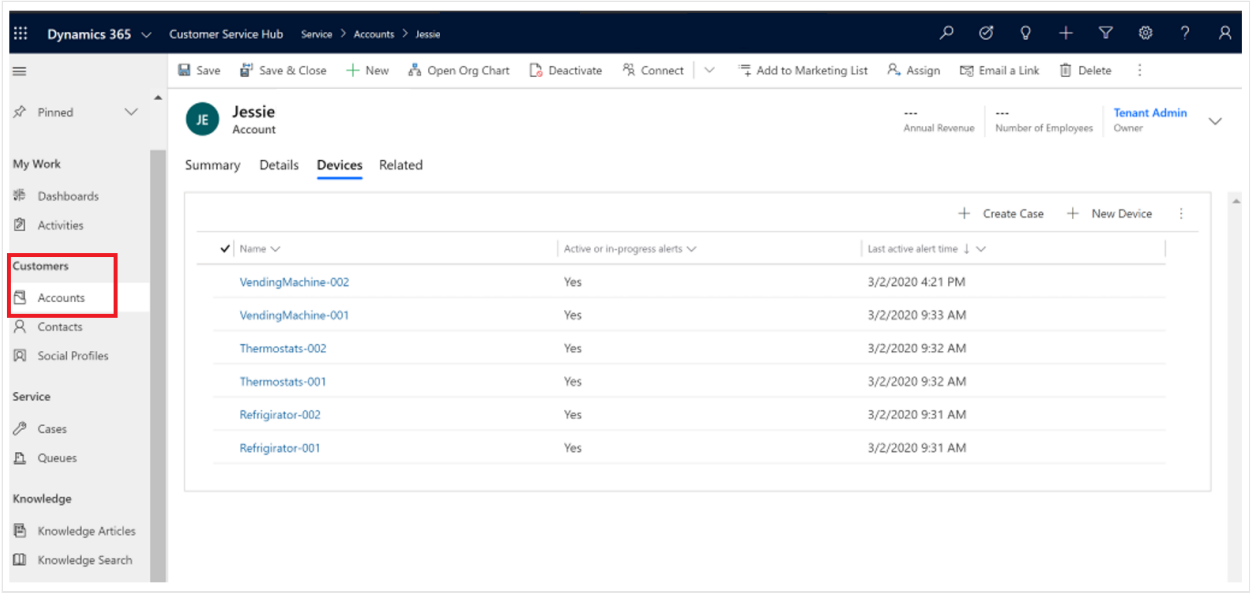
User experience for Connected Customer Service

A list of Connected Customer Service actions that agents can take is as follows:

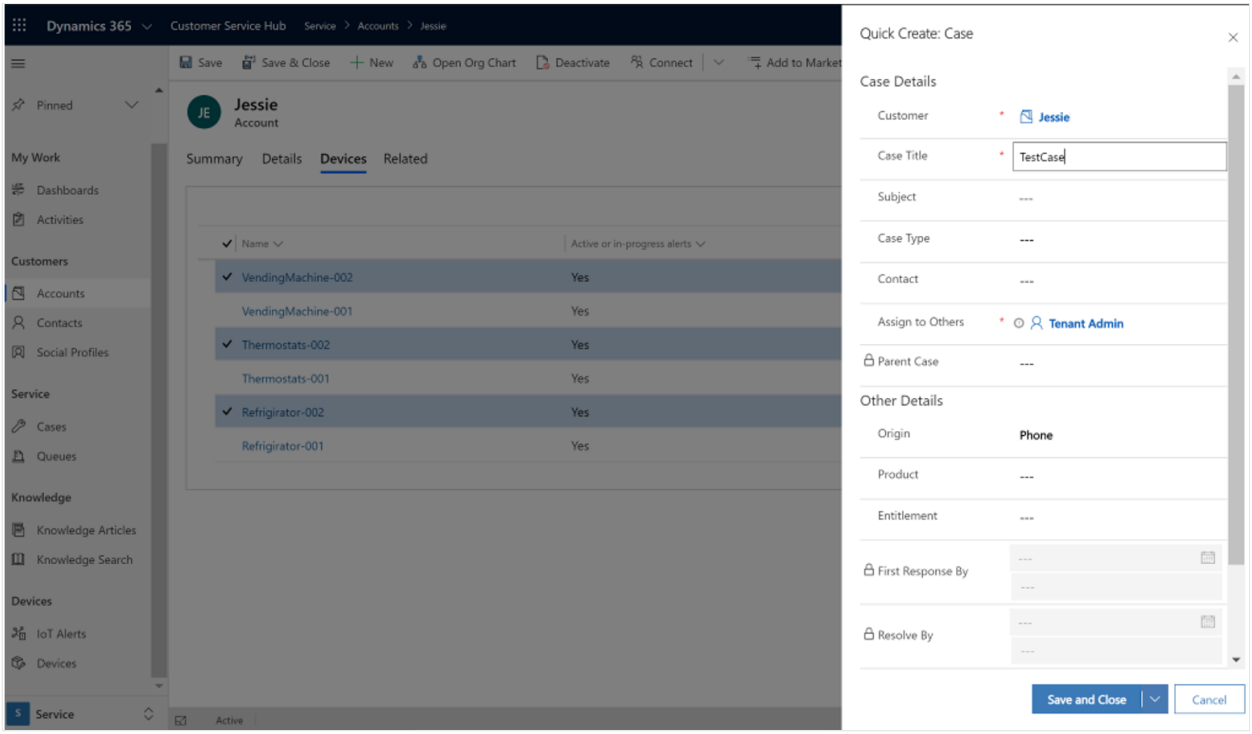
1. **Convert an IoT alert to a case**: Agents can convert an IoT alert to a case that includes pre-populated IoT alert details.



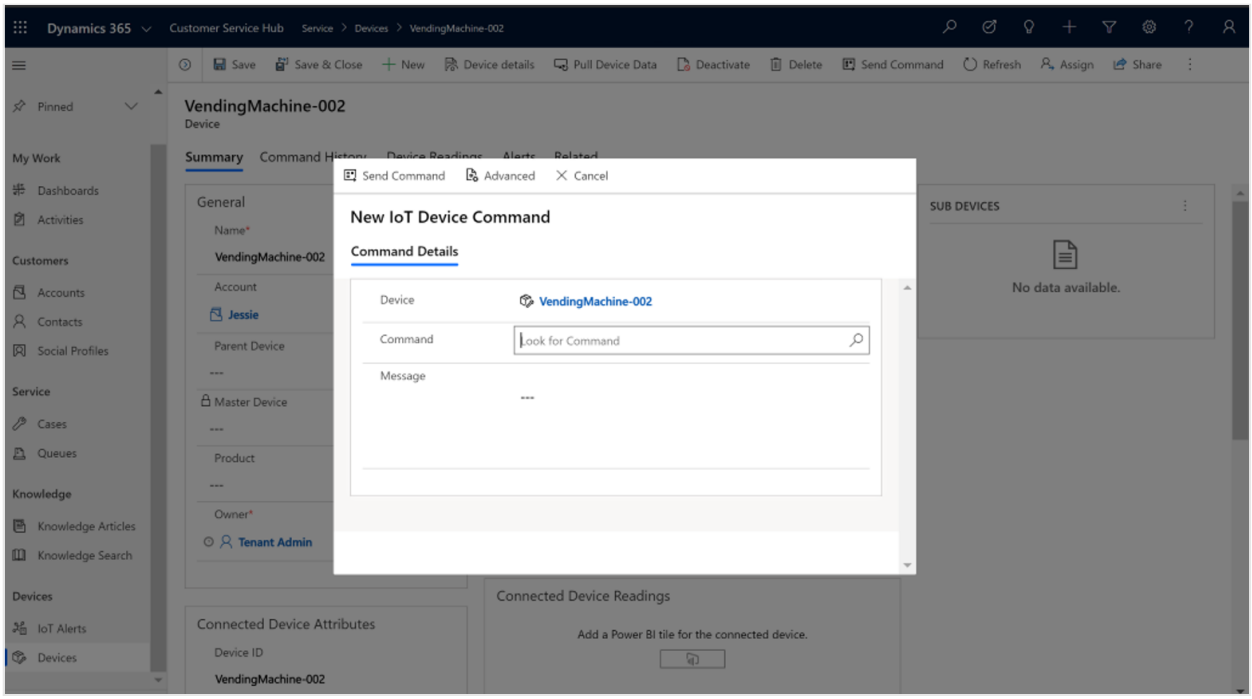
2. **View a customer's device alert history**: Agents can view a customer's device alert history by selecting the customer's account.



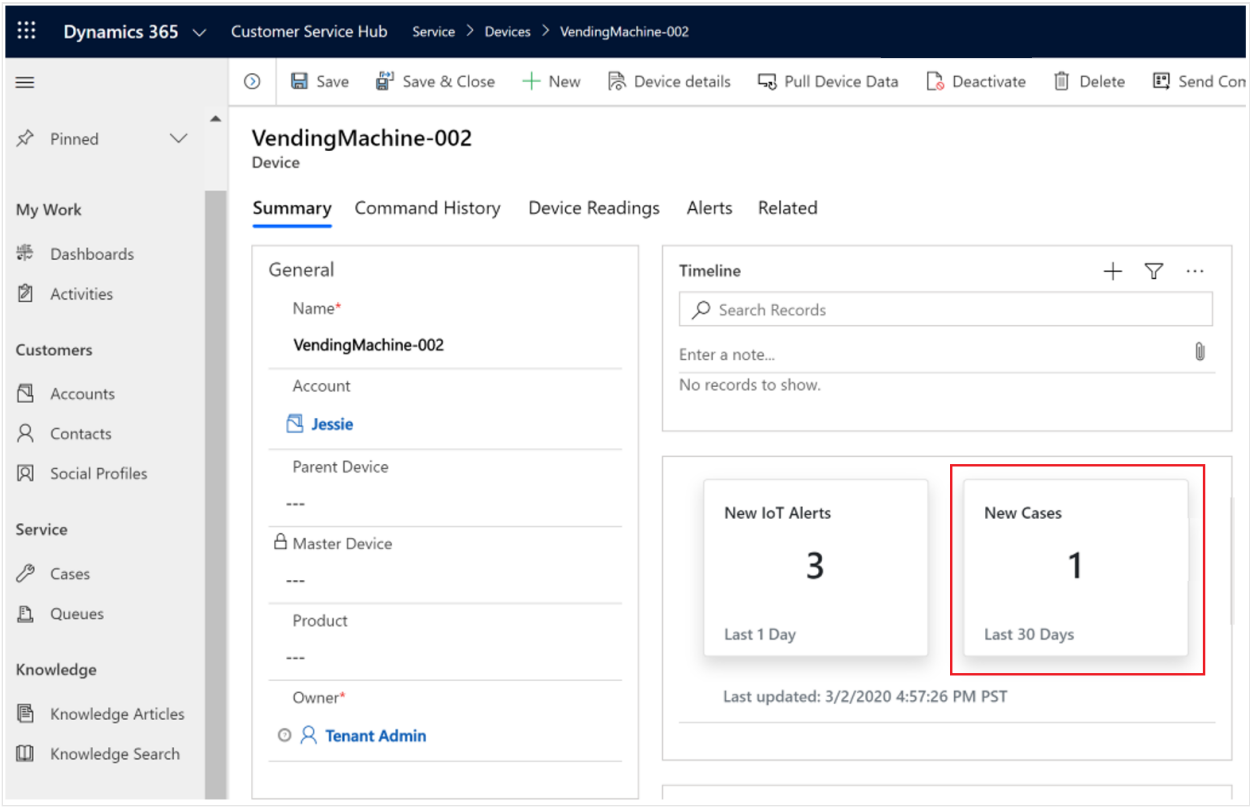
3. **Create a case with multiple devices**: Agents can create a case by selecting multiple devices.



4. **Send commands to IoT devices**: Agents can send commands to IoT devices.



5. **View device history summaries**: Agents can view a device's history summary.



6. **Check real-time device readings**: Agents can check real-time device readings.

7. **View case histories on devices**: Agents can check a case history on a device.

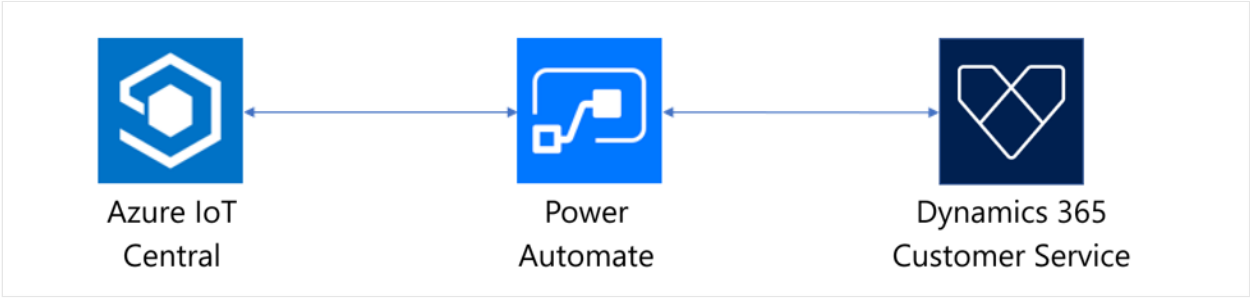
Connected Customer Service for Azure IoT Central - Overview

Article • 01/15/2022

Connected Customer Service for Azure IoT Central provides a direct integration of Dynamics 365 Customer Service with Azure IoT Central, a fully managed IoT software-as-a-service (SaaS) solution.

Azure IoT Central enables builders to configure rules and actions. Based on those actions, IoT alerts will be created in Connected Customer Service. Also, based on service activities in Connected Customer Service, information can be sent back to Azure IoT Central. This is accomplished by using Power Automate, a SaaS offering for automating workflows across applications and services.



The below end-to-end integration processes can be easily implemented based on a pure configuration experience:

- Azure IoT Central can send information about device anomalies to Connected Customer Service (as an IoT Alert) for diagnosis
- Connected Customer Service can create cases or work orders triggered from device anomalies

Azure IoT Central requires no extensive cloud development or coding skills to get an IoT solution up and running.

With Power Automate templates, users can connect their accounts, take advantage of our pre-built templates, and customize their own flows in an easy visual designer without the need for coding experience.

Prerequisites for setting up Connected Customer Service for Azure IoT Central

Article • 08/09/2022

Ready to connect Azure IoT Central to Connected Customer Service (CFS) using Power Automate to see how you can harness the power of the Internet of Things (IoT) and improve customer service (without writing any code)?

Before you take these tutorials, you need to complete three tasks:

- Provision the Azure IoT Central solution using the sample Legacy template.
- Get a Dynamics 365 Customer Service tenant with system administrator credentials.
- Install the Dynamics 365 Connected Customer Service add-on from the Dynamics 365 admin center.

This topic provides you with links to everything you need and walks you through the steps to get started.

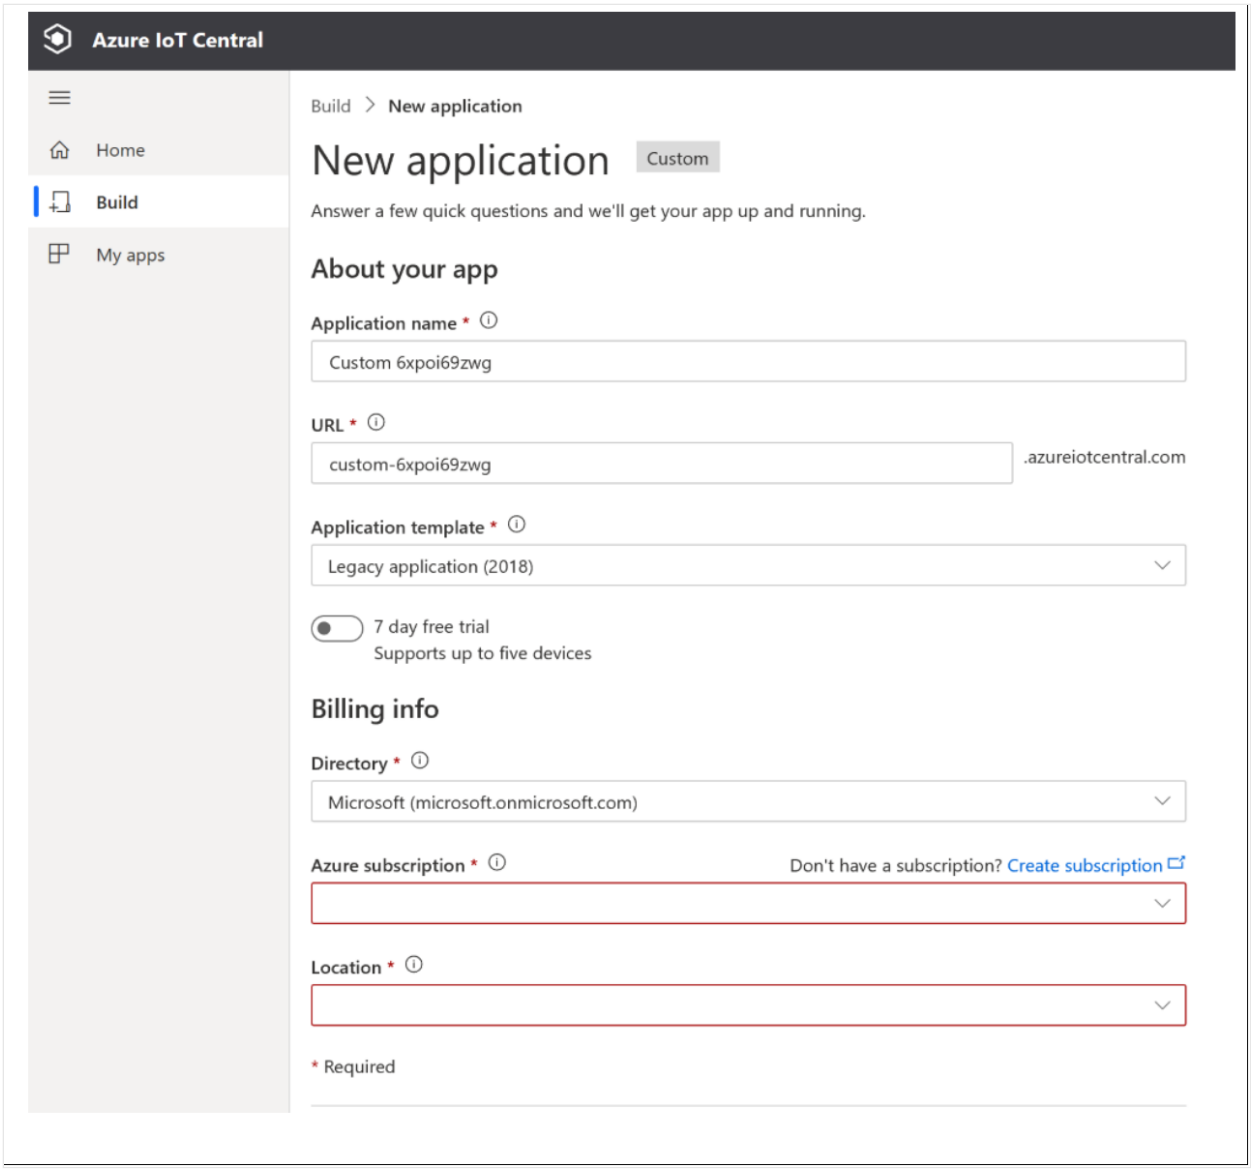
Provision the Azure IoT Central solution using the Legacy template

The various industry templates for retail, energy, government, and healthcare contain device templates that you can use for testing purposes.

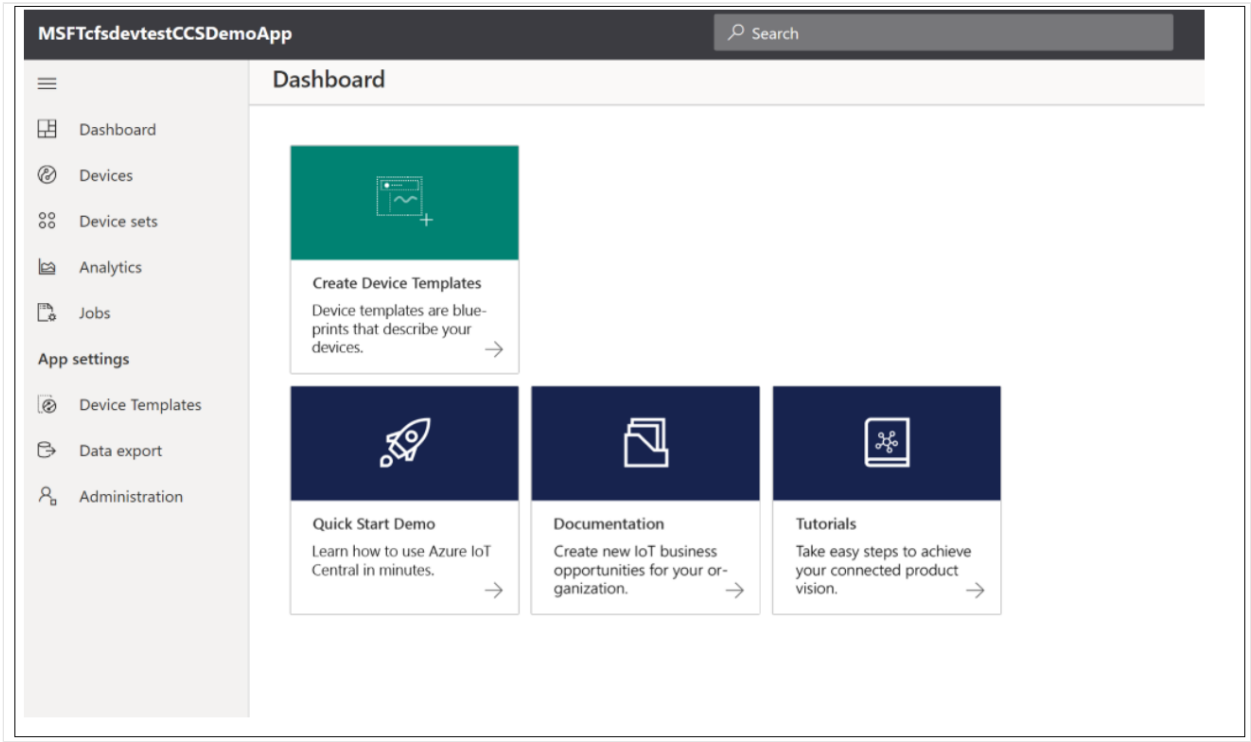
First, navigate to Azure IoT Central. To start creating your new Azure IoT Central application, select **Create Custom App**.

On the **Create Custom App** dialog:

1. Select the Preview or Legacy template of your choosing (recommended for demo) or create a custom app to start from scratch.
2. Then select **Create**.



After a few seconds, you'll see the App home page.



Get a Dynamics 365 Customer Service tenant with system administrator credentials

You'll need a Dynamics 365 Customer Service tenant that you can connect your IoT solution to.

New to Customer Service and need a tenant? No worries. Sign up for a free trial for development purposes.

1 - Receive IoT alerts in Connected Customer Service from Azure IoT Central

Article • 01/26/2022

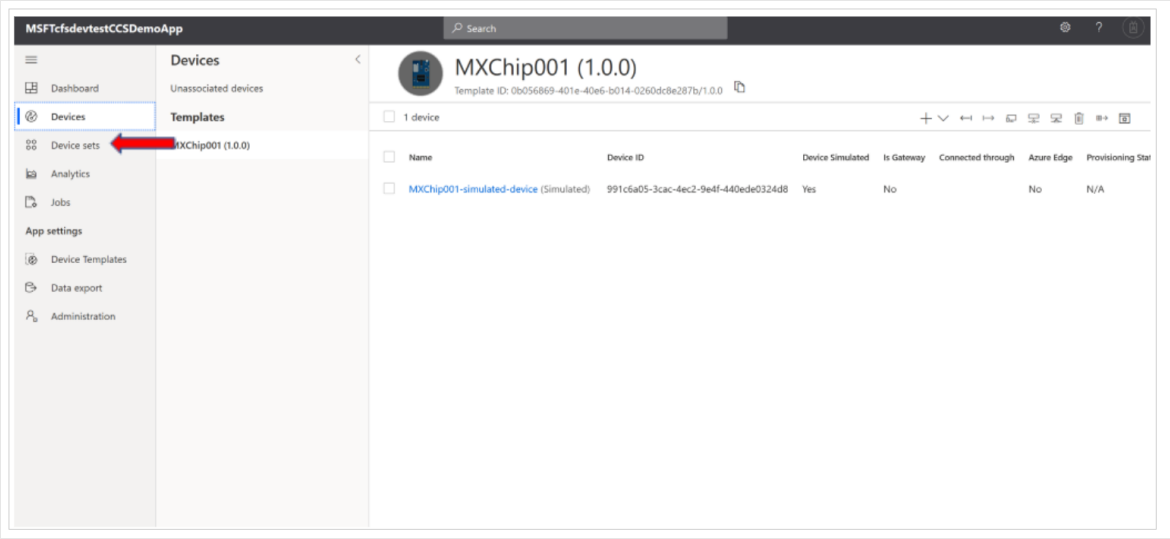
At the end of this step in the tutorial, you'll be able to receive and see alerts from Azure IoT Central in your instance of Connected Customer Service. IoT alerts will display on your dashboard and relate to relevant work orders that have been created automatically.

Goal

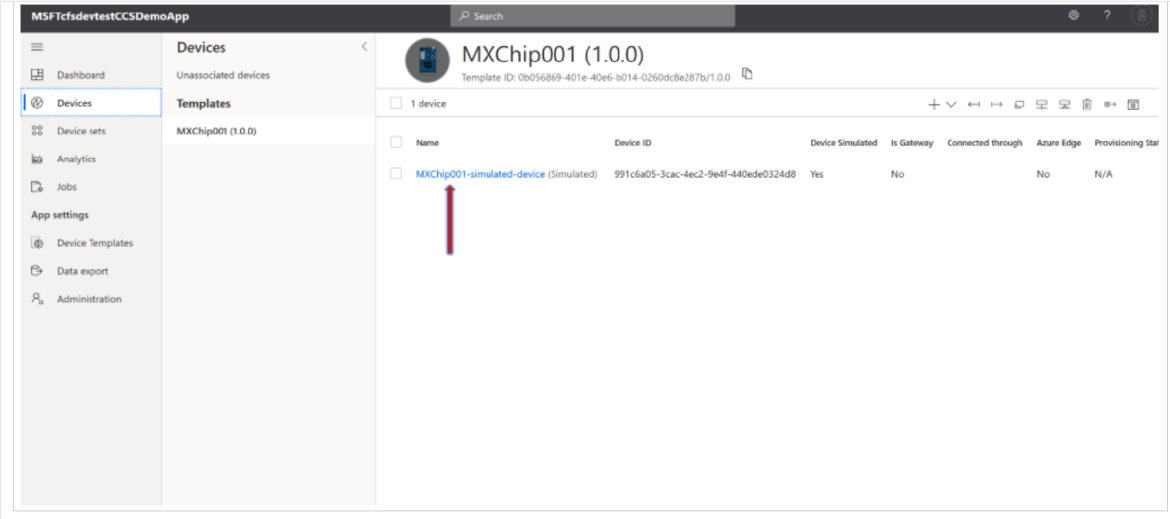
Connect Azure IoT Central to Connected Customer Service by configuring the "Create Connected Service alerts from IoT Central" template in Power Automate.

Steps

1. Sign in to your Azure IoT Central application and navigate to **Devices**.

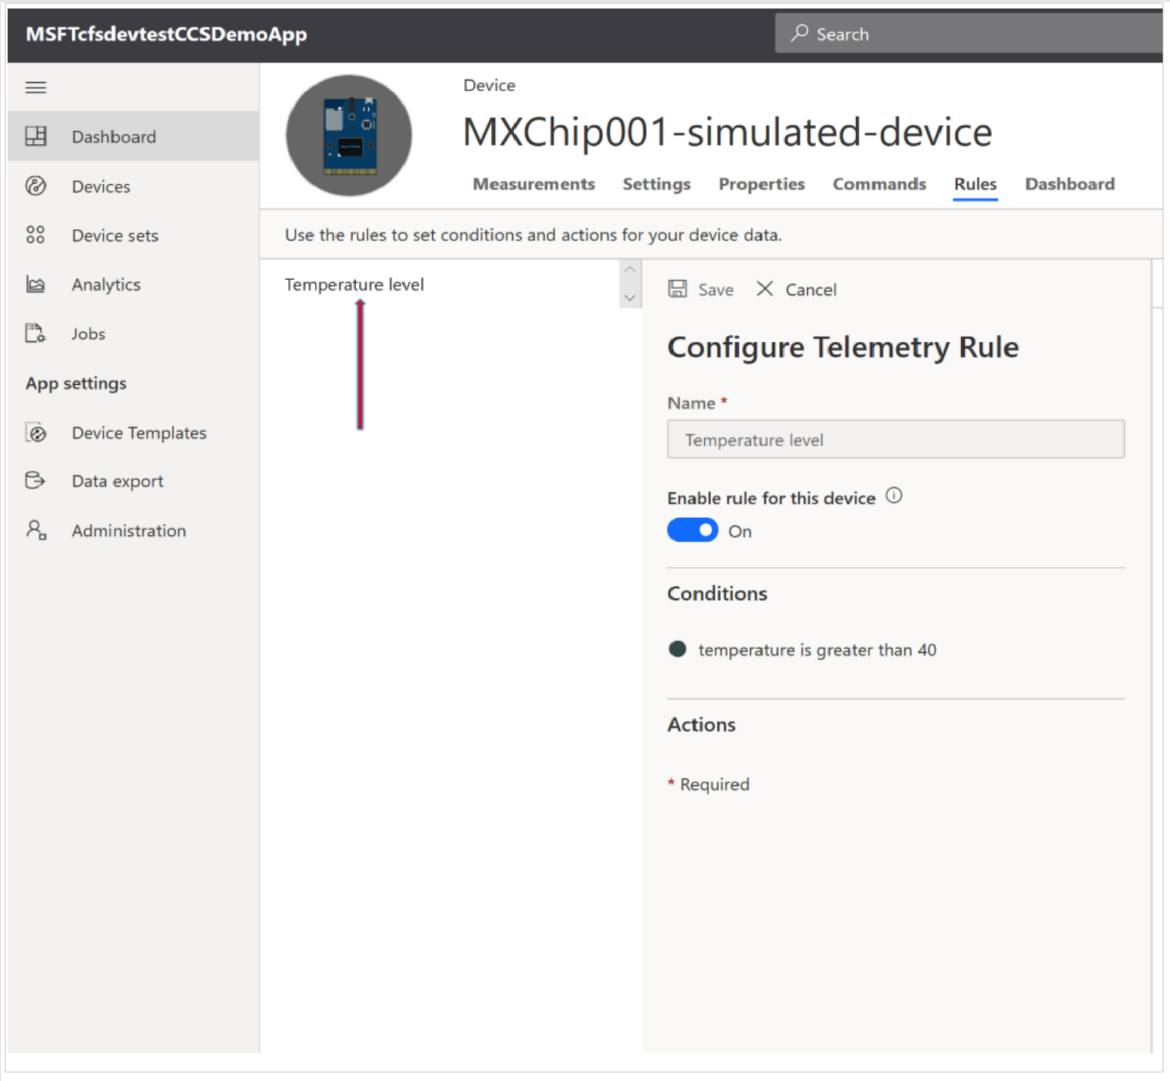


2. From the list of devices, select **MXChip001**.

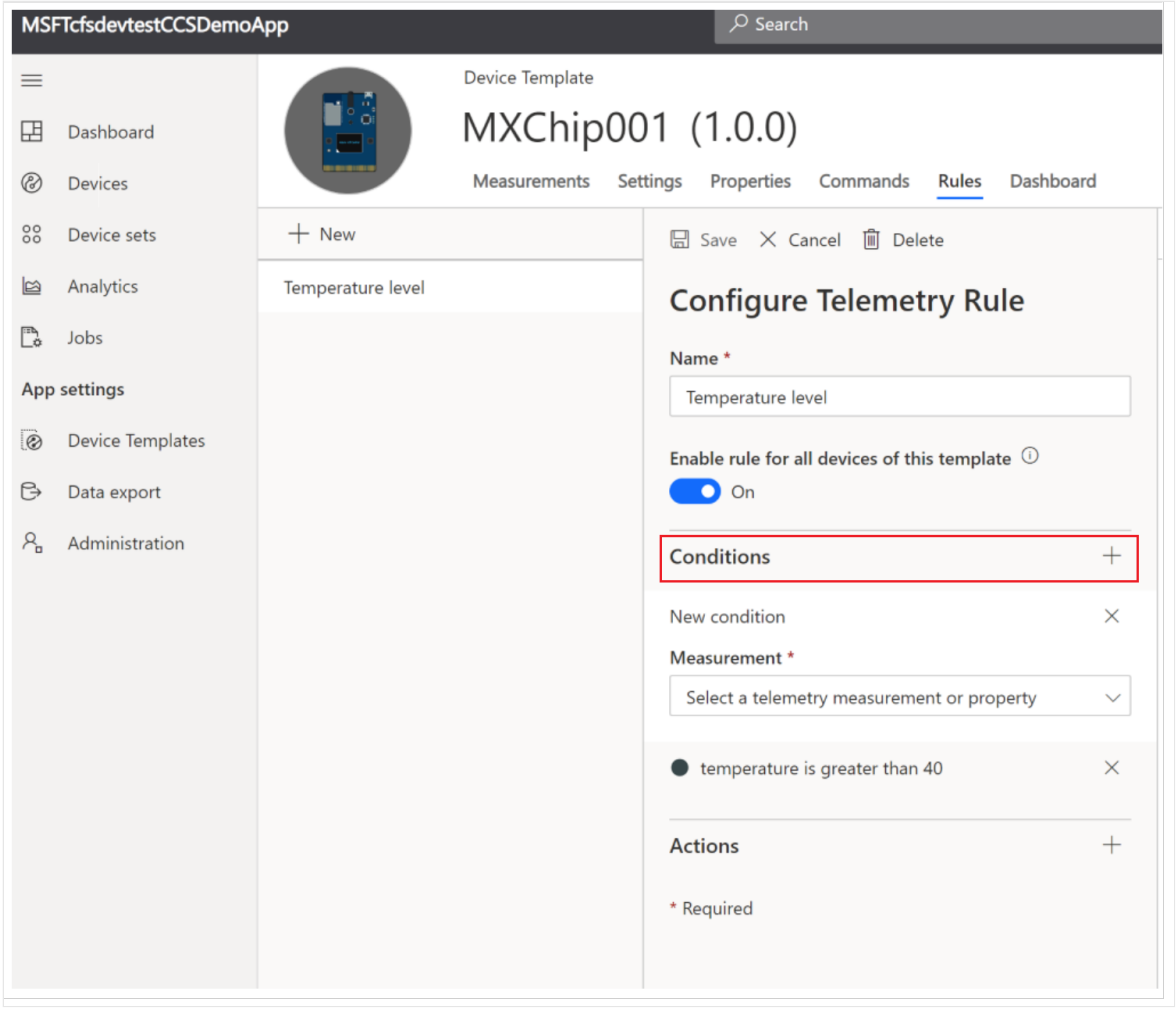


The MXChip001 detail page is displayed.

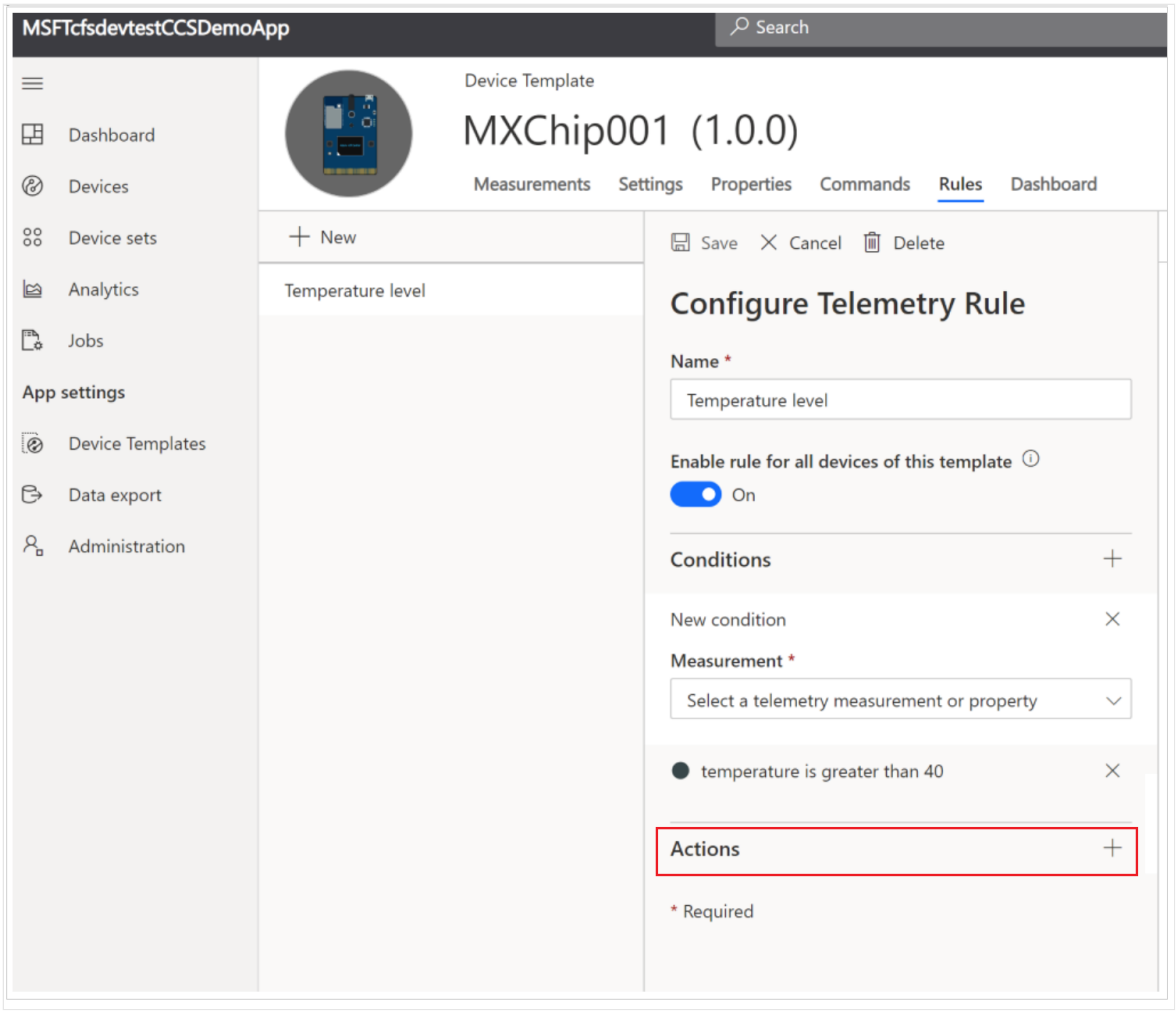
3. Select the **Rules** tab, and then create the rule, **Temperature level**. More information: IoT Central tutorial.

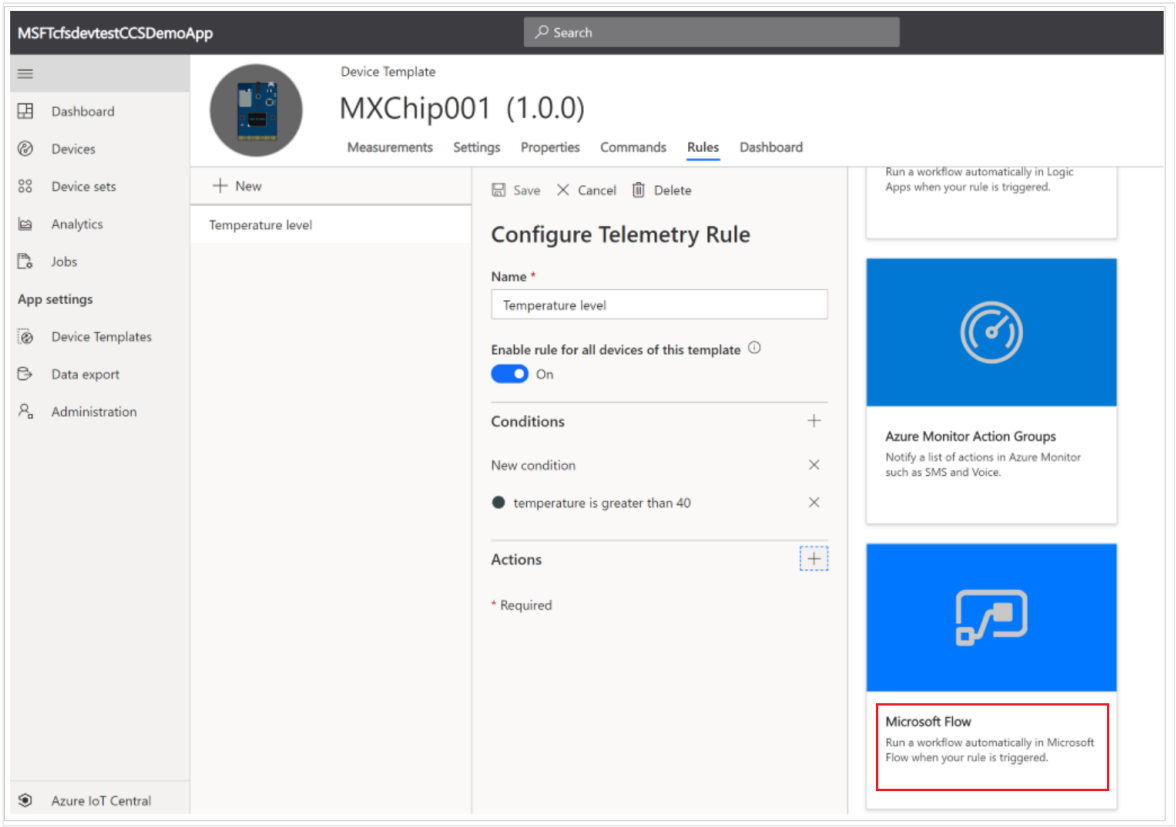


4. Select the plus sign (+) next to **Conditions** to set up the alert trigger threshold.



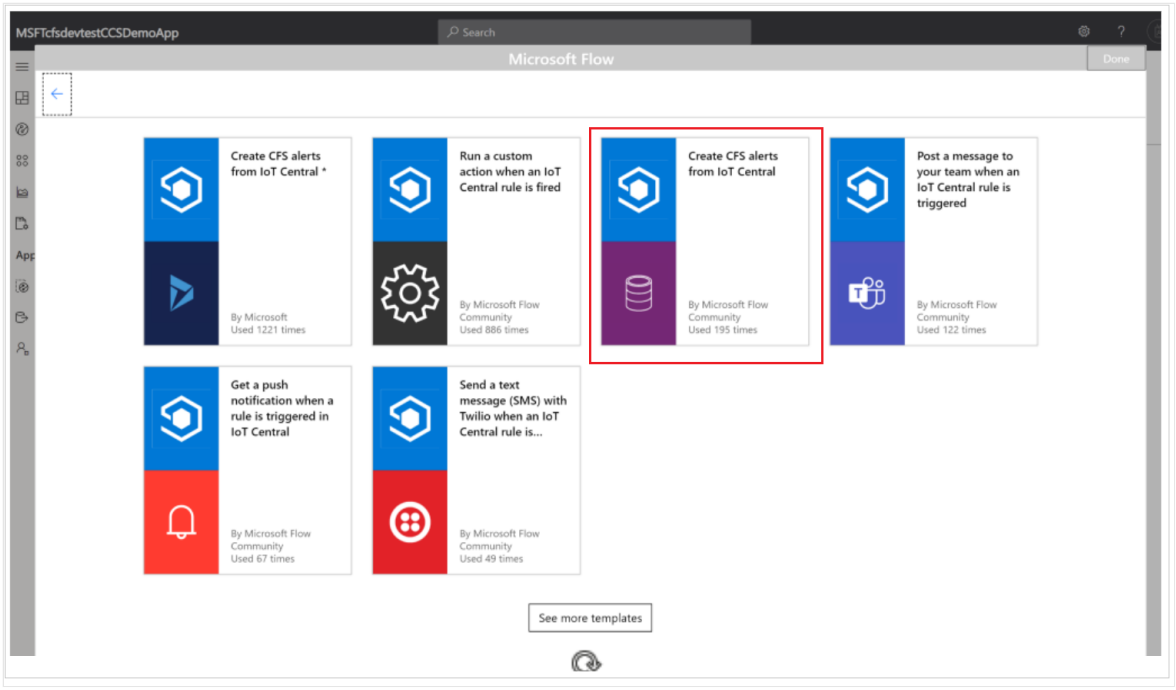
5. Select the plus sign (+) next to **Actions**, and then select **Microsoft Flow**. This is where you'll set up your integrations.

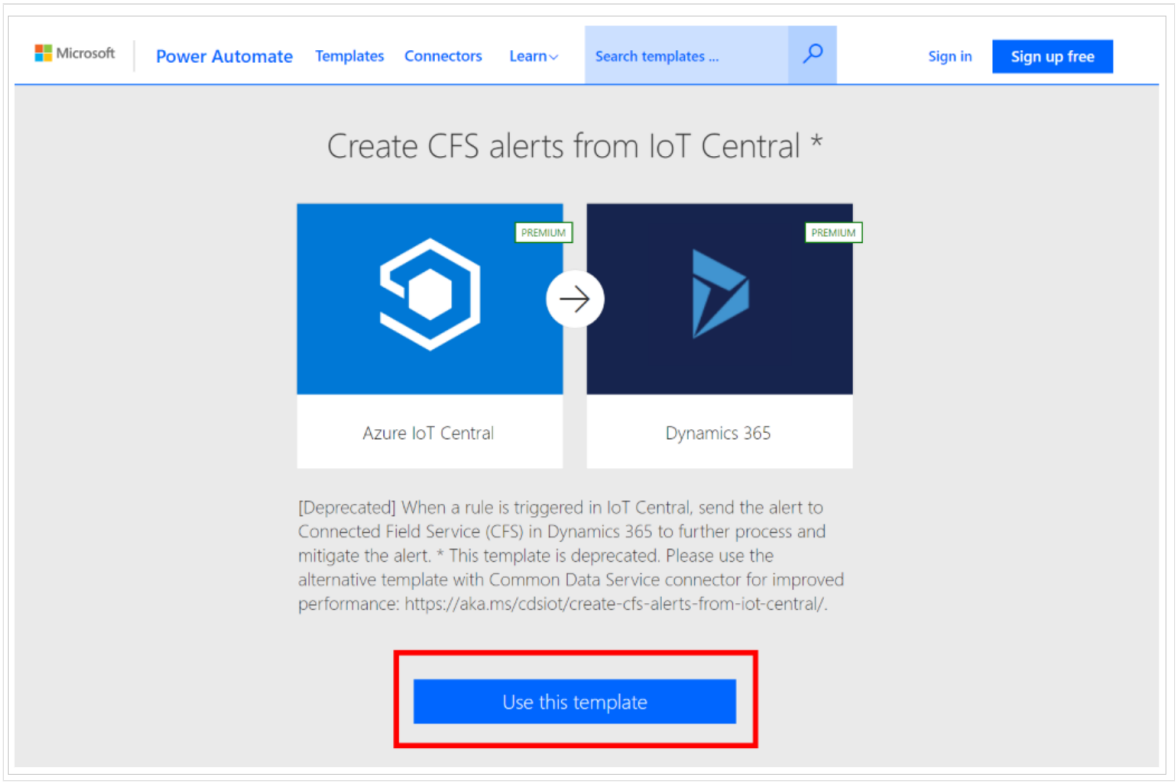




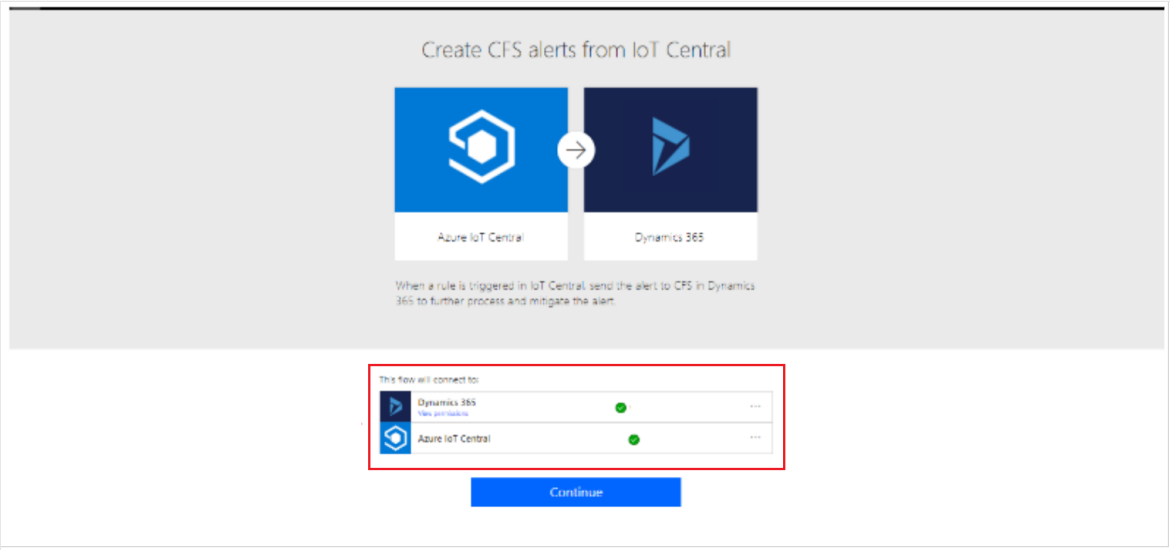
The Power Automate template page for **Create Connected Service alerts from IoT Central** is displayed.

6. Select **Use this template**. (If you can't find these templates, go to the Power Automate Templates page and search for "CDS").





7. You'll be prompted to sign in to both IoT Central and Dynamics 365 accounts. Select your accounts from each, and then select **Continue**.



Now you'll see the actual flow.

8. Because this is a template, you only need to take the following actions:

   a. Select your Azure IoT Central application name.

   b. Set **IoT rule** as the one you created earlier. In our suggested example, it would be: "Temperature level".

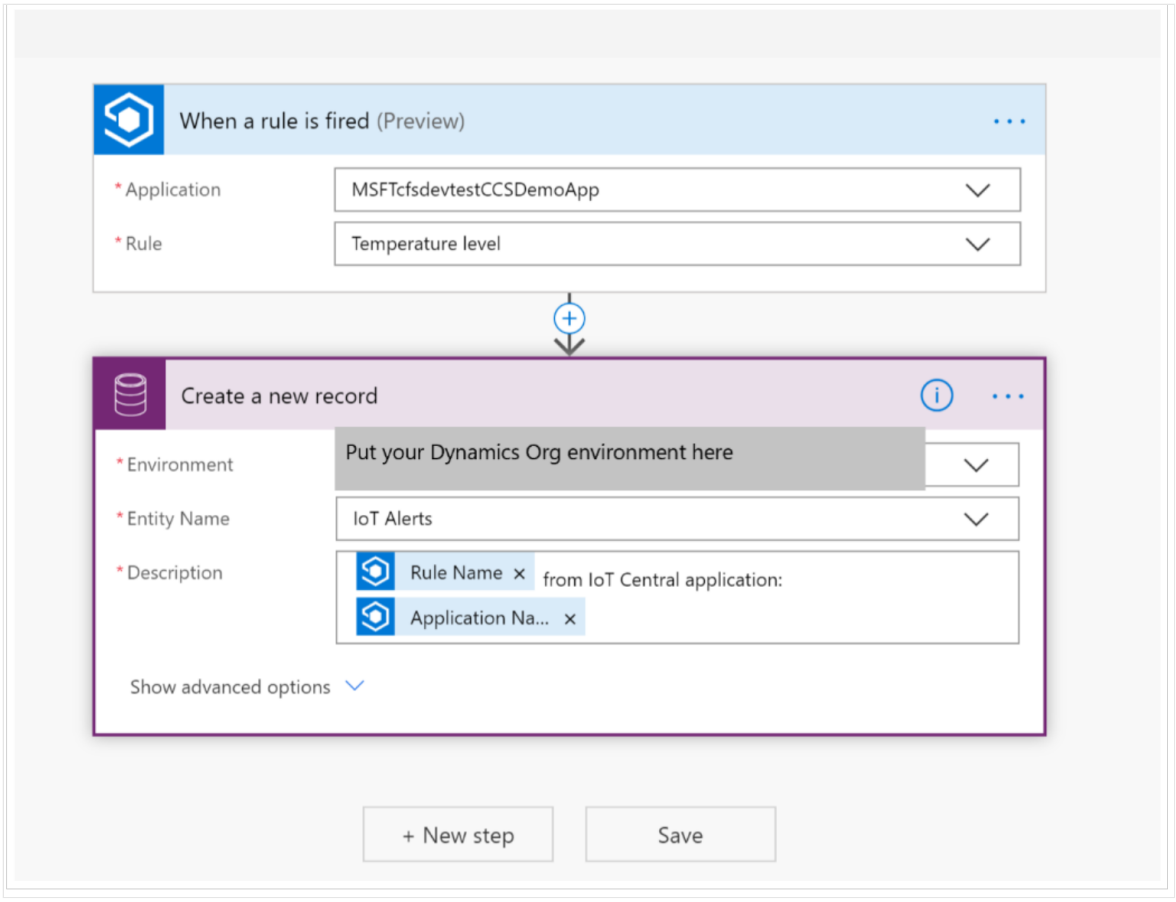
   c. Select your Dynamics 365 organization name.

   d. Set **Entity Name** to **IoT Alerts.**

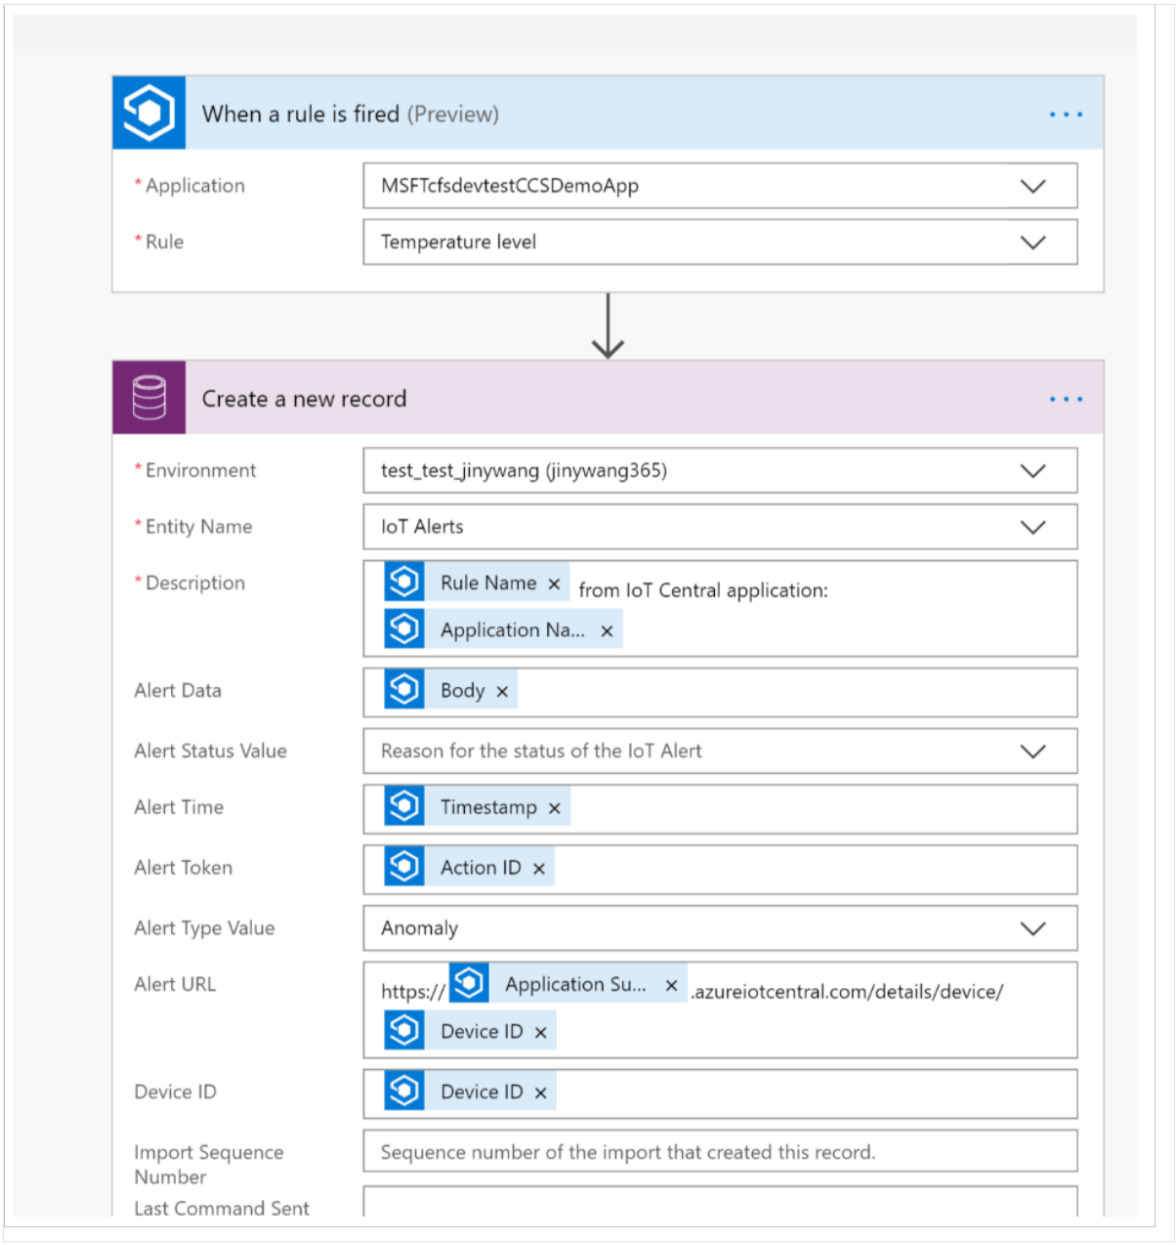
   e. Select **Show advanced options** to reveal several hidden customers.

   f. Set **Alert Type Value** to **Anomaly**.

   g. Save the flow.



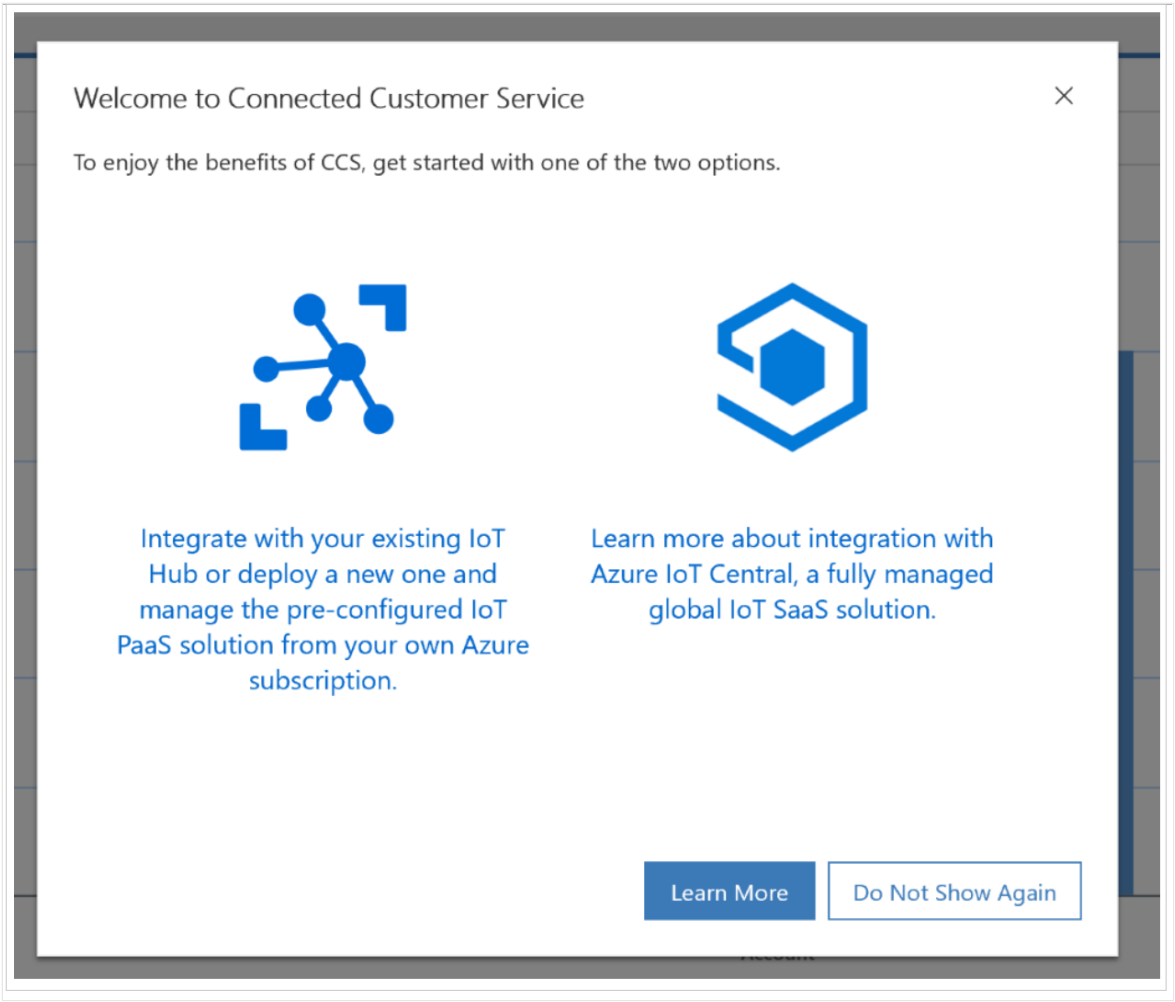
When a rule is fired (Preview)
* Application
MSFTcfsdevtestCCSDemoApp
* Rule
Temperature level
Create a new record
* Environment
Put your Dynamics Org environment here
* Entity Name
IoT Alerts
* Description
Rule Name
from IoT Central application:
Application Na...
Show advanced options
+ New step
Save



From here, the workflow will trigger based on the alert type.

See the results

1. After you've saved your flow, sign in to Dynamics 365 Customer Service, and then select **Connected Customer Service**. You might see a window that offers a few links to learn more about Connected Customer Service and Azure IoT offerings. You can choose to learn more, or just dismiss this window.



2. In Connected Customer Service, you should now see incoming alerts from Azure IoT Central on the dashboard. You can select one of these alerts to see more details, including device information, threshold, and the violated rules. You can also select the IoT Central alert URL that will take you back to IoT Central.

Associate devices with customer accounts in Connected Customer Service

2 - Associate devices with customer accounts in Connected Customer Service

Article • 01/26/2022

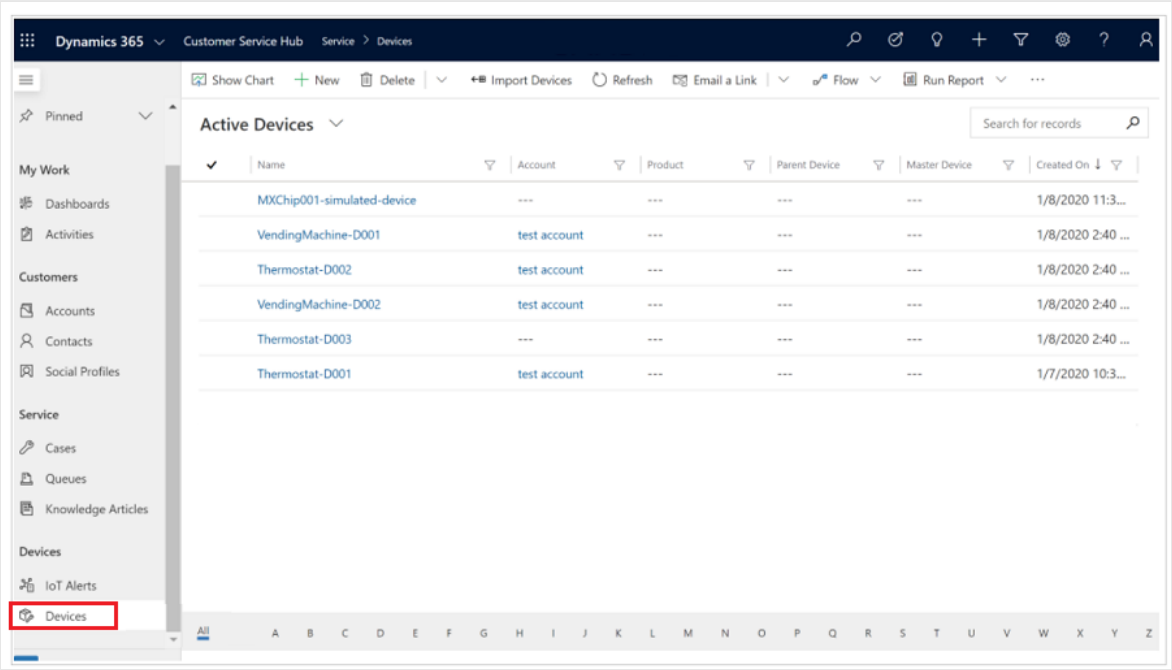
If an IoT device isn't associated with a customer account in Connected Customer Service, the system won't be able to generate work orders or cases for incoming alerts. In this tutorial, we'll walk through how to associate a device with a customer account. While customer accounts are an optional association in Azure IoT Central, they're required in Connected Customer Service.

Goal

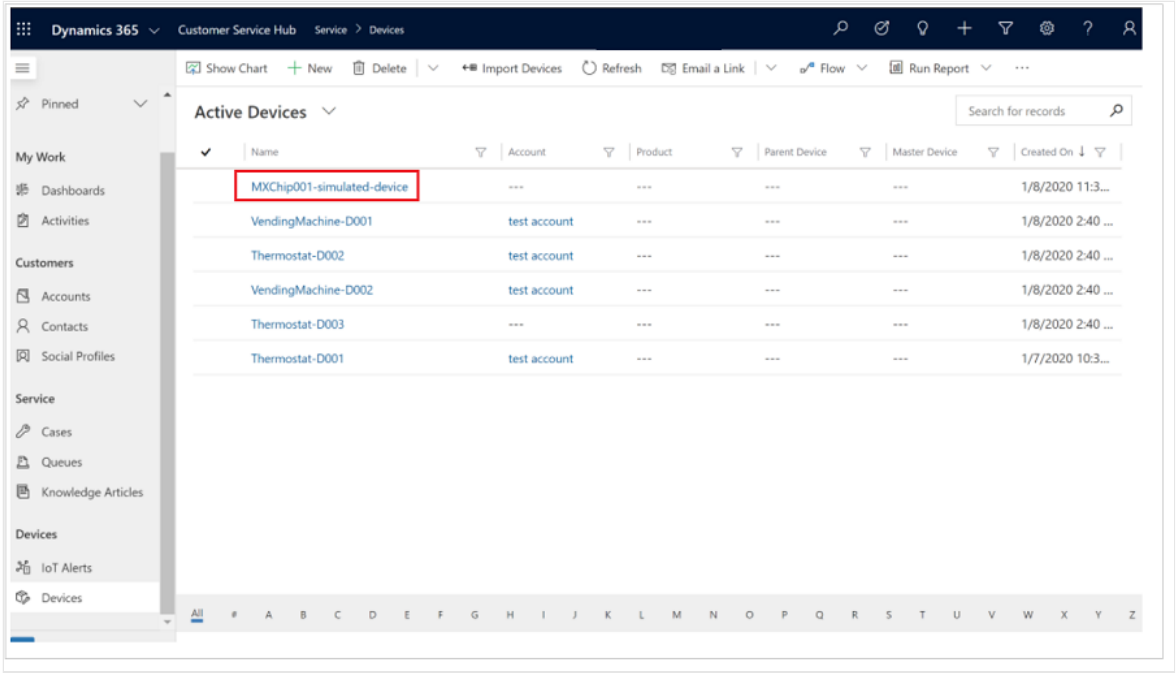
Associate a device in Connected Customer Service with a customer account so that work orders or cases can be generated against incoming IoT alerts.

Steps

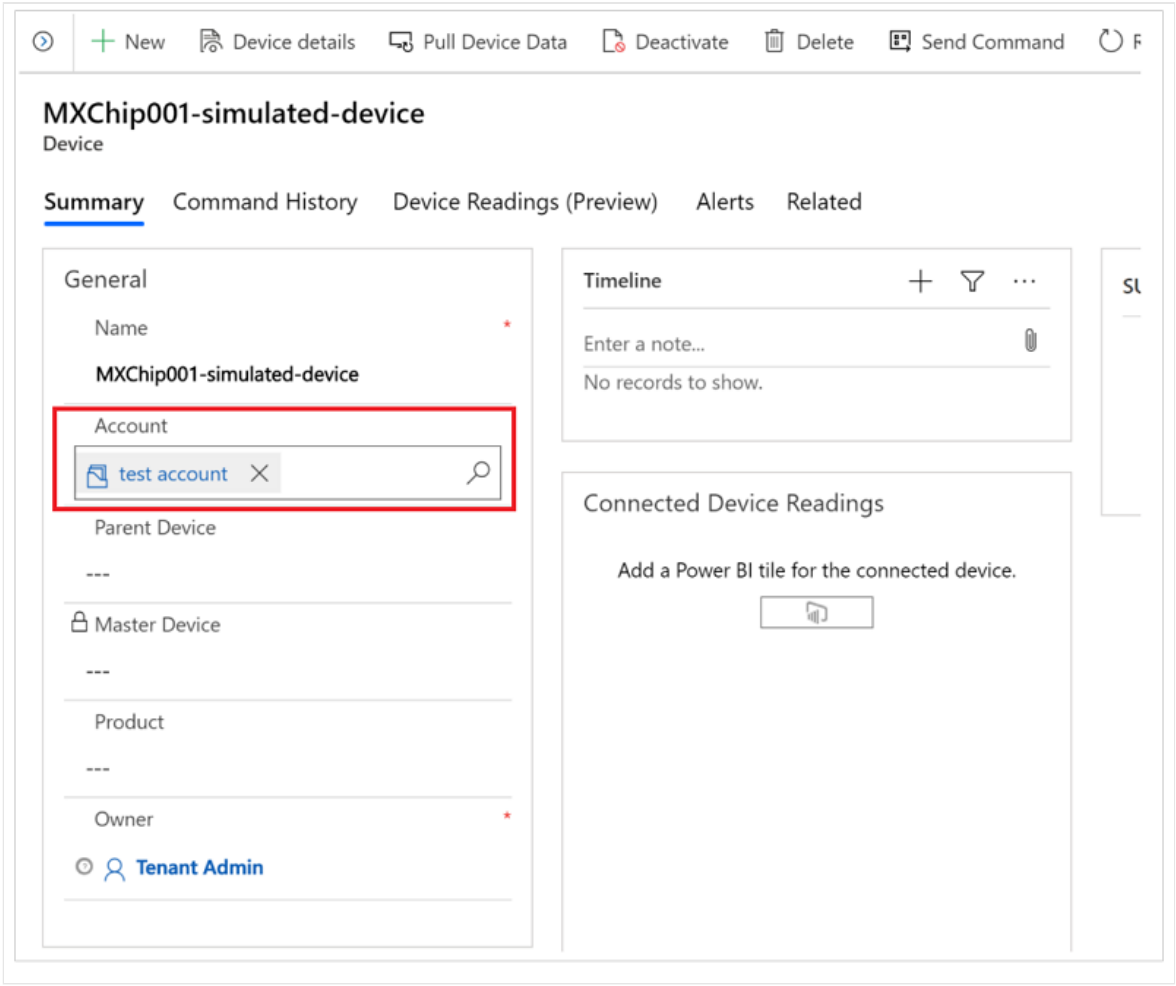
1. In your Connected Customer Service application, select **Devices** from the left pane.



2. On the **Active Devices** page, select one of the devices that doesn't have an account already associated with it.



3. On the device detail page, start typing the name of the customer account in the **Account** field.



4. Save the changes.

See the results

This device will now be associated with a customer account, and can receive IoT alerts from Azure IoT Central.

Develop customized IoT solutions in Connected Customer Service

Article • 08/09/2022

Connected Customer Service for Dynamics 365 integrates Internet of Things (IoT) devices with Dynamics 365 for Customer Engagement to enable their registration, monitoring and management into established business processes. This guide explains the component architecture, supplied interfaces and customization points, and explains the approach to develop customized IoT solutions.

The initial release of Connected Customer Service supports the following two primary development scenarios:

- Extend Connected Customer Service for Dynamics 365 so that manufacturers and hardware service organizations can register, monitor, and manage—including controlling and correcting—IoT devices. Future releases will provide additional support for predicative and prescriptive maintenance capabilities.
- Provide an IoT Platform that ISVs and partners can build on to IOT-enable their Dynamics 365 for Customer Engagement custom entities and managed solutions.

To enable the first scenario, the following capabilities are supported:

- Abstract device registration in an action, so that devices can be easily registered using the CRM web client or the mobile client
- Enable any CRM entity to be IOT-enabled, enabling straightforward IoT integration within existing business processes by using Connection entities
- Receive service alerts and automating their response with a customized workflow
- Send remote commands to IoT devices, for example after diagnosing a problem to correct a malfunctioning device
- Analyze incoming device data, and displaying aggregate, trend and other metrics in custom dashboards

Architecture of Connected Customer Service with IoT Hub

Article • 07/07/2021

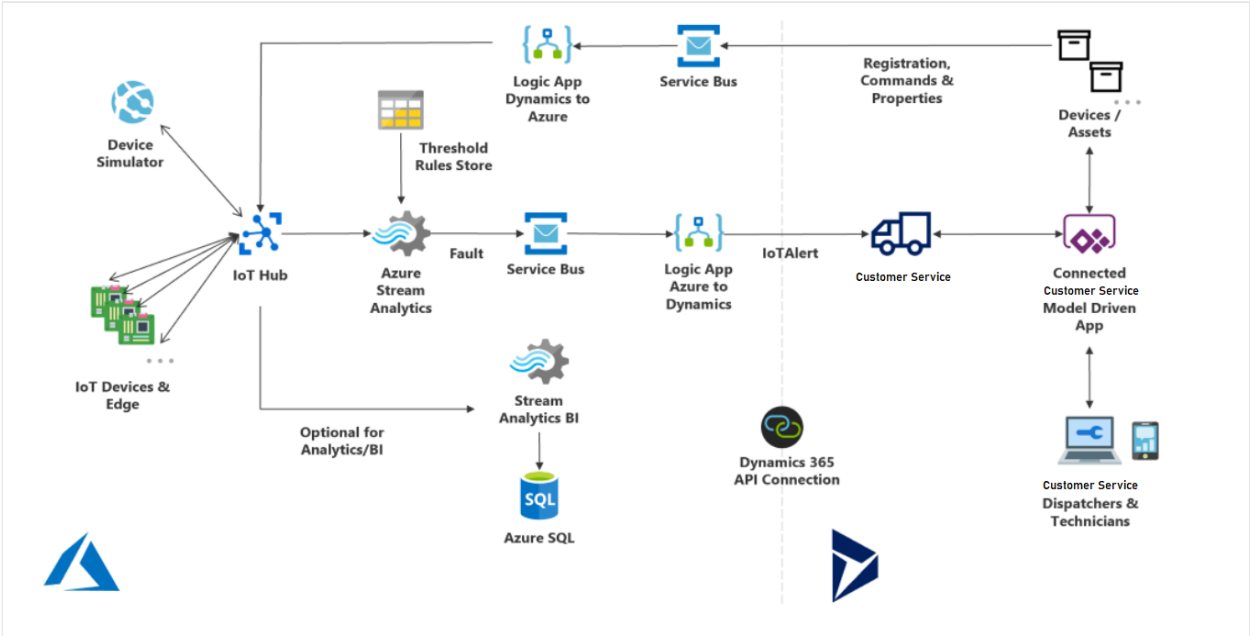
Connected Customer Service with IoT Hub brings together Azure IoT and Dynamics 365 Customer Service. In this topic, you will find an explanation of the architecture and how it all works together.

Prerequisites

To understand what's covered in this topic, you need to know that Connected Customer Service (CCS) refers to a set of solutions, entities, and processes built inside the Dynamics 365 Customer Service Hub app. As of Customer Service Hub 9.0.20034.20XX, CCS is included as part of Customer Service.

For this topic, the words **data** and **telemetry** refer to information sent from an IoT device to the cloud. The words **devices** and **sensors** refer to Internet-connected things like thermometers, gyroscopes, magnetometers, pressure readers, and more that take specific measurements. An **asset** is a piece of equipment that can have one or more sensors connected to it.

Architecture



- **IoT Devices & Edge**: Internet-connected sensors on equipment send data to IoT Hub typically via WiFi or cellular connectivity. A single piece of equipment can have

multiple sensors, each taking different measurements such as temperature and pressure. If a building or area has a collection of equipment each with multiple sensors, then an **Edge device** can be used to organize them and broker telemetry sent to IoT Hub.

- **Device Simulator**: Administrators can simulate devices and telemetry for testing and development purposes before the hardware is set up. This lets them see how simulated alerts flow to Dynamics 365 Customer Service and create work orders.
- **IoT Hub**: The gateway to the cloud, capable of ingesting data on a large scale. IoT Hub is a collection of applications and processes tailored to connected device scenarios that are also customizable. Deploying IoT Hub will deploy a resource group with this collection of applications and processes.
- **Azure Stream Analytics**: Queries device data as it enters IoT Hub. Data only passes through and is not stored.
- **Threshold Rules Store**: Helps decide if device data is abnormal and beyond acceptable boundaries. Abnormal data is characterized as a **Fault**.
- **Service Bus**: Takes faults and enters them into a queue to systematically keep track of them. The queue is helpful for scenarios where faults fail to get transferred to Dynamics 365 and should be attempted again after some time.
- **Stream Analytics & Azure SQL**: Used to store device data for longer time periods to perform data analysis. For example, this would be an option for organizations interested in analyzing large amounts of historical data to predict device failures in the future. This generally incurs a greater Azure cost.
- **Logic App Azure to Dynamics**: Connects Azure with Dynamics 365 (and other applications and platforms). Serves as a way to apply more logic, map entities, and trigger the appropriate actions in Dynamics 365, such as the creation of an **IoT Alert** record. Compare this to IoT Central, which uses Power Automate.
- **IoT Alert**: Faults are passed from IoT Hub to Dynamics 365 in the form of IoT alerts, which is an entity in Customer Service. An IoT alert is the first part of the process inside Dynamics 365. An IoT alert is a subset of all device data that requires attention and potentially an action from the customer service or customer service department.
- **Connected Customer Service Model Driven App**: A set of entities and processes built on Dynamics 365 Customer Service. Among other things, Connected Customer Service allows you to connect IoT devices (sensors) with Customer Service customer assets.

- **Customer Service Agent**: The end users of Connected Customer Service who interact with IoT alerts and cases, on their phones, tablets, and computers.
- **Devices**: Entities in Connected Customer Service in Dynamics 365 that help you manage the sensors and equipment that your organization manages.
- **Registration, Commands & Properties**: Processes used in Connected Customer Service to interact with and send data back to IoT Hub and finally to the device, making CCS a bi-directional solution. For example, commands allow you to execute actions on devices such as reboot. Another example is to display a message on the device for someone to view..
- **Logic App Dynamics to Azure**: The reverse of the previously explained Logic App, this adds detail to data and actions that need to be sent to IoT Hub from Dynamics. IoT Hub will then send the data or action to the connected device.

Component data flow diagram

A data flow between the Azure IoT Hub and Connected Customer Service components is detailed in this downloadable diagram. It details each information flow, its flow direction and relative order for a standard installation of Connected Customer Service for Dynamics 365.

Quickstart: Build your own Connected Customer Service (IoT) solution

Article • 06/28/2022

This article shows you how to get up and running quickly to build your own Connected Customer Service solution that integrates IoT data with Dynamics 365 Customer Service.

What is Connected Customer Service?

Connected Customer Service enables businesses to actively look for issues with customers' devices through IoT signals and proactively resolve those issues, simultaneously increasing customer satisfaction and reducing assisted support service costs.

What you need to get started

Here are the 3 things you need to get started building your own IoT solution:

- **Dynamics 365 Customer Service with system administrator credentials**

  You'll need a Dynamics 365 Customer Service tenant so that you can import your IoT solution on top of it. You'll build an IoT app within that Customer Service tenant.

  New to Customer Service and need a tenant? No worries. Sign up for a free trial for development purposes.

- **Azure subscription with admin credentials**

  The Azure IoT services you'll deploy need to be associated with an Azure subscription.

  New to IoT and need an Azure subscription? We've got you covered. Sign up for an Azure free trial.

- **Dynamics 365 Connected Customer Service add-on**

  The free Connected Customer Service add-on automatically provisions a number of Azure IoT services with predefined demo data seamlessly on top of Dynamics 365 Customer Service. The add-on comes with demo data that enables you to see

the capabilities IoT data brings to Customer Service, including command modeling, customer asset to device mapping, IoT alert – to – case workflow, and more.

Azure subscription prerequisites for Connected Customer Service with IoTHub

Article • 08/31/2023

> **Important**
>
> Azure Active Directory is being renamed to Microsoft Entra ID: No action is needed from you. **Learn more**

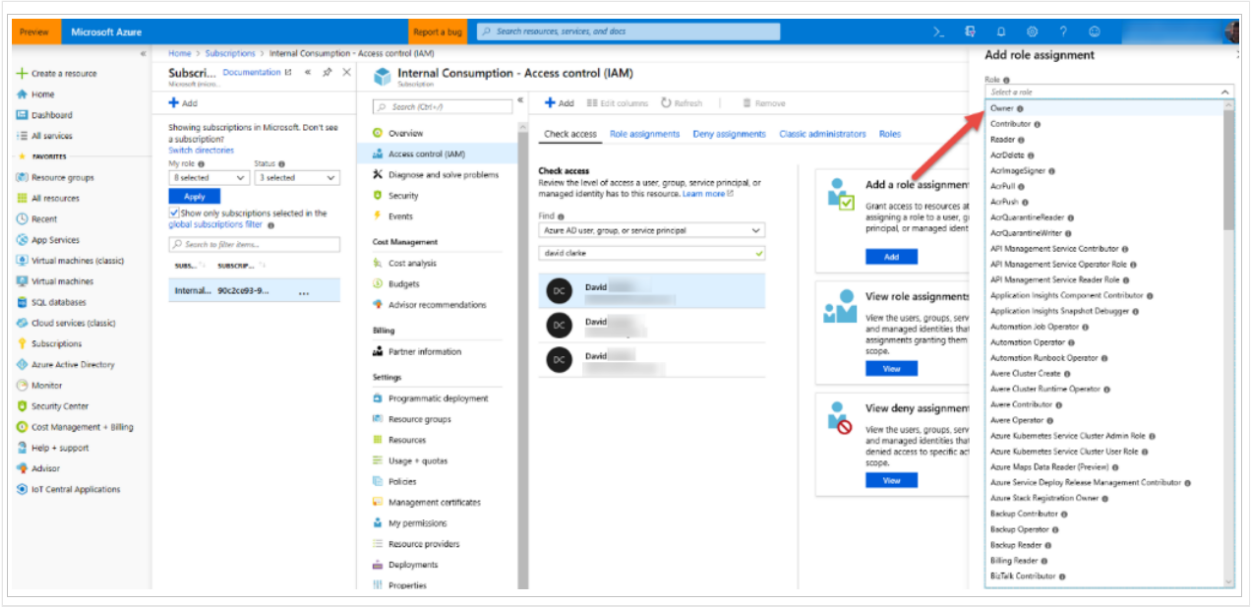
When you're deploying and administering Connected Customer Service with IoTHub, you must make sure of the considerations and prerequisites for your Azure subscription.

Prerequisites

1. You can deploy and administer Connected Customer Service with IoTHub in one Azure tenant only, which should be the home (first) Azure tenant tied to your credentials.

2. To deploy and administer IotHub, you must have one of the following Azure security roles:

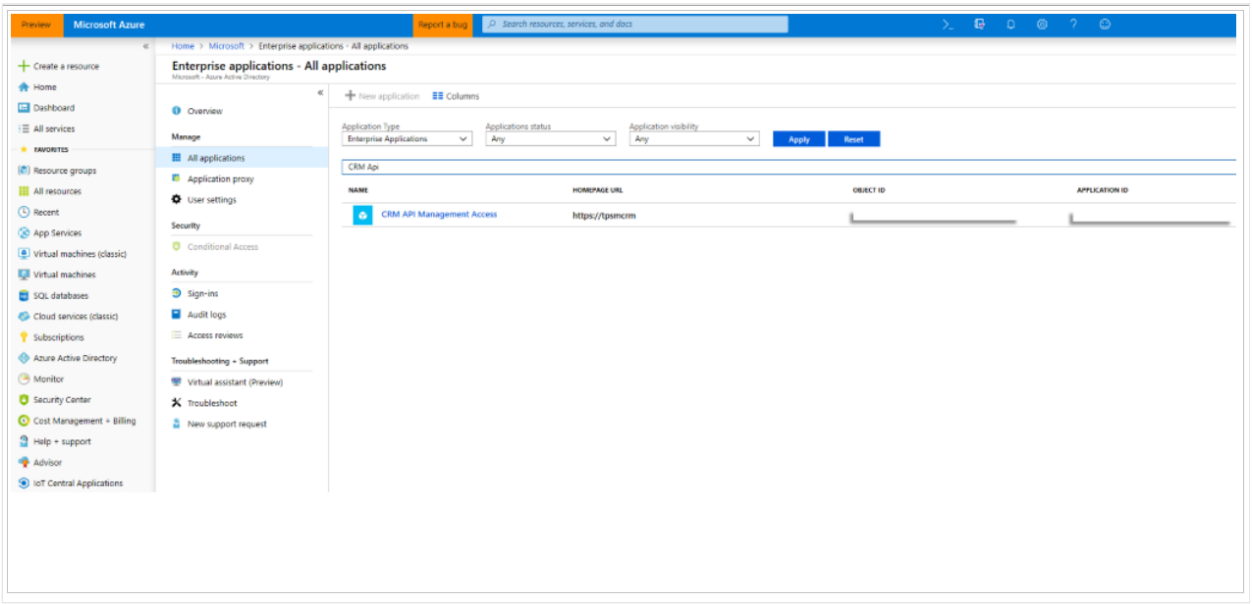
- Owner in role assignments (see the following screenshot)
- One of the following administrator roles:
  - Co-administrator
  - Service administrator
  - Account administrator



3. You'll see subscriptions that are tied to your sign-in **primary active directory** only. For example, david@contoso.com will see subscriptions from the contoso.com directory only. If jason@fabrikam.com invites David into their fabrikam.onmicrosoft.com subscription, David won't be able to use the fabrikam subscription on the deployment app.

4. Organizational Azure accounts only can be used to deploy CCS with IoTHub; personal accounts such as Outlook or Gmail can't be used.

5. Your user must have permission to use the Dynamics API within the Microsoft Entra ID tenant.



Installation and setup - Connected Customer Service for IoT Hub

Article • 04/04/2022

This guide provides the steps required for getting up and running with Connected Customer Service (CCS) for IoT Hub. If you're looking for information about CCS for IoT Central, be sure to visit our tutorial on getting set up.

Prerequisites

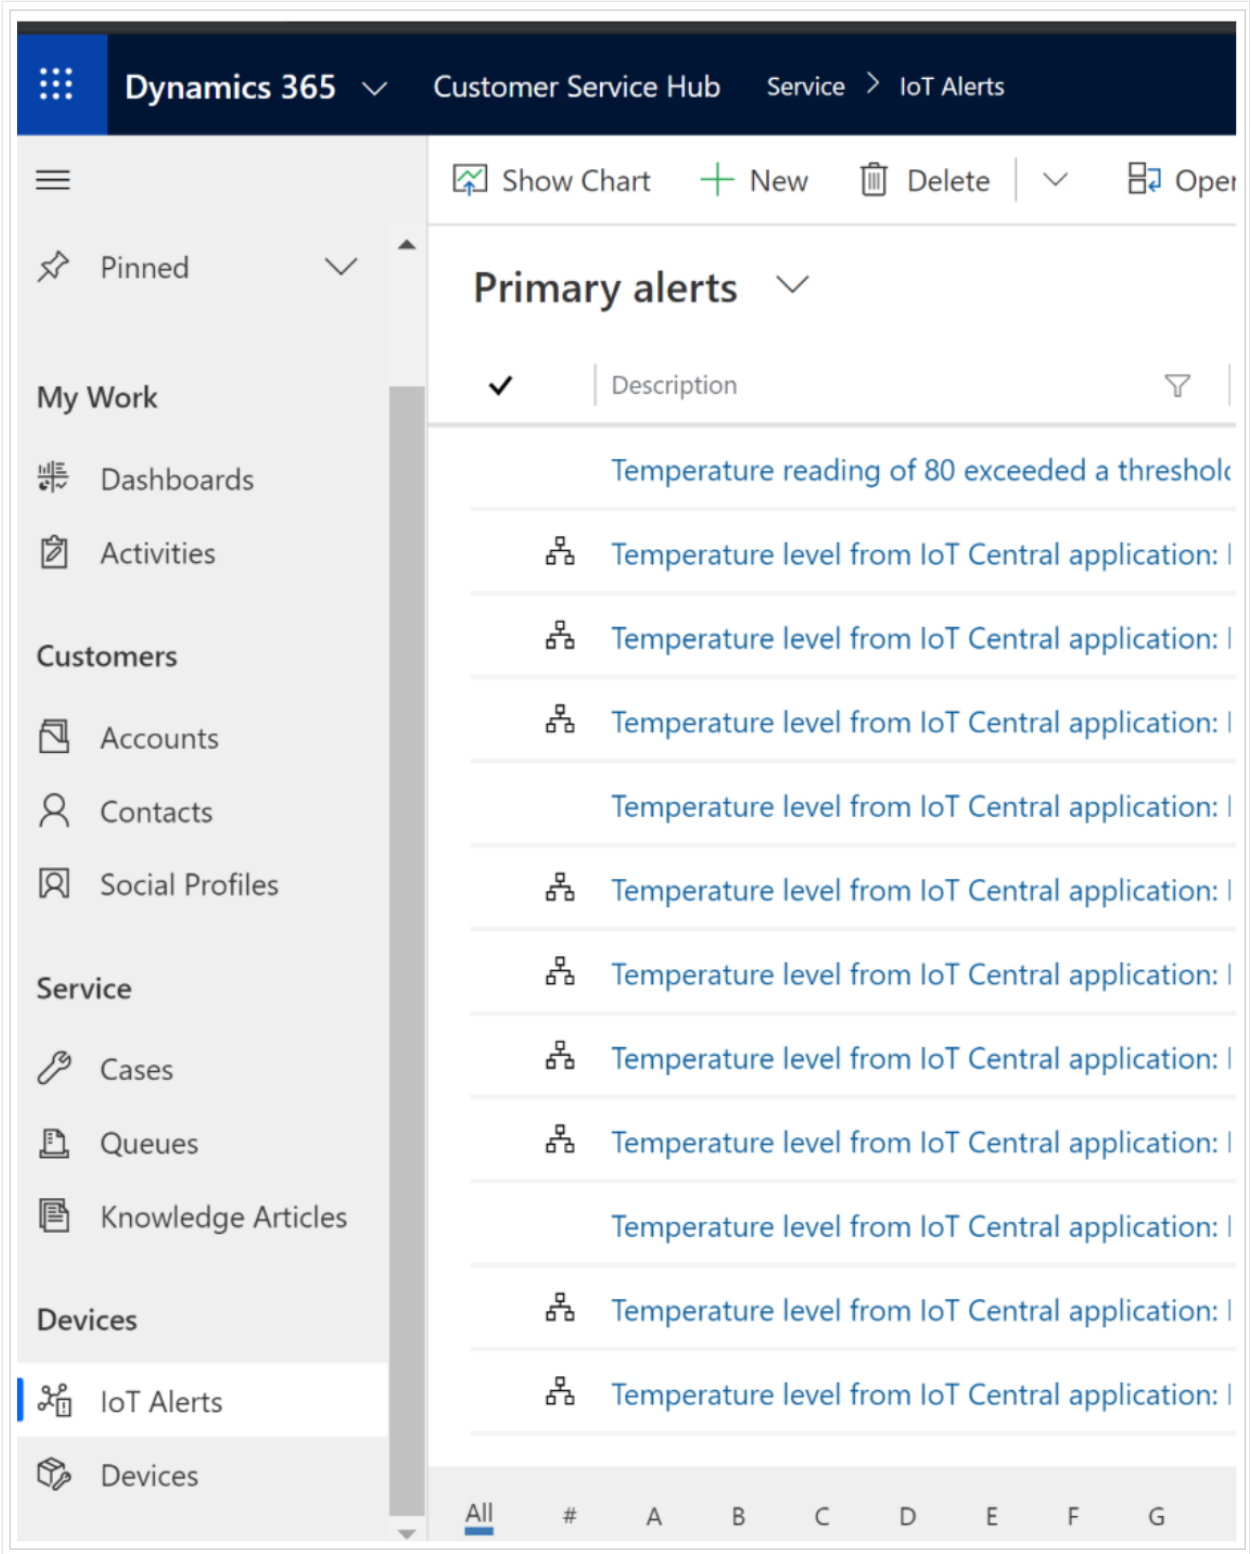
Before you install Connected Customer Service, make sure you have the following:

- Dynamics 365 system administrator credentials. For users with Microsoft 365 global administrator access, they must be assigned the **System Administrator** security role within the Dynamics 365 organization.
- An IoT – Administrator role in the IoT solution (to access IoT entities and IoT functionality), plus another role, like Customer Service – Dispatcher (to access Dynamics 365).
- An active Azure subscription with appropriate privileges. See our topic on Azure prerequisites for more information.
- Microsoft Power BI PRO and the sample report template. More information: Download the Power BI Template for Connected Customer Service

Install Connected Customer Service

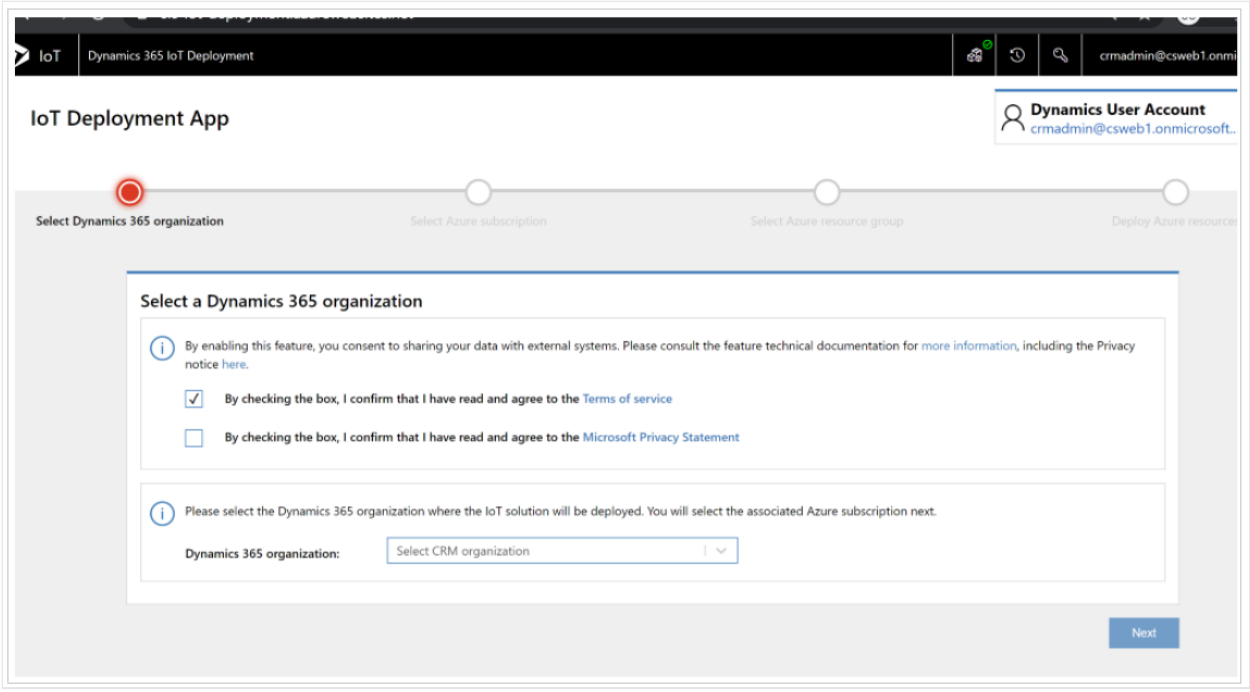
Connected Customer Service is included with Dynamics 365 Customer Service. Creating a new Customer Service environment or upgrading an existing one to v9.0.20034.20XX+ will automatically include the following Connected Customer Service entities and related processes:

- Devices
- IoT alerts



Verify you have the Connected Customer Service entities in your environment.

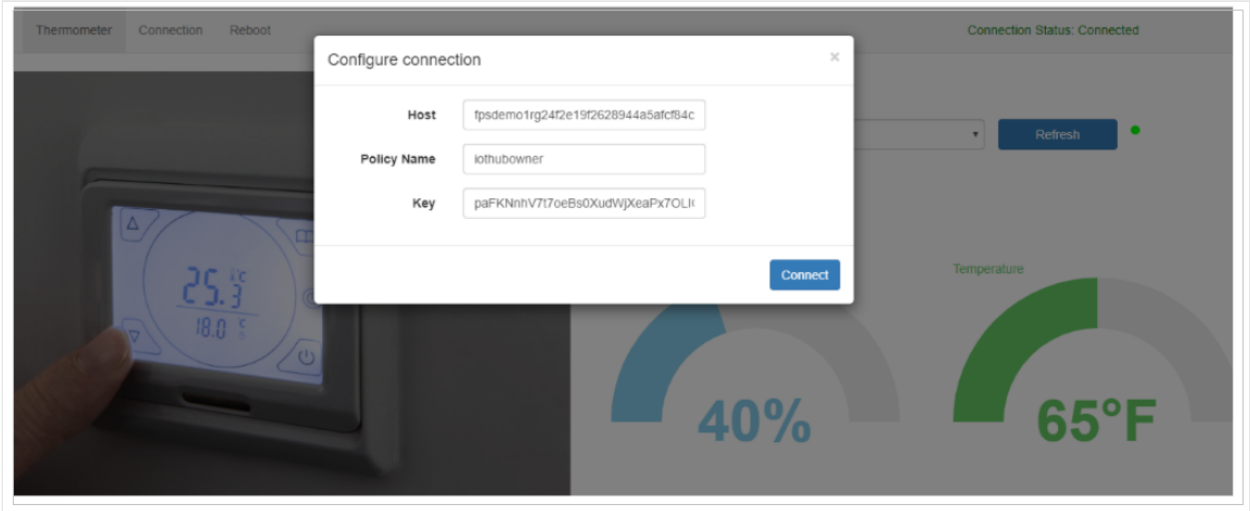
Next, deploy and connect Azure IoTHub to your Customer Service environment by going to https://iotdeployment.dynamics.com/ and following the instructions.



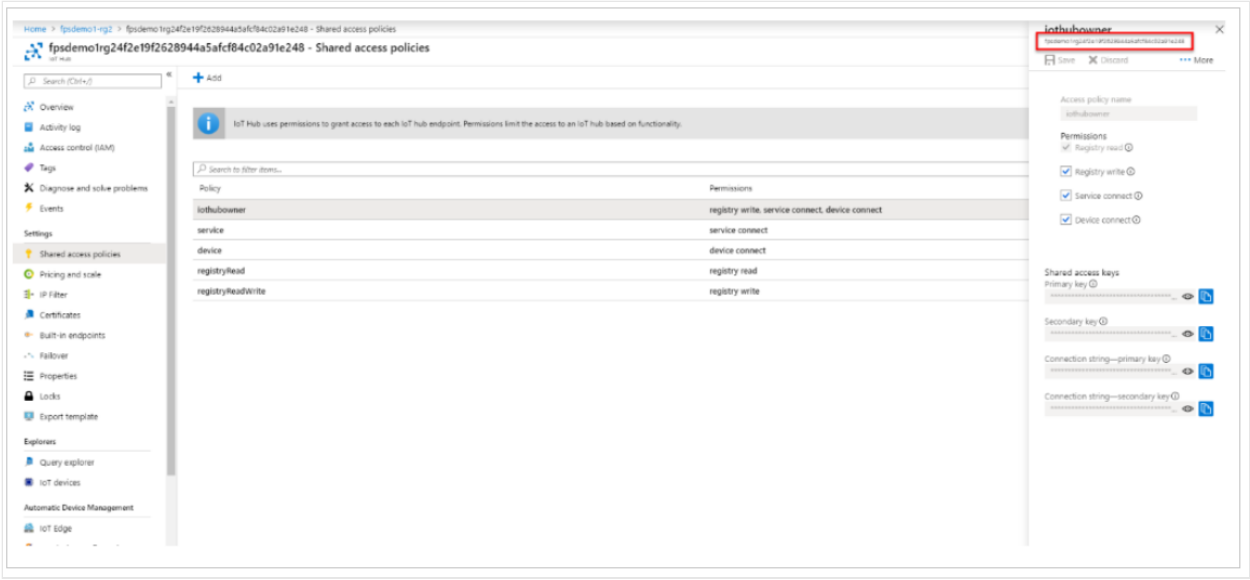
Set up the sample simulator (optional)

To find the simulator URL, sign in to your Azure subscription, and then select the App Service resource type under the newly created resource group. You'll see the URL is in the top-right corner. Copy the URL and complete the following steps:

1. Paste the URL into your browser's address bar to load the page.
2. When the simulator page opens, click **Configuration**.
3. Enter the IoT hub host name and key. The host is simply the name of the IoT Hub resource in Azure portal.



The key can be accessed by clicking on the IoT Hub resource and going to the shared access policies, then copying the primary key for **iothubowner** as seen in the following screenshot.



4. Select the IoT hub in the **Resource Group**.

5. On the left under **General**, click **Shared access policies** to get the host name and primary key.

6. Make sure **Connection status** is marked as **Connected** and then close the dialog box.

   Now you can send a test command by using the sample simulator. For example, click the temperature and increase it to above 70 degrees.

Set up a Power BI chart (optional)

Set up Power BI accounts and open the sample .pbix report.

1. Go to https://powerbi.microsoft.com and create a free Power BI account.

2. Install Power BI Desktop.

3. Sign in to Power BI Desktop with the Power BI user credentials (we recommend that this user is the same as the Dynamics 365 user).

4. Download and open the sample Power BI template.

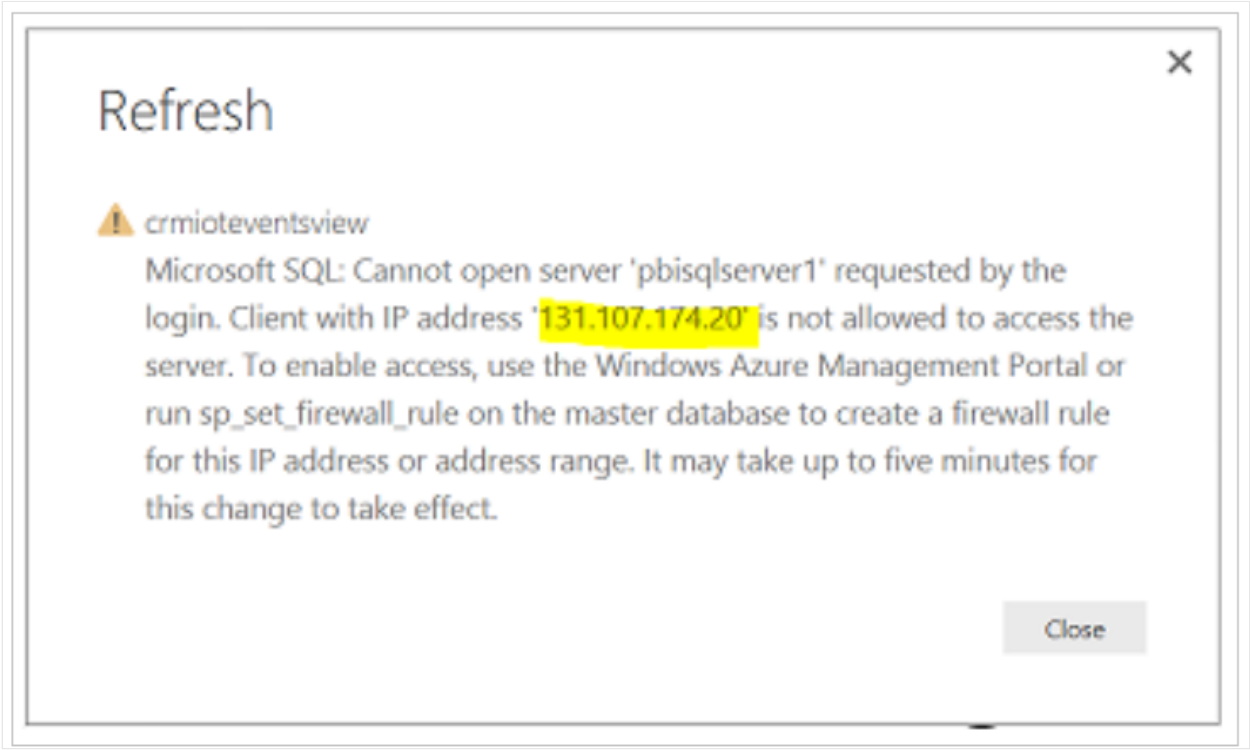
   The Power BI report will open with errors because it was created with a sample SQL database and user. Update the query with your SQL database and user, and then publish the report to Power BI.

Update the query to point to your SQL database

1. Select **Edit Queries**.

2. Select **Advanced Editor**.
3. Replace the source SQL database with the database provisioned in your Azure resource group.
4. Select **Close and Apply**.

   You can find your SQL server name in the SQL database in the Azure portal.
5. Add your IP address to the SQL server firewall to allow Power BI Desktop to connect to the SQL server.
6. Copy the IP address when you see this message.



7. Go to the Azure portal, open the SQL server, and add your IP address to the firewall.

Publish to your Power BI account

1. Save your changes and publish.
2. Once you publish, Power BI Desktop will provide a link and message that instructs you to open the report and provide credentials.
3. Once the report is open, you'll see notifications to edit your credentials.
4. Enter the SQL server admin user name and password to allow Power BI to access your database.

5. In the Power BI sidebar, open the report and pin these tiles to a dashboard. You can create a dashboard or pin to an existing one.

6. Save the dashboard, and then share it with any users who have permissions to see the dashboard and tiles.

    - In the top-right corner of the dashboard, click **Share**, enter the users email address, and click the **Share** button.

Pin the tile in Dynamics 365

1. Open the device, alert, or asset form.

    > **Important**
    >
    > The device that is related to any of the open forms must have a device ID and be registered; otherwise, the PowerBI section will be hidden.

2. The first time you will need to specify the tile you want pinned. After that, the tile will load when you go to the page.

    a. Select the **Add** button.

    b. A configuration window displays. Sign in if prompted.

    c. Pick your dashboard and tile.

    A preview of the tile will load; however, if you have not run the simulator for that device, there will be no data, as shown here.

3. Save the tile.

4. The config window closes, and the Power BI section reloads with the pinned tile.

5. The tile is filtered to the device ID of the current entity.

6. The next time you load any of the device, alert, or asset forms, the Power BI section will load the tile automatically, filtered to the current entity device ID (if there is a device ID and the device has been registered).

Categorize devices

You can also manage devices by categorizing them. For example, you can categorize devices by the commands they support, the type of device, or by devices that break

down more often.

Create a new IoT device category

You can create a new IoT device category in the Customer Service Hub or on Customer Service admin center app.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Miscellaneous** in **Operations**.

   b. In the **Device Categories** section, select **Manage**.

      The **Active IoT Device Categories** view is displayed. You can switch between various system views using the drop-down list.

2. On the command bar, select **New**.
3. Enter a **Name** for the device category.
4. Use the helpful tooltips to fill in information.
5. When you're done, select **Save**.
6. Open the IoT device category record that you created.
7. In the **Devices** section, click **Add IoT Device record**, and then add a device to the category.

Add devices to an existing category

1. From the main menu, select **Internet of Things** > **Registered Devices**.
2. Select an IoT device record to open it.
3. In the **Category** field, use the search button to find and add the device to a category.

View device readings

After a device is registered, you can open the record to view the readings sent by the device. For example, if you're monitoring a thermostat, your reading will show the thermostat temperature.

By default, you can view the last 20 readings. You can change the default setting in the Power BI report by using Power BI Desktop.

1. To view a device reading, from the main menu, click **Customer Service** > **Devices**.
2. From the list of devices, choose a device and open the record.
3. Refer to the **Connect Device Readings** section to view the device readings.

Remotely send commands to a registered device

When a device isn't working properly, the system receives an alert. To troubleshoot the issue remotely, you can send a command by choosing a registered device or by using an existing IoT alert.

> ⓘ **Note**
>
> When you receive multiple alerts from the same device, the alerts will be listed in hierarchical order. You can change the grouping by changing the IoT - Parent IoT Alerts workflow.

Send commands from a registered device

1. From the main menu, click **Customer Service** > **Devices**.
2. From the list of devices, choose a registered device.
3. On the command bar, click **Send Command**.
4. Enter a **Name** for the command.
5. In the **MESSAGE TO SEND** box, copy and paste one of these supported commands. `{"CommandName":"Reset Thermostat","Parameters":{}}` `{"CommandName":"Notification","Parameters":{"Message":"Technician has been dispatched"}}` `{"CommandName":"Set Values","Parameters":{"Reading":{"Temperature":"30","Humidity":"30"}}}`

> **Note**
>
> Before sending a command, make sure there are no spaces or extra characters in the command.

6. On the command bar, click **Send & Close** to send the command.

Respond to an alert

1. Navigate to **Customer Service** > **IoT Alerts**.
2. Choose an existing IoT alert record.
3. On the command bar, select **Send Command**.
4. Enter a **Name** for the command.
5. In the **MESSAGE TO SEND** box, copy and paste one of the supported commands listed in the section above.
6. On the command bar, click **Send & Close** to send the command.

View history of commands sent to a device

1. From the main menu, click **Customer Service** > **Devices**.
2. From the list, choose a device.
3. Scroll down to the **Command** section to view the history.

Create business process flows to automatically handle incoming IoT alerts

When you receive an alert from a device, your service team can manually monitor the alerts and troubleshoot the issue remotely. If the issue is not resolved by sending a remote command, the service rep can create a case or work order and dispatch a field tech. The provided business process flow guides you through the process of manually responding to IoT alerts. More information: Create a business process flow

View the IoT dashboard

The default IoT dashboard provides data on registered devices and alerts. More information: Create or customize dashboards

1. From the main menu, click **Customer Service** or **Internet of Things**.
2. Select **Dashboard**.
    - The first chart shows alerts that you can sort by clicking the IoT **Alerts by** menu.
    - The second chart shows alerts by time.
    - The third chart shows alerts along with the action taken to resolve the issue.

Privacy notice

By installing Connected Customer Service for Dynamics 365, when you provide your Azure subscription information, the required Azure resources (listed below) will be deployed and your Dynamics 365 for Customer Engagement instance will send data (such as commands and registrations) to Azure to enable IoT–enabled scenarios that register devices and then send and receive commands to the registered devices. An administrator can uninstall Connected Customer Service to remove the functionality and then navigate to the Azure portal to manage any related Azure services that are no longer needed.

Azure components and services that are involved with Connected Customer Service functionality are detailed in the following sections.

Note: For more information about additional Azure service offerings, see the Microsoft Azure Trust Center.

Service bus queue

This provides a queue for both inbound and outbound messages (commands) flowing between Dynamics 365 for Customer Engagement and Azure. When an IoT alert is sent to Dynamics 365 for Customer Engagement, or a command is sent from Dynamics 365 for Customer Engagement to the IoT hub, it will be queued here.

Logic Apps

This provides an orchestration service that uses a Dynamics 365 for Customer Engagement connector and a Queue connector. Dynamics 365 for Customer Engagement connectors are used to construct entities that are specific to Dynamics 365 for Customer Engagement and Queue connectors are used for polling the queue.

Stream analytics

This provides a fully managed, real-time event processing engine that helps to unlock deep insights from data. Stream Analytics makes it easy to set up real-time analytic computations on data streaming from devices, sensors, web sites, social media, applications, infrastructure systems, and more. It is functioning as a funnel to send selective IoT alerts to Dynamics 365 for Customer Engagement.

IoT Hub

Connected Customer Services uses the IoT Hub to manage the state of registered devices and assets. In addition, the IoT Hub sends commands and notifications to connected devices—and tracks message delivery with acknowledgement receipts. Device messages are sent in a durable way to accommodate intermittently connected devices.

Simulator

This is a test web app to emulate the device that is sending commands or receiving commands from the IoT hub.

Azure SQL Database

Connected Customer Service uses SQL Azure to store device heartbeat messages for later use by PowerBI to show the status of devices in Dynamics 365 for Customer Engagement.

Azure Blob Storage

Queries that Stream Analytics will use are stored to Azure Blob storage.

Azure Time Series Insight (Preview)

Authorizing API connections between Dynamics 365 and Azure IoT

Article • 08/11/2022

In order to begin using Connected Customer Service (CCS) with IoTHub, you need to authorize CRM API Management Access, which is the final step when deploying from https://iotdeployment.dynamics.com/. This allows data and actions to be passed between Azure IoTHub and Dynamics 365. More specifically, it allows LogicApps to read and write Dynamics 365 data bi-directionally.

Without completing this step, you will not be able to:

1. Send IotAlerts from IoTHub to Dynamics 365
2. Add a device in Dynamics 365 and register it in IoTHub

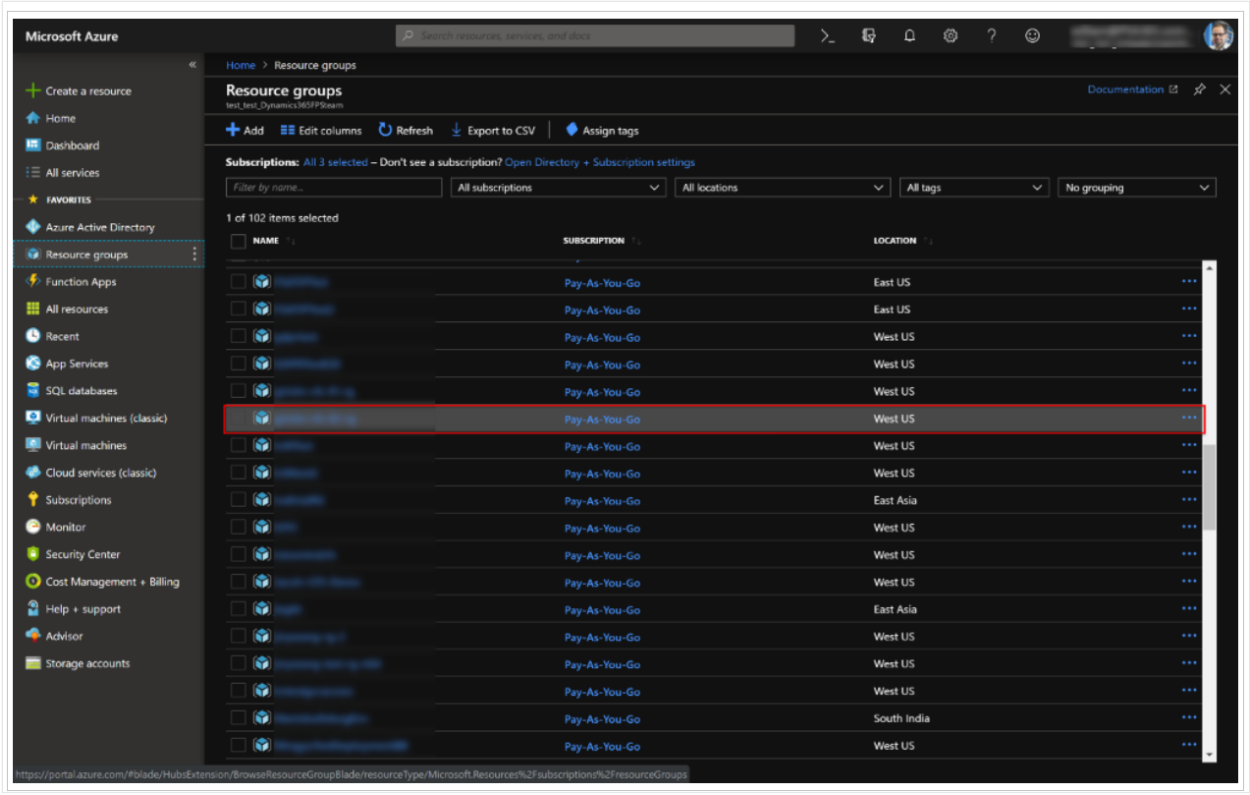
Prerequisites

- Azure account and subscription
- Dynamics 365 Customer Service
- CCS with IoTHub deployed though deployment app

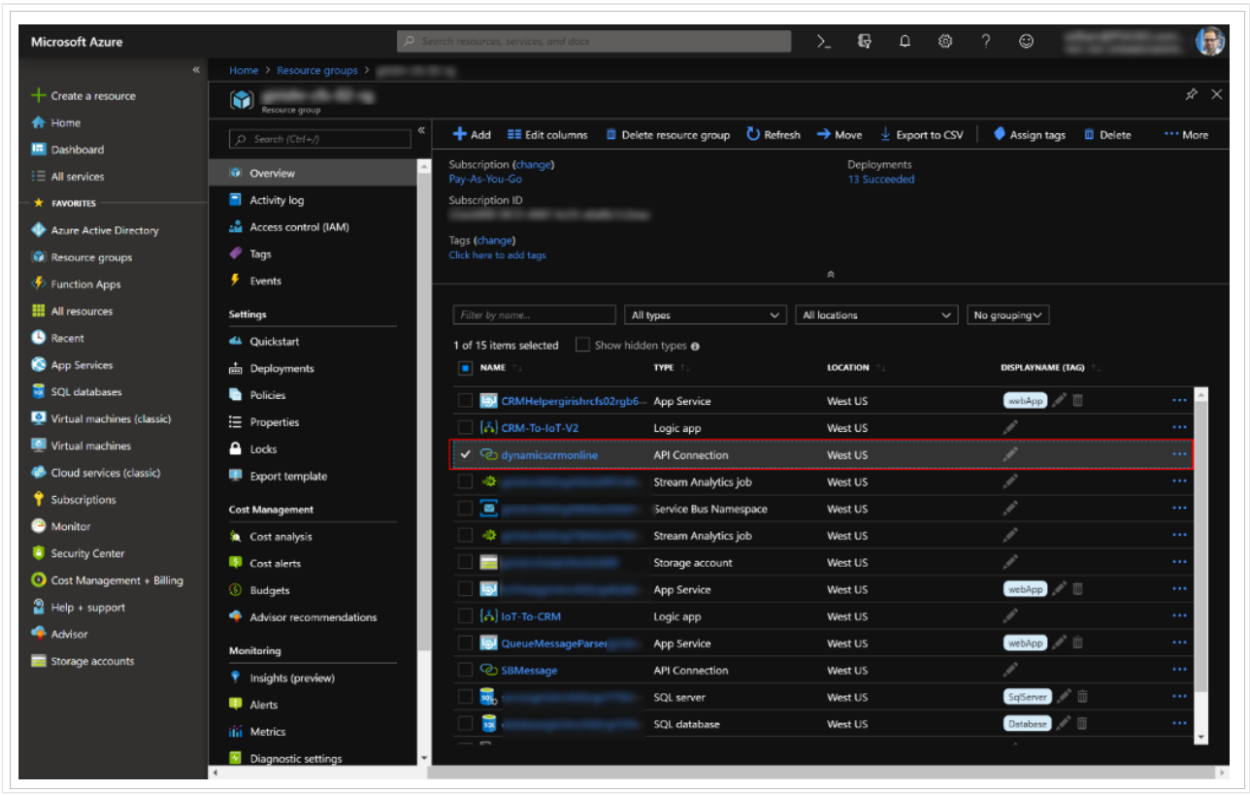
Instructions

Sign into your Azure account, and then go to the Azure portal.

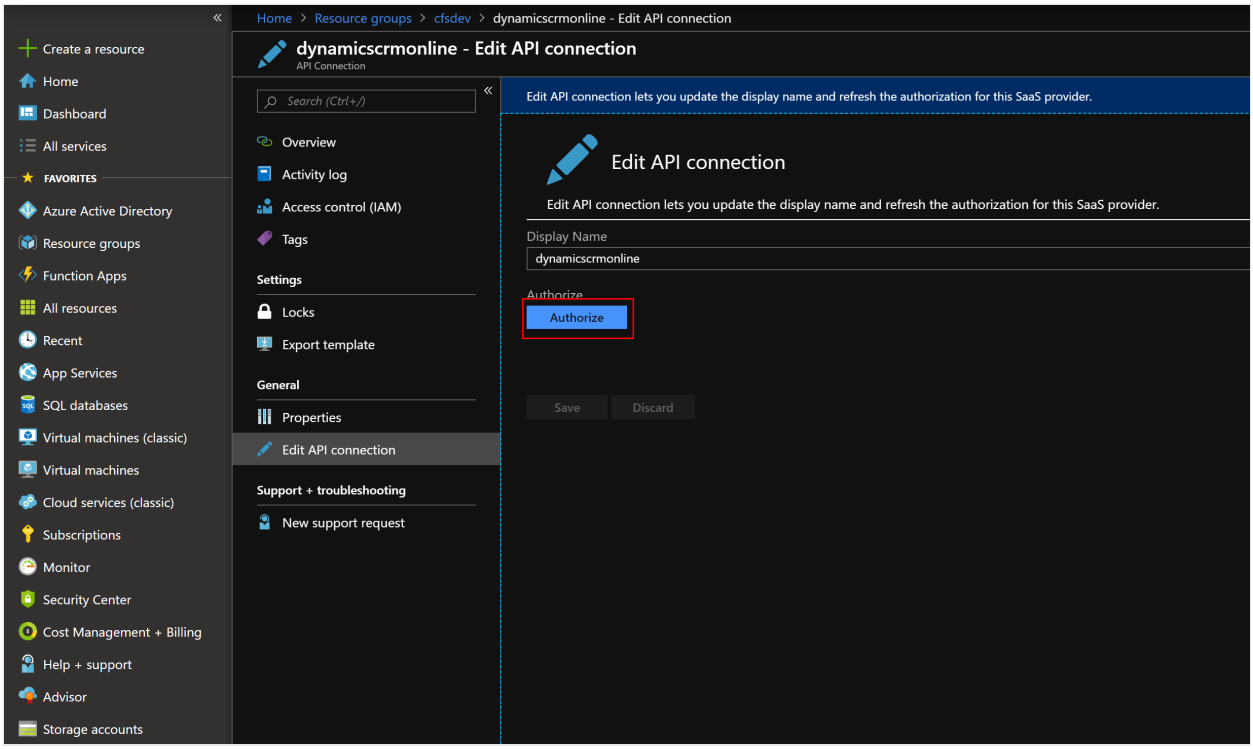
From there, go to **Resource Groups** and find the resource group you recently deployed IoTHub to. See the following screenshot for reference.



One such resource will be an API Connection type to Dynamics CRM. Select and edit this resource.



Finally, select **Authorize**, **Save**, and use your Dynamics 365 credentials that you use to sign into your Connected Customer Service environment, which may be different than your Azure credentials to the Azure portal.



Congratulations! You are now ready to pass data between Azure IoTHub and Dynamics 365 to use Connected Customer Service.

Visualize device readings

Article • 08/31/2023

> **Important**
>
> Azure Active Directory is being renamed to Microsoft Entra ID: No action is needed from you. **Learn more**

To help you understand the current state of a device, its repair history, and the effect of performed work orders, the Connected Customer Service add-in displays near real-time device readings and historical sensor measurements in a chart alongside work order details.

The device readings chart is available on the IoT alert, work order, case, device, and asset forms.

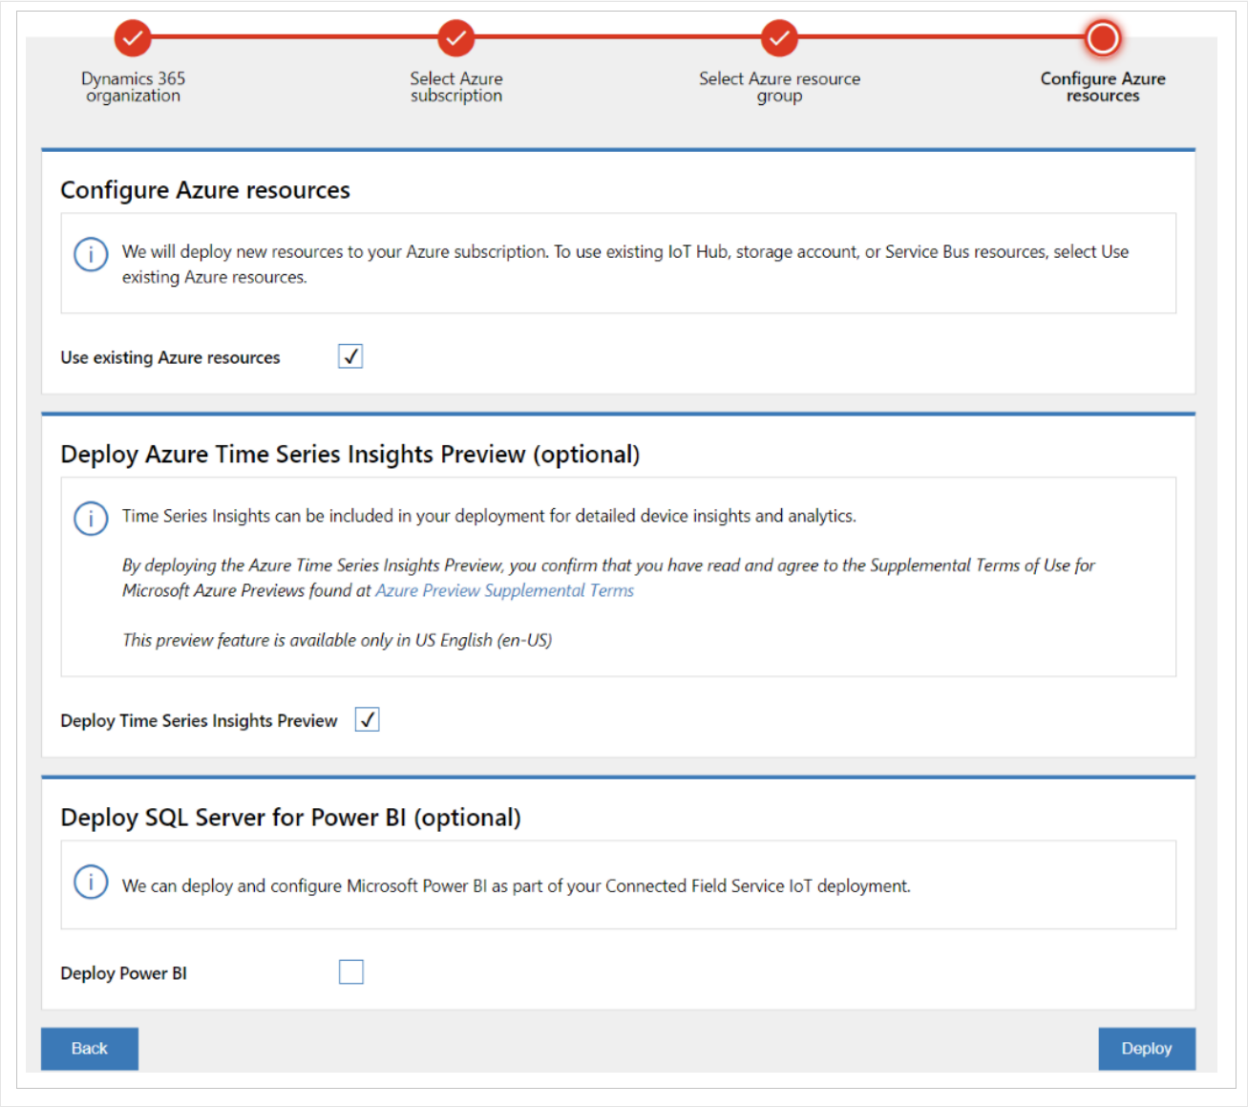
To enable the device readings chart, administrators need to deploy Azure Time Series (Preview) into the Azure subscription when deploying or upgrading Connected Customer Service with Azure IoT Hub for their organization. Administrators do the deployment through the IoT Deployment app.

Prerequisites

- Customer Service version 9.0.20034.20XX or higher
- Currently available in United States English only. This feature is in **preview** and it isn't available in all languages and geographies.

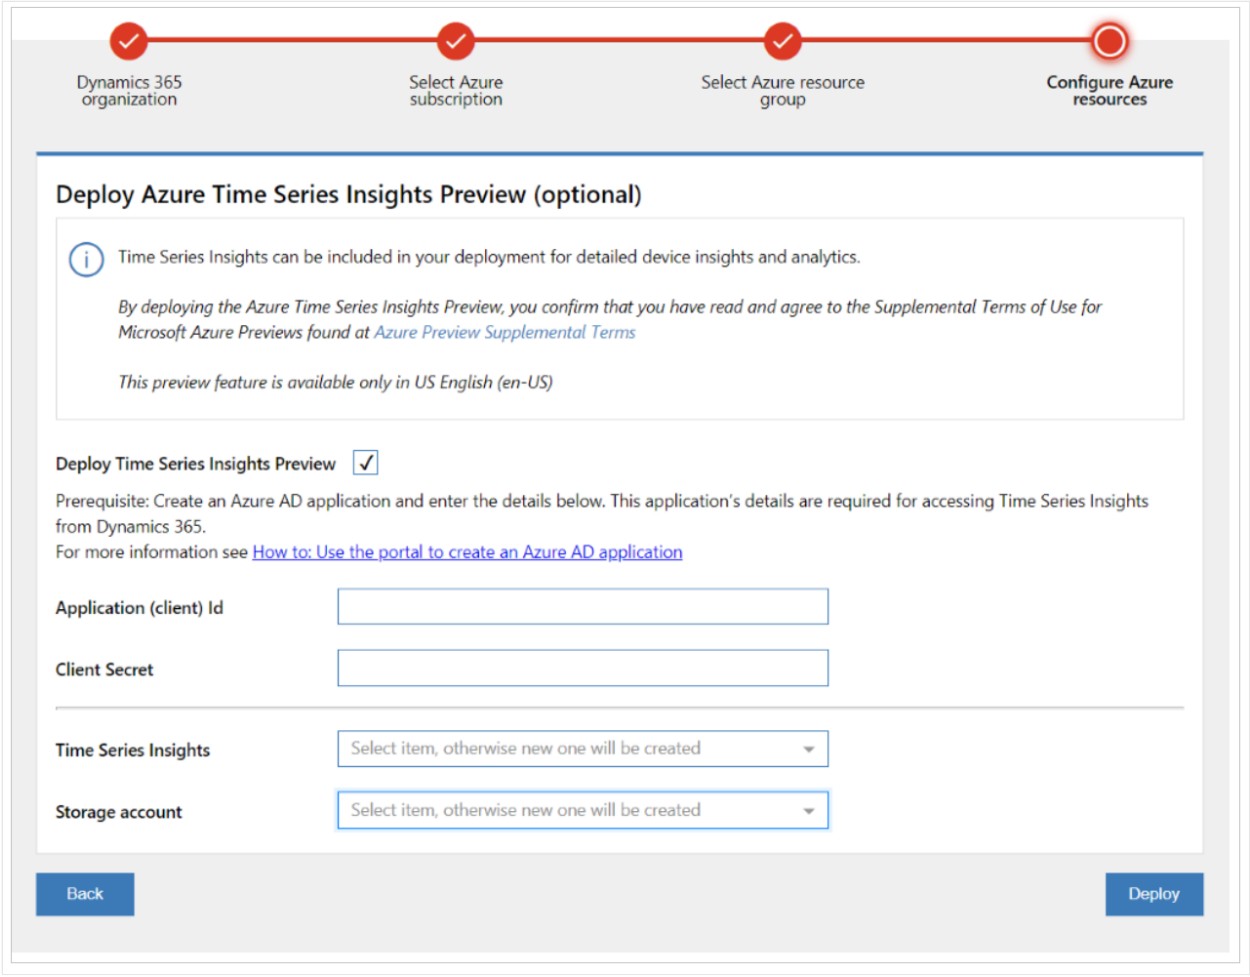
Enable the device readings chart

1. Open the Connected Customer Service IoT Deployment app.
2. Select the Dynamics 365 organization where the IoT solution will be deployed.
3. Select the Azure subscription and the Azure Resource Group. (Note: Select **Upgrade deployment** if you're updating an existing Connected Customer Service for IoT Hub deployment.)
4. Select the **Deploy Time Series Insight Preview** checkbox.
5. Select **Deploy**.



6. Follow the remaining steps in the IoT Deployment app to complete the Time Series Insights Preview deployment.

- Create the application (client) ID: Follow the steps in Create an Azure Active Directory application.
- Create the client secret: Follow the steps in Create a new application secret.



> **Note**
>
> - Storage account selection is only available when you're upgrading an existing deployment.
> - The IoT Deployment app adds timeseriesinsightsconsumergroup into the IoT Hub Consumer Group.

6. After deployment, the **Device Readings (Preview)** tab is displayed on the IoT alert, work order, case, device, and asset forms.

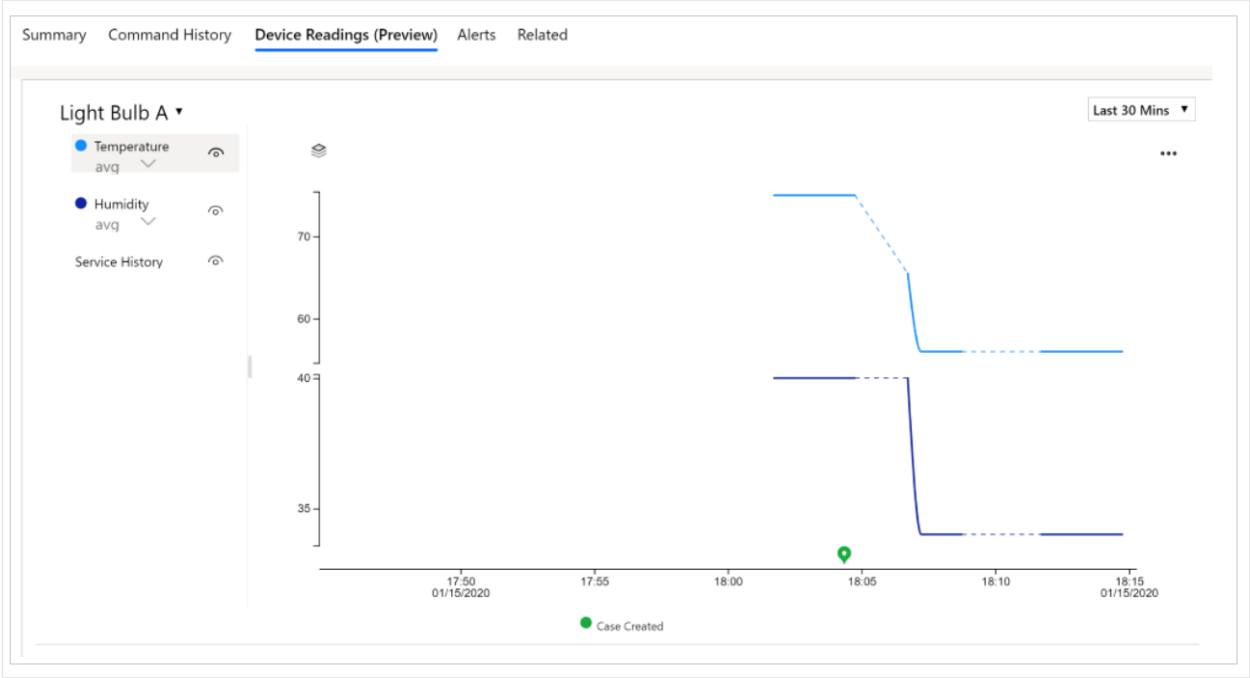
Use the device readings chart

To view device readings, the following data must be in place:

Form	Required data
Device	Device ID isn't empty.
Work order	The work order has a related IoT alert and the IoT alert has a related IoT device. The device ID in the IoT device isn't empty.

Form	Required data
Case	The case has a related IoT alert and the IoT alert has a related IoT device. The Device ID in the IoT device isn't empty.
Asset	The device ID isn't empty. The device readings chart is for the device ID set in Connected Device Attributes section of the asset form.
IoT alert	The alert has a related IoT device. The device ID in the IoT device isn't empty.

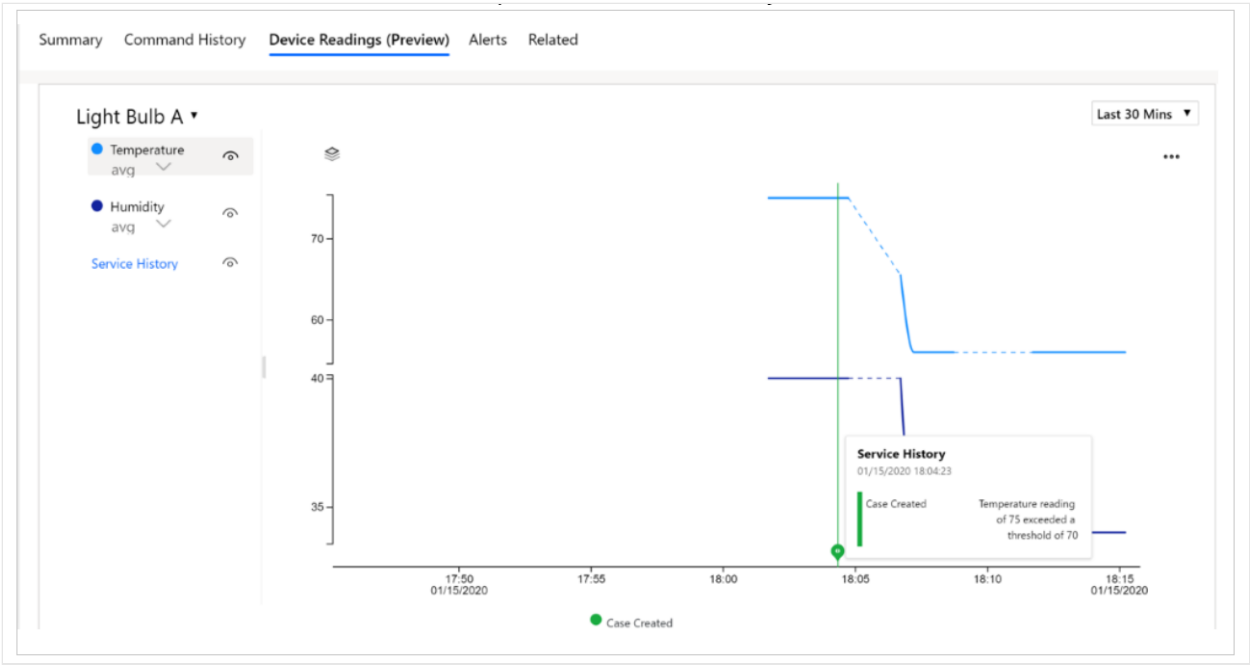
1. Open the **Device Readings (Preview)** tab on IoT alert, work order, case, device, or asset form.



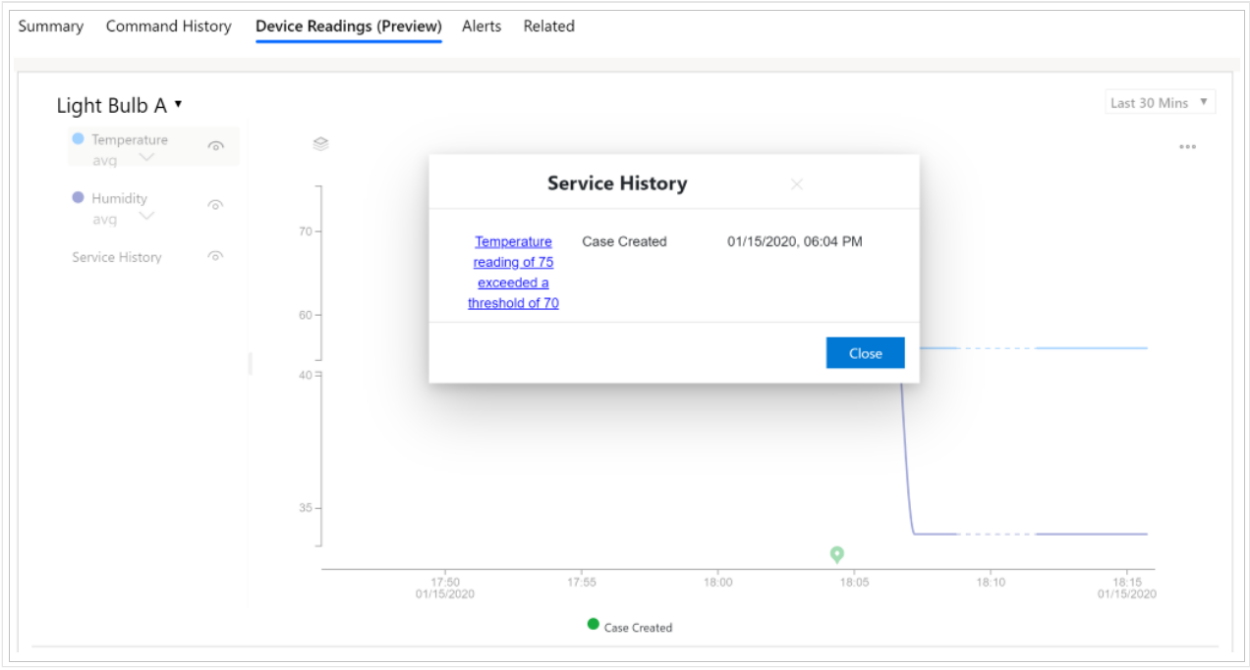
2. Choose the time period from the drop-down list. If the device sends device measurements to TSI, and the device measurement data exists for the selected time period, a chart is loaded.

3. Select the eye icon next to the measurement to show or hide the measurement on the chart.

4. Hover over the chart to see tooltip with measurement details.



5. Select the icon to view service history details.



6. Select the eye icon next to **Service history** to show or hide any case created and closed during the selected time period.

> ⓘ **Note**
>
> If there are no work orders in the selected time period, work order selection will not be displayed.

Error codes

Use the following table to troubleshoot error codes related to device readings.

Error code	Possible root cause	Suggested corrective action
5000101	Local Config Store isn't available	Contact Microsoft Support to investigate
4001002	Value for the Search Span parameter passed to the custom action msdyn_IoTHubQueryDeviceReadings is Null	Verify that valid values for all the required arguments are passed to the custom action msdyn_IoTHubQueryDeviceReadings
4000103	Value for the From or To date argument passed to the custom action msdyn_IoTHubQueryDeviceReadings isn't a valid DateTime	Verify that valid values for all the required arguments are passed to the custom action msdyn_IoTHubQueryDeviceReadings
4000104	Value for the Interval argument passed to the custom action msdyn_IoTHubQueryDeviceReadings isn't a valid Duration	Verify that valid values for all the required arguments are passed to the custom action msdyn_IoTHubQueryDeviceReadings. For interval, the format should be in the ISO 8601 Duration Format. For example: PT1H
4000201	Value for the IotDeviceId argument passed to the custom action msdyn_IoTHubQueryDeviceReadings isn't a valid Guid	Verify that valid values for all the required arguments are passed to the custom action msdyn_IoTHubQueryDeviceReadings. For IotDeviceId, the value should be the msdyn_iotdeviceid, which is a global unique identifier (GUID).
4010202	The user doesn't have permission to query Device Entity (msdyn_iotdevice)	Ensure the user can query Device entity (msdyn_iotdevice)
5000203	Unable to get msdyn_DeviceId for the given msdyn_iotdeviceid in the Device Entity (msdyn_iotdevice)	Make sure the attribute msdyn_DeviceId is populated for the device
5000204	Unable to get Time Series Insights Url for the given msdyn_iotdeviceid	Make sure that CFS Deployment App has deployed Time Series Insights for this CRM Org and the device is linked to the correct IoT Provider
5000205	Client Id used to get Azure AD token for TSI Authorization is invalid or an empty GUID (global unique identifier)	Make sure that valid Client ID is provided in the CFS Deployment App when it was executed
5000206	Client Secret used to get Azure AD token for TSI Authorization has expired	Update the Client Secret in Azure AD and re-run CFS Deployment App to update the new Client ID and Client Secret

Error code	Possible root cause	Suggested corrective action
5000207	Unable to get the access token to query Time Series Insights	Retry your request, and if the problem persists, try updating new Client ID and Client Secret by re-running the CFS Deployment App
5000603	Request to Time Series Insights API returned with a failure	Retry your request. If the problem persists, contact Microsoft Support to investigate
5000604	Response from Time Series Insights API isn't in an expected format	Retry your request. If the problem persists, contact Microsoft Support to investigate

Additional notes

- Available only in United States English (en-US)
- **Known issues:**
  - In custom time settings, the time zone is always set as UTC even when another time zone is selected. The time period displayed after applying the setting is always local time.
  - When deploying immediately after creating a new application (client) ID with the IoT Deployment app, you may see an **unable to deploy TSI with credential** error. Try again after one minute.
- Azure Time Series Insights (Preview) uses a pay-as-you-go (PAYG) pricing model. The pricing and cost estimate calculator is available at https://azure.microsoft.com/pricing/details/time-series-insights. Select the region where you're planning to deploy TSI to understand the storage and query cost. (TSI uses Azure blob to store the data.)

Extend Connected Customer Service solutions

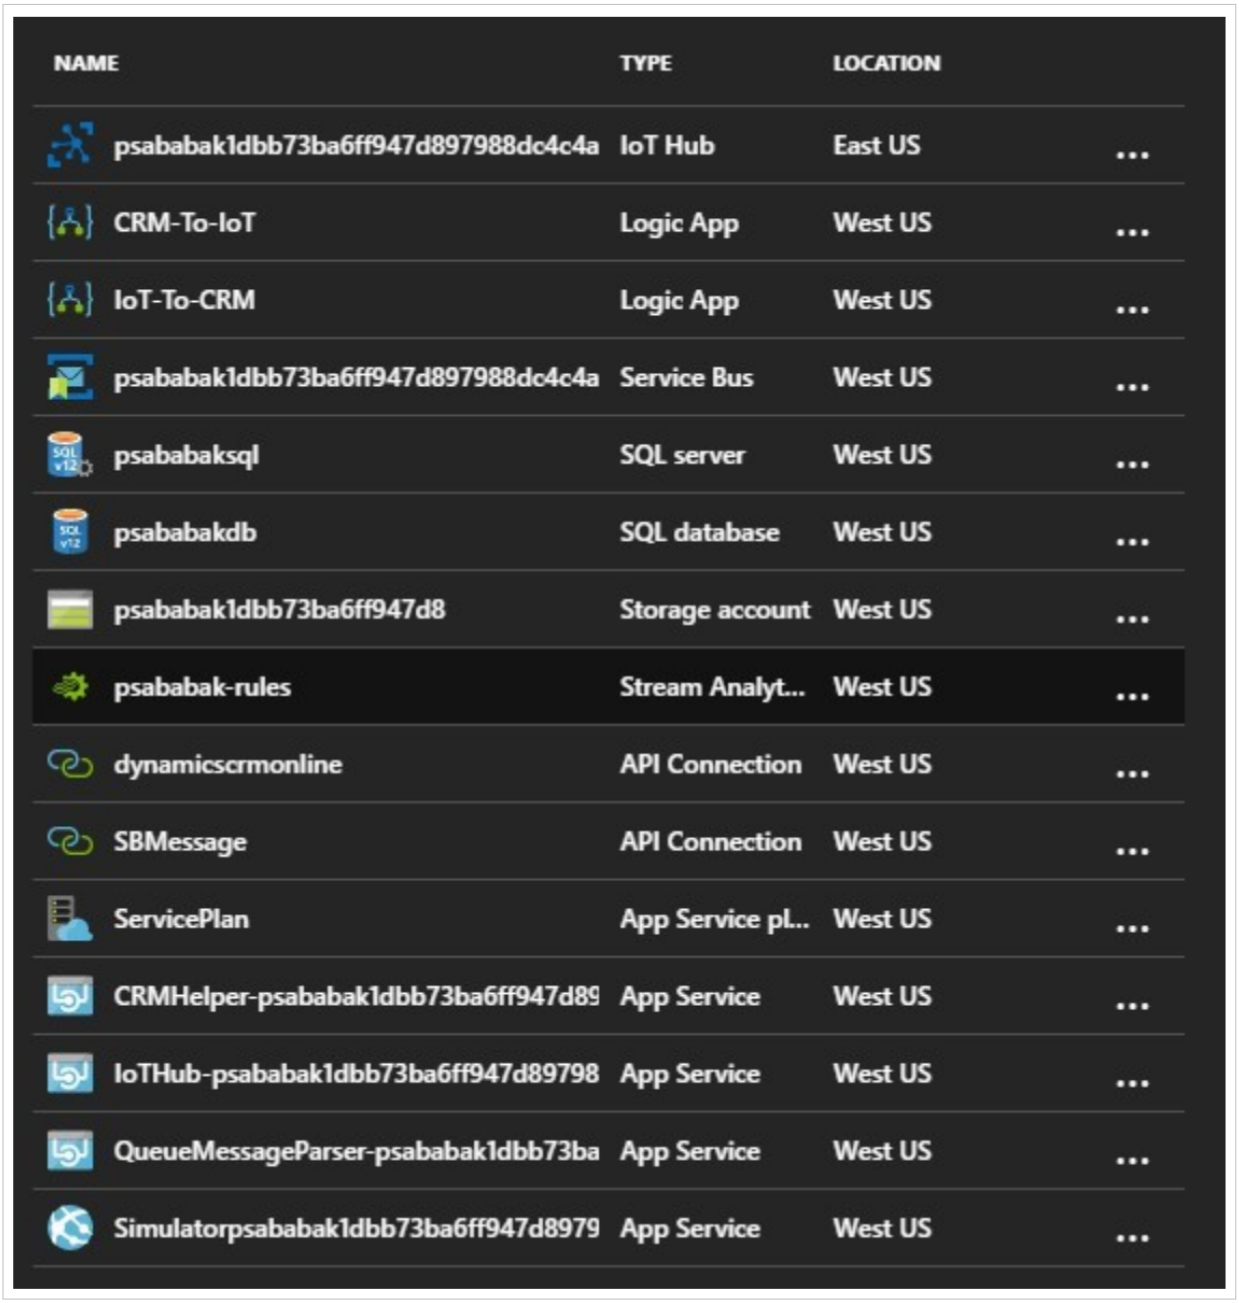
Article • 10/06/2022

Connected Customer Service for Dynamics 365 supports the customization of each standard component or service and the easy addition of custom Azure-based components and services. This flexible architecture is required to support the wide range of current and future IoT devices and the envisioned supporting services for these devices.

Extend Azure Services

The Azure services and components, including the ones detailed in Connected Customer Service architecture, are designed for reliability, scalability, and extensibility. They support management and customization through UI-based and PowerShell administration, JSON-based template-driven deployment and initialization, and REST-based programming interfaces (often including client libraries for specific languages, such as C#/.NET, Python, Java, and Node.js).

After the standard installation, Connected Customer Service will configure your resource group with a set of Azure services similar to the following.



Although extending these Azure services (or adding additional ones) is beyond the scope of this topic, there are ample resources available to the developer, including the following from Microsoft:

- The Microsoft Azure site for product descriptions, pricing and trial offers, documentation, downloads, blogs, and related resources, including the Azure Documentation Center for developers and administrators. Most developers will want to download one or more Azure SDKs and tools such as the Azure Storage Explorer and the Azure Device Explorer.
- MSDN Channel 9 for a wide selection of current and ever-growing Azure videos and posts

Extend Connected Customer Service

> **Note**
>
> The Web API types and operations mentioned in this article/table are available in your environment and you can use the service document of your environment or Postman to explore these types and operations. More information: **Web API Service Documents** and **Use Postman with Microsoft Dataverse Web API**.

The following table lists the custom entities and processes that Connected Customer Service supplies to interface with the associated Azure services and components. These types are more fully described in `Microsoft.Dynamics.CRM.IoTConnector`.

Display Name (ID)	Type	Description
IoT – Debounce IoT Alerts (`Microsoft.Dynamics.CRM.msdyn_ParentIoTAlerts`)	Action	Links potential redundant alerts to an existing parent alert
IoT - Parent IoT Alerts	Workflow	Calls the `IoT - Debounce IoT Alerts` action and passes 60 for the `TimespanSeconds` parameter
IoT – Register Custom Entity (`Microsoft.Dynamics.CRM.msdyn_RegisterCustomEntity`)	Action	Registers any custom entity that may or may not already have connected IoT devices. This action invokes the `IoT – Register Device` action.
IoT – Register Device (`Microsoft.Dynamics.CRM.msdyn_RegisterIoTDevice`)	Action	Publishes the registration requests for an IoT device
IoT – Send Test Alert (`Microsoft.Dynamics.CRM.msdyn_IoTSendTestAlert`)	Action	*Reserved for future use*
JSON-based Field Value – Get Boolean (`Microsoft.Dynamics.CRM.msdyn_JsonGetBoolean`)	Action	Reads a Boolean property in the specified JSON object

Display Name (ID)	Type	Description
JSON-based Field Value – Get Number (`Microsoft.Dynamics.CRM.msdyn_JsonGetNumber`)	Action	Reads a numeric property in the specified JSON object
JSON-based Field Value – Get String (`Microsoft.Dynamics.CRM.msdyn_JsonGetString`)	Action	Reads a string property in the specified JSON object
IoT Alert (`Microsoft.Dynamics.CRM.msdyn_iotalert`)	Entity	Represents a notable event sent from the associated IoT Hub
IoT Device (`Microsoft.Dynamics.CRM.msdyn_iotdevice`)	Entity	Represents a connected device that can be registered with a IoT Hub
IoT Device Category (`Microsoft.Dynamics.CRM.msdyn_iotdevicecategory`)	Entity	Represents a logical grouping of IoT devices
IoT Device Command (`Microsoft.Dynamics.CRM.msdyn_iotdevicecommand`)	Entity	Represents an outgoing message to a device connected to the IoT Hub
IoT Device Registration History (`Microsoft.Dynamics.CRM.msdyn_iotdeviceregistrationhistory`)	Entity	Tracks registration activities of an IoT device

IOT enabling an entity type

Dynamics 365 entities can be associated to IoT entities listed above so that within Dynamics 365 they can participate in IoT-related business processes and analyses. There are two methods of "IoT enabling" a Dynamics 365 entity; you can:

- Programmatically form an association through the standard Dynamics 365 Connection entities capability. You can alternatively accomplish this same association through the administration UI; for more information, see Create connections to view relationships between records.

- Call the `IoT – Register Custom Entity` action to associate an entity with an existing or new `IoT Device`.

The IoT - Parent IoT Alerts workflow

Article • 02/23/2023

The **IoT - Parent IoT Alerts** workflow links potential redundant alerts to an existing parent alert.

> **Note**
>
> The Web API types and operations mentioned in this article/table are available in your environment and you can use the service document of your environment or Postman to explore these types and operations. More information: **Web API Service Documents** and **Use Postman with Microsoft Dataverse Web API**.

Calls the `Microsoft.Dynamics.CRM.msdyn_ParentIoTAlerts` API and passes 60 for the `TimespanSeconds` parameter. The primary entity for this workflow is `msdyn_iotalert`.

This workflow is an example that ships with the thermostat sample solution. It demonstrates how to handle duplicate/redundant alerts to Dynamics 365, which typically occurs when a device malfunctions. This approach is a recommended best practice because unfiltered alerts can result in duplicated remedial processing. For example, it could result in redundant reset commands sent or multiple repair orders generated. These alerts can also negatively affect the performance of your Dynamics 365 instance. (The thermostat sample is coded to filter duplicate alerts to avoid passing them to Dynamics 365, which is also a recommended practice.)

This workflow is enabled by default, but you can deactivate or edit it. For example, you can modify the time span.

Parameters

Data passes to the workflow using parameter(s).

Name	Type	Nullable	Unicode	Description
TimespanSeconds	Edm.Int32	false		Determines the time window to consider when parenting (or suppressing) an alert, from 60 to 180 seconds.

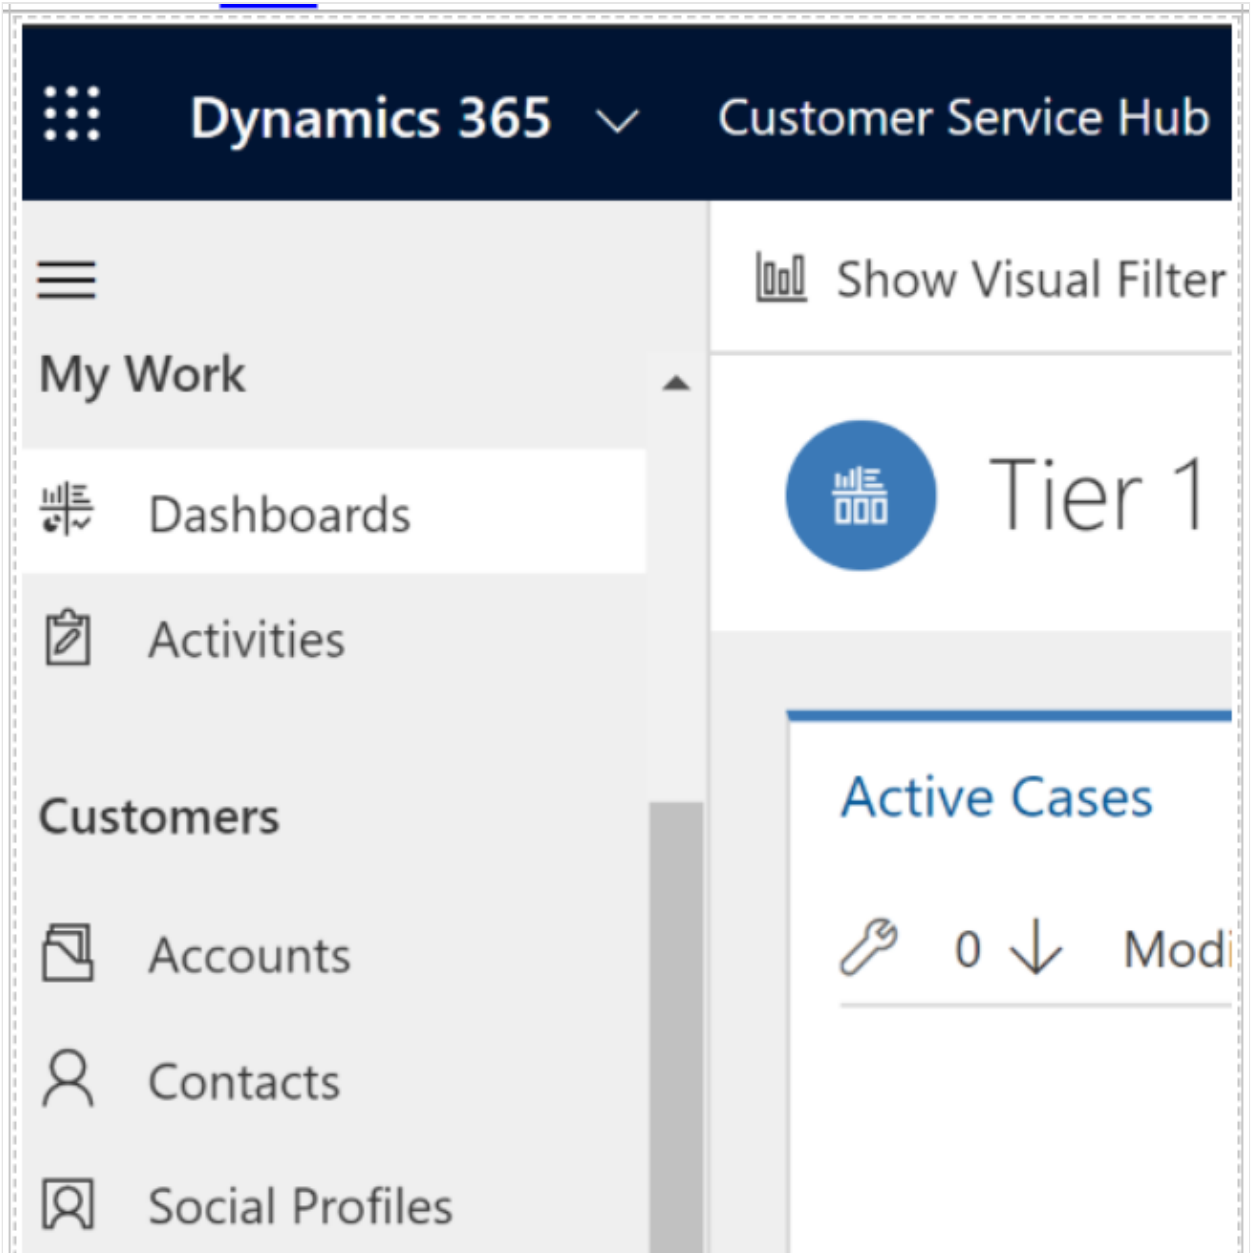
Security roles for Connected Customer Service

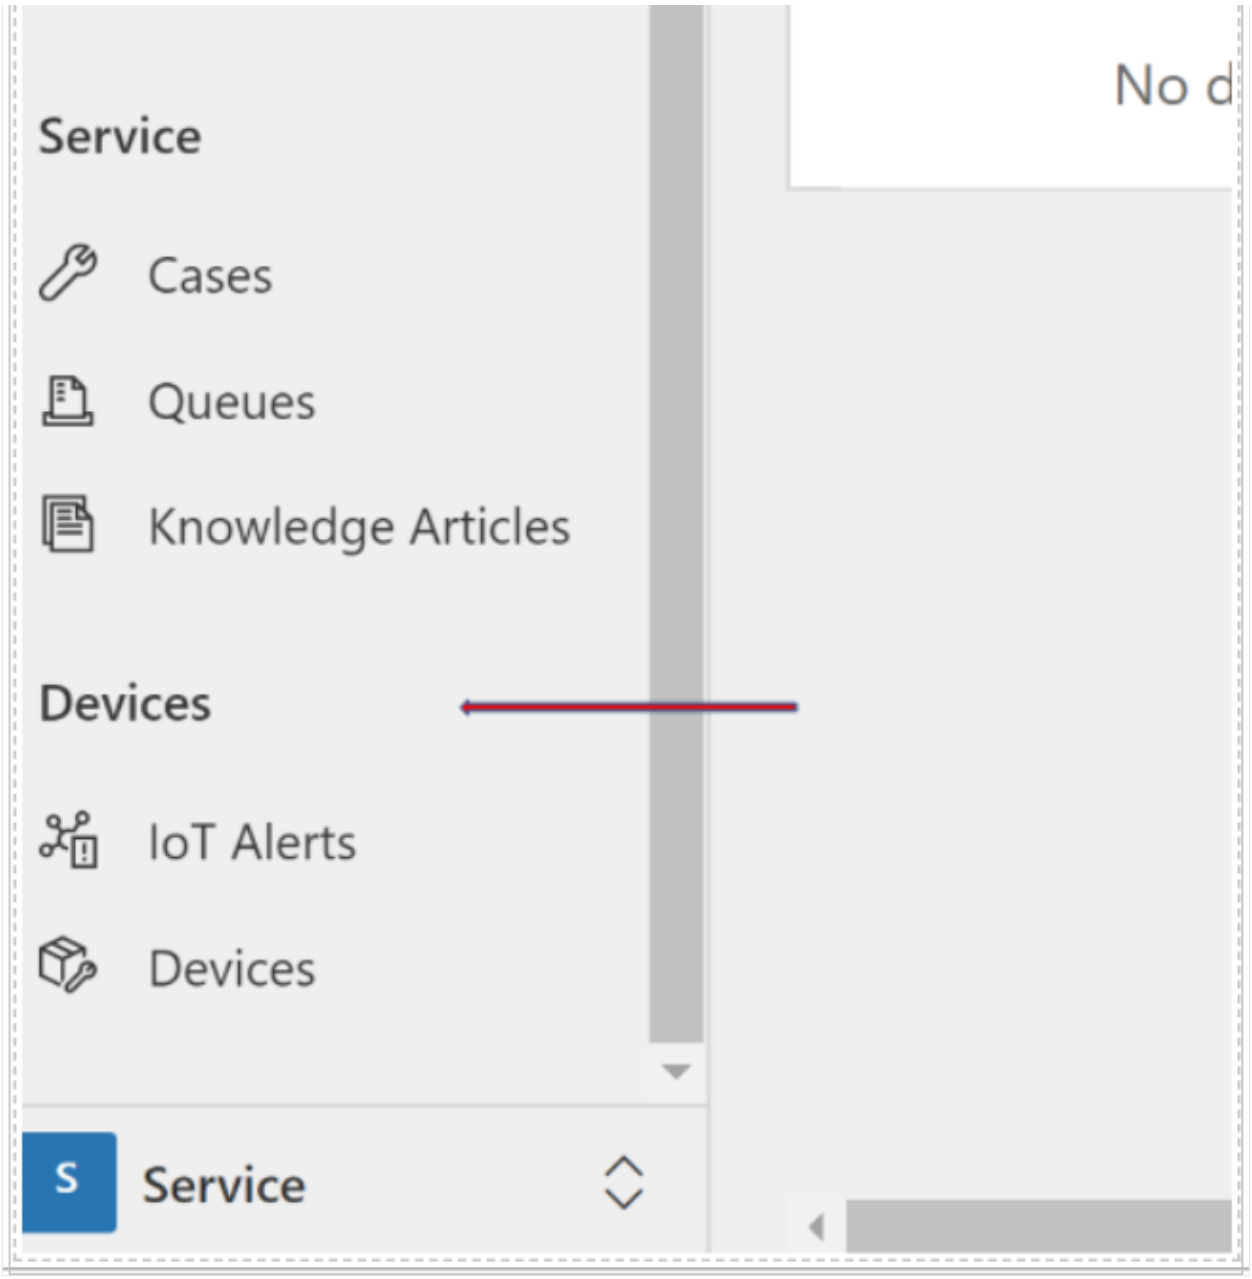
Article • 08/09/2022

Security roles for Connected Customer Service allow administrators to give appropriate access to Internet of Things (IoT) entities, including alerts, assets, devices, and commands, which are all included with Customer Service 9.0.20034.20XX +. These security roles should be added to existing Customer Service security roles.

1. Customer Service Representative who needs to work with device registration and device data pulls (IoT Hub operations).

- CSR should be given the IoT Administrator and IoT Endpoint User security roles. General knowledge of Customer Service security roles. For more information, see the topic on setting up customer service users and security roles.





In general, access to IoT entities should mimic access to the customer asset entity for field service administrators, dispatchers, and resources.

2. A Customer Service administrator who needs to can set up IoT Configuration.

- The CSR admin should be granted Dynamics 365 system administrator access.

Migrate from Omnichannel for Customer Service agent app to Customer Service workspace

Article • 08/25/2023

This article contains configuration information for migrating from the Omnichannel for Customer Service agent-facing app to Customer Service workspace. The Omnichannel for Customer Service agent-facing app was deprecated on April 1, 2023.

Prerequisites

To make configuration changes to Customer Service workspace, you must have one of the following roles:

- System Administrator
- System Customizer

Customize the Customer Service workspace app

The following sections walk through the customizations for the Customer Service workspace app to help you migrate from the Omnichannel for Customer Service agent-facing app.

> **Note**
>
> If you've customized the Omnichannel for Customer Service app in other ways beyond the customizations discussed in this article, you'll need to manually make those same customizations in Customer Service workspace.

Before you migrate, open the app designer if you want to identify the differences between the Omnichannel for Customer Service and Customer Service workspace apps.

1. Sign in to Power Apps and select **Apps** from site map.
2. Select **Customer Service workspace** and then select **Edit** to open the modern app designer.

The following table lists the components in Omnichannel for Customer Service that need to be configured in Customer Service workspace.

Category	Component to configure in Customer Service workspace
Entities	• Feedback • Goal • Phone to Case Process • Social activity
Views	• Views from the four entities (Feeback, Goal, Phone to Case Process, and Social activity) • Omnichannel for Customer Service has all the views selected but Customer Service workspace has selected views only. Include all the views from Account, Case, and Contact entity in the Customer Service workspace app.
Forms	• Forms from the four entities (Feeback, Goal, Phone to Case Process, and Social activity) • Account - Account for Interactive experience (default), TimelineWallControl - Case - Main • Case: Case for Interactive experience (default), TimelineWallControl - Case - Main • Contact - Contact for Interactive experience
Dashboards	• Omnichannel Agent dashboard • Omnichannel Ongoing Conversations dashboard
Business Process Flow	• Phone to Case Process • Users
Site map	• Routing diagnostics

Add pages in Customer Service workspace

Perform the steps in Add pages to your app to add pages in Customer Service workspace.

> ⓘ **Note**
>
> Select **Show in navigation** if you want the selected table to appear on the site map.

Set a form as the default form

You can set a form as the default form using the form order configuration or when a user sets the default form as a personalization setting. The default form order is set at in

the table instead of the app. Therefore, there can be one form order per table.

Perform the steps in Set the form order to set a form as the default form.

Add or remove entities in the Customer Service workspace site map

1. In Power Apps, open the Customer Service workspace app menu, and select **Edit** to open the modern app designer.
2. Under **Pages**, you see the following sections:

    - **Navigation** has the entities, which appear on the site map of Customer Service workspace. Hover over the entity you want to remove, select ellipsis (...), and then select **Remove from navigation**.
    - **All other pages** has the entities, which are available in the app but don't appear on the site map of Customer Service workspace. Hover over the entity you want to add, select ellipsis (...), and then select **Add to navigation**.

3. Select **Save and Publish**.

Add or remove the dashboard in Customer Service workspace

1. In Power Apps, open the Customer Service workspace app menu, and select **Edit** to open the modern app designer.
2. From **Pages**, select **New**.
3. Select **Dashboard**, and then select **Next**.
4. Compare the components with the Omnichannel for Customer Service site map, and add or remove components as needed.
5. Select **Show in navigation** if you want the selected table to appear on the site map.
6. Select **Save and Publish**.

Customize the environment in Customer Service workspace

1. To customize the environment, perform the steps in Add an app to a solution.
2. Publish the customization and export the solution.

Add the Phone to Case business process flow in Customer Service workspace

1. Sign in to Power Apps.
2. Select **Solutions** in the site map, and then open the solution that contains the existing model-driven app for Customer Service workspace.
3. Select the Customer Service workspace menu, and then select **Edit** to open the modern app designer.
4. Complete the steps in Add or edit model-driven app components in the Power Apps app designer to add the **Phone to Case Process** flow.
5. Compare the components with the Customer Service workspace app site map, and add or remove components as needed.
6. Select **Save and Publish**.

Overview of the productivity pane

Enable the Omnichannel for Customer Service app and disable the Customer Service workspace app

Article • 06/28/2023

With the previously announced deprecation of the Omnichannel for Customer Service agent-facing app, the app is now hidden in environments. By default, Customer Service workspace is shown to the following user profiles:

- Omnichannel Agent
- Omnichannel Supervisor
- Omnichannel Administrator

If your business still requires the Omnichannel for Customer Service app, use the steps in this article to enable it.

If you don't want the Customer Service workspace app to be visible for any of the above profiles, follow the steps in Disable the Customer Service workspace app to remove it from the apps page in your environment.

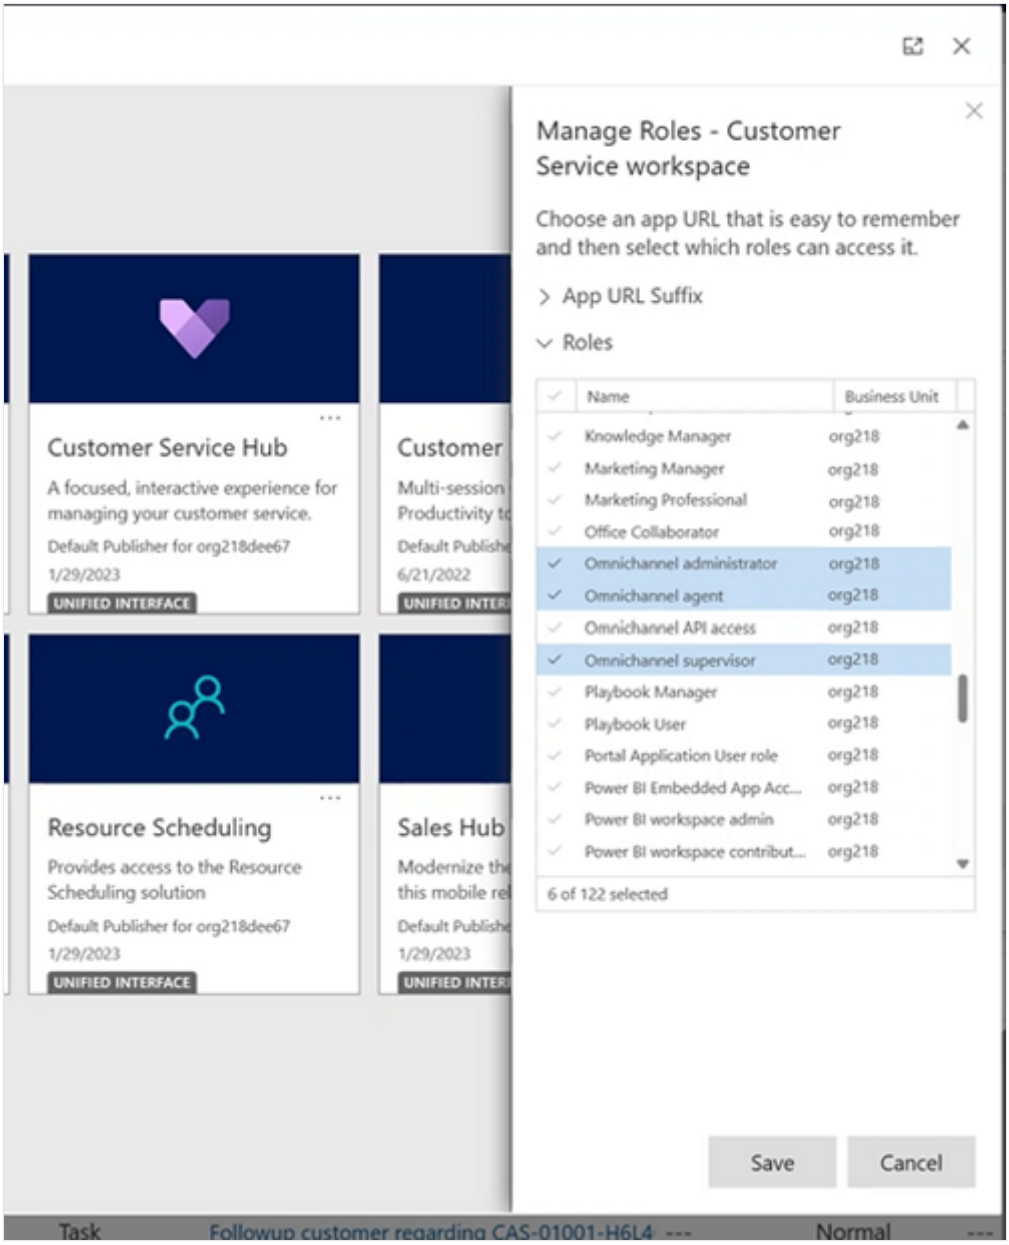
Enable the Omnichannel for Customer Service app

1. Sign in to Power Apps.
2. Select **Environment** on the top navigation bar. The **Select environment** pane is displayed.
3. Search for your environment, and then select it.
4. On the site map, select **Apps**, and then select the ellipsis next to **Omnichannel for Customer Service**.
5. Select **Activate**. Omnichannel then becomes visible on your environment's apps page.

Disable the Customer Service workspace app

1. On the Dynamics 365 **Apps** page, navigate to the **Customer Service workspace** app, and then select **MANAGE ROLES** from the app menu.

2. On the **Manage Roles - Customer Service workspace** right-side pane, deselect the roles you don't want the Customer Service workspace app to be visible to.



3. Select **Save**.

Next steps

For migration information, go to Migrate from Omnichannel for Customer Service to Customer Service workspace

Overview of data migration for records

Article • 08/02/2023

Use the Configuration Migration tool to migrate the configurations from the source organization to the target organization for the records that are based on unified routing.

For information on how to download and use the Configuration Migration tool, see the following articles:

- Download Configuration Migration tool
- How the Configuration Migration tool works

Prerequisites

Check for the following before you migrate your configuration data:

- In the source organization, if a unified routing ruleset refers to the following, then ensure that they exist in the target organization before you proceed with the migration:
  - Custom entities
  - Attributes
  - Relationships
  - Option sets
  - Lookup values
- Ensure that the user who performs the migration has the required privileges on the following entities in the source and target organizations:
  - Characteristic (characteristic)
  - Rating Model (ratingmodel)
  - Rating Value (ratingvalue)
  - Capacity Profile (msdyn_capacityprofile)
  - Queue (queue)
  - Operating hours (msdyn_operatinghour)
  - Overflow Action Config (msdyn_overflowactionconfig)
  - Decision contract (msdyn_decisioncontract)
  - Decision rule set (msdyn_decisionruleset)
  - Assignment Configuration (msdyn_assignmentconfiguration)
  - Assignment Configuration Step (msdyn_assignmentconfigurationstep)
  - Master Entity Routing Configuration (msdyn_masterentityroutingconfiguration)
  - Workstream (msdyn_liveworkstream)
  - Routing configuration (msdyn_routingconfiguration)

- Routing configuration step (msdyn_routingconfigurationstep)
- Workstream capacity profile (msdyn_liveworkstreamcapacityprofile)

Migrate configuration data for the record channel

Perform the steps in the following order to successfully migrate your configuration data from the source to the target organization.

1. Use FetchXML query to filter records
2. Migrate configuration using a solution
3. Migrate skill-based routing rulesets
4. Migrate capacity profiles
5. Migrate queues
6. Migrate intake rules
7. Migrate workstreams
8. Verify your data migration
9. Troubleshoot your data migration

> ⓘ **Important**
>
> The migration process doesn't include:
>
> - Intelligent skill finder
> - Effort estimation for routing (preview)
> - Sentiment prediction for routing (preview)
> - Role persona mapping
> - Presence
> - Queue membership

Next steps

Use FetchXML query to filter records

Troubleshoot migration of records

Migrate configuration data for live chat

Migrate configuration data for voice channel

Use FetchXML query to filter records

Article • 01/23/2023

This article discusses how to download the FetchXL query and edit it in the Configuration Management tool.

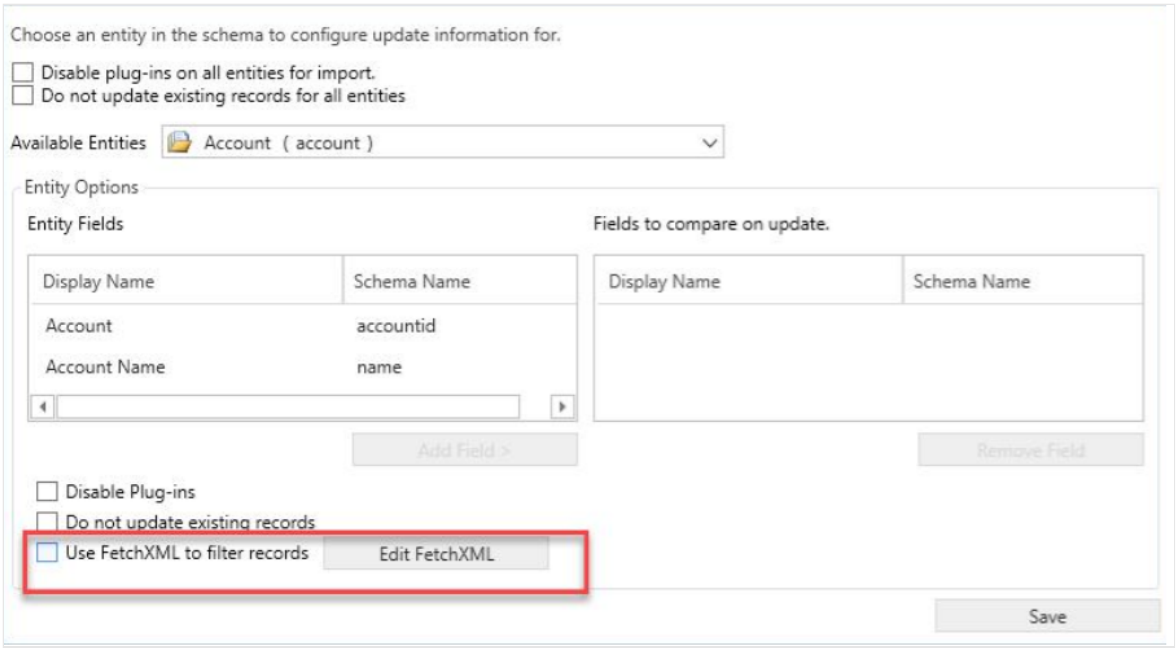
Generate FetchXML query

1. Use the **ADVANCED FIND** menu to create a personal view. More information: Create, edit, or save a view using legacy advanced find
2. Select one or multiple records of the entity to export. More information: Share a personal view.
3. Select **Download FetchXML**.
4. Edit the XML as follows:
    a. Remove "output-format=xml-platform".
    b. Remove all attribute elements.
    c. Remove the order attribute element.
5. Save and close.

Edit the FetchXML query in the Configuration Management tool

1. Open the Configuration Migration tool and in the **Tools** menu, select **Configure Import Settings**.

2. Select **Edit FetchXML**.



3. Enter your FetchXML query in the text box, and select **OK**.

Migrate configuration data for records

Article • 08/02/2023

This article includes procedures for migrating configuration data for records. You must migrate the data in the order of:

1. skill-based routing rulesets
2. capacity profiles
3. queues
4. intake rules
5. workstreams

The procedures include tables with entity information and corresponding sample schemas for each configuration.

Migrate configuration using a solution

You can use solutions to move certain configuration items between environments. If a configuration in your unified routing setup has the following items, they can be moved using a solution.

1. Add the components to a solution and export
   a. Agent Script (msdyn_productivityagentscripts)
   b. Agent Script Step (msdyn_productivityagentscriptsteps)
   c. Application Tab Template (msdyn_applicationtabtemplates)
   d. Notification Field (msdyn_notificationfields)
   e. Notification Template (msdyn_notificationtemplates)
   f. Macro (processes)
   g. Session Templates (msdyn_sessiontemplates)
   h. Template Parameter (msdyn_templateparameters)
2. Import the solution into the target environment

Migrate configuration for skill-based routing rulesets

If skill-based routing rulesets are used in your unified routing setup, perform the steps to migrate the corresponding configuration.

For sample schema to get all the required records, see Sample schema for skill-based routing configuration.

1. Use the Configuration Migration tool to create the schema and export data from the source organization for skill-based routing configuration.

   - **Entity display name**: When you create the schema, select the entities in the sequence that's mentioned in the table.
   - **Attribute display name**: We recommend that you select the attributes defined in the following table. You don't need to select the out-of-the-box system-defined attributes like Created By, Created On, Modified By, Modified On, and Owner. You can select custom attributes if necessary.

   > **Important**

You must manually create bookableresourcecharacteristictype (Global option set value) in the target organization, if necessary.

Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records
Characteristic (characteristic)	• Characteristic Type (characteristictype) • Characteristic (characteristicid) • Description (description) • Name (name)	
Rating Model (ratingmodel)	• Max Rating Value (maxratingvalue) • Min Rating Value (minratingvalue) • Name (name) • Rating Model (ratingmodelid)	
Rating Value (ratingvalue)	• Name (name) • Rating Model (ratingmodel) • Rating Value (ratingvalueid) • Value (value)	

2. Generate the schema and save it.
3. Export the data and generate the compressed (zip) file.
4. Use the Configuration Migration tool, and select the option to import data into the target organization using the compressed file.

Migrate configuration for capacity profiles

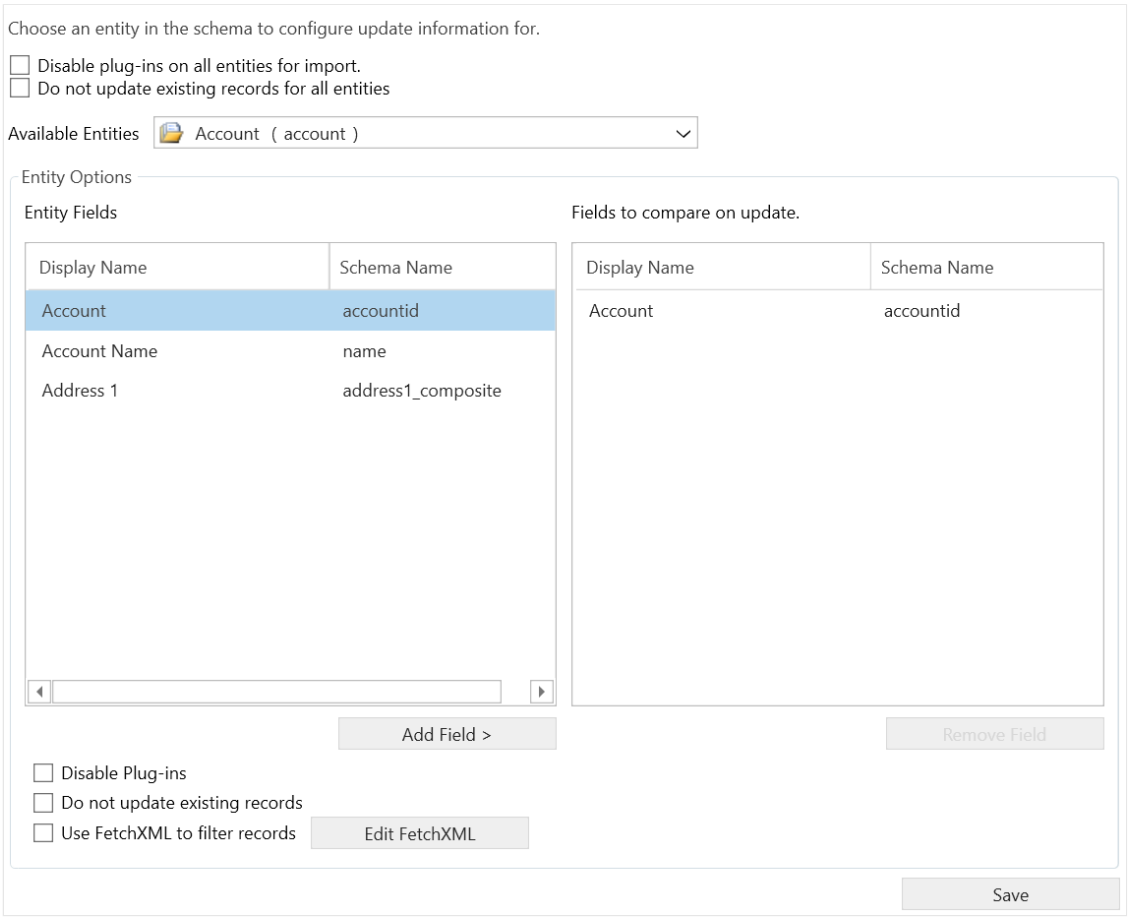
If you have configured capacity profiles in your unified routing setup, perform the steps to migrate the corresponding configuration.

For sample schema to get all the required records, see Sample schema for capacity profiles.

1. Use the Configuration Migration tool to create the schema and export data in source organization for capacity profiles configuration.

   - **Entity display name**: When you create the schema, select the entities in the same sequence as mentioned in the table.
   - **Attribute display name**: We recommend that you select the attributes defined in the following table. You don't need to select the out-of-the-box system defined attributes like Created By, Created On, Modified By, Modified On, and Owner. You can select custom attributes, if necessary.
   - **Use FetchXML to filter records**: For each entity, use the appropriate FetchXML query that's mentioned in the following table to get single, multiple, or all records based on your requirement. For single or multiple records, you need to use source organization to get the correct name in uiname and GUID in value. If required, you can use the **ADVANCED FIND** menu item to construct the appropriate FetchXML query.
   - **Configure import settings**:

- For the Decision contract entity, ensure that you select the **Do not update existing records** checkbox.
- For every entity, including the Decision contract entity, ensure that you select the primary key field of the entity to be used as a field to compare on update. An example for Account is as follows.



> **Note**
>
> The sample query listed in the following table gets single or multiple records. The query has considered the entity as incident and task. Based on your requirements, ensure that you update the entity logical name in the FetchXML query.

The following table summarizes the entities and corresponding FetchXML samples.

Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records

Capacity Profile (msdyn_capacityprofile)	• Block Assignment (msdyn_blockassignment)
	• Capacity Profile (msdyn_capacityprofileid)
	• Default Max Units (msdyn_defaultmaxunits)
	Name (msdyn_name)
	• Reset Duration(msdyn_resetduration)
	• Unique Name (msdyn_uniquename)
		Sample 1: For all capacity profile records
		`<fetch>`
		`<entity name="msdyn_capacityprofile">`
		`<filter type="and">`
		`<condition attribute="ismanaged"`
		`operator="eq" value="0" />`
		`</filter>`
		`</entity>`
		`</fetch>`
		
		Sample 2: For a single capacity profile record
		`<fetch>`

Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records

		`<entity name="msdyn_capacityprofile">` `<filter type="and">` `<condition attribute="msdyn_capacityprofileid" operator="eq" uiname="Demo Capacity Profile 1" uitype="msdyn_capacityprofile" value="{F57CFE3C-14BD-D53E-F423-A1E7F9749DFB}" />` `</filter>` `</entity>` `</fetch>`
		
		Sample 3: For multiple capacity profile records
		`<fetch>` `<entity name="msdyn_capacityprofile">` `<filter type="and">` `<condition attribute="msdyn_capacityprofileid" operator="in">` `<value uiname="Demo Capacity Profile 1" uitype="msdyn_capacityprofile">{F57CFE3C-14BD-D53E-F423-A1E7F9749DFB}</value>` `<value uiname="Demo Capacity Profile 2" uitype="msdyn_capacityprofile">{D0B8ABFB-4A9F-0B1F-6FF4-8003E29A623C}</value>` `</condition>` `</filter>` `</entity>` `</fetch>`

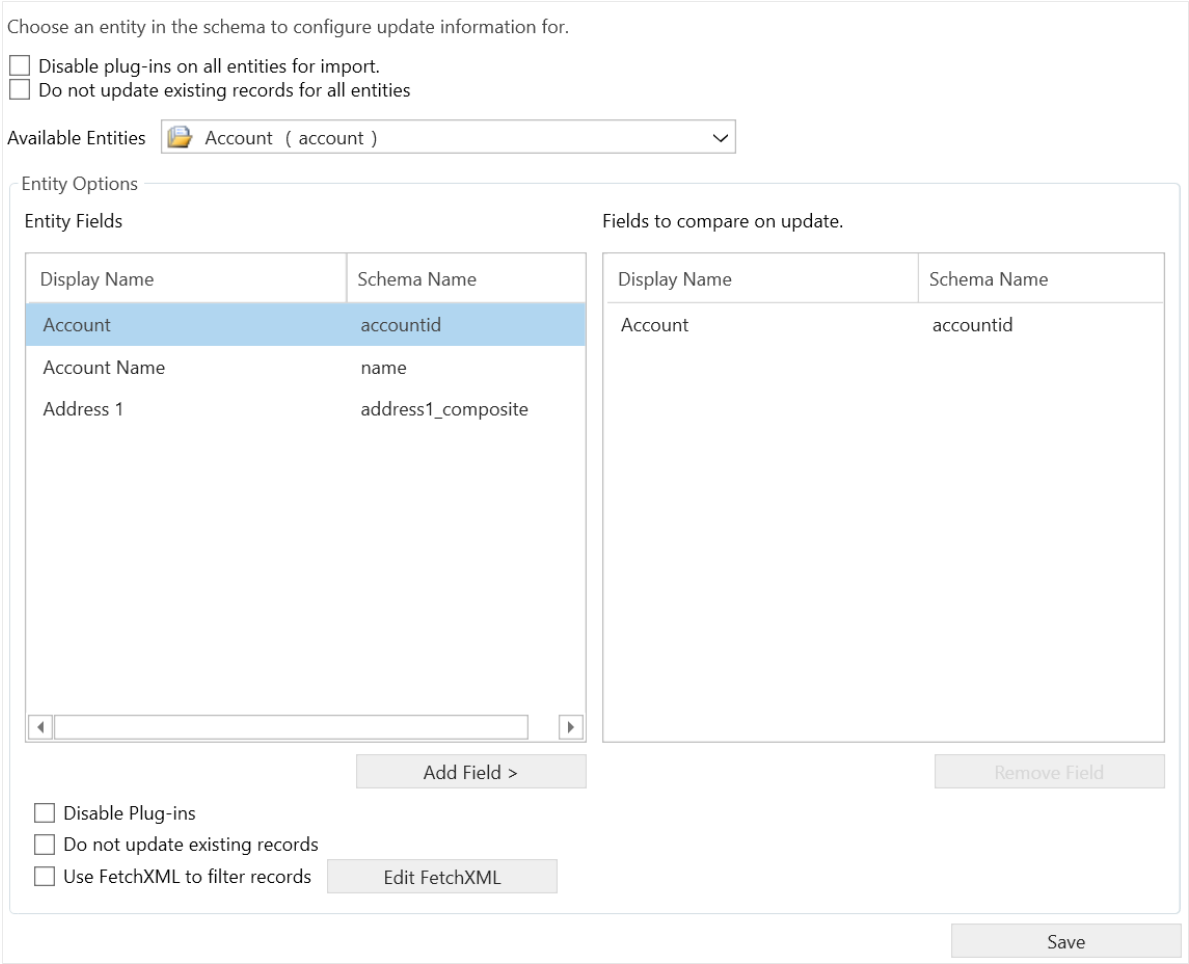
2. Generate the schema and save it.
3. Export the data and generate the compressed (zip) file.
4. Use the Configuration Migration tool, and select the option to import data into the target organization.

Migrate configuration for record queues

Use the Configuration Migration tool to create the schema and export data from the source organization for the record queues configuration.

- **Entity display name**: When you create the schema, select the entities in the same sequence as mentioned in the table.
- **Attribute display name**: We recommend that you select the attributes defined in the following table. You don't need to select the out-of-the-box system defined attributes like Created By, Created On, Modified By, Modified On, and Owner. You can select custom attributes, if necessary.
- **Use FetchXML to filter records**: For each entity, use the appropriate FetchXML query that's mentioned in the following table to get single, multiple, or all records based on your requirement. For single or multiple records, you need to use source organization to get the correct name in uiname and GUID in value. If required, you can use the **ADVANCED FIND** menu item to construct the appropriate FetchXML query.
- **Configure import settings**:

- For the Decision contract entity, ensure that you select the **Do not update existing records** checkbox.
- For every entity, including the Decision contract entity, ensure that you select the primary key field of the entity to be used as a field to compare on update. An example for Account is as follows.



> **Note**
>
> The sample query listed in the following table gets single or multiple records. The query has considered the entity as incident and task. Based on your requirements, ensure that you update the entity logical name in the FetchXML query.

If you're using the out-of-the-box assignment methods for queues, such as highest capacity and round robin, skip the following entities:

- Decision rule set
- Assignment configuration
- Assignment configuration step

The assignment rulesets must be available in the system before the Configutation Migration tool imports the selection criteria. Hence, you need to perform the following steps in the specified order to migrate configuration for record queues:

> **Important**
>
> - For every import of queue records, you must either create new queue records or update existing queue records. You must not mix the actions in the same data import.

- When all records in the data.xml of queue entity are for creation, ensure that the following line is present in the schema.xml: `<field displayname="Queue type" name="msdyn_queuetype" type="optionsetvalue" customfield="true"/>` and correspondingly data will also have the field for msdyn_queuetype.
- When all records in the data.xml of queue entity are for update, ensure that you remove the following line in the schema.xml: `<field displayname="Queue type" name="msdyn_queuetype" type="optionsetvalue" customfield="true"/>` and correspondingly data will also not have that field for msdyn_queuetype.
- When the queue that you want to migrate has an overflow condition set, then you must export and import the decision ruleset first. The migration sequence should look as follows:
  - Decision contract
  - Decision ruleset
  - Queue
  - Assignment Configuration
  - Assignment Configuration Step without selection criteria
  - Operating Hour
  - Overflow Action
- You can't migrate the Calendar item associated with the Operating Hour entity. You'll need to set it correctly after you import the Operating Hour entity into the target environment.

Step 1: Export and import rulesets without selection criteria

The following table summarizes the entities and corresponding FetchXML samples.

S. No.	Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records
1.	Queue (queue)	• Assignment Input Contract Id (msdyn_assignmentinputcontractid) • Assignment Strategy (msdyn_assignmentstrategy) • Description (description) • Is Default Queue (msdyn_isdefaultqueue) • Is Omnichannel queue (msdyn_isomnichannelqueue) • Name (name) • Priority (msdyn_priority) • Queue (queueid) • Queue type (msdyn_queuetype) • Type (queueviewtype) • Operating Hours (msdyn_operatinghourid) • Prequeue Overflow Ruleset (msdyn_prequeueoverflowrulesetid)	Sample 1: All queues for records Sample 2: Single queue for records Sample 3: Multiple queues for records
2.	Decision contract (msdyn_decisioncontract)	• Contract definition (msdyn_contractdefinition) • Decision contract (msdyn_decisioncontractid) • Name (msdyn_name) • Unique name (msdyn_uniquename)	Sample 1: Decision contract for all record queues Sample 2: Decision contract for a single

S. No.	Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records
			Sample 3: Decision contract for multiple record queues
3.	Decision ruleset without selection criteria (msdyn_decisionruleset)	• AI builder model (msdyn_aibmodelid) • Authoring mode (msdyn_authoringmode) • Decision rule set (msdyn_decisionrulesetid) • Description (msdyn_description) • Input contract (msdyn_inputcontractid) • Is input collection (msdyn_isinputcollection) • ML model type (msdyn_mlmodeltype) • Name (msdyn_name) • Output contract (msdyn_outputcontractid) • Rule set definition (msdyn_rulesetdefinition) • Rule set type (msdyn_rulesettype) • Unique name (msdyn_uniquename) • FetchXML for ruleset (msdyn_fetchxml)	Sample 1: Decision ruleset for all record queues without selection criteria defined Sample 2: Decision ruleset for a single record queue without selection criteria defined Sample 3: Decision ruleset for multiple record queues without selection criteria defined
4.	Assignment Configuration (msdyn_assignmentconfiguration)	• Assignment Configuration (msdyn_assignmentconfigurationid) • Description (msdyn_description) • Is Active Configuration (msdyn_isactiveconfiguration) • Name (msdyn_name) • Queue (msdyn_queueid) • Unique Name (msdyn_uniquename)	Sample 1: Assignment configuration for all record queues Sample 2: Assignment configuration for a single record queue Sample 3: Assignment configuration for multiple record queues
5.	Assignment Configuration Step without selection criteria (msdyn_assignmentconfigurationstep)	• Assignment Configuration (msdyn_assignmentconfigurationid) • Assignment Configuration Step (msdyn_assignmentconfigurationstepid) • Is default ruleset (msdyn_isdefaultruleset) • Name (msdyn_name) • Rule Set (msdyn_rulesetid) • Step Order (msdyn_steporder) • Step Type (msdyn_type) • Unique Name (msdyn_uniquename)	Sample 1: Assignment configuration step for all record queues without selection criteria defined Sample 2: Assignment configuration step for a single record queue without selection criteria defined Sample 3: Assignment configuration step

S. No.	Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records
			for multiple record queues without selection criteria defined
6.	Operating Hour (msdyn_operatinghour)	• Description (msdyn_description) • Name (msdyn_name) • Operating Hour (msdyn_operatinghourid) • Status (statecode) • Status Reason (statuscode)	Sample 1: Operating Hours for all record queues Sample 2: Operating Hours for a single record queue Sample 3: Operating Hours for multiple record queues
7.	Overflow Action Config(msdyn_overflowactionconfig)	• Name (msdyn_name) • Overflow Action Config (msdyn_overflowactionconfigid) • Overflow Action Data (msdyn_overflowactiondata) • Overflow Action Type(msdyn_overflowactiontype) • Status (statecode) • Status Reason (statuscode)	Sample 1: Overflow Action Config filtered to specific records

Perform the following steps to export and import the rulesets:

1. Generate the schema and save it.
2. Export the data and generate the compressed (zip) file.
3. Extract the zip file, open the data.xml file present in the extracted folder, and do the following:

    - In the source and target organizations, run the following OData API call and note the GUID of `msdyn_decisioncontractid`.

      ```
      https://<OrgURL>/api/data/v9.1/msdyn_decisioncontracts?
      $select=msdyn_decisioncontractid&$filter=msdyn_uniquename eq 'msdyn_assignmentoutput'
      ```

      In data.xml file, replace all the occurrences of the msdyn_decisioncontractid GUID in the source organization with the msdyn_decisioncontractid GUID of the target organization.

    - In the source and target organizations, run the following OData API call and note the GUID of `msdyn_decisioncontractid`.

      ```
      https://<OrgURL>/api/data/v9.1/msdyn_decisioncontracts?
      $select=msdyn_decisioncontractid&$filter=msdyn_uniquename eq 'msdyn_selectionruleoutput'
      ```

      In data.xml file, replace all occurrences of the msdyn_decisioncontractid GUID in the source organization with the msdyn_decisioncontractid GUID of the target organization.

- In the source and target organizations, run the following OData API call and note the GUID of msdyn_decisioncontractid. `https://<OrgURL>/api/data/v9.1/msdyn_decisioncontracts?$select=msdyn_decisioncontractid&$filter=msdyn_uniquename eq 'msdyn_queueoverflowrulesetinput'`

  In data.xml file, replace all the occurrences of the msdyn_decisioncontractid GUID in the source organization with the msdyn_decisioncontractid GUID of the target organization.

- In the source and target organizations, run the following OData API call and note the GUID of msdyn_decisioncontractid.

`https://<OrgURL>/api/data/v9.1/msdyn_decisioncontracts?$select=msdyn_decisioncontractid&$filter=msdyn_uniquename eq 'msdyn_queueoverflowrulesetoutput'`

In data.xml file, replace all occurrences of the msdyn_decisioncontractid GUID in the source organization with the msdyn_decisioncontractid GUID of the target organization.

4. Package the extracted content again.
5. Use the Configuration Migration tool, select the option to import data, and then select the compressed file.

> **Note**
>
> Set the Calendar Item associated with the Operating Hour entity correctly after you import the Operating Hour entity into the target environment.

For sample schema to get all the required records, see Sample schema for record queues step 1.

Step 2: Export and import rulesets with selection criteria defined

The following table summarizes the entities and corresponding FetchXML samples.

S. No.	Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records
1.	Decision ruleset with selection criteria (msdyn_decisionruleset)	• AI builder model (msdyn_aibmodelid) • Authoring mode (msdyn_authoringmode) • Decision rule set (msdyn_decisionrulesetid) • Description (msdyn_description) • Input contract (msdyn_inputcontractid) • Is input collection (msdyn_isinputcollection) • ML model type (msdyn_mlmodeltype) • Name (msdyn_name) • Output contract (msdyn_outputcontractid) • Rule set definition (msdyn_rulesetdefinition) • Rule set type (msdyn_rulesettype) • Unique name (msdyn_uniquename)	Sample 1: Decision ruleset for all record queues with selection criteria defined Sample 2: Decision ruleset for a single record queue with selection criteria defined Sample 3: Decision ruleset for multiple record queues with selection criteria defined

S. No.	Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records
2.	Assignment Configuration Step with selection criteria (msdyn_assignmentconfigurationstep)	• Assignment Configuration (msdyn_assignmentconfigurationid) • Assignment Configuration Step (msdyn_assignmentconfigurationstepid) • Is default ruleset (msdyn_isdefaultruleset) • Name (msdyn_name) • Rule Set (msdyn_rulesetid) • Step Order (msdyn_steporder) • Step Type (msdyn_type) • Unique Name (msdyn_uniquename)	Sample 1: Assignment configuration step for all record queues with selection criteria defined Sample 2: Assignment configuration step for a single record queue with selection criteria defined Sample 3: Assignment configuration step for multiple record queues with selection criteria defined

Perform the following steps to export and import the rulesets:

1. Generate the schema and save it.
2. Export the data and generate the compressed (zip) file.
3. Extract the zip file, open the data.xml file present in the extracted folder, and do the following:
    - In the source and target organizations, run the following OData API call and note the GUID of `msdyn_decisioncontractid`.

      ```
      https://<OrgURL>/api/data/v9.1/msdyn_decisioncontracts?
      $select=msdyn_decisioncontractid&$filter=msdyn_uniquename eq 'msdyn_assignmentoutput'
      ```

      In data.xml file, replace all the occurrences of the msdyn_decisioncontractid GUID in the source organization with the msdyn_decisioncontractid GUID of the target organization.
    - In the source and target organizations, run the following OData API call and note the GUID of `msdyn_decisioncontractid`.

      ```
      https://<OrgURL>/api/data/v9.1/msdyn_decisioncontracts?
      $select=msdyn_decisioncontractid&$filter=msdyn_uniquename eq 'msdyn_selectionruleoutput'
      ```

      In data.xml file, replace all occurrences of the msdyn_decisioncontractid GUID in the source organization with the msdyn_decisioncontractid GUID of the target organization.
4. Package the extracted content again.
5. Use the Configuration Migration tool, select the option to import data, and then select the compressed file.

For sample schema to get all the required records, see Sample schema for record queues step 2 .

FetchXML for queues

Sample 1: All queues for records

XML

```
<fetch>
   <entity name="queue">
    <filter type="and">
      <condition attribute="msdyn_queuetype" operator="eq" value="192350001" />
      <condition attribute="msdyn_isomnichannelqueue" operator="eq" value="1" />
      <condition attribute="queueid" operator="ne" uiname="Default entity queue" uitype="queue"
value="{5A4B76B0-DAB5-4717-9743-9490F2F822C6}" />
    </filter>
  </entity>
</fetch>
```

Sample 2: Single queue for records

XML

```
<fetch>
   <entity name="queue">
    <filter type="and">
      <condition attribute="queueid" operator="eq" uiname="Test Record Queue 1" uitype="queue"
value="{A5ED5CAA-3A54-EC11-8F8F-000D3A1CBB9E}" />
    </filter>
   </entity>
</fetch>
```

Sample 3: Multiple queues for records

XML

```
<fetch>
   <entity name="queue">
    <filter type="and">
     <condition attribute="queueid" operator="in">
      <value uiname="Test Record Queue 1" uitype="queue">{A5ED5CAA-3A54-EC11-8F8F-000D3A1CBB9E}
</value>
      <value uiname="Test Record Queue 2" uitype="queue">{B2862B31-3B54-EC11-8F8F-000D3A1CBB9E}
</value>
     </condition>
    </filter>
   </entity>
</fetch>
```

FetchXML for decision contract entity

Sample 1: Decision contract for all record queues

XML

```
<fetch distinct="true">
    <entity name="msdyn_decisioncontract">
        <filter type="or">
```

```
            <filter type="and">
                <condition attribute="msdyn_queuetype" entityname="aw" operator="eq"
value="192350001" />
                <condition attribute="msdyn_isomnichannelqueue" entityname="aw" operator="eq"
value="1" />
                <condition attribute="queueid" entityname="aw" operator="ne"
uiname="Default entity queue" uitype="queue" value="{5A4B76B0-DAB5-4717-9743-9490F2F822C6}" />
            </filter>
            <filter type="and">
                <condition attribute="msdyn_isomnichannelqueue" entityname="be" operator="eq"
value="1" />
                <condition attribute="msdyn_queuetype" entityname="be" operator="eq"
value="192350001" />
                <condition attribute="queueid" entityname="be" operator="ne"
uiname="Default entity queue" uitype="queue" value="{5A4B76B0-DAB5-4717-9743-9490F2F822C6}" />
            </filter>
            <filter type="and">
                <condition attribute="msdyn_isomnichannelqueue" entityname="bm" operator="eq"
value="1" />
                <condition attribute="msdyn_queuetype" entityname="bm" operator="eq"
value="192350001" />
                <condition attribute="queueid" entityname="bm" operator="ne"
uiname="Default entity queue" uitype="queue" value="{5A4B76B0-DAB5-4717-9743-9490F2F822C6}" />
            </filter>
        </filter>
        <link-entity name="queue" from="msdyn_assignmentinputcontractid"
to="msdyn_decisioncontractid" link-type="outer" alias="aw"></link-entity>
        <link-entity name="msdyn_decisionruleset" from="msdyn_inputcontractid"
to="msdyn_decisioncontractid" link-type="outer" alias="bb">
            <link-entity name="msdyn_assignmentconfigurationstep" from="msdyn_rulesetid"
to="msdyn_decisionrulesetid" link-type="outer" alias="bc">
                <link-entity name="msdyn_assignmentconfiguration"
from="msdyn_assignmentconfigurationid" to="msdyn_assignmentconfigurationid" link-type="outer"
alias="bd">
                    <link-entity name="queue" from="queueid" to="msdyn_queueid" link-
type="outer" alias="be"></link-entity>
                </link-entity>
            </link-entity>
        </link-entity>
        <link-entity name="msdyn_decisionruleset" from="msdyn_outputcontractid"
to="msdyn_decisioncontractid" link-type="outer" alias="bj">
            <link-entity name="msdyn_assignmentconfigurationstep" from="msdyn_rulesetid"
to="msdyn_decisionrulesetid" link-type="outer" alias="bk">
                <link-entity name="msdyn_assignmentconfiguration"

alias="bl">
                    <link-entity name="queue" from="queueid" to="msdyn_queueid" link-
type="outer" alias="bm"></link-entity>
                </link-entity>
            </link-entity>
        </link-entity>
    </entity>
</fetch>
```

Sample 2: Decision contract for a single record queue

XML

```
<fetch distinct="true">
    <entity name="msdyn_decisioncontract">
        <filter type="or">
            <filter type="and">
                <condition attribute="queueid" entityname="aw" operator="eq"
uiname="Test Record Queue 1" uitype="queue" value="{A5ED5CAA-3A54-EC11-8F8F-000D3A1CBB9E}" />
            </filter>
```

```
            <filter type="and">
                <condition attribute="queueid" entityname="be" operator="eq"
uiname="Test Record Queue 1" uitype="queue" value="{A5ED5CAA-3A54-EC11-8F8F-000D3A1CBB9E}" />
            </filter>
            <filter type="and">
                <condition attribute="queueid" entityname="bm" operator="eq"
uiname="Test Record Queue 1" uitype="queue" value="{A5ED5CAA-3A54-EC11-8F8F-000D3A1CBB9E}" />
            </filter>
        </filter>
        <link-entity name="queue" from="msdyn_assignmentinputcontractid"
to="msdyn_decisioncontractid" link-type="outer" alias="aw"></link-entity>
        <link-entity name="msdyn_decisionruleset" from="msdyn_inputcontractid"
to="msdyn_decisioncontractid" link-type="outer" alias="bb">
            <link-entity name="msdyn_assignmentconfigurationstep" from="msdyn_rulesetid"
to="msdyn_decisionrulesetid" link-type="outer" alias="bc">
                <link-entity name="msdyn_assignmentconfiguration"
from="msdyn_assignmentconfigurationid" to="msdyn_assignmentconfigurationid" link-type="outer"
alias="bd">
                    <link-entity name="queue" from="queueid" to="msdyn_queueid" link-
type="outer" alias="be"></link-entity>
                </link-entity>
            </link-entity>
        </link-entity>
        <link-entity name="msdyn_decisionruleset" from="msdyn_outputcontractid"
to="msdyn_decisioncontractid" link-type="outer" alias="bj">
            <link-entity name="msdyn_assignmentconfigurationstep" from="msdyn_rulesetid"
to="msdyn_decisionrulesetid" link-type="outer" alias="bk">
                <link-entity name="msdyn_assignmentconfiguration"
from="msdyn_assignmentconfigurationid" to="msdyn_assignmentconfigurationid" link-type="outer"
alias="bl">
                    <link-entity name="queue" from="queueid" to="msdyn_queueid" link-
type="outer" alias="bm"></link-entity>
                </link-entity>

        </fetch>
```

FetchXML for operating hour configuration step entity

Sample 1: Operating Hour configuration step for all record queues

XML

```
XMLCopy
        <fetch>
```

```
            <entity name="msdyn_operatinghour">
                <link-entity name="queue" from="msdyn_operatinghourid"
to="msdyn_operatinghourid" link-type="inner" alias="aa">
                <filter type="and">
                    <condition attribute="msdyn_queuetype" operator="eq" value="192350001"/>
                    <condition attribute="msdyn_isomnichannelqueue" operator="eq" value="1"/>
                    <condition attribute="queueid" operator="ne" uiname="Default entity queue"
uitype="queue" value="{5A4B76B0-DAB5-4717-9743-9490F2F822C6}"/>
                </filter>
             </link-entity>
           </entity>
        </fetch>
```

Sample 2: Operating Hour configuration step for a single record queue

XML

```
XMLCopy
        <fetch>
            <entity name="msdyn_operatinghour">
                <link-entity name="queue" from="msdyn_operatinghourid"
to="msdyn_operatinghourid" link-type="inner" alias="ab">
                <filter type="and">
                    <condition attribute="queueid" operator="in">
                        <value uiname="Test Record Queue 1" uitype="queue">{A5ED5CAA-3A54-EC11-
8F8F-000D3A1CBB9E}</value>
                    </condition>
                </filter>
                </link-entity>
            </entity>
        </fetch>
```

Sample 3: Operating Hour configuration step for multiple record queues

XML

```
XMLCopy
        <fetch>
            <entity name="msdyn_operatinghour">
                <link-entity name="queue" from="msdyn_operatinghourid"
to="msdyn_operatinghourid" link-type="inner" alias="ab">
                <filter type="and">
                    <condition attribute="queueid" operator="in">
                        <value uiname="Test Record Queue 1" uitype="queue">{A5ED5CAA-3A54-EC11-
8F8F-000D3A1CBB9E}</value>
                        <value uiname="Test Record Queue 2" uitype="queue">{B2862B31-3B54-EC11-
8F8F-000D3A1CBB9E}</value>
                    </condition>
                </filter>
                </link-entity>
            </entity>
        </fetch>
```

FetchXML for overflow action configuration step entity

Sample 1: Overflow Action Config configuration step filter for a specific record

XML

```
XMLCopy
<fetch>
```

```
  <entity name="msdyn_overflowactionconfig">
    <filter type="and">
      <condition attribute="msdyn_overflowactionconfigid" operator="eq"
uiname="QueueTransfer_caae99a1-dcc4-ed11-83ff-00224805c003 " uitype="msdyn_overflowactionconfig"
value="{6D49F66F-68F3-ED11-8848-00224805C003}"/>
    </filter>
  </entity>
</fetch>
```

Migrate configuration for intake rules for record routing

Prerequisites

Before you migrate intake rules, check for the following:

- If the target organization doesn't have the intake rules for the record type that you want to import, then remove the msdyn_rulesetdefinition attribute of the msdyn_decisionruleset entity from the data.xml before you import.
- If the target organization has intake rules for the record type with the same GUID, then remove the msdyn_rulesetdefinition attribute of the msdyn_decisionruleset entity from the data.xml before you import.
- If the target organization has intake rules for the record type with different GUID, then delete all the intake rules in the target organization before you import.

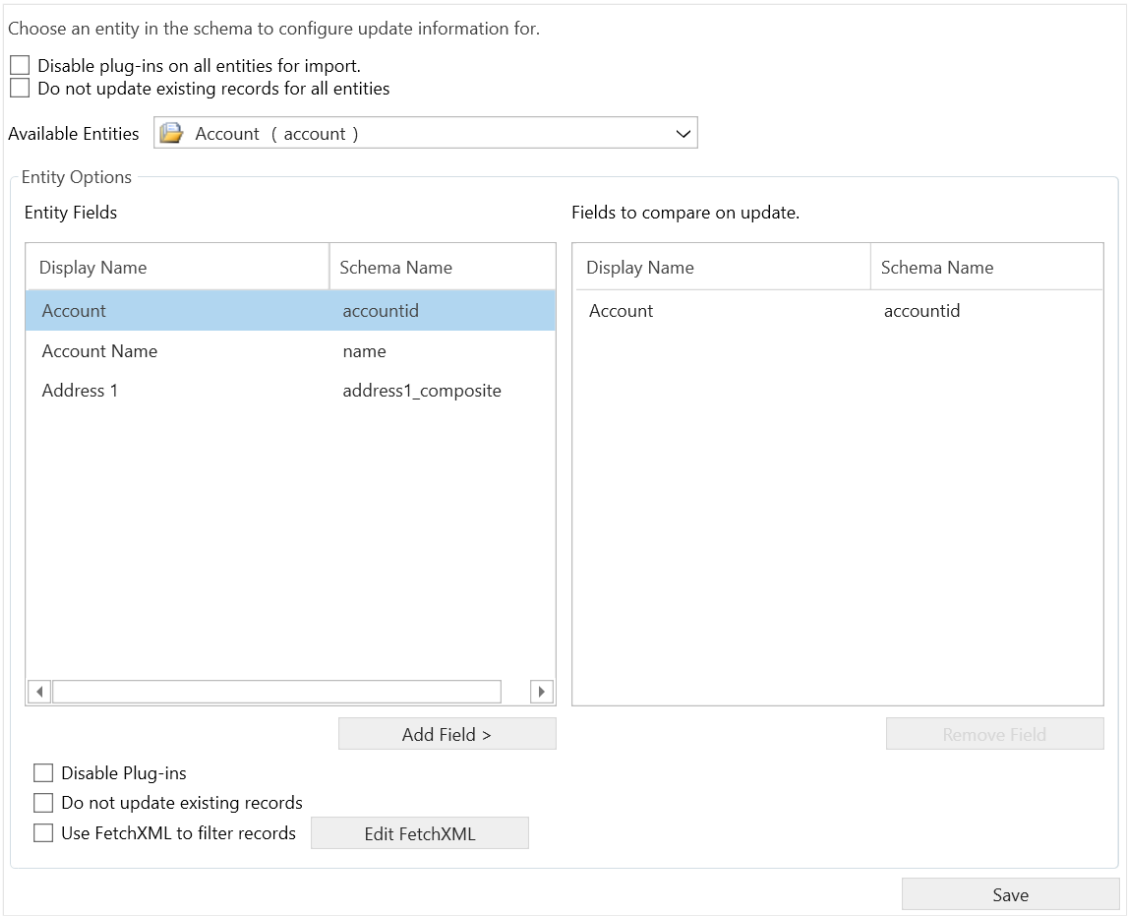
Migrate configuration of intake rules

1. Use the Configuration Migration tool to create the schema and export data from the source organization for a record routing configuration.

    - **Entity display name**: When you create the schema, select the entities in the same sequence as mentioned in the table.
    - **Attribute display name**: We recommend that you select the attributes defined in the following table. You don't need to select the out-of-the-box system defined attributes like Created By, Created On, Modified By, Modified On, and Owner. You can select custom attributes, if necessary.
    - **Use FetchXML to filter records**: For each entity, use the appropriate FetchXML query that's mentioned in the following table to get single, multiple, or all records based on your requirement. For single or multiple records, you need to use source organization to get the correct name in uiname and GUID in value. If required, you can use the **ADVANCED FIND** menu item to construct the appropriate FetchXML query.
    - **Configure import settings**:

        - For the Decision contract entity, ensure that you select the **Do not update existing records** checkbox.

        - For every entity, including the Decision contract entity, ensure that you select the primary key field of the entity to be used as a field to compare on update. An example for Account is as follows.



> **Note**
>
> The sample query listed in the following table gets single or multiple records. The query has considered the entity as incident and task. Based on your requirements, ensure that you update the entity logical name in the FetchXML query.

The following table summarizes the entities and corresponding FetchXML samples.

S.No.	Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records
1.	Master Entity Routing Configuration (msdyn_masterentityroutingconfiguration)	• Entity (msdyn_entitylogicalname) • Master Entity Routing Configuration (msdyn_masterentityroutingconfigurationid) • Name (msdyn_name) • Rule set (msdyn_rulesetid) • Unique Name (msdyn_uniquename)	Sample 1: Master entity routing configuration for a routed records Sample 2: Master entity routing configuration for the incident entity Sample 3: Master entity routing configuration

S.No.	Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records
			for the incident and task entities
2.	Decision contract (msdyn_decisioncontract)	• Contract definition (msdyn_contractdefinition) • Decision contract (msdyn_decisioncontractid) • Name (msdyn_name) • Unique name (msdyn_uniquename)	Sample 1: Decision contract for all routed records Sample 2: Decision contract for the incident entity Sample 3: Decision contract for the incident and task entities
3.	Decision ruleset (msdyn_decisionruleset)	• AI builder model (msdyn_aibmodelid) • Authoring mode (msdyn_authoringmode) • Decision rule set (msdyn_decisionrulesetid) • Description (msdyn_description) • Input contract (msdyn_inputcontractid) • Is input collection (msdyn_isinputcollection) • ML model type (msdyn_mlmodeltype) • Name (msdyn_name) • Output contract (msdyn_outputcontractid) • Rule set definition (msdyn_rulesetdefinition) • Rule set type (msdyn_rulesettype) • Unique name (msdyn_uniquename)	Sample 1: Decision ruleset for all rouced records Sample 2: Decision ruleset for the incident entity Sample 3: Decision ruleset for the incident and task entities

2. Generate the schema and save it.

3. Export the data and generate the compressed (zip) file.

4. Extract the zip file, open the data.xml file present in the extracted folder, and perform the following operations:

   - In the source and target organizations, run the following OData API call and note the `msdyn_decisioncontractid`:

     ```
     https://<OrgURL>/api/data/v9.1/msdyn_decisioncontracts?
     $select=msdyn_decisioncontractid&$filter=msdyn_uniquename eq
     ```

`'msdyn_baseoutputcontractmasterentityroutingconfiguration'`

In data.xml file, replace all occurrences of the msdyn_decisioncontractid GUID in the source organization with the msdyn_decisioncontractid GUID of the target organization.

- In the source and target organizations, run the following OData API call and note the `msdyn_decisioncontractid`:

  `https://<OrgURL>/api/data/v9.1/msdyn_decisioncontracts?$select=msdyn_decisioncontractid&$filter=msdyn_uniquename eq 'msdyn_baseoutputcontractmasterentityroutingconfigurationunifiedrouting'`

  In data.xml file, replace all occurrences of the msdyn_decisioncontractid GUID in the source organization with the msdyn_decisioncontractid GUID of the target organization.

5. Package the extracted content again.
6. Use the Configuration Migration tool, select the option to import data, and then select the compressed file.

For sample schema to get all the required records, see Sample schema for intake rules for record routing.

FetchXML for decision contract entity for intake rules

Sample 1: Decision contract for all routed records

XML

```
<fetch distinct="true">
    <entity name="msdyn_decisioncontract">
        <filter type="or">
            <filter type="and">

        <link-entity name="msdyn_masterentityroutingconfiguration" from="msdyn_rulesetid"
to="msdyn_decisionrulesetid" link-type="inner" alias="cp">
            <filter type="and">
                <condition attribute="msdyn_entitylogicalname" operator="eq" value="incident" />
            </filter>
        </link-entity>
    </entity>
</fetch>
```

Sample 3: Decision ruleset for the incident and task entities

XML

```
<fetch distinct="true">
    <entity name="msdyn_decisionruleset">
        <link-entity name="msdyn_masterentityroutingconfiguration" from="msdyn_rulesetid"
to="msdyn_decisionrulesetid" link-type="inner" alias="cp">
            <filter type="and">
                <filter type="or">
                    <condition attribute="msdyn_entitylogicalname" operator="eq"
value="incident" />
                    <condition attribute="msdyn_entitylogicalname" operator="eq" value="task" />
                </filter>
            </filter>
        </link-entity>
    </entity>
</fetch>
```

FetchXML for entity routing configuration for intake rules

Sample 1: Master entity routing configuration for a routed records

XML

```
<fetch>
    <entity name="msdyn_masterentityroutingconfiguration">
        <filter type="and">
            <condition attribute="msdyn_entitylogicalname" operator="not-null" />
        </filter>
    </entity>
</fetch>
```

Sample 2: Master entity routing configuration for the incident entity

XML

```
<fetch>
    <entity name="msdyn_masterentityroutingconfiguration">
        <filter type="and">
            <condition attribute="msdyn_entitylogicalname" operator="eq" value="incident" />
        </filter>
    </entity>
</fetch>
```

Sample 3: Master entity routing configuration for the incident and task entities

XML

```
<fetch>
    <entity name="msdyn_masterentityroutingconfiguration">
        <filter type="and">
            <filter type="or">
                <condition attribute="msdyn_entitylogicalname" operator="eq" value="incident" />
                <condition attribute="msdyn_entitylogicalname" operator="eq" value="task" />
            </filter>
        </filter>
    </entity>
</fetch>
```

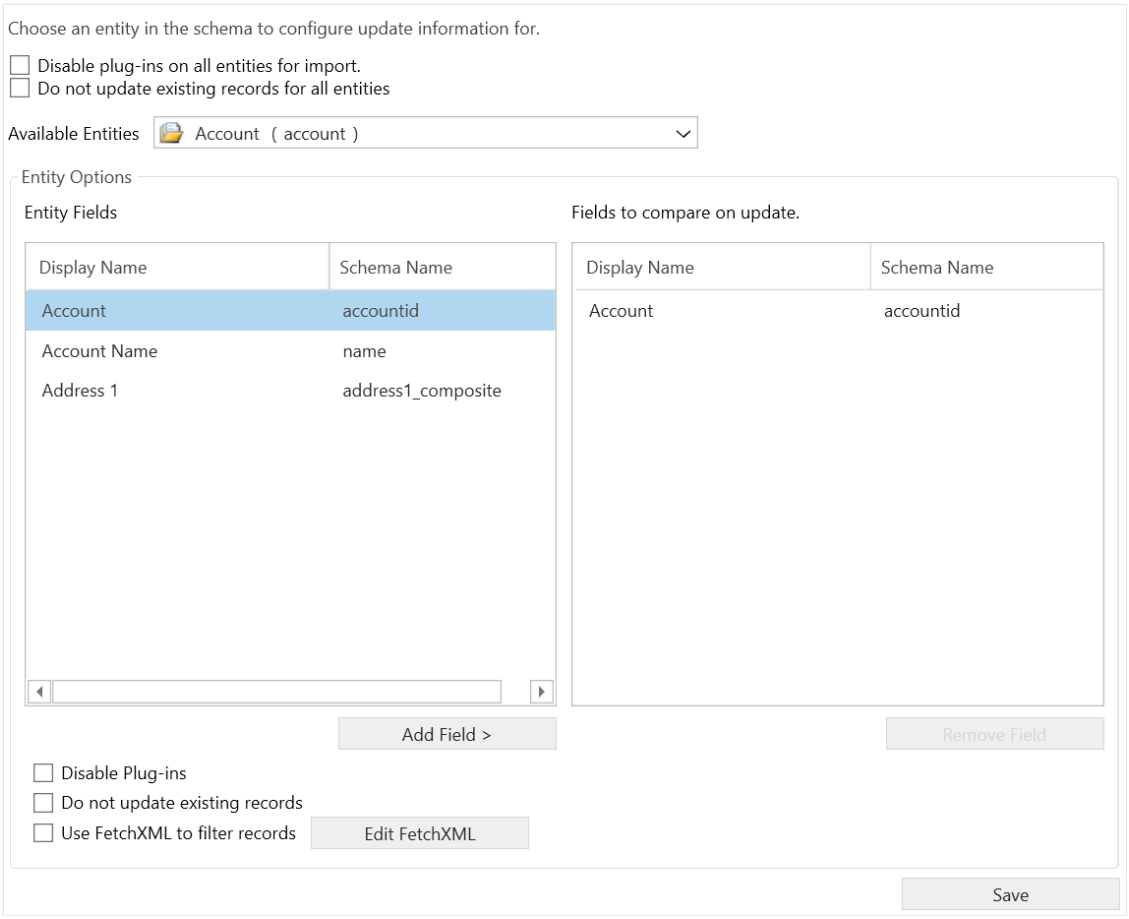
Migrate configuration for record workstreams

1. Use the Configuration Migration tool to create the schema and export data from the source organization for record workstreams.

    - **Entity display name**: When you create the schema, select the entities in the same sequence as mentioned in the table.
    - **Attribute display name**: We recommend that you select the attributes defined in the following table. You don't need to select the out-of-the-box system defined attributes like Created By, Created On, Modified By, Modified On, and Owner. You can select custom attributes, if necessary.
    - **Use FetchXML to filter records**: For each entity, use the appropriate FetchXML query that's mentioned in the following table to get single, multiple, or all records based on your requirement. For single or multiple records, you need to use source organization to get the correct name in uiname and GUID in value. If required, you can use the **ADVANCED FIND** menu item to construct the appropriate FetchXML query.
    - **Configure import settings**:

        - For the Decision contract entity, ensure that you select the **Do not update existing records** checkbox.

        - For every entity, including the Decision contract entity, ensure that you select the primary key field of the entity to be used as a field to compare on update. An example for Account is as follows.



> **Note**
>
> The sample query listed in the following table gets single or multiple records. The query has considered the entity as incident and task. Based on your requirements, ensure that you update the entity logical name in the FetchXML query.

Make sure that the workstreams that're referred in the intake rules exist in the target organization or are present as part of the current migration.

The following table summarizes the entities and corresponding FetchXML samples.

S.No.	Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records
1.	Workstream (msdyn_liveworkstream)	• Allow Automated Messages (msdyn_enableautomatedmessages) • Allowed Presences (msdyn_allowedpresences) • Assign WorkItem After Decline or Timeout (msdyn_assignworkitemafterdecline) • Auto-close after inactivity (msdyn_autocloseafterinactivity) • Block capacity for wrap up state (msdyn_blockcapacityforwrapup) • Bot queue (msdyn_bot_queue) • Bot rule (msdyn_bot_rule) • Bot user (msdyn_bot_user) • Capacity (msdyn_capacityrequired) • Capacity format (msdyn_capacityformat) • Channel (msdyn_streamsource)	Sample 1: All record workstreams Sample 2: Single record workstream Sample 3: Multiple record workstreams

S.No.	Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records
		• Contract Id (msdyn_routingcontractid) • Default (msdyn_sessiontemplate_default) • Default Queue (msdyn_defaultqueue) • Direction (msdyn_direction) • Enable selecting from push-based work streams (msdyn_enableselectingfrompushbasedworkstreams) • Entity (msdyn_masterentityroutingconfigurationid) • FallBack Language (msdyn_fallbacklanguage) • Follow-up after waiting (msdyn_followupafterwaiting) • Handling Time Threshold (msdyn_handlingtimethreshold) • Incoming authenticated (msdyn_notificationtemplate_incoming_auth) • Is Default (msdyn_isdefault) • Keep same agent for entire conversation (msdyn_enableagentaffinity) • Matching Logic (msdyn_matchinglogic) • Max Concurrency (msdyn_maxconcurrentconnection) • Mode (msdyn_mode) • Name (msdyn_name) • Notification (msdyn_notification) • Outbound queue (msdyn_outboundqueueid) • Record Identification Rule (msdyn_recordidentificationrule) • Record Identification Validation Rule (msdyn_recordidentificationvalidationrule) • Screen pop timeout (msdyn_screenpoptimeout) • Screen pop timeout (msdyn_screenpoptimeout_optionSet) • Skill Attachment Rules Count (msdyn_skillattachmentrulescount) • Skill Attachment Rules Count (Last Updated On) (msdyn_skillattachmentrulescount_date) • Skill Attachment Rules Count (State) (msdyn_skillattachmentrulescount_state) • Waiting Time Threshold (msdyn_waitingtimethreshold) • Work Distribution Mode (msdyn_workdistributionmode) • Work Stream (msdyn_liveworkstreamid)	
2.	Decision contract (msdyn_decisioncontract)	• Contract definition (msdyn_contractdefinition) • Decision contract (msdyn_decisioncontractid) • Name (msdyn_name) • Unique name (msdyn_uniquename)	Sample 1: Decision contract for all record workstreams Sample 2: Decision contract for a single record workstream of type = incident

S.No.	Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records
			Sample 3: Decision contract for multiple record workstreams of type = incident and type = task
3.	Decision rule set (msdyn_decisionruleset)	• AI builder model (msdyn_aibmodelid) • Authoring mode (msdyn_authoringmode) • Decision rule set (msdyn_decisionrulesetid) • Description (msdyn_description) • Input contract (msdyn_inputcontractid) • Is input collection (msdyn_isinputcollection) • ML model type (msdyn_mlmodeltype) • Name (msdyn_name) • Output contract (msdyn_outputcontractid) • Rule set definition (msdyn_rulesetdefinition) • Rule set type (msdyn_rulesettype) • Unique name (msdyn_uniquename)	Sample 1: Decision ruleset for all record workstreams Sample 2: Decision ruleset for a single record workstream of type = incident Sample 3: Decision ruleset for multiple record workstreams type = incident and type = task
4.	Routing configuration (msdyn_routingconfiguration)	• Is active configuration (msdyn_isactiveconfiguration) • Name (msdyn_name) • Routing configuration (msdyn_routingconfigurationid) • Unique name (msdyn_uniquename) • Workstream (msdyn_liveworkstreamid)	Sample 1: Routing configuration for all record workstreams Sample 2: Routing configuration for a single record workstream Sample 3: Routing configuration for multiple record

S.No.	Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records
			workstreams
5.	Routing configuration step (msdyn_routingconfigurationstep)	• Name (msdyn_name) • Routing configuration (msdyn_routingconfigurationid) • Routing configuration step (msdyn_routingconfigurationstepid) • Rule set (msdyn_rulesetid) • Step order (msdyn_steporder) • Step type (msdyn_type) • Unique name (msdyn_uniquename)	Sample 1: Routing configuration step for all record workstreams Sample 2: Routing configuration step for a single record workstream Sample 3: Routing configuration step for multiple record workstreams
6.	Workstream capacity profile (msdyn_liveworkstreamcapacityprofile)	• Capacity Profile (msdyn_capacityprofile_id) • Name (msdyn_name) • Workstream (msdyn_workstream_id) • Workstream Capacity profile (msdyn_liveworkstreamcapacityprofileid)	Sample 1: Workstream capacity profile for all record workstreams Sample 2: Workstream capacity profile for a single record workstream Sample 3: Workstream capacity profile for multiple record workstreams

2. Generate the schema and save it.

3. Export the data and generate the compressed (zip) file.

4. Extract the zip file, open the data.xml file present in the extracted folder, and perform the following operations:

- In the source and target organizations, run the following OData API call and note the `msdyn_decisioncontractid`.

  `https://<OrgURL>/api/data/v9.1/msdyn_decisioncontracts?$select=msdyn_decisioncontractid&$filter=msdyn_uniquename eq 'msdyn_baseoutputcontractmasterentityroutingconfiguration'`

  In data.xml file, replace all occurrences of the msdyn_decisioncontractid GUID in the source organization with the msdyn_decisioncontractid GUID of the target organization.

- In the source and target organizations, run the following OData API call and note the `msdyn_decisioncontractid`.

  `https://<OrgURL>/api/data/v9.1/msdyn_decisioncontracts?$select=msdyn_decisioncontractid&$filter=msdyn_uniquename eq 'msdyn_baseoutputcontractmasterentityroutingconfigurationunifiedrouting'`

  In data.xml file, replace all occurrences of the msdyn_decisioncontractid GUID in the source organization with the msdyn_decisioncontractid GUID of the target organization.

- In the source and target organizations, run the following OData API call and note the `msdyn_decisioncontractid`.

  `https://<OrgURL>/api/data/v9.1/msdyn_decisioncontracts?$select=msdyn_decisioncontractid&$filter=msdyn_uniquename eq 'msdyn_demandqueueidentificationoutput'`

  In data.xml file, replace all occurrences of the msdyn_decisioncontractid GUID in the source organization with the msdyn_decisioncontractid GUID of the target organization.

5. Package the extracted content again.
6. Use the Configuration Migration tool, select the option to import data, and select the compressed file.
7. After the import completes successfully, run the import again to ensure references are updated correctly that might have been overridden by the "on create" processes.

For sample schema to get all the required records, see Sample schema for unified routing record workstream.

FetchXML for workstream entity

Sample 1: All record workstreams

XML

```
<fetch distinct="true">
    <entity name="msdyn_liveworkstream">
        <filter type="and">
            <condition attribute="msdyn_mode" operator="eq" value="717210001" />
            <condition attribute="msdyn_streamsource" operator="eq" value="192350000" />
        </filter>
    </entity>
</fetch>
```

Sample 2: Single record workstream

XML

```
<fetch>
    <entity name="msdyn_liveworkstream">
        <filter type="and">
            <condition attribute="msdyn_liveworkstreamid" operator="eq"
uiname="Test Record Workstream Case 1" uitype="msdyn_liveworkstream" value="{759255C7-7AC8-98E0-
7E3E-59A7F0312EFC}" />
        </filter>
    </entity>
</fetch>
```

Sample 3: Multiple record workstreams

XML

```
<fetch version="1.0" output-format="xml-platform" mapping="logical" distinct="false">
    <entity name="msdyn_liveworkstream">
        <filter type="and">

Verify migration of records

Article • 12/20/2022

After you've successfully migrated the configuration data related to unified routing from the source to target organization, do the following in your target organization:

1. Ensure that the unified routing configuration and rulesets are rendered properly as in the source organization.

2. If skills and rating values are used in unified routing rulesets, then you must manually link, associate, or create users, bookable resources, and bookable resources characteristics records.

3. If capacity profiles are used in rulesets and workstreams for unified routing, then you must manually link, associate, or create users, bookable resources, and bookable resources capacity profile records.

Troubleshoot migration of records

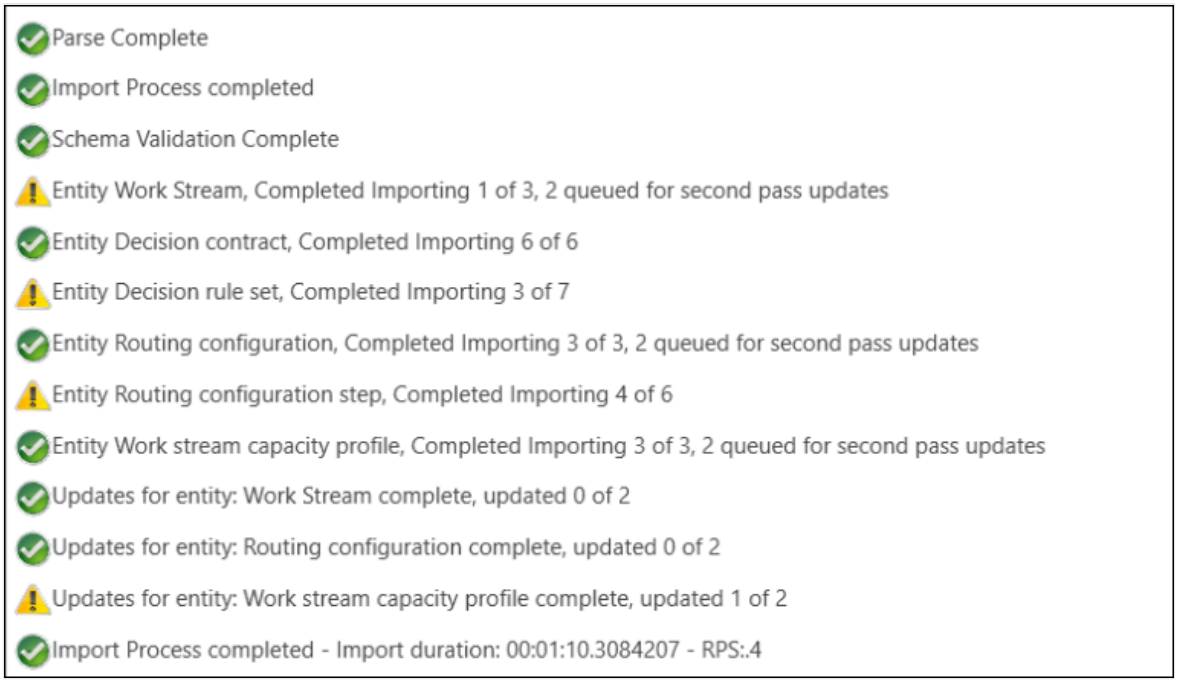
Article • 12/20/2022

To troubleshoot any issues that you might face during migration, check the log files as follows:

- When you import data into the target organization, if you see yellow warning symbols, then check the following logs in the Configuration Migration tool:
  - **Login_ErrorLog.log**: Provides information about any issues you had when you signed in to the organization using the Configuration Management tool.
  - **DataMigrationUtility.log**: Provides information about the tasks performed using the tool during the last migration.
  - **ImportDataDetail.log**: Provides information about the data imported by the tool in the last data import.

  More information: Troubleshoot configuration data migration issues using log files

- If the logs contain network errors, then repeat the import process.

  Here's an example:

```
Time: 11:46:09 PM
Error: There was no endpoint listening at
`https://www.contoso.com/XRMServices/2011/Organization.svc/web?
SDKClientVersion=9.2.46.5279` that could accept the message. This is
often caused by an incorrect address or SOAP action. See
```

```
InnerException, if present, for more details.
Stack Trace: Service stack trace:
```

Revert unmanaged records

If you see a difference in the migrated records between the source and target organizations, then you must delete the unmanaged entity records and repeat the migration process. In the target organization, perform the following steps:

1. For queues, revert the entities in the reverse order of the serial number (**S.No** column) that's listed in the migration article at Migrate configuration for record queues. Migrate the entities in this order:
   a. Assignment Configuration Step
   b. Assignment Configuration
   c. Decision ruleset
   d. Decision contract
   e. Queue

2. For workstreams, revert the entities in the reverse order of their serial number (**S.No** column) that's listed in the migration article at Migrate configuration for record workstreams. Migrate the entities in this order:
   a. Workstream capacity profile
   b. Routing configuration step
   c. Routing configuration
   d. Decision ruleset
   e. Decision contract
   f. Workstream

   For intake rules, revert the entities in the reverse order of their serial number (**S.No** column) that's listed in the migration article at Migrate configuration for intake rules. Migrate the entities in this order:
   a. Master Entity Routing Configuration
   b. Decision ruleset
   c. Decision contract

Next steps

1. Migrate queues
2. Migrate intake rules
3. Migrate workstreams

Migrate data for the live chat channel

Article • 09/18/2023

Use the Configuration Migration tool to migrate the configurations from the source organization to the target organization for live chat.

For information on how to use the Configuration Migration tool, see the following articles:

- Download Configuration Migration tool
- How the Configuration Migration tool works

Prerequisites

The following prerequisites must be met:

- In the source organization, if a unified routing ruleset refers to the following, then ensure that they exist in the target organization before you proceed with the migration:
  - Custom entities
  - Attributes
  - Relationships
  - Option sets
  - Lookup values
- Ensure that the user who performs the migration has the required privileges on the following unified routing entities in the source and target organizations:
  - Workstream (`msdyn_liveworkstream`)
  - Channel configuration (`msdyn_omnichannelconfiguration`)
  - Operating hours (`msdyn_operatinghour`)
  - Characteristic (`characteristic`)
  - Rating Model (`rating model`)
  - Rating Value (`ratingvalue`)
  - Capacity Profile (`msdyn_capacityprofile`)
  - Queue (`queue`)
  - Decision contract (`msdyn_decisioncontract`)
  - Decision ruleset (`msdyn_decisionruleset`)
  - Assignment configuration (`msdyn_assignmentconfiguration`)
  - Assignment configuration Step (`msdyn_assignmentconfigurationstep`)
  - Routing configuration (`msdyn_routingconfiguration`)
  - Routing configuration step (`msdyn_routingconfigurationstep`)
  - Workstream capacity profile (`msdyn_liveworkstreamcapacityprofile`)
  - Context variable (`msdyn_ocliveworkstreamcontextvariable`)
  - Survey question (`msdyn_surveyquestions`)
  - Survey question sequence (`msdyn_questionsequence`)
  - Survey answer option (`msdyn_chatansweroption`)
  - Quick replies (`msdyn_cannedmessages`)
  - Tags (`msdyn_octags`)

> **Important**
>
> The migration of the account, channel, bot configuration, and AI and analytics settings is not in scope.

Migrate live chat configuration

You must perform the steps in the order they're listed to migrate your configuration data successfully. Use the information in the tables and refer to the corresponding sample schemas for each configuration.

1. Migrate configuration using a solution
2. Migrate configuration for skill-based routing
3. Migrate configuration for capacity profiles
4. Migrate configuration for live chat queues
5. Migrate configuration for live chat workstreams
6. Migrate configuration for live chat widgets
7. Verify your migration
8. Troubleshoot migration of data

Migrate configuration using a solution

If you use custom session templates and notifications in your live chat routing setup, perform the steps outlined in Migrate configuration using a solution.

Migrate skill-based configuration

If skill-based routing rulesets are used in your unified routing setup, perform the steps outlined in Export and import data for skill-based routing. Make sure to adjust any filtering fetch xml appropriately for live chat.

Migrate configuration for capacity profiles

If you have configured capacity profiles in your unified routing setup, perform the steps outlined in Export and import data for capacity profiles. Make sure to adjust any filtering fetch xml appropriately for live chat.

Migrate configuration for live chat queues

For migrating queues for live chat, perform the steps outlined in Migrate data for unified routing-based record queues. Make sure to adjust any filtering fetch xml appropriately for live chat.

Migrate configuration for live chat workstreams

1. Use the Configuration Migration tool to create the schema and migrate the data from the source organization for the record workstream.

    - **Entity display name**: When you create the schema, select the entities in the same sequence as mentioned in the table.
    - **Attribute display name**: We recommend that you select the attributes defined in the following table. You don't need to select the out-of-the-box system defined attributes like Created By, Created On, Modified By, Modified On, and Owner. You can select custom attributes, if necessary.
    - **Use FetchXML to filter records**: For each entity, use the appropriate FetchXML query that's mentioned in the following table to get single, multiple, or all records based on your requirement. For single or multiple records, you need to use source organization to get the correct name in uiname and GUID in value. If required, you can use the ADVANCED FIND menu item to construct the appropriate FetchXML query.
    - **Configure import settings**: For the Decision contract entity, ensure that you select the **Do not update existing records** checkbox.

2. Make sure that the workstreams that're referred in the configuration of the live chat widgets are include in the migration.

S.No.	Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records
1. 8.	Quick Reply (msdyn_cannedmessage)	• Locale (msdyn_locale_field) • Message (msdyn_message) • Organization Id (organizationid) • Quick reply (msdyn_cannedmessageid) • Status (statecode) • Status Reason (statuscode) • TagsControlField (msdyn_tagscontrolfield) • Title (msdyn_title)	
9.	Tag (msdyn_octag)	• Name (msdyn_name) • Tag (msdyn_octagid)	

3. Generate the schema and save it.
4. Export the data and generate the compressed (zip) file.
5. Use the Configuration Migration tool, select the option to import data, and select the compressed file.

> **Important**
>
> When you fetch decision rulesets (msdyn_decisionrulesets) containing context variables, some decision rulesets are created without the dependency mappings. To work around this, perform the following steps:
>
> 1. Import data for all entities including the decision ruleset entity (msdyn_decisionrulesets).
> 2. Import data for the decision ruleset entity again. This step ensures that all dependency mappings for the decision rulesets are imported.

For sample schema to get all the required records, see Sample schema for live chat workstream.

FetchXML for workstream entity

Sample 1: All live chat workstreams

XML

```
<fetch distinct="true">
    <entity name="msdyn_liveworkstream">
        <filter type="and">
            <condition attribute="msdyn_mode" operator="eq" value="717210001" />
            <condition attribute="msdyn_streamsource" operator="eq" value=" 192360000" />
        </filter>
```

```
    </entity>
</fetch>
```

Sample 2: Single live chat workstream

XML

```
<fetch>
    <entity name="msdyn_liveworkstream">
        <filter type="and">
            <condition attribute="msdyn_liveworkstreamid" operator="eq" uiname="Test Live
Chat Workstream 1" uitype="msdyn_liveworkstream" value="{759255C7-7AC8-98E0-7E3E-59A7F0312ABC}" />
        </filter>
    </entity>
</fetch>
```

Sample 3: Multiple live chat workstreams

XML

```
<fetch version="1.0" output-format="xml-platform" mapping="logical" distinct="false">
    <entity name="msdyn_liveworkstream">
        <filter type="and">
            <condition attribute="msdyn_liveworkstreamid" operator="in">
                <value uiname="Test Live Chat Workstream 1" uitype="msdyn_liveworkstream">{759255C7-7AC8-
98E0-7E3E-59A7F0312ABC}</value>
                <value uiname="Test Live Chat Workstream 2" uitype="msdyn_liveworkstream">{E6246229-33AC-
5A9E-2FFE-51668AD44098}</value>
            </condition>
        </filter>
    </entity>
</fetch>
```

FetchXML for context variables entity

Sample 1: All live chat workstreams context variables

XML

```
<fetch>
    <entity name="msdyn_ocliveworkstreamcontextvariable" >
        <link-entity name="msdyn_liveworkstream" from="msdyn_liveworkstreamid" to="msdyn_liveworkstreamid"
link-type="inner" alias="aa" >
            <filter type="and" >
                <condition attribute="msdyn_streamsource" operator="eq" value="192360000" />
                <condition attribute="msdyn_mode" operator="eq" value="717210001" />
            </filter>
        </link-entity>
    </entity>
</fetch>
```

Sample 2: Single live chat workstream context variables

XML

```
<fetch>
    <entity name="msdyn_ocliveworkstreamcontextvariable" >
        <filter type="and" >
            <condition attribute="msdyn_liveworkstreamid" operator="eq" uiname="Live Chat Workstream"
uitype="msdyn_liveworkstream" value="{D3A1F09D-51A0-A6B7-266D-58E1BDB97B53}" />
        </filter>

Migrate configuration for live chat widgets

The following assumptions are in place:

- Rules will be exported after chat configurations to be able to use pre-conversation survey questions as conversation context variables.
- You can't create the context variables when you're adding new questions to the pre-conversation survey section.
- Queues can be exported after live chat configurations and rules definition, to be able to use pre-conversation survey questions as context variables.
- The workstream must exist whether it was created manually or previously migrated to the destination organization.

To migrate data for live chat widgets

1. Use the Configuration Migration tool to create the schema and export data from the source organization for the live chat widget and related entities.
    - **Entity display name**: When you create the schema, select the entities in the sequence as mentioned in the table.
    - **Attribute display name**: We recommend that you select the attributes defined in the following table. You don't have to select the system-defined attributes, such as Created By, Created On, Modified By, Modified On, and Owner. You can select custom attributes if necessary.

S.No.	Entity display name (Logical name)	Attribute display name (Logical name)
1.	Chat widget (msdyn_livechatconfig)	FetchXML to filter records for live chat **Note:** - Replace the value for msdyn_liveworkstream in the condition section. - Don't include msdyn_widgetappid and msdyn_widgetsnippet as part of the entity. - Ensure as part of the entity declaration in the schema that the plugin is disabled. 		• Status (statecode) • Status Reason (statuscode)

2. Generate the schema and save it.
3. Export the data and generate the compressed (zip) file.
4. Use the Configuration Migration tool, select the option to import data, and then select the compressed file.

For sample schema to get all the required records, see Sample schema for live chat channel

FetchXML for live chat

XML

```
    <fetch version="1.0" mapping="logical" distinct="false">
    <entity name="msdyn_livechatconfig">
        <link-entity name="msdyn_liveworkstream" from="msdyn_liveworkstreamid" to="msdyn_liveworkstreamid"
link-type="inner" alias="ab">
            <filter type="and">
                <condition attribute="msdyn_liveworkstreamid" operator="eq" uiname="elopez-ws-lcw-m7"
uitype="msdyn_liveworkstream" value="{EBEE52BD-2EFD-99C5-C658-F13E7C7D3F8C}" />
            </filter>
        </link-entity>
    </entity>
</fetch>
```

Verify your migration

After you import the unified routing-related configuration data successfully from the source to target organization, perform the following steps in the target organization:

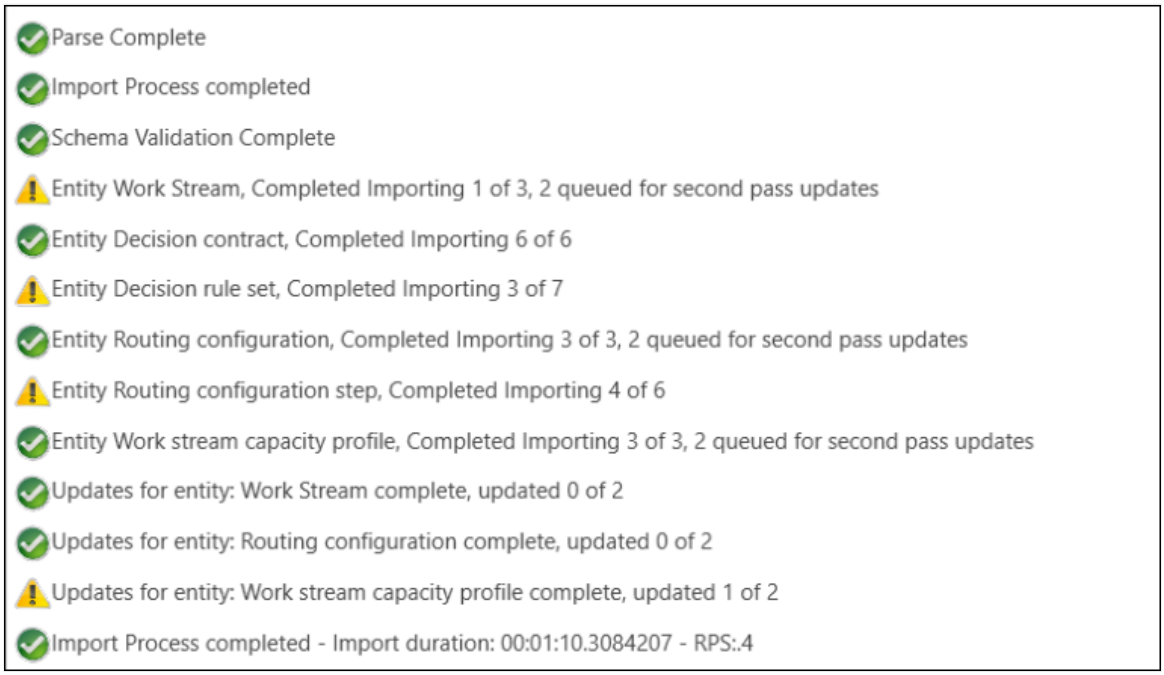
1. In the UI, make sure that the unified routing configuration and rulesets are rendered properly and don't display errors.
2. If skills and rating values are used in unified routing rulesets, then you need to manually link, associate, or create the users, bookable resources, and bookable resources characteristics records.
3. If capacity profiles are used in rulesets and workstreams for unified routing, then you need to manually link, associate, or create the users, bookable resources, and bookable resources capacity profile records.

Considerations for export and import of data

To troubleshoot any issues that you might face during migration, check the log files as follows:

- When you import data into the target organization, if you see yellow warning symbols, then check the following logs in the Configuration Migration tool:
  - **Login_ErrorLog.log**: Provides information about any issues you had when you signed in to the organization using the Configuration Management tool.
  - **DataMigrationUtility.log**: Provides information about the tasks performed using the tool during the last migration.
  - **ImportDataDetail.log**: Provides information about the data imported by the tool in the last data import.

  More information: Troubleshoot configuration data migration issues using log files



- If the logs contain network errors, then repeat the import process.

  Here's an example:

```
Time: 11:46:09 PM
Error: There was no endpoint listening at
`https://www.contoso.com/XRMServices/2011/Organization.svc/web?SDKClientVersion=9.2.46.5279` that
could accept the message. This is often caused by an incorrect address or SOAP action. See
InnerException, if present, for more details.
Stack Trace: Service stack trace:
```

Migrate configuration for records based on unified routing

Migrate data for the voice channel

Article • 09/18/2023

Use the Configuration Migration tool to migrate the configurations from the source organization to the target organization for the voice channel. For information on how to use the Configuration Migration tool, see the following articles:

- Download Configuration Migration tool
- How the Configuration Migration tool works

Prerequisites

The following prerequisites must be met:

- In the source organization, if a unified routing ruleset refers to the following, then ensure that they exist in the target organization before you proceed with the migration:
  - Custom entities
  - Attributes
  - Relationships
  - Option sets
  - Lookup values
- Ensure that the user who performs the migration has the required privileges on the following unified routing entities in the source and target organizations:
  - Workstream (`msdyn_liveworkstream`)
  - Channel configuration (`msdyn_omnichannelconfiguration`)
  - Notification template (`msdyn_notificationtemplate`)
  - Session template (`msdyn_sessiontemplate`)
  - Operating hours (`msdyn_operatinghour`)
  - Characteristic (`characteristic`)
  - Rating Model (`rating model`)
  - Rating Value (`ratingvalue`)
  - Capacity Profile (`msdyn_capacityprofile`)
  - Queue (`queue`)
  - Decision contract (`msdyn_decisioncontract`)
  - Decision ruleset (`msdyn_decisionruleset`)
  - Assignment configuration (`msdyn_assignmentconfiguration`)
  - Assignment configuration Step (`msdyn_assignmentconfigurationstep`)
  - Routing configuration (`msdyn_routingconfiguration`)
  - Routing configuration step (`msdyn_routingconfigurationstep`)
  - Workstream capacity profile (`msdyn_liveworkstreamcapacityprofile`)
  - Context variable (`msdyn_ocliveworkstreamcontextvariable`)

> **Important**
>
> The migration of the account, channel, Azure Communication Services phone number acquisition, phone number configuration, bot configuration, and AI and analytics settings is not in scope.

Migrate the voice channel configuration

You must perform the steps in the order they're listed to migrate your configuration data successfully. Use the information in the tables and refer to the corresponding sample schemas for each configuration.

1. Migrate configuration using a solution
2. Export and import configuration for skill-based routing
3. Export and import configuration for capacity profiles
4. Export and import configuration for voice channel queues
5. Export and import configuration for voice channel workstreams
6. Migrate configuration for voice channels
7. Verify your migration
8. Troubleshoot export and import of data

Migrate configuration using a solution

If you use custom session templates and notifications in your voice routing setup, perform the steps outlined in Migrate configuration using a solution

Migrate skill-based configuration

If skill-based routing rulesets are used in your unified routing setup, perform the steps outlined in Migrate data for skill-based routing. Make sure to adjust any filtering fetch xml appropriately for voice.

Migrate configuration capacity profiles

If you have configured capacity profiles in your voice routing setup, perform the steps outlined in Export and import data for capacity profiles.

Migrate configuration for voice channel queues

For exporting and importing queues for the voice channel, perform the steps outlined in Migrate data for unified routing-based record queues.

Migrate configuration for voice channel workstreams

1. Use the Configuration Migration tool to create the schema and export data from the source organization for voice workstreams.

    - **Entity display name**: When you create the schema, select the entities in the same sequence as mentioned in the table.
    - **Attribute display name**: We recommend that you select the attributes defined in the following table. You don't need to select the out-of-the-box system defined attributes like Created By, Created On, Modified By, Modified On, and Owner. You can select custom attributes, if necessary.
    - **Use FetchXML to filter records**: For each entity, use the appropriate FetchXML query that's mentioned in the following table to get single, multiple, or all records based on your requirement. For single or multiple records, you need to use source organization to get the correct name in uiname and GUID in value. If required, you can use the **ADVANCED FIND** menu item to construct the appropriate FetchXML query.
    - **Configure import settings**: For the Decision contract entity, ensure that you select the **Do not update existing records** checkbox.

2. Ensure that the workstreams that are referred in the configuration of the voice channels are included in the migration.

			profile for a single voice workstream Sample 3: Workstream capacity profile for multiple voice workstreams

3. Generate the schema and save it.
4. Export the data and generate the compressed (zip) file.
5. Use the Configuration Migration tool, and select the option to import data, and select the compressed file.

> **Important**
>
> When you fetch decision rulesets (msdyn_decisionrulesets) containing context variables, some decision rulesets are created without the dependency mappings. To work around this, perform the following steps:
>
> 1. Import data for all entities including the decision ruleset entity (msdyn_decisionrulesets).
> 2. Import data for the decision ruleset entity again. This step ensures that all dependency mappings for the decision rulesets are imported.

For sample schema to get all the required records, see Sample schema for voice workstream.

FetchXML for workstream entity

Sample 1: All voice workstreams

XML

```
<fetch distinct="true">
  <entity name="msdyn_liveworkstream">
    <filter type="and">
      <condition attribute="msdyn_mode" operator="eq" value="717210001" />
      <condition attribute="msdyn_streamsource" operator="eq" value="192440000" />
    </filter>
  </entity>
</fetch>
```

Sample 2: Single voice workstream

XML

```
<fetch>
  <entity name="msdyn_liveworkstream">
    <filter type="and">
      <condition attribute="msdyn_liveworkstreamid" operator="eq" uiname="Test Voice Workstream 1"
uitype="msdyn_liveworkstream" value="{759255C7-7AC8-98E0-7E3E-59A7F0312ABC}" />
    </filter>
  </entity>
</fetch>
```

Sample 3: Multiple voice workstreams

XML

```
<fetch version="1.0" output-format="xml-platform" mapping="logical" distinct="false">
  <entity name="msdyn_liveworkstream">
    <filter type="and">
      <condition attribute="msdyn_liveworkstreamid" operator="in">
        <value uiname="Test Voice Workstream 1" uitype="msdyn_liveworkstream">{759255C7-7AC8-98E0-7E3E-
59A7F0312ABC}</value>
        <value uiname="Test Voice Workstream 2" uitype="msdyn_liveworkstream">{E6246229-33AC-5A9E-2FFE-
51668AD44098}</value>
      </condition>
    </filter>
  </entity>
</fetch>
```

FetchXML for context variables entity

Sample 1: All voice workstreams context variables

XML

```
<fetch>
    <entity name="msdyn_ocliveworkstreamcontextvariable" >
        <link-entity name="msdyn_liveworkstream" from="msdyn_liveworkstreamid" to="msdyn_liveworkstreamid"
link-type="inner" alias="aa" >
            <filter type="and" >
                <condition attribute="msdyn_streamsource" operator="eq" value="192440000" />
                <condition attribute="msdyn_mode" operator="eq" value="717210001" />
            </filter>
        </link-entity>
    </entity>
</fetch>
```

Sample 2: Single voice workstream context variables

XML

```
<fetch>
    <entity name="msdyn_ocliveworkstreamcontextvariable" >
        <filter type="and" >
            <condition attribute="msdyn_liveworkstreamid" operator="eq" uiname="Voice Workstream"
uitype="msdyn_liveworkstream" value="{D3A1F09D-51A0-A6B7-266D-58E1BDB97B53}" />
        </filter>
    </entity>
</fetch>
```

Sample 3: Multiple voice workstreams context variables

XML

```
<fetch>
    <entity name="msdyn_ocliveworkstreamcontextvariable" ><a name="BKMK3vwcv"></a>
        <filter type="or" >
            <condition attribute="msdyn_liveworkstreamid" operator="eq" uiname="Voice Workstream"

  </entity>
</fetch>
```

Migrate configuration for voice channel settings

Assume that the workstream must already exist; created manually or previously migrated in the destination organization.

To migrate data for voice channel

1. Use the Configuration Migration tool to create the schema and export data from the source organization for the voice channel and related entities.

   - **Entity display name**: When you create the schema, select the entities in the sequence that's mentioned in the table.
   - **Attribute display name**: We recommend that you select the attributes defined in the following table. You don't have to select the system-defined attributes, such as Created By, Created On, Modified By, Modified On, and Owner. You can select custom attributes if necessary.

S.No.	Entity display name (Logical name)	Attribute display name (Logical name)
1.	Voice Channel Setting (msdyn_ocvoicechannelsetting)	FetchXML to filter records for voice channel settings **Note:** - Replace the value for msdyn_liveworkstream in the condition section. - Don't include Phone Number (msdyn_phonenumberid) column as records in Phone Number table are environment-specific and can't be migrated. You need to assign phone number manually in destination environment. If you aren't allowed to perform this action for any reason, you can include Phone Number column. But, before you import, you need to manually edit data.xml file inside the exported zip file and replace its value with the correct phone number GUID in the destination environment. - Ensure as part of the entity declaration in the schema that the plugin is enabled. (disableplugins="false") • Announce average wait time (msdyn_announceaveragewaittime) • Announce position in queue (msdyn_announcepositioninqueue) • Enable agent control of the recording (msdyn_agentrecordingcontrolsenabled) • Enable agent control of the transcription (msdyn_agenttranscriptioncontrolsenabled) • Enable agent control to add an external participant (msdyn_agentexternalparticipantcontrolenabled) • Enable agent control to add an external participant (msdyn_agentexternalparticipantcontrolenabled) • Enable agent control to add an external participant on Teams (msdyn_agentexternalteamsparticipantcontrolenabled) • Name (msdyn_name) • Operating hours (msdyn_operatinghoursid) • Recording Enabled (msdyn_recordingenabled) • Recording mode (msdyn_recordingmode) • Status (statecode) • Status Reason (statuscode) • Transcription Enabled (msdyn_transcriptionenabled) • Transcription mode (msdyn_transcriptionmode) • Voice Channel Setting (msdyn_voicechannelsettingid) • Work stream (msdyn_liveworkstreamid)
2.	Localization (msdyn_oclocalizationdata)	FetchXML to filter records for voice channel localizations • Automated message (msdyn_systemmessageid) • Default Localized Text (msdyn_defaultlocalizedtext) • Entity Column Name (msdyn_entitycolumnname) • Entity Name (msdyn_entityname) • Entity Record ID (msdyn_entityrecordid) • Is Default (msdyn_isdefault) • Language Code (msdyn_customerlanguageid) • Language Code (msdyn_languagecode) • Localization (msdyn_oclocalizationdataid) • Localized text (msdyn_localizedtext) • Organization ID (organizationid) • Status (statecode) • Status Reason (statuscode)
3.	Message (msdyn_ocsystemmessage)	• Channel (msdyn_streamsource)

S.No.	Entity display name (Logical name)	Attribute display name (Logical name)
		• Default language (msdyn_defaultlanguage) • Instance ID (msdyn_instanceid) • Message (msdyn_ocsystemmessageid) • Message description (msdyn_messagedescription) • Message recipient (msdyn_messagereceiver) • Message template trigger (msdyn_messagetemplatetrigger) • Message Text (msdyn_messagetext) • Message trigger (msdyn_systemmessageeventtype) • Message type (msdyn_messagetype) • Name (msdyn_name) • Organization ID (organizationid) • Status (statecode) • Status Reason (statuscode)
4.	Voice (msdyn_ocvoice)	• Language (msdyn_languageid) • Name (msdyn_name) • pitch (msdyn_pitch) • speaking speed (msdyn_speakingspeed) • Status (statecode) • Status Reason (statuscode) • voice (msdyn_ocvoiceid) • voice name (msdyn_voicename) • voice style (msdyn_voicestyle)
5.	Voice Channel Language Setting (msdyn_ocvoicechannellanguagesetting)	**Note:** - Before migrating this table, make sure Survey bot systemuser (msdyn_surveybotsystemuserid) exists in User (systemuser) table, and all music files referenced by Hold music (msdyn_holdmusicid) and Wait music (msdyn_waitmusicid) columns in each record already exist in the Phone Music (msdyn_ocphonemusic) table of destination environment. Unfortunately, Phone Music table has file columns and can't be migrated. • Hold music (msdyn_holdmusicid) • Is Primary (msdyn_isprimary) • Language (msdyn_languageid) • Name (msdyn_name) • Status (statecode) • Status Reason (statuscode) • Survey bot systemuser (msdyn_surveybotsystemuserid) • Voice (msdyn_ocvoiceid) • Voice Channel Language Setting (msdyn_ocvoicechannellanguagesettingid) • Voice channel setting (msdyn_ocvoicechannelsettingid) • Wait music (msdyn_waitmusicid)
6.	Provisioning State (msdyn_ocprovisioningstate)	FetchXML to filter records for voice provisioning states • voicechannelsettingsid (msdyn_ocvoicechannelsettingsid) • Name (msdyn_name)

2. Generate the schema and save it.

3. Export the data and generate the compressed (zip) file.

4. Use the Configuration Migration tool, select the option to import data, and then select the compressed file.

For sample schema to get all the required records, see Sample schema for voice channel.

FetchXML for voice provisioning state

XML

```
<fetch>
  <entity name="msdyn_ocprovisioningstate">
    <link-entity name="msdyn_ocvoicechannelsetting" from="msdyn_ocvoicechannelsettingid"
to="msdyn_voicechannelsettingid" link-type="inner" alias="ac">
      <link-entity name="msdyn_liveworkstream" from="msdyn_liveworkstreamid" to="msdyn_liveworkstreamid"
link-type="inner" alias="ad">
        <filter type="and">
          <condition attribute="msdyn_liveworkstreamid" operator="eq" uiname="Test Voice Workstream 1"
uitype="msdyn_liveworkstream" value="{759255C7-7AC8-98E0-7E3E-59A7F0312ABC}" />
        </filter>
      </link-entity>
    </link-entity>
  </entity>
</fetch>
```

Verify your migration

After you import the unified routing-related configuration data successfully from the source to target organization, perform the following steps in the target organization:

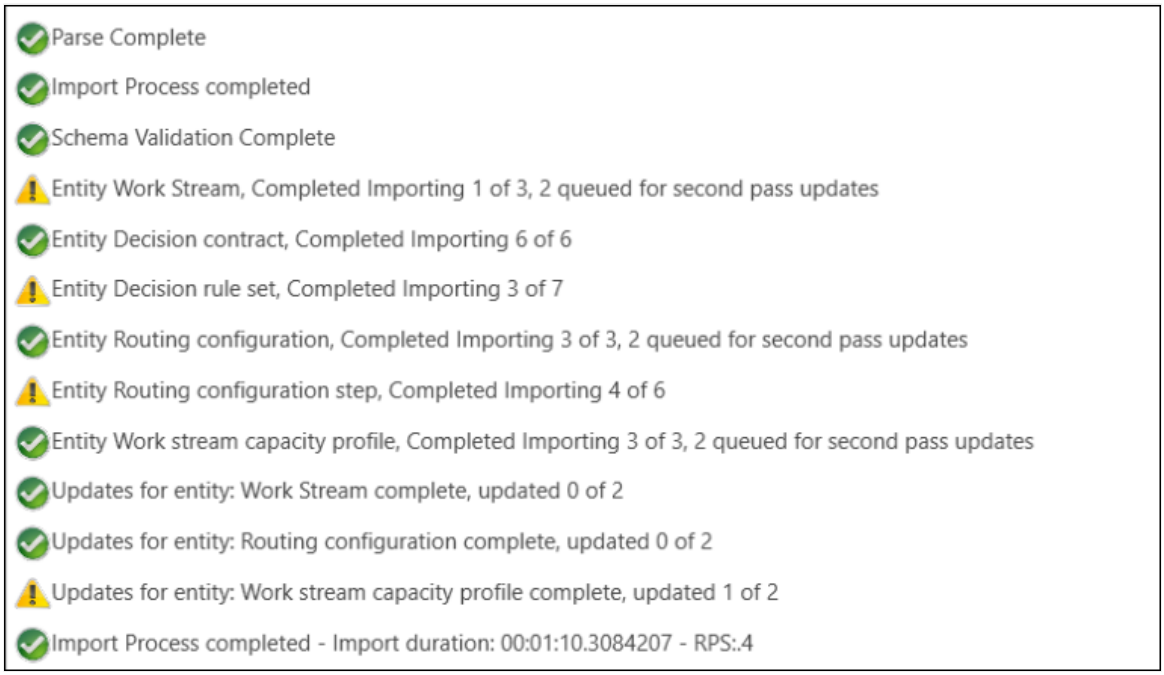
1. In the UI, make sure that the voice channel configuration and rulesets are rendered properly and don't display errors.
2. If skills and rating values are used in unified routing rulesets, then you need to manually link, associate, or create the users, bookable resources, and bookable resources characteristics records.
3. If capacity profiles are used in rulesets and workstreams for unified routing, then you need to manually link, associate, or create the users, bookable resources, and bookable resources capacity profile records.

Considerations for export and import of data

To troubleshoot any issues that you might face during migration, check the log files as follows:

- When you import data into the target organization, if you see yellow warning symbols, then check the following logs in the Configuration Migration tool:
  - **Login_ErrorLog.log**: Provides information about any issues you had when you signed in to the organization using the Configuration Management tool.
  - **DataMigrationUtility.log**: Provides information about the tasks performed using the tool during the last migration.
  - **ImportDataDetail.log**: Provides information about the data imported by the tool in the last data import.

  More information: Troubleshoot configuration data migration issues using log files



- If the logs contain network errors, then repeat the import process.

  Here's an example:

```
Time: 11:46:09 PM
Error: There was no endpoint listening at
`https://www.contoso.com/XRMServices/2011/Organization.svc/web?SDKClientVersion=9.2.46.5279` that
could accept the message. This is often caused by an incorrect address or SOAP action. See
InnerException, if present, for more details.
Stack Trace: Service stack trace:
```

Migrate configuration data for SMS channel

Article • 09/18/2023

Use the Configuration Migration tool to migrate the configurations from the source organization to the target organization for SMS.

For information on how to use the Configuration Migration tool, see the following articles:

- Download Configuration Migration tool
- How the Configuration Migration tool works

Prerequisites

The following prerequisites must be met:

- In the source environment, if a unified routing ruleset refers to the following, then ensure that they exist in the target organization before you proceed with the migration:
  - Custom entities
  - Attributes
  - Relationships
  - Option sets
  - Lookup values
- Ensure that the user who performs the migration has the required privileges on the following unified routing entities in the source and target environments:
  - Workstream (`msdyn_liveworkstream`)
  - Channel configuration (`msdyn_omnichannelconfiguration`)
  - Operating hours (`msdyn_operatinghour`)
  - Characteristic (`characteristic`)
  - Rating Model (`rating model`)
  - Rating Value (`ratingvalue`)
  - Capacity Profile (`msdyn_capacityprofile`)
  - Queue (`queue`)
  - Decision contract (`msdyn_decisioncontract`)
  - Decision ruleset (`msdyn_decisionruleset`)
  - Assignment configuration (`msdyn_assignmentconfiguration`)
  - Assignment configuration Step (`msdyn_assignmentconfigurationstep`)
  - Routing configuration (`msdyn_routingconfiguration`)
  - Routing configuration step (`msdyn_routingconfigurationstep`)
  - Workstream capacity profile (`msdyn_liveworkstreamcapacityprofile`)
  - Context variable (`msdyn_ocliveworkstreamcontextvariable`)
  - Quick replies (`msdyn_cannedmessages`)
  - Tags (`msdyn_octags`)

> **Important**
>
> The migration of the account, channel provider, phone number, bot configuration, and AI and analytics settings is not in scope.

Migrate SMS configuration

You must perform the steps in the order they're listed to migrate your configuration data successfully. Use the information in the tables and refer to the corresponding sample schemas for each configuration.

1. Migrate configuration using a solution
2. Migrate configuration for skill-based routing
3. Migrate configuration for capacity profiles
4. Migrate configuration for SMS queues
5. Migrate configuration for SMS workstreams
6. Migrate configuration for SMS channels
7. Verify your migration
8. Troubleshoot migration of data

Migrate configuration using a solution

If you use custom session templates and notifications in your SMS routing setup, perform the steps outlined in Migrate configuration using a solution.

Migrate skill-based configuration

If skill-based routing rulesets are used in your SMS routing setup, perform the steps outlined in Export and import data for skill-based routing. Make sure to adjust any filtering fetch xml appropriately for SMS.

Migrate configuration for capacity profiles

If you have configured capacity profiles in your SMS routing setup, perform the steps outlined in Export and import data for capacity profiles. Make sure to adjust any filtering fetch xml appropriately for SMS.

Migrate configuration for SMS queues

For migrating queues for SMS, perform the steps outlined in Migrate data for unified routing-based record queues. Make sure to adjust any filtering fetch xml appropriately for SMS.

Migrate configuration for SMS workstreams

1. Use the Configuration Migration tool to create the schema and export data from the source organization for SMS workstreams.

    - **Entity display name**: When you create the schema, select the entities in the same sequence as mentioned in the table.
    - **Attribute display name**: We recommend that you select the attributes defined in the following table. You don't need to select the out-of-the-box system defined attributes like Created By, Created On, Modified By, Modified On, and Owner. You can select custom attributes, if necessary.
    - **Use FetchXML to filter records**: For each entity, use the appropriate FetchXML query that's mentioned in the following table to get single, multiple, or all records based on your requirement. For single or multiple records, you need to use source organization to get the correct name in uiname and GUID in value. If required, you can use the **ADVANCED FIND** menu item to construct the appropriate FetchXML query.
    - **Configure import settings**: For the Decision contract entity, ensure that you select the **Do not update existing records** checkbox.

2. Ensure that the workstreams that are referred in the configuration of the SMS channels are included in the migration.

S.No.	Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records
1.	Workstream (msdyn_liveworkstream)	• API Key (msdyn_apikey) • API Key Version Number (msdyn_apikeyversionnumber) • Allow Automated Messages (msdyn_enableautomatedmessages) Allowed Presences (msdyn_allowedpresences) • Assign WorkItem After Decline or Timeout (msdyn_assignworkitemafterdecline) • Auto-close after inactivity (msdyn_autocloseafterinactivity) • Block capacity for wrap up state (msdyn_blockcapacityforwrapup) • Bot queue (msdyn_bot_queue) • Bot rule (msdyn_bot_rule) • Bot user (msdyn_bot_user) • CallbackPreviewDialing (msdyn_notificationtemplate_callback_previewdialing) • Connectors (msdyn_connectorsurl) • Consult (msdyn_notificationtemplate_consult) • Conversation mode of chat channels (msdyn_conversationmode) • Customer ID (msdyn_customerid) • Customer Disconnect Hold Duration For Open Conversation (msdyn_customerdisconnectholddurationforopenconversation) • Capacity (msdyn_capacityrequired) • Capacity format (msdyn_capacityformat) • Channel (msdyn_streamsource) • Contract Id (msdyn_routingcontractid) • Default (msdyn_sessiontemplate_default) • Default Queue (msdyn_defaultqueue) • Direction (msdyn_direction) • Enable selecting from push-based work streams (msdyn_enableselectingfrompushbasedworkstreams) • Entity (msdyn_masterentityroutingconfigurationid) • FallBack Language (msdyn_fallbacklanguage) • Follow-up after waiting (msdyn_followupafterwaiting) • Handling Time Threshold (msdyn_handlingtimethreshold) • Incoming authenticated (msdyn_notificationtemplate_incoming_auth) • Incoming unauthenticated (msdyn_notificationtemplate_incoming_unauth) • Is Default (msdyn_isdefault) • Keep same agent for entire conversation (msdyn_enableagentaffinity) • Last Validation On (msdyn_lastvalidationon) • Last Validation Status (msdyn_lastvalidationstatus) • Matching Logic (msdyn_matchinglogic) • Max Concurrency (msdyn_maxconcurrentconnection) • Mode (msdyn_mode) • Name (msdyn_name) • Notification (msdyn_notification) • Notification scenario placeholder (msdyn_notificationscenarioplaceholder) • Outbound queue (msdyn_outboundqueueid) • Record Identification Rule (msdyn_recordidentificationrule) • Record Identification Validation Rule (msdyn_recordidentificationvalidationrule) • Restrict download of recording (msdyn_restrictdownloadrecording) • Restrict download of transcript (msdyn_restrictdownloadtranscript) • Screen pop timeout (msdyn_screenpoptimeout) • Screen pop timeout (msdyn_screenpoptimeout_optionSet) • Secure API Key (msdyn_secureapikey)	Sample 1: All SMS workstreams Sample 2: Single SMS workstream Sample 3: Multiple SMS workstreams

S.No.	Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records
		• Skill Attachment Rules Count (msdyn_skillattachmentrulescount) • Skill Attachment Rules Count (Last Updated On) (msdyn_skillattachmentrulescount_date) • Skill Attachment Rules Count (State) (msdyn_skillattachmentrulescount_state) • Session scenario placeholder (msdyn_sessionscenarioplaceholder) • SupervisorAssign (msdyn_notificationtemplate_supervisorassign) • Transfer (msdyn_notificationtemplate_transfer) • Waiting Time Threshold (msdyn_waitingtimethreshold) • Work Distribution Mode (msdyn_workdistributionmode) • Work Stream (msdyn_liveworkstreamid)	
2.	Context Variable (msdyn_ocliveworkstreamcontextvariable)	• Name (msdyn_name) • Relation Ship Name (msdyn_relationshipname) • Type (msdyn_datatype) • Work stream (msdyn_liveworkstreamid) • IsList (msdyn_islist) • Modifiable (msdyn_ismodifiable) • Display Name (msdyn_displayname) • Displayable (msdyn_isdisplayable) • Entity Logical Name (msdyn_entitylogicalname) • Context variable (msdyn_ocliveworkstreamcontextvariableid) • Status (statecode) • Status Reason (statuscode) • System Defined (msdyn_issystemdefined)	Sample 1: Context Variables for all SMS workstreams Sample 2: Context variables for a single SMS workstream Sample 3: Context Variables for multiple SMS workstreams
3.	Decision contract (msdyn_decisioncontract)	• Contract definition (msdyn_contractdefinition) • Decision contract (msdyn_decisioncontractid) • Name (msdyn_name) • Unique name (msdyn_uniquename)	Sample 1: Decision contract for all SMS workstreams Sample 2: Decision contract for a single SMS workstream Sample 3: Decision contract for multiple SMS workstreams
4.	Decision rule set (msdyn_decisionruleset)	• AI builder model (msdyn_aibmodelid) • Authoring mode (msdyn_authoringmode) • Decision rule set (msdyn_decisionrulesetid) • Description (msdyn_description) • Input contract (msdyn_inputcontractid) • Is input collection (msdyn_isinputcollection) • ML model type (msdyn_mlmodeltype) • Name (msdyn_name) • Output contract (msdyn_outputcontractid) • Rule set definition (msdyn_rulesetdefinition) • Rule set type (msdyn_rulesettype)	Sample 1: Decision ruleset for all SMS workstreams Sample 2: Decision ruleset for a single SMS workstream

S.No.	Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records
		• Unique name (msdyn_uniquename)	Sample 3: Decision ruleset for multiple SMS workstreams
5.	Routing configuration (msdyn_routingconfiguration)	• Is active configuration (msdyn_isactiveconfiguration) • Name (msdyn_name) • Routing configuration (msdyn_routingconfigurationid) • Unique name (msdyn_uniquename) • Workstream (msdyn_liveworkstreamid)	Sample 1: Routing configuration for all SMS workstreams Sample 2: Routing configuration for a single SMS workstream Sample 3: Routing configuration for multiple SMS workstreams
6.	Routing configuration step (msdyn_routingconfigurationstep)	• Name (msdyn_name) • Routing configuration (msdyn_routingconfigurationid) • Routing configuration step (msdyn_routingconfigurationstepid) • Rule set (msdyn_rulesetid) • Step order (msdyn_steporder) • Step type (msdyn_type) • Unique name (msdyn_uniquename)	Sample 1: Routing configuration step for all SMS workstreams Sample 2: Routing configuration step for a single SMS workstream Sample 3: Routing configuration step for multiple SMS workstreams
7.	Workstream capacity profile (msdyn_liveworkstreamcapacityprofile)	• Capacity Profile (msdyn_capacityprofile_id) • Name (msdyn_name) • Workstream (msdyn_workstream_id) • Workstream Capacity profile (msdyn_liveworkstreamcapacityprofileid)	Sample 1: Workstream capacity profile for all SMS workstreams Sample 2: Workstream capacity profile for a single SMS workstream

S.No.	Entity display name (Logical name)	Attribute display name (Logical name)	Use FetchXML to filter records
			Sample 3: Workstream capacity profile for multiple SMS workstreams
8.	Tag (msdyn_octag)	• Name (msdyn_name) • Tag (msdyn_octagid)	

3. Generate the schema and save it.
4. Export the data and generate the compressed (zip) file.
5. Use the Configuration Migration tool, and select the option to import data, and select the compressed file.

> **Important**
>
> When you fetch decision rulesets (msdyn_decisionrulesets) containing context variables, some decision rulesets are created without the dependency mappings. To work around this, perform the following steps:
>
> 1. Import data for all entities including the decision ruleset entity (msdyn_decisionrulesets).
> 2. Import data for the decision ruleset entity again. This step ensures that all dependency mappings for the decision rulesets are imported.

For sample schema to get all the required records, see Sample schema for SMS workstream.

FetchXML for workstream entity

Sample 1: All SMS workstreams

XML

```
<fetch distinct="true">
    <entity name="msdyn_liveworkstream">
        <filter type="and">
            <condition attribute="msdyn_mode" operator="eq" value="717210001" />
            <condition attribute="msdyn_streamsource" operator="eq" value="192340000" />
        </filter>
    </entity>
</fetch>
```

Sample 2: Single SMS workstream

XML

```
<fetch>
    <entity name="msdyn_liveworkstream">
        <filter type="and">
            <condition attribute="msdyn_liveworkstreamid" operator="eq" uiname="Test SMS workstream 1"
uitype="msdyn_liveworkstream" value="{759255C7-7AC8-98E0-7E3E-59A7F0312ABC}" />
        </filter>
    </entity>
</fetch>
```

Sample 3: Multiple SMS workstreams

XML

```
<fetch version="1.0" output-format="xml-platform" mapping="logical" distinct="false">
    <entity name="msdyn_liveworkstream">
        <filter type="and">
            <condition attribute="msdyn_liveworkstreamid" operator="in">
                <value uiname="Test SMS workstream 1" uitype="msdyn_liveworkstream">{759255C7-7AC8-98E0-
7E3E-59A7F0312ABC}</value>
                <value uiname="Test SMS workstream 2" uitype="msdyn_liveworkstream">{E6246229-33AC-5A9E-
2FFE-51668AD44098}</value>
            </condition>
        </filter>
    </entity>
</fetch>
```

FetchXML for context variables entity

Sample 1: All SMS workstreams context variables

XML

```
<fetch>
    <entity name="msdyn_ocliveworkstreamcontextvariable" >
        <link-entity name="msdyn_liveworkstream" from="msdyn_liveworkstreamid" to="msdyn_liveworkstreamid"
link-type="inner" alias="aa" >
            <filter type="and" >
                <condition attribute="msdyn_streamsource" operator="eq" value="192340000" />
                <condition attribute="msdyn_mode" operator="eq" value="717210001" />
            </filter>
        </link-entity>
    </entity>
</fetch>
```

Sample 2: Single SMS workstream context variables

XML

```
<fetch>
    <entity name="msdyn_ocliveworkstreamcontextvariable" >
        <filter type="and" >
            <condition attribute="msdyn_liveworkstreamid" operator="eq" uiname="SMS workstream"
uitype="msdyn_liveworkstream" value="{D3A1F09D-51A0-A6B7-266D-58E1BDB97B53}" />
        </filter>
    </entity>
</fetch>
```

Sample 3: Multiple SMS workstreams context variables

XML

```
<fetch>
    <entity name="msdyn_ocliveworkstreamcontextvariable" >
        <filter type="or" >
            <condition attribute="msdyn_liveworkstreamid" operator="eq" uiname="SMS workstream"
uitype="msdyn_liveworkstream" value="{D3A1F09D-51A0-A6B7-266D-58E1BDB97B53}" />
            <condition attribute="msdyn_liveworkstreamid" operator="eq" uiname="SMS workstream 1"
uitype="msdyn_liveworkstream" value="{f9e18e67-d1a8-ed11-aad1-00224805c057}" />
        </filter>
    </entity>
</fetch>
```

FetchXML for decision contract entity

Sample 1: Decision contract for all SMS workstreams

XML

```
<fetch distinct="true" >
    <entity name="msdyn_decisioncontract" >
        <filter type="or" >
            <filter type="and" >
                <condition attribute="msdyn_mode" entityname="an" operator="eq" value="717210001" />

            </filter>
        </link-entity>
    </entity>
</fetch>
```

Migrate configuration for SMS channels

Assume that the workstream must exist whether it was created manually or previously migrated to the destination organization.

To migrate data for SMS channels

1. Use the Configuration Migration tool to create the schema and export data from the source organization for the SMS channel and related entities.

   - **Entity display name**: When you create the schema, select the entities in the sequence as mentioned in the table.
   - **Attribute display name**: We recommend that you select the attributes defined in the following table. You don't have to select the system-defined attributes, such as Created By, Created On, Modified By, Modified On, and Owner. You can select custom attributes if necessary.

S.No.	Entity display name (Logical name)	Attribute display name (Logical name)
1.	SMS Number Setting (msdyn_ocsmschannelsetting)	FetchXML to filter records for SMS channel settings **Note:** - Replace the value for msdyn_liveworkstream in the condition section. - You need to include Phone Number (msdyn_phonenumberid) column even though data is invalid, as the records in Phone Number table are environment-specific and can't be migrated. You need to fix phone number manually in destination environment after migration. If you aren't allowed to perform this action for any reason, you can manually edit data.xml file inside the exported zip file and replace its value with the correct phone number GUID in the destination environment. - Don't include Survey (msdyn_postconversationsurvey) and Survey (msdyn_postconversationsurveyseparatebotsurvey) columns as survey records are synced with Dynamics 365 Customer Voice in each environment, so they can't be migrated. - Ensure as part of the entity declaration in the schema that the plugin is disabled. (disableplugins="false") • Bot Survey (msdyn_postconversationsurveybotsurvey) • Enable (msdyn_postconversationsurveyenable) • Enable file attachments for agents (msdyn_enablefileattachmentforagents) • Enable file attachments for customers (msdyn_enablefileattachmentforcustomers) • Message (msdyn_postconversationsurveybotsurveymessagetext) • Message (msdyn_postconversationsurveymessagetext) • Name (msdyn_name) • ocsmschannelsetting (msdyn_ocsmschannelsettingid) • Operating hours (msdyn_operatinghoursid) • Phone Number (msdyn_phonenumberid) • SMS number language (msdyn_language) • Survey Mode (msdyn_postconversationsurveybotsurveymode) • Survey Mode (msdyn_postconversationsurveymode) • Work stream (msdyn_liveworkstreamid)
2.	Localization (msdyn_oclocalizationdata)	FetchXML to filter records for SMS channel localizations • Automated message (msdyn_systemmessageid) • Default Localized Text (msdyn_defaultlocalizedtext) • Entity Column Name (msdyn_entitycolumnname) • Entity Name (msdyn_entityname) • Entity Record ID (msdyn_entityrecordid) • Is Default (msdyn_isdefault) • Language Code (msdyn_customerlanguageid) • Language Code (msdyn_languagecode) • Localization (msdyn_oclocalizationdataid) • Localized text (msdyn_localizedtext) • Organization ID (organizationid) • Status (statecode)

S.No.	Entity display name (Logical name)	Attribute display name (Logical name)
		• Status Reason (statuscode)
3.	Message (msdyn_ocsystemmessage)	• Channel (msdyn_streamsource) • Default language (msdyn_defaultlanguage) • Instance ID (msdyn_instanceid) • Message (msdyn_ocsystemmessageid) • Message description (msdyn_messagedescription) • Message recipient (msdyn_messagereceiver) • Message template trigger (msdyn_messagetemplatetrigger) • Message Text (msdyn_messagetext) • Message trigger (msdyn_systemmessageeventtype) • Message type (msdyn_messagetype) • Name (msdyn_name) • Organization ID (organizationid) • Status (statecode) • Status Reason (statuscode)

2. Generate the schema and save it.
3. Export the data and generate the compressed (zip) file.
4. Use the Configuration Migration tool, select the option to import data, and then select the compressed file.

For sample schema to get all the required records, see Sample schema for SMS channel.

FetchXML for SMS channel settings

XML

```
<fetch>
    <entity name=" msdyn_ocsmschannelsetting">
        <link-entity name="msdyn_liveworkstream" from="msdyn_liveworkstreamid" to="msdyn_liveworkstreamid"
link-type="inner" alias="ab">
            <filter type="and">
                <condition attribute="msdyn_liveworkstreamid" operator="eq" uiname="ALM SMS Test
Workstream" uitype="msdyn_liveworkstream" value="{87bf4384-a02f-4802-8be7-1d6884a7e73f}" />
            </filter>
        </link-entity>
    </entity>
</fetch>
```

FetchXML for SMS channel localizations

XML

```
<fetch>
    <entity name="msdyn_oclocalizationdata">
        <link-entity name="msdyn_ocsystemmessage" from="msdyn_ocsystemmessageid"
to="msdyn_systemmessageid" link-type="inner" alias="ah">
            <filter type="and">
                <condition attribute="msdyn_streamsource" operator="eq" value="192360000"/>
            </filter>
        </link-entity>
    </entity>
</fetch>
```

Verify your migration

After you import the unified routing-related configuration data successfully from the source to target organization, perform the following steps in the target organization:

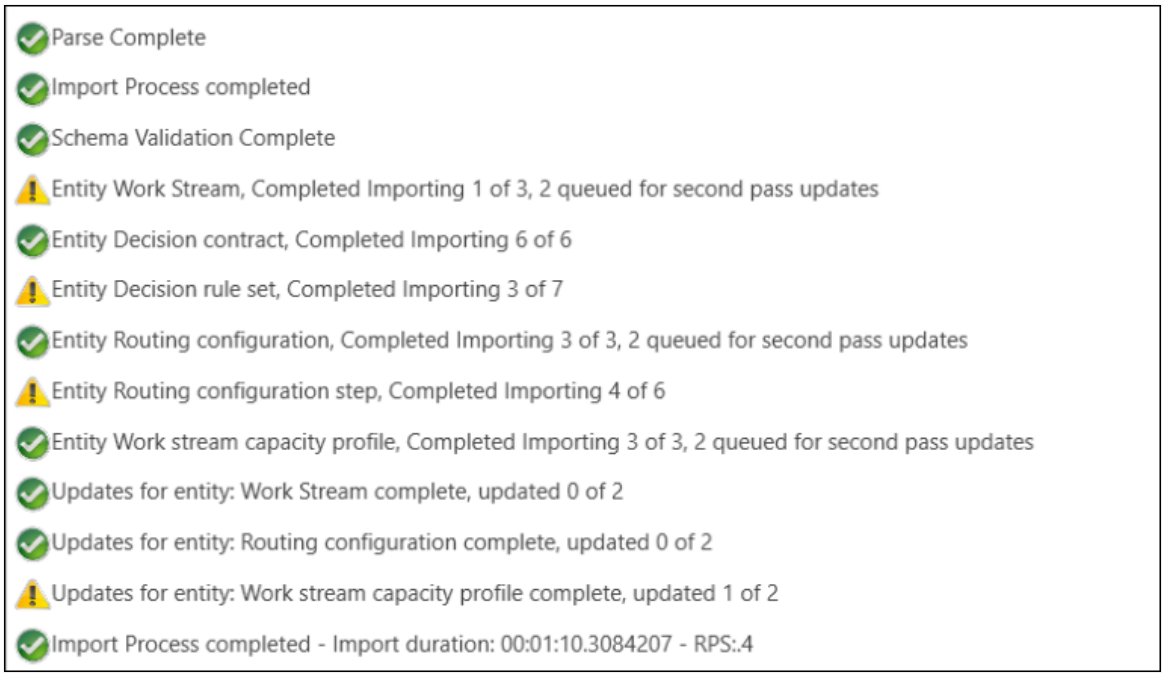
1. In the UI, make sure that the unified routing configuration and rulesets are rendered properly and don't display errors.
2. If skills and rating values are used in unified routing rulesets, then you need to manually link, associate, or create the users, bookable resources, and bookable resources characteristics records.
3. If capacity profiles are used in rulesets and workstreams for unified routing, then you need to manually link, associate, or create the users, bookable resources, and bookable resources capacity profile records.

Considerations for export and import of data

To troubleshoot any issues that you might face during migration, check the log files as follows:

- When you import data into the target organization, if you see yellow warning symbols, then check the following logs in the Configuration Migration tool:
  - **Login_ErrorLog.log**: Provides information about any issues you had when you signed in to the organization using the Configuration Management tool.
  - **DataMigrationUtility.log**: Provides information about the tasks performed using the tool during the last migration.
  - **ImportDataDetail.log**: Provides information about the data imported by the tool in the last data import.

  More information: Troubleshoot configuration data migration issues using log files

- If the logs contain network errors, then repeat the import process.

  Here's an example:

```
Time: 11:46:09 PM
Error: There was no endpoint listening at
`https://www.contoso.com/XRMServices/2011/Organization.svc/web?SDKClientVersion=9.2.46.5279` that
could accept the message. This is often caused by an incorrect address or SOAP action. See
InnerException, if present, for more details.
Stack Trace: Service stack trace:

Migrate configuration for records based on unified routing

Migrate workstreams created in Omnichannel Administration

Article • 07/25/2023

> **ⓘ Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

When will the Omnichannel Administration app be removed?

The rollout of removing the Omnichannel Administration app has started and will be applied region wise. For example, in Canada, the removal is expected to be complete by July 24, and in North America, by August 11, 2023.

Do I need to migrate any records?

If you want to continue to use the workstreams that were created in the Omnichannel Administration app, then you must migrate them to the Customer Service admin center app. The backend tables for the workstreams and the routing services are different in both the apps. The legacy routing service of the deprecated app will also be shut down.

If you are already using Customer Service admin center and unified routing, you don't need to take any action.

How do I know in which app my workstreams were created?

If the workstreams or any related records like rules that you are using are visible in the Customer Service admin center app and routing is working fine, then no migration is needed. The migrated records or records created with the new table structure only are visible in Customer Service admin center.

How do I validate if the migration is successful?

After you have migrated all the workstream configurations from Omnichannel Administration, they'll be available in Customer Service admin center. Use the steps in the following section to do a sanity check.

Use the migration application for legacy workstreams

1. Use the Unified routing migration application.
2. Download the Migrate workstreams for unified routing PDF that is available with the migration utility, and follow the steps to migrate your workstreams.
3. After the migration is complete, open the Customer service admin center app, and perform the following steps to verify that the workstreams are migrated according to your requirement:
   a. Open the route to queue rules and skill identification rules, if any, and verify the migrated rules to make sure that they represent the same rules as what you've configured before migration.
   b. Perform a sanity check by initiating chats and verifying that they are routed to the expected queues.
   c. Configure the work classification rules and any other settings pertaining to unified routing.

> **Important**
>
> After the upgrade, your queues will start using unified routing services for assignment. By default, all existing queues will use the "highest capacity" assignment method for work distribution. You can change the assignment method to round robin or a custom assignment method according to your need. More information: **Set up assignment methods in Customer Service**.

Migrate workstreams for routing records

After upgrading Omnichannel for Customer Service, we recommend that you use the Customer Service admin center app to configure record routing. You can no longer configure record routing in the Omnichannel Administration app because it won't work as expected. The existing workstreams that you created for routing records in the Omnichannel Administration app can't be migrated. Instead, you'll need to recreate them in Customer Service admin center, and then enable them for unified routing.

FAQ on unified routing

Migrate automatic record creation rules and service-level agreements

Article • 08/29/2023

The migration tool for automatic record creation rules and service-level agreements (SLAs) helps migrate the rules in the web client to Unified Interface. This also includes the conversion of the workflows to Power Automate-based flows.

The migration tool provides the following functionality:

- Ability to run the migration tool multiple times and view the status at any point in time.
- Flexibility to choose the rules in the web client that need to be migrated.
- Messages on potential issues on why a ruled failed the migration process.

The migration tool does not change the functioning of the existing rules or items in the web client and they will continue to run on existing cases as configured. You have the flexibility to decide the actions for the rules.

Prerequisites

- For migrating automatic record creation rules, your environment must have Customer Service version 9.0.20034.20XX or later to opt in for migration.
- For migrating SLAs, your environment must have Customer Service version 9.0.20053.1030 or later to opt in for migration.
- Administrator permissions.

Things to consider

When you perform your migration, you will be able to view detailed results only for rules or items that have failed the premigration check or those that were partially migrated (incomplete).

When you rerun the migration tool, it will pick up any updates or edits in the web client if the rule or item has been:

- Edited in the web client prior to the actual migration.
- Edited in the web client to resolve errors after a failed migration attempt.

The following updates or edits to a rule or item made in the web client will not be considered if:

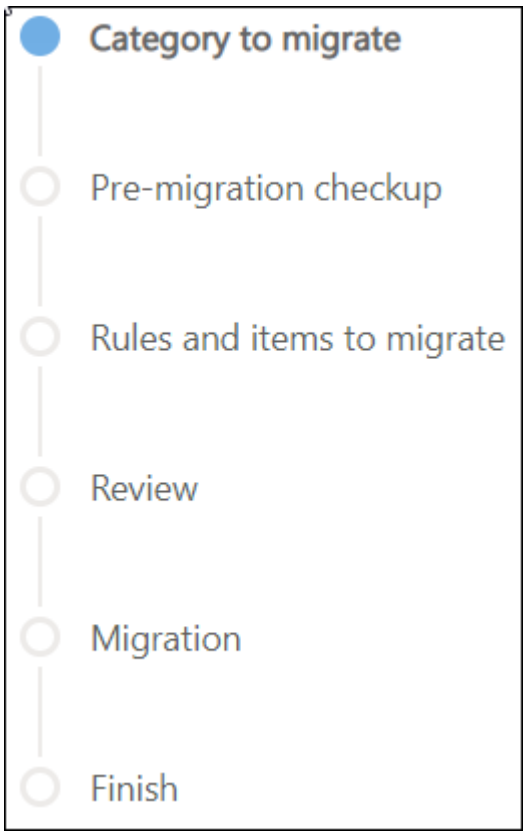
- The rule is edited in the web client after it is successfully migrated to Unified Interface.
- Any edits were made in the migrated rules in Unified Interface as well.

After migrating a rule or item successfully, if you edit it in the web client, the changes will not be visible in Unified Interface. For the edits to be visible in Unified Interface, you must delete the successfully migrated rule or item in Unified Interface and migrate it again from the web client.

To learn about how to create rules in the Customer Service Hub app, see Automatically create or update records in Customer Service Hub and Define service-level agreements.

How the migration process works

The migration progress is indicated on the page as follows; the colored circle indicates the migration stage.



1. **Category to migrate:** Allows you to pick and choose the rules you want to migrate.
2. **Pre-migration checkup:** Provides insights into any potential migration failures you might incur prior to beginning your migration.

3. **Rules and items to migrate:** Allows you to select the rules you want to migrate.
4. **Review** Provides you with the opportunity to go through any rules that have been identified as having errors or issues and fix them prior to migration.
5. **Migration:** Post-migration, allows you to review the successfully migrated rules and rules that failed migration.
6. **Finish:** Provides you with a summary and status page of the successfully migrated rules, pending rules, and rules that failed migration.

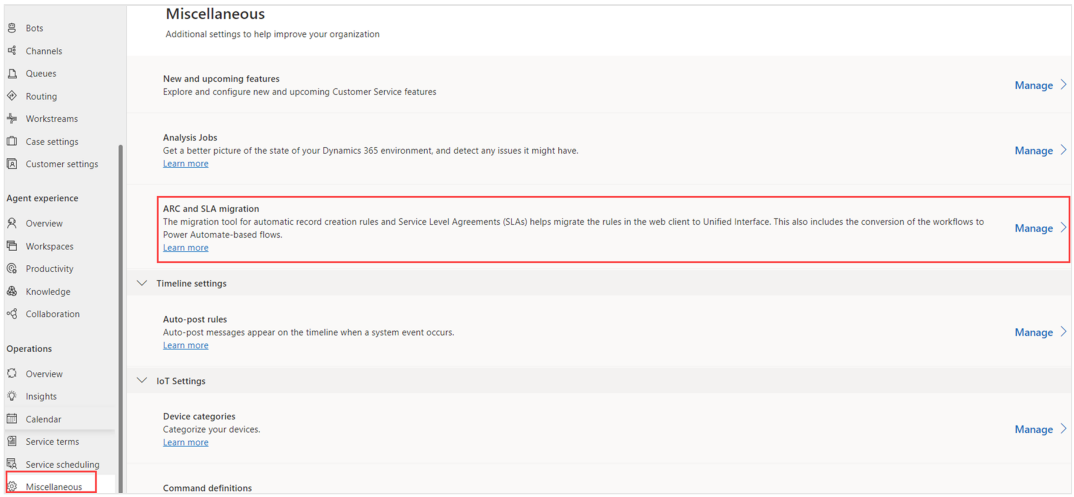
Access the migration tool

1. Go to one of the admin apps, and perform the following steps.

Customer Service admin center

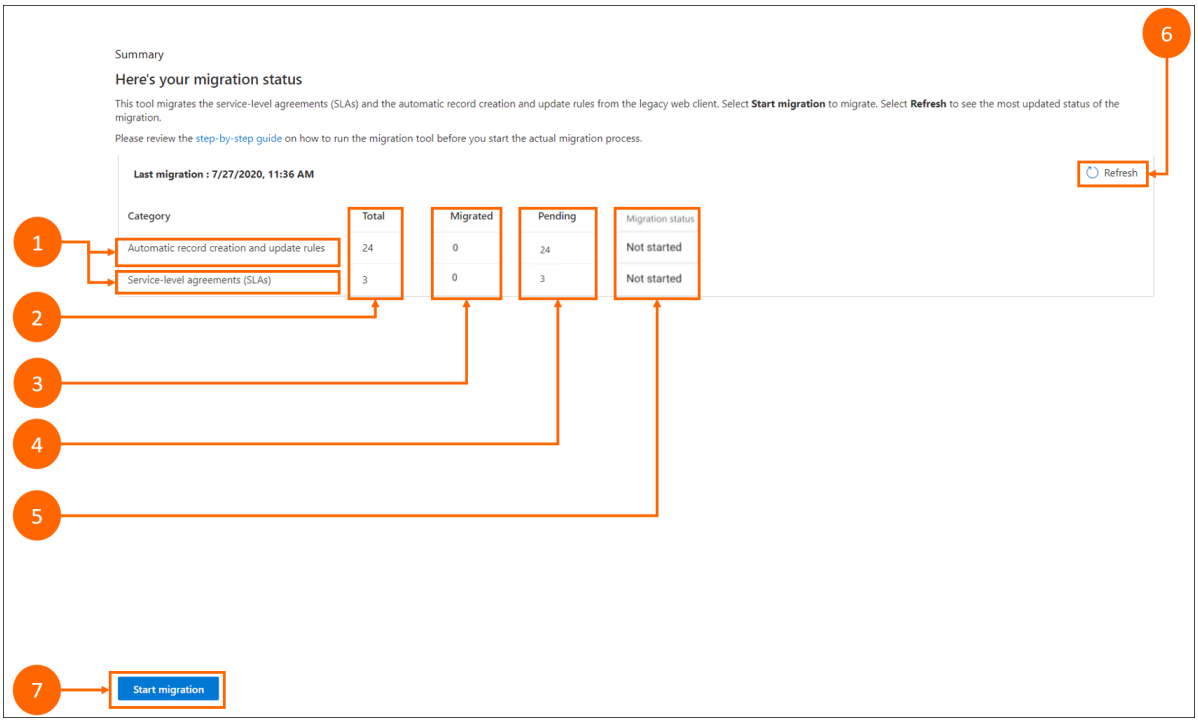
a. In the site map, select **Miscellaneous** in **Operations**. The **Miscellaneous** page appears.

b. In the **ARC and SLA migration** section, select **Manage**.



Migration Summary

When you select **ARC & SLA Migration** in the left pane, the **Summary** page is displayed as follows.



The annotations are explained as follows.

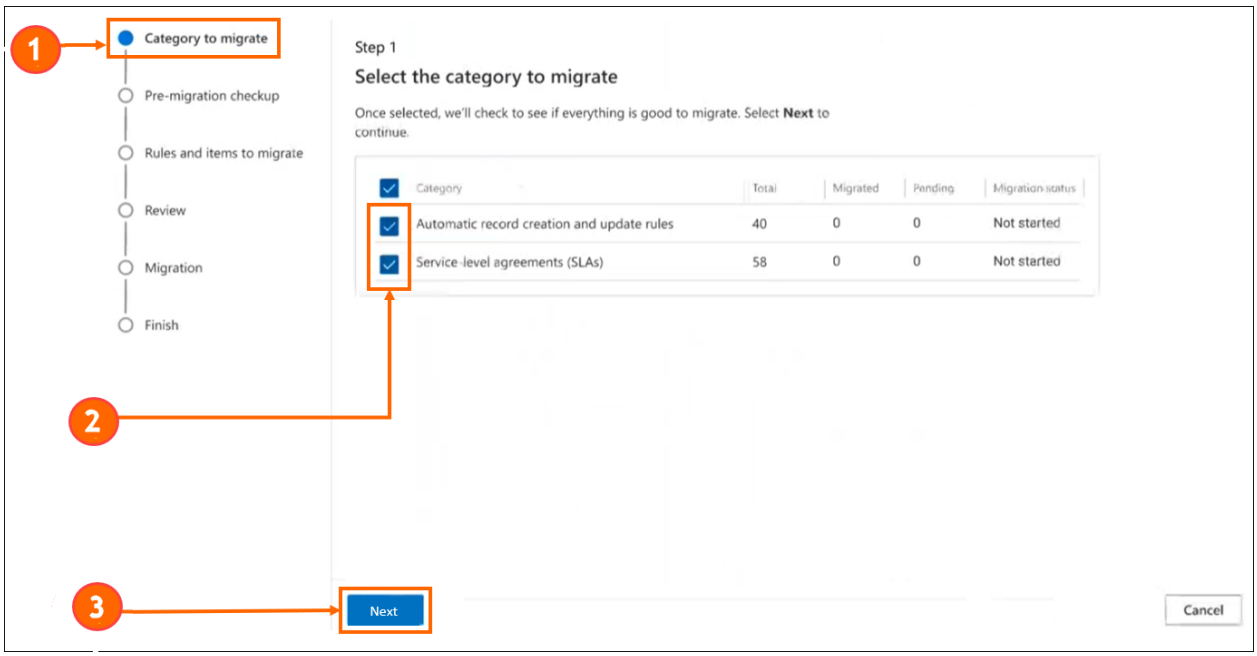
label	Description
1	**Category**: An overview of the automatic record creation rules and SLAs.
2	**Total**: Displays the number of rules available overall in the web client.
3	**Migrated**: Displays the number of rules you have migrated.
4	**Pending**: Displays the number of rules in the web client that are pending migration (includes failed rules, partially or incomplete migrated rules, and rules that have not been attempted).
5	**Migration status**: Displays whether migration has started.
6	**Refresh**: Allows you to update migration status.
7	**Start migration**: Allows you to begin the migration process.

Migrate the automatic record creation rules and SLA items

You can migrate both the automatic record creation rules and SLA items together or separately from the web client. The information in the following sections is organized according to the migration process on the left of the migration pages that leads you through the migration states.

Category to migrate

When you select **Start migration**, the **Step 1** page is displayed. Select the categories that you want to migrate.



The annotations are explained as follows.

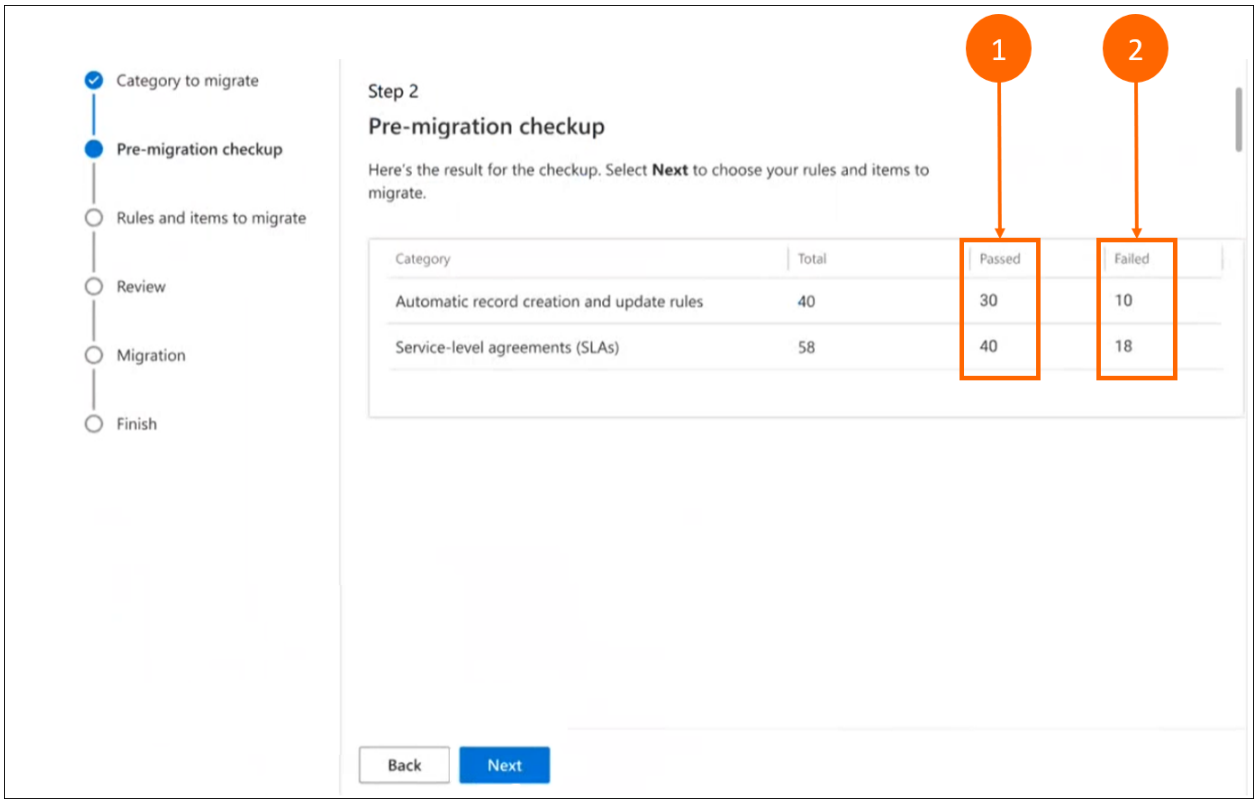
Label	Description
1	A tracker that is displayed on the left, shows you where you are in the migration process at any time.
2	You can migrate the automatic record creation rules and SLAs separately or both at the same time.
3	You must select a category for migration before you can proceed. select **Next** to go to the next stage.

Premigration checkup

The **Step 2** page provides a premigration check that displays what the actual migration results will look like so you can mitigate potential migration failures before you begin.

The check can be done on automatic record creation rules and or SLAs, depending on your selection from the previous screen.

When you run the migration process for the first time, you won't have any insights until you complete the premigration checkup. After the premigration check is complete, the following overview is displayed.



Label	Description
1	The number of rules that will successfully complete migration.
2	The number of rules that might fail the migration.

Rules and items to migrate

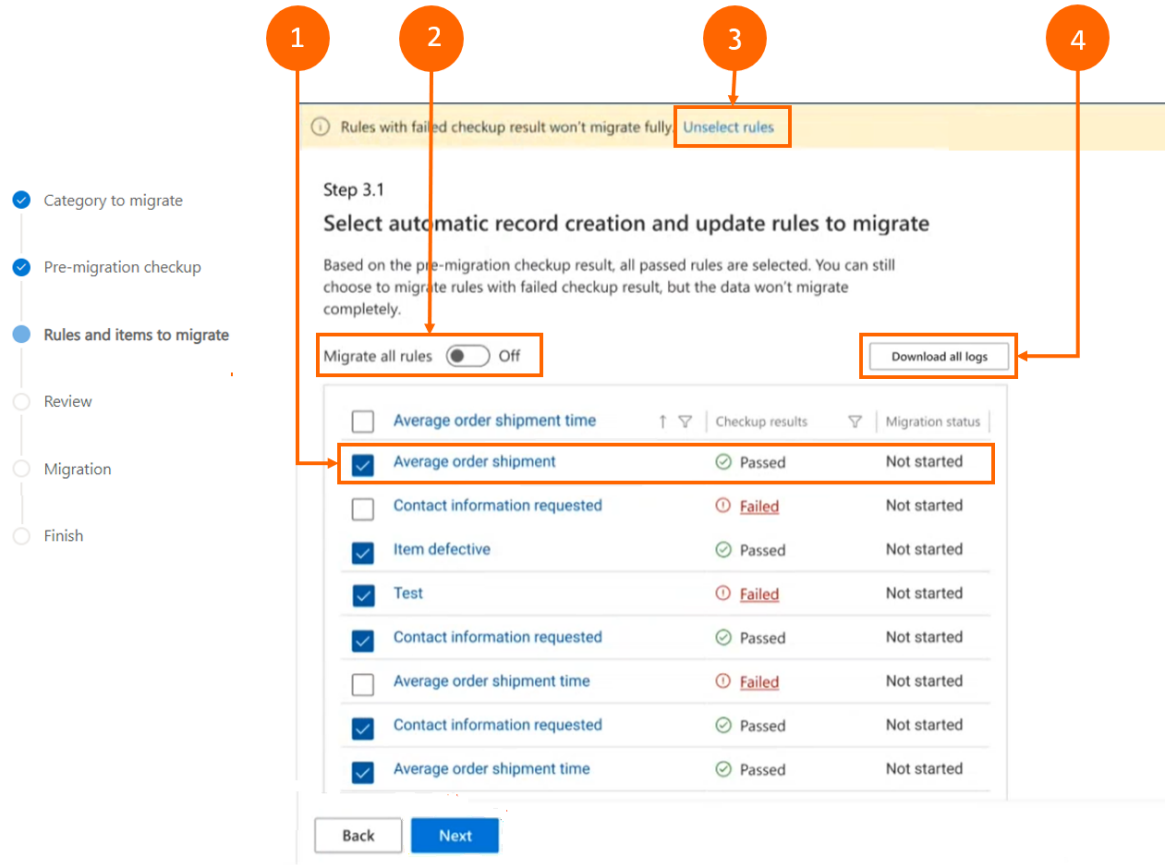
If you have selected both automatic record creation rules and SLAs, the step 3 page is divided into **Step 3.1** and **Step 3.2** pages, one each for automatic record creation rules and SLAs.

By default, the rules and items that successfully complete the premigration check are selected to be migrated. You can select the rules and items that you want to migrate.

The rules and items that fail the premigration check can still be migrated; however, the data will not completely migrate. If you want to migrate both passed and failed rules, use the **Migrate all rules** option to override any current selection and migrate all rules.

Automatic record creation and update rules

In this section, the Step 3.1 page that appears for the rules that you select for migration is shown as an example.



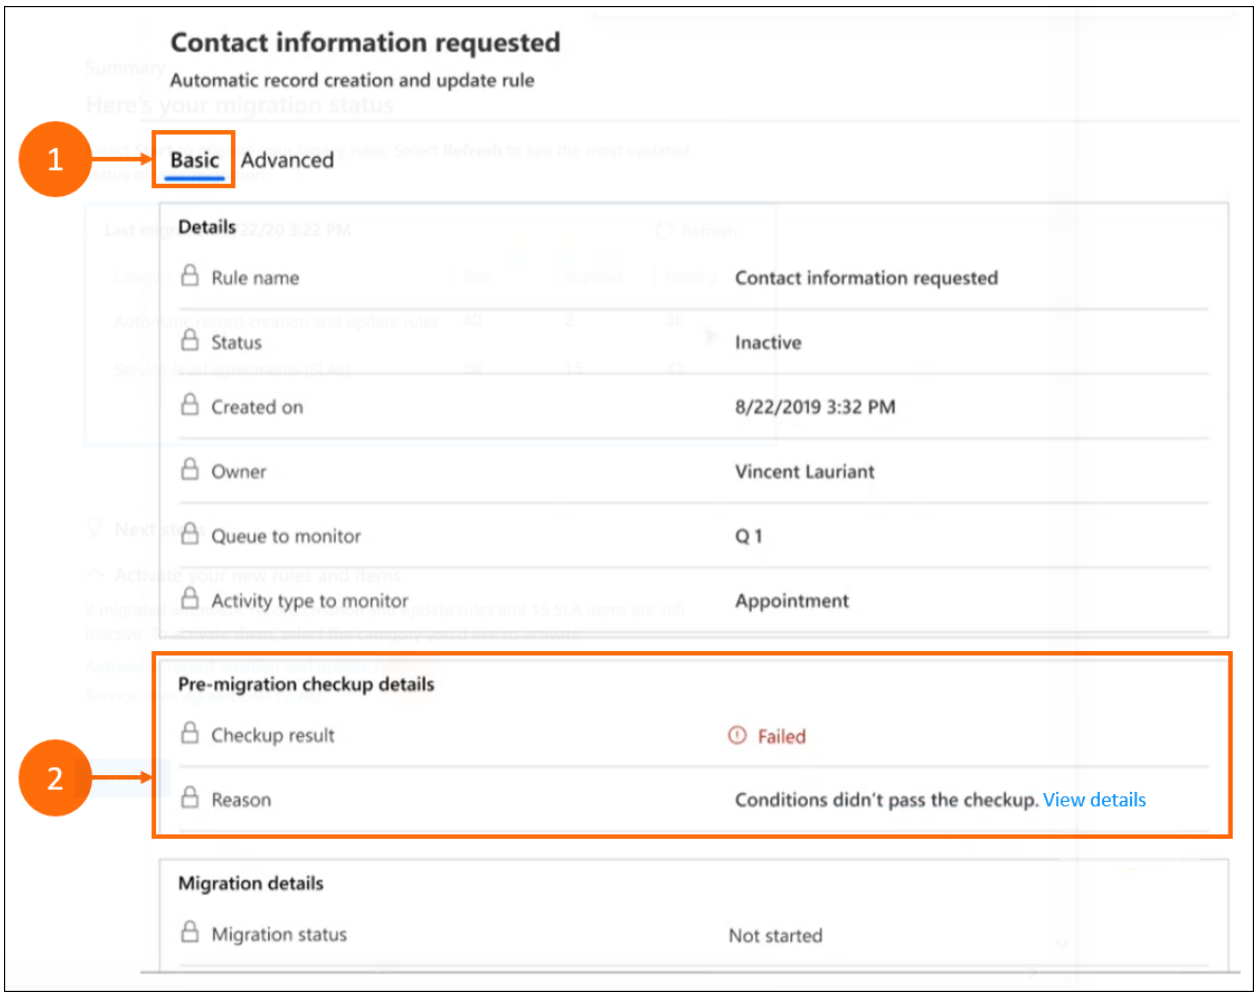
Label	Description
1	Rules that pass are automatically selected for migration. You can clear the selection for any rules that you don't want to migrate. Rules that failed are not selected for migration. To understand why a rule failed, you can select it and view the details about the failure, and then use the information to fix the failure prior to or after migration.
2	**Migrate all rules** provides you the ability to override the current selection to select all rules, regardless of their premigration check result.
3	This alert notifies you that while you can migrate rules that failed the premigration check, the data on failed rules will not migrate completely and provides the option to **unselect rules** that failed.
4	Lets you **download all logs** for review and troubleshooting purposes.

View details of rules that failed

When you select a rule that failed the premigration check, you have a choice of **Basic** and **Advanced** views to understand why a rule failed. You can use this information to either troubleshoot and fix the ruled that failed, or choose to migrate the rule and fix it in Customer Service Hub after migration is complete.

Basic view

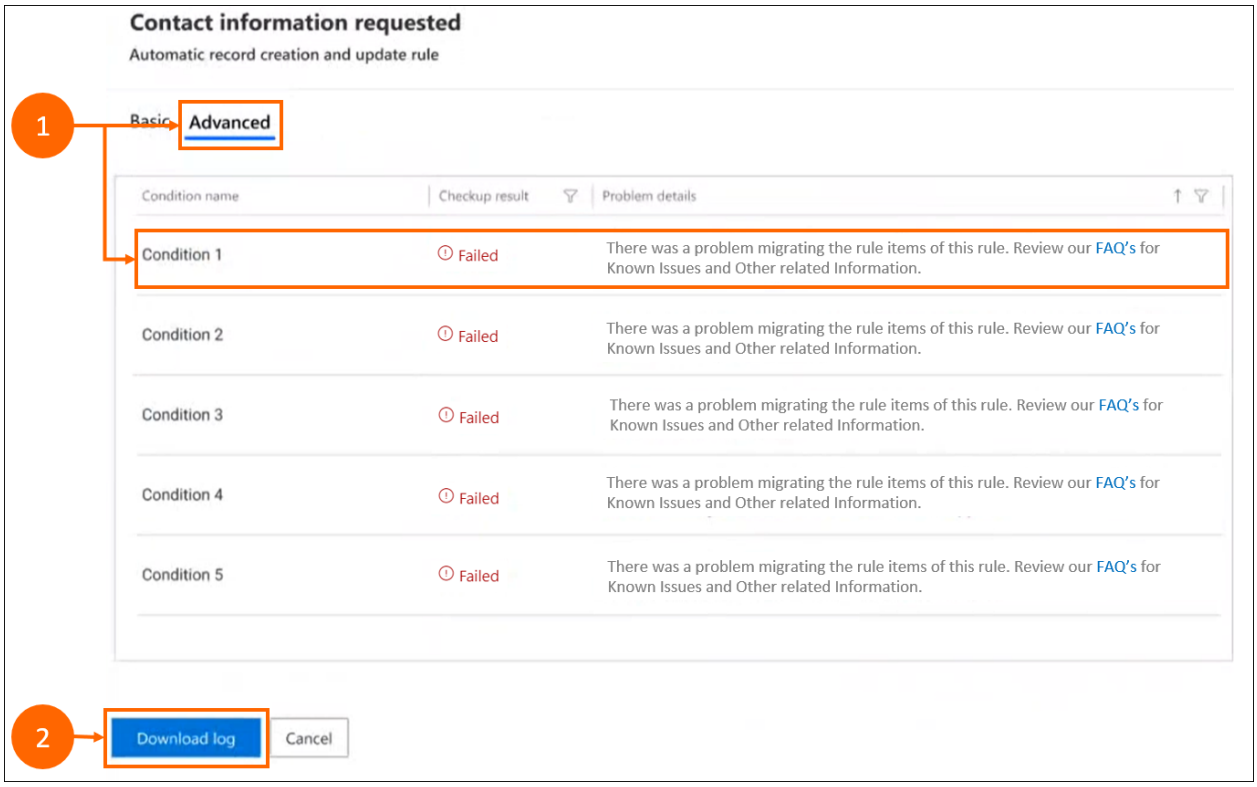
The **Basic** view provides an overview for each individual rule that failed.



Label	Description
1	High-level details on rules that fail.
2	**Pre-migration checkup details** shows results along with details of why a rule failed.

Advanced view

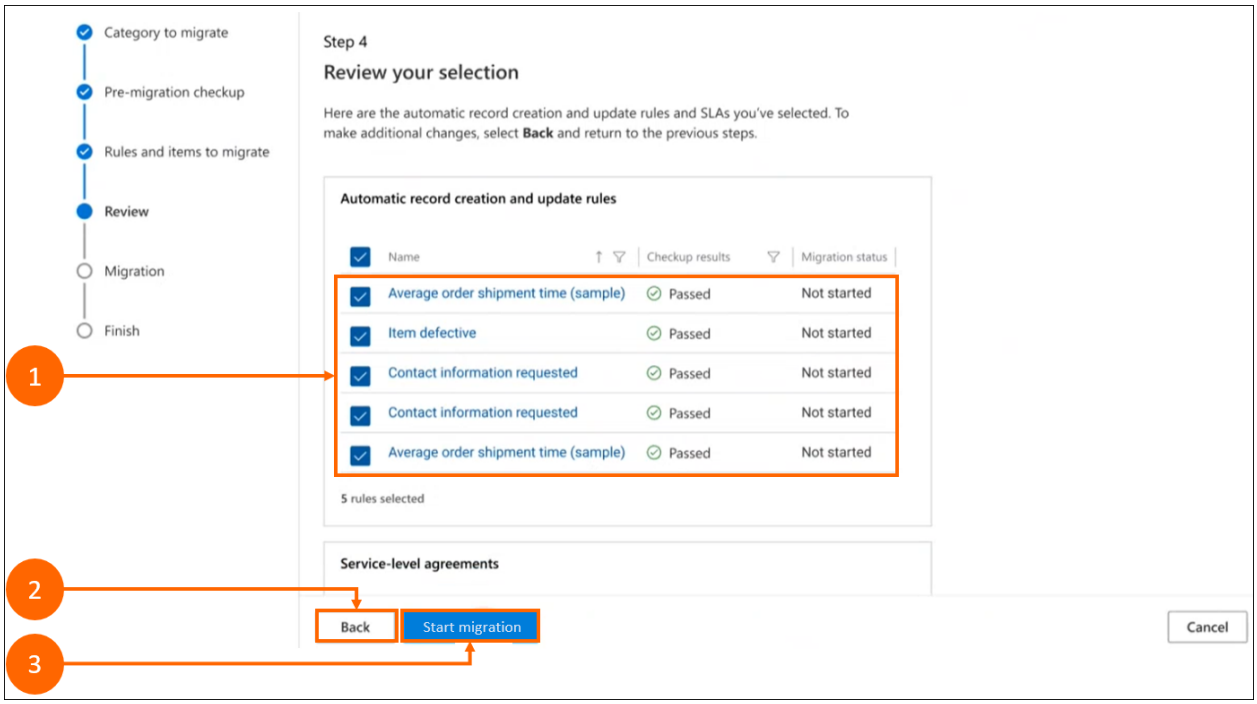
The **Advanced** view provides the problem details on rules that failed.



Label	Description
1	Additional details about why the rule might have failed migration, which you can use to troubleshoot and resolve prior to migration.
2	The **Download log** provides a list of failed rules to review and troubleshoot.

Review

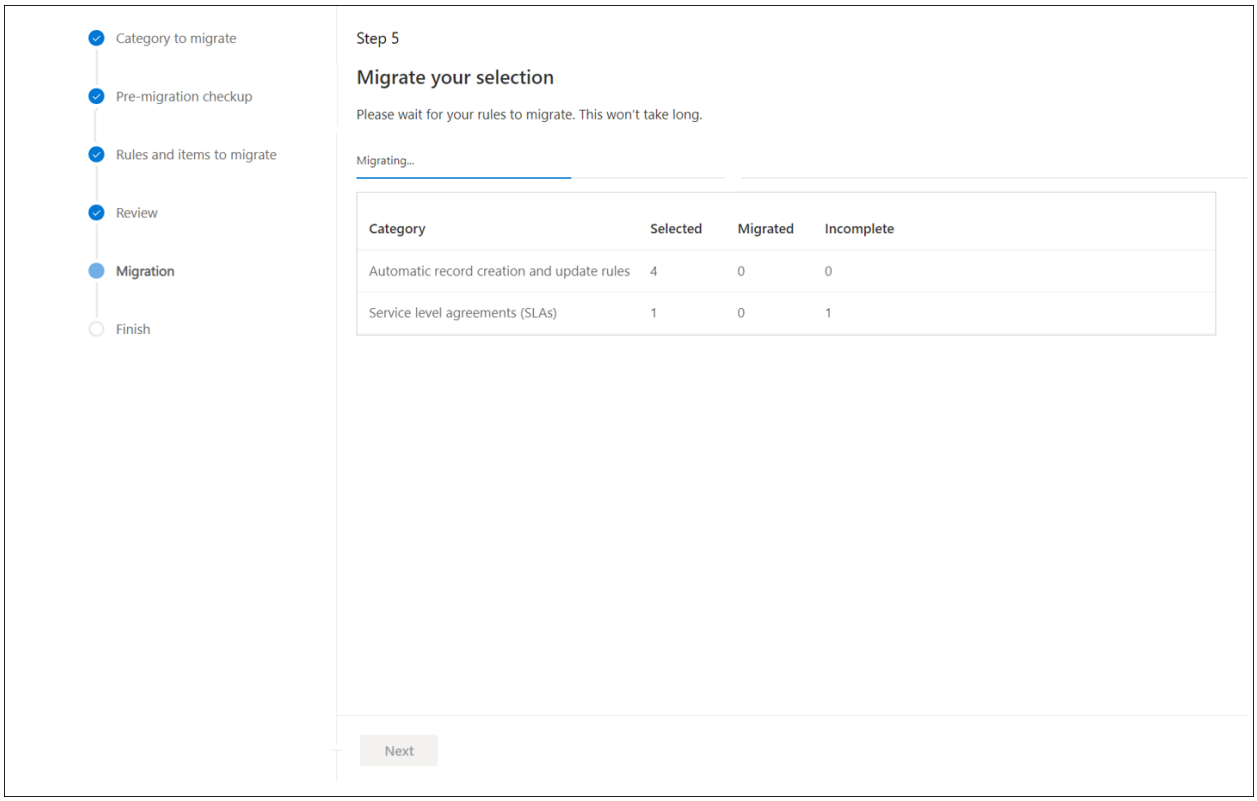
When you have selected the automatic record creation rules and SLA items, a list is displayed for your review.



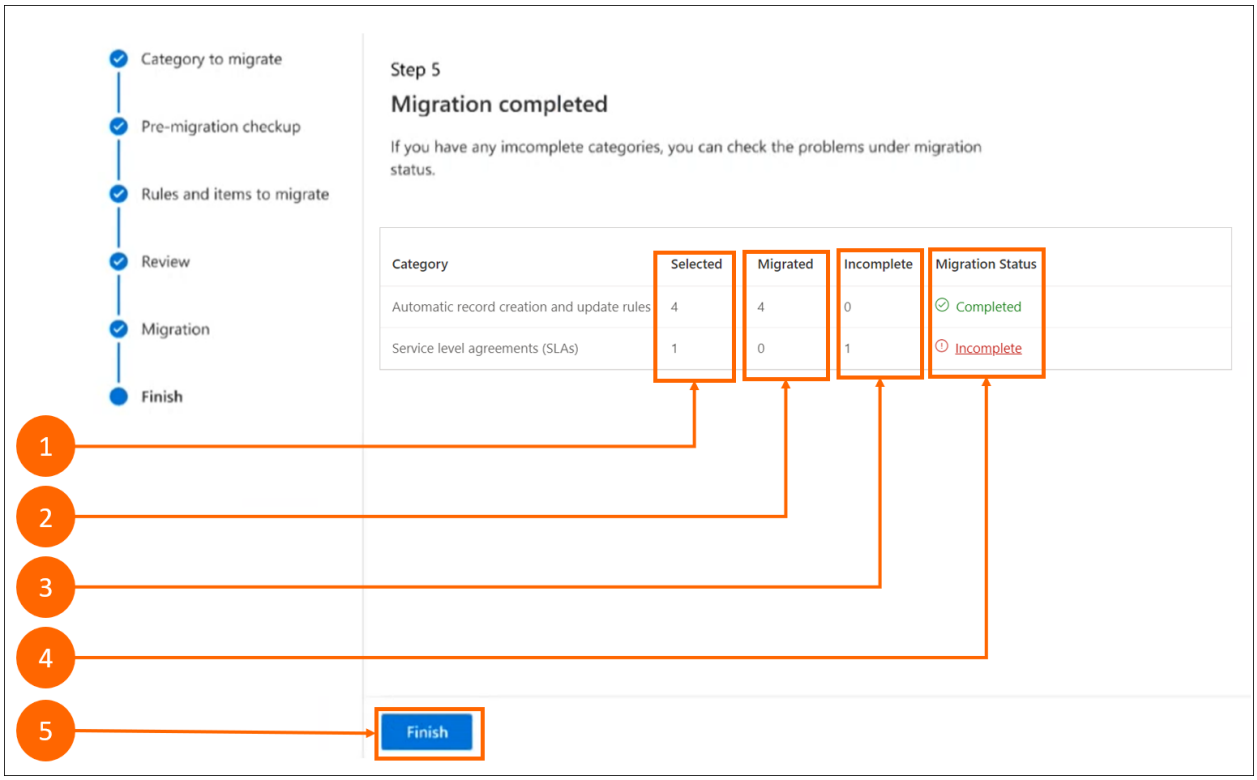
Label	Description
1	View a list of all the rules that you've selected for migration.
2	Select **Back** to return to the previous step to make additional changes.
3	Select **Start migration** to begin the migration.

Migration

After you begin your migration, the details are displayed on the page.



The migration details are displayed after the migration is complete.

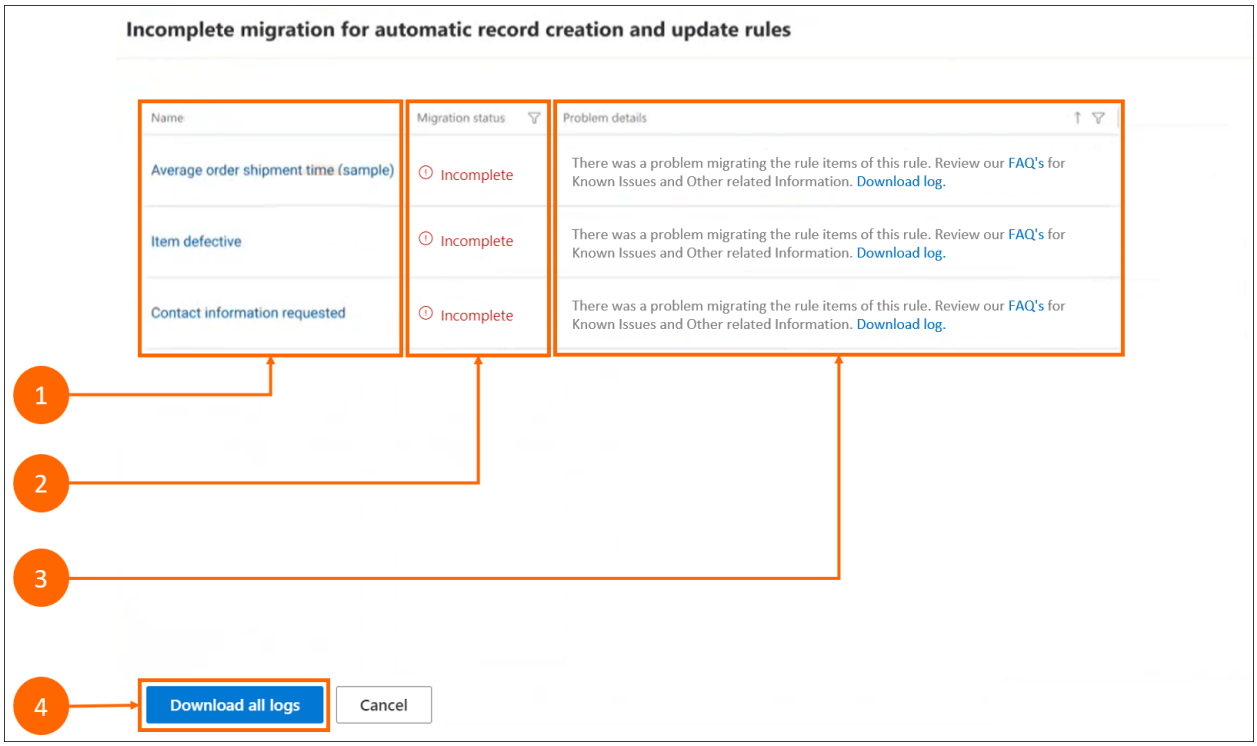


Label	Description
1	**Selected**: Displays the total number of rules that were selected for the current migration run.
2	**Migrated**: Displays the total number of rules that successfully completed migration.

Label	Description
3	**Incomplete**: Displays the total number of rules that encountered errors and didn't successfully complete migration.
4	**Migration Status**: Displays either a green check mark, which represents rules successfully migrated, or a red exclamation mark, which represents some or all rules did not successfully complete migration.
5	**Finish**: Completes the migration process when finished.

Incomplete migration details

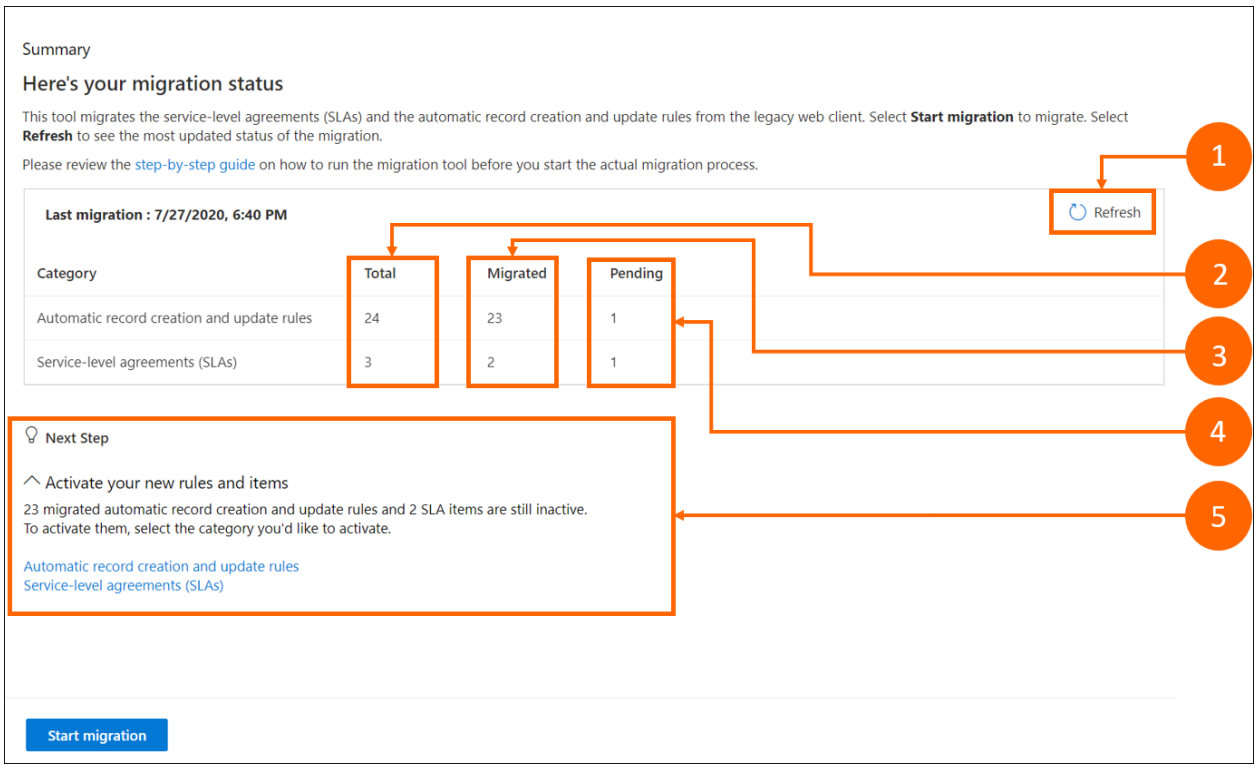
To view ARC or SLA rules that did not successfully complete migration, you can select **Incomplete** in the **Migration status** section.



Label	Description
1	**Name**: Displays each individual rule that failed.
2	**Migration status**: Displays the status as incomplete.
3	**Problem details**: Displays why the rule failed and has a **Download log** option that provides more details.
4	**Download all logs**: Let you download the logs of the rules that you can use for reviewing and troubleshooting.

Finish

When you've completed your first run and selected **Finish**, a migration **Summary** page is displayed.

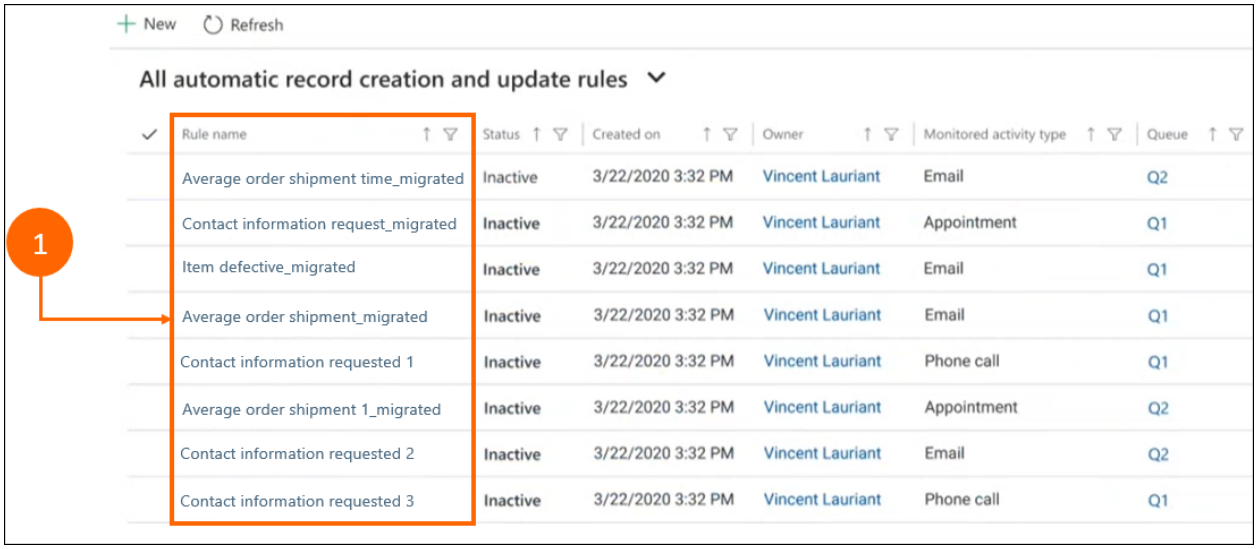


Label	Description
1	**Refresh**: Lets you view your updated migration status.
2	**Total**: Displays the number of legacy rules present overall.
3	**Migrated**: Displays the number of rules you have completely migrated to date.
4	**Pending**: Displays the number of rules you have pending migration (includes failed rules, partially/incomplete migrated rules, and rules that have not been attempted).
5	**Next Step**: Provides links to all the automatic record creation rules and SLA items that you can review and choose to activate them.

You can also refer to the migration playbook which includes all the information you need to work on the migration. More information: Dynamics 365 SLA and ARC Migration Playbook.

Review and activate migrated rules in Customer Service Hub

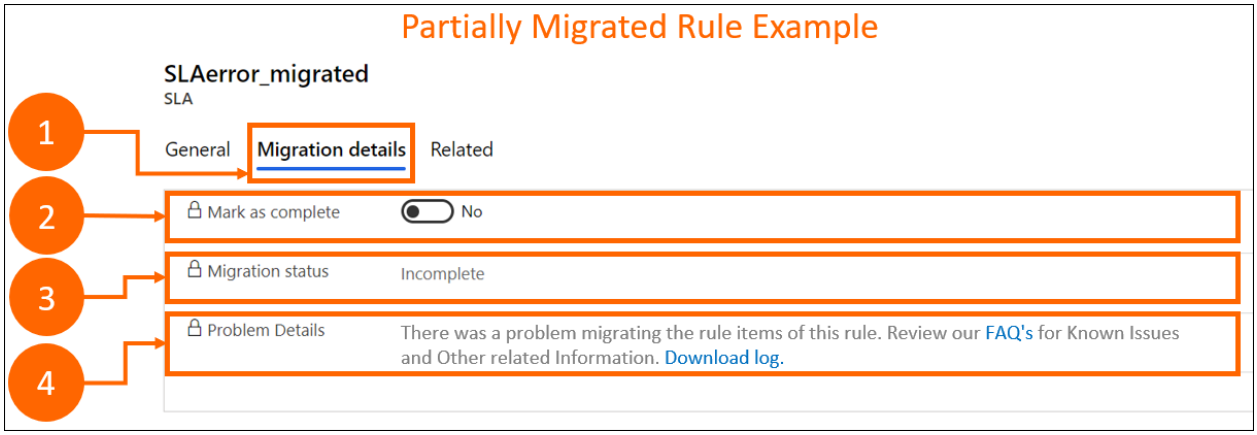
You can select the links on the migration summary page to view the automatic record creation rules or SLA items in Customer Service Hub. On the respective pages that appear, you can review and activate the migrated rules or items.



Label	Description
1	**Rule name**: Displays migrated rules with an underscore (_) to make it easier to identify the migrated rules. For example: **_migrated**.

Take action on partially migrated rules

Select a rule with the **_migrated** suffix to view its details. On the **Migration details** tab, you can review the problem details and set the **Mark as complete** toggle to Yes after resolving the migration issue.

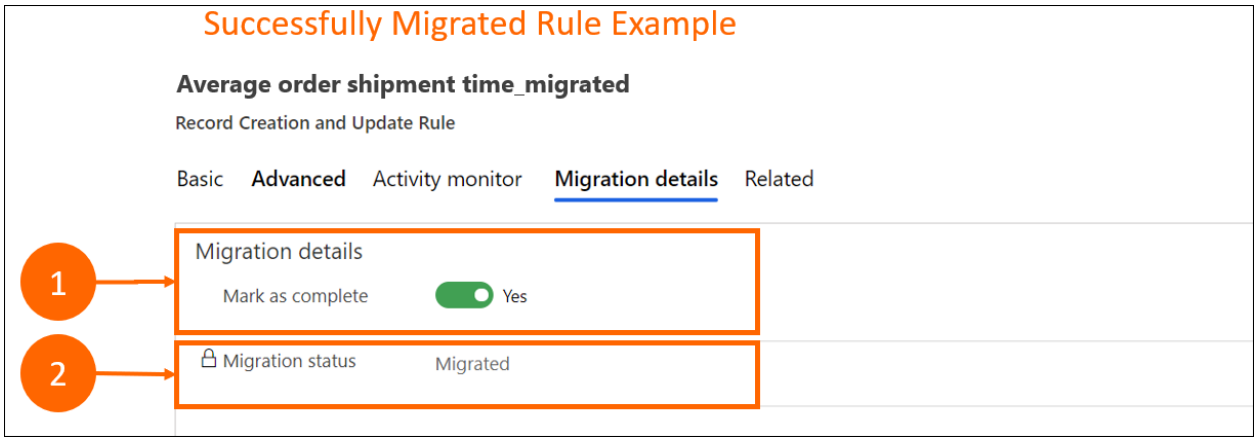


Label	Description
1	The **Migration details** tab.
2	**Mark as complete**: If set to yes, the migration status changes to **Migrated**. **Note**:

Label	Description
	• When the toggle is **Yes**, the rule won't be picked up in subsequent migrations. • If you don't take any action on an incomplete rule, the rule continues to be picked up in subsequent migrations. Also, the rule will be replaced when it is selected to migrate again.
3	**Migration status**: Displays the status of the rule as either **Migrated** or **Incomplete**.
4	**Problem Details**: Provides high-level detail on any errors encountered for the rule during migration.

View successfully migrated rules

A successfully migrated rule's migration status is set to migrated by default.



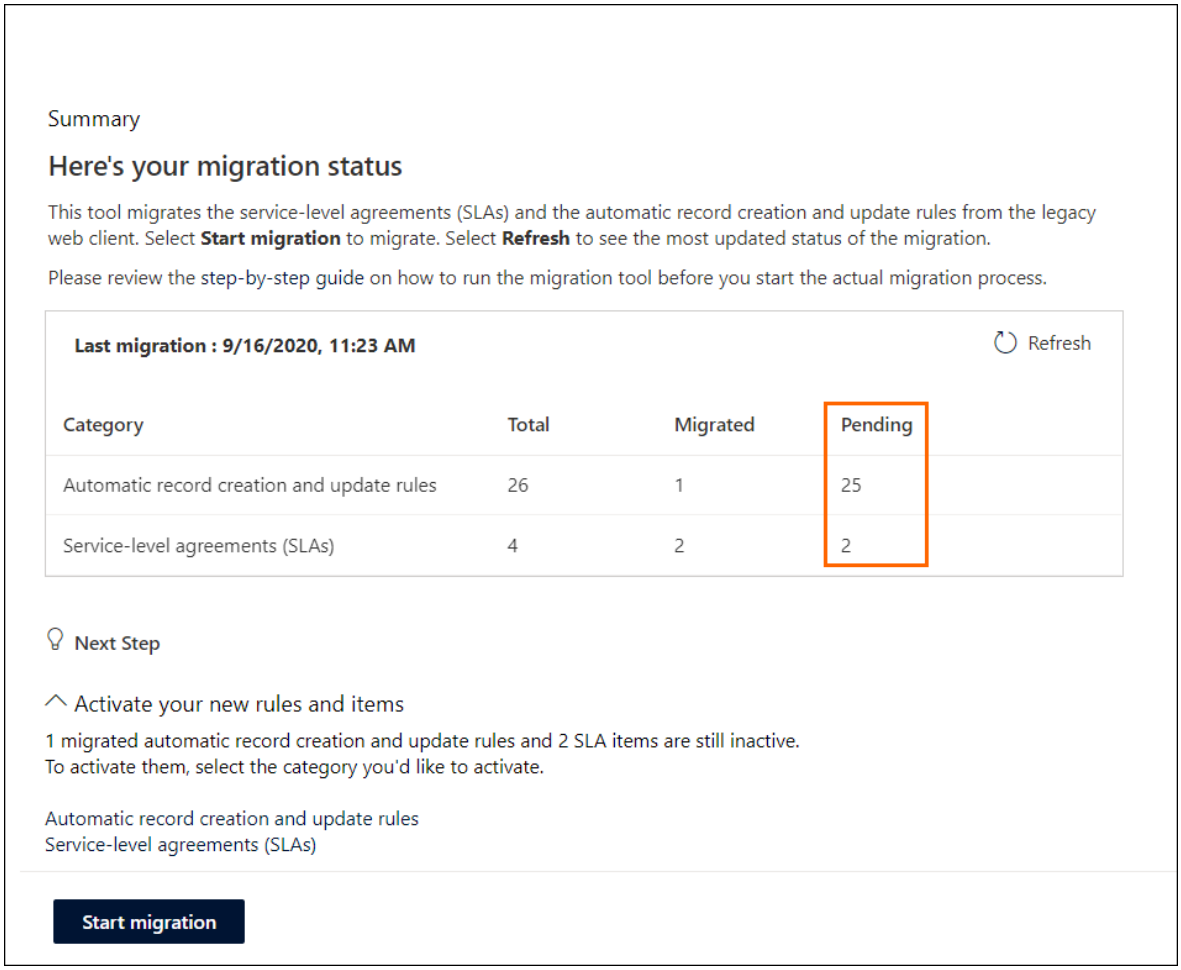
Label	Description
1	**Mark as complete**: Toggled to **Yes** by default.
2	**Migration status**: Displays the status of the rule as either **Migrated** or **Incomplete**.

Rerun the migration tool

If you have many rules and items to migrate and want to perform the migration in batches or want to attempt to migrate the unsuccessfully migrated rules and items again, you can rerun the migration tool. If you need to migrate a successfully migrated rule or item again, make sure you delete the migrated rule in Customer Service Hub, and then run the migration process.

1. Select **ARC & SLA Migration tool** in the left pane in **Service Management**. The **Summary** page displays the status of the previous migration. In the **Pending**

column, the number indicates the rules and items that are pending migration. These include failed rules, partially or incomplete migrated rules, and rules that have not been attempted.



2. Select **Start migration**, and perform the steps to run the migration of the rules and items again.

The steps to rerun the migration are same as when you run the migration for the first time. More information: Migrate the automatic record creation rules and SLA items

In the **Premigration checkup** state, the tool reviews only those rules that were previously not migrated, partially migrated, or failed the migration. On this page, the **Total** column lists the number of rules that are available for migration.

Strategy for migrating from contracts to entitlements

Article • 07/07/2021

This document contains information about the settings that admins should manage when migrating contract records to entitlements. This migration support information will help customers prepare for the deprecation of the following:

- Contracts
- Contract line items
- Contract templates

Plan the migration

The process of migrating contracts to entitlements is as follows:

1. **Contract template to entitlement template mapping:** For records that are based on contract templates, migrate them to the entitlement templates.
2. **Contracts to entitlements:** Migrate the contract lines to entitlements by creating individual entitlements.
3. **Runtime tasks:** Run scripts to perform the migration.

Mapping: Contract templates to entitlement templates

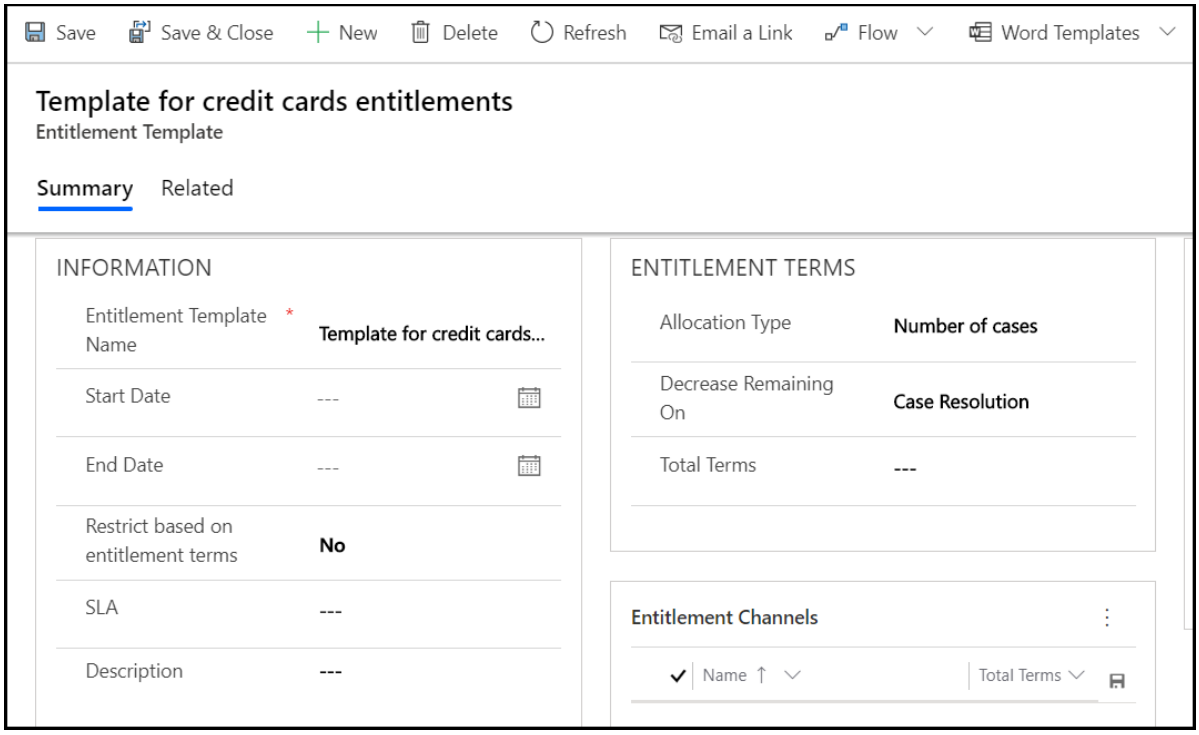
For feature parity, perform the tasks mentioned in the following sections to map the contract templates to the entitlement templates.

Allotment type

The allotment type based on coverage dates in the contracts template, which allows to create any number of cases between the start date and end date of a contract, isn't available in the entitlements template. To enable the same functionality, in the entitlement template, set the value for **Restrict based on entitlements terms** to **No**.

A screenshot of the allotment type in the contract template is as follows.

A screenshot of the entitlement template is as follows.



After an entitlement is created from the entitlement template, add custom code to copy the custom fields added on entitlement for parity with contract lines.

> **Note**
>
> The calendar option in the contracts template is not available in the entitlements template.

Benefits in entitlement

- Created cases will now display warning notices when they exceed the allocated terms.
- Customer usage can be monitored with the option to set and apply restrictions in the future.

Custom fields

Create custom fields in entitlement templates to migrate data from the fields in the contract template that aren't available in the entitlement template. Perform the following steps to switch from the contract template and map to the entitlement template:

1. Create custom fields with attributes on the entitlement template. For more information, see Create and edit fields (attributes).
2. Place the created fields on the form as per your business needs. For more information, see Add a field to a form.

Mapping: Contracts to entitlements

If you're currently using contracts, you can map to entitlements by following these steps:

1. Create a separate entitlement for each contract line.
2. Create custom attributes on the entitlement for missing contract lines attributes.
3. After an entitlement is created from the entitlement template, add custom code to copy the custom fields added on the entitlement for parity with contract lines.

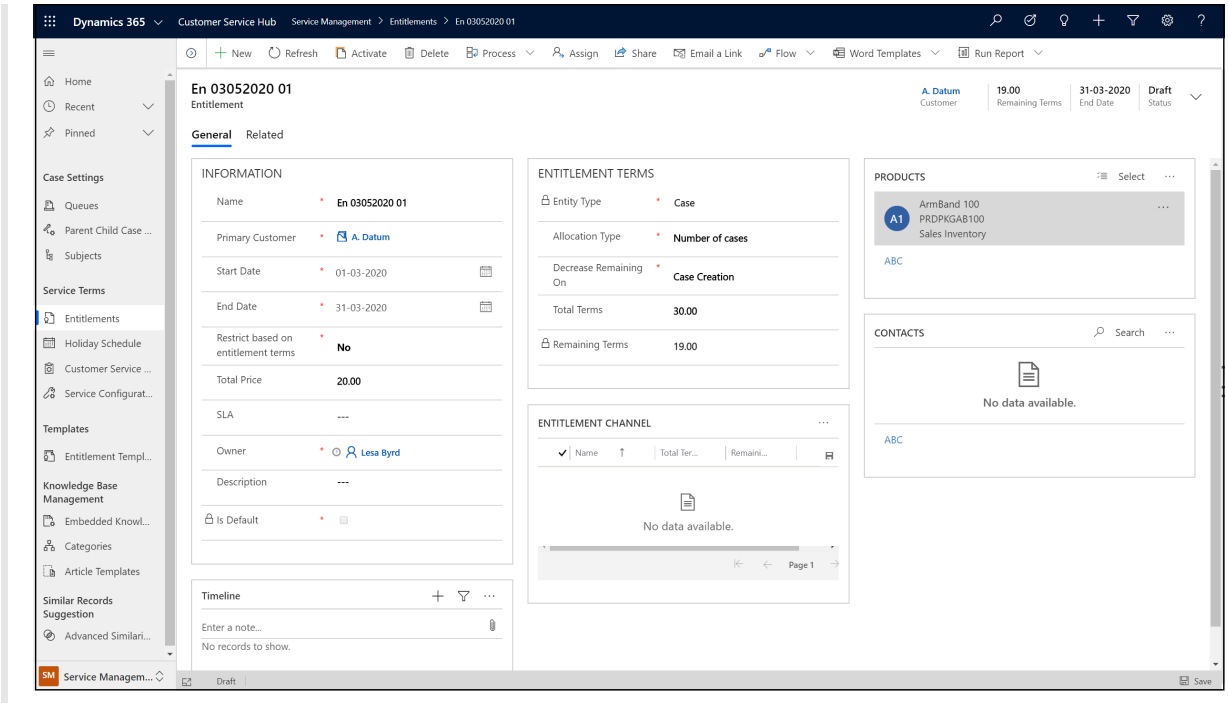
Things to consider

This section provides information on the functionalities that are different between contracts and entitlements and need to be considered in the migration process.

Single product contract

If you've a contract tied to a single product, follow these steps:

1. Create an entitlement.
2. Add only one product in the **PRODUCTS** grid.



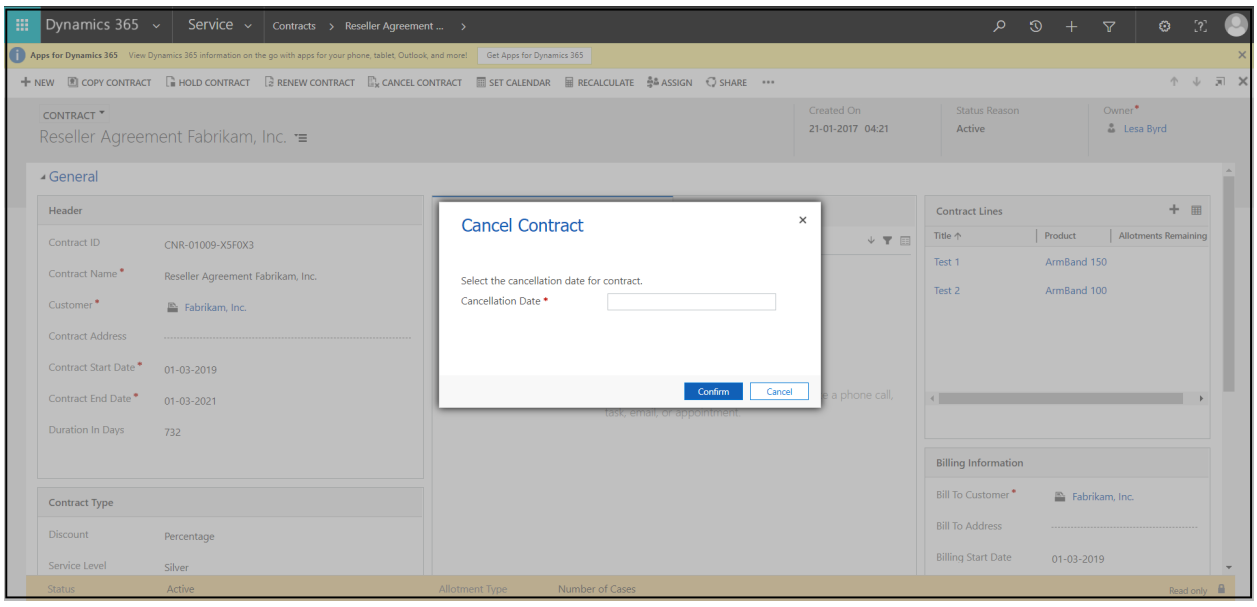
> **Note**
>
> The concept of grouping contract lines for a contract isn't available in entitlements. You need to create separate entitlements for every contract line.

Contract and entitlement cancellation

A contract or entitlement can be canceled using the following steps:

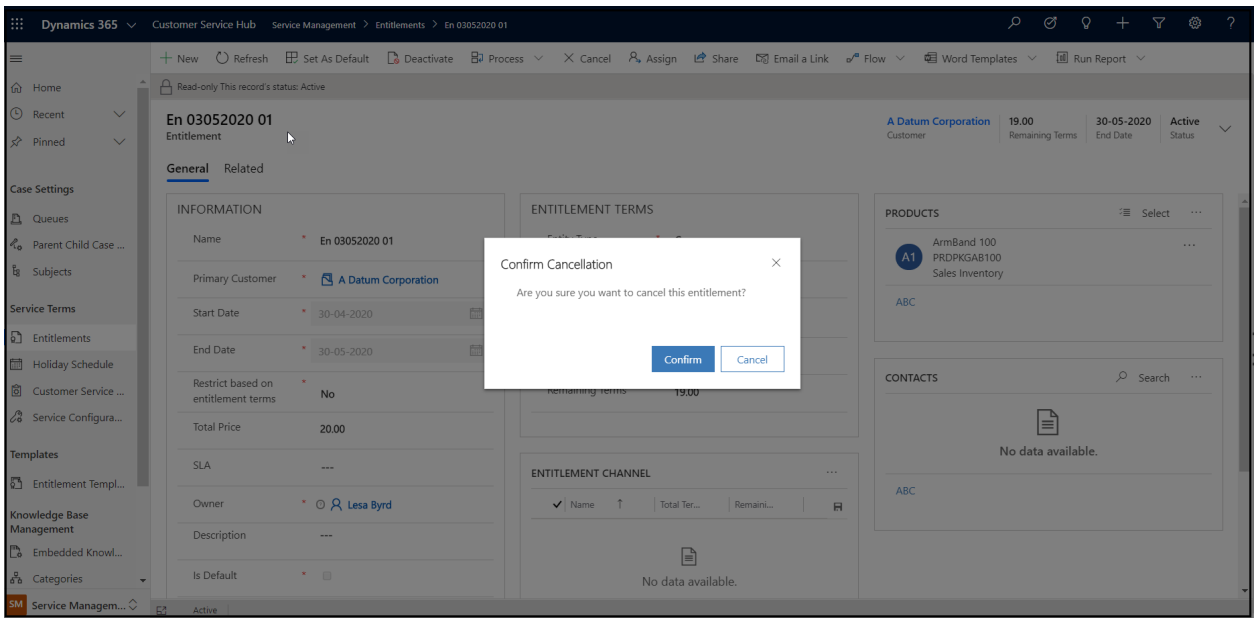
Cancel a contract

Contracts can be canceled immediately or in the future by selecting a date.



Cancel an entitlement

An entitlement can be canceled only immediately; you can't set a date to cancel it in the future.



Billing unit in contracts

Billing unit isn't available in entitlements. To achieve this capability in entitlements, use custom logic.

For simple rollups, use rollup fields. For more information, see rollup fields.

Commands in contracts

The following commands have been deprecated in entitlements:

- **Copy Contract:** To clone the contract.
- **Recalculate:** To recalculate the billing rollup.
- **Hold Contract:** To hold the contract.
- **Release Hold:** To release the on-hold contract.

The following commands are available in entitlements:

- **Renew:** To renew the expired entitlement.
- **Cancel:** To cancel the active entitlement.

State mapping

- The invoiced state in a contract can be mapped to the waiting state in the entitlement.
- The draft, active, canceled, and expired states are the same for both contracts and entitlements.
- The on-hold state isn't available in entitlements.

Runtime scripts for migrating contracts

After making sure that all aspects of feature parity for records in contracts are available in entitlements, perform the following steps to migrate from contracts to entitlements:

1. Move the contract and contract lines to entitlements using update scripts or an import tool such as Microsoft Excel.
2. Create and run update scripts to update entitlements on a case instead of contracts.

For business requirements, if a resolved case needs to be updated, perform the following steps:

1. Activate the case.
2. Update the entitlement lookup.
3. Resolve the case.

> **Important**
>
> In contracts and contract lines, the contract lines can be associated with a product that is different from the one listed in a case. However, in entitlements, the product listed in a case should match the product listed in the entitlement.
>
> **Example**: The contract lines associated with the product Armband 100 can be associated in the case list that is linked to another product, Armband 150. However, in entitlements, an error will occur when you link an entitlement associated with a product, Armband 100, with a case linked to Armband 150.

Introduction to migration of legacy Service scheduling data

Article • 11/30/2021

Using the new scheduling experience in Customer Service Hub, you can schedule all your resources optimally and efficiently to plan service activities for your customers. You can now migrate your data to the new scheduling experience using the data migration wizard in the Customer Service Hub app.

To learn more, see Understand the new scheduling experience.

Consider the following scenarios before you begin migration:

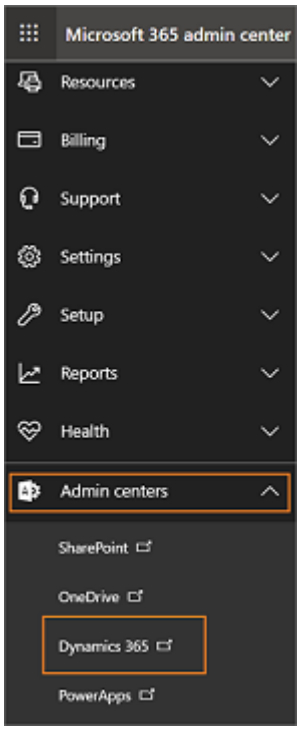
- If you haven't been using the legacy scheduling experience and you are setting it up for the first time in the Customer Service Hub app, see Set up the new scheduling experience.

  > **Note**
  >
  > As an admin, you should configure all your entity records in the new experience manually from the user interface. You must follow the order as given in the **Scheduling scenario** while configuring entity records in the new scheduling experience.

- If you've been using the legacy scheduling experience and plan to migrate to the new scheduling experience in the Customer Service Hub app, use the migration solution. The new migration package lets you migrate scheduling entity records. To learn more, see Migrate entity records and Install Scheduling solution.

Install Scheduling solution

1. Go to Microsoft 365 Admin center.
2. Select **... Show all** > **Admin centers** > **Dynamics 365**. Dynamics 365 opens in a new tab.



3. In the **Dynamics 365 Administration Center**, under the **Instances** tab, select an instance type from the drop-down.
4. Select the edit icon next to solutions. The **Manage your solutions** page appears.
5. In the **Manage your solutions** page, select **Service Scheduling Migration**. The status column shows **Not installed**.
6. Select the install icon next on the **Service Scheduling Migration** card. The **Terms of service** page appears.
7. In the **Terms of service** page, read the terms and conditions and then select **Install**. The installation may take few minutes.

After successful installation, you can access scheduling in the Customer Service Hub sitemap.

Plan your migration

Migrate entity records

Plan your migration

Article • 01/29/2022

This topic explains the considerations and best practices that you need to be aware before starting the migration.

Considerations for migration

The following conditions need to be considered to perform migration.

- **Role privileges:** To perform the migration, you must have administrator or system customizer roles. The list of privileges that are required if you want to assign to any other roles are as follows:
  - msdyn_ursmigrationlogs
  - msdyn_ursmigrationinfo
  - msdyn_ursmigratedentitiesinfo

- **Order of migration:** Migration of the entity records follow an order. That is, when the migration of one entity record completes, then the next entity will be processed for migration.

  The order of the migration is as stated:

  1. Site
  2. User
  3. Facility/Equipment
  4. Team
  5. Resource Group
  6. Service
  7. Service Activity

- **Migration start date and end date:** Start date and end date helps you to migrate the service activities that are scheduled to happen between the date range you've specified (only the start date is inclusive).

  Scenario example: You've specified the migration end date field as **07/22/2019**.

Migration End date	Activity scheduled date	Activity end date	Entity record migration	Reason

Migration End date	Activity scheduled date	Activity end date	Entity record migration	Reason
07/22/2019	07/23/2019	07/23/2019	No	The service activity won't be migrated as the scheduled date is beyond the end date.
07/22/2019	07/22/2019 at 2300 hours	07/23/2019 at 0500 hours	No	The service activity won't be migrated as the scheduled activity ends at a date later than the specified migration end date.
07/22/2019	07/22/2019 at 2359 hours	07/22/2019 at 0500 hours	Yes	The service activity will be migrated as the activity ends before the specified migration end date.

- **Recommendation:** For best migration experience, we recommend that you don't use Service Scheduling until the migration is completed.
- **Ignore entity records:** If you don't want to migrate certain entity records from legacy Service Scheduling to Unified Interface based Service Scheduling, then you need to add **Migration Status** attribute and set the value as **Ignore**. The records that are marked as **Ignore** won't be migrated by the tool. The field displays the following statuses:

Status	Description
Failed	The entity records that failed in the migration process.
Ignore	The entity records that are ignored in the migration process.
In Progress	The entity records that are in progress in the migration process.
Migrated	The entity records that are migrated in the migration process.
Not Started	The entity records that are not yet started for migration.

- **Failed Migration for certain records:** When the migration of an entity record fails, then you can retry migration. For the retry scenario, the number of records that are displayed in the screen are the records that didn't migrate in the first run of the migration and also, those entity records that were created after the first run.
- **New entity record:** If you create any records after you start the migration, the new entity records might not be reflected in the migration summary.

- **Custom plugins and workflows:** After the migration, if you've custom plugins and workflows, examine them for compatibility with the new scheduling experience.
- **Updating records during migration:** After you've migrated an entity record, if you update the record in the legacy service scheduling, the difference of update can't be migrated using the tool. You must manually update the changes in the new service scheduling experience.

Ignore entity records during migration

To ignore an entity record during migration, perform the following steps.

1. Sign in to Dynamics 365.
2. Go to **Settings** > **Customizations** > **Customize the System**.
3. Expand the entity you want to ignore, and select **Forms**. For example: **Facility/Equipment**.
4. Select the section to which you want to add the field.
5. Drag the **Migration Status** field from the **Field Explorer** pane and drop the field in the section where you want to add.
6. Select **Save**.
7. Select **Publish** to publish the customizations.

Introduction to migration of entity records

Migrate entity records

Migrate data from legacy Service scheduling using migration tool

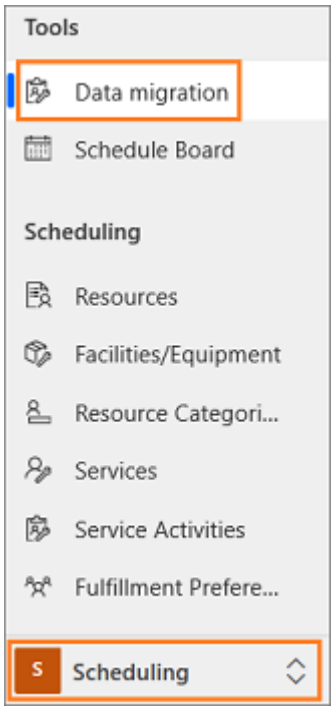
Article • 11/30/2021

Follow these steps to migrate entity records from legacy scheduling experience to the new scheduling experience.

1. Sign in to the Customer Service Hub app with Administrator or System Customizer role privileges.

2. Select **Scheduling** from **Change area**.

3. Select **Data migration** under **Tools**. The **Migrate to Service scheduling on Unified Interface** page displays the **Last run status**. If you've never run the tool, then the **Date** and **Status** field will be blank.



4. Review the details and select **Next** in the **Migrate to Service scheduling on Unified Interface** page. The **Step 1/3: Configuration data** page appears that displays the name of the entity records and the total number of records that will be migrated.

5. Specify the following in the **Step 2/3: Service Activities** page and select **Migrate**.

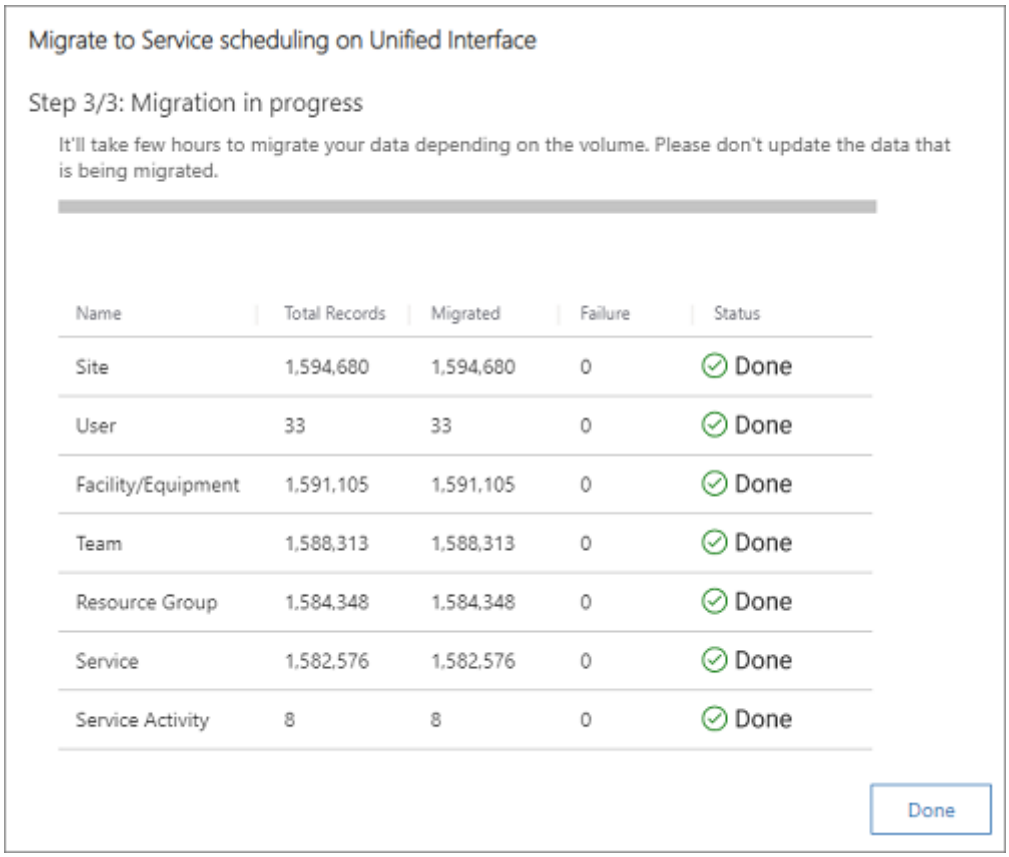
Field	Description	Value
Migrate Service Activities	Set the toggle to **On** to migrate the service activities.	On

Field	Description	Value
Start date	Select a start date from the date picker.	6/20/2019. **Note:** This is an example value.
End date	Select a end date from the date picker.	9/23/2019. **Note:** This is an example value.

The tool considers all the Service activities that are scheduled to start and be completed within the date range.

> **Note**
>
> - The migration tool doesn't consider the records whose status is marked as Ignore. To learn more, see **Understand migration status**.
> - If you create any records after you start the migration, the new entity records will not be fetched and migrated.

6. Review the information in the confirmation dialog and select **Migrate**. Once you migrate, the action cannot be undone.
7. Review the status of the migration. If the migration is successful, select **Done**, and the migration status page is displayed.



> **Note**
>
> After you've migrated an entity record, if you update the record in the legacy service scheduling, the difference of update can't be migrated using the tool. You must manually update the changes in the new service scheduling experience.

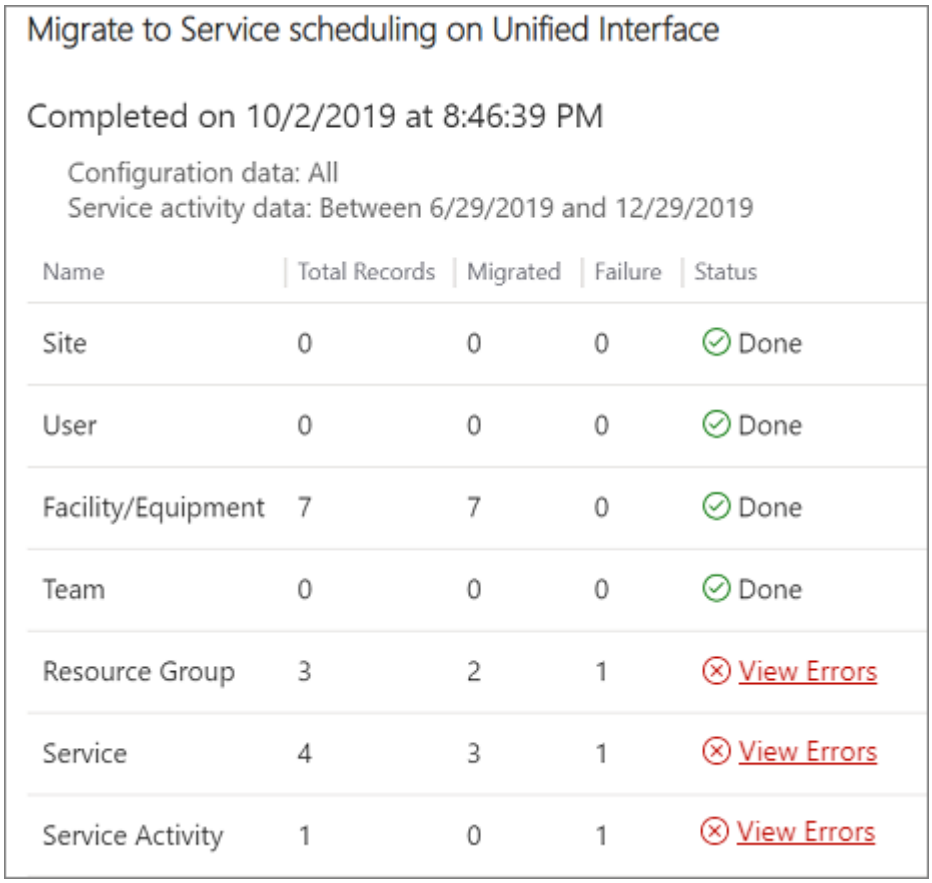
Understand migration summary and troubleshoot

The status column displays two types of migration statuses for the entity records:

- **Done:** When the migration of the entity records is completed successfully, the tool displays the status as Done.
- **View Errors:** When the migration of the entity records is failed, the tool displays the status as View Errors.

View errors

If the migration of one or more entity records has failed, the status column displays for which entity records the error has occurred.



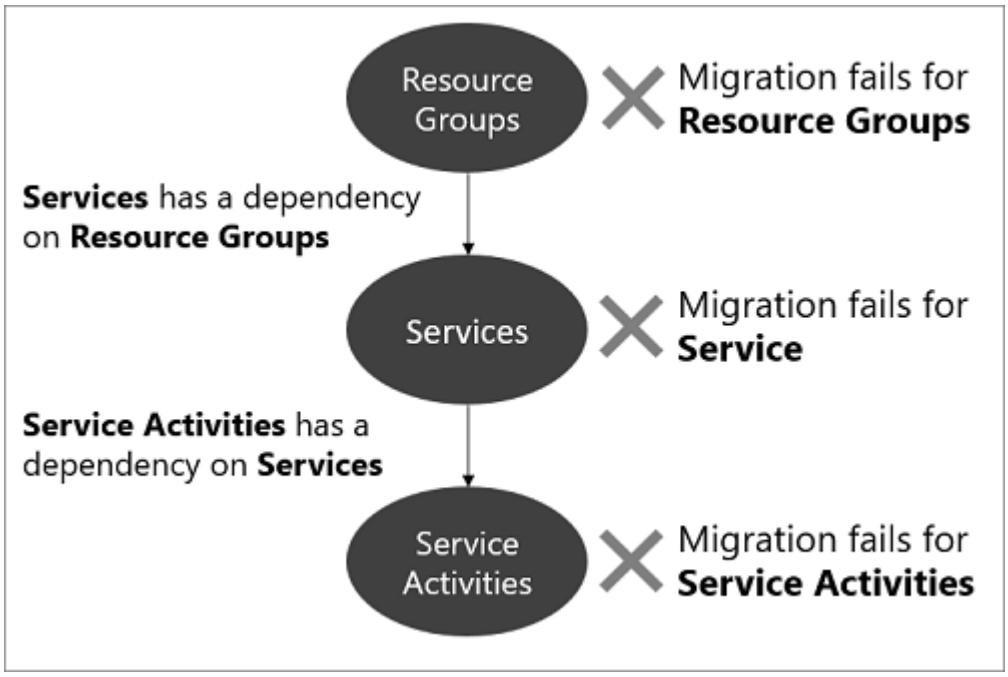
Select the **View Errors** in the status column to view the details in a new browser tab. The tool navigates to the associated entity view that shows the record name, status (which will be failed all the time), and migration failure reason.

For example, when you select the View Errors option against the **Service Activity**, a new browser tab opens, and the tool displays **Service Activities - Migration Status** page.

To learn more, see Troubleshoot using migration information.

Troubleshoot to resolve migration errors

One of the reasons for the failure of entity record migration is a dependency among the entity records. That is, a **Service Activity** entity record has a dependency on the **Service** entity record, which in turn has a dependency on the **Resource Group** entity record. If the migration of **Resource Group** fails, then migration of **Service** and **Service Activity** also fails.



> **Tip**
>
> Resolve the errors in the order in which the entity records are migrated. To learn about the order of migration, see **Considerations for migration**.

For example,

Henry Ross, a customer, has scheduled a service activity with Contoso Bike Center. To do this service activity, the **Bike technicians** resource group and **Bike overhaul** service are required.

See the matrix for the dependency.

Entity name	**Record name**
Resource Group	Bike technicians
Service	Bike overhaul
Service Activity	Henry Ross (customer)

The **Service Activity** for Henry Ross has a dependency on the **Service**, Bike overhaul and **Resource Group**, Bike technicians.

Let us take the preceding example to learn how to resolve the error.

1. Select **View Errors** against the **Service Activities** record in the **Data Migration Wizard** tab.

The **Service Activities - Migration Status** page opens in a new browser tab. You can view the migration error message for the **Henry Ross** customer stating service has failed due to the **Dependent ResourceGroup is not migrated**, which has the GUID as `3979D7DB-F5DA-E911-A81F-000D3A6D4947`.

2. Open a new browser window and go to `https://<dynamics org url>api/data/v9.0/services(<Guid>)`. For example, `https://<dynamics org url>api/data/v9.0/services(3979D7DB-F5DA-E911-A81F-000D3A6D4947)`.

   Now, you find the record name. In our case, it is **Bike technicians**, which is a **Resource Categories** entity in the new service scheduling experience.

3. Select **View Errors** against the **Resource Categories** record in the **Data Migration Wizard** tab.

   The **Resource Categories - Migration Status** page opens in a new browser tab. You can view the error the caused the Site entity record failure.

4. Resolve the error that caused the migration failure, and then you can go to the migration step, and select **Retry Migration** to start the migration for the failed entity records.

   > ⓘ **Note**
   >
   > In case of retry scenario, the migration tool shows the number of records that need to be migrated in that retry scenario of migration.

5. Review the migration status, if there are any errors, investigate in a similar way as explained in this example.

Omnichannel for Customer Service app deprecation and migration FAQ

Article • 06/28/2023

This article contains commonly asked questions about the deprecation of the Omnichannel for Customer Service app and migrating to Customer Service workspace.

Why is the Customer Service workspace app replacing Omnichannel for Customer Service?

Continued investment in two multisession apps that are at feature-level parity limits our ability to deliver new features for customers.

Is the omnichannel feature being deprecated?

No, omnichannel is a platform feature that's accessed through applications. One of those applications for agents, Omnichannel for Customer Service, has been planned for deprecation.

What does deprecation mean?

Deprecation means Microsoft plans to stop investing in a feature or app after the deprecation date. In this case, the Omnichannel for Customer Service app is deprecated as of April 1, 2023.

Is the Omnichannel for Customer Service app still supported now that it's deprecated?

Yes, support is available until June 2024.

Can I continue to use the Omnichannel for Customer Service app?

Yes, you can. Omnichannel for Customer Service continues to be supported until June 2024. More information: Enable the Omnichannel for Customer Service app and disable the Customer Service workspace app

What is the end-of-support date?

End of support for the Omnichannel for Customer Service app is planned for June 2024.

Since Omnichannel for Customer Service is no longer being invested in now that it's deprecated, what app should I use?

You can use the Customer Service workspace app, which has feature-level parity with the Omnichannel for Customer Service app.

Do I need a different license to access the Customer Service workspace app?

No, you don't need a different license. The Customer Service workspace app is available with your current licensing.

Will I lose functionality when I move from the Omnichannel for Customer Service app to the Customer Service workspace app?

No, the two applications are at feature parity.

How do I manage the Customer Service Workspace app?

You can manage Customer Service workspace in the Customer Service admin center app, which is also used to manage Omnichannel for Customer Service.

How do I move my Omnichannel for Customer Service app configurations to the Customer Service workspace app?

To migrate your Omnichannel for Customer Service app configuration to Customer Service workspace, follow the steps in the migration guide.

Migration tool FAQ

Article • 08/22/2023

FAQ on migration tool for automatic record creation rules and service level agreements (SLAs)

Who can access or run the migration tool?

Administrators and users with CSR manager roles can run the migration tool.

Are migrated rules automatically activated post-migration?

No. You must manually activate the migrated rules when migration is complete.

Can I still use my legacy rules after the deprecation deadline?

Yes, any active legacy rules after the deprecation deadline will still run until they're deactivated. However, supportability and the editing experience will stop after deprecation.

Can I activate a rule with an incomplete migration status?

No. A migrated rule can only be activated when **Mark as complete** is toggled to **Yes** (that's when the rule is considered successfully migrated).

> ⓘ **Note**
>
> Review the incomplete rule to resolve any issues before you toggle the **Mark as complete** to **Yes**, and then activate the rule.

Will the legacy rule be deactivated?

- **For ARC, yes.** When you activate a migrated ARC rule in Unified Interface, the corresponding legacy rule will be deactivated.
- **For SLA, no.** When you activate a migrated SLA rule in Unified Interface, the corresponding legacy rule remains active because they can coexist.

What does an "incomplete" status mean?

- If located in the **Summary** section, it means the overall migration process couldn't successfully complete the migration of all selected rules.
- If listed next to a rule, it means the rule has either failed or couldn't be fully migrated (meaning one or more items or conditions failed to migrate).

Where can I find a list of partially migrated rules that are tracked in the migration tool?

Rules that are partially identified or identified as "incompletely migrated" are tracked under **Pending** in the **Summary** section since they aren't considered fully migrated. Only rules that completed migration successfully are counted under **Migrated**.

Are custom forms or fields supported by the migration tool?

- **For ARC, yes.** The migration tool does support custom entities and custom fields, attributes, and configurations.
- **For SLA, no.** Custom entities, fields, attributes, and configurations aren't fully supported by the migration tool. Users would need to modify any existing customization flows, workflows, plugins, or any other custom code on the custom entities, fields, attributes, and configurations to complete the migration.

Do I need a separate license for Power Automate before running migration?

No. For more information on licensing guidelines, go to What are Microsoft Power Apps and Power Automate use rights for Dynamics 365 applications?

Some of my rules are incomplete or partially migrated. What should I do?

You can either fix the rule in the web client based on the problem details and rerun your migration, or fix the migrated rule directly in Unified Interface.

Can I rerun the migration tool for a specific migrated rule?

Yes, you can rerun the migration tool for a specific migrated rule based on the following:

- **For incomplete or failed migration rules:** Select the same rule when you rerun the migration tool. It automatically replaces the existing failed or incomplete rule with the newly migrated one.
- **For successfully migrated rules:** Delete the migrated rule in Unified Interface before rerunning the migration tool.

What happens to existing SLA records that are associated with legacy SLAs after the migration is complete?

1. If the legacy SLA is deactivated after migration: The timer will continue to run until the terminal state for such SLA records but the **Resolve** or **Pause** functionality won't work.

2. If the legacy SLA is still in **Active** state: Existing SLA records with legacy SLAs will continue to work as expected.

3. If you want to use SLAs created in the Unified Interface apps on existing records: You'll need to update the SLA field to Unified Interface SLA manually or write the plugin to update the records. For example, the plugin logic could be Modern Flow or Workflow.

For information about migrated rule or flows in modern ARC, go to FAQ about modern automatic record creation.

Known condition conversion issues

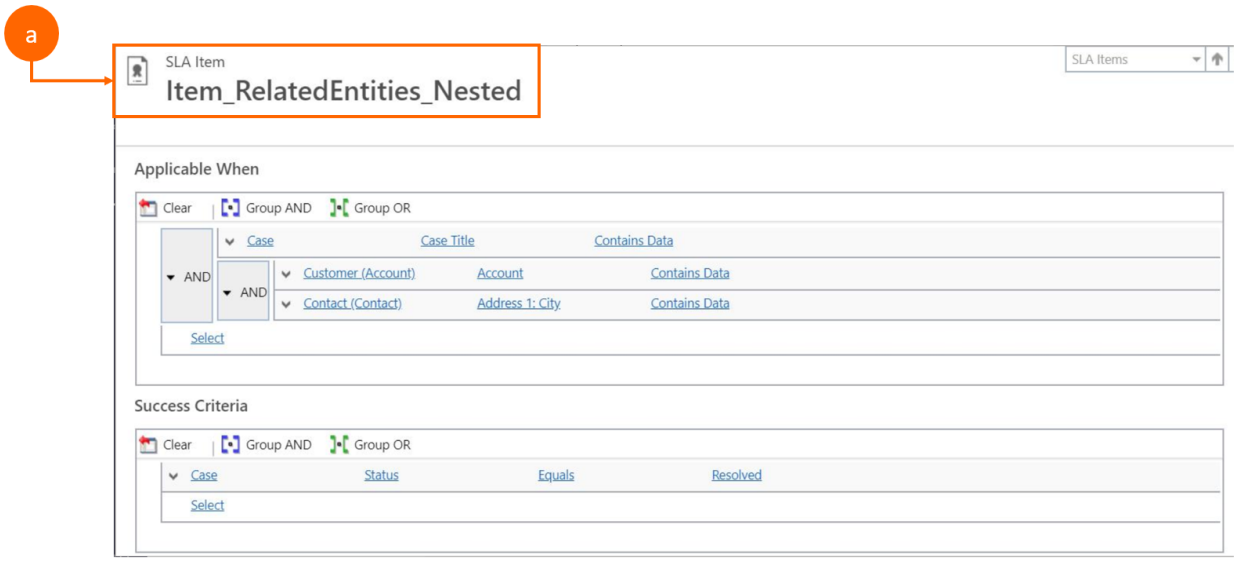
The following are key scenarios where rules or items won't successfully complete migration:

If my rule items or conditions have related entities inside a nested group clause (and/or), will they be migrated to Unified Interface?

No. We currently only support one level of the related entity hierarchy. For such rule items or conditions to successfully migrate, you need to remove any related entity in group clause before you migrate. If you don't take any action, the rule will fail during the **Premigration checkup** step, and if you then choose to continue with the migration, the rule will have an empty condition for the respective item.

Example: Premigration view

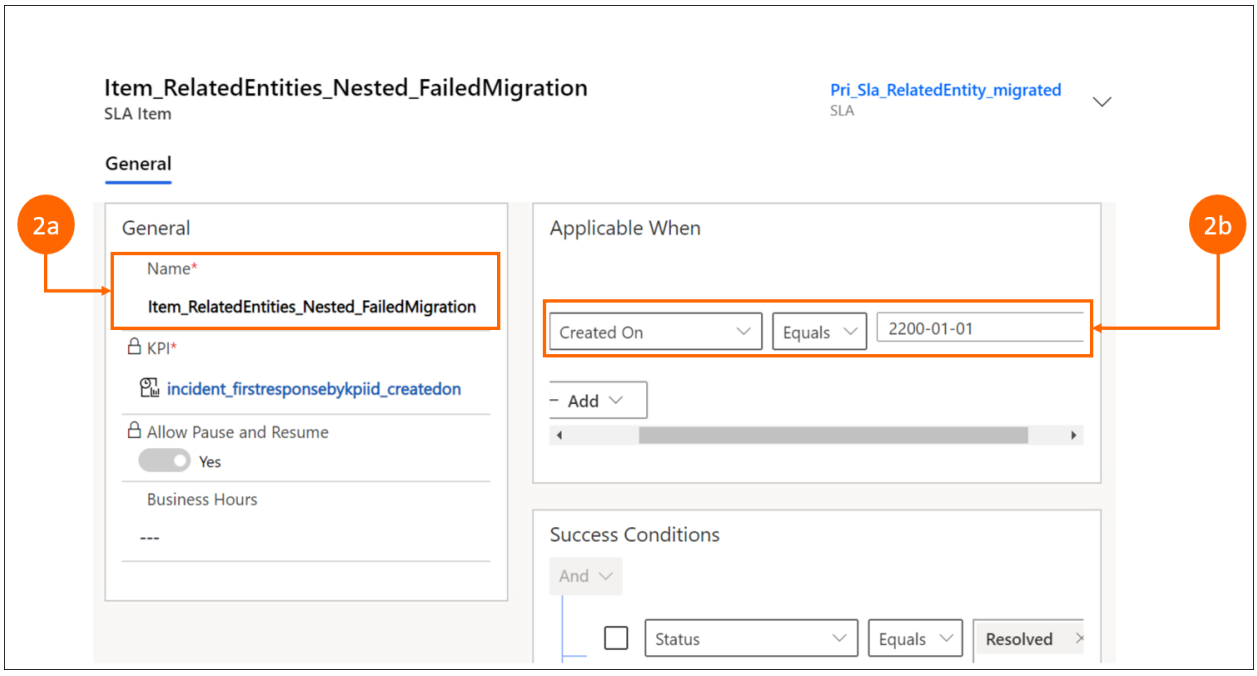
a. Premigration web client view.



Example: Post-migration Unified Interface view

2a. The migrated item title changes to **_FailedMigration** appended.

2b. The same standard placeholder, **Created On equals 2200-01-01**, is added to the condition.

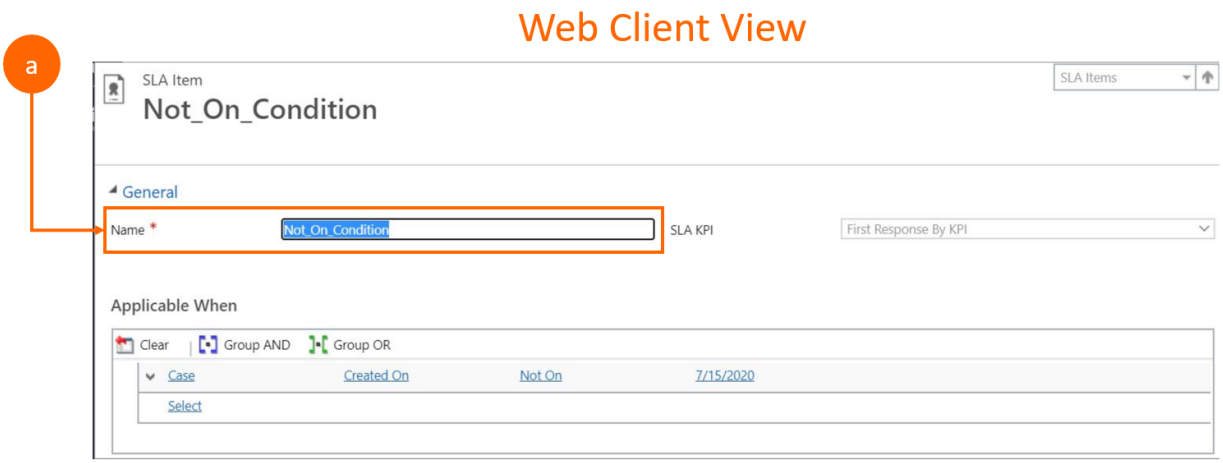


Why do my rule items or conditions with a DateType field that uses a "not on" operator fail during the premigration checkup and actual migration?

The **Not on** operator for the **Date** data type isn't supported in Unified Interface, and therefore isn't supported as part of migration. To fix this issue, you can change the legacy items or conditions from **{not-on selecteddate}** to **{selecteddate less than and selecteddate greater than}** in the web client before rerunning the migration tool for the respective rule.

Example: Premigration view

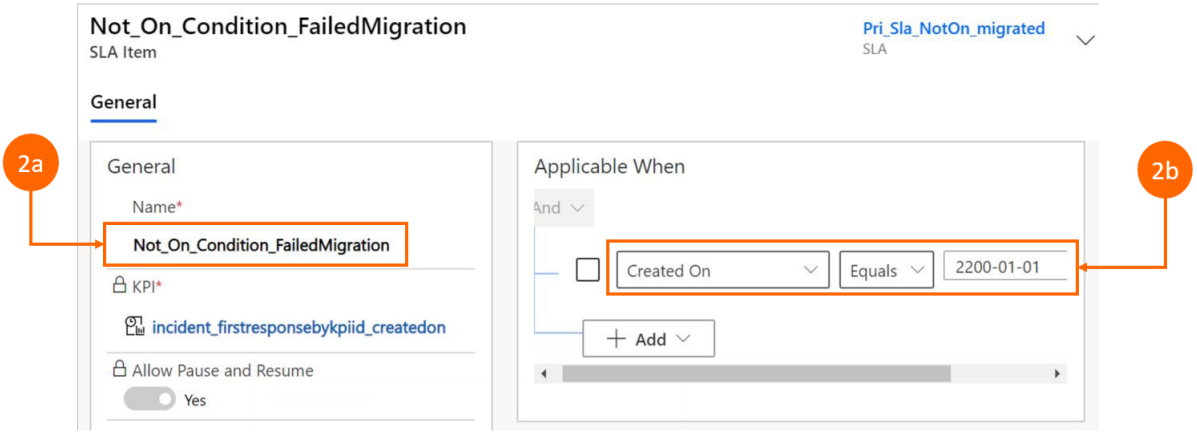
a. Premigration web client view.



Example: Post-migration Unified Interface view

2a. The migrated item title changes to **_FailedMigration** appended.

2b. The condition **Created On equals 2200-01-01** is added to the condition.



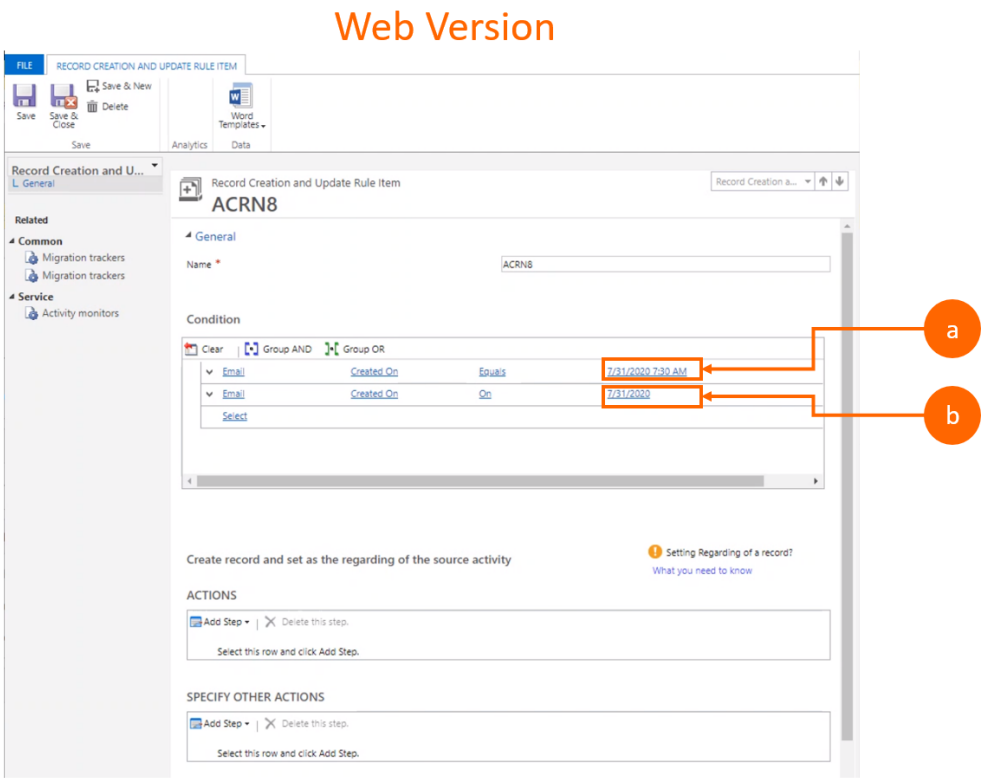
Why does the data in my DateTime field change during migration?

A separate time field doesn't exist in Unified Interface, so the DateTime field will change from a calendar control to text field. Input should be in a specific format as shown in the text box below:

Example: Premigration view

a. Premigration **Date and time** location.

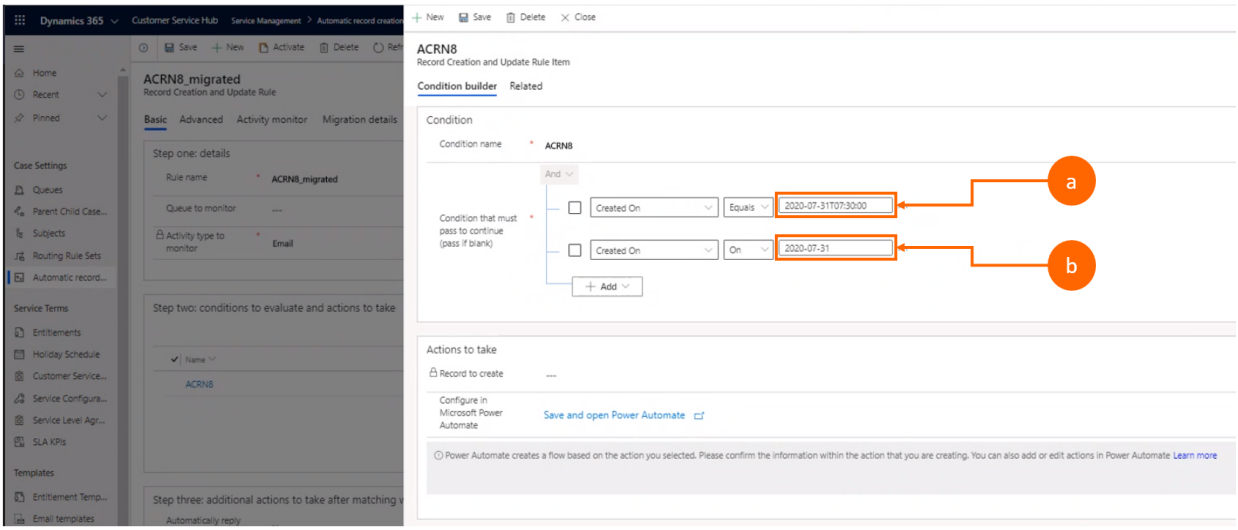
b. Premigration **Date only** location.



Example: Post-migration Unified Interface view

a. Post-migration **Date and time** location

b. Post-migration **Date only** location

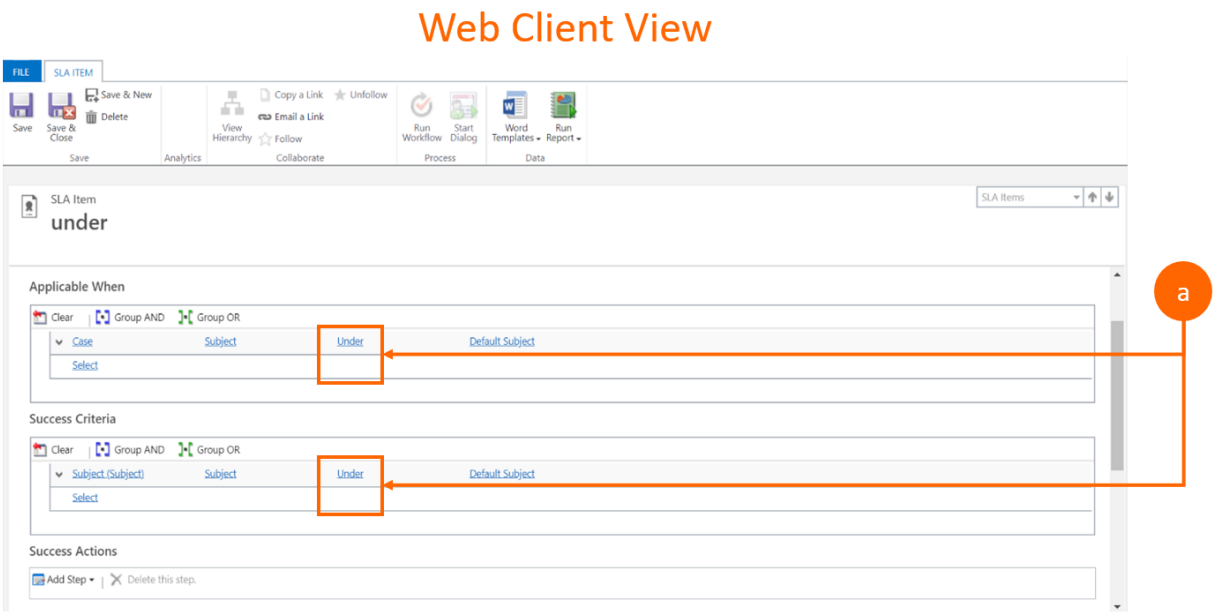


Why are some of my operator fields blank in Unified Interface after migration?**

For lookup data types, only the **equal / not equal, null /not null** operators are supported in Unified Interface and the migration tool. **Under** and **not-under** operators aren't supported in Unified Interface, and therefore aren't supported in the migration tool. Any conditions that have **under** or **not-under** operators are translated as **related entities** after migration and are shown as blank in Unified Interface after migration, and can't be edited.

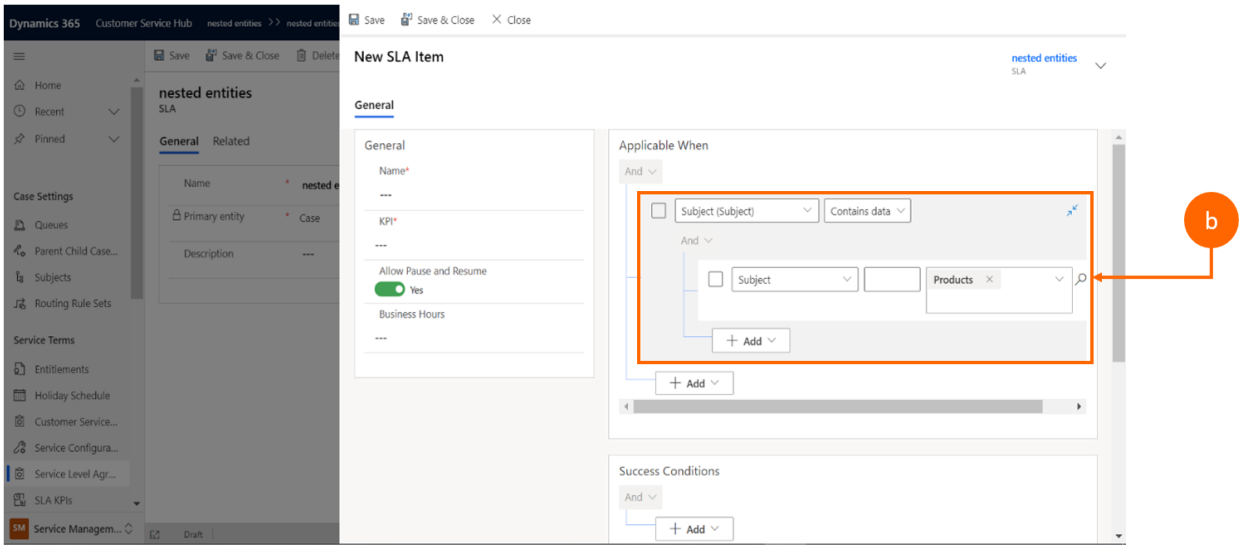
Example: Premigration view

a. Premigration web client view.



Example: Post-migration Unified Interface view

b. Post-migration Unified Interface view.



> **Note**
>
> The following limitations are applicable when defining a condition in Customer Service Hub:
>
> - The Date & Time picker control is no longer available in the conditions; however, you can still edit the date and time in the text field.
> - Only one level of the related entity hierarchy is supported, though the application lets you select nested, related entities.
> - The related entity inside a group of the and/or clause isn't supported.
> - The "not-on" operator for the Date data type is not supported.
> - For the lookups data type, only the "equal," "not equal," "null," and "not null" operators are supported. The "under" and "not-under" operators aren't supported.

Can I migrate a rule again after it's been activated?

- **Yes, for automatic record creation rules.** You can migrate an activated rule again, but you must first deactivate and delete it from Unified Interface before you can migrate it again.
- **No for SLAs.** After a migrated SLA rule is activated, it's linked to another entity (such as a case or is in use). To attempt to migrate an activated rule (which is a successfully migrated rule by default) again, you'd need to delete that specific rule.

However, there's a limitation with Unified Interface SLA rules, and once a rule is associated with a case or entity (that is, if it has been activated even once), you can't delete the rule even if it is deactivated. Therefore, the rule cannot be migrated again if it has been previously activated or applied.

Can I migrate deprecated standard SLA rules?

No. The migration tool only supports enhanced SLA rules. Standard SLA rules have been deprecated and are no longer supported in Unified Interface and therefore aren't supported in the migration tool. For more information, go to Standard SLAs in Dynamics 365 Customer Service are deprecated.

Known issues

Channel property deprecation

If you've used any channel properties in legacy rules customization, those rules won't be migrated successfully using the migration tool. There isn't a general workaround that can be applied to resolve this gap for all users. The workaround is highly dependent on how you use the channel properties in the legacy rules.

Behavior difference when the option “Create cases for activities associated with a resolved case” option is selected.

- Legacy behavior: If the email has a related case that was resolved since the specified time, the resolved case will be reactivated out of the box without customization.
- Modern behavior: If the email has a related case that was resolved since the specified time, a new case will be created out of the box. Customization is required to reactivate an existing case instead of creating a new case.

Behavior difference when the option “Create case if a valid entitlement exists for the customer” option is selected.

- Legacy behavior: If the email sender doesn't have a valid entitlement and the email has a related case, the existing related case will be updated.

- Modern behavior: If the email sender doesn't have a valid entitlement, no flow will be invoked.

Parity gaps between workflow and Power automate flow, applies only to customization on rule item actions

- “First not null” expression can’t be migrated automatically. Customization can be manually applied on the flow for the migration.
- Mapping a lookup record’s display name to a string field can’t be migrated automatically. Customization can be manually applied on the flow for the migration.
- Activity party fields used as source fields aren't supported in flow.

Known flow issues

Migrated rules have an extra @ character for fields with @ string type

If the legacy automatic record creation rule workflow is customized and has a plain text @ character in a string field, you’ll see two @, instead of one on migration. For example, if you add an email address in plain text in the case description field, then the @ character will be treated as a special character and migrated as @@.

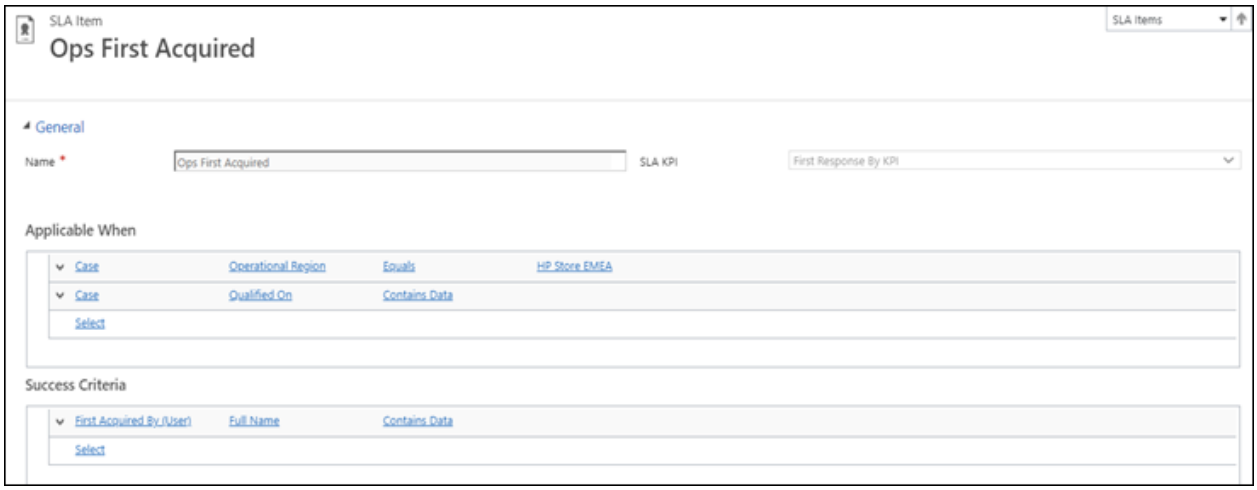
This is because @ is identified as a special character for any dynamics expression, such as @triggerOutputs()?[body/_emailsender_value] in the migration flow.

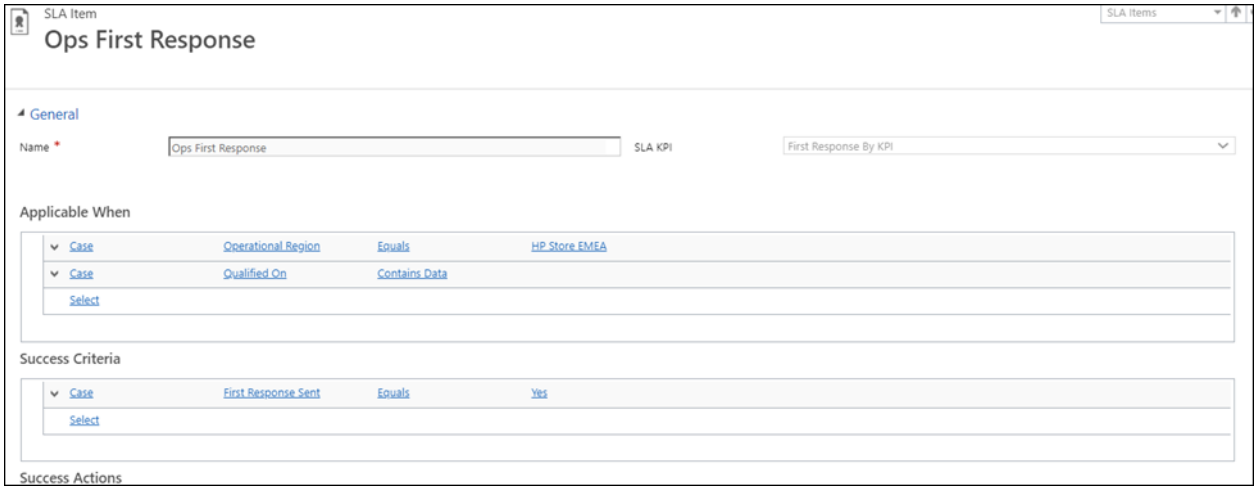
The workaround is to manually remove the extra @ in the migrated flow.

Migration doesn't support multiple items or conditions having the same "applicable when" within same SLA

In the web client, multiple items can be defined with the same "applicable when" condition and different success criteria for an SLA. However, the same capability isn't supported in Unified Interface. Therefore, during migration, the second or subsequent such SLA item with the same "applicable when" condition won't be created. The

following screenshots capture the scenario that isn't supported in Unified Interface.





Activity party-type attribute issues during workflow-to-flow conversion

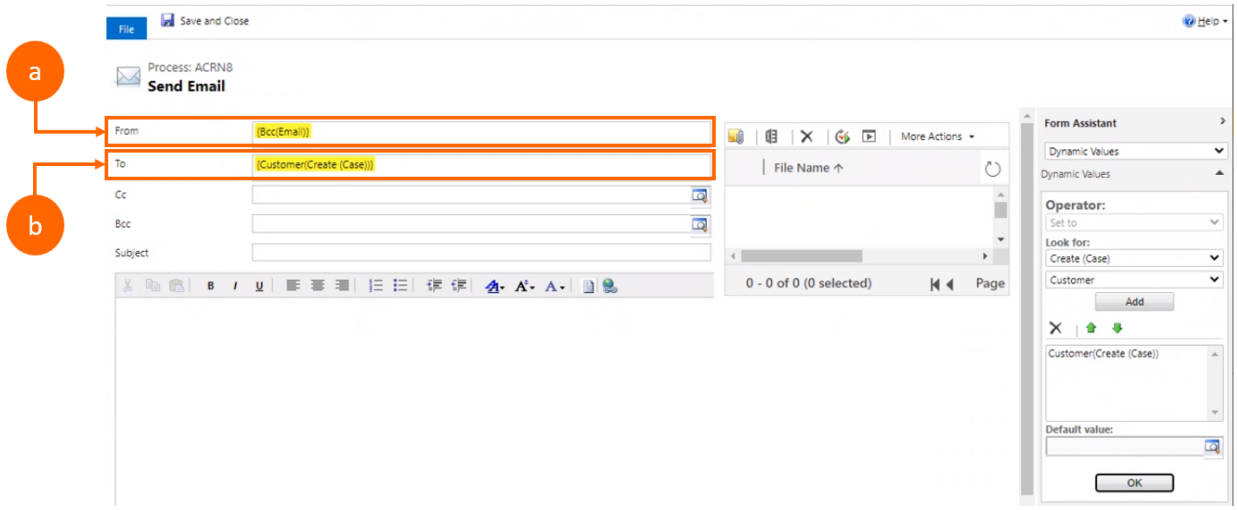
Any activity party-type attribute assigned to another activity party-type field (the most commonly impacted fields are: to, from, cc, and bcc, in emails) won't migrate during the workflow-to-flow conversion, as Flow currently doesn't support this scenario. Although the migration of the rule won't fail, the data value for such activity party-type fields that relies on another activity party-type attribute will be empty post-migration.

Example: Premigration view

a. The **From** field, which is an activity party-type field that's assigned another activity party-type attribute **{Bcc(Email)}** will be empty post-migration.

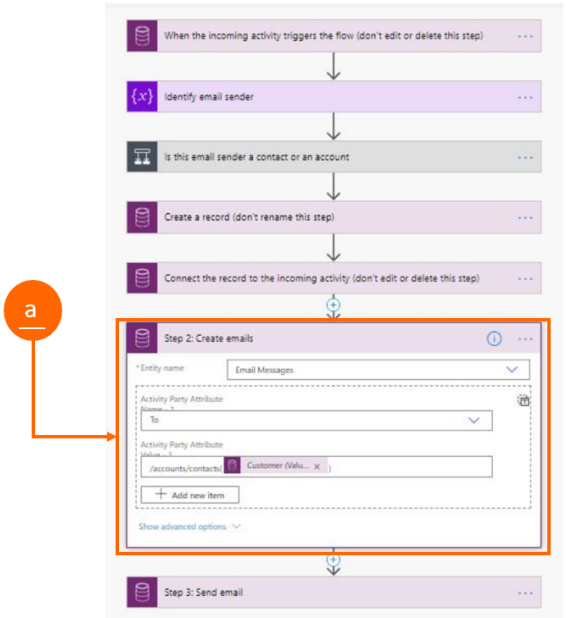
b. The **To** field will migrate.

Web Client View



Example: Post-migration Unified Interface view

b. The **To** field post-migration.



First not null checks in expressions within legacy workflow during workflow-to-flow conversion is not supported.

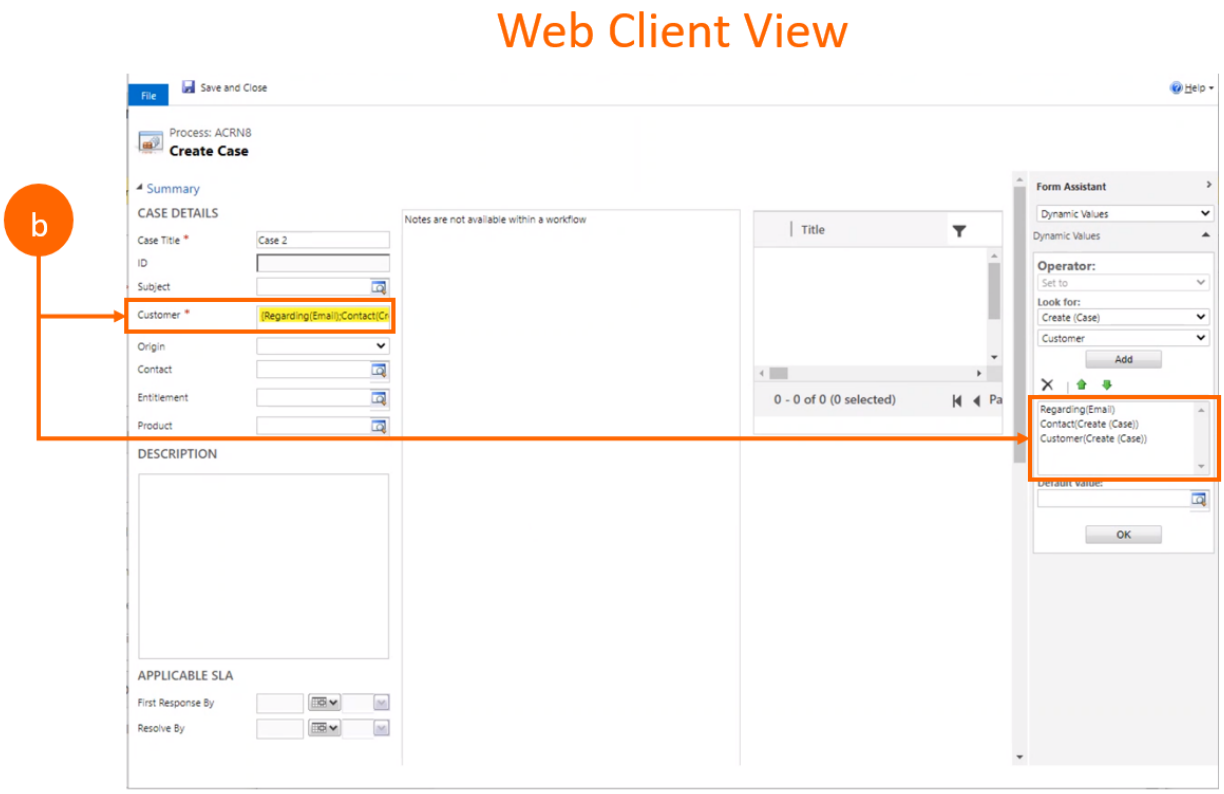
In legacy workflows, a lookup field can be mapped with multiple expressions where you check and assign the **First Not Null** expression, as shown in the web client example below. Currently, this isn't supported as part of workflow-to-flow conversion, as it's a known limitation from the legacy workflow designer. Therefore, the workflow converter assigns the first expression (without performing the null check) and removes the rest of the expressions, irrespective of whether they have **non-null** values. In the sample

snapshot that follows, the flow will only have **Regarding(Email)** in the **Customer** field within this step.

Example: Premigration view

a. Unified Interface view: In Flow, the Customer field will only have: **Regarding(Email)** regardless of whether it is null.

b. Web client view: In the workflow, the Customer field has: **{Regarding(Email); Contact(Create (Case)); Customer(Create (Case))}**



> **ⓘ Important**

Deprecations in Customer Service

Article • 10/18/2023

The features that have been deprecated in Customer Service are listed in this article.

Administrators and IT professionals can use this information to prepare for future releases.

> **Important**
>
> "Deprecated" means we intend to remove the feature or capability in a major future release. The feature or capability will continue to work and will be fully supported until it is officially removed. This deprecation notification might span a few years. After removal, the feature or capability will no longer work. We are notifying you now so that you have sufficient time to plan and update your code before the feature or capability is removed.

Intraday insights reports in Omnichannel for Customer Service are deprecated

The Omnichannel intraday insights reports are deprecated as of May 1, 2023. Support will continue to be available for the deprecated intraday insights reports until October 31, 2023. However, no new functionalities for intraday insights will be released henceforth.

Effective April 30, 2024, Omnichannel intraday insights reports won't be available for existing organizations. Reports won’t be available for new organizations or tenants onboarded after May 01, 2023, or for those organizations that haven’t used the reports in the last 30 days.

Some admin apps are deprecated

With the release of the Customer Service admin center app that consolidates admin experiences across the Customer Service suite, we announce that the following admin experiences are deprecated and no longer supported after April 2023.

- Service Management area in the Customer Service Hub app
- Omnichannel admin center
- **App profile manager:** Is removed in April 2023.

Also, as of October 2022, the Omnichannel admin center and the service management area in Customer Service Hub are hidden by default in newly created organizations and environments. You can bring them back, but we recommend that you start using the Customer Service admin center app to perform tasks like manage cases, and configure unified routing, channels, and agent experience profiles. More information: Get started with Customer Service admin center

Omnichannel Administration app is deprecated and removed in July 2023

Support for the Omnichannel Administration app ended on April 30, 2022, and the app was removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: Get started with Customer Service admin center

Omnichannel for Customer Service agent-facing app is deprecated and will be removed in June 2024

Effective April 2023, the Omnichannel for Customer Service agent-facing app is deprecated. Support is available until June 2024. We recommend that you migrate your omnichannel configuration to Customer Service workspace. More information: Migrate from Omnichannel for Customer Service to Customer Service workspace

setContextProvider method for authenticated chat is deprecated

The setContextProvider method for authenticated chat has been deprecated and isn't supported as of October 1, 2021. We recommend that you use the JWT token for authenticated chat. More information: Send authentication tokens

Support for some knowledge management entities is deprecated

The KbArticle, KbArticleComment, and KbArticleTemplate knowledge management entities that were deprecated earlier aren't supported as of October 1, 2021. We recommend that you use the newer KnowledgeArticle entity (introduced in CRM Online

2016 Update and Dynamics 365) for knowledge management in Dynamics 365. More information: Work with knowledge articles

Internet Explorer 11 support for Dynamics 365 and Microsoft Power Platform is deprecated

Effective October 31, 2022, Dynamics 365 Customer Service and Power Platform are blocked in Internet Explorer. As of early October 2022, users are redirected to Microsoft Edge if it's installed on their device. Otherwise, they'll receive a non-dismissible message informing them why they're blocked and to use Customer Service on Microsoft Edge. More information: Support end for Internet Explorer

For any questions, contact your Microsoft Customer Service representative or Microsoft Partner.

Automatic record creation rules in web client are deprecated

Effective October 01, 2020, the automatic record creation and update rules are deprecated in the web client. We recommend that you migrate your automatic record creation rules that were created in the web client to the new Unified Interface experience. For information on how to migrate the rules, see Migrate automatic record creation rules and service-level agreements. You can also refer to the migration playbook, which includes all the information you need to work on the migration. More information: Dynamics 365 SLA and ARC Migration Playbook.

Microsoft will continue to provide support and critical security updates for these features in the web client until April 01, 2023.

> **Note**
>
> The deprecation isn't applicable to the features in Dynamics 365 Customer Engagement (on-premises).

SLAs in web client are deprecated

Effective October 1, 2020, the service-level agreements (SLAs) are deprecated in the web client. We recommend that you migrate your SLAs that were created in the web client to the new Unified Interface experience. For information on how to migrate the items, see

Migrate automatic record creation rules and service-level agreements. You can also refer to the migration playbook, which includes all the information you need to work on the migration. More information: Dynamics 365 SLA and ARC Migration Playbook.

Microsoft will continue to provide support and critical security updates for these features in the web client until April 1, 2023.

> **Note**
>
> The deprecation isn't applicable to the features in Dynamics 365 Customer Engagement (on-premises).

Service scheduling in Dynamics 365 Customer Service is deprecated

The existing service scheduling functionality is deprecated, and is longer available as of December 1, 2020. The new scheduling experience, built on Universal Resource Scheduling, is now available in Unified Interface.

Existing service scheduling users will be provided advance notice for a time bound migration to the new scheduling capabilities.

There are two approaches to migrate to the scheduling experience:

Follow the guidance in the Service Scheduling Guide to set up the new scheduling experience for an existing Dynamics 365 Customer Service organization.

If your organization requires features that rely on legacy APIs, the product team is offering an incremental migration option and will update your organization to the Unified Interface experience and continue to allow the use of the legacy APIs. This approach is available as of 2020 release wave 2 with Early Access in August 2020.

Contracts, Contract Line Items, and Contract Templates entities are deprecated

The Contracts, Contract Line Items, and Contract Templates entities are deprecated and aren't supported as of April 1, 2022. They'll be removed in a future major release of Dynamics 365. This functionality has been replaced by entitlements in Unified Interface. The web client will not be available after Tuesday, December 1, 2020, and you must migrate to Unified Interface by this date. We recommend that you migrate your

contracts to entitlements at the earliest to avoid any loss in functionality. For information on the migration strategy, see Strategy for migrating from contracts to entitlements.

Standard SLAs in Dynamics 365 Customer Service are deprecated

Standard service level agreements (SLA Type field is set to Standard) are deprecated and will be removed in a future major release. Standard SLAs are replaced by enhanced SLAs. More information: Enhanced service level agreements

Customer Service Insights standalone app is deprecated

The Customer Service Insights standalone app is deprecated. We recommend that you migrate to the embedded experience within the core Dynamics 365 Customer Service applications.

Customer Service workspace legacy layout is deprecated

The Customer Service workspace legacy layout is deprecated as of April 2023, and won't be supported after October 2023. For more information, see Deprecated Customer Service workspace layout

Routing and assignment in Omnichannel Administration

Article • 06/15/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> - Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated and will be removed in July 2023**.
> - We recommend that you upgrade to the latest version of Omnichannel for Customer Service and use unified routing. For more information, see **Overview of unified routing**. With the upgrade, you can also use the Customer Service admin center app. For more information, see **Customer Service admin center**.

Routing and work assignment ensures that conversations from all the channels are routed to agents efficiently.

Advantages of routing and work assignment are as follows:

- Automate work assignments across channels.
- Set up work assignments for the best available agents based on their capacity and presence.
- Analyze and manage agent productivity across channels.

Routing and work assignment is a two-step process:

1. Routing dispatches conversations into the right queues.
2. Work assignment allocates the conversations in a queue to agents in real time, based on capacity and presence.

Overview of routing system

A customer initiates a conversation from the portal, and the conversation reaches the Omnichannel system. Now, based on the routing rules condition defined in the routing system, it starts routing the conversation to the appropriate queues.

The routing rules condition is based on the channel, CRM, and customer context that you, as an administrator, define in the Omnichannel Administration app.

When the conversation reaches to the queues, the work assignment system assigns the conversation based on triggers that are explained in the following sections.

Overview of work assignment system

> **Important**
>
> If you've upgraded your Omnichannel for Customer Service environment to 2021 release wave 1, your queues will start using unified routing services for assignment. By default, all existing queues will use the "highest capacity" assignment method for work assignment. You can change the assignment method to round robin or a custom assignment method according to your need. More information: **Set up assignment methods in Customer Service**.

The work assignment system assigns the conversation (work item) to an agent based on the following triggers:

- Work item available trigger
- Agent available trigger

Work item available trigger

When a conversation is present in a queue, the work assignment system searches for the best available agent based on the capacity and presence if there are no other conversations present in the queue.

If there are other conversations present in the queues, then the conversation will be added to the end of the queue and will be assigned to the agents after other conversations are assigned.

Agent available trigger

The work assignment system assigns one of the existing conversations that is in the queues when an agent is available.

An agent is available in the following scenarios:

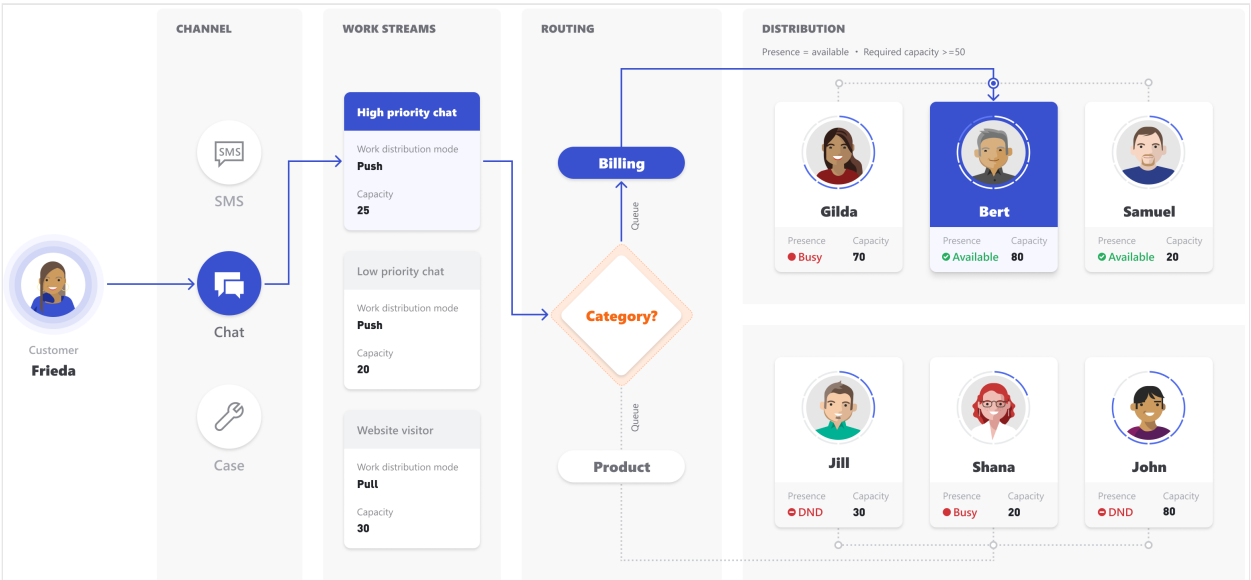
- When an agent signs in to the Omnichannel for Customer Service app.
- When an agent presence status changes from one state to another, such as **Away** to **Available**, **Away** to **Busy**, and **Away** to **DND**. An agent is also available depending on the allowed presence that is configured for the work stream.
- When an agent capacity changes due to the closure of a conversation or assignment of a conversation.
- The agent affinity is set to yes for a work stream.

Whenever agents are available, the work assignment system always retrieves the oldest conversations (longer duration) that is present in the highest priority queue and assigns the conversation to the agent who satisfies the capacity condition.

Scenario walk-through of routing and work assignment

The following section outlines a scenario to understand unified routing and work assignment and how conversations are assigned to agents.

A customer initiates a conversation (chat) regarding **Billing**. Now, routing and work assignment help route the conversation to the **Billing** queue, and assign the conversation to an agent who is a member of the queue with the required presence and capacity. This is shown in the following illustration.



Let us see the steps involved in the scenario walk-through.

- When a chat conversation originates from the customer, the system identifies the channel, and the routing and work assignment configuration details are applied. These configuration details are defined in the workstreams. Learn more, see Understand and create work streams.

  In this walk-through, the system identifies the work stream as **Product & Billing live chat** and applies the configuration details of the work stream to the incoming conversation. In this work-stream, the conversation requires a capacity of **50 units**. This implies that when the system assigns this conversation to an agent, the system blocks 50 units of agent's capacity.

- Next, the routing and work assignment logic starts. With the help of context variables, **Routing rules** identify that the conversation belongs to the **Billing** queue, and the system routes to the **Billing** queue.

- As the conversation reaches the Billing queue, the system allocates the conversation to one of the agents of the Billing queue, who satisfy the following criteria:
  - Capacity is **50 units** or more.
  - Presence status is **Available**.

As **Bert** has the required capacity and presence, the system assigns the conversation to **Bert**. After Bert starts working on the conversation, the presence changes to **Busy** and the remaining capacity is updated to **30 units**.

Adjusting an agent's capacity based on conversation allocation

Agent capacity is specified by the administrator in the User settings. See Manage users to learn how to set agent capacity. An agent's capacity is adjusted by the system when a conversation is allocated, and the following actions occur:

- The conversation is added to the agent's **My Items** list.
- The agent's presence status changes to **Busy** or **Busy DND**.
- The agent's utilized capacity increases.
- The agent's available capacity decreases.

Adjusting an agent's capacity based on closure of allocated conversation

When an agent has finished working on a conversation, the system adds the capacity back to the agent's availability, and the following actions occur:

- The conversation is removed from the agent's **My Items** list.
- The agent's presence status changes to **Available**.
- The agent's utilized capacity decreases.
- The agent's available capacity increases to the extent of free capacity.

If conversations are waiting to be assigned, they are allocated as soon as the agent becomes available.

To effectively route and distribute work to agents, admins can set up the following items in Omnichannel for Customer Service:

- Assign roles and enable users for Omnichannel for Customer Service
- Manage users in Omnichannel for Customer Service
- Understand and create work streams
- Configure a chat channel
- Configure an SMS channel
- Work with queues in Omnichannel for Customer Service
- Automatically identify customers using pre-chat responses
- Create and manage routing rules
- Configure and manage custom presence

Create workstreams in Omnichannel Administration

Article • 06/15/2022

ⓘ Important

- Support for the Omnichannel Administration app ended on April 30, 2022. We recommend that you use the Omnichannel admin center or Customer Service admin center app to configure the latest features, such as unified routing and voice channel. For more information about the deprecation announcement, see Omnichannel Administration app is deprecated.
- Additionally, workstreams that you create in the Omnichannel Administration app can't be modified in the Omnichannel admin center app. You'll need to migrate the existing workstreams and then manage them in the Omnichannel admin center app. More information: **Migrate workstreams created in Omnichannel Administration**

Introduction

A workstream is a collection of routing rules. Routing settings define how conversations should be routed to queues. Work distribution settings define how conversations should be allocated to agents within a queue. You can create the workstreams in the Omnichannel admin center, Customer Service Hub, and Omnichannel Administration apps.

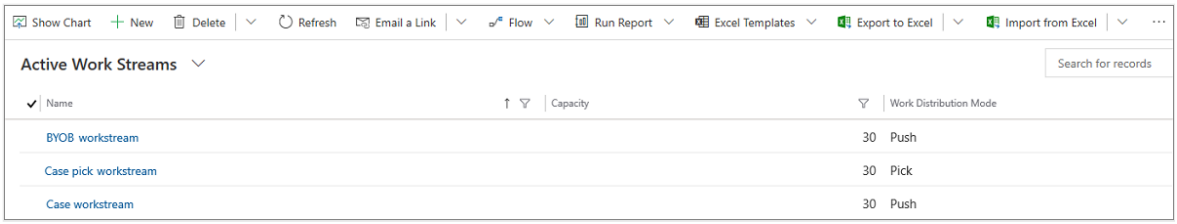
A workstream can belong to multiple channels of the same type, like multiple chat channels. In this case, all the conversations from these channels inherit the routing and work distribution settings of the workstream they belong to.

If you want to create workstreams to configure unified routing, see Create workstreams in Omnichannel admin center.

Perform the following steps:

1. In the Omnichannel Administration site map, go to **Work Distribution Management** > **Work Streams**.

   The **Active Work Streams** view is displayed.



2. On the command bar, select **New** to create a work stream.

3. In the **Work Distribution** tab of the new work stream, follow these steps:

   a. In the **General information** section, specify the following information:

   - **Name**: Enter a name for the workstream.
   - **Channel**: Channel is defined as a medium through which a customer reaches out for support. For example, a customer can contact an agent through chat.

     Select a channel from the dropdown list:
     - Live chat
     - SMS
     - Facebook
     - Entity Records
     - WeChat
     - Microsoft Teams
     - LINE
     - WhatsApp
     - Custom
     - Twitter
   - **Capacity**: Specify the units of capacity that are required to process a single conversation for the workstream in the text box. For information on how to determine capacity units, see Capacity.
   - **Auto-close after inactivity**: Enter the unit of time after which a conversation is moved from **Waiting** to **Closed** state because of inactivity.

   b. Select **Save**. The workstream is saved.

   c. In the **Work distribution settings** section, perform the following steps:
      i. Select whether the **Work distribution mode** should be **Push** or **Pick** for agents to take up a conversation.
      ii. In **Allowed Presences**, select a base presence, such as **Available** and **Busy**, from the dropdown. You can select all options also. Agents will be allocated work items if the agent presence is set to one of the statuses specified here.

If you have enabled missed notifications, do not select **Away** as an allowed presence. For information, see Configure and manage custom presence.

iii. If you have selected **Push** in **Work distribution mode**, set the toggle to **Yes** for **Enable selecting from push-based work streams**. The agents can assign work items to themselves irrespective of constraints, such as capacity and presence.

iv. If you want an ongoing conversation to be assigned to the same agent when the conversation status changes from waiting to active, make sure the **Enable Agent Affinity** is set to yes. By default, the toggle is enabled for SMS and social channels.

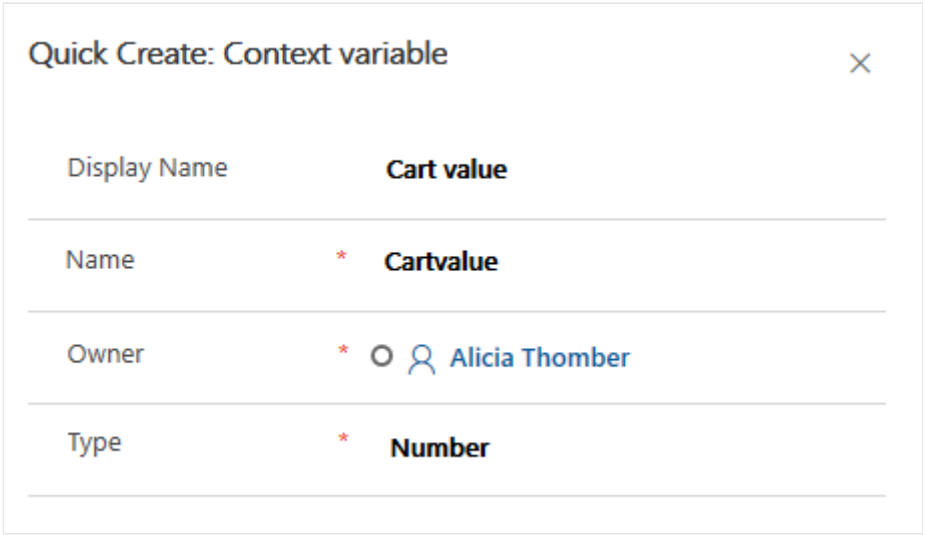
> **Note**
>
> The **Enable Agent Affinity** option is available only when the work distribution mode is push. More information: **Agent affinity**

4. View and create context variables in the **Context variables** tab. Context variables enrich conversations with pre-chat data, channel data, and custom context data. These attributes can then be used to define routing rules to route conversations to different queues.

   a. Select **New** to create a context variable in the **Quick Create** window.

   b. Enter **Display Name** for the new variable. The **Name** field is populated accordingly.

   c. Select the **Type** of variable from the drop-down list. You can choose from **Text** or **Number**.



5. Define routing rule items in the **Routing rule items** tab. Routing rule items are configured for each work stream, so that conversations can be routed to the

correct queues. To learn how to configure a routing rule, see Create and manage routing rules in Omnichannel.

6. Select **Save**. The workstream is saved.

Associate workstreams with channel artifacts

You can associate work streams with channel artifacts so that the conversations can be assigned to agents seamlessly. For example, for a live chat widget, a default workstream is already associated in the **Work stream** field. You can select the search icon to associate another workstream. Select **New** to create a new workstream from within the live chat widget.

>
> - Support for the Omnichannel Administration app ended on April 30, 2022, and the app was removed in July 2023. We recommend that you use the **Customer Service admin center** app to configure the latest features, such as unified routing and the voice channel. More information: **Omnichannel Administration app is deprecated and will be removed in July 2023**.
> - We recommend that you upgrade to the latest version of Omnichannel for Customer Service and use unified routing. For more information, see **Overview of unified routing**.

Introduction

In Omnichannel for Customer Service, queues are used for collecting and distributing workload among agents. The workload includes conversations, such as chat or SMS. Agents are added as members to the queues, and the workload is distributed among these agents.

Route conversations to queues

Queues in Omnichannel for Customer Service are proxies for skills or domains. You can create separate queues for each line of business, such as billing, investment, and products. When a customer query is raised for any of the areas, it is routed to the corresponding designated queue. You also can set up a customer support availability matrix by using a combination of queues, operating hour schedules, and routing rules.

In an enterprise scenario, you can have various supervisors handling different issues, and therefore, different types of queues are required to handle the various scenarios. Accordingly, routing rules are set up based on the complexity of issues that need to be handled.

To simplify the routing experience for administrators and supervisors, queues are categorized based on the channel types as follows:

- **Messaging**: To route all messaging conversations pertaining to the live chat, SMS, and social channels.
- **Entity records**: To route cases pertaining to entity records.

The queue types help ensure that issues will be routed correctly and help avoid cross-queue assignments. When you configure workstreams and routing rule items, the queues that will be available for selection will be based on the channel type for the workstream. For example, for routing rules for a live chat workstream, only messaging-type queues will be shown for selection. Similarly, in a conversation transfer scenario, you can transfer a chat conversation only to a messaging queue and a case to an entity queue.

Create queues in Omnichannel Administration

Out of the box, the following default queues are available in Omnichannel for Customer Service:

- **Default entity queue**: The queue that is available for routing entity records.
- **Default messaging queue**: The queue that is available for routing all messaging conversations pertaining to the live chat, SMS, and social channels.

The default queues can't be edited or deleted. All Omnichannel for Customer Service users are members of the default queues. Therefore, the membership of these default queues also can't be changed.

> ⓘ **Note**
>
> When no custom queues or routing rules are defined, all conversations are directed to one of the out-of-the-box default queues based on the work item type.

Perform the following steps to create a queue in Omnichannel for Customer Service:

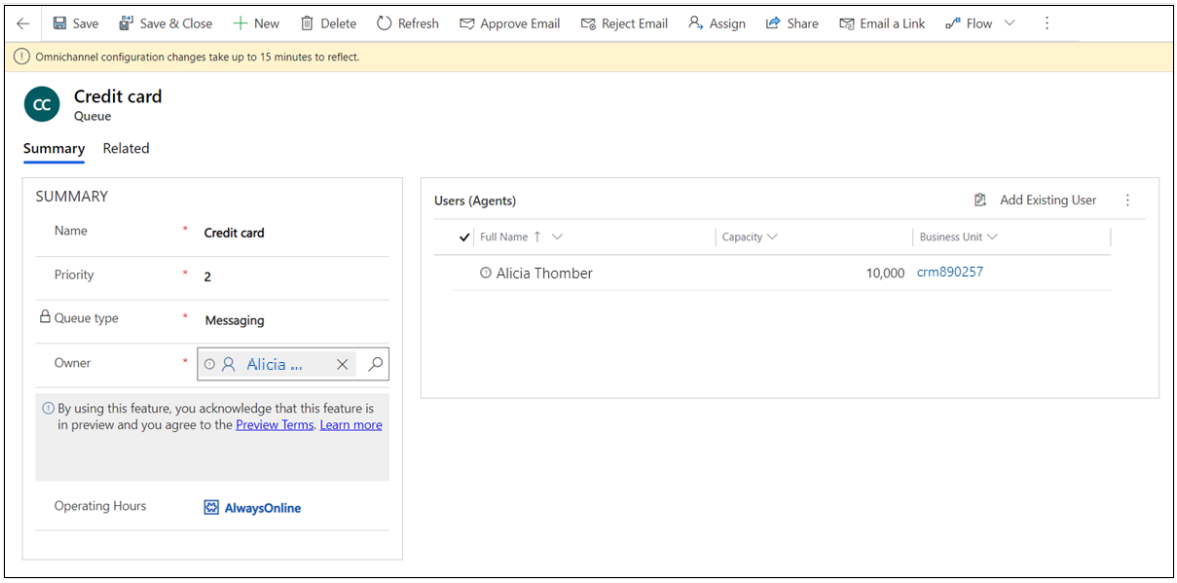
1. In the Omnichannel Administration site map, go to **Queues & Users** > **Queues**. The **Omnichannel queues** view is displayed.

2. On the command bar, select **New**.

3. On the **Summary** tab, in the **General Information** section, provide the following information:

   - **Name**: Enter a name for the queue.
   - **Priority**: Assign a priority to define how quickly a conversation should be picked from the queue.
   - **Queue type**: Select either **Messaging** or **Entity**. You can't edit the queue type after you save the queue.
   - **Owner**: Search and select an owner for the queue if you do not want to use the default owner.
   - **Operating Hours**: Search and select an operating hour schedule that you want to specify for the queue.

4. Select **Save**. The **Users (Agents)** section is displayed.



5. In the **Users (Agents)** section, select **Add Existing User** to add existing agents to the queue.

6. On the **Lookup Records** flyout menu, select the agents to add, and then select **Add**.

> **Tip**
>
> To select users from other views, you can change the view by selecting **Change View**.

> **Important**

If you've upgraded your Omnichannel for Customer Service environment to 2021 release wave 1, your queues will start using unified routing services for assignment. By default, all existing queues will use the "highest capacity" assignment method for work distribution. You can change the assignment method to round robin or a custom assignment method according to your need. More information: **Set up assignment methods in Customer Service**.

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Important

- Support for the Omnichannel Administration app ended on April 30, 2022. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. For more information about the deprecation announcement, see Omnichannel Administration app is deprecated.
- Additionally, workstreams that you create in the Omnichannel Administration app can't be modified in the Customer Service admin center app. You'll need to migrate the existing workstreams and then manage them in the Customer Service admin center app. More information: **Migrate workstreams created in Omnichannel Administration**

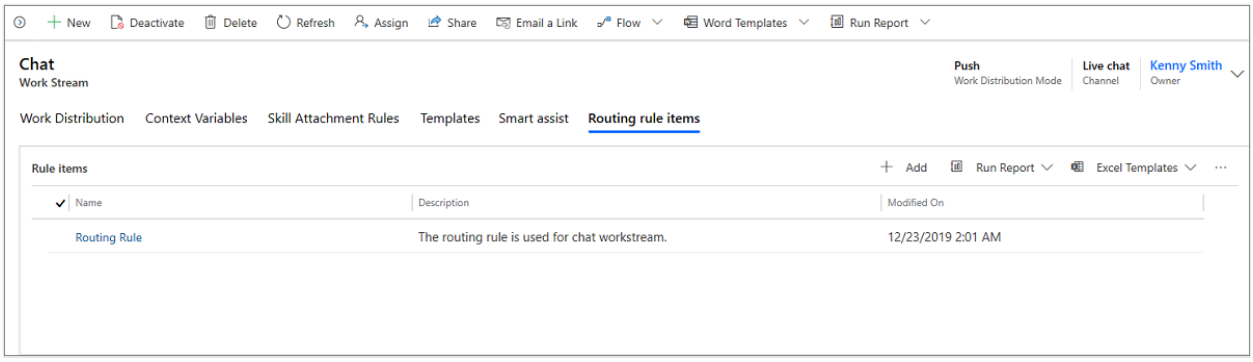
Introduction

Routing rules define how conversations are routed to different queues. Each routing rule has a condition and a destination queue. If the rule condition is evaluated as **True**, then the conversation is routed to the destination queue.

Important

Routing rules for entity records are defined at the entity record channel level. To learn more, see **Entity records routing**.

A single work stream can have multiple routing rules that are evaluated in the order of definition. For example, if a work stream called **Chat** contains 5 routing rules, an incoming chat conversation will be evaluated against all the 5 routing rules in the defined order. While you can define as many rules as your business requires, the application processes only the first 100 rules.



Routing rules are evaluated from top to bottom. If a rule condition is evaluated as **True**, the chat gets routed to the destination queue and skips further evaluation. If a rule condition is evaluated as **False**, further rules are evaluated.

Routing rule conditions could be based on channel context, pre-chat context, and contact, account, or case context. For example, you can define a routing rule so that chats from high priority customers who have specific queries about investments can be routed to a specific queue.

> **ⓘ Important**
>
> If all the rule conditions are evaluated as False for a conversation, it goes to the **Default** queue. For more information, see **Queues in Omnichannel for Customer Service**.

Create a routing rule

To create a routing rule, select a work stream by navigating to **Work Distribution Management** > **Work Streams**, and define a new rule in the **Routing Rule Items** tab.

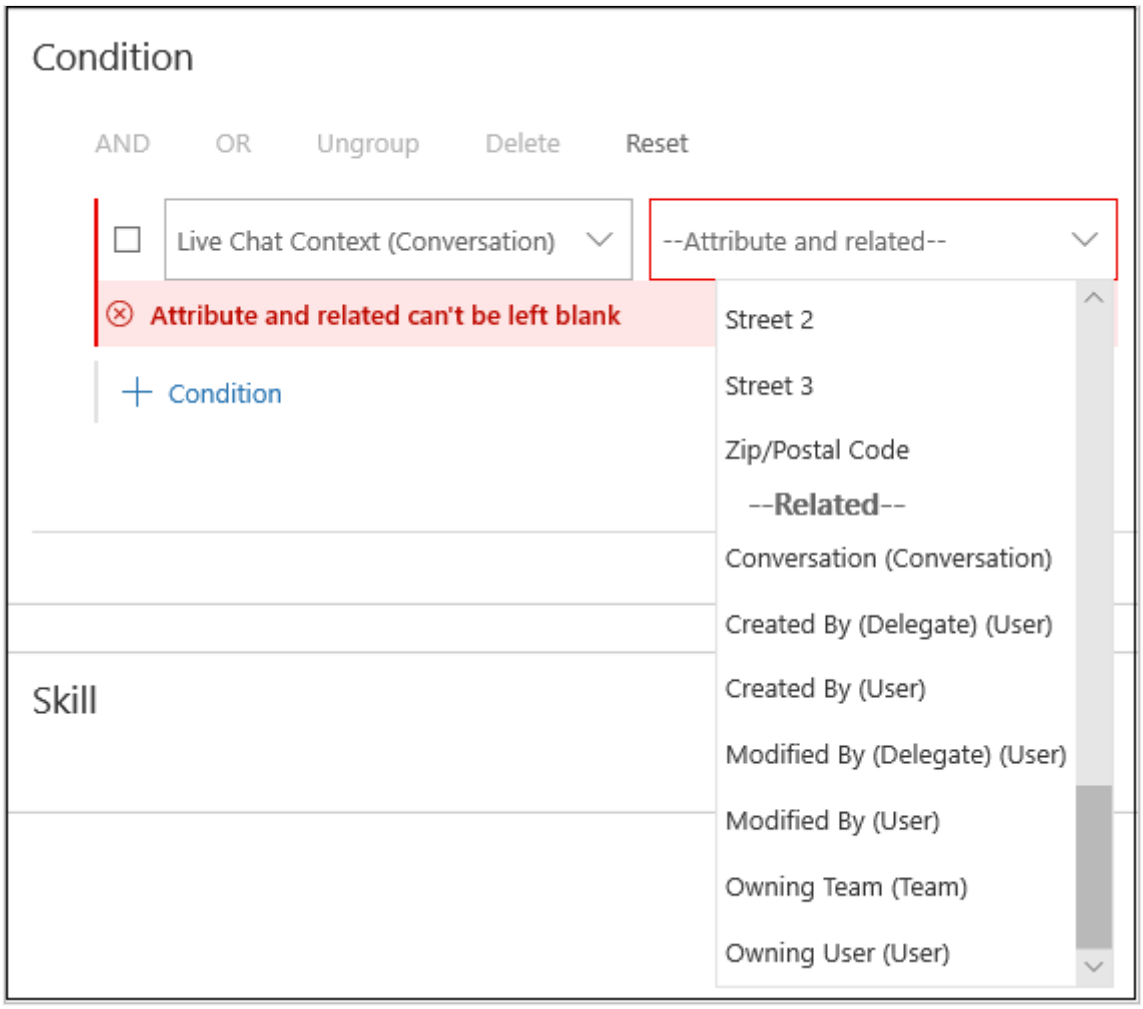
1. Select **Add**. The **New Rule Item** page appears.
    a. In the **General information** section of the **General** tab, provide the following information:
        i. **Name**. Name of the rule item
        ii. **Work Stream** is auto populated
        iii. **Queue**. Look up a queue or select **New** to add a new queue. For more information, see Create a queue in Omnichannel for Customer Service

b. **Description**. A brief description of the rule item.

c. In the **Condition** section, provide the conditions for the rule. Based on the conditions defined, the conversations are routed to the correct queues. You can define the conditions based on the following:

- Entity
- Attribute or related entity
- Attribute
- Operator
- Value

For an entity, you can define rules based on related level 1 attributes.



2. Select **Save**.

Create workstreams for record routing in Omnichannel Administration

Article • 06/15/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Important

- Support for the Omnichannel Administration app ended on April 30, 2022. We recommend that you use the Omnichannel admin center or Customer Service admin center app to configure the latest features, such as unified routing and voice channel. For more information about the deprecation announcement, see **Omnichannel Administration app is deprecated**.
- You can no longer configure record routing in the Omnichannel Administration app because it will not work as expected. If you have existing workstreams for routing records, you'll need to recreate them in the Customer Service admin center app. More information: **Migrate workstreams for routing records**

Create a record workstream

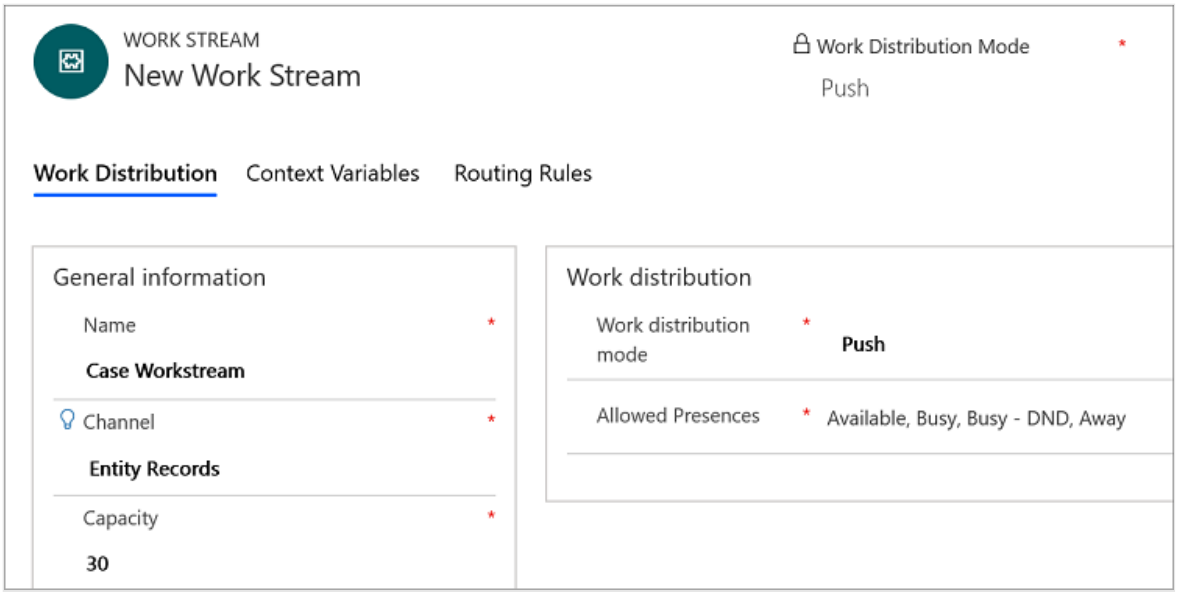
To route records, as a first step, you need to enable entity for routing using entity records channel configuration. To learn more Entity records routing.

This topic describes how to create a work stream for an entity that has been enabled for routing.

1. Sign in to the Omnichannel Administration app.
2. Select **Work Streams** under **Channels** in the site map.
3. Select **New** in the **Active Work Streams** page.

4. Specify the following in the **New Work Stream** page.

Tab	Field	Value	Description
Work Distribution	Name	Case Work stream	Provide a name to the work stream. **Note:** The value provided is an example.
Work Distribution	Channel	Entity Records	Select the **Entity Records** channel from the list.
Work Distribution	Entity	Case	Select an entity from the drop-down menu. If you want to create a entity, select + **New**. To learn more, see Enable entity for routing.
Work Distribution	Capacity	50	Specify the units of capacity that are required to process a conversation for the work stream in the text box. **Note:** • The value provided is an example.
Work Distribution	Work distribution mode	Push	Select **Push** when you want to automatically route the cases to the agents. Select **Pick** when you want the agents to explicitly pick a conversation from the **Open work items** in agent dashboard.
Work Distribution	Allowed presences	Allowed, Busy	Set the allowed presence status Select the option and type a presence status in the search box. Select a status from the list. **Note:** • The value provided is an example.



5. Select **Save** to save the work stream.

> **Note**
>
> When you enable an entity for routing, the Omnichannel Administration app creates a default workstream for the entity. If you create a new work stream or update the default work stream according to your business scenario, you need to update the work stream information in **Entity Records distribution Flow**. To learn more, see **Update entity records work distribution flow**.

Upgrade path for preview users

If you are upgrading to the latest version from a preview version, then earlier configured work streams will be obsolete. You need to create a new entity records channel and then redefine the workstreams.

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Important

- Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and the voice channel. More information: **Omnichannel Administration app is deprecated and will be removed in July 2023**.
- We recommend that you upgrade to the latest version of Omnichannel for Customer Service and use unified routing. For more information, see **Overview of unified routing**. With the upgrade, you can also use the Customer Service admin center app. For more information, see **Customer Service admin center**.

Overview

You can setup multiple work streams for same entity records if you want to distribute the entity records using different work streams based on certain conditions.

For example, you want high priority cases to be pushed to agents and demand more capacity than low priority cases, which can be picked by agents. You can achieve it by configuring multiple work streams.

This walkthrough demonstrates how to set up two work streams, one each for high priority cases and low priority cases and to distribute the cases appropriately.

In this section

Step 1: Create work stream

Step 2: Update Entity Record Distribution Flow

Step 1: Create work stream

Create entity records work stream to define how the records will be distributed. In this walkthrough, we will create two work streams - **High Priority Cases** and **Low Priority Cases**.

High priority cases work stream is set up to distribute the cases using automatic push, and the capacity required in 60 units.

Low priority cases work stream is set up to distribute the cases for manual pick up, and capacity required is 30 units.

To learn more, see Create workstream for entity record routing.

Step 2: Update entity records distribution flow

If you create or edit an entity record work stream, you must update **Entity records Distribution Flow**. The Omnichannel Administration app automatically creates this flow out-of-the-box for distributing entity records.

Entity records Distribution Flow contains the following components.

Component	Modification recommendation
When the record is created	Do not modify.
Initialization	Do not modify.
Omnichannel Work Distribution	You can see the list of entity records for which work streams were created in the Omnichannel Administration app.
<Entity Record>	Select to view the components under the Entity record.
Work Stream Initialization - <Entity Record>	Do not modify.
Entity record - <Entity Record>	Do not modify.

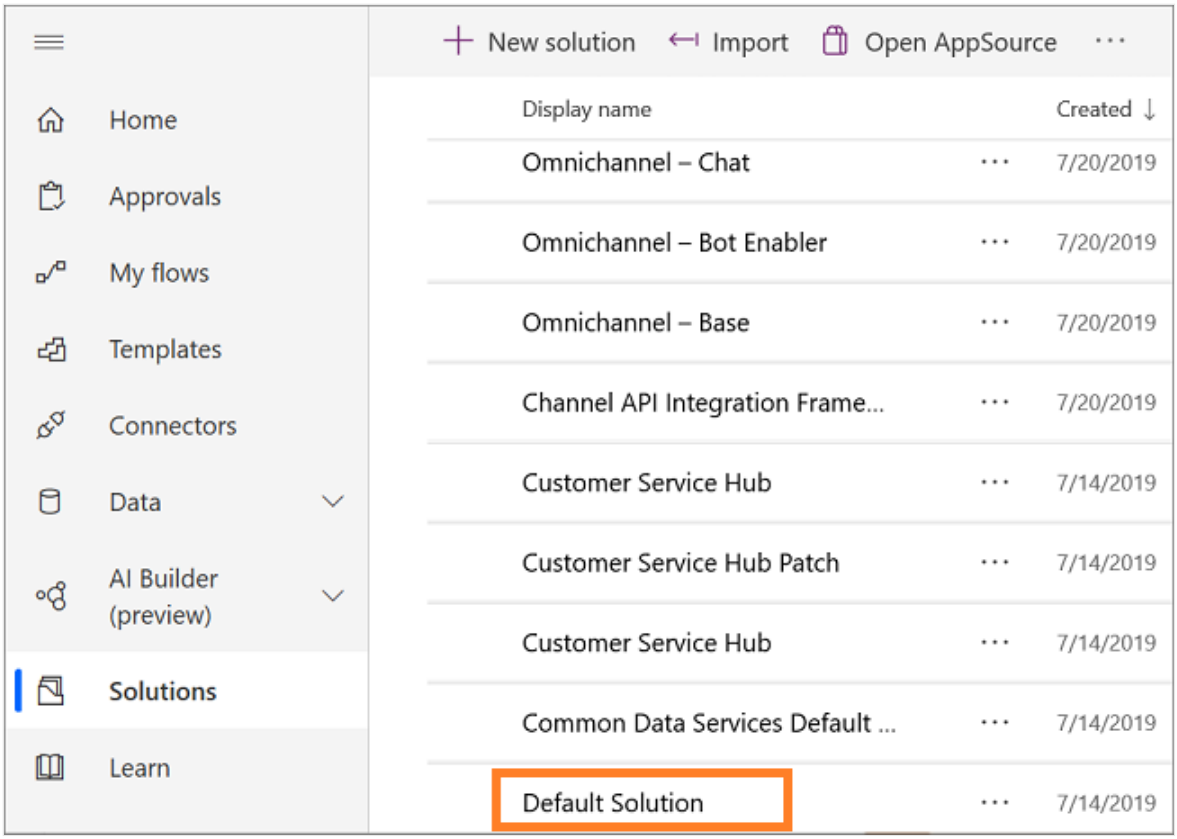
Component	Modification recommendation
Work Stream Selection for Routing (<Entity Record>)	Update the condition and work stream ID.
Invoke Omnichannel	Do not modify.

> ⚠ **Warning**
>
> We recommend you update only the **Work Stream Selection for Routing** component in **Entity Records Distribution Flow**. If you update any other component step in the flow, the entity routing might fail.

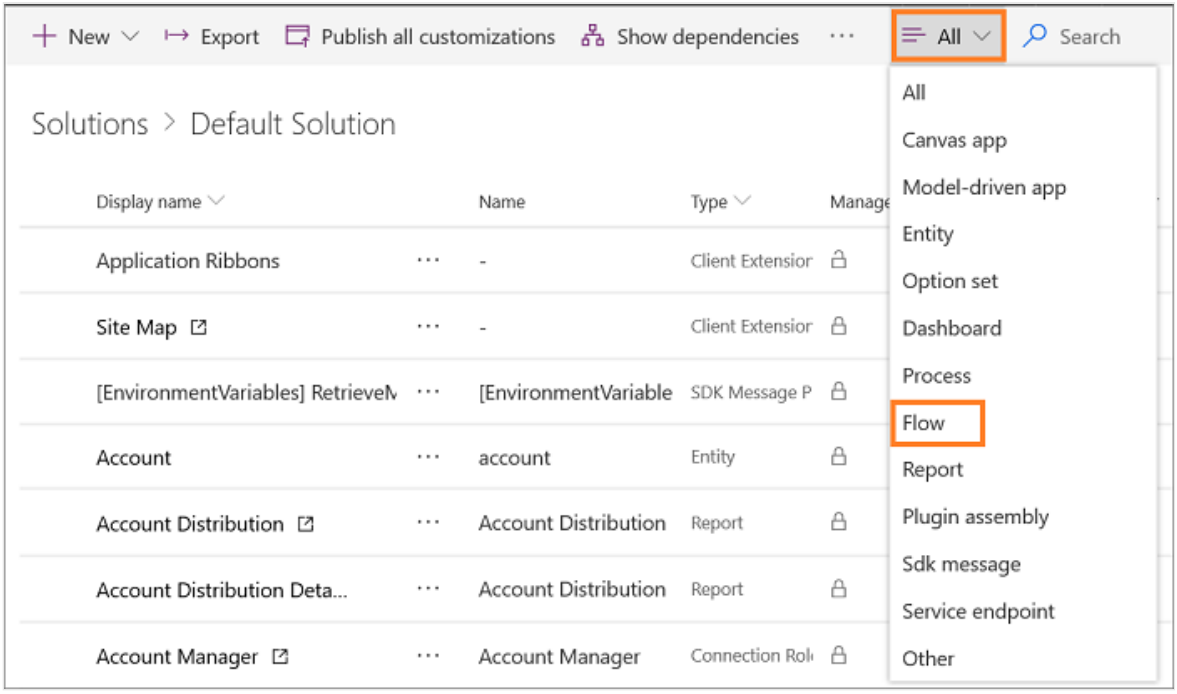
Update entity records work distribution flow

Navigate to the flow

1. Sign in to the Omnichannel Administration app.
2. Select **Work Streams** under **Work Distribution Management**.
3. Select the work stream for which you want to update the flow.
4. Select **Flow** menu in the command bar, and then select **See your flows**. Power Automate opens in a new browser window.
5. Select **Solutions** in the sitemap, and then select **Default Solution** from the list.



6. Select the **All** button in the menu and select **Flow** to filter the flows.



7. Select **Entity Record Distribution Flow** from the list.

8. Select the **Edit** button from the command bar at the top. The flow appears in a new tab.

Authenticate

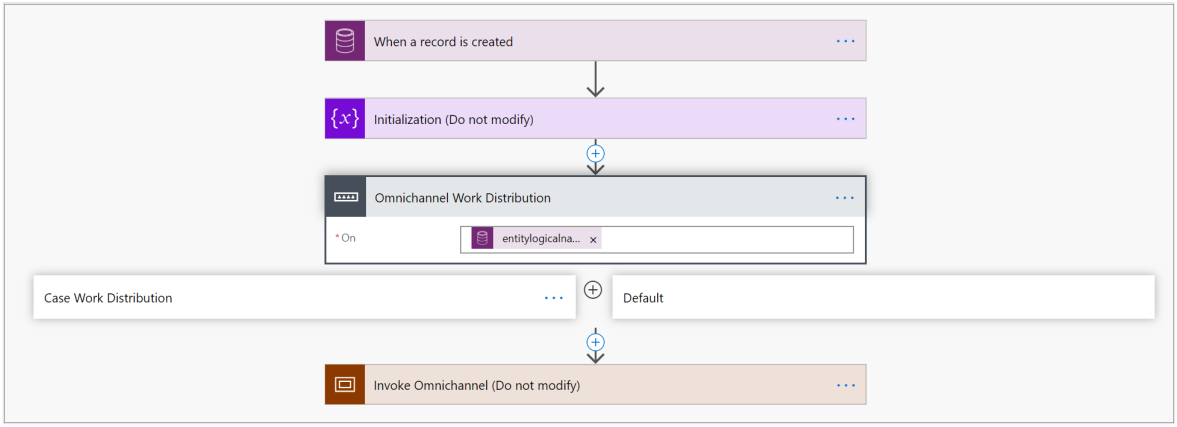
9. Select the flow component that shows the warning icon. Select an existing connection to resolve the warning. The flow component uses the current user credentials and resolves the warning.

Update the work stream ID

10. Select the **Omnichannel Work Distribution** section.

11. Select **<Entity Record> Distribution**. For example, **Case Work Distribution**.

12. Select the **Work Stream Selection for Routing** section.



13. Remove the **Select Default Work Stream - <Entity Record>** section by selecting the ellipses, and then by selecting **Delete**.

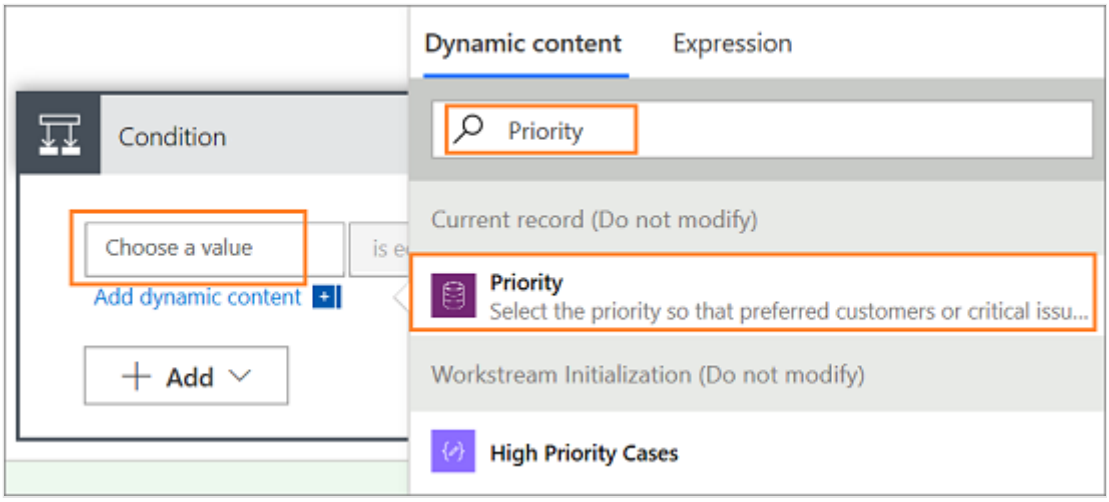
    For example, **Select Default Work Stream - Case**

    Remove the default work stream so you can update the work stream with the one you created earlier.

14. Select **Add an action** in the **Work Stream Selection for routing entity- (<Entity Record>)** section.

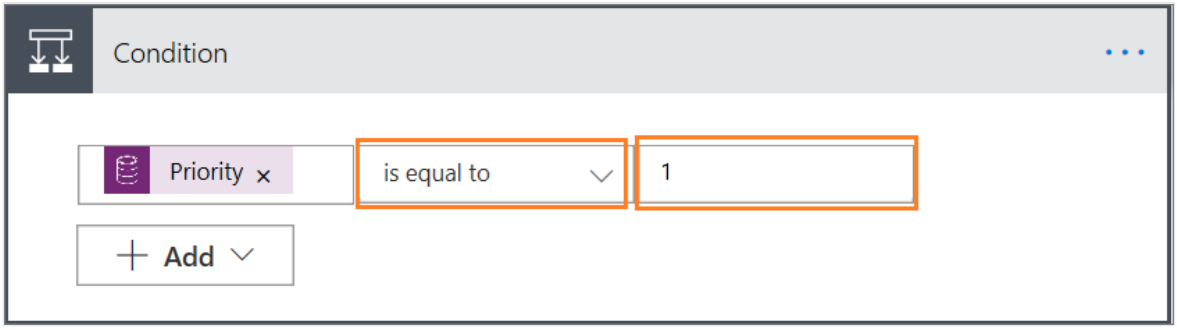
15. Select **Conditions** under the **Actions** tab.

16. Select the **Choose a value** box to add a rule. A flyout control appears. Type in the search box to look up the attributes of the Case record that is being routed. For example, **Priority**. The rule appears in the list, and when you select the rule, it is added to the field.

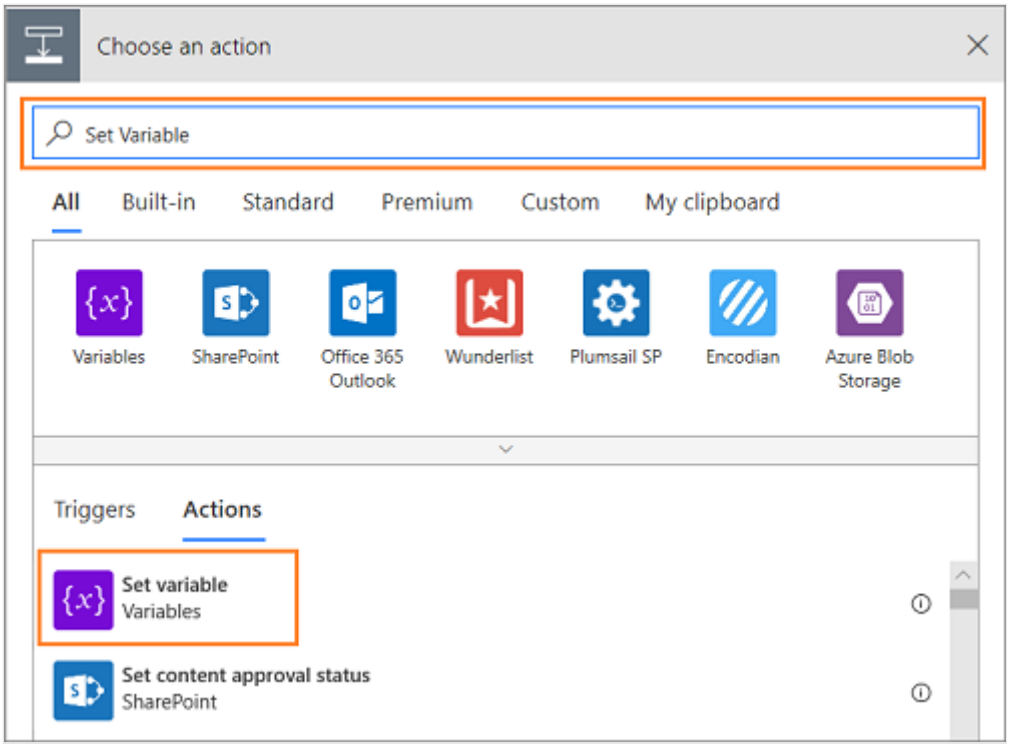


17. Select a condition from the list. For example, **is equal to**.

18. Type the rule value in the field. For example, **1**.



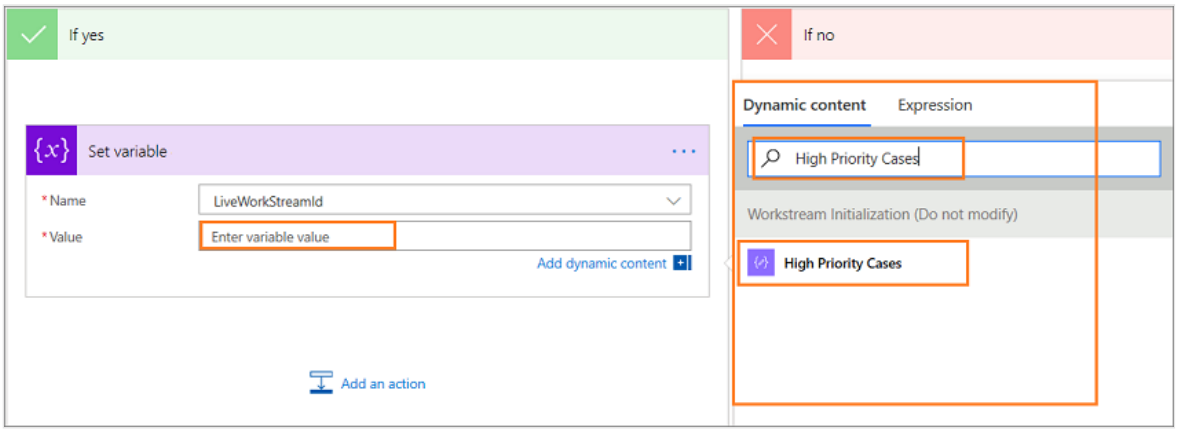
19. Select **Add an action** button under the **If yes** section. The **Choose an action** component appears. Now, type **Set Variable** in the **Search connectors and actions** box and the action appears in the list. Select it and the **Set Variable** action appears.



20. Select the **LiveWorkStreamId** from the Name drop-down list.

21. Select the **Value** field search box to add a variable. A flyout control appears. Type the name of the work stream that you created in the search box. For example, **High Priority Cases** is one of the case work stream that you created to route high priority cases. The value appears in the list, and when you select the value, it is added to the field.

> **Note**
>
> If you update the name of the work stream in Omnichannel Administration app, then you must perform step 21. Otherwise, the cases won't be automatically distributed to the agents.



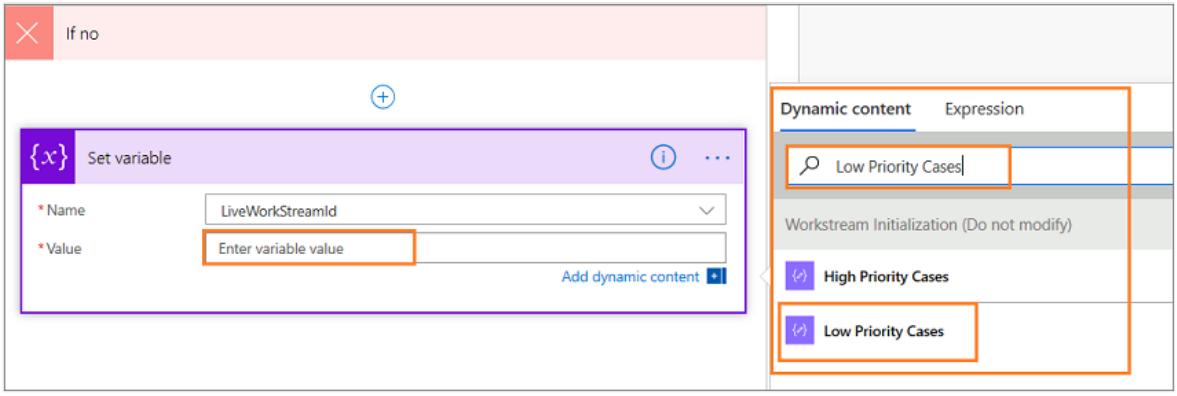
22. Select **Add an action** button under the **If no** section. The **Choose an action** component appears. Now, type **Set Variable** in the **Search connectors and actions**

box and the action appears in the list. Select it and the **Set Variable** action appears.

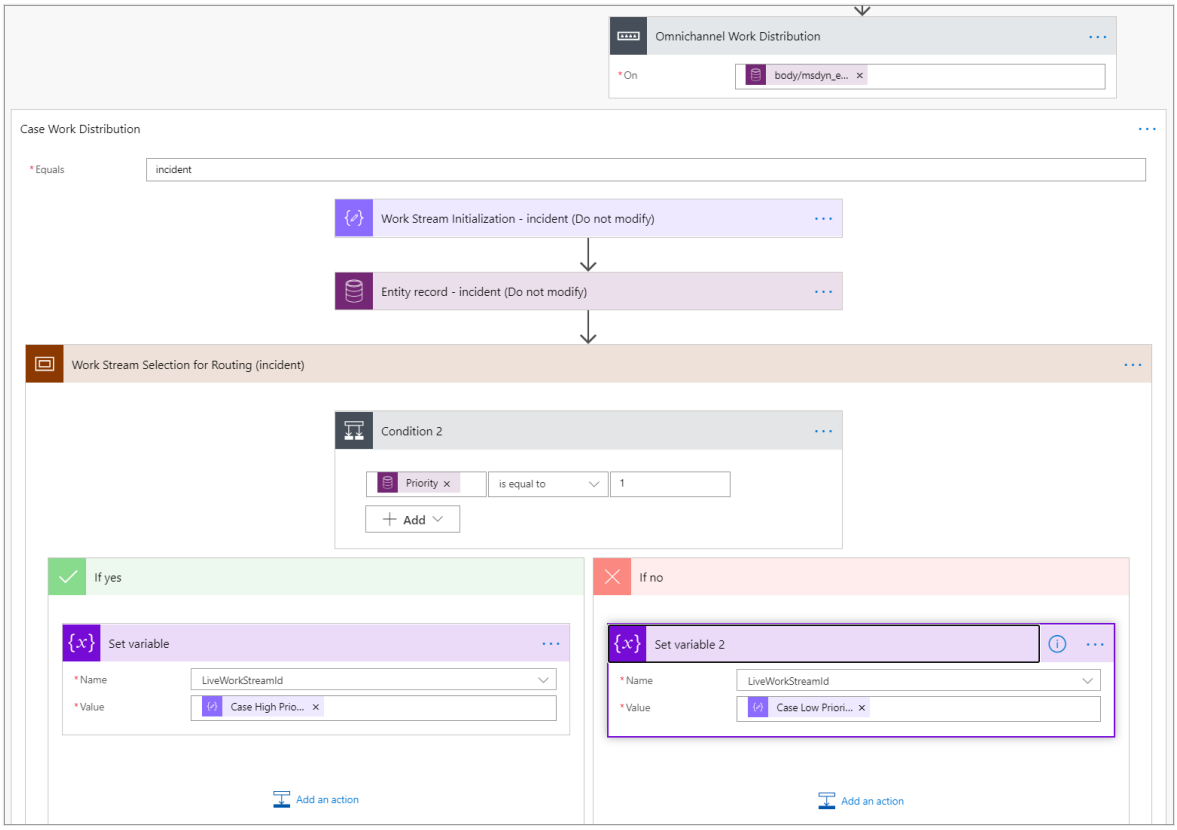
23. Select the **LiveWorkStreamId** from the Name drop-down list.

24. Select the **Value** field search box to add a variable. A flyout control appears. Type the name of the work stream you created in the search box. For example, **Low Priority Cases** is one of the case work stream that you created to route low priority cases. The value appears in the list, and when you select the value, it is added to the field.

> **Note**
>
> - If you update the name of the work stream in Omnichannel Administration app, then you must perform step 24. Otherwise, the cases won't be automatically distributed to the agents.
> - Adding multiple work streams in the conditions are optional. If your business process requires multiple work stream conditions, you can create it.



25. Select **Save** to save **Entity Record Distribution Flow**.



Now, you've defined **Entity Record Distribution Flow** such that any case whose priority is 1 (high) is distributed using high priority work stream, and other cases will be distributed using low priority work stream. Similarly, you can extend the conditions such that the Flow supports your business scenario requirements.

> **Important**
>
> Whenever you want to update the entity record work stream ensure that **Entity Records Distribution Flow** is closed. Assume, you've made certain updates to the Flow. Now, while the Flow is still in the open in the browser, you go to Omnichannel Administration app and update the work stream. In this case, after you save the work stream, the Flow will be reset to its earlier state and you will loose the changes you did to the Flow.

Route records in Omnichannel Administration app

Article • 06/15/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Important

- Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated and will be removed in July 2023**.
- We recommend that you upgrade to the latest version of Omnichannel for Customer Service and use unified routing. For more information, see **Overview of unified routing**. With the upgrade, you can also use the Customer Service admin center app. For more information, see **Customer Service admin center**.

Overview

In Omnichannel Administration, **Entity Records** channel helps you to automatically route cases and other records to agents based on the agent's skill, capacity, and presence. To learn more about skill-based routing, see Skill-based routing overview.

Automatic distribution of cases and other records

With routing for records, organizations can route cases and other records to omnichannel queues. The cases and other records routed to omnichannel queues are automatically distributed and assigned to best available agents based on their skill, capacity, and presence.

Routing and queues

Cases and other records can be routed to omnichannel queues with work items that originate from other channels such as Chat and SMS.

This allows organizations to tightly define the work profile that their agents are supposed to handle, and organizations can automate the work flow assignment across channels and assign the work items based on agents skill, capacity, and presence.

Configure records channel

To setup the **Entity Record** channel for cases, follow the steps:

Step	Description
Step 1: Create queues and add agents	Define queues for your organization and add agents (users) to the queues.
Step 2: Enable entity for queues	Enable the entity for queues.
Step 3: Enable entity for routing channel	Create entity record configuration to enable an entity for routing.
Step 4: Create routing rules	Create routing rules to route cases to the appropriate queues.

Create queues and add agents

Create an omnichannel queue or use an existing omnichannel queue, and then add agents to these queues. To learn more, see Create a queue.

Enable entities for queues

Perform the steps mentioned in Enable entities for queues for unified routing.

Enable record for routing

Create record configuration to enable it for routing.

1. Sign in to the Omnichannel Administration app.
2. Select **Entity Records** under **Channels** in the sitemap.
3. Select **New** in the **Active Entities** page.

4. Specify the following in the **New Entity** page.

Tab	Field	Description	Value
Basic Details	Name	Specify a name for the record channel.	Case channel **Note:** This is an example value.
Basic Details	Entity	Select a value from the list.	Case (Incident)

5. Select **Save** to save the record channel. After you save, in the **Work distribution** section, a default work stream is automatically created to distribute these records.

> ⓘ **Note**
>
> When you create a record channel configuration, a default work stream will be created to distribute these records. You can edit the default work stream or create more work streams as per your business scenarios. To learn more, see **Create work stream for record routing**.

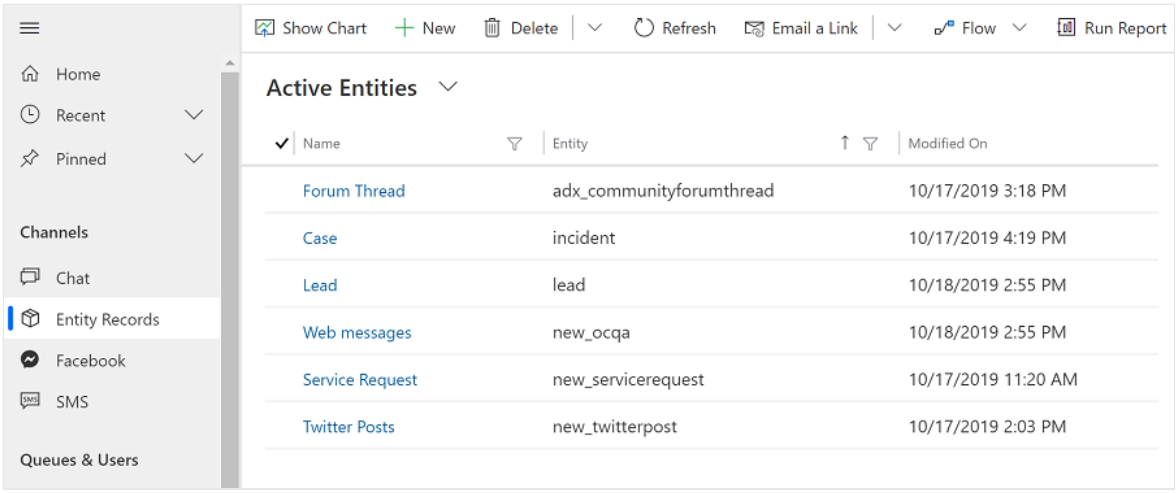
Create routing rules

After creating a record configuration, and enabling the record for routing, you can define routing rules to route these records to appropriate queues.

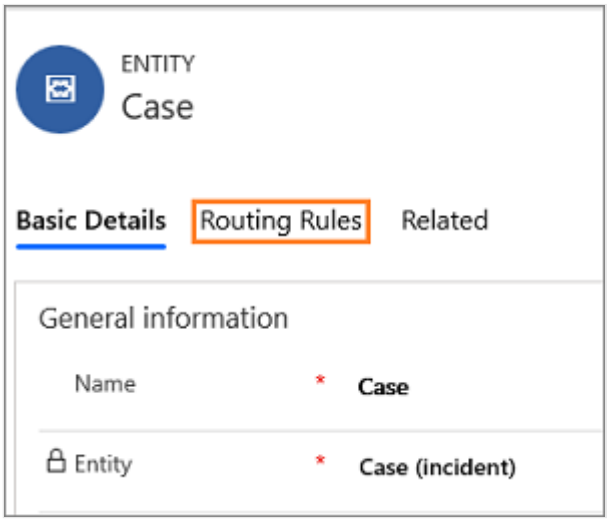
Routing rules for records consists of routing rule sets, which in turn contains rule items.

Let's see how to create routing rule set and rule items for records. In this procedure, we are adding it for case record as example.

1. Sign in to the Omnichannel Administration app.
2. Select **Entity Records** under **Channels** in the sitemap.
3. Select a records channel that you created for routing the records from the **Active Entities** view.



4. Select the **Routing Rules** tab in the entity records channel.



Create routing rule set

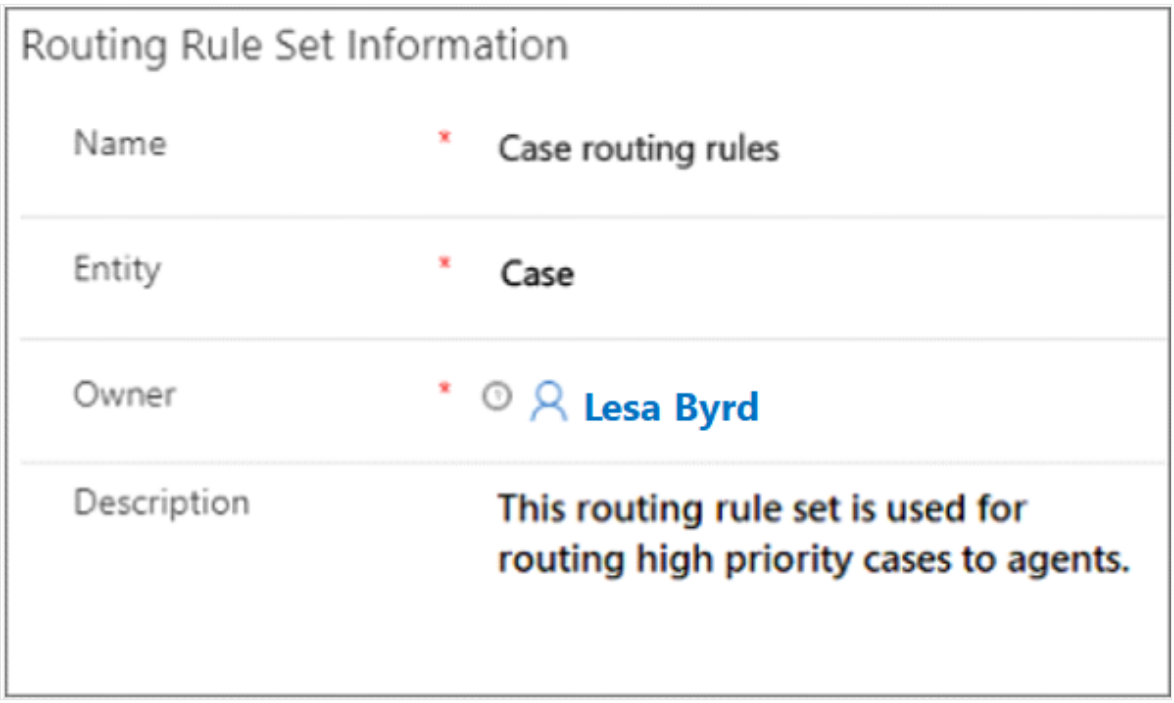
Routing rule set is a collection of rule items, and you can have multiple routing rule sets defined for a record. However, only one routing rule set can be active at any point in time. The rules items in active routing rule set are used to route the records. To create a new routing rule set, follow steps 5-7.

> ⓘ **Note**
>
> You can't edit an active routing rule set. Therefore, if you're importing a solution that includes an active routing rule set into an organization where the rule set already exists with the same ID, the solution import will fail.

5. Select **New Routing Rule Set**.

6. Specify the following in the **New Routing Rule Set** page.

Tab	Field	Value	Description
General	Name	Case routing rules	Specify a name to the routing rule set.
General	Entity	Case	Select the entity for which you are creating the rule set.
General	Description	This routing rule set is used for routing high priority cases to agents.	Specify a description for you to identify the purpose of the routing rule set.

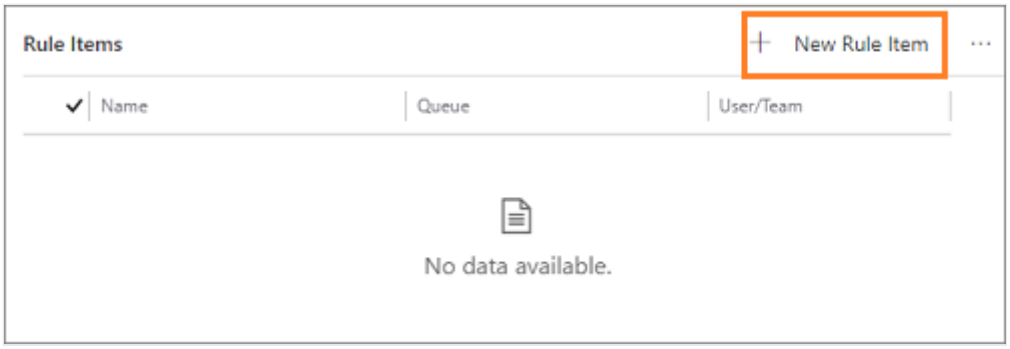


7. Select **Save** to save the rule set. Once you save the record, you can see the **Rule Items** section in the page.

Create rule item

You can define multiple routing rule items in a routing rule set. A rule item consists of a condition and destination to route the records. Let's see how to define the rule items. To create a new rule item, follow steps 8-13.

8. Select **New Rule Item** in the **Rule Items** section. A **New Rule Item** page appears.



9. Specify the following on the **New Rule Item** page.

Tab	Field	Value	Description
General	Name	Product - Credit card	Specify a name to the rule item.
General	Description	This rule item is used for routing credit card cases.	Specify a description for you to identify the purpose of the rule item.

10. Select **Add** in the **Rule Criteria** section, and then select **Add row**.

    a. Select a rule from the list for the first box. For example, **Subject**.

    b. Select a condition from the list. For example, **Contains**.

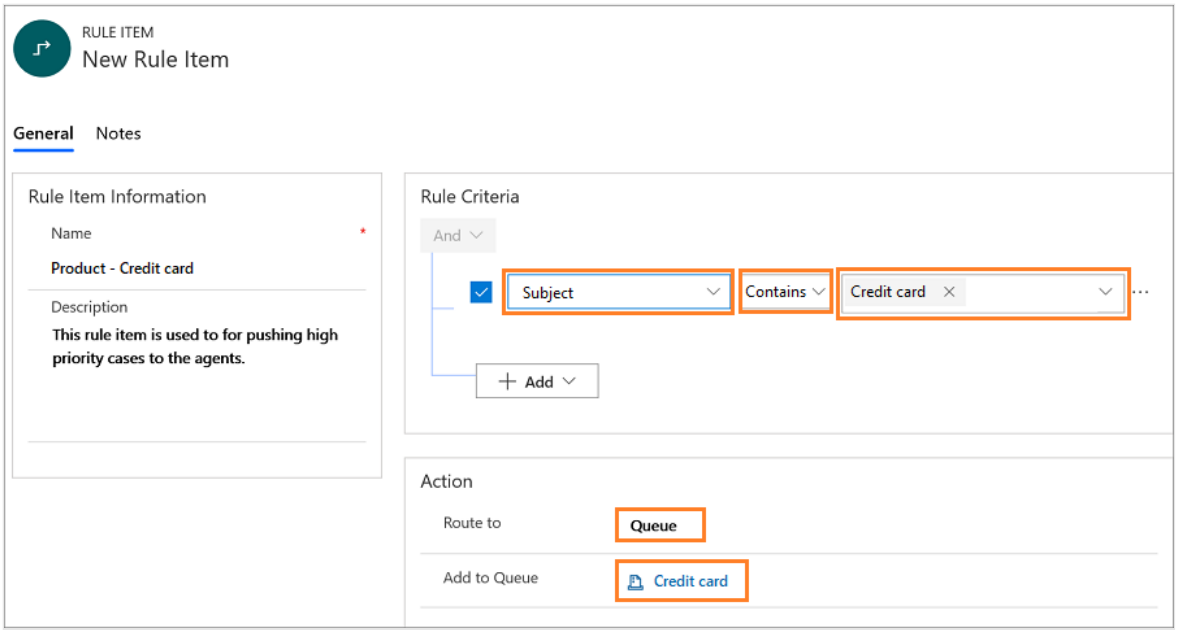
    c. Select a value for the rule from the list. For example, **Credit card**.

    > ⓘ Note
    >
    > You can define conditions for both primary entity attributes and related entity attributes.

11. Select **Queue** for the **Route to** field.

12. Select an omnichannel queue for the **Add to Queue** field.

    The steps 9 to 11 indicate if the **Subject** of a case is **Credit card**, then route the case to the selected omnichannel queue.



> [!NOTE]
> You must select an omnichannel queue for automatic work distribution in the **Add to Queue** field to automatically assign records to agents.

13. Select **Save** to save the rule item.

You've successfully created queues, enabled entity for routing, and created routing rule sets. Now, activate the routing rule set.

Upgrade path for preview users

If you are upgrading from preview release to the latest version, then earlier configured work streams will be obsolete. You need to create a new entity records channel and then redefine the work streams. To learn more, see Create workstream for entity record routing.

Attach skills to conversations in Omnichannel Administration

Article • 06/15/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Important

- Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated and will be removed in July 2023**.
- We recommend that you upgrade to the latest version of Omnichannel for Customer Service and use unified routing. For more information, see **Overview of unified routing**. With the upgrade, you can also use the Customer Service admin center app. For more information, see **Customer Service admin center**.

Understand skill-based routing

When a customer initiates a conversation, the following happens:

- Based on the skill attachment rules, the system attaches the skills to the conversation.
- Based on the routing rules, the system routes the conversation to the appropriate queue.
- Now, the assignment system starts matching the agents' skills with those skills attached to the conversation. After finding a match as per the match criteria (exact or closest), the assignment engine assigns the conversation to the agent.

In the portal, when a customer fills in the prechat survey questions, the system receives them as context variables. The system attaches these variables to the incoming conversation as a skill. The assignment engine matches the skills of the agents. The skill is matched on exact or closest match. If the agent and conversation skills match, the assignment engine assigns the conversation to the agent.

For example:

Bert Hair, is a customer from Spain, who uses **Xbox** product. Bert goes to **www.contoso.com** portal to initiate a chat with the Contoso customer service. In the pre-chat survey question, Bert chooses **Xbox**. Because Bert's geolocation is Spain, the system attaches **Xbox** as the product and the **Spanish** language as the skill to the conversation. Then, the assignment engine assigns the conversation to an agent who matches the skill and language.

> **Note**
>
> The system attaches the skills to a conversation based on the skill attachment rules.

Match skills

When the skill attachment rules attach skills and proficiency levels, the assignment logic matches the required skill with the skills of the agent. The system assigns the conversation to an agent based on the skill criteria that is chosen.

Admins can achieve the skill matching based on the business requirements:

- Exact skill matching
- Closest or nearest skill matching

Exact skill matching

In exact skill matching, the assignment logic searches for an agent with the required skills and proficiency and lists them in the order of highest available capacity by default. The default order can be set to round robin by the administrator.

If no agent is available with all the required skills and corresponding or higher proficiency, then the conversation remains unassigned in the queue.

Exact match will filter all matching agents whose proficiency is greater than or equal to the required proficiency.

The following table describes how exact skill matching works for a single or multiple-skill scenario.

Skill scenario	Skill & proficiency criteria	Description
Single	Xbox = 4	The system searches for all agents with **Xbox** greater than or equal to **4**.
Multiple	Xbox = 4 Spanish = 5	The system searches for all agents with **Xbox** skill rating greater than or equal to 4 and **Spanish** skill rating greater than or equal to 5.

Closest skill matching

If no agent is available with any of the required skills, then the conversation might be assigned to an agent without the required skills.

The closest skill match will order all agents based on their closeness to the required skill and proficiency. For example, if the required skills are four, then agents with four skills will be put on top (exact qualified), then agent with five skills (overqualified), and then agent with three skills (under qualified). In this scenario where closest match is chosen as the skill matching algorithm at workstream level; if more than one agent with same skill score are there; the system won't order them by round robin or highest capacity. The system will continue to assign all the incoming work items to the same agent until other constraints like capacity and presence are met.

> ⓘ **Note**
>
> If you don't intend to use skills based routing model, choose **None** in the **Default skill matching algorithm** option in the workstream settings.

The following table describes how exact skill matching works for a single- or multiple-skill scenario.

Skill scenario	Skill & proficiency	Description

Skill scenario	Skill & proficiency	Description
Single	Xbox = 4	• Agents are first ordered by exact qualified match (Xbox equals 4), followed by overqualified match (Xbox is greater than 4), and then underqualified match (Xbox is less than 4) • If none of the criteria are met, then the work item might be assigned to an agent who doesn't have the Xbox skill.
Multiple	Xbox = 4 Spanish = 5	• Agents are first ordered by exact qualified (Xbox equals 4, Spanish equals 5), then overqualified (Xbox is greater than 4, Spanish is greater than 5) and then underqualified (Xbox is less than 4, Spanish is less than 5). • If none of the criteria are met, then the work item might be assigned to an agent who doesn't have the Xbox and Spanish skills.

> ⓘ **Note**
>
> The system provides a score for the agents against each skill based on the scenarios mentioned and rating model. The system calculates the normalised score of the agent by considering the skills and then, based on the score, assigns the conversation to the agents.

Prerequisites

To attach skills, you need a workstream record. You can either create or use an existing workstream configuration.

Create rules to attach a skill in Omnichannel Administration

1. Sign in to the **Omnichannel Administration** app.
2. Select **Work Streams** under **Work Distribution Management**.
3. Select a workstream from the list.
4. Select the **Skill Attachment Rules** tab.

5. Select a skill-matching option for the **Matching Logic** field. You can select one of the following:

   - Exact skill matching
   - Closest skill matching

   To learn more, see Match skills.

6. Select **Add** to create a new skill rule. The **SKILL ATTACHMENT RULE** page opens.

7. Specify the following in the **New Skill Attachment Rule** page.

Field	Description	Value
Name	Provide a name for the skill rule.	Xbox product and Spain location
Description	Describe the skill rule.	This is a skill-matching rule for the Xbox product and Spain location.

8. Set up the conditions. Select an **Entity**, **Related Attribute**, **Attribute**, **Operator**, and **Value**. For an entity, you can define rules based on related level 1 attributes.

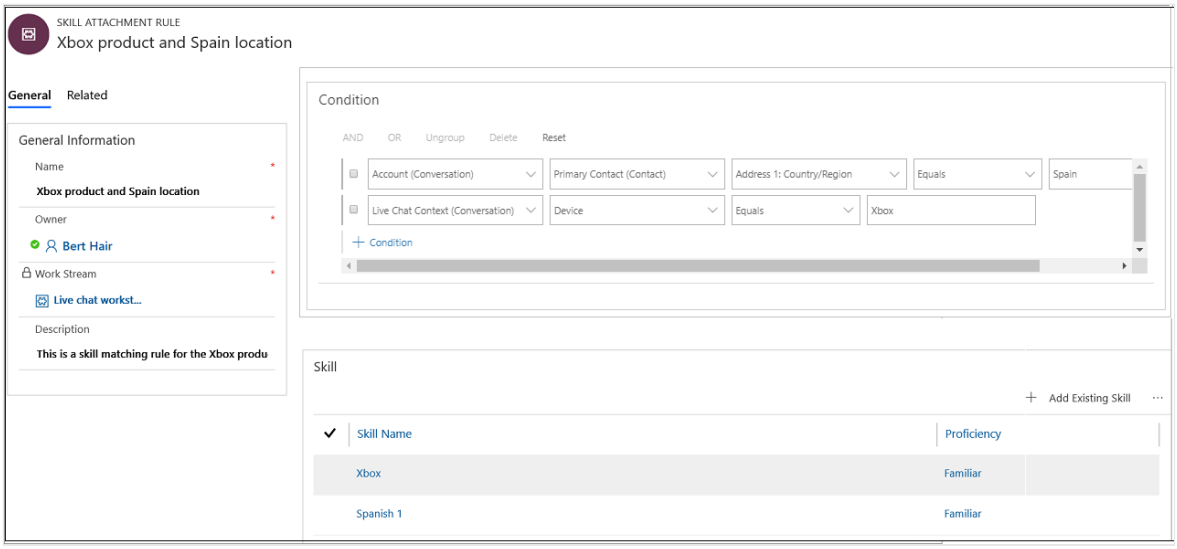
   An example is as follows.

Entity	Related Attribute	Attribute	Operator	Value
Account (Conversation)	Primary contact (Contact)	Address 1: Country/Region	Equals	Spain

9. Select **Save** to save the record. After you save, the **Skill** section appears.

10. Select **Add Existing Skill**. The **Quick Create: Attach Skill** pane appears.

11. Select a skill from the lookup menu, and select a proficiency level from the list, and then select **Save and Close** to save and add the skill to the grid.



If the condition (criteria) matches, then the omnichannel system attaches the skill.

12. Select **Save**. After you save, the rule appears in the **Attachment Rules** section of the workstream.

Omnichannel for Customer Service for developers

Article • 03/17/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Live chat widget SDK

Omnichannel for Customer Service live chat widget SDK provides methods that lets you do the following.

- Set, retrieve, and remove custom context provider for a live chat session.
- Open an existing chat or start a new one.
- Set, retrieve, and remove authentication-token providers for a live chat session.

Start a chat
Live chat SDK reference

Start proactive chat

Anticipating areas where customers need help and then engaging them through chat when they have been browsing your website for some time helps improve customer experience. Omnichannel for Customer Service allows you to offer proactive chat request to your customers when you think they can use some help.

Start a chat proactively

Send custom context

When a customer starts a chat, you can pass custom context to Omnichannel for Customer Service.

Send custom context

Display custom context

Learn how you can display the context variables in the Conversation Summary control for a conversation on the agent user interface.

Display custom context

Send authentication token

Learn how you can pass an authentication token to Omnichannel for Customer Service to authenticate a customer when they start a chat.

Send authentication token

Enable a bot to escalate and end conversation

Omnichannel for Customer Service allows you to route a conversation to a human agent when you think human intervention is required to successfully help the customer.

Enable a bot to escalate and end conversation

Close conversations automatically

Learn how you can automatically close a conversation using Web API.

Configure automatic closure of conversations

runMacro API

The `runMacro` API allows you to execute a macro whose name was passed as a parameter in the API call.

runMacro method

Build a smart assist bot

Read how you can build a smart assist bot to help agents resolve customer queries faster and more effectively.

Build a smart assist bot

Enable bot context

Enable your Azure bot to understand context while authoring a bot flow.

Enable bot context

Bring your own custom messaging channel

Read how you can implement a connector to integrate custom messaging channels using Direct Line Bot.

Integrate your own custom channel: Direct Line

Extend Omnichannel for Customer Service

Article • 02/18/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Dynamics 365 supports several scenarios to extend Omnichannel for Customer Service:

Telephony: You can integrate a third-party telephony system. For example, in a contact center, you can bring the softphone provider of your choice directly into the agent experience. This telephony integration ensures that incoming and outgoing voice calls are handled in a single agent experience, and that all necessary data is passed between the telephony system and Dynamics 365.

Additional digital channels: Beyond the digital channels such as web chat and Facebook Messenger that are provided out of the box with the Digital Messaging Add-on, you might need other custom channels. These might include channels that your organization has created for use internally.

Custom experiences: Some organizations might need highly customized experiences from a user perspective. For example, an organization that wants to create a highly customized app that embeds the messaging capabilities of Omnichannel for Customer Service might need to go beyond the standard approach.

The following table shows the SKUs that correspond with each experience.

Experience	Customer Service Enterprise	Chat for Dynamics 365 Add-on	Digital Messaging Add-on
Telephony (via third-party providers)	Yes	Yes	Yes
Web chat	-	Yes	Yes
Social channels, including Facebook Messenger, WeChat, Teams, SMS, and WhatsApp	-	-	Yes

Experience	Customer Service Enterprise	Chat for Dynamics 365 Add-on	Digital Messaging Add-on
Custom chat and messaging channels via Direct Line	-	-	Yes

> **Note**
>
> SMS and WhatsApp require additional third-party subscriptions. Refer to channel documentation for more information.

Embed other tools in Omnichannel for Customer Service

Telephony

Dynamics 365 Channel Integration Framework 2.0 provides APIs to integrate your telephony channel with multisession web experiences (Omnichannel for Dynamics 365 Customer Service). These APIs allow the telephony channel to show notifications for an incoming conversation with relevant information, start new sessions for conversations, and open application tabs as needed. More information: Dynamics 365 Channel Integration Framework 2.0

Other messaging channels

You can integrate your line-of-business (in-house), social, and other messaging channels with Omnichannel for Customer Service. This is primarily done through configuring a custom messaging channel via Direct Line. After integration, you can use unified routing to automatically assign work items (conversations) to agents on these custom channels.

Direct Line allows custom channels to be brought into Omnichannel for Customer Service by using the Microsoft Bot Framework. To bring in a custom channel, you can set up a Direct Line connection through the Azure Bot Service (which will incur Azure charges), and then bring that Direct Line bot into Omnichannel for Customer Service. More information: Configure a custom messaging channel

InfluenceScore

Property	Value
Description	Will contain the Influencer score coming from NetBreeze.
DisplayName	Influence Score
IsValidForForm	True
IsValidForRead	True
IsValidForUpdate	False
LogicalName	influencescore
MaxValue	1000000000
MinValue	0
Precision	2
RequiredLevel	None
Type	Double

IsDecrementing

Property	Value
Description	For system use only.
DisplayName	Decrementing
IsValidForForm	True
IsValidForRead	True
LogicalName	isdecrementing
RequiredLevel	None

Property	Value
Type	Boolean

IsDecrementing Options

Value	Label
1	Yes
0	No

DefaultValue: False

IsEscalated

Property	Value
Description	Indicates if the case has been escalated.
DisplayName	Is Escalated
IsValidForForm	True
IsValidForRead	True
LogicalName	isescalated
RequiredLevel	None
Type	Boolean

IsEscalated Options

Value	Label
1	Yes
0	No

DefaultValue: False

KbArticleId

Property	Value
Description	Choose the article that contains additional information or a resolution for the case, for reference during research or follow up with the customer.
DisplayName	Knowledge Base Article
IsValidForForm	True
IsValidForRead	True
LogicalName	kbarticleid
RequiredLevel	None

Property	Value
Targets	kbarticle
Type	Lookup

LastOnHoldTime

Property	Value
DateTimeBehavior	UserLocal
Description	Contains the date time stamp of the last on hold time.
DisplayName	Last On Hold Time
Format	DateAndTime
IsValidForForm	True
IsValidForRead	True
LogicalName	lastonholdtime
RequiredLevel	None
Type	DateTime

MasterId

Property	Value
Description	Choose the primary case the current case was merged into.
DisplayName	Master Case
IsValidForForm	False
IsValidForRead	True
LogicalName	masterid
RequiredLevel	None
Targets	incident
Type	Lookup

MessageTypeCode

Property	Value
Description	Shows whether the post originated as a public or private message.
DisplayName	Received As
IsValidForForm	True
IsValidForRead	True
IsValidForUpdate	False

Property	Value
LogicalName	messagetypecode
RequiredLevel	None
Type	Picklist

MessageTypeCode Options

Value	Label
0	Public Message
1	Private Message

msa_partnercontactid

Added by: Dynamics 365 Portals - Portal Dependencies Solution

Property	Value
Description	Allows a partner contact to be assigned to a specific case.
DisplayName	Partner Contact
IsValidForForm	True
IsValidForRead	True
LogicalName	msa_partnercontactid
RequiredLevel	None
Targets	contact
Type	Lookup

msa_partnerid

Added by: Dynamics 365 Portals - Portal Dependencies Solution

Property	Value
Description	Creates a Relationship between a Partner (account) and a case for indirect service arrangements.
DisplayName	Partner
IsValidForForm	True
IsValidForRead	True
LogicalName	msa_partnerid
RequiredLevel	None
Targets	account
Type	Lookup

msdyn_iotalert

Added by: Connected Customer Service for Microsoft Dynamics 365 Solution

Property	Value
Description	The iot alert that initiated this case
DisplayName	IoT Alert
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_iotalert
RequiredLevel	None
Targets	msdyn_iotalert
Type	Lookup

OverriddenCreatedOn

Property	Value
DateTimeBehavior	UserLocal
Description	Date and time that the record was migrated.
DisplayName	Record Created On
Format	DateOnly
IsValidForForm	False
IsValidForRead	True
IsValidForUpdate	False
LogicalName	overriddencreatedon
RequiredLevel	None
Type	DateTime

OwnerId

Property	Value
Description	Owner Id
DisplayName	Owner
IsValidForForm	True
IsValidForRead	True
LogicalName	ownerid
RequiredLevel	SystemRequired
Targets	systemuser,team

Property	Value
Type	Owner

OwnerIdType

Added by: Active Solution Solution

Property	Value
Description	Owner Id Type
DisplayName	
IsValidForForm	False
IsValidForRead	True
LogicalName	owneridtype
RequiredLevel	SystemRequired
Type	EntityName

ParentCaseId

Property	Value
Description	Choose the parent case for a case.
DisplayName	Parent Case
IsValidForForm	True
IsValidForRead	True
LogicalName	parentcaseid
RequiredLevel	None
Targets	incident
Type	Lookup

PrimaryContactId

Property	Value
Description	Select a primary contact for this case.
DisplayName	Contact
IsValidForForm	True
IsValidForRead	True
LogicalName	primarycontactid
RequiredLevel	None
Targets	contact

Property	Value
Type	Lookup

PriorityCode

Property	Value
Description	Select the priority so that preferred customers or critical issues are handled quickly.
DisplayName	Priority
IsValidForForm	True
IsValidForRead	True
LogicalName	prioritycode
RequiredLevel	None
Type	Picklist

PriorityCode Options

Value	Label
1	High
2	Normal
3	Low

ProcessId

Property	Value
Description	Contains the id of the process associated with the entity.
DisplayName	Process Id
IsValidForForm	False
IsValidForRead	True
LogicalName	processid
RequiredLevel	None
Type	Uniqueidentifier

ProductId

Property	Value
Description	Choose the product associated with the case to identify warranty, service, or other product issues and be able to report the number of incidents for each product.
DisplayName	Product

Property	Value
IsValidForForm	True
IsValidForRead	True
LogicalName	productid
RequiredLevel	None
Targets	product
Type	Lookup

ProductSerialNumber

Property	Value
Description	Type the serial number of the product that is associated with this case, so that the number of cases per product can be reported.
DisplayName	Serial Number
FormatName	Text
IsLocalizable	False
IsValidForForm	True
IsValidForRead	True
LogicalName	productserialnumber
MaxLength	100
RequiredLevel	None
Type	String

ResolveBy

Property	Value
DateTimeBehavior	UserLocal
Description	Enter the date by when the case must be resolved.
DisplayName	Resolve By
Format	DateAndTime
IsValidForForm	True
IsValidForRead	True
LogicalName	resolveby
RequiredLevel	None
Type	DateTime

ResolveByKPIId

Property	Value
Description	For internal use only.
DisplayName	Resolve By KPI
IsValidForForm	True
IsValidForRead	True
LogicalName	resolvebykpiid
RequiredLevel	None
Targets	slakpiinstance
Type	Lookup

ResolveBySLAStatus

Property	Value
Description	Shows the status of the resolution time for the case according to the terms of the SLA.
DisplayName	Resolve By SLA Status
IsValidForForm	True
IsValidForRead	True
LogicalName	resolvebyslastatus
RequiredLevel	None
Type	Picklist

ResolveBySLAStatus Options

Value	Label
1	In Progress
2	Nearing Noncompliance
3	Succeeded
4	Noncompliant

ResponseBy

Property	Value
DateTimeBehavior	UserLocal
Description	For internal use only.
DisplayName	First Response By
Format	DateAndTime
IsValidForForm	True

Property	Value
IsValidForRead	True
LogicalName	responseby
RequiredLevel	None
Type	DateTime

ResponsibleContactId

Property	Value
Description	Choose an additional customer contact who can also help resolve the case.
DisplayName	Responsible Contact
IsValidForForm	True
IsValidForRead	True
LogicalName	responsiblecontactid
RequiredLevel	None
Targets	contact
Type	Lookup

RouteCase

Property	Value
Description	Tells whether the incident has been routed to queue or not.
DisplayName	Route Case
IsValidForForm	True
IsValidForRead	True
IsValidForUpdate	False
LogicalName	routecase
RequiredLevel	None
Type	Boolean

RouteCase Options

Value	Label
1	Yes
0	No

DefaultValue: True

SentimentValue

Property	Value
Description	Value derived after assessing words commonly associated with a negative, neutral, or positive sentiment that occurs in a social post. Sentiment information can also be reported as numeric values.
DisplayName	Sentiment Value
IsValidForForm	True
IsValidForRead	True
IsValidForUpdate	False
LogicalName	sentimentvalue
MaxValue	100000000000
MinValue	-100000000000
Precision	2
RequiredLevel	None
Type	Double

ServiceStage

Property	Value
Description	Select the stage, in the case resolution process, that the case is in.
DisplayName	Service Stage
IsValidForForm	True
IsValidForRead	True
LogicalName	servicestage
RequiredLevel	None
Type	Picklist

ServiceStage Options

Value	Label
0	Identify
1	Research
2	Resolve

SeverityCode

Property	Value
Description	Select the severity of this case to indicate the incident's impact on the customer's business.

Property	Value
DisplayName	Severity
IsValidForForm	True
IsValidForRead	True
LogicalName	severitycode
RequiredLevel	None
Type	Picklist

SeverityCode Options

Value	Label
1	Default Value

SLAId

Property	Value
Description	Choose the service level agreement (SLA) that you want to apply to the case record.
DisplayName	SLA
IsValidForForm	True
IsValidForRead	True
LogicalName	slaid
RequiredLevel	None
Targets	sla
Type	Lookup

SocialProfileId

Property	Value
Description	Unique identifier of the social profile with which the case is associated.
DisplayName	Social Profile
IsValidForForm	True
IsValidForRead	True
IsValidForUpdate	False
LogicalName	socialprofileid
RequiredLevel	None
Targets	socialprofile
Type	Lookup

StageId

Property	Value
Description	Contains the id of the stage where the entity is located.
DisplayName	(Deprecated) Stage Id
IsValidForForm	False
IsValidForRead	True
LogicalName	stageid
RequiredLevel	None
Type	Uniqueidentifier

StateCode

Property	Value
Description	Shows whether the case is active, resolved, or canceled. Resolved and canceled cases are read-only and can't be edited unless they are reactivated.
DisplayName	Status
IsValidForCreate	False
IsValidForForm	True
IsValidForRead	True
LogicalName	statecode
RequiredLevel	SystemRequired
Type	State

StateCode Options

Value	Label	DefaultStatus	InvariantName
0	Active	1	Active
1	Resolved	5	Resolved
2	Cancelled	6	Cancelled

StatusCode

Property	Value
Description	Select the case's status.
DisplayName	Status Reason
IsValidForForm	True
IsValidForRead	True

Property	Value
LogicalName	statuscode
RequiredLevel	None
Type	Status

StatusCode Options

Value	Label	State
1	In Progress	0
2	On Hold	0
3	Waiting for Details	0
4	Researching	0
5	Problem Solved	1
6	Cancelled	2
1000	Information Provided	1
2000	Merged	2

SubjectId

Property	Value
Description	Choose the subject for the case, such as catalog request or product complaint, so customer service managers can identify frequent requests or problem areas. Administrators can configure subjects under Business Management in the Settings area.
DisplayName	Subject
IsValidForForm	True
IsValidForRead	True
LogicalName	subjectid
RequiredLevel	None
Targets	subject
Type	Lookup

TicketNumber

Property	Value
Description	Shows the case number for customer reference and searching capabilities. This cannot be modified.
DisplayName	Case Number
FormatName	Text
IsLocalizable	False

Property	Value
IsValidForForm	True
IsValidForRead	True
IsValidForUpdate	False
LogicalName	ticketnumber
MaxLength	100
RequiredLevel	None
Type	String

TimeZoneRuleVersionNumber

Property	Value
Description	For internal use only.
DisplayName	Time Zone Rule Version Number
Format	None
IsValidForForm	False
IsValidForRead	True
LogicalName	timezoneruleversionnumber
MaxValue	2147483647
MinValue	-1
RequiredLevel	None
Type	Integer

Title

Property	Value
Description	Type a subject or descriptive name, such as the request, issue, or company name, to identify the case in Microsoft Dynamics 365 views.
DisplayName	Case Title
FormatName	Text
IsLocalizable	False
IsValidForForm	True
IsValidForRead	True
LogicalName	title
MaxLength	200
RequiredLevel	ApplicationRequired

Property	Value
Type	String

TransactionCurrencyId

Property	Value
Description	Choose the local currency for the record to make sure budgets are reported in the correct currency.
DisplayName	Currency
IsValidForForm	True
IsValidForRead	True
LogicalName	transactioncurrencyid
RequiredLevel	None
Targets	transactioncurrency
Type	Lookup

TraversedPath

Property	Value
Description	A comma separated list of string values representing the unique identifiers of stages in a Business Process Flow Instance in the order that they occur.
DisplayName	(Deprecated) Traversed Path
FormatName	Text
IsLocalizable	False
IsValidForForm	False
IsValidForRead	True
LogicalName	traversedpath
MaxLength	1250
RequiredLevel	None
Type	String

UTCConversionTimeZoneCode

Property	Value
Description	Time zone code that was in use when the record was created.
DisplayName	UTC Conversion Time Zone Code
Format	None
IsValidForForm	False

Property	Value
IsValidForRead	True
LogicalName	utcconversiontimezonecode
MaxValue	2147483647
MinValue	-1
RequiredLevel	None
Type	Integer

ImportSequenceNumber

Property	Value
Description	Sequence number of the import that created this record.
DisplayName	Import Sequence Number
Format	None
IsValidForForm	False
IsValidForRead	True
IsValidForUpdate	False
LogicalName	importsequencenumber
MaxValue	2147483647
MinValue	-2147483648
RequiredLevel	None
Type	Integer

msdyn_actioninputparameterId

Property	Value
Description	Unique identifier for entity instances
DisplayName	Action Input Parameter
IsValidForForm	False
IsValidForRead	True
IsValidForUpdate	False
LogicalName	msdyn_actioninputparameterid
RequiredLevel	SystemRequired

Property	Value
Type	Uniqueidentifier

msdyn_ActionTemplateInputParameterId

Property	Value
Description	Unique identifier for Macro Action Template associated with Action Input Parameter.
DisplayName	Action Template Input Parameter
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_actiontemplateinputparameterid
RequiredLevel	None
Targets	msdyn_macroactiontemplate
Type	Lookup

msdyn_name

Property	Value
Description	The name of the custom entity.
DisplayName	Name
FormatName	Text
IsLocalizable	False
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_name
MaxLength	100
RequiredLevel	ApplicationRequired
Type	String

msdyn_parametertype

Property	Value
Description	Unique value to store the parameter type
DisplayName	Parameter Type
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_parametertype
RequiredLevel	None
Type	Boolean

msdyn_parametertype Options

Value	Label
1	Mandatory
0	Optional

DefaultValue: False

msdyn_visibility

Property	Value
Description	Action card section that renders these parameters. Possible values: required,advanced,important,internal,read-only
DisplayName	Visibility
FormatName	Text
IsLocalizable	False
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_visibility
MaxLength	100
RequiredLevel	None
Type	String

OverriddenCreatedOn

Property	Value
DateTimeBehavior	UserLocal
Description	Date and time that the record was migrated.
DisplayName	Record Created On
Format	DateOnly
IsValidForForm	False
IsValidForRead	True
IsValidForUpdate	False
LogicalName	overriddencreatedon
RequiredLevel	None
Type	DateTime

OwnerId

Added by: Active Solution Solution

Property	Value
Description	Owner Id
DisplayName	Owner
IsValidForForm	True
IsValidForRead	True
LogicalName	ownerid
RequiredLevel	SystemRequired
Targets	systemuser,team
Type	Owner

OwnerIdType

Added by: Active Solution Solution

Property	Value
Description	Owner Id Type
DisplayName	
IsValidForForm	False
IsValidForRead	True
LogicalName	owneridtype
RequiredLevel	SystemRequired
Type	EntityName

statecode

Property	Value
Description	Status of the Action Input Parameter
DisplayName	Status
IsValidForCreate	False
IsValidForForm	True
IsValidForRead	True
LogicalName	statecode
RequiredLevel	SystemRequired
Type	State

statecode Options

Value	Label	DefaultStatus	InvariantName
0	Active	1	Active
1	Inactive	2	Inactive

statuscode

Property	Value
Description	Reason for the status of the Action Input Parameter
DisplayName	Status Reason
IsValidForForm	True
IsValidForRead	True
LogicalName	statuscode
RequiredLevel	None
Type	Status

statuscode Options

Value	Label	State
1	Active	0
2	Inactive	1

TimeZoneRuleVersionNumber

Property	Value
Description	For internal use only.
DisplayName	Time Zone Rule Version Number
Format	None
IsValidForForm	False
IsValidForRead	True
LogicalName	timezoneruleversionnumber
MaxValue	2147483647
MinValue	-1
RequiredLevel	None
Type	Integer

UTCConversionTimeZoneCode

Property	Value
Description	Time zone code that was in use when the record was created.
DisplayName	UTC Conversion Time Zone Code
Format	None
IsValidForForm	False
IsValidForRead	True
LogicalName	utcconversiontimezonecode
MaxValue	2147483647
MinValue	-1

IsValidForRead	True
LogicalName	msdyn_isforceassignment
RequiredLevel	None
Type	Boolean

msdyn_isforceassignment Choices/Options

Value	Label
1	Yes
0	No

DefaultValue: False

msdyn_isunitbased

Property	Value
Description	Indicates if the capacity update is unit based or not
DisplayName	Is unit based
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_isunitbased
RequiredLevel	None
Type	Boolean

msdyn_isunitbased Choices/Options

Value	Label
1	Yes
0	No

DefaultValue: False

msdyn_name

Property	Value

Property	Value
Description	The name of the custom entity.
DisplayName	Name
FormatName	Text
IsLocalizable	False
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_name
MaxLength	100
RequiredLevel	ApplicationRequired
Type	String

msdyn_presenceid

Property	Value
Description	
DisplayName	Presence Id
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_presenceid
RequiredLevel	None
Targets	msdyn_presence
Type	Lookup

msdyn_resetduration

Property	Value
Description	The reset duration of the capacity profile.
DisplayName	Reset Duration
Format	None
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_resetduration
MaxValue	2147483647
MinValue	-2147483648
RequiredLevel	None
Type	Integer

msdyn_sessionid

Property	Value
Description	
DisplayName	Session Id
IsValidForForm	True

Property	Value
IsValidForRead	True
LogicalName	msdyn_sessionid
RequiredLevel	None
Targets	msdyn_ocsession
Type	Lookup

msdyn_starttime

Property	Value
DateTimeBehavior	UserLocal
Description	Start of a capacity update
DisplayName	Start Time
Format	DateOnly
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_starttime
RequiredLevel	None
Type	DateTime

OverriddenCreatedOn

Property	Value
DateTimeBehavior	UserLocal
Description	Date and time that the record was migrated.
DisplayName	Record Created On
Format	DateOnly
IsValidForForm	False
IsValidForRead	True
IsValidForUpdate	False
LogicalName	overriddencreatedon
RequiredLevel	None
Type	DateTime

OwnerId

Added by: Active Solution Solution

Property	Value
Description	Owner Id
DisplayName	Owner
IsValidForForm	True
IsValidForRead	True
LogicalName	ownerid
RequiredLevel	SystemRequired

Property	Value
Targets	systemuser,team
Type	Owner

OwnerIdType

Added by: Active Solution Solution

Property	Value
Description	Owner Id Type
DisplayName	
IsValidForForm	False
IsValidForRead	True

ImportSequenceNumber

Property	Value
Description	Sequence number of the import that created this record.
DisplayName	Import Sequence Number
Format	None
IsValidForForm	False
IsValidForRead	True
IsValidForUpdate	False
LogicalName	importsequencenumber
MaxValue	2147483647
MinValue	-2147483648
RequiredLevel	None
Type	Integer

msdyn_ActionType

Property	Value
Description	Action type for agent script step
DisplayName	Action type
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_actiontype
RequiredLevel	ApplicationRequired
Type	Picklist

msdyn_ActionType Options

Value	Label
192350000	Text
192350001	Macro
192350002	Script

msdyn_AgentScriptId

Property	Value
Description	Unique identifier for agent script associated with agent script step.
DisplayName	Agent script
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_agentscriptid
RequiredLevel	None
Targets	msdyn_agentscript
Type	Lookup

msdyn_agentscriptstepId

Property	Value
Description	Unique identifier for entity instances
DisplayName	Agent script step
IsValidForForm	False
IsValidForRead	True
IsValidForUpdate	False
LogicalName	msdyn_agentscriptstepid
RequiredLevel	SystemRequired
Type	Uniqueidentifier

msdyn_Description

Property	Value
Description	Description for agent script step
DisplayName	Description
FormatName	Text
IsLocalizable	False
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_description
MaxLength	2000
RequiredLevel	None
Type	String

msdyn_MacroActionId

Property	Value
Description	Unique identifier for macro associated with agent script step.
DisplayName	Target macro
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_macroactionid
RequiredLevel	None
Targets	workflow
Type	Lookup

msdyn_name

Property	Value
Description	The name of the custom entity.
DisplayName	Name
FormatName	Text
IsLocalizable	False
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_name
MaxLength	2000
RequiredLevel	ApplicationRequired
Type	String

msdyn_Order

Property	Value

Property	Value
Description	Display order
DisplayName	Order
Format	None
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_order
MaxValue	2147483647
MinValue	1
RequiredLevel	ApplicationRequired
Type	Integer

msdyn_RouteActionId

Property	Value
Description	Unique identifier for target script associated with agent script step.
DisplayName	Target script
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_routeactionid
RequiredLevel	None
Targets	msdyn_agentscript
Type	Lookup

msdyn_TextInstruction

Property	Value
Description	Instruction for text action type
DisplayName	Text instructions
Format	Text
IsLocalizable	False
IsValidForForm	True
IsValidForRead	True
LogicalName	msdyn_textinstruction
MaxLength	2000
RequiredLevel	None
Type	Memo

OverriddenCreatedOn

Property	Value

Property	Value
DateTimeBehavior	UserLocal
Description	Date and time that the record was migrated.
DisplayName	Record Created On
Format	DateOnly
IsValidForForm	False
IsValidForRead	True
IsValidForUpdate	False
LogicalName	overriddencreatedon
RequiredLevel	None
Type	DateTime

OwnerId

Added by: Active Solution Solution

Property	Value
Description	Owner Id
DisplayName	Owner
IsValidForForm	True
IsValidForRead	True
LogicalName	ownerid
RequiredLevel	SystemRequired
Targets	systemuser,team
Type	Owner

OwnerIdType

Added by: Active Solution Solution

Property	Value
Description	Owner Id Type
DisplayName	
IsValidForForm	False
IsValidForRead	True
LogicalName	owneridtype
RequiredLevel	SystemRequired
Type	EntityName

statecode

Property	Value
Description	Status of the Agent script step

Property	Value
DisplayName	Status
IsValidForCreate	False
IsValidForForm	True
IsValidForRead	True
LogicalName	statecode
RequiredLevel	SystemRequired
Type	State

statecode Options

Value	Label	DefaultStatus	InvariantName
0	Active	1	Active
1	Inactive	2	Inactive

statuscode

Property	Value
Description	Reason for the status of the Agent script step
DisplayName	Status Reason
IsValidForForm	True
IsValidForRead	True
LogicalName	statuscode
RequiredLevel	None
Type	Status

statuscode Options

Value	Label	State
1	Active	0
2	Inactive	1

TimeZoneRuleVersionNumber

Property	Value
Description	For internal use only.
DisplayName	Time Zone Rule Version Number
Format	None
IsValidForForm	False
IsValidForRead	True
LogicalName	timezoneruleversionnumber
MaxValue	2147483647

Property	Value
MinValue	-1
RequiredLevel	None
Type	Integer

UTCConversionTimeZoneCode

Property	Value
Description	Time zone code that was in use when the record was created.
DisplayName	UTC Conversion Time Zone Code
Format	None
IsValidForForm	False
IsValidForRead	True
LogicalName	utcconversiontimezonecode
MaxValue	2147483647
MinValue	-1
RequiredLevel	None
Type	Integer

Read-only attributes

These attributes return false for both **IsValidForCreate** or **IsValidForUpdate**. Listed by **SchemaName**.
