Welcome to Dynamics 365 Customer Service

Article • 08/09/2023

Tip

- If you'd like to try Dynamics 365 Customer Service for free, you can sign up for a **30-day trial**.
- Explore **Copilot**, a feature that significantly enhances agent productivity in Customer Service.

Welcome to Dynamics 365 Customer Service! We're delighted to offer you a suite of capabilities to ensure your business can deliver the best customer service experience possible to your customers. We believe that knowing your customers enables you to personalize each experience and optimizes your agents' productivity so you can earn customers for life.

The agent experience is the heart of Dynamics 365 Customer Service. The key to improving satisfaction in service delivery is enabling agents to take customer requests from any channel, handle multiple sessions at a time, interact with multiple apps without losing context, and enhance their workflow with productivity tools.

We offer several app experiences for you to choose from, depending on your support organization's needs.

Use Customer Service to:

- Track customer issues through cases
- Record all interactions related to a case
- Share information in the knowledge base
- Use unified routing to efficiently route work items
- Manage conversations across channels, including voice
- Use AI-driven embedded insights and analytics to improve customer satisfaction
- Collaborate with experts in Microsoft Teams
- Create and track service levels through service-level agreements (SLAs)
- Define service terms through entitlements
- Manage performance and productivity through reports and dashboards
- Create and schedule services
- Participate in chats

Administer Customer Service

You can configure and manage the different capabilities in Customer Service by using any of the following apps based on the licensing module that you've purchased. While you can use any of the admin apps to set up the features in Customer Service, we recommend that you use the latest apps and centrally manage the features in a robust framework.

- **Customer Service admin center**: Use the app to manage the different features of Customer Service in one place. You can configure all the features of the customer support, operations, and agent experiences through the new app. You can manage core customer service and other features, such as service terms, service scheduling, and all the channels in Omnichannel for Customer Service. More information: Customer Service admin center at a glance

  > **Important**
  >
  > With the release of the Customer Service admin center app that consolidates admin experiences across the Customer Service suite, we announce that the following admin experiences are deprecated and no longer supported after April 2023.
  >
  > - Service Management area in the Customer Service Hub app
  > - Omnichannel admin center
  > - **App profile manager:** Is removed in April 2023.
  >
  > Also, starting in October 2022, the Omnichannel admin center and the service management area in Customer Service Hub will be hidden by default in newly created organizations and environments. You have the option to bring them back, but we recommend that you start using the Customer Service admin center app to perform tasks like manage cases, and configure unified routing, channels, and agent experience profiles. More information: **Get started with Customer Service admin center**

- **Omnichannel admin center** (Deprecated): Helps in managing all your chat and digital messaging channels, including the voice channel.

- **App profile manager** (Deprecated): Helps in creating and managing targeted app experiences for agents and supervisors as an alternative to building and maintaining custom apps. You can create custom profiles with specific session templates, conversation channels, and productivity tools. You can then assign these profiles to agents and supervisors who use the Customer Service workspace app.

These capabilities are available in the new Customer Service admin center app also. We recommend that you use the new app.

- **Omnichannel Administration** (Deprecated): Helps in setting up and managing the chat and digital messaging channels and other features in Omnichannel for Customer Service.

  > ⓘ **Note**
  >
  > Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. For more information about the deprecation announcement, see **Omnichannel Administration app is deprecated and will be removed in July 2023**.

The following table provides the features that can be configured through the admin apps.

Feature	Customer Service admin center	Omnichannel admin center (deprecated)	Customer Service Hub -> Service Management (deprecated)

- Customer Service Workspace
- Omnichannel for Customer Service
- Customer Service Hub

Get started with Customer Service workspace

Article • 08/01/2023

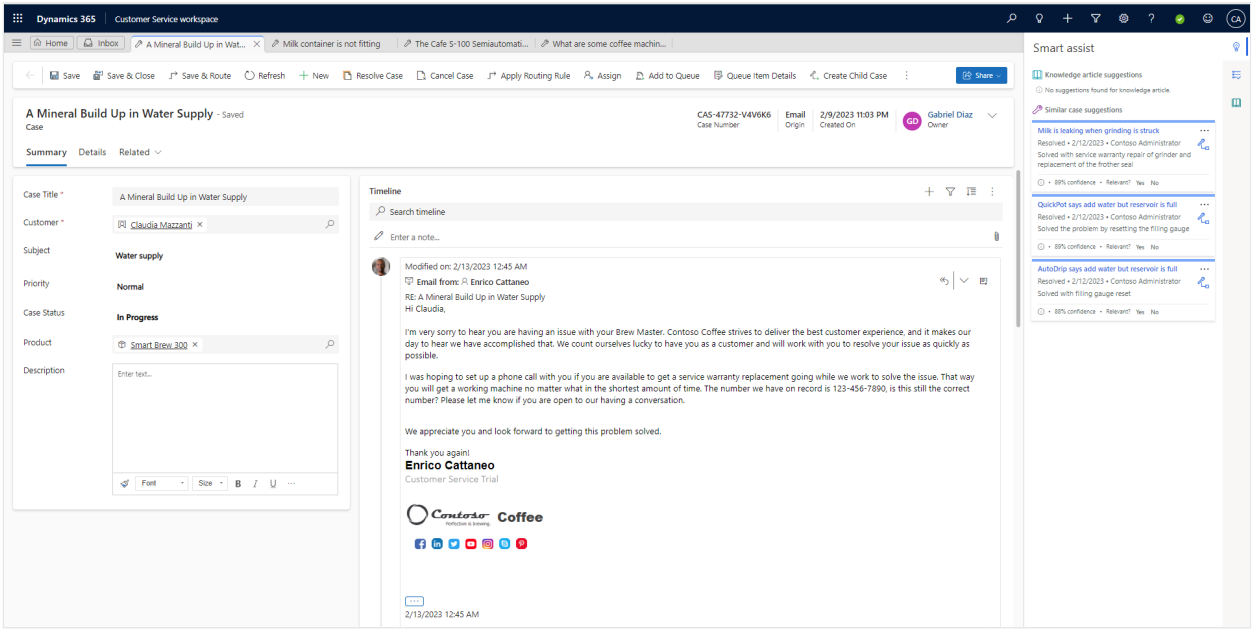
Dynamics 365 Customer Service workspace helps agents increase productivity with a browser-like, tabbed experience. Agents can use the app to work on multiple cases and conversations. It's a modern, customizable, high-productivity application that allows agents to work on multiple sessions at a time in a single workspace.

The application uses artificial intelligence in productivity tools like Smart Assist to identify similar cases and relevant articles, thereby boosting agent productivity. Features such as agent scripts and macros provide agents with guidance and resources to automate repetitive tasks to achieve a great customer experience.

For more information about licensing and system requirements, see Customer Service workspace system requirements

Set up Omnichannel in Customer Service workspace

You can set up your Customer Service workspace environment so that agents who work on cases can also engage with customers via channels like Live Chat, voice, and SMS without leaving the app, by using the Dynamics 365 Customer Service Digital Messaging add-on. More information: Set up Omnichannel for Customer Service channels in Customer Service workspace



Customer Service workspace sessions and tabs

Customer Service workspace allows agents to work on multiple sessions at a time in a single app while keeping the work organized. Agents can work on up to nine sessions and within a session, they can open up to 10 tabs. A new session is launched when an agent opens a case from the **Home** session or accepts an incoming conversation. If the agent opens the customer record from a session, a new tab opens in the same session. Agents can select the hamburger icon to access the site map. When an agent opens a page from the site map, the page loads in the current focused session.

Navigate sessions and tabs

The following table gives an overview of the multisession navigation:

Action	Result
Open a record from the Home session	Record opens in a new session.
Open a record from the Global search	Record opens in a new session.
Open a record from the retrieved search records	Record opens in a focused session.
Open a record using the Quick Create notification	Record opens in a new session
Create a new record	Record opens in a new session
Open a record from the timeline	Record opens in a new tab in the focused session
Open a record from a form lookup	Record opens in a new tab in the focused session
Open a view from the Sitemap	View opens in a new tab in the focused session
Open a dashboard from the Sitemap	Dashboard opens in a new tab in the focused session

Use the Inbox

If your administrator has turned on the inbox for your profile, you can select the **Inbox** tab to view all the cases, conversations, and activities that are assigned to you. Use the inbox to work on high-velocity tasks. You can also promote inbox sessions to regular sessions when you need more time to resolve a case or complete a conversation.

The asynchronous channels available in the conversation inbox are: SMS, persistent chat, Facebook, WeChat, LINE, WhatsApp, and Microsoft Teams.

More information: Configure the inbox view

Use the productivity pane with Smart Assist

When you work on a case, the productivity pane on the right side of the Customer Service workspace displays intelligence-driven suggestions to help you. The productivity pane uses Smart Assist to suggest related cases and knowledge articles that could be relevant. You'll also see agent scripts that guide you through a consistent series of steps with potentially automated actions through macros.

More information: Productivity pane

Work with cases, activities, knowledge articles, and email templates

On the Customer Service Agent Dashboard, here are some of the actions you can do:

- View cases and activities assigned to you
- View cases available to work on
- Create, delete, and filter cases and activities from the workspace

Customize the agent experience with Customer Service admin center

Agent experience profiles enable you to create targeted app experiences for agents and supervisors, and are an alternative to building and maintaining custom apps. With the agent experience profiles, administrators can create custom profiles with specific session templates, conversation channels, and productivity tools. These profiles can then be assigned to users.

More information: Agent experience profiles

Considerations

Here are a few things to note when you use Customer Service workspace in your organization:

- We recommend that you have only one browser instance accessing the app.
- `XRM.Navigation.openForm` and `Xrm.Navigation.navigateTo` APIs have a similar navigation as the multisession app. For example:
  - A new session is initiated if you open a form through `XRM.Navigation.openForm` from Home.

    - A new tab in the focused session is initiated if you open a form through `XRM.Navigation.openForm` from a case session.
- Opening a WebResource through `Xrm.Navigation.openWebResource` opens a new browser window but doesn't remove the navigation and command bars. You can programmatically open web resources as session tabs using the `Microsoft.Apm.createTab` method. More information: createTab method
- You can open sessions and tabs using Microsoft.Apm APIs. More information: App profile manager JavaScript API Reference

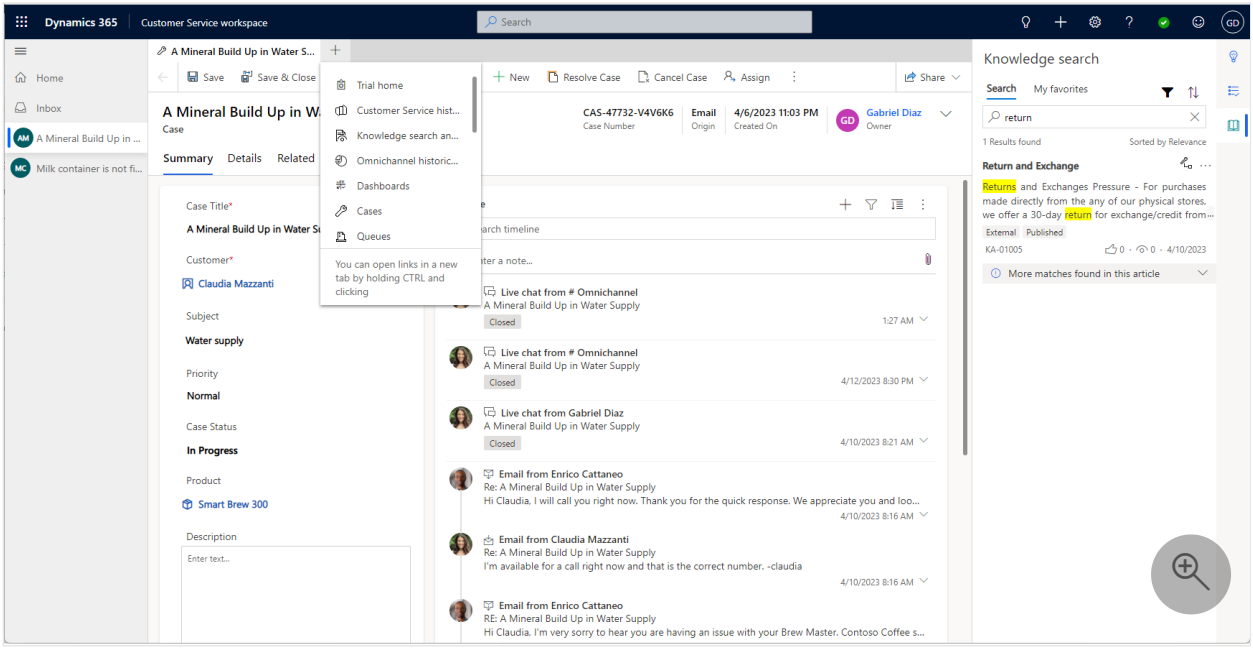
Limitations

The following limitations apply to Customer Service workspace:

- When you switch between tabs or sessions:
    - Subgrid controls don't retain the filter or sort conditions.
    - Web resources, form components, custom pages, and third-party websites don't retain the state of the page.
    - When changing the status record in a tab, the corresponding record open in a grid or subgrid of another tab doesn't refresh automatically.
- Customer Service workspace isn't supported in mobile devices, Unified Service Desk, and with Dynamics 365 Customer Engagement (on-premises).

Deprecated Customer Service workspace layout

The legacy layout has been deprecated and will be removed in October 2023.



Turn on legacy layout (deprecated)

You can enable the legacy layout in one of the following ways:

Customer Service admin center

1. In Customer Service admin center, select **Miscellaneous** in **Operations**.
2. Select **Manage** for **New and upcoming features**.
3. Clear the **Multisession Layout improvements** and then select **Save**.

Turn off the close session dialog

1. With Customer Service workspace open, press the F12 key to open the developer tools window.
2. In the console window, enter the following command:
   `Xrm.Utility.getGlobalContext().saveSettingValue("msdyn_SuppressSessionCloseWarning",true)`
3. Refresh the app page.

Turn on legacy navigation (deprecated)

> **Note**
>
> The legacy navigation is deprecated and will be removed in a future release.

1. With Customer Service workspace open, press the F12 key to open the developer tools window.
2. In the console window, type the following command and press **Enter**:
   `Xrm.Utility.getGlobalContext().saveSettingValue("msdyn_MultisessionNavigationImprovements",false)`
3. Refresh the app page.

Migrate from Unified Service Desk to Customer Service workspace

Customer Service Team Member app

Article • 01/30/2023

With the entry-level Team Member license, you can now address self-service support scenarios for your employees using the new Customer Service Team Member app module. Employees can create cases for their problems, such as laptop issues, HR queries, and administrative needs, and interact with agents through the commenting feature. They can also search the knowledge base for solutions pertaining to their problems.

Install Customer Service Team Member app

The Customer Service Team Member app must be manually installed in your instance and the **Customer Service Team Member** role assigned to the users before they can access it.

1. As an administrator, sign in to Power Platform administration center.
2. In the site map, expand **Resources**, and select Dynamics 365 apps.
3. On the apps list page, select the ellipses beside **Customer Service Team Member**, and select **Install**.
4. In the **Install Customer Service Team Member** panel, select an environment from the list.
5. Select the terms of service, and then select **Install**.
6. Grant the **Customer Service Team Member** role to the users who will access the app. To learn about granting the role, see Assign a security role to a user.

Change the default account

You can update the default account that appears for employees when they are creating a case. Perform the steps outlined in this section to update the default account.

> **Important**
>
> Do not modify or update the default account that is available out of the box with the app; instead, deactivate the out-of-the-box account, and configure a new account and set it as the default.

1. In your instance, log on to Customer Service Hub as an administrator, and create an account.

2. Retrieve the account record ID from the URL where you created the account.
3. Go to https://make.powerapps.com, and select **Solutions**.
4. In the **Solutions** list, browse and select **Customer Service Team Member**.
5. On the **Solutions** > **Customer Service Team Member** page, select **Default customer account**. The **Edit Default customer account** dialog box appears.
6. Under **Current value**, select **New value**.
7. In the box that appears, paste the account ID that you had copied in step 2, and select **Save**. The account that you have chosen is set as the default account.

Use the Customer Service Team Member app

In the Customer Service Team Member app, you can perform the following tasks:

- Create cases, read, and update the cases that you created.
- Use the comments feature for your cases to interact with agents.
- Search and view knowledge articles.

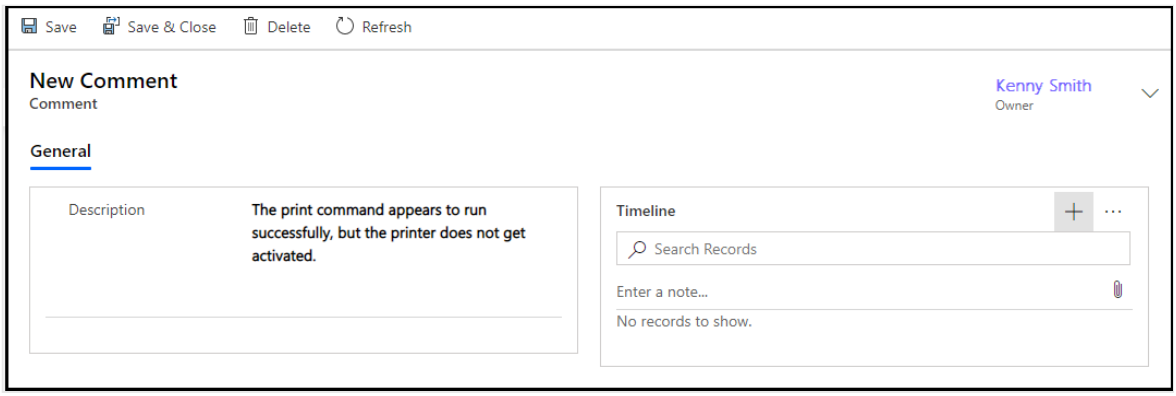
1. Sign in to Dynamics 365, and select **Customer Service Team Member**.
2. Select **Cases**. The **Active Cases created by me** page appears.
3. Select **New Case**. The **New Case** page appears.
4. Enter the following details on the **Summary** tab:

    - **Case Title:** Specify a title.
    - **Subject:** Specify the subject.
    - **Product:** Select the product category.
    - **Description:** Specify a description that summarizes the problem.

    > **Note**
    >
    > The **Customer** value is not available for editing; it is mapped to the "Default account" that is configured by your administrator.

5. Select **Save**. The **Comments** section appears on the page that can be used to provide additional information.
6. Select **New Comment**. The **New Comment** page appears.
7. In **General** > **Description**, enter additional information that would be useful in addressing the problem.

8. Select **Save**. The **Timeline section is enabled where you can add notes and upload files pertaining to the problem.**



9. (Optional.) Select **Enter a note** to add notes and attach files.

10. Select **Save & Close**. The **Active Cases created by me** page appears.

11. Select **Knowledge Search** to search for articles pertaining to your problem area that may help in addressing the issue. To learn more, see Use the direct knowledge base search in Customer Service Hub

    > **Note**
    >
    > "Send article URLs" is not supported in the Customer Service Team Member app.

12. If you want to close a case after it has been resolved, you can select the case on the **Active Cases created by me** page and click **Close Case**. Alternatively, you can close the case on the **My Case** page.

Get started with Customer Service admin center

Article • 10/24/2023

Welcome to Customer Service admin center, the app that unifies and simplifies administration experience across the Customer Service suite.

Use the Customer Service admin center app to set up the features in Customer Service, such as unified routing, cases, queues, knowledge articles, channels, rules for automatic record creation, agent experience profiles, and customer service schedules.

The enhancements include:

- Consolidated administration experiences that're currently distributed in three different apps: Customer Service Hub, Omnichannel admin center, and app profile manager.
- Step-by-step guided experience for setting up a channel.
- Search option to easily find the administrator settings for the various features in the app.
- Reorganized and task-oriented site map.
- Overview pages for each area that list at-a-glance information with deep links to manage features.
- Landing pages per feature with an overview of all the capabilities.
- The site map adapts to the capabilities that are provisioned. Based in core Customer Service, if Omnichannel for Customer Service is provisioned, then other features are automatically available.

https://www.microsoft.com/en-us/videoplayer/embed/RE4TYJn?maskLevel=0&postJsllMsg=true

Prerequisites

You'll need one or more of the following security roles to access this app to perform the various configuration tasks:

- **System Administrator**: To access and edit all the site map entries.

- **System Customizer**: To access and edit all the site map entries.
- **CSR Manager**: To access the entities like queues for the email record, automatic record creation and update rules, and workstreams in Customer Service.
- **App Profile Manager administrator and Basic User**: To access the app and edit app profile-related entities.
- **Omnichannel administrator and Basic User**: To access the app and edit all the omnichannel-related entities, like chat and voice and queues, and workstreams.

Also, to create a shared mailbox, you need the Microsoft 365 tenant admin privileges.

If you use custom roles, you must make sure that you have the appropriate permissions corresponding to the feature you want to configure.

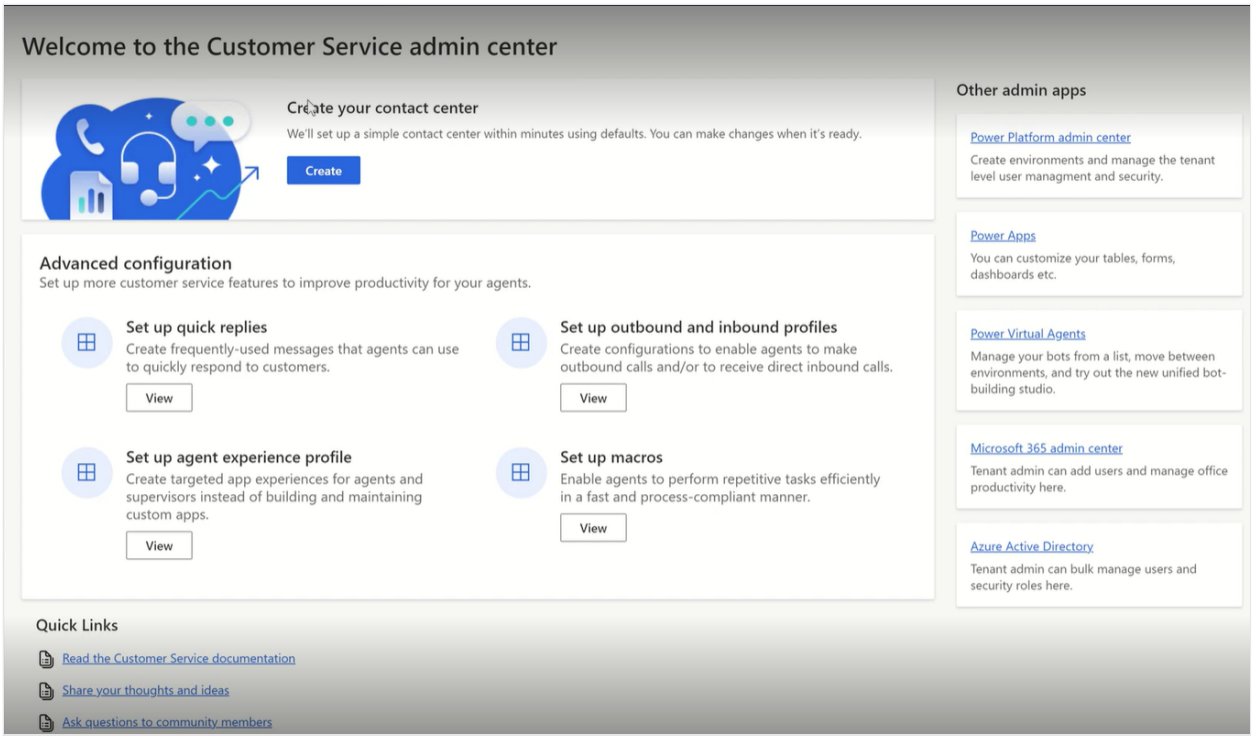
More information: Assign roles and enable users for Omnichannel for Customer Service

Access the app

The app is automatically installed in all the Customer Service organizations. You can sign in to Dynamics 365, and on the apps page, select Customer Service admin center.

Create your contact center

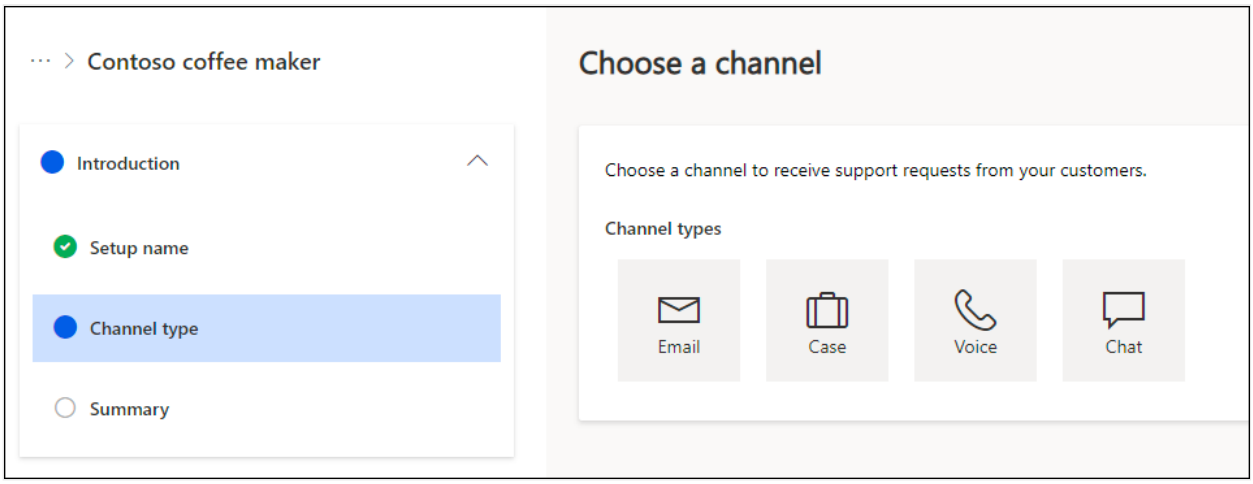
On the **Home** page, use the **Create your contact center** wizard to set up a new contact center with one click. When you select **Create**, the wizard automatically sets up the live chat and voice channels, a default agent experience profile, and the recommended AI features and reports. After the setup is complete, the summary page displays the channels and features that you can try. You can also customize the settings by following the bubble tour, which requires the Omnichannel administrator and Omnichannel agent roles.



> **Note**
>
> The create your contact center feature is available for new organizations only.

Guided channel setup

You can use the guided channel setup wizard to configure channels, such as a channel for routing cases. The wizard helps you create the channel, configure users and permissions, and set up routing rules to get you started with handling customer issues with minimal setup.



> **Important**

To successfully create a guided setup for each channel, you must have full privileges to all the tables used in the setup.

Navigate the site map in Customer Service admin center

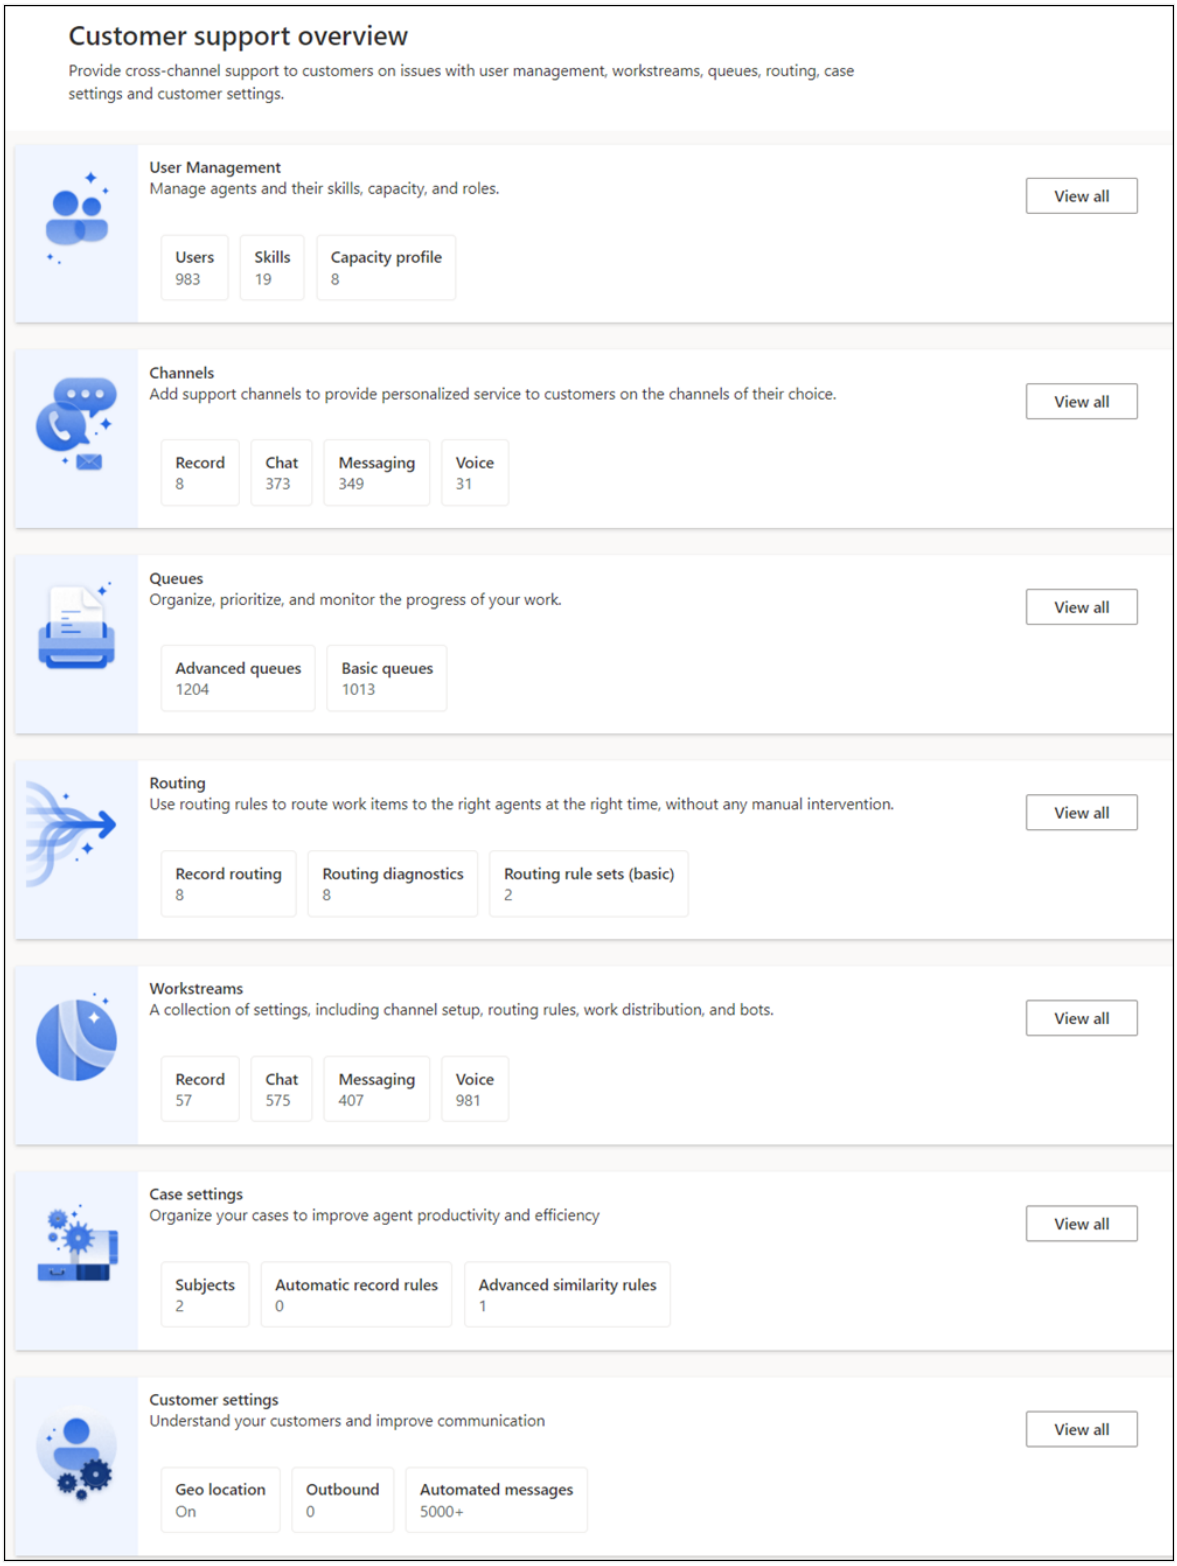
The Customer Service features are organized in the site map as follows. Every group contains an overview page with deep links to the features within the area.

> ⓘ **Note**
>
> The options that appear on the site map are dependent on the features that you have provisioned.

The overview page for every group lists a summary of the objects that are available for each feature. For example, the number of users who are available, and channels and queues that are configured in the organization.

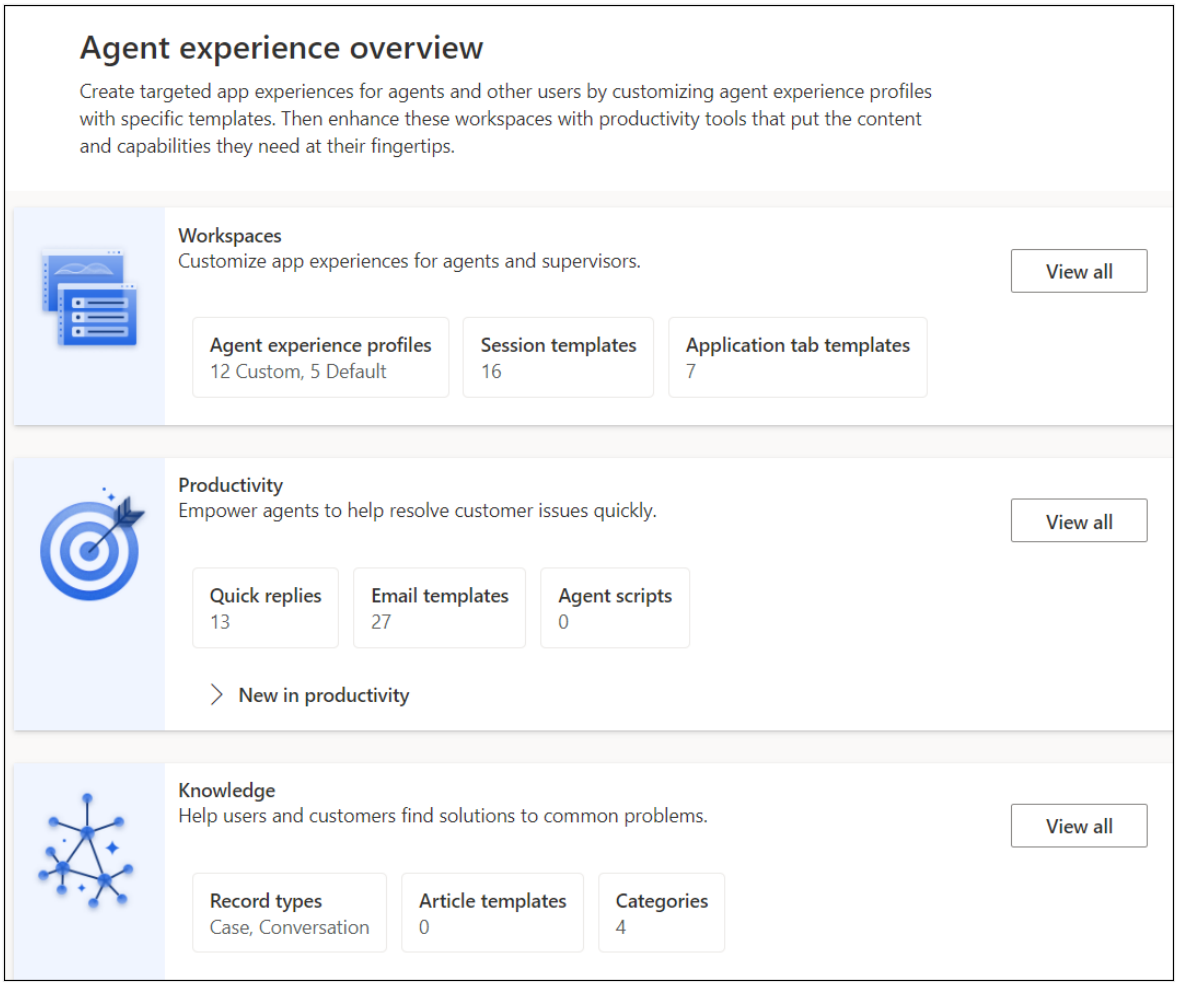
You can manage the following features in **Customer support**:

- **User management**: Users, their skills, capacity profiles, and role persona mapping
- **Channels**: Channels, such as record, chat, and voice, and the messaging accounts and phone numbers.
- **Queues**: Manage basic and advanced queues.
- **Routing**: Settings, such as enable unified routing, configure record routing, routing diagnostics, and machine learning models for skill-based, effort-based, and sentiment-based routing.
- **Workstreams**: Workstreams for the different channels.
- **Case settings**: Subjects, automatic record creation rules, advanced similarity rules, parent-child case settings, and case resolution dialog.
- **Customer settings**: Blocked numbers, authentication settings, geo location, phone music, outbound messaging and automate messages.



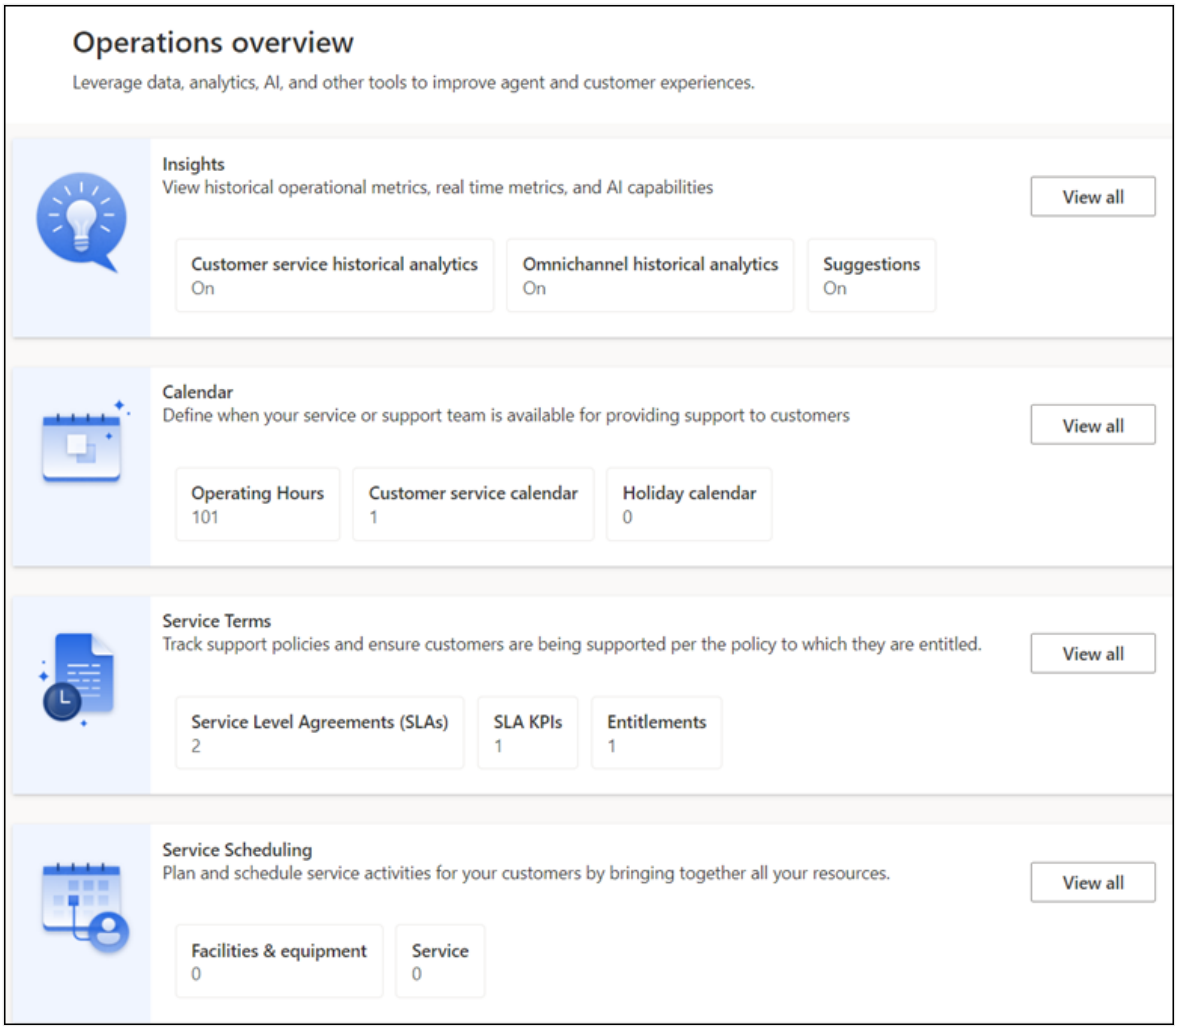
You can manage the following features in **Agent experience**:

- **Workspaces**: Agent experience profiles, templates, and third-party voice channel provider.
- **Productivity**: Transcripts, outbound profiles, templates for emails and messages, macros, and custom presence.
- **Knowledge**: Record types for which knowledge management needs to be enabled, filters, external portal, article templates, and search providers.



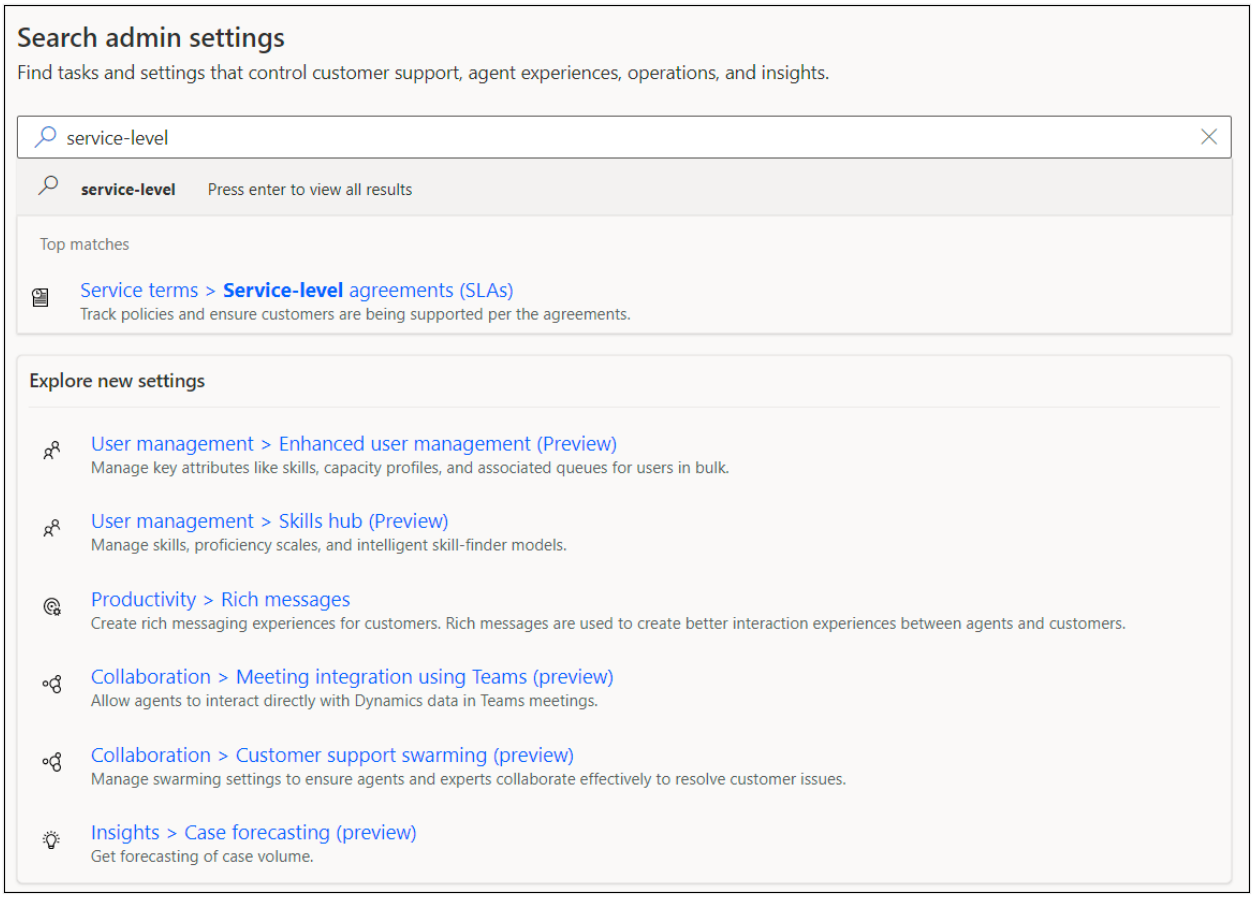
You can manage the following features in **Operations**:

- **Insights**: Historical analytics for Customer Service and Omnichannel for Customer Service, Omnichannel intraday insights and AI feature settings for cases and conversations, real-time translation and machine-learning models for skills, and skill-based, effort-based, and sentiment-based routing setup.
- **Calendar**: Operating hours, Customer Service calendar, and holiday calendar.
- **Service terms**: Service-level agreements (SLAs), SLA KPIs, and entitlements
- **Service scheduling**: Organizational units, facilities and equipment, resources, service scheduling, business closure, fulfillment preferences, and resource categories.
- **Miscellaneous**: Analysis jobs, migration tool, and IoT settings.



Search admin settings

Use the search option on the **Search admin settings** page to quickly list the admin setting that you want to manage. Along with the top matches, the page also lists settings for the new features.



FAQ

See the FAQ about Customer Service admin center for any questions that you might have.

You have the option to bring them back, but we recommend that you start using the Customer Service admin center app to perform tasks like manage cases, and configure unified routing, channels, and agent experience profiles. More information: **Get started with Customer Service admin center**

Omnichannel for Customer Service is a robust application that extends the power of Dynamics 365 Customer Service to enable organizations to instantly connect and engage with customers through channels, such as live chat, SMS, and WhatsApp. It provides a modernized design, with simplified and streamlined admin workflows that empower Omnichannel administrators to setup Omnichannel for Customer Service quickly with fewer efforts.

The Omnichannel admin center app lets you configure the channels, agents, and supervisor settings, and the corresponding features to use the channels for handling customer issues through conversations.

The app is automatically installed in all the Customer Service organizations that have Omnichannel for Customer Service provisioned. You can sign in to Dynamics 365, and on the apps page, select Omnichannel admin center.

If you are an upgrading user of Omnichannel for Customer Service, you can perform all the tasks in Omnichannel admin center that you'd been performing in the Omnichannel Administration app.

Learn the basics of the Customer Service Hub

Article • 03/21/2023

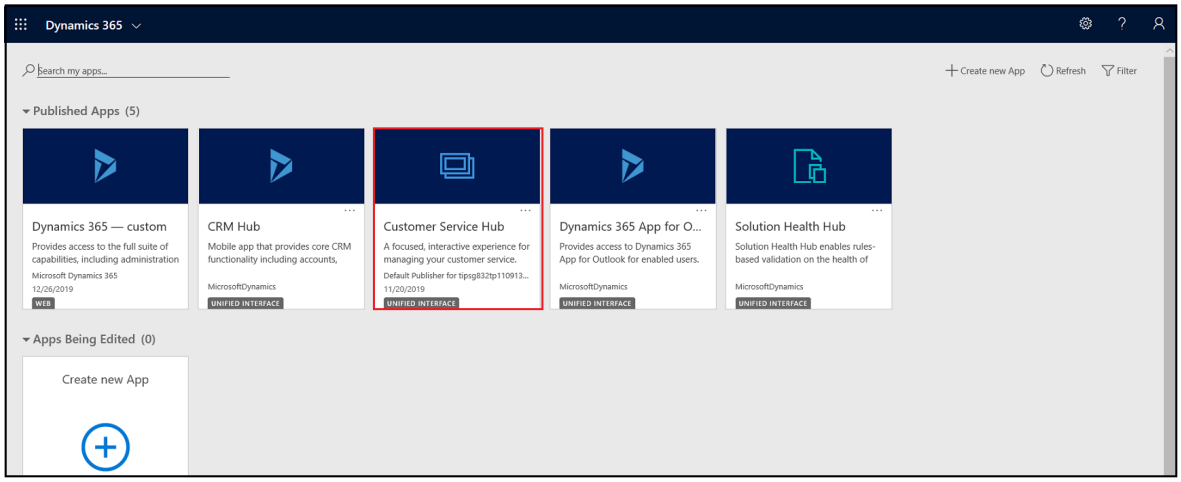
Open the Customer Service Hub

The Customer Service Hub app is available to use on a desktop browser and on a mobile device for managing knowledge articles and case management. You can open the Customer Service Hub in one the following ways:

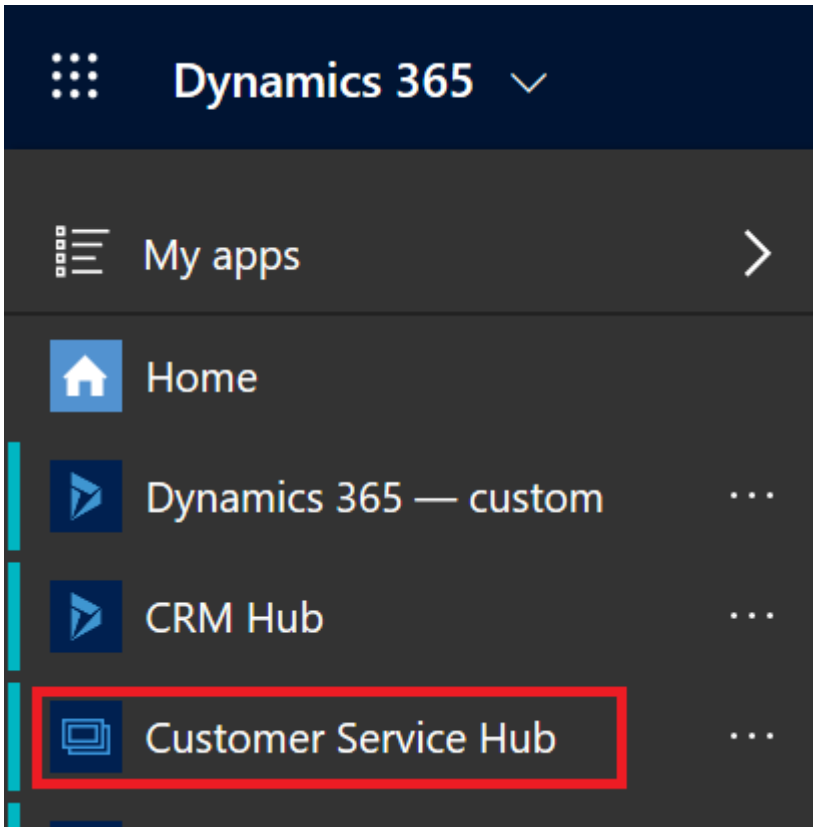
> **Note**
>
> These options are available only to users with the Customer Service app access role, System Administrator role, or System Customizer role.

Desktop browser

- On the Dynamics 365 page, in the **Published Apps** area, select **Customer Service Hub**.



- If you're on the Settings page, then in the Dynamics 365 Customer Service site map, navigate to the app switcher, and then select **Customer Service Hub**.



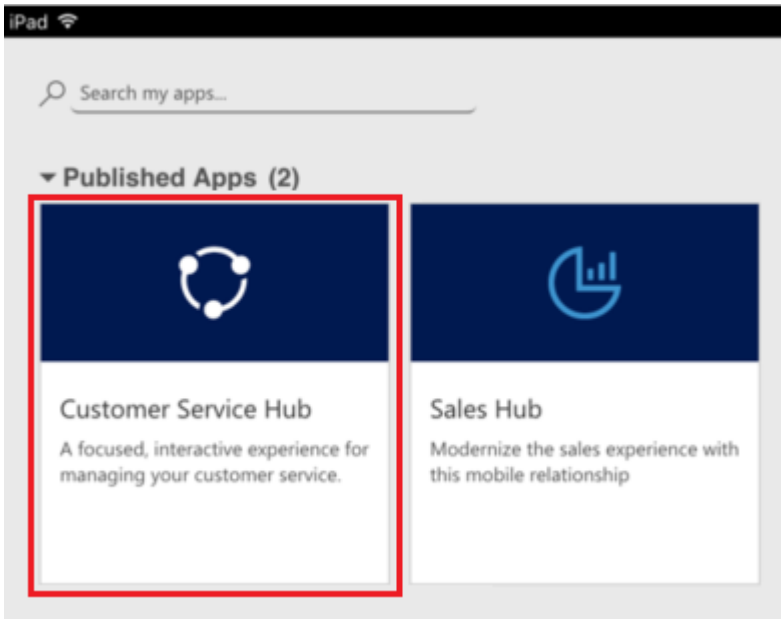
Mobile device

To access the Customer Service Hub app on a mobile device:

1. Install the Dynamics 365 Customer Service mobile app.

To install the Dynamics 365 Customer Service mobile app, see Install Dynamics 365 for phones and tablets

2. From the My Apps page, select **Customer Service Hub**.



Work with case management record types, dashboards, and tools

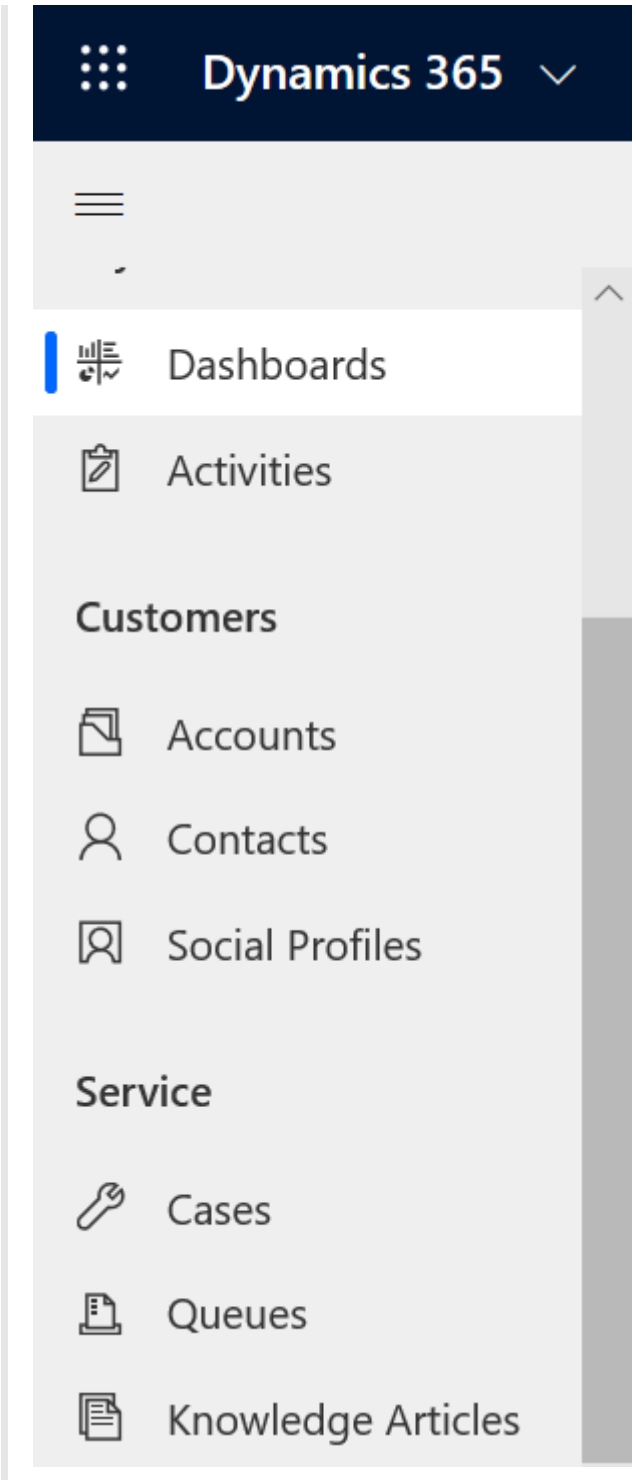
In the Customer Service Hub, you'll find everything you need to easily manage customer service for your organization:

- Dashboards
- Activities: Email, Task, Appointment, Phone Call, Social Activity
- Accounts
- Contacts
- Social Profiles
- Cases
- Queues
- Knowledge Articles

The Customer Service Hub app comes with an enhanced site map to enable easy navigation of the interface. More information: Understand the site map navigation.

Understand the site map navigation

1. Select the site map icon , select **Service**, and then select an entity record type.



When you select a record type from the menu, such as Accounts, Contacts, or Cases, you'll see a list of corresponding customer records (also known as Entity grid).

To view recently opened records, select the down-arrow next to the record type in the site map.

Here's what each entity record type is used for:

- **Dashboards** collect all your most important data in one place. You can select from multiple dashboards as per your role.
- **Activities** help you keep track of tasks, email messages, appointments, phone calls and much more.

- **Accounts** are the companies you do business with.
- **Contacts** help you manage and store information about the customers you work with.
- **Social Profiles** let you track a contact's presence in social media.
- **Cases** help you create and track your customer requests and issues.
- **Queues** keep a track of cases waiting for you to work on.
- **Knowledge Articles** capture your customer's questions, issues, feedback, and resolutions, so that other service reps can benefit from them.

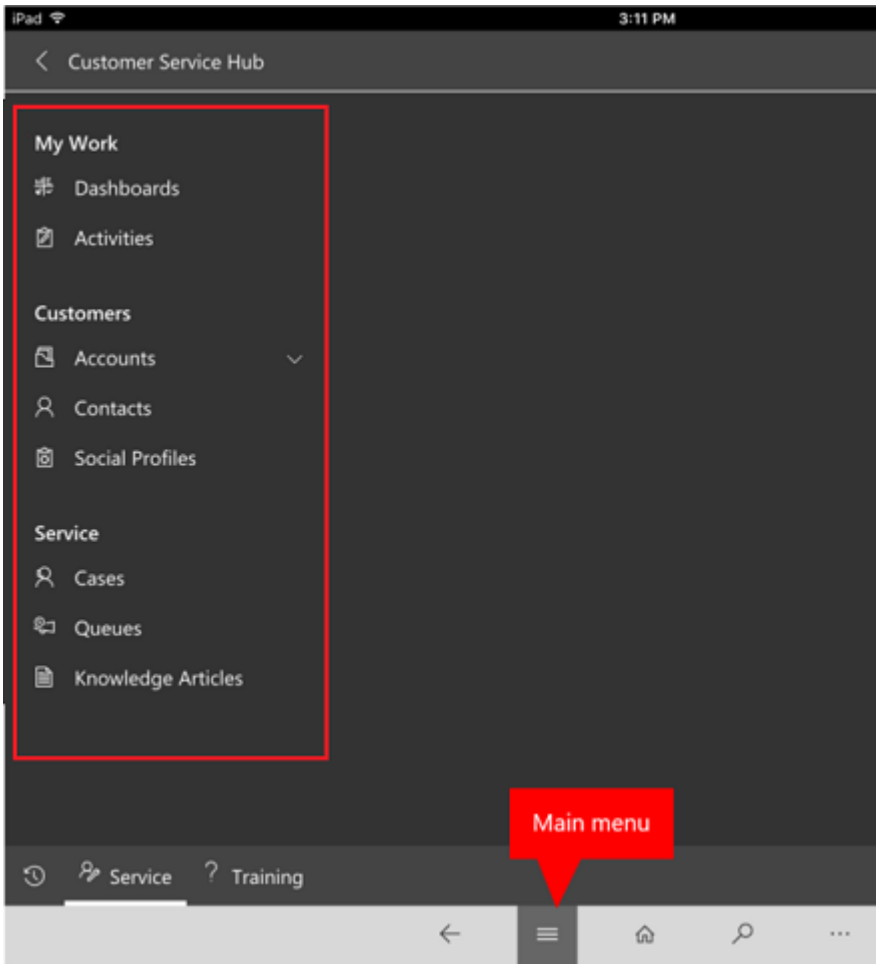
2. Select **...** to go to **Training**, and access the documentation site to view the **Help Center**.

3. You can also access **Service Management** from the site map. Service Management lets you define all the customer service admin settings from the Customer Service Hub site map. Select **...** to go to **Service Management**.

   More information: Configure Customer Service.

4. Select **Favorites and Recent** button to see recently viewed records, or to see views that have been pinned as favorites.

   For a mobile device, the site map is displayed as illustrated in the following image:



Open the default dashboard for a record type

When you're viewing the list of records for a specific record type, select **Open Dashboards** in the command bar to switch to the default dashboard for that record type.

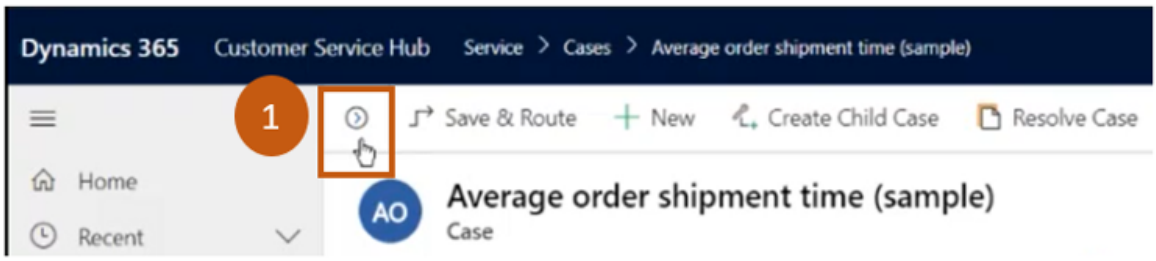
To return to the list of records, select **Open Views** in the command bar.

More information: Use interactive dashboards to effectively manage service cases

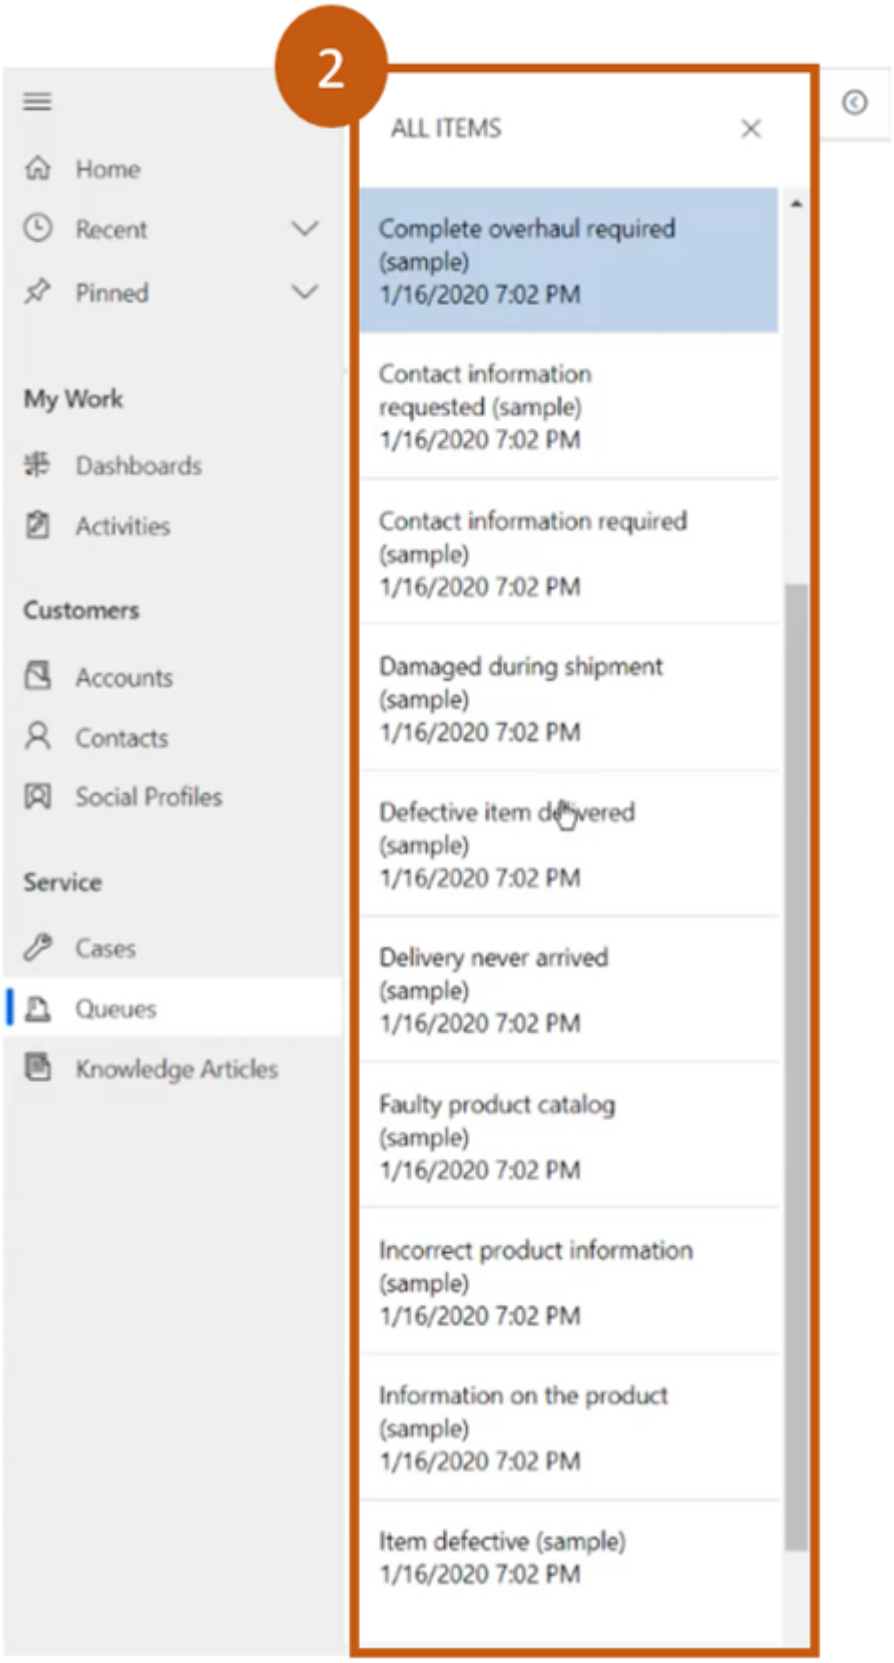
Navigate through records and pages

When you're viewing a record:

1. Select and expand **Open Record Set** to navigate to other records.



2. A side panel opens where you can view other records. You can directly select the records from the panel and view the details of the record.



Note

The option Open Record Set will not be available on devices with comparatively smaller screen sizes.

More information: Create and manage queues and Create and manage a case.

Quickly create new records

- To create records quickly by filling in only the most basic information, select the **New** button given on the nav bar.

  > **Tip**
  >
  > On a mobile device, from the nav bar, tap ··· and then tap **Quick Create Menu**.

Email a link

You can email links to records so your colleagues can quickly find these records by selecting the links. To email links to records, select one or more records in the list, and then on the command bar, select **Email a link**. The default email client opens with the links to these records. The recipients will see all content in the records for which they have permission.

Know your forms

Forms are designed to help you quickly handle important customer service tasks and complete actions from a single place.

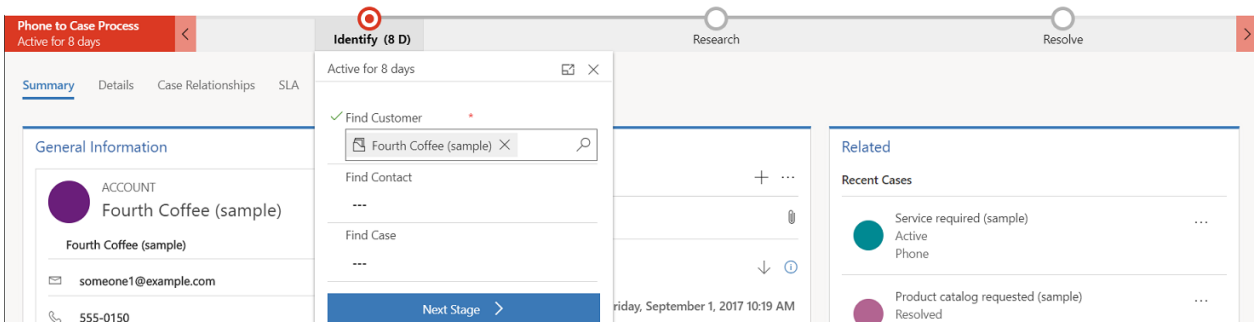
The different components of a form are explained in the following sections.

Business processes

In the Customer Service Hub, forms for cases and knowledge articles include a process bar (also called a business process flow), which appears when you save the record for the first time.

When you select a process stage on the process bar, you'll see the steps to take to complete that stage. A flag on a stage indicates the stage you're currently on. When you select an active stage, you can see the **Next Stage** button move to the next stage in the process.

The stages in the business process flow are displayed in floating mode, or docked mode. Stages can be aligned in a vertical layout, instead of horizontal, which makes it easier to see what steps are required to move forward. You can also choose to include an optional step in the business process flow and define criteria to trigger it.



If there's more than one process to follow, you can switch between them by selecting **Process** > **Switch Process** on the command bar, and then selecting the process you want to use. Or you can choose to abandon the process if it no longer applies.

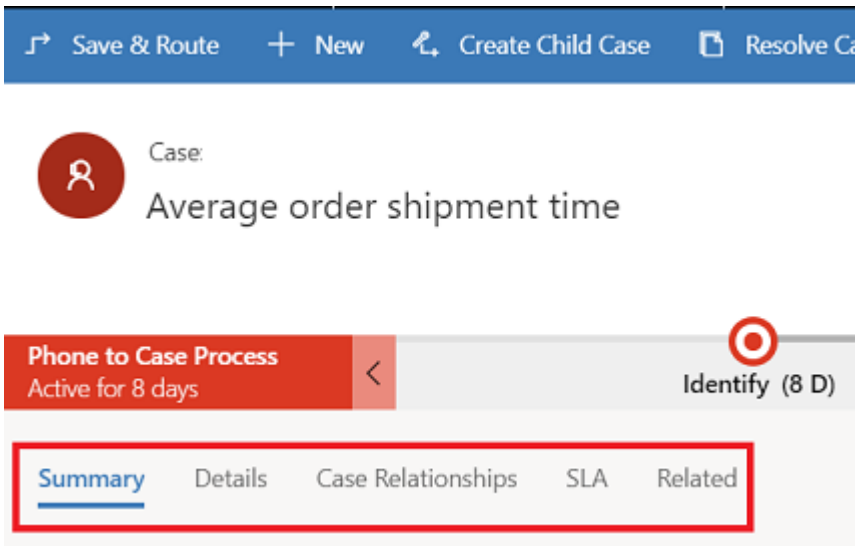
When a business process flow based on multiple entities is applied to a case or a knowledge article, the following limitations apply:

- The business process flow based on multiple entities isn't displayed on the form.
- The **Switch Process** option only shows business process flows that are based on a single entity.
- If there are only multi-entity business process flows for an entity, the **Switch Process** option isn't available.

Tabs on the form

Each case form is composed of one or more tabs. By default, the **Summary** tab shows information about the customer, interactions with the customer, and other related records. You can select different tabs to enter or see other miscellaneous details of a record.

For example, here's a view of how the tabs appear on the case form:

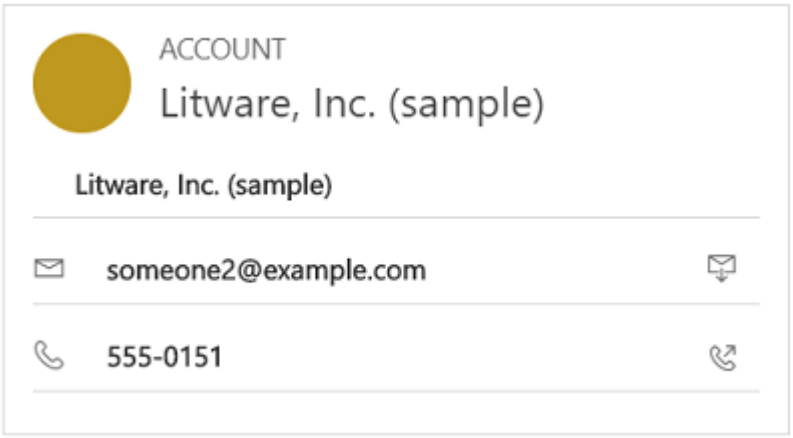


This table lists the default tabs for each record type and the information that they show for a particular record.

Record type	Default tabs
Case	**Summary**. Includes the customer card, Timeline, and the Related section. **Details**. Tracks Case details, other details, and social response details of the case. **Case Relationships**. Shows merged cases, child cases, and associated knowledge articles. You can add a child case to the current case from the Child Cases list. It also shows a list of knowledge articles associated with the case. **SLA**. Shows the related SLA KPI Instance records that are created for each SLA KPI that is tracked for the case. **Related**. Shows related entities, such as activities and connections.
Account	**Summary**. Includes the customer card, Timeline, and the Related section. **Details**. Tracks other details like company profile, marketing details, contact preferences, and billing and shipping. **Related**. Shows related common entities.
Contact	**Summary**. Includes the customer card, Timeline, and the Related section. **Details**. Tracks other details like personal information, marketing details, contact preferences, and billing and shipping. **Related**. Shows related common entities.
Activities	Activity forms show a tab called Task for the respective activity and a Related tab for common entities.
Knowledge Articles	**Content**. Lets you write and edit the content for the article. **Summary**. Tracks basic settings, Timeline, publishing settings, and related information. **Analytics**. Shows the number of views, feedback, and a list of cases using the article. **Related**. Shows related common entities.
Social Profiles	**Social Profile**. Captures general information, and social profile details along with related social profiles. **Related**. Shows related common entities.

Contact card

See a complete view of your customer's touch points in the Contact card. This card is available in the **General Information** section of the **Summary** tab.

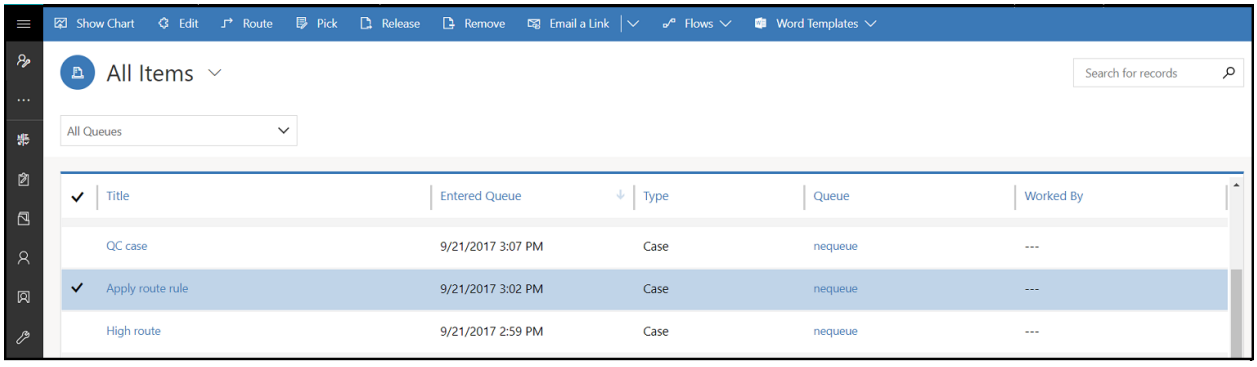


You can add a picture to the account or contact record in Dataverse, and it will appear on this card. You can make calls to customers from the Contact card using Skype for Business – IP telephony.

For account records, the card shows contact details for the primary contact associated with the account. For contact records, the card appears if the contact is the customer value on the case form.

Work with Queues

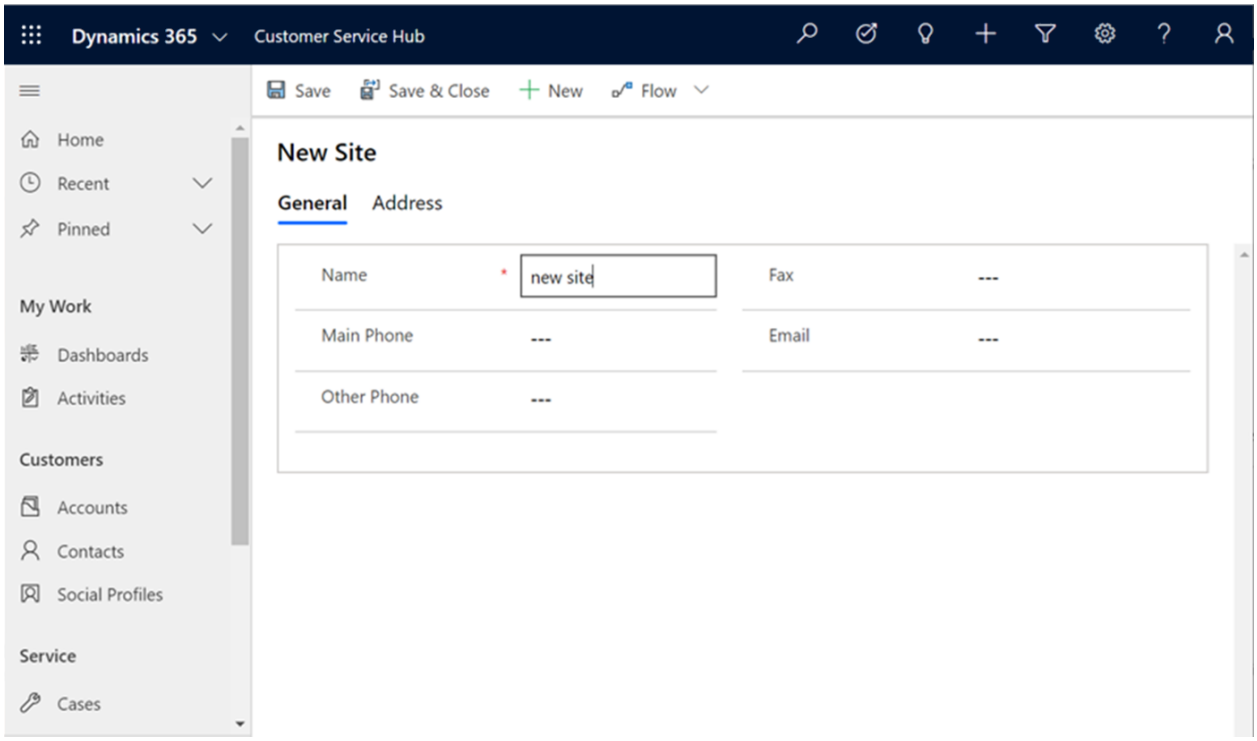
Use queues to organize, prioritize, and monitor the progress of your work. In Dynamics 365 Customer Service, queues are containers that are used to store anything that needs to be completed or requires an action. For example, you could use queues for completing a task or closing a case. To learn more about creating and managing queues, see Create and manage queues.



To know how to add a case to a queue, see Add a case to a queue.

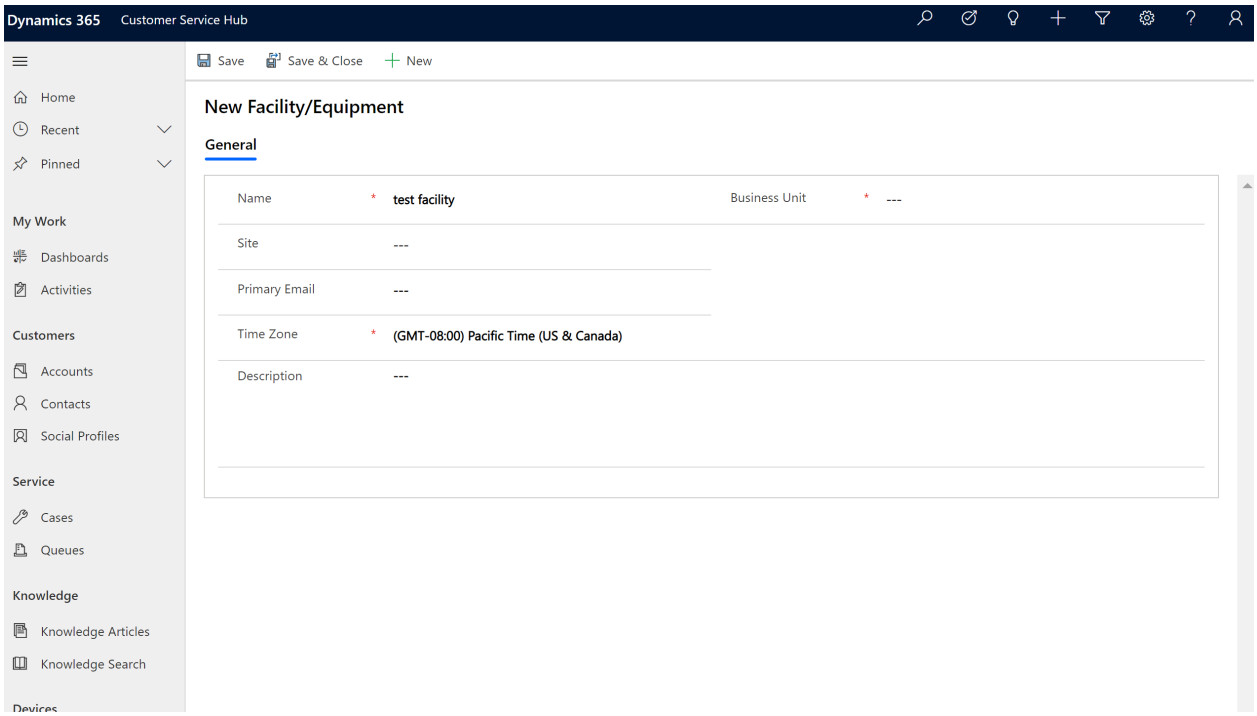
Understand Site

To create a new site, you need to go to **Advanced find** . Then you can customize other entity forms (for example, Account) by adding this site field.



Understand Facility/Equipment

To create a new Facility/Equipment item, you need to go to **Advanced find** , where you can create Facility/Equipment.

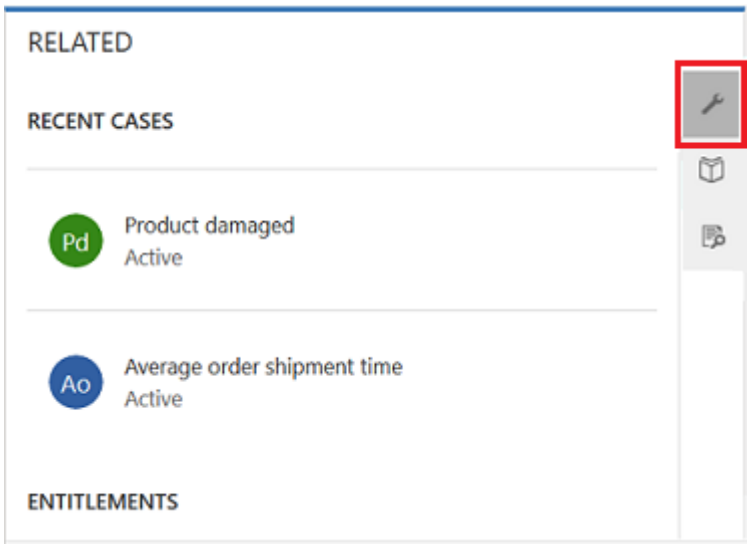


Related section

In the **Related** section (also known as Reference panel), use the tabs to see related records for the current record. This section is enabled by default for account, contact,

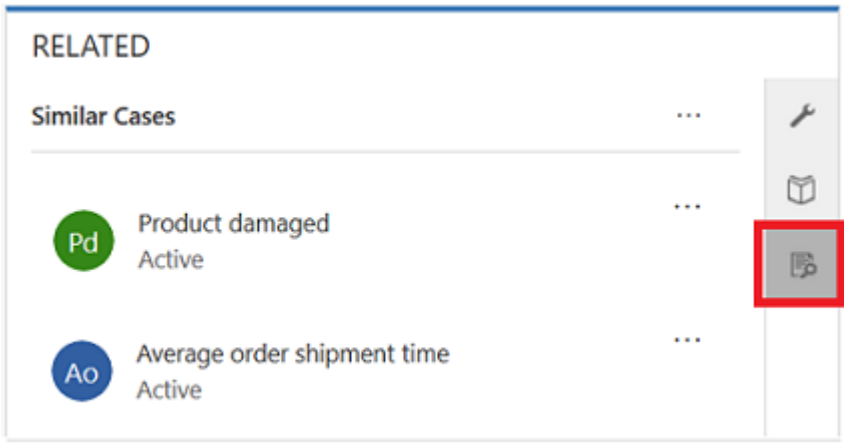
case, and knowledge article records. Your customizer can add this section for all entities (including custom entities) that are enabled for interactive experience. The reference panel is also available in model-driven apps. For information, see Reference Panel in model-driven apps .

By default, the first tab in the Related section of a case record shows the **Recent Cases and Entitlements** for the current case record you're working on.



The second tab in the Related section of a case record is the **Knowledge Base search**. Knowledge Base search lets you search for the knowledge articles related to a specific record. It also lets you view automatic suggestions. You can filter the search results to display articles that are Published, Draft, or Approved. For more information, see Search for Knowledge articles.

The third tab in the Related section of a case record displays **Similar Cases**. Select **...** on a record to follow or unfollow the case, and explore other options.



Watch this video to learn more about the Reference Panel in the Customer Service Hub: https://www.microsoft.com/en-us/videoplayer/embed/d8224c3f-6e20-4b8e-9d0d-b0f5602c7708?postJsllMsg=true

> ⓘ **Note**
>
> You can configure rules that help you view similar cases based on automatic suggestions. For more information, see **Use advanced similarity rules to view similar case suggestions**.

Similarly,

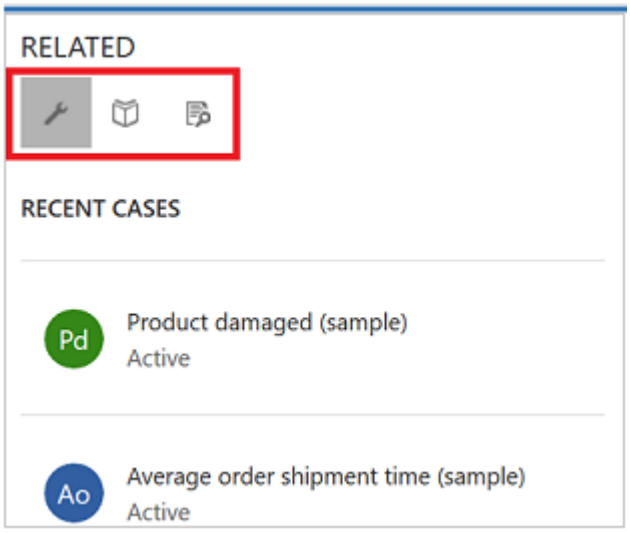
- For **Accounts** records, you can view **Contacts**, **Recent Opportunities**, **Recent Cases**, and **Entitlements** in the Related section.
- For **Contacts** records, the Related section displays **Recent Opportunities**, **Recent Cases**, and **Entitlements**.
- For **Knowledge articles** records, select an article and go to the **Summary** tab to view the **Related Information** panel. Here you can view **Related versions**, **Related translations**, **Related categories**, **Related articles**, and **Related products** for an article.

> ⓘ **Note**
>
> Your system administrator or customizer can choose if Related section should be included in a form. They can also decide on what related data should be displayed in the section for each form.

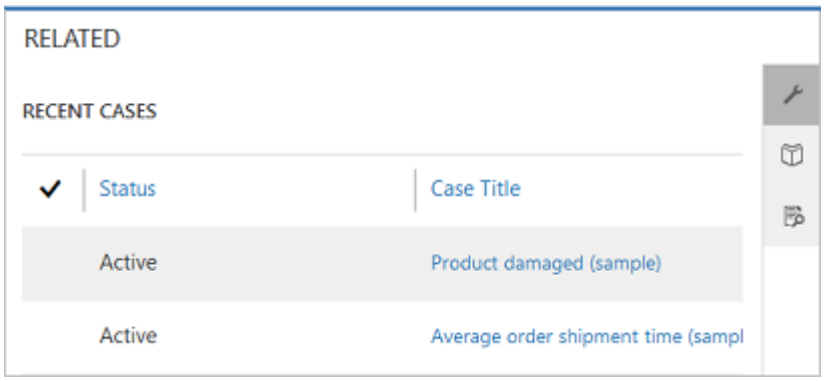
Reference Panel reflow

The Customer Service Hub is available to use on a desktop browser, and on a mobile device. Depending on the zoom level and the resolution of the system on which you're accessing the hub interface, the Reference panel adjusts the tabs and records for an optimum experience.

For example, on a browser, if you zoom in to about 100% or more, the tabs get docked on the top of the panel.



Similarly, if you zoom out to about 60-70%, the records appear in grid form.



Understand Activities

Activities are the tasks that you or your team perform while interacting with customers. An activity is any action that can be entered on a calendar and has time dimensions (start time, stop time, due date, and duration) that help determine when the action occurred or is planned to occur.

For example, you can make a record to track a phone call with a customer, or list an appointment scheduled with a customer to discuss a certain issue. You can create activities for yourself, or assign them to other service reps.

In Dynamics 365 Customer Service, the following activities are supported:

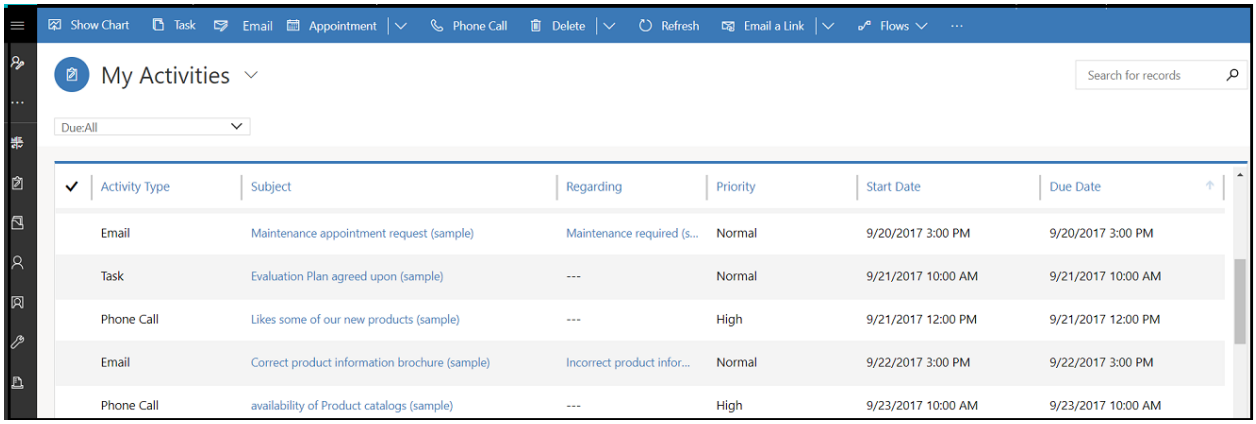
- Email
- Task
- Appointment
- Phone Call
- Social Activity

> ⓘ Note

You can create and edit emails in the Customer Service Hub app on a desktop browser. However, on a mobile device, email is read only on the app.

Open Activities view

In the Customer Service Hub site map, select **Service** > **Activities**. The **My Activities** view is displayed.



- Select in the nav bar to go to **Activities** to quickly add a new activity.
- Select **My Activities** to switch between activity views.
- Select **Due** to see the list of activities that are due in coming time or are already overdue.
- Explore the command bar options to create a new activity like new **Task**, **Email**, **Appointment**, or **Phone call**.

  For example: To create a new email, select **Email** from the command bar. The New Email activity form is displayed.
- Select **...** in the command bar and go to **Open Dashboards** to directly open activity dashboard.
- To view the status of an activity, select the activity record. The status is displayed in the bottom left corner of the activity form.

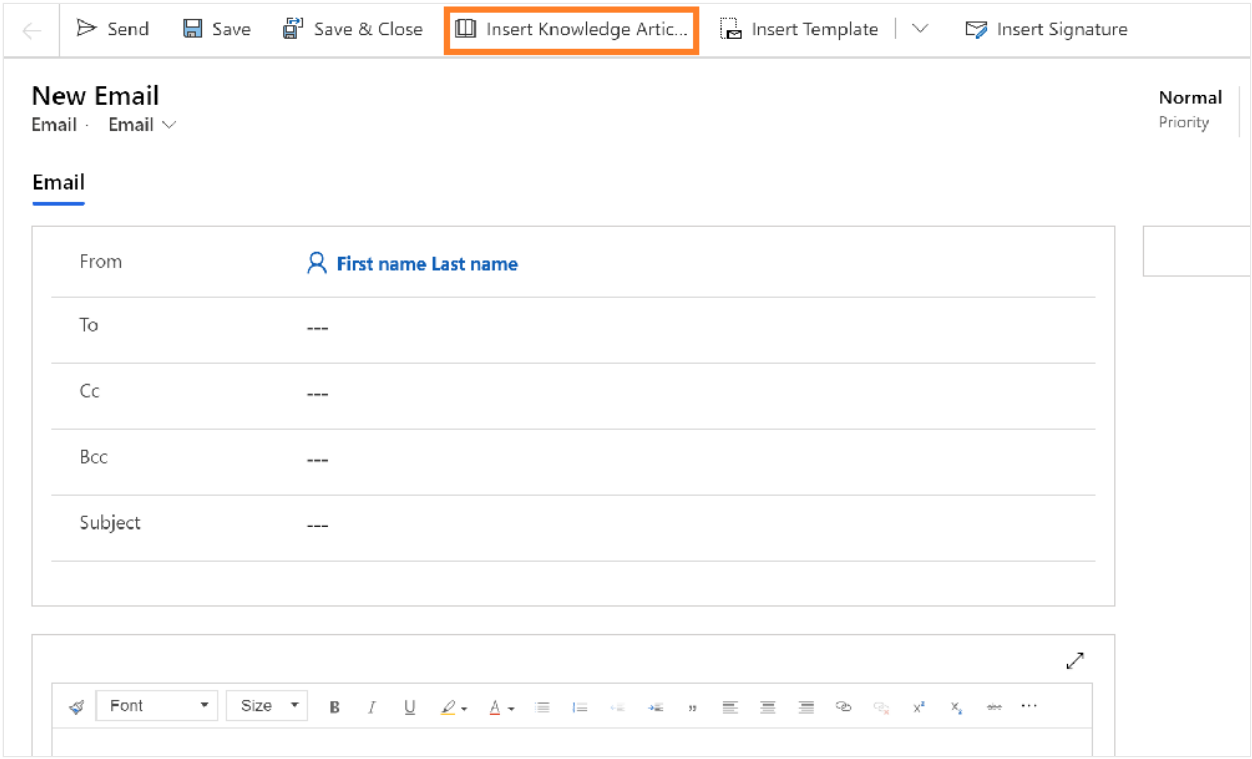
Insert a knowledge article into an email

While working on an email, you can quickly help customers by searching and selecting a relevant knowledge article to include in your email. You can insert the article and/or share a link to it in the body of your message.

You can insert a knowledge article in an email in Dynamics 365 Customer Engagement (on-premises) 9.1. More information: New features in Dynamics 365 Customer Engagement (on-premises)

1. On an email form where you're drafting, place your cursor where you want to place the knowledge article or its link, and then select **Insert Knowledge Article**.

   The **Select knowledge article to insert** screen is displayed.

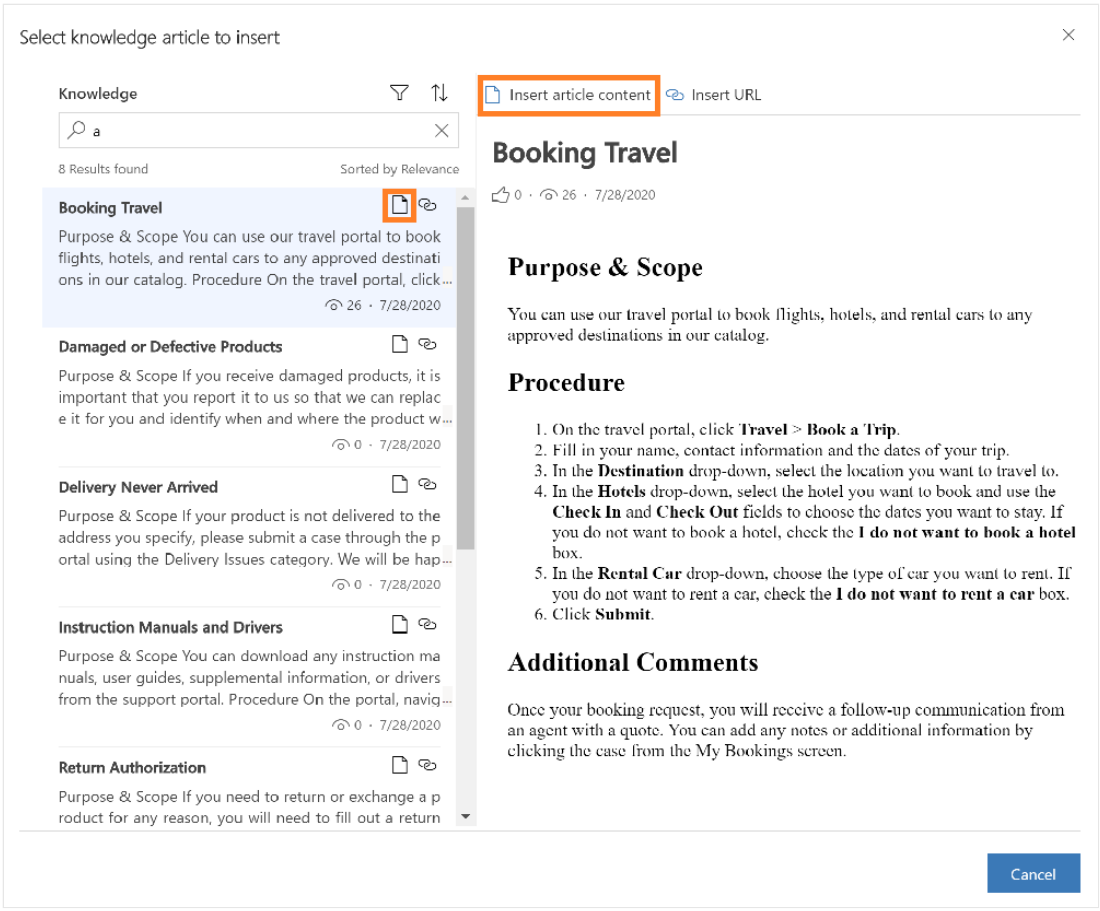


2. Search for the article you want to include. For more information about searching for knowledge articles, see Search for knowledge articles in the Customer Service Hub.

   A list of available articles will be displayed. You can select an article in the search results to view it in the preview pane.

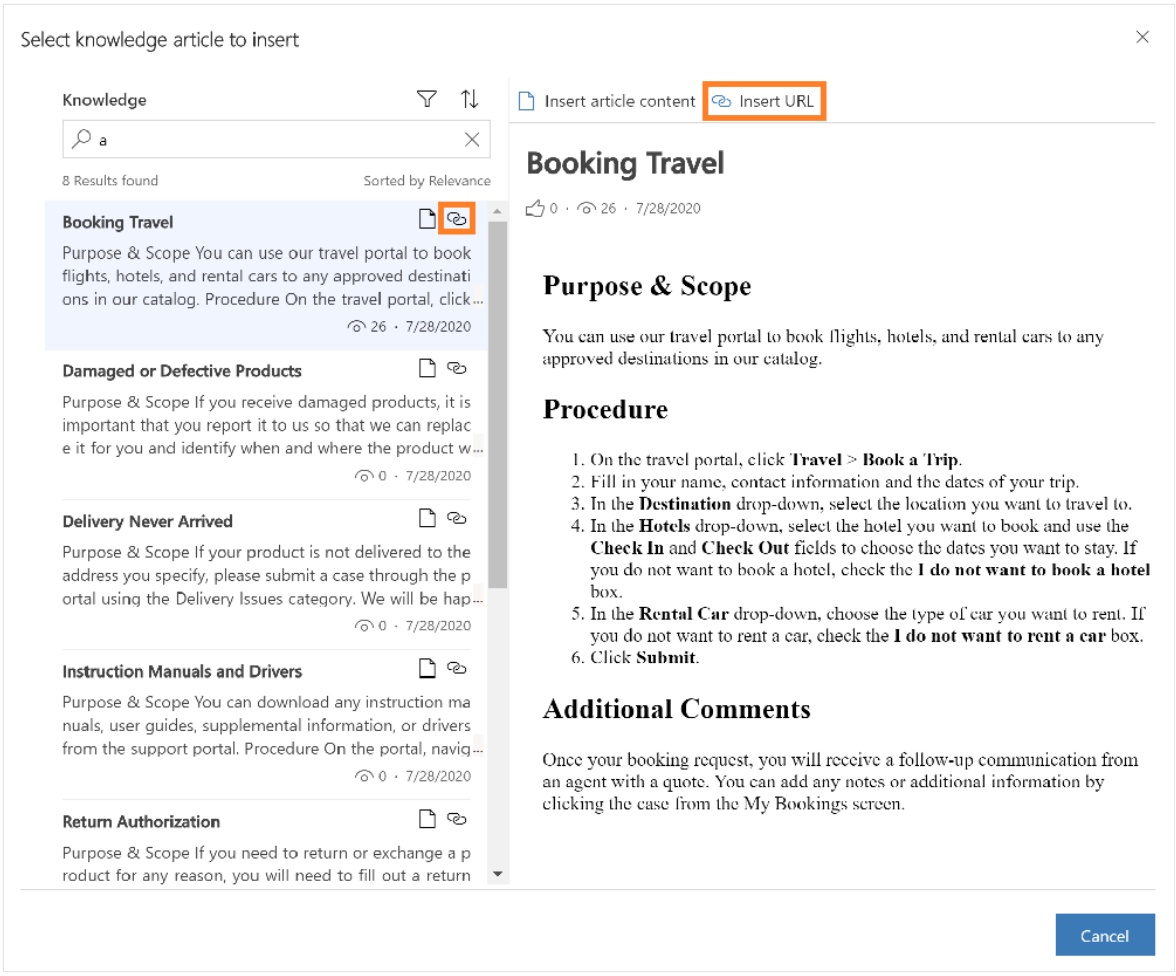
3. When you've found the article you want to include, do one of the following actions:

   - To insert an article into the email, select the **Insert content** icon for the article in the search results or in the article preview pane, select **Insert article content** at the top of the pane. This will insert the content into the body of your email and close the **Select knowledge article to insert** page.



> **Note**
>
> - To insert a knowledge article into a field that is enabled for using the rich text editor options, you must first configure the custom rich text editor for the field. For more information on this configuration, see **Customize the email experience**.
> - If you add more than one field, and then select **Insert Knowledge Article**, by default, the knowledge article gets inserted into the first field in the form.

- If your administrator has set up an external portal that supports a URL format, you can include a link. For more information, see Set up knowledge management (Customer Service Hub). To insert an article as a link in the email, select the **URL** icon for the article in the search results or in the article preview pane, select **Insert URL** at the top of the pane. This will insert a link to the article into the body of your email and close the **Select knowledge article to insert** page.

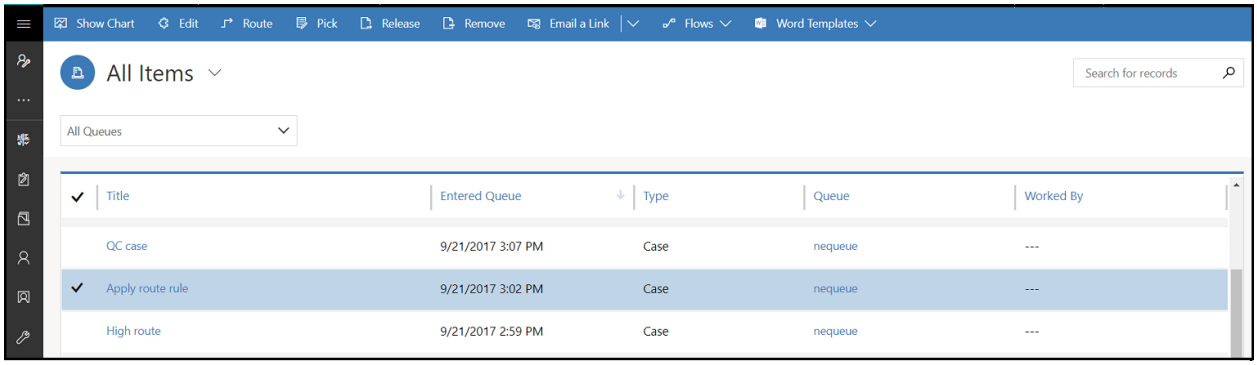


Create and Manage Queues

Use queues to organize, prioritize, and monitor the progress of your work. In Dynamics 365 Customer Service, queues are containers that are used to store anything that needs to be completed or requires an action. For example, you might use a queue for completing a task or closing a case. To know more about creating and managing queues, see Create and manage queues.

Open Queues view

In the Customer Service Hub site map, select **Service** > **Queues**. The queues view is displayed.

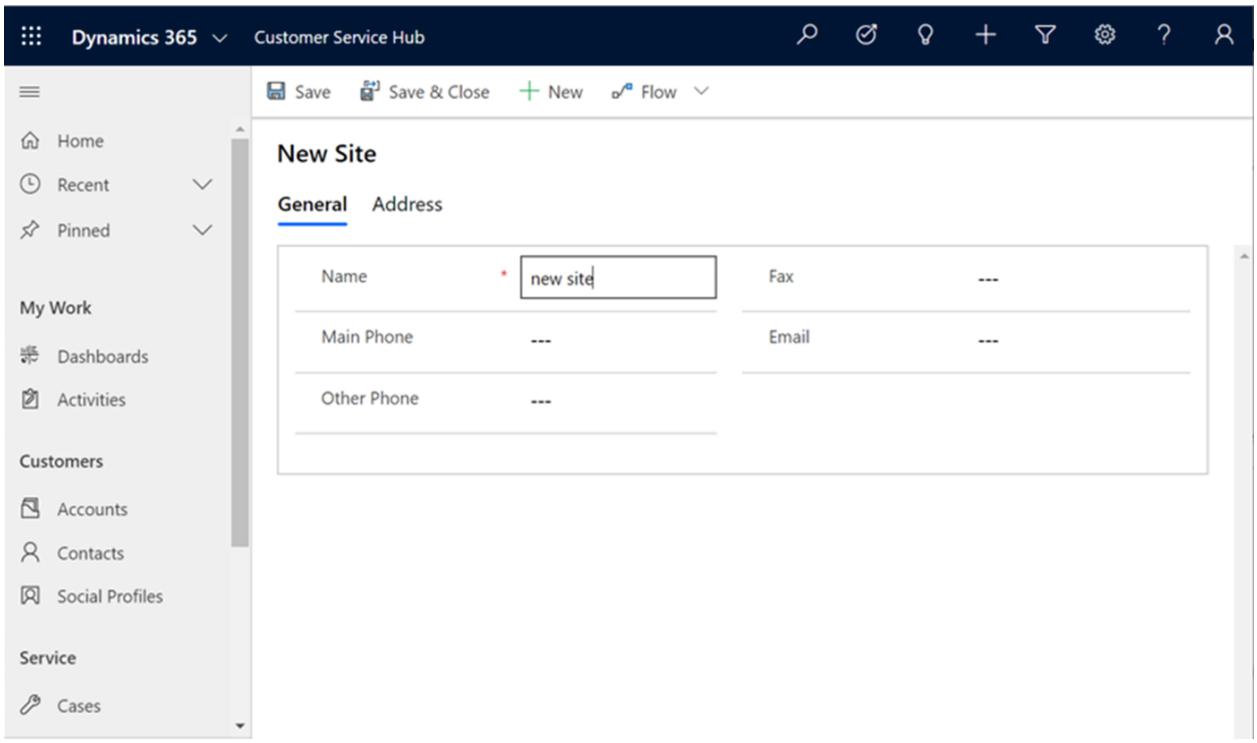


- Use the drop-down lists to switch between the views and the various queues.
- Select a record in the queues view to:
  - **Edit** the record
  - **Route** the record
  - **Pick** the record. It will be assigned to you and will be moved to your queue.
  - **Release** the record. It will be assigned back to the queue owner for other's to pick up.

To learn how to add a case to a queue, see Add a case to a queue.

Create a new site

To create a new site, go to **Advanced find** . Then you can customize other entity forms (for example, Account) by adding this site field.



Create a facility/equipment item

To create a new Facility/Equipment item, go to **Advanced find** , where you can create Facility/Equipment.

Track your cases efficiently and act on them quickly

Configure Customer Service

Article • 09/30/2022

> **Important**
>
> With the release of the Customer Service admin center app that consolidates admin experiences across the Customer Service suite, we announce that the following admin experiences are deprecated and no longer supported after April 2023.
>
> - Service Management area in the Customer Service Hub app
> - Omnichannel admin center
> - **App profile manager:** Is removed in April 2023.
>
> Also, starting in October 2022, the Omnichannel admin center and the service management area in Customer Service Hub will be hidden by default in newly created organizations and environments. You have the option to bring them back, but we recommend that you start using the Customer Service admin center app to perform tasks like manage cases, and configure unified routing, channels, and agent experience profiles. More information: **Get started with Customer Service admin center**

Use the Customer Service Hub app to set up everything related to customer service, like defining parent-child case hierarchy, creating queues, routing rule sets, rules for automatic case creation, service-level agreements (SLAs), entitlements, and customer service schedules.

Customer Service Hub

Use the Service Management to set up various admin tasks for customer service.

In the bottom left pane, select the change area, and select Service Management.

More information: Understand the site map navigation

Customer Service app

In the Customer Service app, navigate to **Settings** > **Service Management**.

Case settings

- Queues
- Parent Child Case Settings
- Routing Rule Sets
- Automatic Record Creation
- Subjects

Service terms

- Service Level Agreements
- Entitlements
- Holiday Schedule
- Customer Service Schedule
- Service Configuration Settings

What's new in Dynamics 365 Customer Service

Omnichannel for Customer Service for administrators

Article • 10/03/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

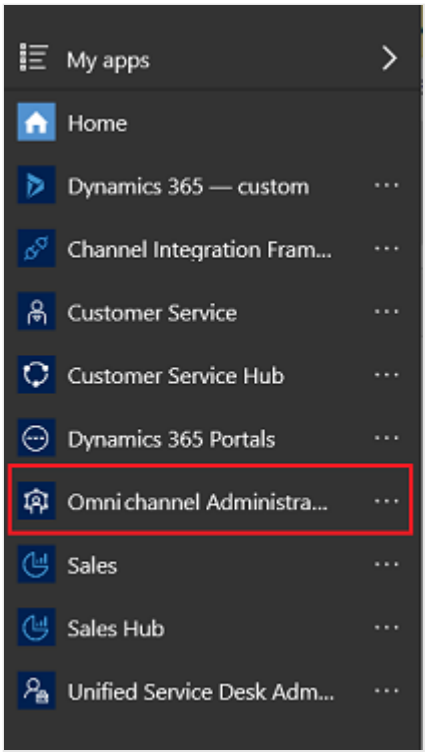
> **Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

Omnichannel for Customer Service is a customizable application you can effectively configure to meet the requirements of your business. Use Omnichannel for Customer Service to manage users (agents and supervisors), work streams, conversations, and queues, and effectively route important conversations to agents quickly. You can manage the capacity of agents so they handle conversations effectively and assist your customers better. You can manage the types of conversations agents receive using work stream and queue configurations.

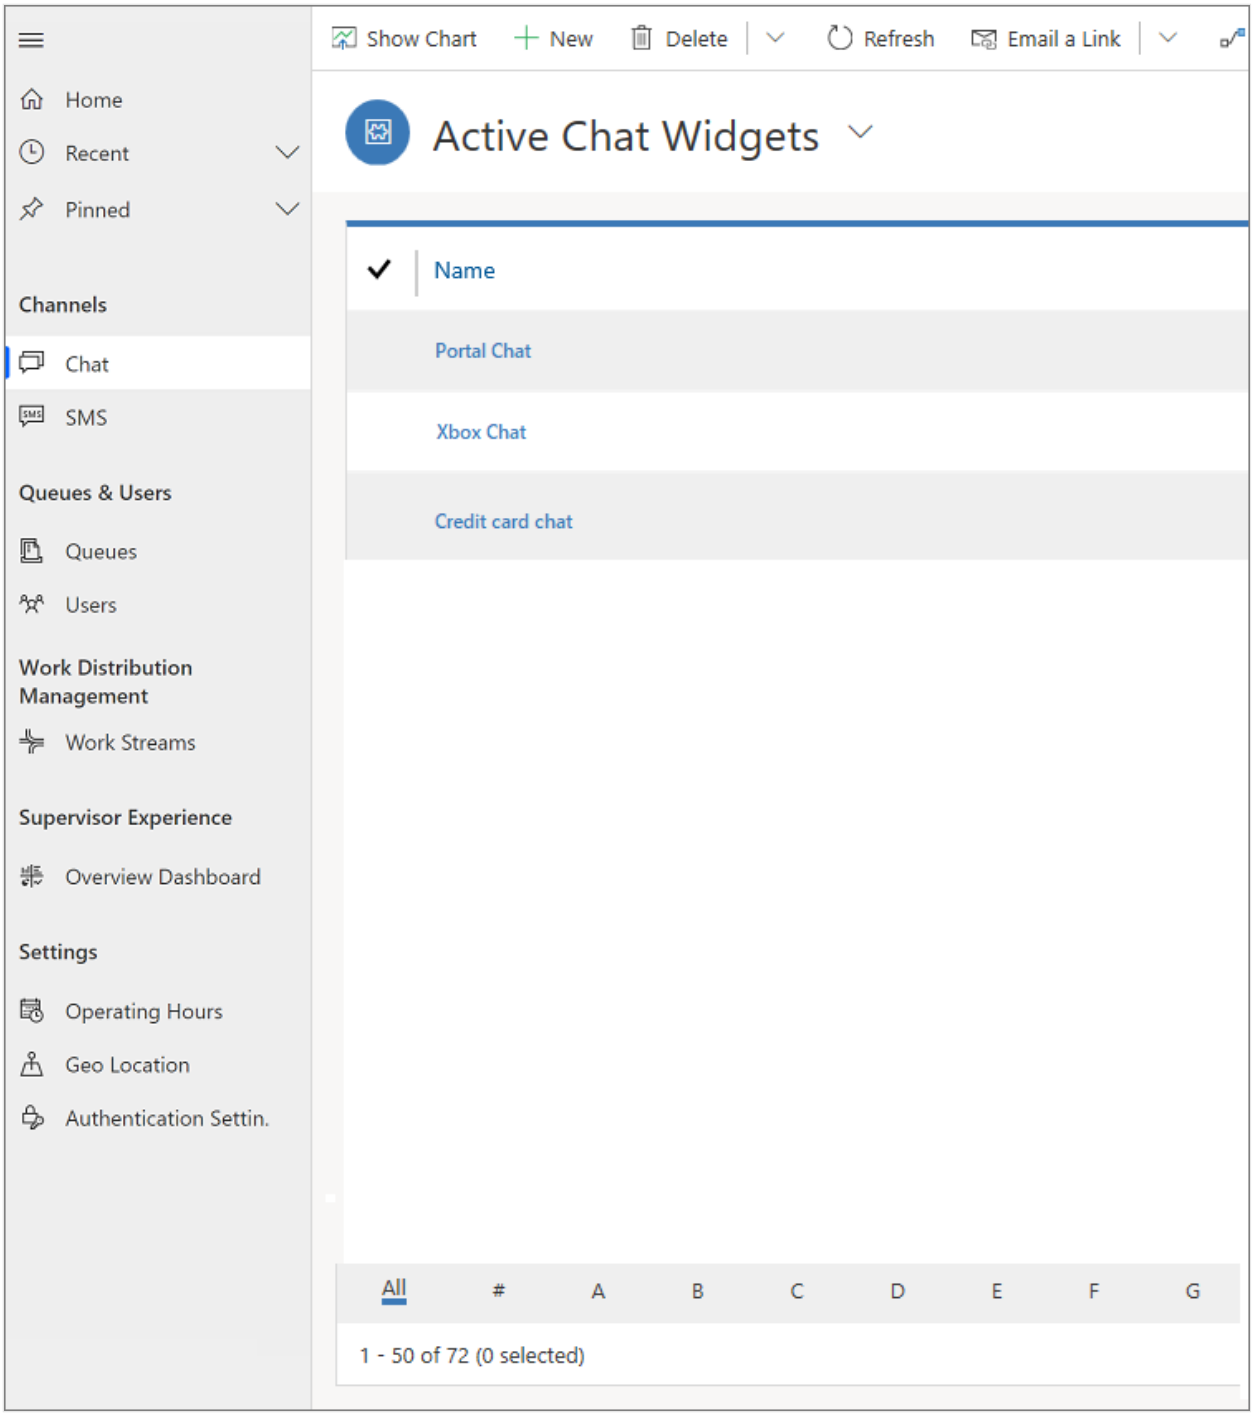
Access Omnichannel for Customer Service for administrators

1. Provision the Omnichannel for Customer Service app. Follow the steps given in Provision Omnichannel for Customer Service to set up and enable the Omnichannel for Customer Service app in your instance.

2. After the app is enabled, go to the apps page, navigate to the app switcher and then select **Omnichannel Administration**.



You can view the entities in the **Omnichannel Administration** site map.



In this section

- Understand routing and work distribution
- Understand and create work streams
- Create a chat widget

How-to topics

- Assign roles and enable users for Omnichannel for Customer Service
- Manage a user in Omnichannel
- Configure a chat channel

- Configure an SMS channel
- Configure a Facebook channel
- Automatically identify customers using pre-chat responses
- Create custom presence status
- Create a new Omnichannel queue
- Create a routing rule
- Enable knowledge articles in the Omnichannel for Customer Service
- Add a chat widget
- Configure a pre-chat survey
- Create quick replies
- Create and manage operating hours
- Create chat authentication settings
- Embed chat widget in Power Apps portals

Introduction to Omnichannel for Customer Service

Article • 08/09/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Tip

- If you'd like to try Dynamics 365 Customer Service for free, you can sign up for a **30-day trial**.
- Explore **Copilot**, a feature that significantly enhances agent productivity in Customer Service.

Omnichannel for Customer Service is a robust application that extends the power of Dynamics 365 Customer Service to enable organizations to instantly connect and engage with their customers via channels like Live Chat, voice, and SMS.

Omnichannel for Customer Service also provides a modern, customizable, high-productivity app that allows agents to engage with customers across different channels. The application offers contextual customer identification, real-time notification, integrated communication, and agent productivity tools like knowledge base integration, search, and case creation to ensure agents are effective.

Supervisors get real-time and historical visibility and insights into the operational efficiency of agents and the utilization across various channels.

The enterprise-grade routing and work distribution engine allows customers to configure agent presence, availability, and routing rules, thus ensuring agents are working on the most relevant engagements.

Important

- Omnichannel for Customer Service uses third-party cookies for authentication. Make sure that the cookies are not blocked in your browser in any mode so

that certain services, such as agent or supervisor presence, can work properly.
- The multisession mode and navigation capabilities are supported in the Omnichannel for Customer Service and Customer Service workspace apps only, and not in copies of these apps or custom apps.

Channels available with Omnichannel for Customer Service

You can enable the following channels in your organization with Omnichannel for Customer Service.

Chat

Chat is an engagement channel that enables your agents to connect with customers in real-time. More information: Try channels for Dynamics 365 Customer Service and Configure a chat channel

SMS

SMS is an engagement channel that supports asynchronous mode of communication, and allows your organization to connect to customers by using text messages. More information: Try channels for Dynamics 365 Customer Service and Configure an SMS channel

Voice

With the voice channel, Omnichannel for Customer Service provides agents with the ability to receive and make public switched telephone network (PSTN) calls through a native calling experience in Dynamics 365, with real-time AI-powered features such as live call transcription, sentiment analysis, and AI-based suggestions to boost agent productivity. More information: Introduction to the voice channel

Microsoft Teams

Using Microsoft Teams as an engagement channel for support of internal functions—such as technical support, human resources, and finance—allows organizations to connect their employees with internal support personnel by using the Omnichannel

Add-in for Dynamics 365 Customer Service. More information: Configure Microsoft Teams

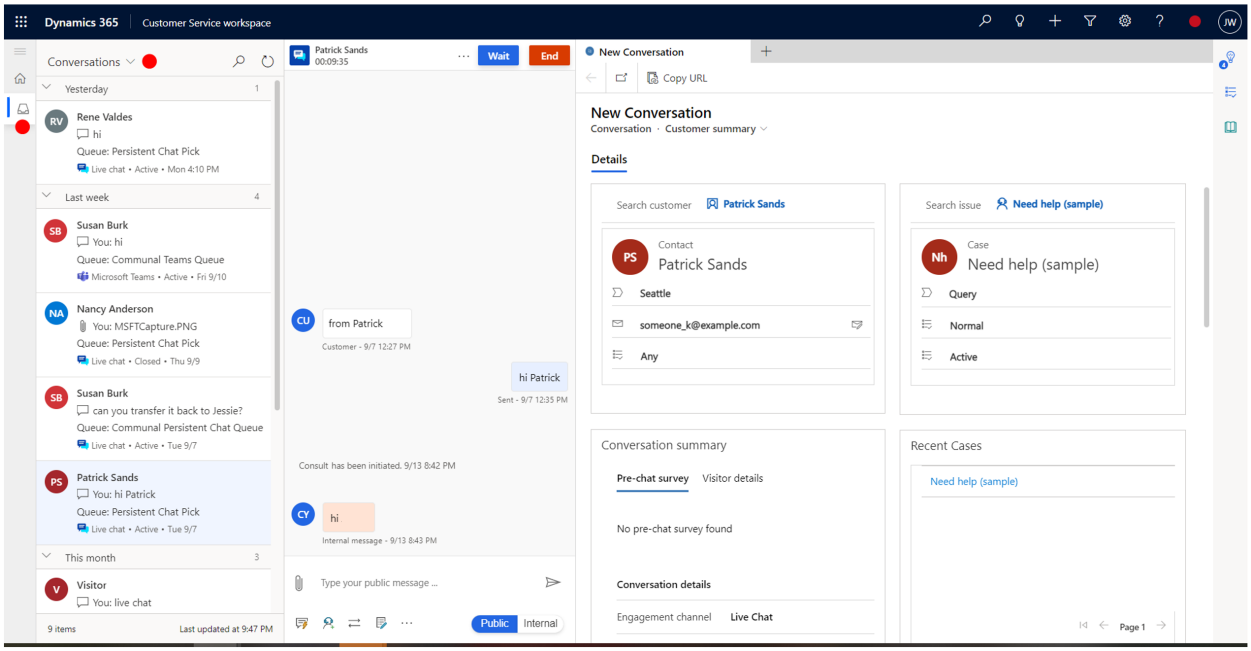
Social channels

Social channels such as Facebook, LINE, and WeChat give you an incredible opportunity to capitalize on the social media trend and engage with your customers in a seamless and personalized experience. In addition to popular social channels, you can create your own custom messaging channel. For more information, see Try channels for Dynamics 365 Customer Service.

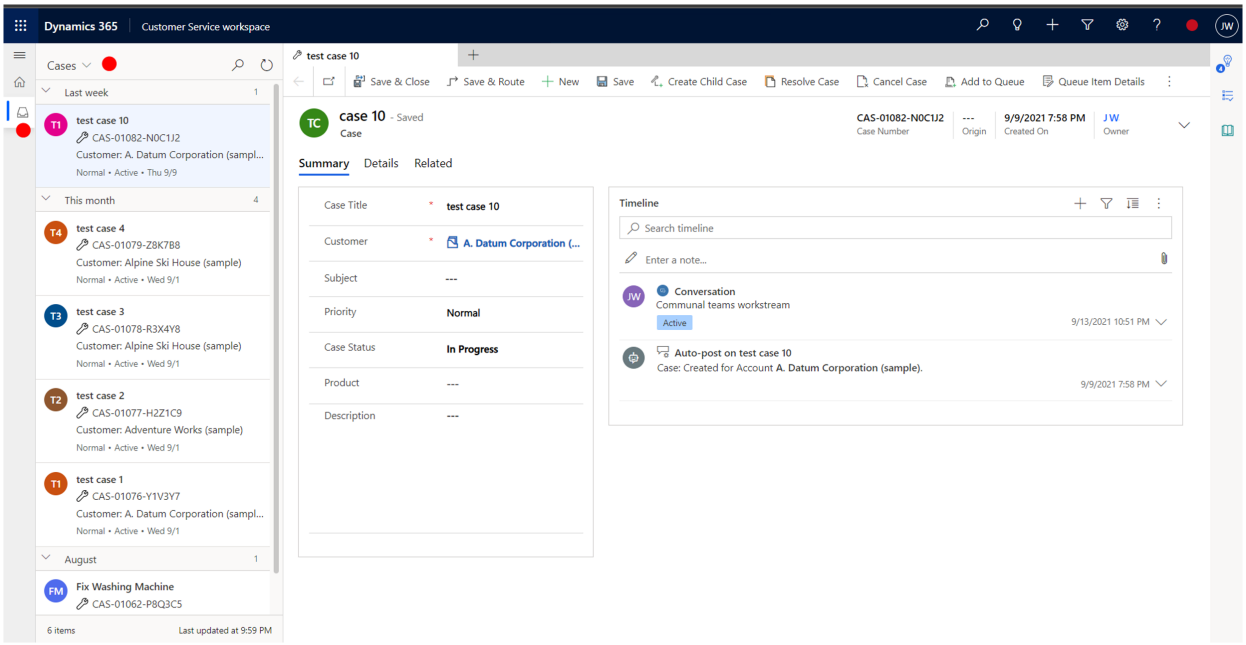
Inbox view

As an agent, when you open Customer Service workspace or Omnichannel for Customer Service, you can select the inbox icon to show all of the cases and conversations that are assigned to you. The inbox is designed to help you efficiently work on high velocity tasks, as well as promote inbox sessions to regular sessions when you need more time to resolve cases and complete your conversations. The following asynchronized channels are available in the conversation inbox: SMS, persistent chat, Facebook, Twitter, WeChat, LINE, WhatsApp, and Teams.

The following image shows the inbox conversation view:



The following image shows the inbox case view:



For information on how to configure the inbox view, see Configure the inbox view in App profile manager.

Install demo data for Chat for Dynamics 365 Customer Service

Article • 03/08/2023

This article offers instructions on how to install sample or demo data for Chat for Dynamics 365 Customer Service capabilities to help you build your own demo environments.

The sample data is available as a downloadable demo package, which you can install in your Omnichannel for Dynamics 365 Customer Service demo environment that has the Chat for Dynamics 365 Customer Service add-on.

ⓘ Important

- Once installed, you can't uninstall the demo data.
- The Chat for Dynamics 365 Customer Service demo data is available only in English.
- Install the demo data on a demonstration, evaluation, training, or test environment only and not on production environments.

Prerequisites

The following are required for installing sample data in your target environment:

- A Microsoft Power Platform environment.
- Your base language is English.
- The environment has no Omnichannel for Customer Service data already, or has only the default data that comes with a new environment.
- The environment has Omnichannel for Customer Service provisioned and the Chat channel is enabled.

ⓘ Note

If you need to install the demo data on top of an existing Chat trial or a demo environment that already has data (not recommended), you'll need to suspend the safety prechecks performed by the installer. For more information, see the **Technical notes**.

Download the sample data

Download the demo data from the Download Center and save it on your computer.

Chat for Dynamics 365 Customer Service demo data

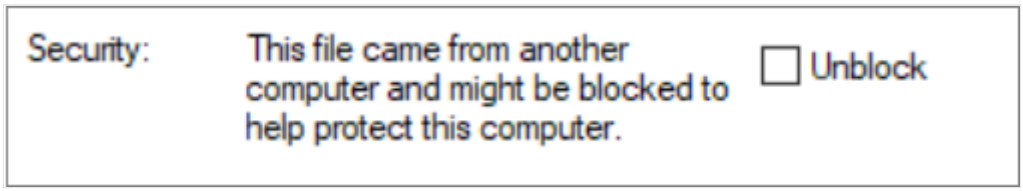
Extract files

The Chat demo data installer is a self-extracting executable file. After you download the demo data, perform the following steps:

1. Run the **.exe** file that you downloaded.
2. Accept terms and conditions to unpack the compressed zip file.
3. Extract the contents of that file to a folder on your computer.

Depending on the operating system and security settings, you might need to perform the following steps after unpacking the zip file:

1. Open the **OmnichannelDemoDataPackage** folder.
2. Right-click the **OmnichannelDemoDataPackage.dll** file and choose **Properties**.
3. Choose **Unblock**.



4. Select **Apply**.
5. Select **OK**.

Set up users

The OmnichannelDemoData package installs a few users such as those listed in the table below. To install the demo data, you need to create (or temporarily rename) users in your Power Platform environment to match the incoming demo data configuration.

First name	Last name	User alias	Email	Role

First name	Last name	User alias	Email	Role
Alex	Allman	alexallman	alexallman@sampleorg.onmicrosoft.com	Omnichannel Supervisor
Lilly	Michael	lillymichael	lillymichael@sampleorg.onmicrosoft.com	System Administrator, Omnichannel Administrator
Penelope	Mayo	penelopemayo	penelopemayo@sampleorg.onmicrosoft.com	Omnichannel Agent

Configure users

1. Sign in to your Power Platform environment.
2. Select **Settings** > **Security** > **Users**.
3. Replace `"Lilly Michael"` with `"lillymichael"` in the `UserFullname="Lilly Michael"` tag. Ensure the username is all lowercase.
4. Select the **Lilly Michael** user. The user page appears.
5. Select **Manage Roles** in the command bar at the top. The **Manage User Roles** dialog box appears.
6. Select the check box for the following role names:
   - **System Administrator**
   - **Omnichannel Administrator**
7. To grant full admin rights to Lilly Michael, select **OK**.

   This ensures that demo data records are created with the correct user ownership and therefore views are populated correctly.
8. Repeat steps 1 through 7 for the other users mentioned in the table.

Update data mapping file

Next you need to update a data mapping file with the email address of the default user context in the downloaded package.

1. Open **PkgFolder**.

2. Open the **usermap.xml** file in Notepad (or another XML editor).
3. Set the `DefaultUserToMapTo=` field to the email address of user Lilly Michael.

   For example: `<MappingConfiguration DefaultUserToMapTo="lilymichael@sampleorg.onmicrosoft.com">`
4. Select **Save**.

> **Tip**
>
> We recommend that you create a backup of your environment so you can revert to the initial stage if you encounter issues during the demo data installation. To learn more, see **Back up and restore instances**.

Run the package deployer

When you install any of the demo data, the following actions occur during the installation process:

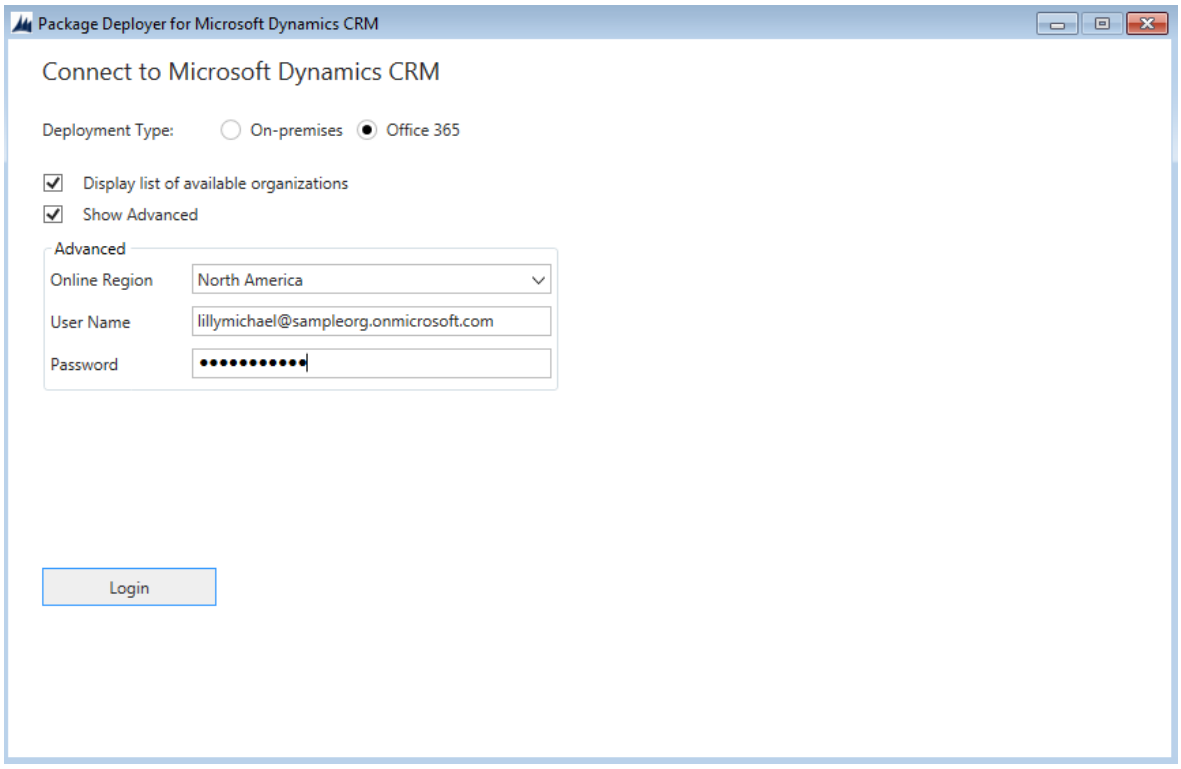
- Default parameters for using Omnichannel for Customer Service are created and/or set.
- Demo data and configuration for the applications are imported (Chat widget, Work Streams, Queues, and other entities) to demonstrate key capabilities.

Wondering what capabilities you can demo with the demo data? See the Fabrikam scenario below.

1. Open the **OmnichannelDemoData** folder.
2. Run **PackageDeployer.exe**.
3. Accept the terms and conditions.
4. Specify the following in the connect screen and select **Login**. In this step, you need to connect to the Power Platform environment where you want to deploy the demo data:

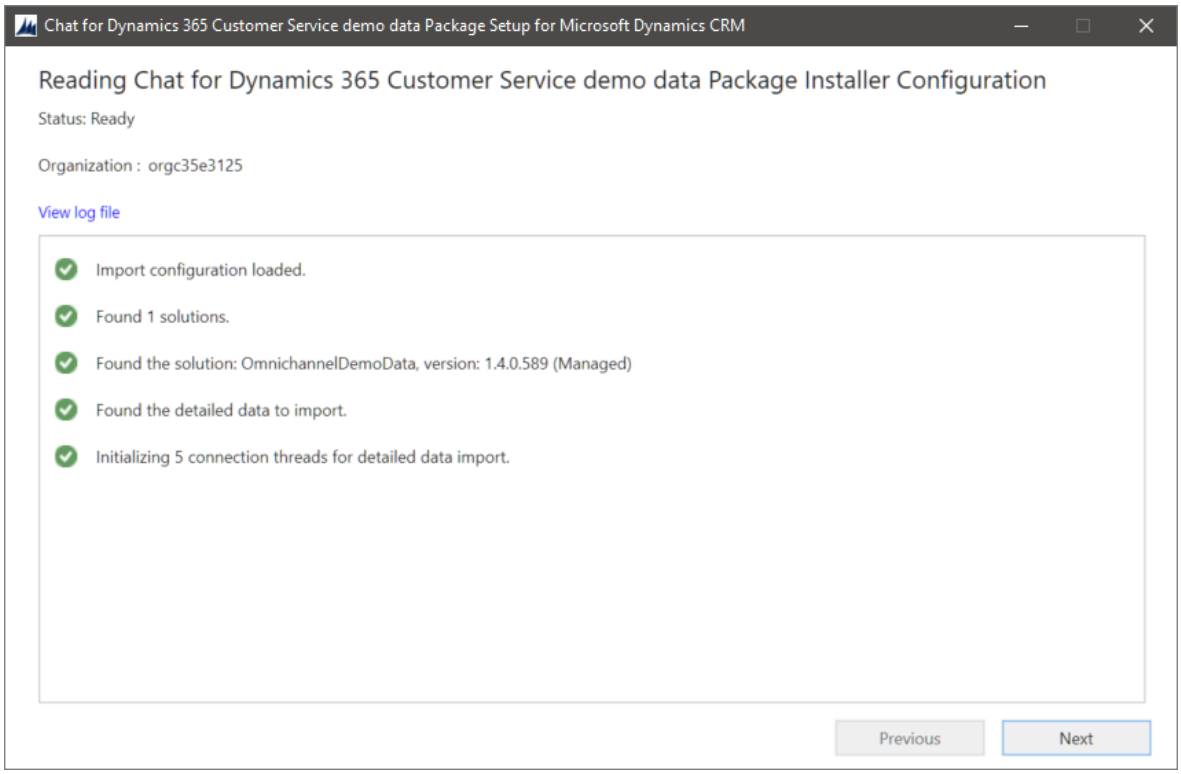
Field	Value	Description
Deployment Type	Microsoft 365	To connect to a Power Platform environment.

Field	Value	Description
Display list of available organizations	Select the check box.	
Show Advanced	Select the check box.	
Online Region	North America	Select the organization that you want to connect to.
User Name	`lilymichael@sampleorg.onmicrosoft.com`	Specify the user name of the system administrator user that you configured in the Configure users section.
Password		Specify the password of the system administrator user that you configured in the Configure users section.

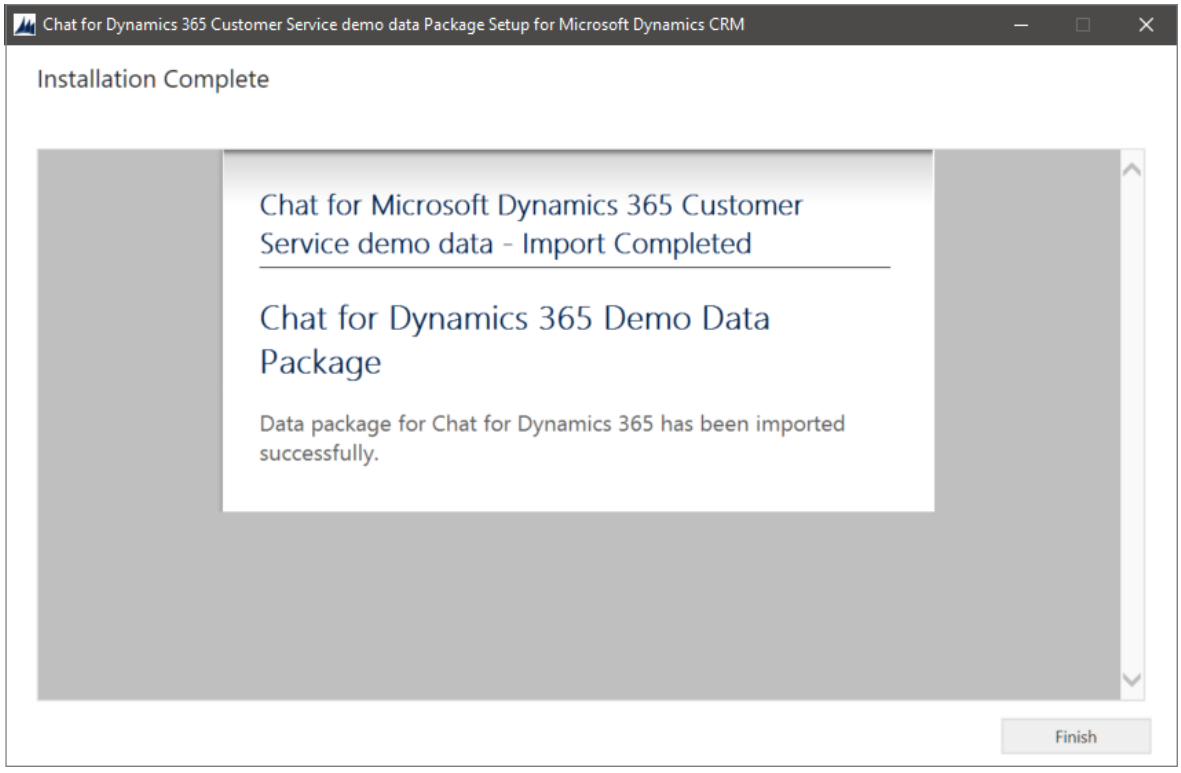


5. Select **Next** in the subsequent screens until you see the **Reading Chat for Dynamics 365 Customer Service demo data Package Installer Configuration** dialog box.

6. To start the demo data installation, select **Next**.



7. After the demo data is installed successfully, select **Finish**.



Verify demo data installation

> **Important**
>
> - Support for the Omnichannel Administration app ended on April 30, 2022. We recommend that you use the Omnichannel admin center or Customer Service

admin center app to configure the latest features, such as unified routing and voice channel. For more information about the deprecation announcement, see Omnichannel Administration app is deprecated.

- Additionally, workstreams that you create in the Omnichannel Administration app can't be modified in the Omnichannel admin center app. You'll need to migrate the existing workstreams and then manage them in the Omnichannel admin center app. More information: **Migrate workstreams created in Omnichannel Administration**

Verify that the number of records and types of entities listed in the **Fabrikam** fictitious scenario appear as expected.

After the demo data completely loads, do the following:

1. Sign in to Omnichannel for Customer Service as the Lilly Michael user.
2. Verify the following:
    - Go to **Omnichannel Administration** > **Queues & Users** > **Users** to confirm the three Omnichannel users are created.
    - Go to **Omnichannel Administration** > **Queues & Users** > **Queues** to confirm the Queue 1 (sample) and Queue 2 (sample) are created.
    - Go to **Omnichannel Administration** > **Channels** > **Chat** to confirm the Portal Chat (sample) is created.
    - Go to **Omnichannel Administration** > **Work Distribution Management** > **Work Streams** to confirm the Chat Push (sample) is created.

Technical notes

Install demo data in an environment that already has data

> ⚠ **Warning**
>
> We recommend that you don't install demo data on top of existing data because to do so, you have to remove safety precautions.

If you must install demo data on top of an existing Omnichannel for Customer Service trial or demo environment that already has data, you'll need to suspend the safety prechecks performed by the installer.

To suspend the safety prechecks, follow these steps:

1. Go to the **PkgFolder** folder.
2. Open the **DemoDataPreImportConfig.xml** file with Notepad (or another XML editor).
3. Set the value of `TerminateOnPreCheckFailure` from true to false.

```
<TerminateOnPreCheckFailure>false</TerminateOnPreCheckFailure>
```

This change causes the installer to skip safety prechecks.

Configuration components

There are several configuration components in this pre-import configuration file. For technical users, these include:

- **<RequiredSolutions>**: Specifies prerequisite solution installations and their version numbers.
- **<InstallSampleData>**: Installs demo data to your Power Platform environment. This is the same demo data that you can install from **Settings** > **Data Management**.
- **<DefaultParameterDescription>**: Specifies the default description for the parameters.

Fabrikam scenario

The fictional company Fabrikam is a manufacturer of an electronic device assembly line of robots and is known for its product quality, innovation, and solid customer service, including: installation planning, implementation, and ongoing maintenance services. Fabrikam is headquartered in the United States (Fabrikam, U.S.), and has Customer Service Support (CSS) operations centered in the United States, primarily in the greater Seattle area. The CSS contact center is focused on providing excellent support experiences to their customers.

A high-level overview of the Chat for Dynamics 365 Customer Service demo data is as follows:

- Three Omnichannel users
- One web customer
- One case
- Four sessions
- One Chat for Dynamics 365 Customer Service workstream
- One Chat widget
- One Omnichannel for Customer Service queue

Try channels in Omnichannel for Customer Service

Quickly configure a chat widget

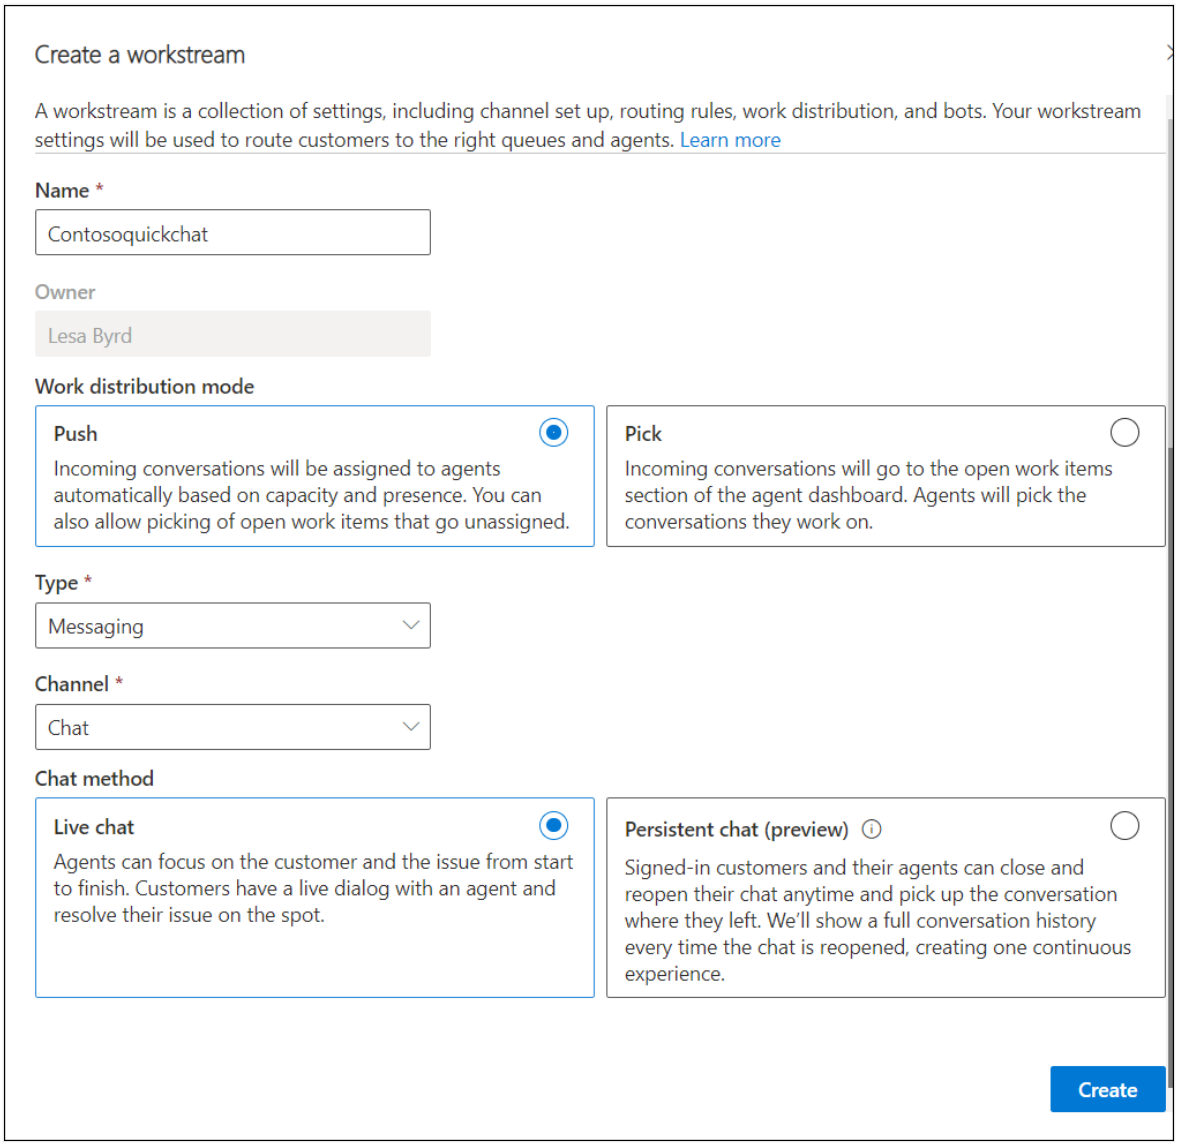
Article • 02/11/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Use the Omnichannel admin center app to quickly configure and add a chat widget to your portal to chat with your website visitors. To configure a chat widget and embed it in portal, you must:

Step 1: Create a workstream for chat

1. Sign in to Dynamics 365, and open the Omnichannel admin center app.
2. In the site map, go to **Workstreams** in **General Settings**, and select **New** from the command bar.
3. On the **Create a workstream** dialog box, do the following:
    - **Name**: Specify a workstream name
    - **Work distribution mode**: Select **Push** or **Pick**.
    - **Type**: Select **Messaging**.
    - **Channel**: Select **Chat**.



4. Select **Create**.

Step 2: Configure a chat widget

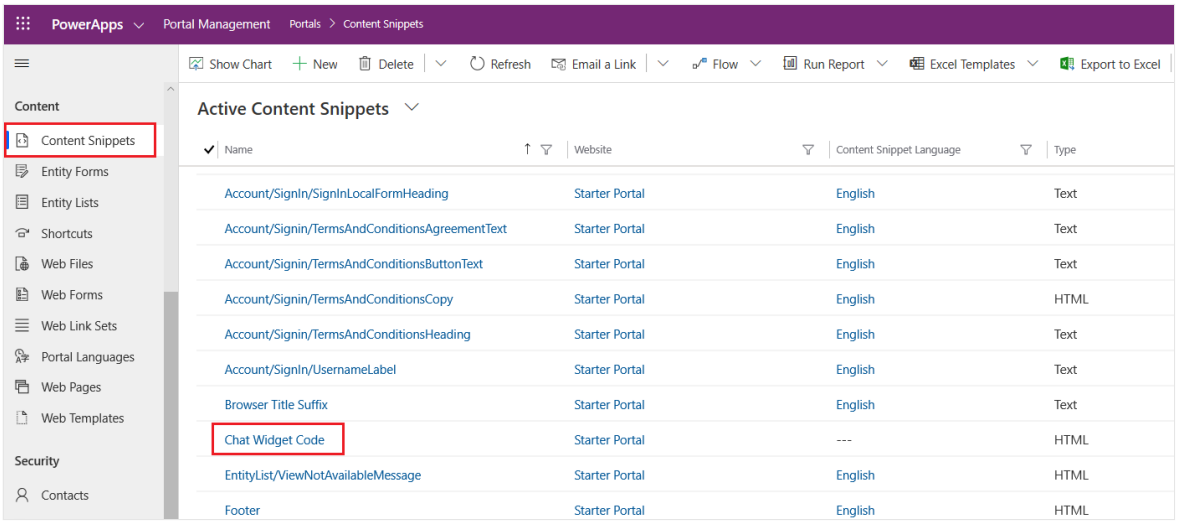
1. On the workstream page that you created, select **Set up chat**.
2. On the **Live chat setup** wizard that appears, enter the details. More information: Configure a chat widget.

Step 3: Embed chat widget in portal

> **Note**
>
> The chat widget requires session storage and local storage to be functional in your customers' browsers. Make sure to notify your customers to enable cookies in their browsers so these services can work properly.

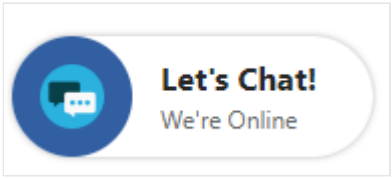
Follow these steps to embed your chat widget into a Power Apps portal. For steps to embed your chat widget into your website, see Embed chat widget in your website or Power Apps portal. For steps to embed your chat widget into mobile experiences, see Render a live chat widget on the mobile app.

1. Open the Portal Management app.
2. Go to **Portal** > **Content Snippets**.
3. Find the **Chat Widget Code** content snippet and open it.



4. On the **General** tab, scroll down to the **Value (HTML)** section.
5. Paste the chat widget snippet code in the **HTML** tab.

6. Save the changes. The chat widget is now embedded into the portal. By default, the chat widget is displayed in minimized mode as follows:



You can maximize the chat widget by selecting it.

Sign up for a free Dynamics 365 Customer Service trial

Article • 01/11/2023

Dynamics 365 Customer Service offers a 30-day free trial. After a quick sign-up, you'll have access to many of the app's key features. The trial allows you to test the app with sample data and even try out your own customer data. Learn more about what Customer Service has to offer.

To sign up for the trial:

1. Go to the Try Dynamics 365 Customer Service page and select **Try for free**.
2. Follow the onscreen guidance to enter the email associated with your Microsoft account or your personal email ID, such as alansteiner@gmail.com, and your contact information.

> **Note**
>
> - Check the availability of the product in the region you want to try before you sign up for a trial.
> - If you use a personal email ID to sign up for the trial, not all the trial features will be available. More information: **Trial FAQ**

The trial will take a few moments to load, then you can start using Customer Service.

What to try?

The trial environment includes many of the same features as the paid version. The following links will guide you through using some of the key features.

- Understand how agents manage their cases and work on them.
- View AI-suggested cases and knowledge articles for a case.
- Explore the agent dashboard.
- Understand the agent communication pane for conversations.
- Overview of the voice channel.
- Know more about chat notifications.
- View AI-suggested cases and knowledge articles for a conversation.
- View how supervisors monitor agent conversations.

Dynamics 365 Customer Service trial FAQ

Article • 06/13/2023

This article answers your most frequently asked questions about the free product trial of Customer Service and Omnichannel for Customer Service.

Sign-up

What are the system requirements for the trial?

This app is a cloud-based service that doesn't require special software other than an up-to-date web browser, though some restrictions apply. For the best trial experience, avoid accessing the trial site in incognito mode. Learn more about web application requirements.

How do I sign up for the trial without a Microsoft 365 tenant?

You can enter a non-work email address and we will create an account and tenant for you.

Can I sign up for trial using a personal email ID that's not associated with a Microsoft account?

You can use a personal email ID. But you won't be able to access Power Platform admin center to add more users to the trial, change security roles, or extend the trial period.

Can I sign up for multiple Dynamics 365 apps such as Sales, Marketing, and Customer Service?

Yes, you can. To view all available trials, visit the trial hub page. You can use the same email account to sign up for different trials. However, it is not possible to have multiple apps on the same trial site. Each trial will be on a different tenant and URL. The trial data won’t be shared across apps.

Trial app

I didn't receive the trial details email after signing up, what should I do?

When you sign up for the trial, you'll receive an email with the trial details. If you don't see the email in your inbox, check your spam folder. Alternatively, use the following steps to access your app:

1. Go to trial site and select Try for free.
2. Enter the email ID that you used, to sign up for the trial. You'll be redirected to your trial app.

How do I add more users to a trial?

To add users, go to the Microsoft 365 admin center using the trial admin account. Follow the admin center guidance to add users up to the trial license limit. If the user you are adding already has a Microsoft 365 account, assign them an appropriate security role in the trial org. For more information, see Assign a security role to a user.

How many users can I add to my trial environment?

You can add an unlimited number of users to the trial environment.

How do I reset the trial environment?

You can't reset the trial environment. However, you can wait for the trial period to end and then sign up again for a new trial.

How do I extend the trial?

You can extend the trial for another trial period in the admin center. For instructions, see Extend your trial. You can extend your trial once.

How do I cancel the trial?

If you have signed up for the trial using a managed Azure Active Directory account, you can request your Power Platform admin to delete the trial environment. If you have signed up using your personal account, you cannot cancel the trial manually. The trial

will expire after the 30-day trial period and the trial environment will be automatically deleted.

Can I convert the trial to a paid license?

Yes, you can purchase licenses through direct, credit card purchase at admin.microsoft.com. Or, you can work with sales to establish a volume licensing or enterprise agreement. Visit our Pricing page for more information on pricing and purchasing.

To purchase the license using an existing account, work with the administrator of the account to apply for licenses.

After you've applied for the license to your tenant, you can publish your environment to production. You can remove the sample data. However, you have to manually reset the configuration and remove any test data that you've added. We recommend that you create a fresh environment to use for your production environment and add the configurations you'd like to move forward with.

What are the trial limits and quotas?

The following limitations apply for the trial:

- The trial is available to you for 30 days. After that, you can request for an extension for another 30 days, buy a paid license, or sign up for a new trial.
- The trial will expire if there's no activity on the app for 14 consecutive days. Expired trials can't be reactivated. However, you can start a new trial.
- You can have only one active trial per app at a time. You can sign up again after your current trial for the app ends.

Customer Service-specific questions

What features are available in the trial?

The environment you receive in trial is a fully functional, Power Platform environment with the following out-of-the-box capabilities:

- Dynamics 365 Customer Service Enterprise
  - Customer Service workspace with AI-powered case and knowledge suggestions, knowledge search, and agent scripts with macros for common tasks automation
  - Case management, knowledge management, unified routing, email

- Digital Messaging and Voice Channel for Dynamics 365 Customer Service
  - Chat, voice, and other digital messaging channels
- Power Apps
  - To create app profiles, configure templates, customize the solution
- Dynamics 365 Power Virtual Agents
  - To add Power Virtual Agents bot to chat and channels

  > **Note**
  >
  > If you use a personal email ID for the Customer Service trial, you can't customize the Power Virtual Agents bot. The default Power Virtual Agents bot that's used in scenarios like voice and chat tour will work with the personal email address. However, you can't access the links to customize the bot using the Power Virtual Agents designer.

- Dynamics 365 Customer Voice
  - To add pre and post-conversation surveys in messaging
- Dynamics 365 Power Automate
  - To build customized and automated flows and business processes

More information: Dynamics 365 Customer Service pricing

How do I remove sample data from the trial instance?

Your trial environment is curated to provide you with a fully functional application to ensure you can discover the business value of Customer Service right away. Sample data is available to ensure all features are fully illustrated for you. You can learn how the product works as if it were deployed to many users in your organization and with existing customer interactions. Because it's a real environment, you can manually add or delete individual data records in your trial environment as you want. You can't do a bulk delete of the sample data and configurations from the trial environments.

How do I reset or reimport sample data?

Sample data comes with the trial environment and experience. To get a fresh dataset, you must wait for your trial to expire and start a new trial.

Can I call the trial phone number from outside the US?

No, you can't call the trial phone number because it's a toll-free US number that works within the US only. For more information and a workaround, see Use trial phone number.

Can I use the trial phone numbers for inbound or outbound SMS?

No. The trial phone numbers aren't available for inbound or outbound SMS.

Can I use the trial phone numbers for outbound calls?

No. The trial phone numbers aren't available for outbound calls.

Which geographical regions are supported in the trial version?

For the list of geographical regions supported in Customer Service, see Datacenter regions.

For the list of geographical regions supported in Omnichannel for Customer Service, see International availability. Additionally, the new trial experience isn't supported in Brazil, Government Community Cloud, Norway, and South Africa.

Which languages are supported in the trial version of Omnichannel for Customer Service?

For the list of languages supported in Omnichannel for Customer Service, see Language availability.

Administrators Learning Catalog

Article • 09/21/2022

Do you need to keep systems and data flowing, provisioned, and secure round-the-clock?

The following catalog is organized from core knowledge to specific domains, and from most basic to most advanced. If content exists in multiple formats, we'll let you know. You can choose the training format that best meets your needs.

Getting Started

Content	Description	Format	Length
Implementing Dynamics 365 Customer Engagement Online	Create, design, and administer Microsoft Dynamics 365 Customer Engagement tenants and instances, including planning for multi-instance deployments, managing authentication methods, managing updates, backup and restore instances, install and manage Microsoft Dynamics 365 clients for end-users, and authorizing access to different features for all users in the organization.	Free, self-paced online learning path	5 hours 5 minutes
Manage permissions and administration for Common Data Service	Do you need to manage user access rights? In this learning path, you'll learn how to manage permissions associated with environments and entities. You'll also learn about different administrative portals and how to access each.	Free, self-paced online learning path	1 hour 23 minutes
Introduction to configuration in Dynamics 365 model-driven apps	One of the key features of a Dynamics 365 model-driven app is its ability to be extended and customized without code. In this learning path, we'll explore the Power Platform's configuration abilities and how to use them for a model-driven app.	Free, self-paced online learning path	1 hour
Connect and engage with customers with Omnichannel for Dynamics 365 Customer Service	Developing and deploying true omnichannel solutions are critical to the success of any organization that provides customer service to its customers. By ensuring the unified and contextual experience regardless of the channel used, organizations can increase customer satisfaction, resolve issues faster, and increase revenue. With Dynamics 365's Omnichannel for Customer Service solution, organizations deploy a true Omnichannel solution that exists inside the Dynamics 365 organization that they use every day.	Free, self-paced online learning path	3 hours 30 minutes

Developers Learning Catalog

Article • 09/21/2022

Do you need to write code to integrate with other data sources, extend core system functionality, or build a complex application?

The following catalog is organized from core knowledge to specific domains, and from most basic to most advanced. If content exists in multiple formats, we'll let you know, so that you can choose the training format that best meets your needs.

Build

Content	Description	Format	Length
Introduction to developing with the Power Platform	So, you want to be a Power Platform developer! This learning path is the first step in learning about the platform, tools, and the ecosystem of the Power Platform.	Free, self-paced learning path	2.5 hours

Extend

Content	Description	Format	Length
Extending the Power Platform user experience Model Driven apps	Create client scripting, perform common actions with client script, and automate business process flow with client script is covered in this learning path. Learn about what client script can do, rules, and maintaining scripts. Discover when to use client script as well as when not to use client script.	Free, self-paced learning path	3.5 hours
Extending the Power Platform Microsoft Dataverse	Getting started with extending the Power Platform Dataverse can be overwhelming. This learning path looks at the tools and resources needed for extending the Power Platform. We'll start with looking at the SDKs, the extensibility model, and event framework. This learning path also covers when to use plug-ins. Configuration of plug-ins as well as registering and deploying plug-ins.	Free, self-paced learning path	2 hours

Content	Description	Format	Length
Extend Dynamics 365 portals	The ability to easily surface and interact with Dataverse data on an externally facing web site is the core benefit for implementing a Dynamics 365 portal. This learning path describes how to transform a content portal into a full web app interacting with Dataverse. We will explain how to secure data access based on the authenticated user role and relationship to the data. We will also cover the options available to customizers and developers to extend the portal functionality and integrate with Microsoft 365 and Power platform components.	Free, self-paced learning path	2.5 hours

Exam

Exam	Description
Exam MB-400: Microsoft Power Apps + Dynamics 365 Developer	Take this exam if you are a developer who works with Microsoft Power Apps model-driven apps in Dynamics 365 to design, develop, secure, and extend a Dynamics 365 implementation.

System requirements for Customer Service Hub

Article • 09/20/2022

The Customer Service Hub's intuitive interface brings together vital information in one place, so you can focus on the things that matter.

Supported browsers and mobile devices

The following browsers are supported:

- Google Chrome
- Microsoft Edge (supported on Windows 10)
- Apple Safari 11
- Internet Explorer 11

> **Note**
>
> Support for Internet Explorer 11 is deprecated. We recommend that you use Microsoft Edge. More information: **Deprecation announcement**

The following mobile devices and operating systems are supported:

- **iOS 10:** Tablet and phone
- **Android:** Tablet and phone (Android 6 and 7)
- Windows 10

System requirements for Customer Service workspace

Article • 08/09/2023

This article provides information about the prerequisites and system requirements for using Customer Service workspace in your organization.

Prerequisites

This section lists the prerequisites for using Customer Service workspace.

Licensing

An active subscription to Microsoft Dynamics 365 Customer Service Enterprise in your tenant for each user.

Software requirements

Area	Requirements
Model-driven app	Dynamics 365 Customer Service workspace app 9.2.0000.00000.
Web browsers	Supported browsers: • Microsoft Edge; latest three major releases • Google Chrome; latest three major releases

Hardware requirements

Area	Requirements
RAM	A minimum of 4 GB
Latency	Not more than 150 milliseconds
Throughput	A minimum of 4 Mbps

For more requirements, see Model-driven app requirements.

Important

To use the omnichannel capabilities, you'll need a higher network bandwidth. For more information, see: **Omnichannel for Customer Service system requirements**

Limitations

- Customer Service workspace isn't supported in mobile devices, Unified Service Desk, and with Dynamics 365 Customer Engagement (on-premises).

Introduction to Customer Service workspace

Omnichannel for Customer Service system requirements

Article • 09/19/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

This article provides information about the prerequisites and system requirements for deploying Omnichannel for Customer Service in your organization.

You can deploy Omnichannel for Customer Service over a Customer Service application and use it in the following ways:

- Omnichannel for Customer Service app - Web experience on the Unified Interface application
- Unified Service Desk client application

Prerequisites

This section lists the prerequisites for using Omnichannel for Customer Service.

International availability

Make sure that Omnichannel for Customer Service is available in your region. More information: International availability

Licensing

- You must have an active subscription to Microsoft Dynamics 365 Customer Service Enterprise or Dynamics 365 Customer Engagement Plan in your tenant for each user of Digital Messaging or Chat for Dynamics 365 Customer Service.
- For each chat channel user, you must have an active subscription to the **Dynamics 365 Customer Service Digital Messaging add-on** for each Digital Messaging user or **Chat for Dynamics 365 Customer Service**.

- For each voice channel user, you must have an active subscription to **Dynamics 365 Customer Service Voice Channel Add-in** or **Dynamics 365 Customer Service Digital Messaging and Voice Add-in**. For information on purchasing add-ins, see Buy an add-on.

For more information about licenses and pricing, see the Dynamics 365 licensing guide.

System requirements for Omnichannel for Customer Service

The system requirements to use Omnichannel for Customer Service are as follows. These requirements might vary depending on your configuration size and the applications that you run.

Area	Requirements
Model-driven app	Dynamics 365 Customer Service app 9.2.21034.00160 or later.
Web browsers	Supported browsers: • Microsoft Edge (Chromium based); version 79.0.309.65 or later is required for the desktop notifications feature. • Google Chrome **Important** Omnichannel for Customer Service uses third-party cookies for authentication. Make sure that the cookies are not blocked in your browser in any mode so that certain services, such as agent or supervisor presence, can work properly.
Azure Communication Services	Required for 1st party voice and SMS in the voice channel in production environments. For requirements specific to Azure Communication Services, see Network recommendations.
Hardware	• Microphone and speakers for the voice experience. • **Minimum:** 4 GB of RAM
Internet bandwidth for voice and video	• **Minimum:** 4 Mbps upload speed; 8 Mbps download speed • **Recommended:** 8 Mbps upload speed; 16 Mbps download speed

For other hardware and software requirements, see Model-driven app requirements.

Supported web browsers for voice and video in live chat widget

The following browsers are supported by the customer-facing live chat widget that you'll display on your portal:

- **Windows:** Chromium-based browser such as Microsoft Edge, Google Chrome, and Mozilla Firefox
- **macOS and iOS:** Safari
- **Android:** Chromium-based browser such as Microsoft Edge and Google Chrome

Provision Omnichannel for Customer Service

To enable the Omnichannel for Customer Service app in your org, see Provision Omnichannel for Customer Service.

To upgrade Omnichannel for Customer Service, see Upgrade Omnichannel for Customer Service.

> ⓘ **Note**
>
> - Omnichannel for Customer Service is not supported with Dynamics 365 Customer Engagement (on-premises).
> - Omnichannel for Customer Service is supported only on desktops, and not on phones and tablets.
> - We recommend that you use browsers in normal mode to optimally experience the Omnichannel for Customer Service app.

Allow access to websites

If your organization uses a URL filter to block a category of websites or URLs, ensure that you allow the following websites as an exception for your users so they can access the Omnichannel for Customer Service app on the business portal.

- `https://*.communication.azure.com`
- `https://login.microsoft.net`
- `https://login.microsoftonline.com`
- `https://login.windows.net`
- `https://browser.pipe.aria.microsoft.com`
- `https://*.teams.microsoft.com`
- `https://plat.teams.microsoft.com`
- `https://authsvc.teams.microsoft.com`

- `https://*.ng.msg.teams.microsoft.com`
- `https://*.notifications.teams.microsoft.com`
- `https://*.trouter.teams.microsoft.com`
- `https://ecs.office.com`
- `https://*.skype.com`
- `https://*.trouter.skype.com`
- `https://*.edge.skype.com`
- `https://aad.skypetoken.skype.com`
- `https://config.edge.skype.com`
- `https://edge.skype.com`
- `https://api.aps.skype.com`
- `https://*.asm.skype.com`
- `https://*.omnichannelengagementhub.com`
- `https://ocsdk-prod.azureedge.net`
- `https://*.service.signalr.net`

If your customers are using a URL filter to block a category of websites or URLs, you might have to ask your customers to allow a specific website as an exception. Your customers must allow access to the following URLs from their browsers to use the live chat widget in the portal.

- `https://*.communication.azure.com`
- `https://*.teams.microsoft.com`
- `https://plat.teams.microsoft.com`

System customizer guide

Service quotas

Article • 10/18/2023

Service quotas are the limits on resources, configurations, and items that are provided as part of Omnichannel for Customer Service. The tables that follow describe the service quotas and whether they can be adjusted for Dynamics 365 Customer Service Voice Channel Add-in and Dynamics 365 Customer Service Digital Messaging and Voice Add-in subscriptions.

> **Note**
>
> - All limits are at an organizational level for licensed organizations. The limits don't apply to trial or other non-licensed organizations.
> - If you need a higher limit on a measure that's indicated as adjustable, contact Microsoft Support to check whether the limit can be increased.

Configuration limits

Measure	Description	Default limit per channel or submeasure	Adjustable?
Intake rules	Maximum number of intake rules	100 for records	No
Route-to-queue rules	Maximum number of route-to-queue rulesets and rules per workstream	100 for rules	No
Classification rules	Maximum number of classification rulesets and rules per workstream	10 rulesets	No
		100 rules per ruleset	No

Conversation limits

Measure	Description	Default limit per channel or submeasure	Adjustable?
Message size	Maximum size of a single message payload including metadata like timestamps, tags, and links	Approximately 28 KB for any messaging channel	No

Measure	Description	Default limit per channel or submeasure	Adjustable?
Incoming conversations or work items	Maximum rate of incoming conversations per minute, aggregated across channels	Total of 25 incoming conversations or work items per minute[1] for voice, live chat, digital messages, and record channels	Yes
	Maximum rate of incoming conversations per minute by channel	• Voice - 7 per minute[2] • Live chat - 20 per minute • Record - 25 per minute • Social and Direct Line - 20 per minute[2]	Yes

> **Note**
>
> For application limits for channels with third-party integrations like SMS integration through Twilio or TeleSign, see the third-party documentation.

Miscellaneous limits

Measure	Description	Default limit per channel or submeasure	Adjustable?
Bulk user provisioning	Number of users that can be added using role attachment in a single update	500 per 15 minutes[2] **Note**: You can add up to 500 users in a single update that takes 15 minutes for provisioning	Yes
Bulk user updates	Number of users with attributes like skills, capacity profiles, and queue membership that can be edited in a single bulk update	25 users per bulk update[2]	Yes
Bulk user calendar or schedule updates	Number of users whose calendars can be updated in bulk	500 per 15 minutes[2]	Yes
Dataverse Storage Entitlement (aggregated at tenant level)	Microsoft Dataverse storage entitlement based on license; includes SQL/DB, file,	32 GB of base storage per tenant[3] 2.25 GB of extra storage	Other Dataverse storage can be purchased

Measure	Description	Default limit per channel or submeasure	Adjustable?
	and log storage in Dataverse More information: Dynamics 365 licensing guide	per Customer Service license per user[4] 35 GB of extra file storage for the Voice Channel Add-in per user	
Time for configuration updates to take effect, including channel and routing settings and updates to agent skills, capacity profile, and calendar	Maximum time for configuration changes to reflect in the user experience	15 minutes	No.
Block size per assignment cycle	Maximum number of unassigned conversations or work items picked per assignment cycle per queue	• 100 digital messaging or voice conversations[5] • 2000 records-related work items prioritized and assigned in blocks of 500[5]	Yes.
Updates to a routed record	Number of actions per minute like resolve a case, queue transfer, agent transfer, queue item delete that can be done for routed records.	25 updates per minute per organization.	Yes.

[1] To get quality service in a channel, ensure that you don't exceed the defined limit for that channel. When multiple channels are in use, the total conversations per minute should remain under the overall limit of 25. For example, with 5 voice calls per minute, 15 live chat sessions per minute, and 10 digital messages, the total limit is considered to be 25. Any conversation coming in after the 25th item, irrespective of the channel, might reduce the service quality.

[2] These are recommended limits beyond which system reliability and performance might decrease.

[3] 10 GB of SQL/DB storage, 20 GB of file storage, and 2 GB of log storage

[4] 250 MB of SQL/DB storage and 2 GB of file storage

[5] If eligible agents aren't available to serve the default block size of top priority conversations, then the auto assignment process can appear to be paused. In such cases, we recommend that you use features like overflow management to manage high load or review agent availability, scheduling, and skill configuration to expand the eligible agent pool. If these options aren't adequate, contact Microsoft Support with your business scenario to check whether the block size can be increased.

Best practices for setting up the voice channel

Article • 08/18/2023

Use the information in this article to set up the hardware and software for an optimal performance of the voice channel in Omnichannel for Customer Service. The requirements might vary based on the overall configuration and size of your contact center.

Hardware configuration

For optimized voice communication, make sure of the following settings:

- **Network configuration**: A stable Internet connection is crucial for uninterrupted calls. Use a wired Ethernet connection or a stable wireless network with sufficient bandwidth. For minimum and recommended bandwidth speeds, see system requirements.
- **Compatible headsets**: For clear communication, use USB headsets with noise-canceling microphones. If you rely on laptop speakers and microphone, you're likely to experience background noise in calls and meetings.
- **Use devices correctly**:
  - Test your microphone and speaker settings.
  - Place your microphone close to your mouth to capture your voice clearly. Adjust the sensitivity to remove unwanted echo.
  - Adjust speaker volume to a comfortable level to prevent audio distortion.
  - Minimize background noise.

Software configuration

The software settings to ensure seamless integration are as follows:

Firewall and security: Add the URLs and IP addresses to the allowlist to allow communication between your system and the Omnichannel servers and prevent any security-related issues during your interactions. Make sure that the firewall configuration aligns with the guidelines in Azure Communication Services.

International availability of Omnichannel for Customer Service

Article • 10/10/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

The purpose of this document is to provide information about the geographic location and language availability of live chat and digital messaging channels.

> **Note**
>
> For information about the supported regions and languages in the voice channel, see **Supported cloud locations, languages, and locale codes**.

Geographic location availability

Your Microsoft 365 tenant must be co-located in one of the following geographic locations where Omnichannel for Customer Service is available. These geographic locations refer to your Microsoft 365 tenant only and not the data center where your Power Platform environment or org instance resides.

> **Note**
>
> In the Europe and Asia Pacific regions, Omnichannel for Customer Service is currently not available in a tenant that's located in Norway, Sweden, and Singapore.

See the following table for the availability of the channels in the supported geographical regions.

Region	All messaging channels
Asia Pacific	✓
Australia	✓

Region	All messaging channels
Canada	✓
Europe	✓
France	✓
Germany	✓
Government Community Cloud (GCC)[1]	✓
India	✓
Japan	✓
North America	✓
South America	✓
Switzerland	✓
United Arab Emirates (UAE)	✓
United Kingdom	✓

[1] The Apple Messages for Business, Google's Business Messages, and Microsoft Teams channels aren't available in GCC.

Language availability

The product user interface (UI) is available in the following languages.

Language	Language	Language
Arabic	Greek	Romanian
Basque	German	Russian
Bulgarian	Hebrew	Serbian (Cyrillic)
Catalan	Hindi	Serbian (Latin)
Chinese	Hungarian	Slovak
Chinese (Hong Kong SAR)	Indonesian	Slovenian
Chinese (Simplified)	Italian	Spanish
Croatian	Japanese	Swedish

Language	Language	Language
Czech	Kazakh Thai	Thai
Danish	Korean	Turkish
Dutch	Latvian	Ukrainian
English	Lithuanian	Vietnamese
Estonian	Malay (Malaysia)	
Finnish	Norwegian	
French	Polish	
Galician	Portuguese	

To know the languages that are supported in analytics, see Multilingual sentiment.

Privacy and personal data in Microsoft Dynamics 365

Article • 05/02/2023

Microsoft Dynamics 365 is committed to helping our customers meet their privacy and personal data requirements. In this topic, you will find information and resources to help you understand how Microsoft Dynamics 365 supports protecting and enabling the privacy rights of individuals, and information and tools to define and support your specific obligations. You can read more about the Microsoft commitment to security at the Microsoft Trust Center.

Data subject requests

The European Union (EU) General Data Protection Regulation (GDPR) gives significant rights to individuals regarding their data. Refer to the Microsoft Learn General Data Protection Regulation Summary for an overview of GDPR, including terminology, an action plan, and readiness checklists to help you meet your obligations under GDPR when using Microsoft products and services.

You can learn more about GDPR and how Microsoft helps support it and our customers who are affected by it.

- The Microsoft Trust Center provides general information, compliance best practices, and documentation helpful to GDPR accountability, such as Data Protection Impact Assessments, Data Subject Requests, and data breach notification.
- The Service Trust portal provides information about how Microsoft services help support compliance with GDPR.

EU Data Boundary

Learn about Microsoft services and the EU Data Boundary at Overview of the EU Data Boundary.

Relevance Search

The Relevance Search report is available for Dynamics 365 Customer Service, Field Service, Marketing, Project Service Automation, and Sales.

Resources to help administrators and customizers configure Relevance Search:

- Configure Relevance Search
- What admins need to know about Relevance Search (video)

Resources to help users get started with Relevance Search:

- Use Relevance Search to search for records
- Find info faster with Relevance Search (video)
- Get more productive with Relevance Search (video)

Person search report

The Person search report is available for Dynamics 365 Finance, Commerce, Human Resources, and Supply Chain Management.

- If you're an application user or administrator, start with Person search report.
- If you're a developer, learn how to extend the Person search report.

Compliance Manager

Compliance Manager is a cross–Microsoft cloud services solution that is designed to help organizations meet complex compliance obligations. It does real-time risk assessment that reflects your compliance posture against data protection regulations when you use Microsoft cloud services. It also provides recommended actions and step-by-step guidance.

You can try Compliance Manager by visiting the Service Trust Portal and downloading it. To get started using Compliance Manager, see Microsoft Purview Compliance Manager (preview).

Compliance Manager white papers and datasheets

Keyboard navigation support for the Customer Service Hub

Article • 11/30/2021

Microsoft is committed to making its products and services easier for everyone to use.

Dynamics 365 Customer Service supports moving around the Customer Service Hub (formerly known as Interactive Service hub) using the keyboard.

The Customer Service Hub app is based on Unified Interface. To see the list of keyboard shortcuts that apply to an app based on Unified Interface, see Use keyboard shortcuts in Dynamics 365 Customer Service applications.

To do	Select
Go to the next tab stop in the defined tab stop order. The tab order is from left to right and top to bottom.	Tab
Go to the previous tab in the tab order.	Shift + Tab
Go to the next section or major component for example to go to the next stream in the dashboard.	F8
Go to the previous section. This shortcut can't be used on Mozilla Firefox for the intended purpose.	Shift + F8
Move to the next item in a list or in a group of options.	Down Arrow
Move to the previous item in a list or in a group of options.	Up Arrow
Expand a collapsed control.	Right Arrow
Collapse an expanded control.	Left Arrow
Select a check box or make a selection.	Spacebar
Perform or complete an action, such as clicking a link or searching for records based on keywords.	Enter
Close or cancel an alert or flyout.	Esc
Select multiple continuous records in a list or queue.	Shift + Down/Up arrow
Select multiple discontinuous records in a list or queue.	Press Ctrl, go to the desired record, and then use the spacebar to select the record

Availability of Customer Service Hub

Article • 07/09/2021

Try Dynamics 365 Customer Service for free

The Customer Service Hub solution is automatically installed in the environments that have customer engagement apps, such as Customer Service and Sales Hub.

The salient features of the integrated solution are as follows:

- Existing customers can access **Customer Service Hub** in their environment. To learn more: Introduction to Customer Service Hub.
- Users with the **Customer service app access** security role can view and use the app. To learn about granting or revoking the role, see Assign a security role to a user.
- If you delete the app manually, it will be installed automatically during the next update cycle.
- You can determine which users will have access and visibility to the app using security roles. To learn more: Manage access to Power Apps apps by using security roles.

Move from Dynamics 365 Customer Service Enterprise to Dynamics 365 Customer Service Professional

Article • 07/18/2022

Customer Service Professional is targeted at businesses that have fewer needs and don't require the full capabilities that are offered by Customer Service Enterprise.

To switch from Customer Service Enterprise to Customer Service Professional, do the following steps:

1. Purchase a Customer Service Professional subscription.
2. Assign Customer Service Professional licenses to the users and remove the Customer Service Enterprise licenses from the users.
3. Review the Microsoft Dynamics 365 Licensing Guide.

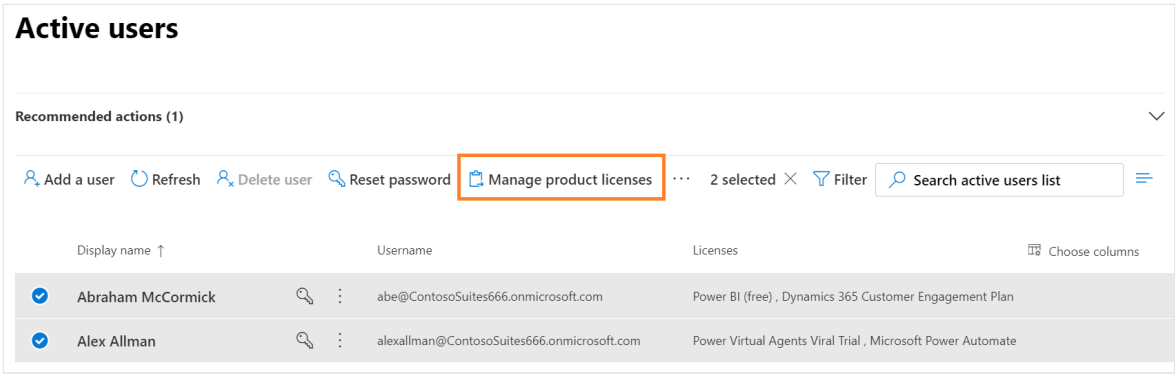
Purchase a Customer Service Professional subscription

1. Sign in to the Microsoft 365 admin center with the Dynamics 365 account that has admin permissions.
2. In the navigation pane, expand **Billing** and select **Purchase Services**, and then select the Dynamics 365 Customer Service Professional tile.
3. Select **Buy**, and then follow the steps to purchase new licenses.

Assign and remove licenses

After you've purchased the licenses, assign the licenses to users.

1. In the Microsoft 365 admin center navigation pane, select **Users** > **Active users**.
2. Select multiple users, and then select **Manage product licenses**.



3. Select **Replace** to unassign existing licenses and assign new ones.
4. Select the license for your Dynamics 365 Customer Service Professional plan.
5. Select **Save changes**.
6. Review the license status on the **Active users** page, and make other assignments as needed.

> **Important**
>
> As per contractual agreement, you can't mix Enterprise and Professional users on the same instance. If you plan to keep Professional licenses, make sure that you abide by the contractual requirements. More information: **Microsoft Dynamics 365 Licensing Guide**

Dynamics 365 Licensing Update

Provision Omnichannel for Customer Service

Article • 10/04/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Tip**
>
> If you'd like to try Dynamics 365 Customer Service for free, you can sign up for a **30-day trial**.

Omnichannel for Customer Service provides a modern, customizable, high-productivity app that lets agents help customers across different channels via a unified interface. It lets organizations choose the channel that suits their business needs. It also ensures that a high level of responsive, quality service is received across channels.

To find out if Omnichannel for Customer Service is available in your region, see International availability.

Looking for an upgrade? See Upgrade Omnichannel for Customer Service for more information.

You can provision the following channels in Omnichannel for Customer Service:

- Chat
- Voice
- SMS
- Social
- Microsoft Teams

> **Important**
>
> The channels that you want to provision might require a license. More information: **Dynamics 365 Licensing Guide**.

Prerequisites

- Obtain an active subscription of one or more of the following:
  - To provision the Omnichannel for Customer Service application, Chat for Dynamics 365 Customer Service or Dynamics 365 Digital Messaging
  - To provision the voice channel, Voice Channel for Dynamics 365 Customer Service

    > **Note**
    >
    > More information: **Pricing**, Dynamics 365 Licensing Guide, and **How to purchase through Volume Licensing**. You can also get a free 30-day trial if you have the required prerequisites. More information: **Try channels for Dynamics 365 Customer Service**.

- Set up the prerequisites mentioned in the system requirements. More information: Prerequisites.

- Ensure that the provisioning user has the following permissions:
  - Microsoft 365 Global admin role. More information: Assign admin roles to user in Microsoft Office 365
  - Dynamics 365 System Administrator role on the root business unit for your organization. More information: Assign security roles to a user in Power Platform and Create or edit business units
  - Read-Write access in the Client Access License Information (CAL). More information: Create a Read-Write user account in Power Platform

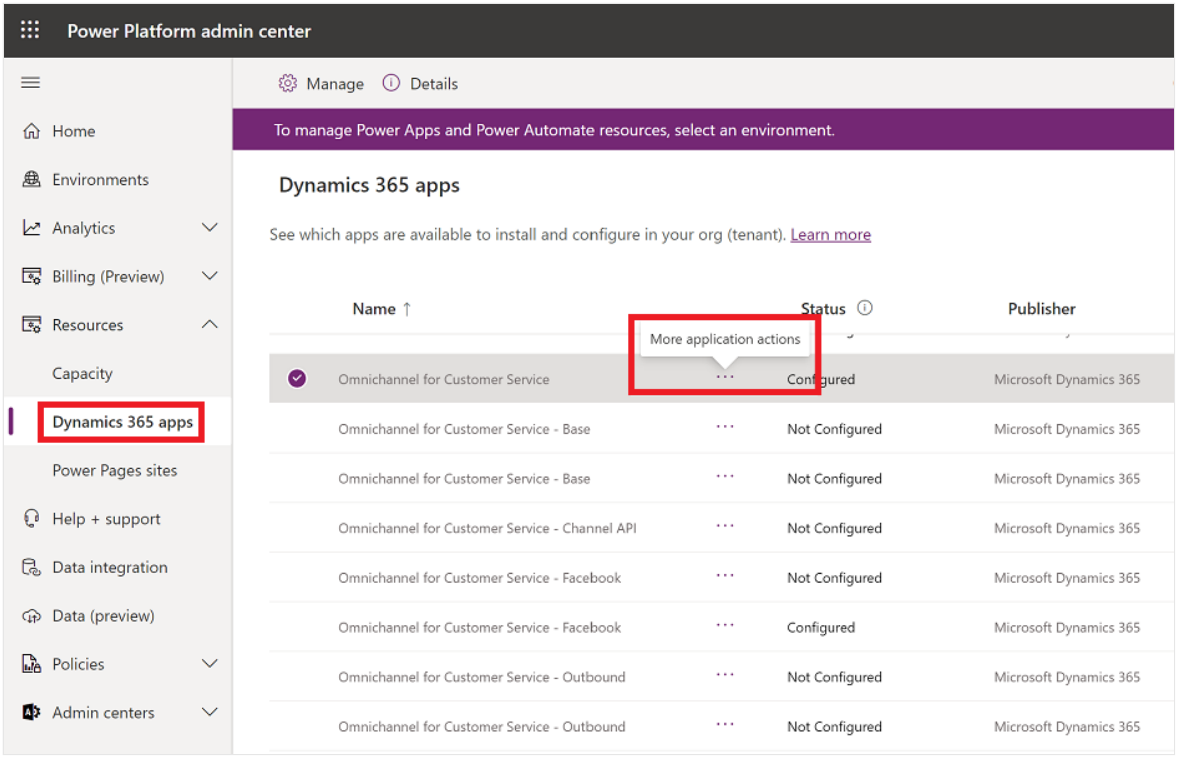
Set up Omnichannel for Customer Service

1. In Power Platform admin center, on the **Environments** page, select the environment in which you want to set up Omnichannel for Customer Service.
2. In the left pane, expand **Resources**, and select **Dynamics 365 apps**.

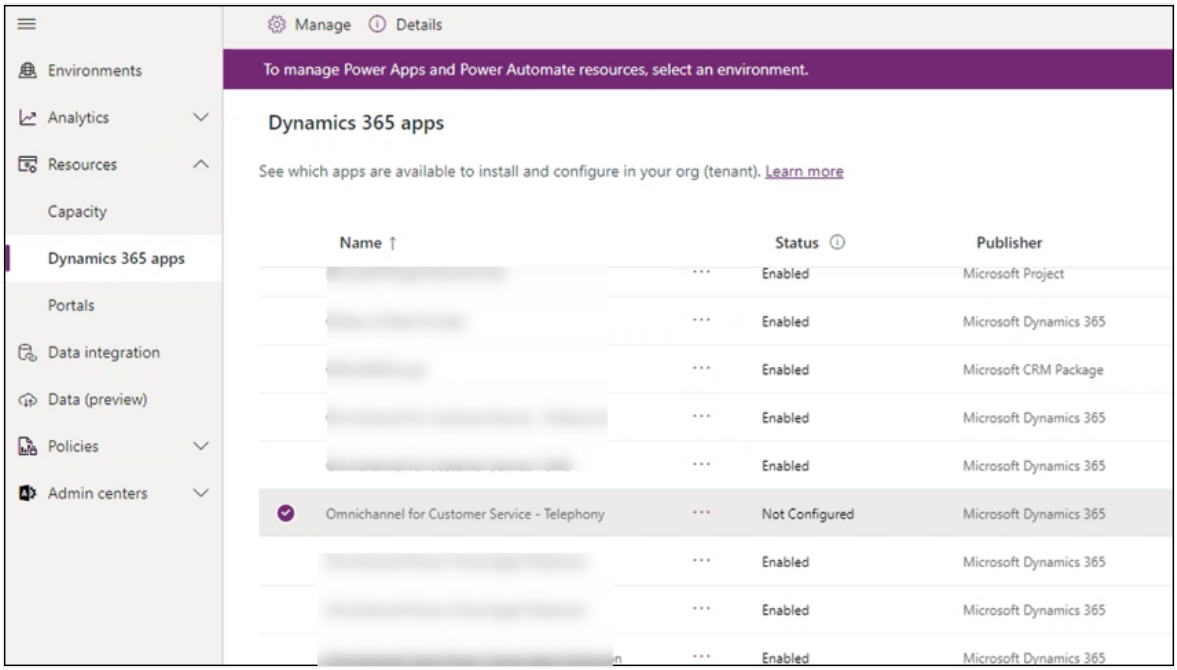
   > **Note**
   >
   > Don't select **Environments** in the left pane and try to navigate to **Dynamics 365 apps** from there. The correct way to navigate to the **Dynamics 365 apps**

management options is to expand **Resources** in the left pane and select **Dynamics 365 apps**.

3. On the **Dynamics 365 apps** page, select the ellipsis for **More application actions** next to **Omnichannel for Customer Service**, and then select **Manage**.

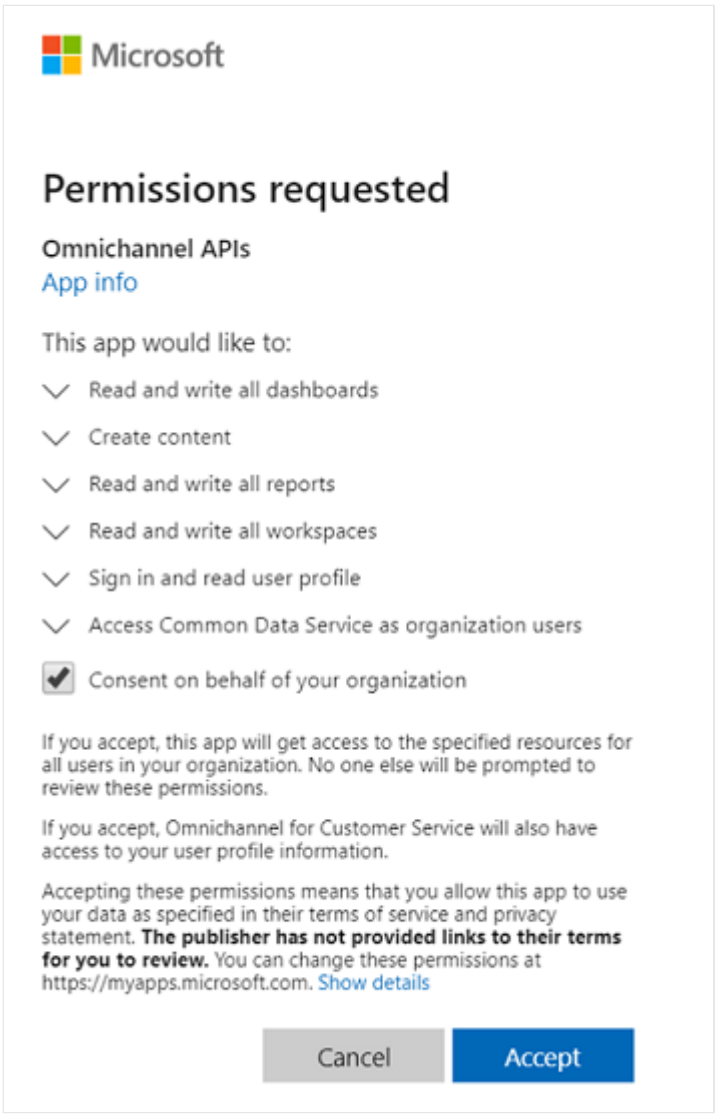


4. If you're installing the voice channel only, select **More commands** for **Omnichannel for Customer Service - Telephony**.



5. On the **Manage Omnichannel for Customer Service** message, select **OK**. The **Dynamics 365 Administration Center | Omnichannel** page is displayed on a new tab.

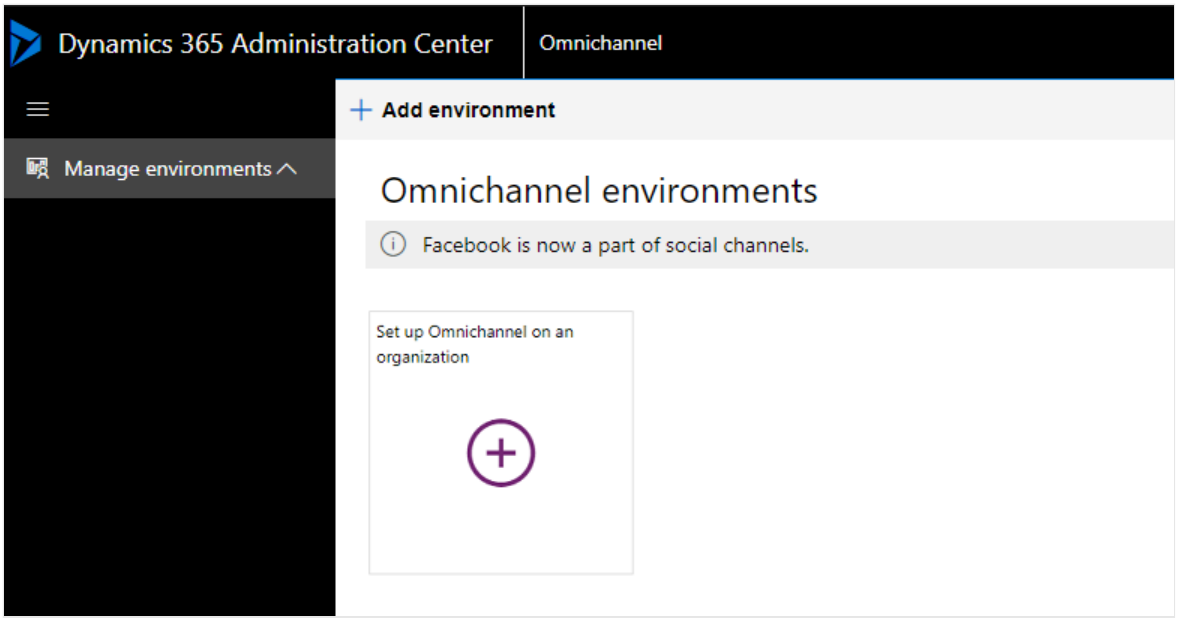
6. Select the **Consent on behalf of your organization** checkbox.



7. Select **Accept** to grant data access consent.

   For information about app permissions, see Azure app Power BI API permissions and Data access consent to provision Omnichannel for Customer Service.

8. On the **Manage Omnichannel Instances** page, select **Add environment** to add an environment. Omnichannel is set up for the organization environment that you add here.



> **Important**
>
> As an admin, you can configure Omnichannel in multiple environments. You can view the status of all organization environments where the Omnichannel app has been configured in the **Manage environments** view.

9. Select the environment in the dropdown list, then perform the following steps.

   a. Select **Next**, and in the **Chat** section, set the **Add chat** toggle to **Yes** to enable the Chat channel.

   b. In the **Voice** section, set the **Add voice** toggle to **Yes** to enable the voice channel. Ensure that you select the **Voice and SMS Terms** checkbox.

   c. In the **SMS** section, set the **Add SMS** toggle to **Yes** to enable SMS. Select the checkbox to confirm that you agree to the SMS terms.

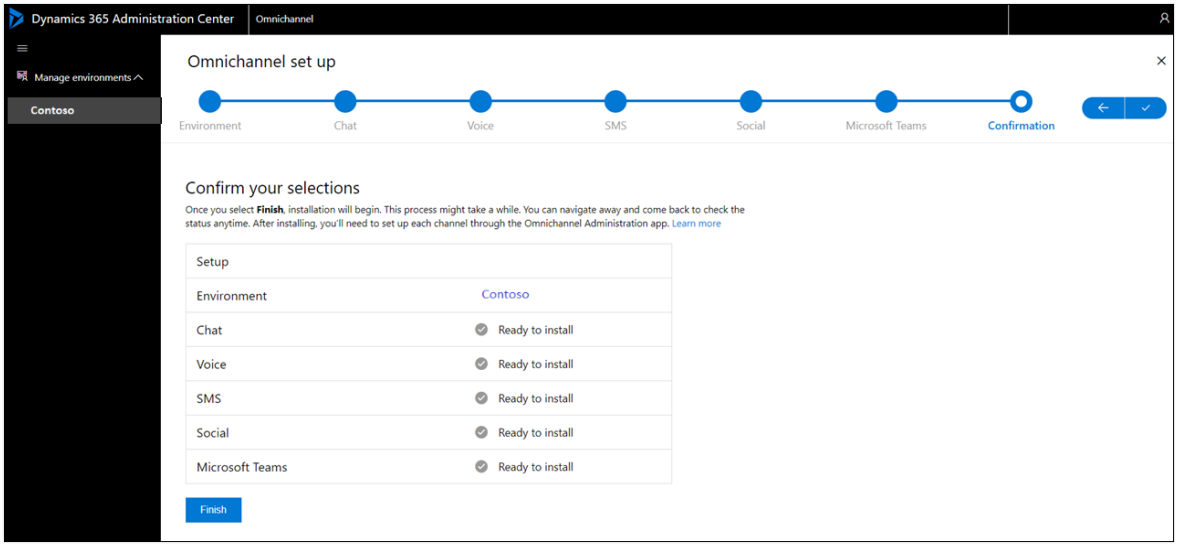
   > **Important**

> You must select the checkbox for **SMS Terms** to enable SMS and proceed with the setup.

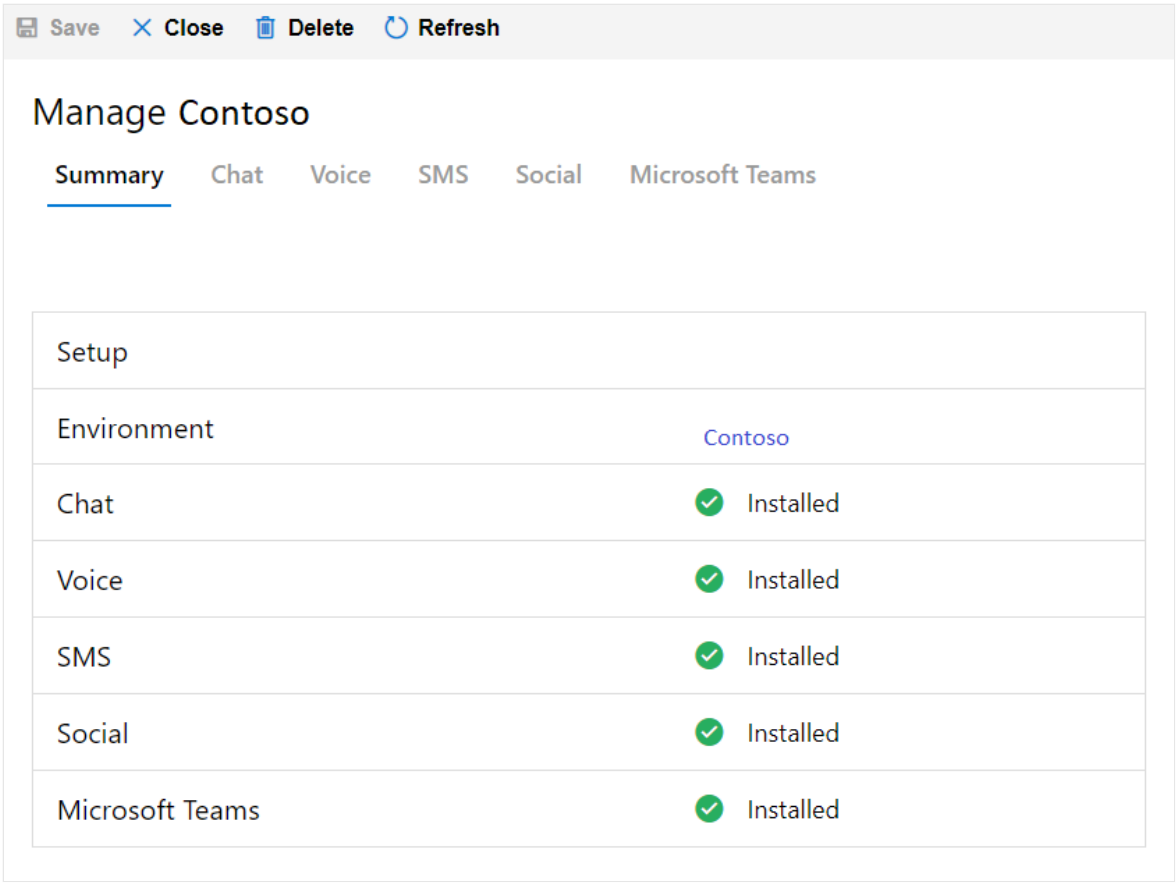
d. In the **Social channels** section, set the **Add social** toggle to **Yes** to enable social channels.

e. In the **Microsoft Teams** section, set the **Add Microsoft Teams** toggle to **Yes** to enable Microsoft Teams.

10. On the **Confirmation** page, verify your selections, and then select **Finish** to provision Omnichannel for Customer Service in your organization.



The setup can take several minutes. You can close the window and check after some time, or refresh to check if it's complete. After the setup is complete, the selected channels are enabled in your environment.



Important

- After you successfully provision Omnichannel for Customer Service, you might see the status as "Not configured" on the **Dynamics 365 apps** page. You can safely ignore the status.
- If the provisioning of Omnichannel for Customer Service fails and you retry it, you might see an app profile named **Omnichannel Upgraded OOB Default app profile** on the **App profiles** page in Power Apps. You can safely delete this app profile that is created.

Update Omnichannel for Customer Service application

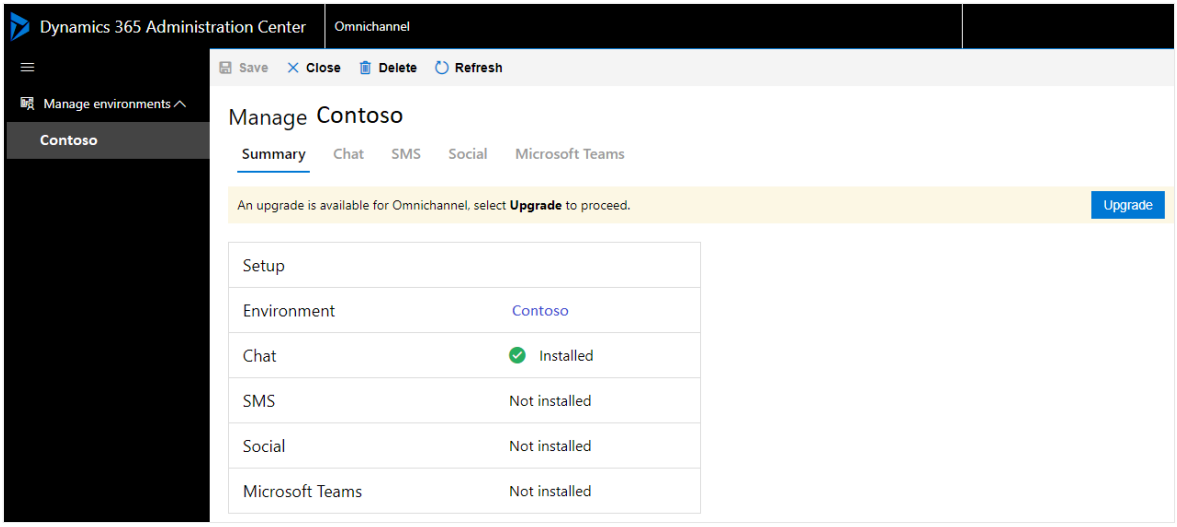
After the Omnichannel for Customer Service application is successfully provisioned, you can update the environment by enabling or disabling the required channels.

1. In the **Power Platform Admin Center**, on the **Environments** page, select the environment where you want to set up Omnichannel for Customer Service.

2. In the left pane, expand **Resources**, and then select **Dynamics 365 Apps**.

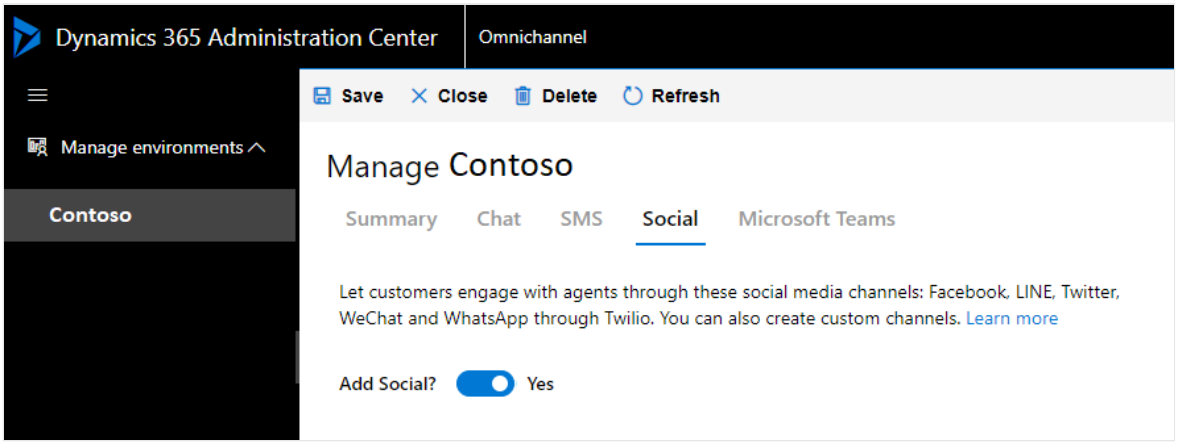
3. On the **Dynamics 365 apps** page, select **More commands** beside **Omnichannel for Customer Service**, and then select **Manage**.

4. Select **OK** on the **Manage Omnichannel for Customer Service** message. The **Dynamics 365 Administration Center | Omnichannel** page is displayed on a new tab.

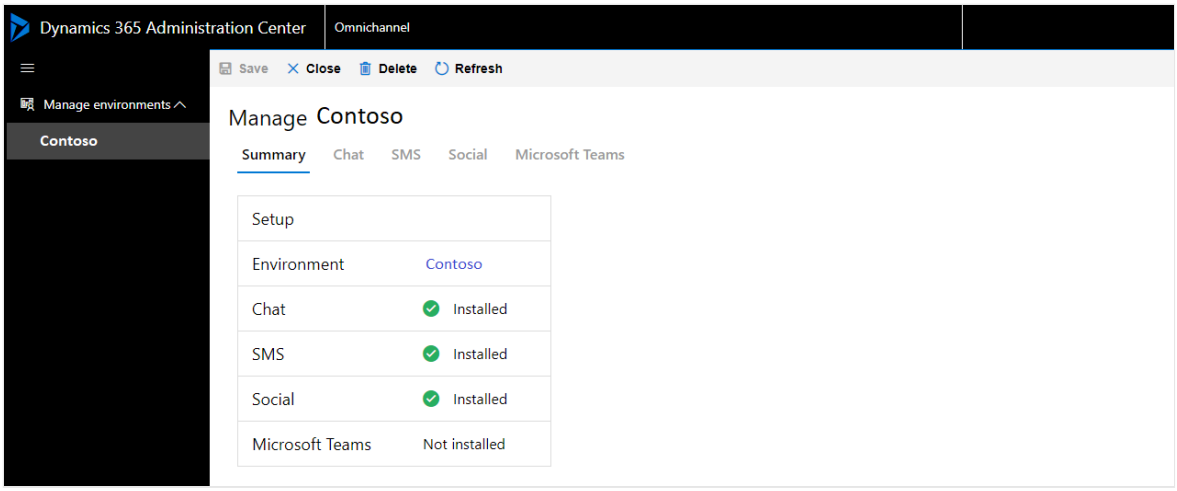


5. Select the channel to be enabled. For example, in this procedure, we'll enable the Social channels.

6. On the **Social** tab, set the toggle to **Yes** to enable social channels in your environment.

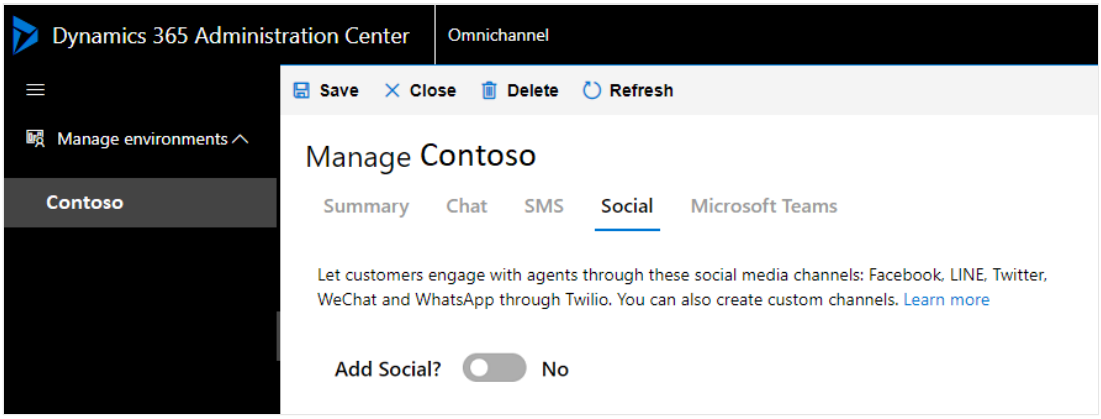


7. Select **Save**. After the update is complete, the status is displayed on the **Summary** tab.



8. To disable a previously enabled channel, set the toggle to **No**. For example, in this procedure, we'll disable the Social channel.

    - On the **Social** tab, set the toggle to **No** to disable social channels in your environment. A confirmation message is displayed to remove the channel. Select **Remove**.



> **Note**
>
> If you disable all channels, Omnichannel for Customer Service will be removed from your organization.

Troubleshoot provisioning

Instance is not available to select on the provisioning application

Export and import app configuration data

Article • 07/31/2023

> **Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

After you've used Omnichannel for Customer Service in a test environment, you can export some of your app configuration data to a live production environment. Use the configuration management tool to export and import the data. More information: Download the Configuration Migration tool from NuGet using the PowerShell script

> **Important**
>
> Channel configurations are specific to the environment in which they're created, so exporting and importing complete configurations as-is won't work. We recommend that you create them using the Customer Service admin center app.

While you can use the Configuration Migration tool to export and import entity data, omnichannel-related configurations contain different entities that have internal dependencies. Therefore, you must bring together the required data by following a very specific process. For example, if you've already imported the context variables and then try to import preconversation configuration, which also creates context variables, the import might not work. Similarly, you must import all the internal entities, such as ruleset configurations that contain decision rulesets and contracts, for the import of workstreams and record queues to be successful.

> **Note**
>
> - To export and import record type of channel across environments, contact **Microsoft Support**.
> - Environment lifecycle operations, such as copy and restore of environment, aren't supported.

- However, if you do copy an environment, Omnichannel for Customer Service in the target environment must be **uninstalled** and **provisioned** again.
- We recommend that you don't export the msdyn_analytics entity. Because the entity contains org-specific configuration data for intraday insights in Omnichannel for Customer Service, exporting it might lead to an incorrect configuration of your intraday insights data.

Remove Omnichannel for Customer Service

Article • 07/07/2021

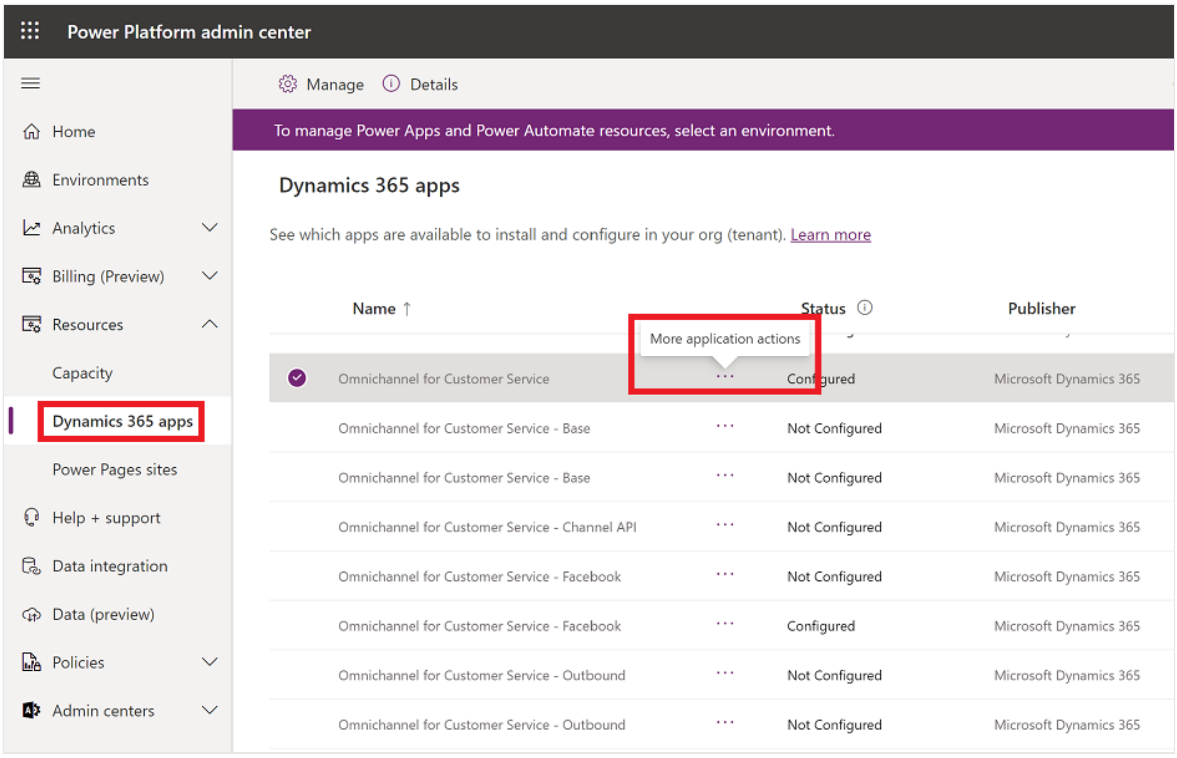
Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

You can remove Omnichannel for Customer Service and disable all channels for a Dynamics 365 Customer Service organization.

> **Note**
>
> Omnichannel for Customer Service will be automatically removed if you do any of the following:
>
> - Delete the Dynamics 365 CRM instance from the Dynamics 365 admin center.
> - Reset the Dynamics 365 CRM instance from the Dynamics 365 admin center.
> - Modify or change the Dynamics 365 CRM instance to a different organization ID.
>
> Removing Omnichannel for Customer Service will not delete Omnichannel solutions. To delete Omnichannel solutions, see **Delete Omnichannel solutions**.

To remove the Omnichannel for Customer Service from the organization,

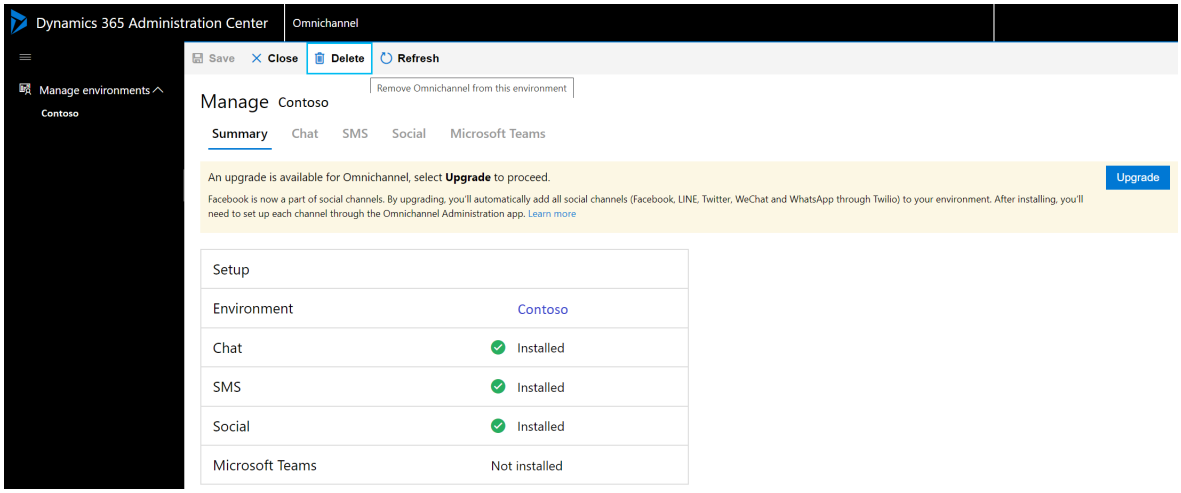
1. In **Power Platform Admin Center**, on the **Environments** page, select the environment in which Omnichannel for Customer Service needs to be removed.



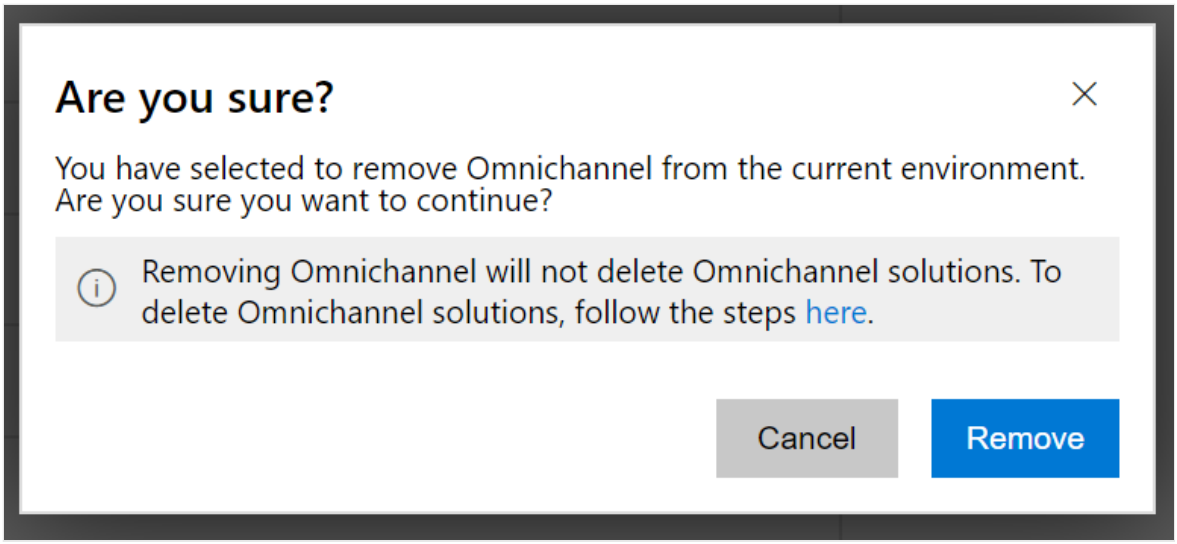
2. In the left pane, expand **Resources**, and select **Dynamics 365 Apps**.

3. On the **Dynamics 365 apps** page, select **More commands** beside **Omnichannel for Customer Service**, and then select **Manage**.

4. On the **Manage <*environment_name*>** page, select **Delete**.



5. In the confirmation dialog box, select **Remove** to proceed.



Important

Removing Omnichannel for Customer Service will disable all channels in the selected organization.

After Omnichannel is removed, you can enable it again from the **Manage environments** view.

Uninstall solutions in Omnichannel for Customer Service

Article • 05/23/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

When you uninstall Omnichannel for Customer Service from your organization, the omnichannel solutions are not removed. If you want to remove omnichannel solutions from your organization, you must use the same order as mentioned in the following table.

> **Important**
>
> Some solutions are shared across apps, and shouldn't be removed unless you intend to uninstall those apps too; skip those solutions.
>
> For example, if you plan to remove omnichannel solutions from your organization, you must remember that the unified routing part of Omnichannel for Customer Service solutions might be used in unified routing for Customer Service. So you must ensure that you don't uninstall or delete the common solutions as it might affect the way unified routing works in Customer Service.

1. Sign in to your `https://<org>.dynamics.com/apps` environment.
2. Select **Settings** > **Advanced Settings** on the command bar. The **Settings** page is displayed in a new browser tab.
3. Go to Dynamics 365 **Settings** > **Solutions**.
4. On the **Solutions** page, select each solution from the following list, and then select **Delete** to remove them one at a time.

Order	Solution name	Note
1	`ProductivityToolsAnchor`	

Order	Solution name	Note
2	`msdyn_OmnichannelProductivityToolsSettings`	
3	`msdyn_Smartassist_managed`	Required for Customer Service Hub and Customer Service workspace
4	`msdyn_ProductivityPaneControl_managed`	
5	`msdyn_AgentGuidance_managed`	
6	`msdyn_Agentscript_managed`	Required for Customer Service Hub and Customer Service workspace
7	`msdyn_ProductivityMacros_managed`	
8	`OmnichannelPrimeChatAnchor`	
9	`OmnichannelPrimeSMSAnchor`	
10	`OmnichannelPrimeFacebookAnchor`	
11	`OmnichannelPrimeTeams`	
12	`OmnichannelPrimeSocialChannelsAnchor`	
13	`OmnichannelPrimeOutboundAnchor`	
14	`OmnichannelPrimeTelephony`	
15	`OmnichannelPrimeAnchor`	
16	`msdyn_CustomerServiceworkspaceChannels`	
17	`msdyn_OmnichannelEngagementHubPatch`	
18	`OmnichannelEngagementHubPreview`	
19	`msdyn_OmnichannelPrimePatch`	
20	`OmnichannelPrime`	
21	`msdyn_OmnichannelSMSPatch`	
22	`msdyn_OmnichannelFacebookPatch`	
23	`OmnichannelOutbound`	
24	`OmnichannelSMS`	
25	`OmnichannelTeams`	

Order	Solution name	Note
26	`OmnichannelSocialChannels`	
27	`OmnichannelChat`	
28	`OmnichannelFacebook`	
28	`msdyn_OmnichannelBotEnablerPatch`	
29	`OmnichannelBotEnabler`	
30	`OmnichannelTelephony`	You must delete all the related workstreams before you delete OmnichannelTelephony
31	`ScenariosAndChannels`	
32	`msdyn_CIFrameworkPatch`	
33	`ChannelAPIIntegrationFramework`	
34	`OmnichannelIntelligence`	
35	`OmnichannelConfiguration`	
36	`msdyn_MacrosDataOmnichannel`	

5. A confirmation message appears that prompts you to uninstall the managed solution. Select **OK**.

Uninstall Omnichannel historical analytics solutions

To remove the solutions for Omnichannel historical analytics

1. Disable Omnichannel historical analytics in the Insights section of Omnichannel admin center. More information: Configure Omnichannel historical analytics reports

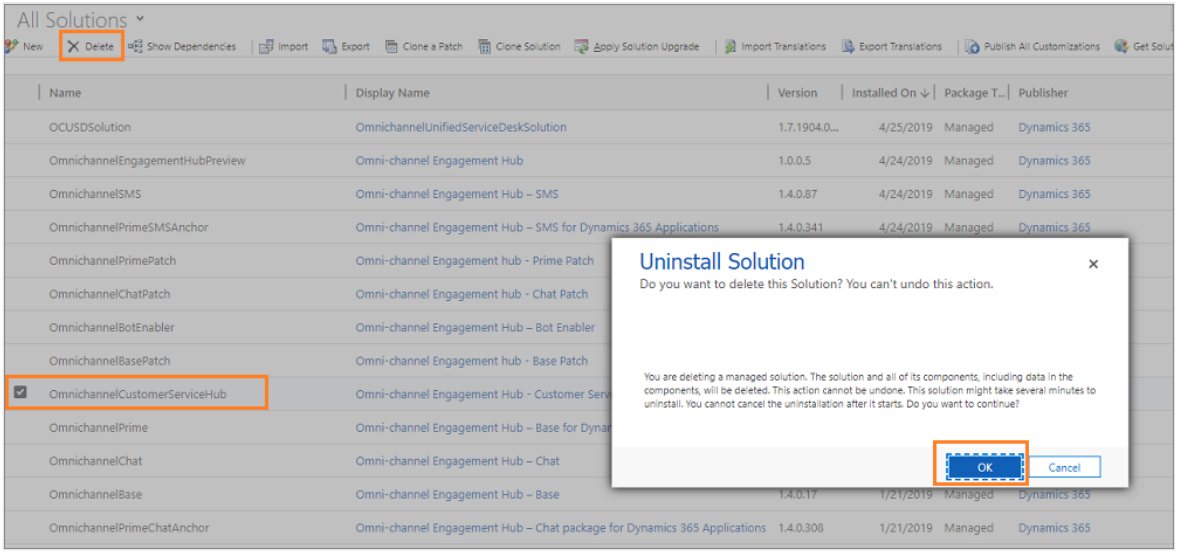
2. On the **Solutions** page, select and uninstall the following solutions, one at a time, in this order:
   a. `msdyn_InsightsAnalyticsOCConfiguration`
   b. `msdyn_DataInsightsAndAnalyticsForOC`

Uninstall OmnichannelCustomerServiceHub solution

When you upgrade Omnichannel for Customer Service to the latest release, certain managed solutions appear on the **Solutions** page of Microsoft Dataverse. After the upgrade is complete, you must uninstall those solutions from the previous release if the upgrade does not remove them. Also, if your organization is using the **Customer Service Hub** app, then you must uninstall the app from the channel configuration in the **Channel Integration Framework** app.

To uninstall the OmnichannelCustomerServiceHub solution from your organization

1. Sign in to your `https://<org>.dynamics.com/apps` environment.
2. Select **Settings** > **Advanced Settings** on the command bar. The **Settings** page is displayed on a new browser tab.
3. Go to Dynamics 365 **Settings** > **Solutions**.
4. On the **Solutions** page, select the **OmnichannelCustomerServiceHub** solution, and then select **Delete**.
5. A confirmation message appears that prompts you to uninstall the managed solution. Select **OK**.



You have deleted the **OmnichannelCustomerServiceHub** solution from your organization.

Remove Customer Service Hub from channel provider configuration

The following steps describe how to remove Customer Service Hub solution from your organization.

1. Sign in to the Dynamics 365 instance.
2. Select the dropdown button on Dynamics 365 and select **Channel Integration Framework**.
3. Select the record that is related to Omnichannel.
4. Remove **Customer Service Hub** from the **Select Unified Interface Apps for the Channel** section.
5. Select **Save** to save the record.

Upgrade Omnichannel for Customer Service

Article • 07/07/2021

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Upgrade to the latest version of Omnichannel for Customer Service to unlock the benefits of new features. You can now upgrade to the latest release of Omnichannel for Customer Service from the **Omnichannel environments** page in **Dynamics 365 Admin Center**.

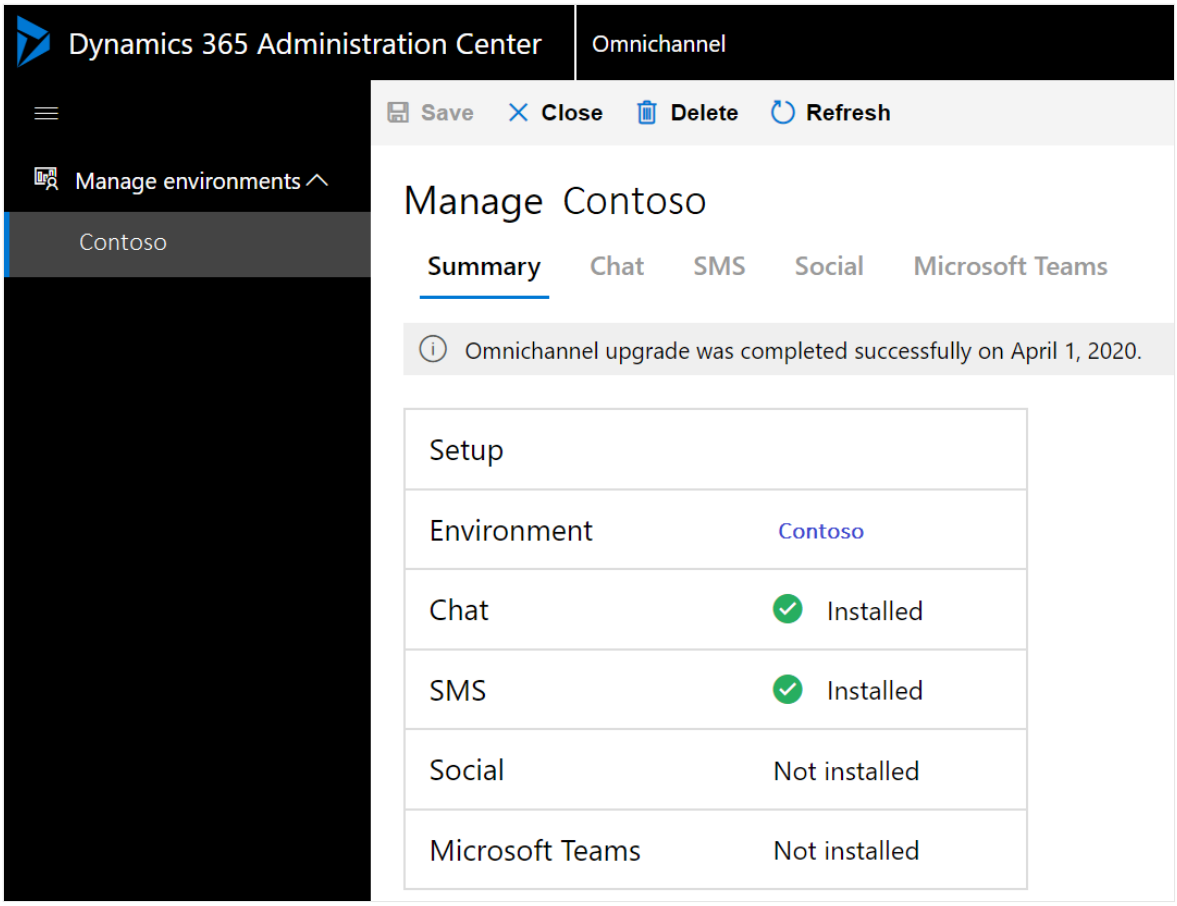
See What's new in Omnichannel for Customer Service to learn about the new features in the latest release.

Do the following steps to upgrade Omnichannel for Customer Service:

1. Log in to the Power Platform admin center.
2. Expand **Resources**, and select **Dynamics 365 apps**.
3. On the **Dynamics 365 apps** page, scroll to the **Omnichannel for Customer Service** application, select the ellipses (...), and then select **Manage**. The **Omnichannel environments** page opens on a new tab.
4. Select your environment under **Manage environments** in the left pane.
5. Select the **Upgrade** button that is enabled when an upgrade is available.

   The system begins the upgrade and displays the message **Omnichannel upgrade is currently in progress**.

   When the upgrade process is completed successfully, your environment is upgraded to the latest version, and the message **Omnichannel for Customer Service upgrade was completed successfully** is displayed with the date.



Upgrade Omnichannel for Customer Service package on Unified Service Desk

If you are using Omnichannel for Customer Service on Unified Service Desk, see Deploy package on Dynamics 365 Customer Service instance to upgrade.

Try channels in Omnichannel for Customer Service

Article • 01/11/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Channels, like Live Chat, voice, and SMS, are engagement channels that let your agents connect with customers in real time and provide quick personalized help.

You can perform the following steps to try channels in Omnichannel for Customer Service:

1. Sign up for a free 30-day trial of channels through Microsoft 365 admin center.
2. Provision Omnichannel for Customer Service.

Channels trial through Microsoft 365 admin center

The Dynamics 365 Customer Service Digital Messaging Add-on Trial is a free 30-day trial of Chat, SMS, and social channels that you can download from the Microsoft 365 admin center.

Prerequisites for trial through Microsoft 365 admin center

You must have obtained one of the following subscriptions through the Microsoft 365 admin center (that is, Web Direct):

- Paid or trial subscription of Dynamics 365 Customer Service Enterprise
- Paid or trial subscription of Dynamics 365 Customer Engagement
- For voice channel, subscription of Dynamics 365 Customer Engagement Applications Trial

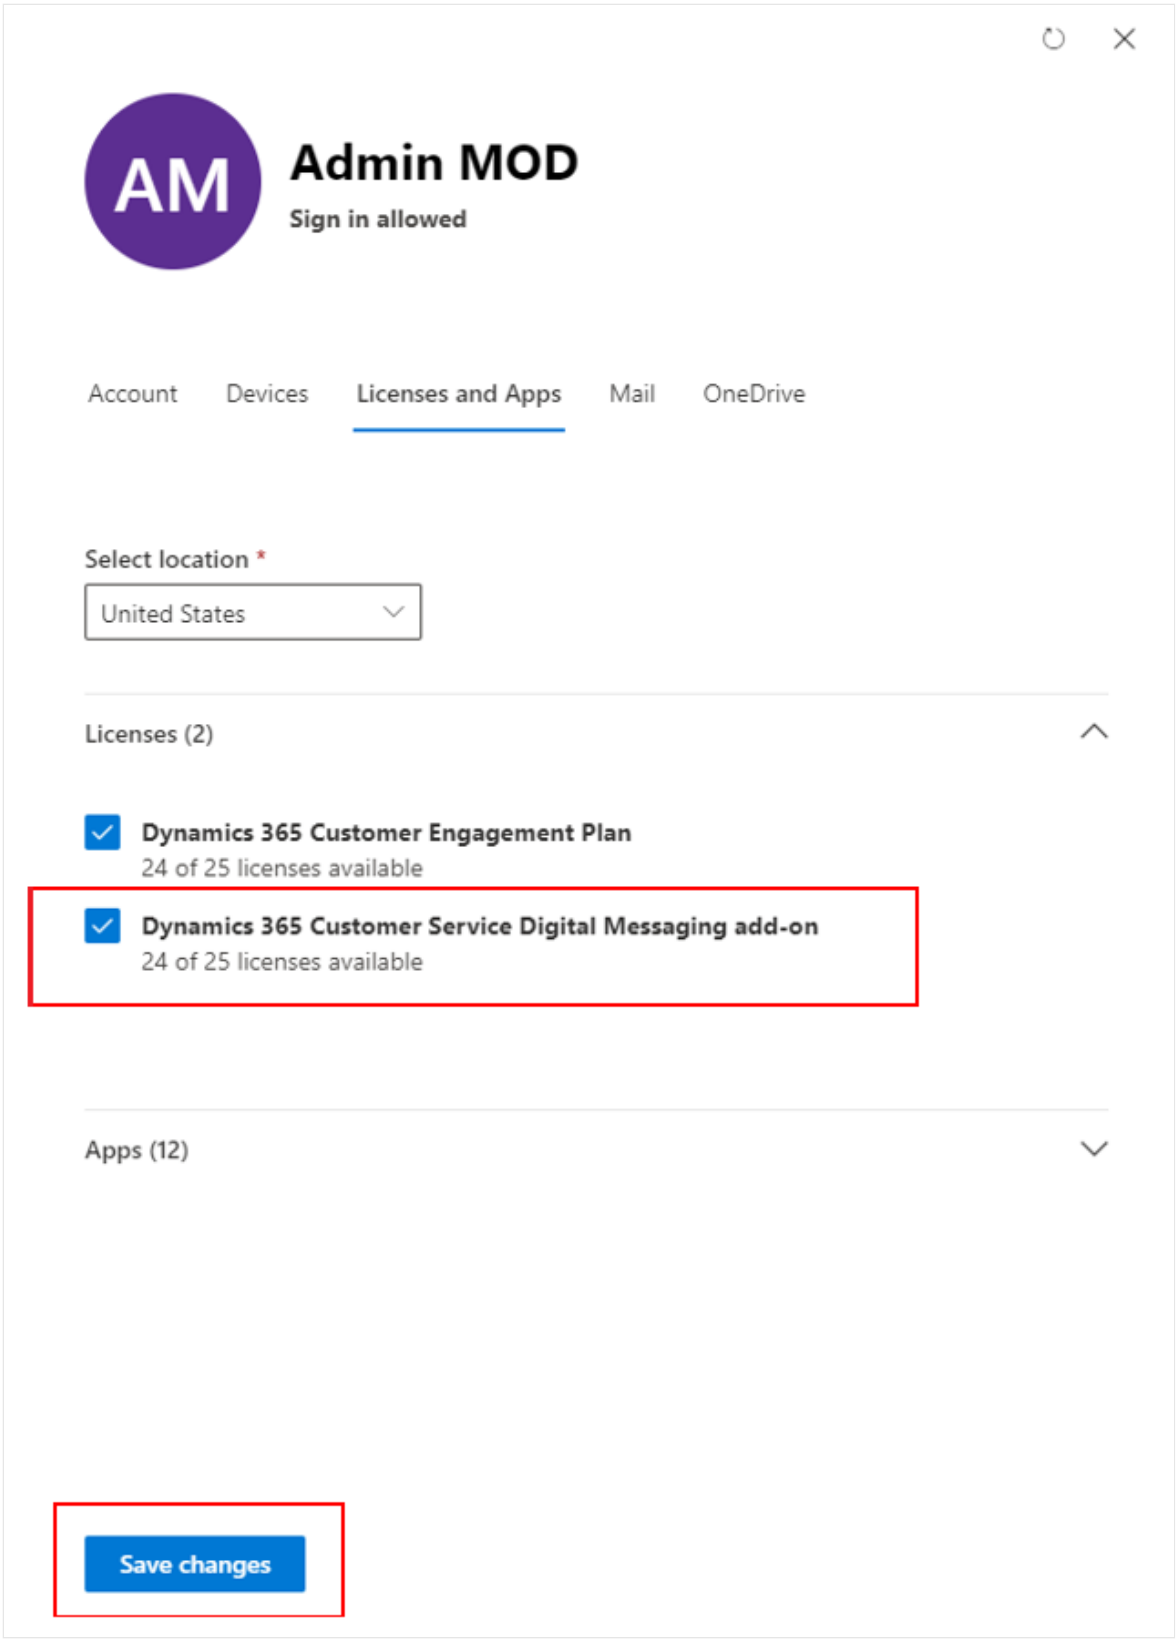
> **Important**

If you don't have one of these subscriptions, or if you purchased your subscription somewhere other than Web Direct, then the option to try channels will not be available in the Microsoft 365 admin center. In such cases, we recommend that you use the **Customer Service trial**.

For information about the Digital Messaging license, pricing, and prerequisites, see the Dynamics 365 Licensing Guide.

Get a trial subscription of channels

1. Sign in to Microsoft 365 admin center with the global administrator credentials.
2. Go to **Billing** > **Purchase Services**, scroll down, and select **Add-ons**.
3. Select **Dynamics 365 Customer Service Digital Messaging add-on Trial**.
4. You can start a 30-day trial of Digital Messaging with 25 user licenses.
5. After signing up for a trial, you must assign licenses of Digital Messaging to the users who need to engage with customers and provide support via Omnichannel for Customer Service. Select one or more active users and edit their product licenses. After you're done, select **Save**.



Get a trial subscription of voice channel

1. In Microsoft 365 admin center, expand **Billing**, and select **Purchase services**.
2. Search for **Dynamics 365 Customer Engagement Applications Trial**, and select it.
3. Select the **Add-ons** tab, and then select one of the following add-ons to get the trial subscription of the voice channel:

- Dynamics 365 Customer Service Voice Channel Add-in Trial
- Dynamics 365 Customer Service Digital Messaging and Voice Add-in Trial

4. Select **Details**, and on the page that appears, select **Start free trial** to complete your purchase.

5. Go to the **Active users** page, and assign the trial license to the user who will provision the voice trial. Only then the user will be able to see the voice trial for provisioning it.

6. Provision the channel in your environment by following the steps mentioned in the next section of this article.

Provision channels in your organization

Perform the tasks in Provision Omnichannel for Customer Service to set up Omnichannel for Customer Service and enable Chat, SMS, social, and voice channels in your organization.

After a channel is enabled in your organization, you can sign in to the Dynamics 365 organization, and select the Customer Service admin center or Omnichannel admin center app to start configuring the channel. See the following articles to configure channels in Omnichannel for Customer Service:

- Configure the chat channel
- Configure the SMS channel
- Configure the Facebook channel
- Configure the voice channel

Get a Power BI (free) subscription

If you already have a subscription of Dynamics 365 Customer Service Enterprise or a subscription of Power BI in your tenant, you can skip this step. Otherwise, you must get a Power BI (free) subscription.

1. Sign in to Microsoft 365 admin center with the global administrator credentials.

2. Go to **Billing** > **Purchase services**.

3. Search for Power BI (free) and complete the purchase of Power BI (free) subscription.

Provide consent to access data to provision Omnichannel for Customer Service

Article • 08/31/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> Azure Active Directory is being renamed to Microsoft Entra ID: No action is needed from you. **Learn more**

This article provides information about the consent that's needed to access the different components and data during the installation and provision of Omnichannel for Customer Service.

Provide consent to access data

Omnichannel for Customer Service app requires the following permissions to read and write data on behalf of users:

- **Allow the application to read flows**: The app can access the flows if they have been used in macros.
- **Allow the application to manage flows**: The app can manage flows if they have been used in macros and to which you have access.
- **Access Microsoft Flow as signed in user**: Allows you to access Microsoft Flow as a signed-in user if flows have been used in macros.
- **Create content**: The app can automatically create content and datasets for you.
- **Read and write all dashboards**: The app can access and edit all your dashboards and any dashboards that you have access to.

- **Read and write all reports**: The app can access and edit all your reports and any reports that you have access to.
- **Read and write user settings and state**: The app can access and edit your user settings and the user-specific state associated with content you have access to.
- **Read and write all workspaces**: The app can access and edit all workspaces that you have access to.
- **Sign you in and read your profile**: Allows you to sign in to the app with your work account and let the app read your profile. It also allows the app to read basic company information.
- **Access Common Data Service as you**: Allows the app to access Microsoft Dataverse as you.

A detailed explanation is as follows:

- **Permissions Create content, Read and write all dashboard, Read and write all reports, Read and write user settings and state, and Read and write all workspaces**: During the provisioning of Omnichannel for Customer Service, "Omnichannel Insights for Dynamics 365" Power BI app is deployed to gain insights about your customer service omnichannel delivery performance and customer sentiment. The Power BI app consists of the following Power BI components. Omnichannel App needs the read and write permissions to deploy and interact with these components.
  - **Workspace**: Omnichannel Insights for Dynamics 365
  - **Dashboards**:
    - Omnichannel Insights for Dynamics 365
    - Omnichannel Sentiment Analysis (OCSA) for Dynamics 365
  - **Reports**: Omnichannel Insights for Dynamics 365
  - **Datasets**: Omnichannel Insights for Dynamics 365

  More information: Omnichannel Insights for Dynamics 365 - Power BI App | Omnichannel Insights Dashboard
- **Sign in and read your profile**: Allows Omnichannel to sign into the app with user's work account and let the app read the user profile. It also allows the app to read basic company information.
- **Access Common Data Service as you**:
  - **For Customer Service users**: Allows Customer Service to automatically create a non-licensed, non-interactive application user, and assign security roles to the

application user. This application user is primarily used to access omnichannel agents and supervisors characteristics, such as capacity, skill, and presence; configuration data such as workstreams and queues; and to sync queue item and conversation data with Dataverse.

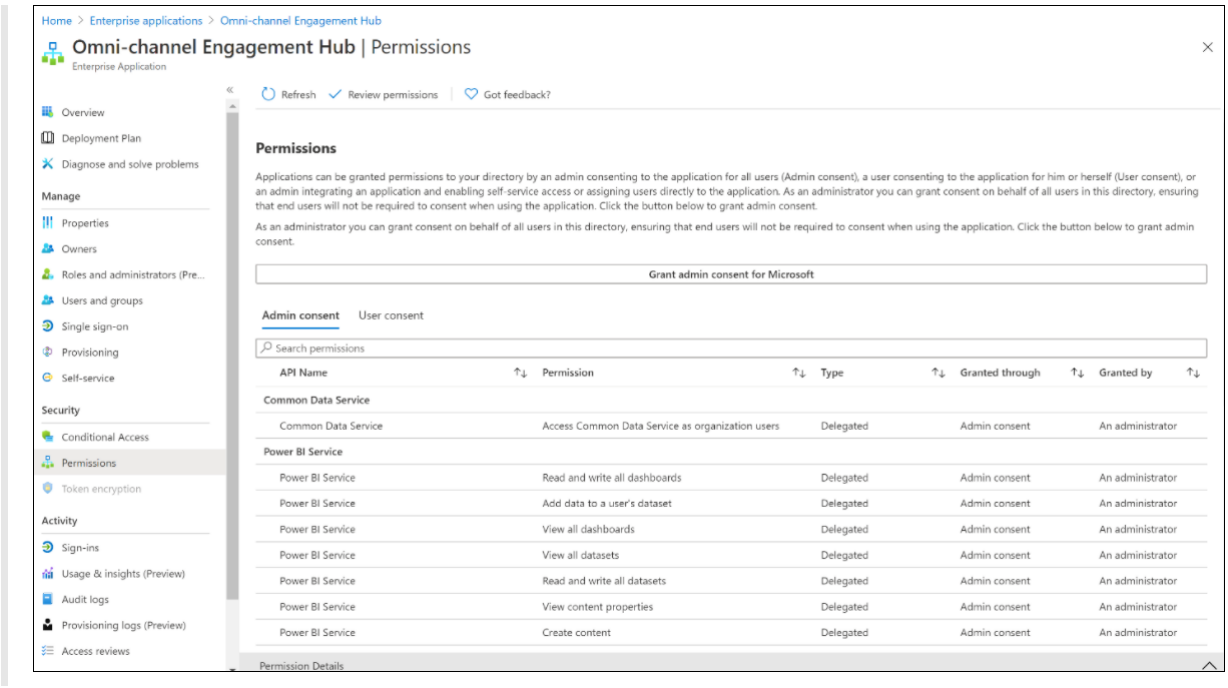
- **For Omnichannel for Customer Service users**: Allows Omnichannel for Customer Service to automatically create a non-licensed, non-interactive application user, and assign security roles to the application user. This application user is primarily used to access omnichannel agents' characteristics, such as capacity, skill, and presence, and to sync chat-related entities with Dataverse.

What happens when I provide data access consent and provision Omnichannel for Customer Service?

The following enterprise applications will be created in your Microsoft Entra ID and corresponding security permissions mentioned during data consent will get propagated to these apps. The Omnichannel Application User created in Dataverse will have reference to these AAD enterprise applications thereby helping it to interact with Dataverse and Omnichannel satellite services.

- Omni-channel Engagement Hub
- Omni-channel Engagement Hub APIs
- Omni-channel Engagement Hub Provisioning Application

A screenshot of the engagement hub is as follows.



FAQ

Why is an admin consent required? Is it only for giving consent to the delegated permissions that are listed? Or are more privileged operations performed in the tenant after the admin consent? If yes, which principals are created, and what roles or permissions are assigned?

Only the delegated permissions are required. On consent, the following two service principals are created:

– "Omnichannel APIs"

- "Omnichannel for Customer Service"

Why is the global admin role required, and not a less powerful one?

We need to add the service principal to Microsoft Entra ID for the tenant as a requirement, and therefore, we need global admin permissions.

Which are the Omnichannel principals? We found at least four Omnichannel principals.

“Omnichannel APIs” is the main application ID that's used for UI operations such as triggering provisioning of UR and loading the presence for an agent. “Omnichannel for Customer Service” is the app that has Dataverse permissions and is used to read data from Dataverse and write data to Dataverse for the Omnichannel service for the unified routing capability of classification and assignment.

The following applications were created as third-party applications. They'll be moved to be first-party Microsoft applications.

- “Omnichannel for CS Provisioning App Primary” is the first-party app equivalent of “Omnichannel APIs”.
- “Omnichannel for CS CRM ClientApp Primary” is the first-party app equivalent of “Omnichannel for Customer Service”.

How do all these principals interact with each other?

These four principals don't interact with each other.

Which principal performs the background automation that unified routing seemingly enables, and what permissions does it have?

The “Omnichannel for Customer Service” application. This app has Dataverse permissions that are used to read data from Dataverse and write data to Dataverse for Omnichannel service for the unified routing capability of classification and assignment.

Provision unified routing for Customer Service

Overview of user management

Article • 02/17/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

To begin using Customer Service Hub, Customer Service workspace, and Omnichannel for Customer Service, each member of your organization will need a user account.

You'll use the Microsoft 365 admin center to create user accounts. The user account registers the user with Microsoft Online Services environment. In addition to registration with the online service, you must assign a license to the user account for the user to have access to the service.

When you assign a user the global administrator or the service administrator role in the Microsoft Online Services environment, it automatically assigns the user the System Administrator security role.

The topics in this section explain how to use the Microsoft 365 admin center to create security roles for users, and then how to use advanced settings in Omnichannel for Customer Service to create user roles to perform specific actions in the app.

Role persona mapping

Create users

Article • 10/06/2023

You use the Microsoft 365 admin center to create user accounts for every user who needs access to apps, flows, or chatbots. The user account registers the user with Microsoft Online Services environment.

Create a user account

When you create a user account in the Microsoft 365 admin center, the system generates a user ID and temporary password for the user. You have the option to let the service send an email message to the user as clear text. Although the password is temporary, you might consider copying the information to send to the user through a more secure channel, such as from an email service that can digitally encrypt the contents.

For step-by-step instructions for creating a Microsoft Online Services user account, see Add users individually or in bulk.

> **Note**
>
> When you create a user and assign a license in the Microsoft 365 admin center, the user is also created in customer engagement apps. It can take a few minutes to complete the synchronization process between the Microsoft 365 admin center and customer engagement apps.
>
> By entering a user ID and password, a user can access the Microsoft 365 admin center to view information about the service. However, the user won't have access to customer engagement apps until the user has a security role assigned either directly or indirectly as a member of a **group team**.

> **Tip**
>
> To force an immediate synchronization between the Microsoft 365 admin center and customer engagement apps, do the following:
>
> - Sign out of the customer engagement app and the Microsoft 365 admin center.

- Close all open browsers used for the customer engagement app and the Microsoft 365 admin center.
- Sign back in to the customer engagement app and the Microsoft 365 admin center.

User types

Regular users

These are the regular synchronized users from Azure Active Directory (Azure AD).

Application users

Identified by the presence of ApplicationId attribute in the system user record. To check the Azure AD application ID, see View or edit the details of an application user.

Non-interactive users

- License specific provisioning business rules does not apply to these users after they are marked as non-interactive. Note: security group specific rules still apply.
- Cannot access Microsoft Dataverse web interface or admin portals.
- Can only access Dataverse via SDK/API calls.
- There is a maximum limit of 7 non-interactive users per instance.

Support user

See System and application users.

- Not synchronized with Azure AD, and created by Dataverse out of the box.
- Placeholder user record for all of the internal Microsoft support users.
- Key identifiers:
  - UPN value is crmoln@microsoft.com.
  - Access mode value is 3.
- All Microsoft support users will be mapped to this well-known record at runtime.

Delegated administrator

See the following:
For partners: the Delegated Administrator

System and application users

- Not synchronized with Azure AD, and created by Dataverse out of the box.
- Placeholder user record for all of customer's delegated admin partner users to access Dataverse as delegated administrators.
- Key identifiers:
  - UPN value is crmoln2@microsoft.com.
  - Access mode value is 5.
- All the delegated admin partner users will be mapped to this well-known record at runtime.

User profile information

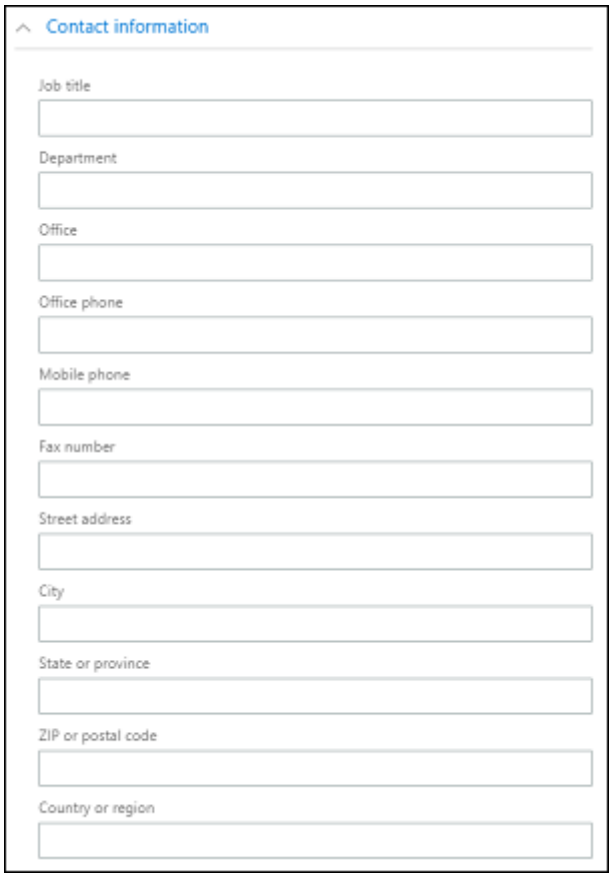
Some user profile information is maintained and managed in the Microsoft 365 admin center. After you create or update a user, these user profile fields are automatically updated and synchronized in your Microsoft Power Platform environments.

The following table shows the fields that are managed in the **Users** section of the Microsoft 365 admin center.

Customer engagement apps user form	**Microsoft 365/Azure AD user**
User Name	Username
Full Name*	Display Name
Title	Job title
First Name	First Name
Last Name	Last Name
Primary Email**	Email
Main Phone	Office phone
Mobile Phone	Mobile phone
Fax	Fax number
Address	Street address
Address	City
Address	State or province
Address	Country or region

Customer engagement apps user form	Microsoft 365/Azure AD user
AzureActiveDirectoryObjectId***	ObjectId
* Full Name isn't automatically updated and synchronized with customer engagement apps. ** To prevent data loss, the Primary Email field isn't automatically updated and synchronized with customer engagement apps. *** object ID of a user or a service principal in Azure Active Directory.	

The following image shows Microsoft 365 user contact fields.

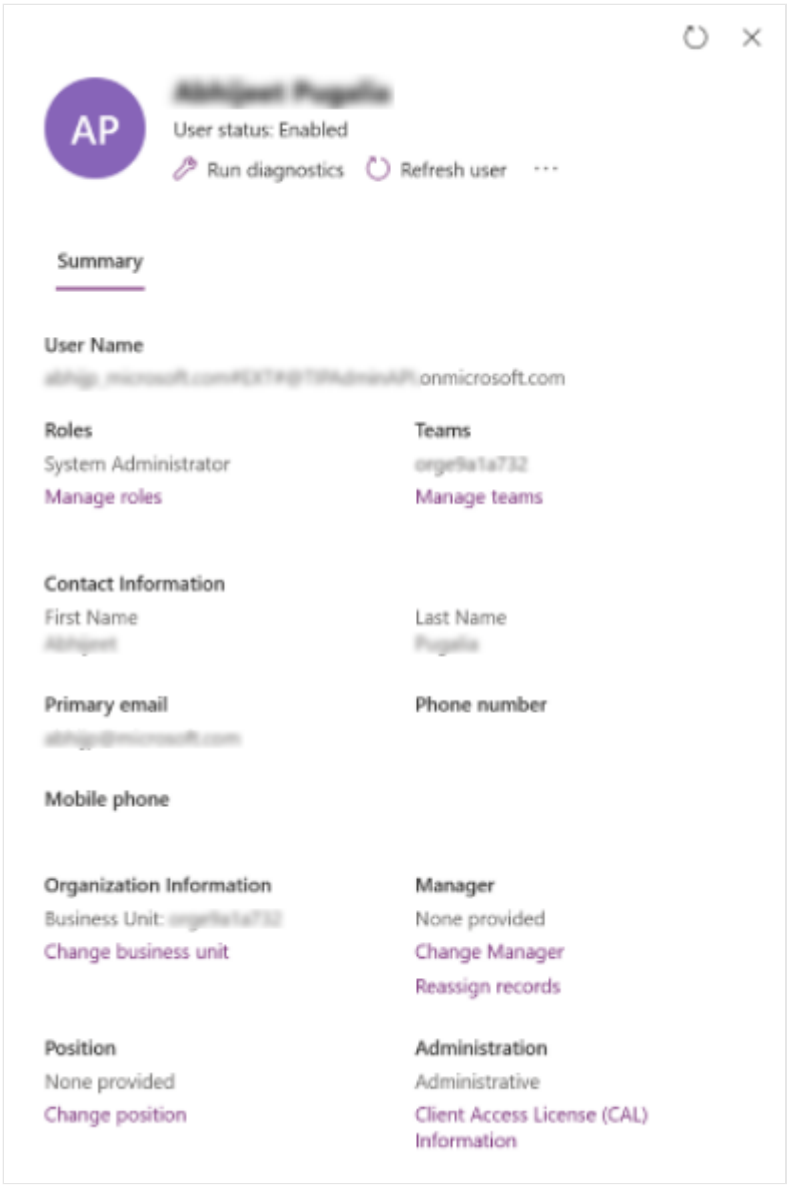


View and edit a user profile

To view and edit a user's profile in the Power Platform admin center:

1. Select an environment and go to **Settings** > **Users + permissions** > **Users**.
2. Select a user in the list.

On the user profile page you can view and make changes to important user profile information such as Security Roles, Team membership, Business Unit, Manager, Position, and more. You can also **Run diagnostics** to troubleshoot access issues or **Refresh User** to re-sync from Azure Active Directory.



Add a license to a user account

You can license the user when you create the user account, or you can license the user later. You must assign a license to every user account that you want to access the online service. See Assign licenses.

Assign a security role

Security roles control a user's access to data through a set of access levels and permissions. The combination of access levels and permissions that are included in a specific security role sets limits on the user's view of data and on the user's interactions with that data. See Assign a security role to a user.

Enable or disable user accounts

User enablement and disablement only applies to environments that have a Dataverse database. To enable a user in an environment that has a Dataverse database, ensure that they're allowed to sign in, assign a license to the user, and then add the user to the security group that's associated with the environment. These are the same criteria used to add users to an environment.

To enable a user, assign a license to the user and add the user to the security group that's associated with an environment. If you enable a user account that was disabled, you must send a new invitation for the user to access the system.

To disable a user account, remove a license from the user or remove the user from the security group that's associated with an environment. Removing a user from the security group doesn't remove the user's license. If you want to make the license available to another user, you have to remove the license from the user account that was disabled.

> **Note**
>
> You can also remove all security roles from a user to prevent the user from signing in to and accessing customer engagement apps. However, this doesn't remove the license from the user, and the user will remain in the list of enabled users. We don't recommend using this method to remove access from a user.
>
> When you use a security group to manage enabling or disabling users or provisioning access to an org, nested security groups within the selected security group aren't supported and will be ignored.
>
> You can **assign records** to a disabled user account and also **share reports** and accounts with them. This can be useful when migrating on-premises versions to online. If you need to assign a security role to users who have a Disabled status, you can do so by enabling the allowRoleAssignmentOnDisabledUsers in **OrgDBOrgSettings**.
>
> A Global admin, Power Platform admin, or a Dynamics 365 admin does not need a license to be enabled in an environment. See: **Global admins and Power Platform admins can administer without a license**. But since they are unlicensed, they will be set in the **Administrative access mode**.

You must be a member of an appropriate administrator role to do these tasks. More information: Assign admin roles

Enable a user account in an environment

To enable a user in an environment that has a Dataverse database, you enable sign-in for the user, assign a license to the user, and then add the user to a security group.

To enable sign-in

1. Sign in to the Microsoft 365 admin center.
2. Select **Users** > **Active users**, and then select the user.
3. Ensure that under the user's display name, you see **Sign in allowed**. If you don't, select **Block this user**, and then unblock sign in.

To assign a license

1. Sign in to the Microsoft 365 admin center.
2. Select **Users** > **Active users**, and then select the user.
3. Select the **Licenses and Apps** tab, and then select the licenses you want to assign.
4. Select **Save changes**.

To add a user to a security group

1. Sign in to the Microsoft 365 admin center.
2. Select **Teams & groups** > **Active teams & groups**.
3. Select the security group that's associated with your environment.
4. Select the **Members** tab.
5. Under **Members**, select **View all and manage members** > **Add members**.
6. Choose users from the list or search for users, and then select **Save**.

Disable a user account in an environment

To disable a user account in an environment that has a Dataverse database, you can either remove the user from the security group or remove the license from the user.

To remove a user from a security group

1. Sign in to the Microsoft 365 admin center.
2. Select **Teams & groups** > **Active teams & groups**.
3. Select the security group that's associated with your environment.
4. Select the **Members** tab.
5. Under **Members**, select **View all and manage members**
6. Select the users in the list to remove them, and then select **Save**.

To remove a license from a user

1. Sign in to the Microsoft 365 admin center.
2. Select **Users** > **Active users**, and then select the user.
3. Select the **Licenses and Apps** tab, and then select the licenses you want to remove.
4. Select **Save changes**.

Note that removing a license from a user might not always result in disabling the user account, though the license will be freed up for assigning to another user. The recommended approach to disabling a user account in an environment is to remove them from the security group that's associated with the environment.

> **Note**
>
> You can also delete users in the Microsoft 365 admin center. When you remove a user from your subscription, the license assigned to that user automatically becomes available to be assigned to a different user. If you want the user to still have access to other applications you manage through Microsoft 365—for example, Microsoft Exchange Online or SharePoint—don't delete them as a user. Instead, simply remove the license you've assigned to them.
>
> When you sign out of the Microsoft 365 admin center, you aren't signing out of customer engagement apps. You have to do that separately.

> **Tip**
>
> To force an immediate synchronization between the Microsoft 365 admin center and customer engagement apps, do the following:
>
> - Sign out of the customer engagement app and the Microsoft 365 admin center.
> - Close all open browsers used for the customer engagement app and the Microsoft 365 admin center.
> - Sign back in to the customer engagement app and the Microsoft 365 admin center.

Add users to Dataverse

For users to have access to applications and data in an environment, at a minimum the SystemUser table in Dataverse must have a record corresponding to the respective user

identity. There are different mechanisms to add users in Dataverse, either automatic or on demand:

> **Tip**
>
> Check out the following video: **Adding users to Dataverse**.

1. A system background process runs periodically to synchronize changes from Azure AD and updates the SystemUser records in Dataverse based on pre-determined set of requirements. The time taken to synchronize all changes into Dataverse is dependent on total number of users must be added or updated. For large organizations with thousands of users in Azure AD, we recommend creating security groups associated with each environment, so only the required subset of users is added into Dataverse.

   > **Note**
   >
   > Not all users added in Azure AD will be pickup by the automatic synchronization process. **This section** details the eligibility criteria the system background process applies to add a user from Azure AD into Dataverse.

2. If users already exist in Azure AD, they are automatically added to SystemUsers table at first attempt to access the environment. Note that if a user already exists in Dataverse, but in a disabled state, attempting to access the environment will result in the user's state to be updated to "enabled", assuming they are entitled at the time of access.

3. Users that have the necessary permissions, can use the API to add or update users in Dataverse on demand.

4. Administrators can leverage the Power Platform admin center user management experience to add users in Dataverse on demand.

Categories of users not added automatically in Dataverse

In certain conditions, the above-mentioned system background process is not adding users automatically into Dataverse. In these cases, users will be added on demand either when they first attempt to access the environment or by an administrator using the API or the Power Platform admin center. These conditions are:

1. Users are part of a Dataverse for Teams environment type.
2. Users are part of an environment with a Dataverse database and have a free Dataverse service plan from Microsoft 365 licenses.
3. Users are part of an environment with a Dataverse database and environment level app-pass license type.

> ⓘ **Note**
>
> Users cannot be added to SystemUser table either automatically or on demand in case of environments without Dataverse database.

Requirements for successfully adding users in Dataverse

Below criteria must be met for successfully adding the user in the Dataverse table:

1. User must be enabled and not deleted or soft-deleted in Azure AD. User must be enabled in Azure AD to be enabled in a Dataverse database. If user is added to Dataverse and then deleted in Azure AD, the state in the Dataverse table will be updated to “disabled”.

2. User must have a valid license with these exceptions:
   a. Admin users do not require a license. Unlicensed Azure AD admins are enabled in the systems as “Setup user” and have administrative only access mode.
   b. Individual users do not need to have a license when the environment has app pass capacity. This only applies to adding users on demand (either at first attempt to access the environment or through API/Power Platform admin center).
   c. Individual users do not need to have a license when the tenant they are part of has a tenant level Marketing license. This only applies to adding users on demand (either at first attempt to access the environment or through API/Power Platform admin center).
   d. Non-interactive users do not need a license
   e. Free Dataverse plans from Microsoft 365 license are honored when users added on-demand (either at first attempt to access the environment or through API/Power Platform admin center)

> ⓘ **Note**

Guest users should also have a license from the environment's tenant. License from Guest user's tenant is NOT considered as valid license.

3. If the environment has a security group defined, user must be part of the respective security group, unless the user is a Tenant or Power Platform Administrator. Non-admin users or Dynamics 365 service admin must be in the security group to access the system. When the owner of the security group is added to Dataverse through an on-demand action, the user will be considered a valid member of the security group and will be added to Dataverse successfully.

Adding users to Dataverse has different implications depending on the environment type:

1. If users are part of a trial environment, then they will not need email approval for being added to Dataverse. Users will only be added to Dataverse on demand. The background sync process will still run to keep the users in the environment up-to-date, but will not add users automatically.

2. Only the initial user that created the developer environment type will be added to Dataverse.

3. Users that are part of a Dataverse for Teams environment will only be added to Dataverse's SystemUser table as result of the user's first attempt to access the environment.

Create a Read-Write user account

By default, all licensed users are created with an access mode of **Read-Write**. This access mode provides full access rights to the user based on the security privileges that are assigned.

To update the access mode of a user

1. In the Power Platform admin center, select an environment, and go to **Settings** > **Users + permissions** > **Users**.
2. Select **Enabled Users**, and then open a user from the list.
3. On the user pane command bar select **...** > **Manage user in Dynamics 365**.
4. In the user form, scroll down under **Administration** to the **Client Access License (CAL) Information** section. In the **Access Mode** list, select **Read-Write**.
5. Select the **Save** icon.

Create an Administrative user account

An Administrative user is a user who has access to the Settings and Administration features but has no access to any of the functionality. Use this account to assign administrative users to perform day-to-day maintenance functions (create user accounts, manage security roles, and so on). Because an administrative user doesn't have access to customer data nor any functionality, the user doesn't require a license (after setup).

You need to have the System Administrator security role or equivalent permissions to create an administrative user. First, you'll create a user account in Microsoft 365, and then in to the customer engagement app, select the **Administrative** access mode for the account.

> ⓘ **Note**
>
> Any admin user with the Global admin, Power Platform admin, or Dynamics 365 Service admin role will receive the **Administrative** access mode as long as there are no user licenses assigned. This is true regardless of enabling app-passes or pay-as-you-go use at the tenant level.
>
> See **Create an administrative user and prevent elevation of security role privilege** for an example of how an Administrative user account can be used.

1. Create a user account in the Microsoft 365 admin center.

   Be sure to assign a license to the account. You'll remove the license (in step 12) after you've assigned the **Administrative** access mode.

2. In the **Optional settings** form, expand **Roles**.

3. Clear the **User (no administrator access)** check box.

4. Scroll down the form, and then select the **Show all** link.

5. Select the **service administrator** check box. **Note:** If you've selected **Global Administrator**, you don't need to select this option.

Wait for the user to sync to the environments.

6. In the Power Platform admin center, select an environment, and go to **Settings** > **Users + permissions** > **Users**.

7. Select **Enabled Users**, and then open a user from the list.

8. On the user pane command bar select **...** > **Manage user in Dynamics 365**.
9. In the user form, scroll down under **Administration** to the **Client Access License (CAL) Information** section. In the **Access Mode** list, select **Administrative**.

   Now you need to remove the license from the account.
10. Go to the Microsoft 365 admin center.
11. Select **Users** > **Active Users**.
12. Select the Administrative user account, and then select the **Licenses and Apps** tab.
13. Clear the license box(es), and then select **Save changes**.

Create a non-interactive user account

The non-interactive user isn't a "user" in the typical sense—it doesn't represent a person, it's an access mode that's created by means of a user account. It's used for programmatic access to and from customer engagement apps between applications. A non-interactive user account lets these applications or tools—such as a connector from customer engagement apps to ERP—authenticate and access customer engagement apps without requiring a license. For each environment, you can create up to seven non-interactive user accounts.

You need to have the System Administrator security role or equivalent permissions to create a non-interactive user. First, you'll create a user account in Microsoft 365. Then, in customer engagement apps, select the non-interactive access mode for the account.

1. Create a user account in the Microsoft 365 admin center.

   Be sure to assign a license to the account.
2. In the Power Platform admin center, select an environment, and go to **Settings** > **Users + permissions** > **Users**.
3. Select **Enabled Users**, and then open a user from the list.
4. On the user pane command bar select **...** > **Manage user in Dynamics 365**.
5. In the user form, scroll down under **Administration** to the **Client Access License (CAL) Information** section. In the **Access Mode** list, select **Non-interactive**.

   You then need to remove the license from the account.
6. Go to the Microsoft 365 admin center.

7. Select **Users** > **Active Users**.
8. On the **Licenses and Apps** tab, select the non-interactive user account.
9. Clear the license box(es), and then select **Save changes**.
10. Go back to the customer engagement app and confirm that the non-interactive user account **Access Mode** is still set for **Non-interactive**.

Create an application user

You can use server-to-server (S2S) authentication to securely and seamlessly communicate between Dataverse and your web applications and services. S2S authentication is the common way that apps registered on Microsoft AppSource use to access the Dataverse data of their subscribers. All operations performed by your application or service by using S2S will be performed as the application user you provide, rather than the user who's accessing your application.

All application users are created with a non-interactive user account, however they aren't counted toward the limit of seven non-interactive user accounts. In addition, there's no limit on how many application users you can create in an environment.

> **⊗ Caution**
>
> For an application user, the system adds a "#" as the First Name for the Application User you create. This is by design.

For step-by-step information about creating an application user, see Create an application user.

Enable or disable application users

When application users are created, they're automatically enabled. The default **Application User** form shows the status in the form footer; the **Status** field can't be updated.

You can customize the default **Application User** form to allow updates to the **Status** field so that you can enable or disable application users, if required. For step-by-step information about customizing the default **Application User** form, see Enable or disable application users.

> ⊗ **Caution**
>
> Disabling an application user will break all the integration scenarios that use the application user.

Manage application users in the Power Platform admin center

We are in the process of moving application user management from the legacy web client as documented in Enable or disable application users. See the following topic for managing application users from the Power Platform admin center: Manage application users in the Power Platform admin center.

How stub users are created

A stub user is a user record that has been created as a placeholder. For example, records have been imported that refer to this user but the user doesn't exist in customer engagement apps. This user can't sign in, can't be enabled, and can't be synchronized to Microsoft 365. This type of user can only be created through data import.

> ⊗ **Caution**
>
> To prevent creating duplicate user records with the same UPN or throw errors during data import workflows, synchronize the users from Entra ID to Dataverse before running data import.

A default security role is automatically assigned to these imported users. The **Salesperson** security role is assigned in an environment and the **Basic User** security role is assigned in a Power Apps environment.

> ⓘ **Note**
>
> By default, a security role can only be assigned to users with an Enabled status. If you need to assign a security role to users who have a Disabled status, you can do so by enabling the allowRoleAssignmentOnDisabledUsers **OrgDBOrgSettings**.

Update a user record to reflect changes in Azure AD

When you create a new user or update an existing user in Dynamics 365 Customer Engagement (on-premises), some fields in the user records, such as name and phone number, are populated with the information obtained from Active Directory Domain Services (AD DS). After the user record is created, no further synchronization occurs between Azure AD user accounts and customer engagement apps user records. If you make changes to the Azure AD user account, you must manually edit the user record to reflect the changes.

1. In the Power Platform admin center, select an environment, and go to **Settings** > **Users + permissions** > **Users**.
2. In the list, select the user record you want to update, and then select **Edit**.

The following table shows the fields that are populated on the user form (user record) from the Azure AD user account.

User form	Active Directory user	Active Directory object tab
User name	User logon name	Account
First name	First name	General
Last name	Last name	General
Main Phone	Telephone number	General
Primary Email	Email	General
Address*	City	Address
Address*	State/province	Address
Home phone	Home	Telephones
* The Address field comprises the values from the City and State/province fields in Azure AD.		

FAQ

If a user that is added to Dataverse SystemUser table becomes disabled or unlicensed in Azure AD, how is that reflected in Dataverse?

User record is not deleted, but its state in Dataverse will be updated to “disabled”.

Are all users in Azure AD being added to Dataverse?

Users from Azure AD are added to Dataverse only if they meet the criteria. If already existing users do not meet the criteria, their state will be updated to “disabled”,

How can the admin increase the performance of adding users in Dataverse?

Assigning an Azure AD security group to the environment is a best practice in general, that can also result in a performance increase as regard to adding users that are part of the security group to Dataverse.

Assign roles and enable users for Omnichannel for Customer Service

Article • 05/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Use the information in this article to configure security roles and enable users to perform the various tasks in Customer Service.

Roles in Omnichannel for Customer Service

The Dynamics 365 users can access and perform different functions based on the roles that are assigned to them. The following roles can be assigned individually or in combination based on the tasks that need to be performed:

- **Basic User:** Required by all users of Omnichannel for Customer Service.
- **Omnichannel administrator:** Required for performing administrator tasks; also requires the **System Administrator** role to manage user roles and privileges in Omnichannel for Customer Service.
- **Omnichannel supervisor:** Required for performing supervisor tasks.
- **Omnichannel agent:** Required for performing agent tasks.
- **Productivity tools user:** Required by users of Dynamics 365 Productivity Tools.
- **Productivity tools administrator:** Required by administrator users of Dynamics 365 Productivity Tools.
- **App Profile Manager Administrator:** Required for creating and assigning app profiles to users of Customer Service and Omnichannel for Customer Service.
- **App Profile User:** Required by users of Customer Service and Omnichannel for Customer Service.

For information on the App Profile Manager Administrator and App Profile User roles, see Roles and privileges associated with app profile manager

Ensure that the **Omnichannel API access** role isn't assigned to a supervisor or agent type of user.

Additionally, the **Customer Service Representative** role is required to work with the Case entity.

Use the Microsoft 365 admin center to create user accounts for every user who needs access to Omnichannel for Customer Service. For more information, see Create users and assign security roles.

Assign roles to users

To be able to map roles to personas in role persona mapping, you must assign the roles to users directly and not through team memberships. For more information about role persona mapping, see Role persona mapping.

Perform the following steps to assign roles to users in the advanced settings area of Dynamics 365:

1. Select **Settings** > **Advanced Settings** on the command bar. The **Settings** page is displayed in a new browser tab.
2. Select **Settings** > **Security** > **Users**.
3. Select the users from the list for whom you want to assign a security role.
4. Select **Manage Roles** in the menu. The security roles available for the business unit are displayed.
5. In the **Manage User Roles** dialog box, select the security roles that you want to assign to the user, and then select **OK**.

To view and manage users in omnichannel for Customer Service, see Manage users in Omnichannel for Customer Service.

Understand roles and their privileges

Each role in Omnichannel for Customer Service can perform a set of actions based on the privileges that are listed as follows.

Privileges	Omnichannel administrator	Omnichannel supervisor	Omnichannel agent	Productivity tools user	Productivity tools administrator
Can view user list/presence list/workstream list/queue list/PBI config list	Yes	Yes			
Can edit roles of a user	Yes				
Can edit default presence and default capacity of a user	Yes	Yes			
Can edit queue assignment of a user	Yes	Yes			
Can add/edit/delete presence	Yes				
Can add/remove users from presence	Yes	Yes			
Can add/edit/delete presence associations	Yes				
Can add/edit/delete workstreams	Yes				
Can add/edit/delete channel settings, context settings, routing rules	Yes				
Can add/edit/delete queues	Yes				
Can add/remove agents from queue	Yes	Yes			
Can add/edit/delete bots	Yes				
Can view/add/edit/delete quick replies	Yes	Yes			

Privileges	Omnichannel administrator	Omnichannel supervisor	Omnichannel agent	Productivity tools user	Productivity tools administrator
Can add/edit/delete PBI config	Yes				
Can view/add/edit/delete operating hours	Yes				
Can view/add/edit/delete auth settings	Yes				
Can view operating hours		Yes			
Can monitor, assign, and transfer conversations		Yes			
Can view user list/presence list/workstream list/queue list			Yes		
Can view quick replies			Yes		
Can read agent script				Yes	
Can read agent script step				Yes	
Can read workflow				Yes	
Can read `msdyn_actioninputparameter`				Yes	Yes
Can read `msdyn_actionoutputparameter`				Yes	Yes
Can read `msdyn_inputparameters`				Yes	Yes
Can read `msdyn_macroconnector`				Yes	Yes
Can read `msdyn_parameterdefinition`				Yes	Yes
Can read `msdyn_designeroptions`				Yes	Yes
Can read `msdyn_macroactiontemplate`				Yes	Yes
Can read macro action				Yes	
Can create/read/write/append/delete agent script					Yes
Can create/read/write/append/delete agent script step					Yes
Can create/read/write/append/delete agent script workflow					Yes
Can read `msdyn_macrosolutionconfiguration`					Yes
Can create/read/write/append/delete macro action					Yes

Configure permissions to access secure columns

Administrator users will need column-level permissions on secure columns when they configure the following features and channels:

- Authentication settings
- Azure Communication Services
- Geographical location providers
- Google's Business Messages channel
- Payment profiles for Apple Messages for Business channel
- SMS channels through TeleSign and Twilio
- WeChat channel
- WhatsApp channel

The secure columns can be identified by the information icon that's present for the column.

The entities and their secret attributes are as follows. For more information on the entities and their attributes, see Overview of entities.

Entity	Secret attributes
msdyn_authenticationsettings	msdyn_authenticationclientsecret
msdyn_liveworkstream (for SMS)	msdyn_secureapikey
msdyn_ocapplepay	msdyn_ocbase64merchantcertstring msdyn_ocbase64merchantcertstringcontd msdyn_ocmerchantcertificatepassword
msdyn_ocbotchannelregistrationsecret	msdyn_securemsappsecret
msdyn_occommunicationprovidersetting	msdyn_securesecret
msdyn_oc_geolocationprovider	msdyn_secureproviderapikey
msdyn_ocgooglebusinessmessagesagentaccount	msdyn_agentaccountclienttoken
msdyn_ocgooglebusinessmessagespartneraccount	msdyn_partneraccountclienttoken msdyn_base64credentialfilestring msdyn_base64credentialfilestringcontd
msdyn_ocsmssettingsecret	msdyn_secureapikey
msdyn_octwitterapplication	msdyn_securetwitterconsumersecret msdyn_securetwitterconsumerkey
msdyn_octwitterhandlesecret	msdyn_useraccesstoken msdyn_useraccesstokensecret
msdyn_ocwechatchannelconfig	msdyn_secureapplicationsecret msdyn_securetoken msdyn_secureencodingaeskey
msdyn_ocwhatsappchannelaccount	msdyn_secureauthentiationtoken

Manage permissions on secret attributes

1. In Power Platform admin center, create or update the column security profile. More information: Associate security profiles and set permissions

2. Provide the read, update, or create permissions to the security profile on the columns that correspond to the secret attributes mentioned in the preceding table.

Use the enhanced experience to manage users

Article • 10/23/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Use the information in this article to manage your agent users for Customer Service. The enhanced user management experience is a simplified UI that eases the complexity of configuring the various settings required for your agent users to provide customer service optimally.

You can manage the following settings for the users in bulk:

- Skills
- Queues
- Capacity profiles
- Swarming

On the user management page, the following three views are available:

- **Contact center users**: Lists users who are assigned the agent, supervisor, or admin persona.
- **All users**: Lists all the Customer Service users.
- **Swarm experts**: Lists users who are assigned to be swarm experts.

The enhanced user management experience is available in Customer Service admin center only.

Manage contact center users

The attributes that you want to add must be configured in the system. You can update up to 200 users in a single step. For the selected users, you can update up to five attributes in a single step. If you need to update more than five attributes for the selected users, you can save the changes and then update the next set of attributes.

1. Sign in to Dynamics 365, and go to the Customer Service admin center app.

2. Select **User management** under **Customer support** in the site map.

3. On the page that appears, select **Manage** for **Enhanced user management**. The **Contact center users** view displays the users that have been configured in Power Platform admin center.

4. Hover the pointer over the rows of the users that you want to update and select the check boxes.

5. To update user attributes, select **Update user attributes**, and select one of the following options:

    - **Update skills**: On the dialog box that appears, do the following:
        - **Add skills to users:** In the **Skills** box, select the skills that you want to add, select a proficiency, and then select **Add to all**. The selected skill and proficiency is added for the users in the list. To have a different proficiency for the skills, select one skill and proficiency at a time.
        - **Activate or deactivate**: Select a skill in the **Skills** box, and select the ellipses to select **Activate for all** or **Deactivate for all**. Users with a deactivated skill will not be considered during assignment if the skill requirement of a work item matches the deactivated skill.
        - **Remove skills**: To remove a skill from the list of users, select the skill in the **Skills** box, and select **Remove from all**. Save your changes. The selected skills are removed for the users.

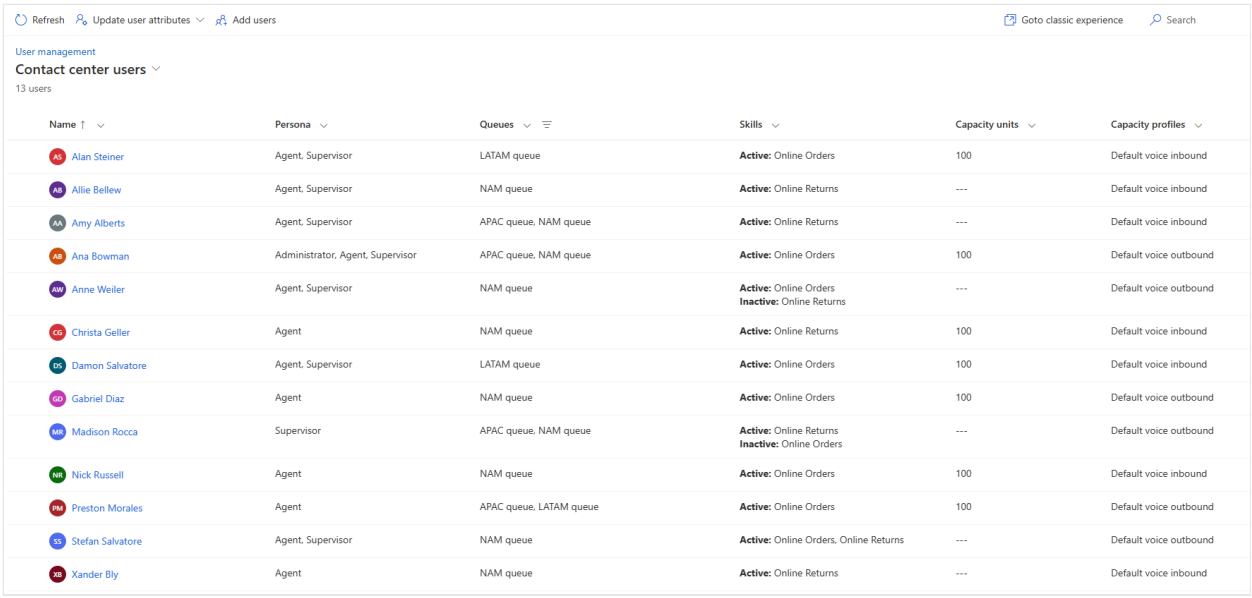
    - **Update queues**: On the dialog box that appears, in the **Queues** box, select the queues to add or remove, and then select **Add to all** or **Remove from all**. Save your changes.

    - **Update capacity**: On the dialog box that appears, in the **Capacity profiles** box, select the profiles that you want to add or remove, and then select **Add to all** or **Remove from all**. Save your changes.

6. To add users as swarm experts, select **Swarming** and then select **Add as swarm expert**.

7. If you want to see the list of swarm experts, select the **Swarm experts** view. More information: Configure customer support swarming

The users and their updated attributes will be displayed in the **Contact center users** view.



Name	Persona	Queues	Skills	Capacity units	Capacity profiles
Alan Steiner	Agent, Supervisor	LATAM queue	**Active:** Online Orders	100	Default voice inbound
Allie Bellew	Agent, Supervisor	NAM queue	**Active:** Online Returns	---	Default voice inbound
Amy Alberts	Agent, Supervisor	APAC queue, NAM queue	**Active:** Online Returns	---	Default voice inbound
Ana Bowman	Administrator, Agent, Supervisor	APAC queue, NAM queue	**Active:** Online Orders	100	Default voice outbound
Anne Weiler	Agent, Supervisor	NAM queue	**Active:** Online Orders **Inactive:** Online Returns	---	Default voice outbound
Christa Geller	Agent	NAM queue	**Active:** Online Returns	100	Default voice inbound
Damon Salvatore	Agent, Supervisor	LATAM queue	**Active:** Online Orders	100	Default voice inbound
Gabriel Diaz	Agent	NAM queue	**Active:** Online Orders	100	Default voice outbound
Madison Rocca	Supervisor	APAC queue, NAM queue	**Active:** Online Returns **Inactive:** Online Orders	---	Default voice outbound
Nick Russell	Agent	NAM queue	**Active:** Online Orders	100	Default voice inbound
Preston Morales	Agent	APAC queue, LATAM queue	**Active:** Online Orders	100	Default voice outbound
Stefan Salvatore	Agent, Supervisor	NAM queue	**Active:** Online Orders, Online Returns	---	Default voice outbound
Xander Bly	Agent	NAM queue	**Active:** Online Returns	---	Default voice inbound

Manage users using the classic experience

Users should be configured as a bookable resource so that they can be assigned work items by using unified routing.

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **User management** in **Customer support**.

   b. On the **User management** page, select **Manage** for **Users**.

2. On the **Omnichannel Users** page, double-click a user in the list.

3. Select the **Omnichannel** tab.

4. Specify the following in the user page.

Section	Field	Description	Example value
User Details	Capacity	If capacity units is configured, allocate a value that indicates the capacity of the agent. For information: Capacity.	100
User Details	Default Presence	Assign a default presence status for agent. This is the status that the agent is logged in with, in the Omnichannel for Customer Service app.	

5. Select **New Bookable Resource** under the **Skills Configuration** section. The **New Bookable Resource** page appears.

6. Do the following:

   a. Specify the name of agent in the **Name** field.

   b. Select **Save**. The **Work Hours** tab is enabled.

> **Important**
>
> To add the work hours for a bookable resource, universal resource scheduling must be available in your organization. Universal resource scheduling is available with Dynamics 365 Field Service, Dynamics 365 Project Service, or Dynamics 365 Service Scheduling. More information: **Overview of Service Scheduling**

   a. You can update the existing work hours or create work hours for the user.

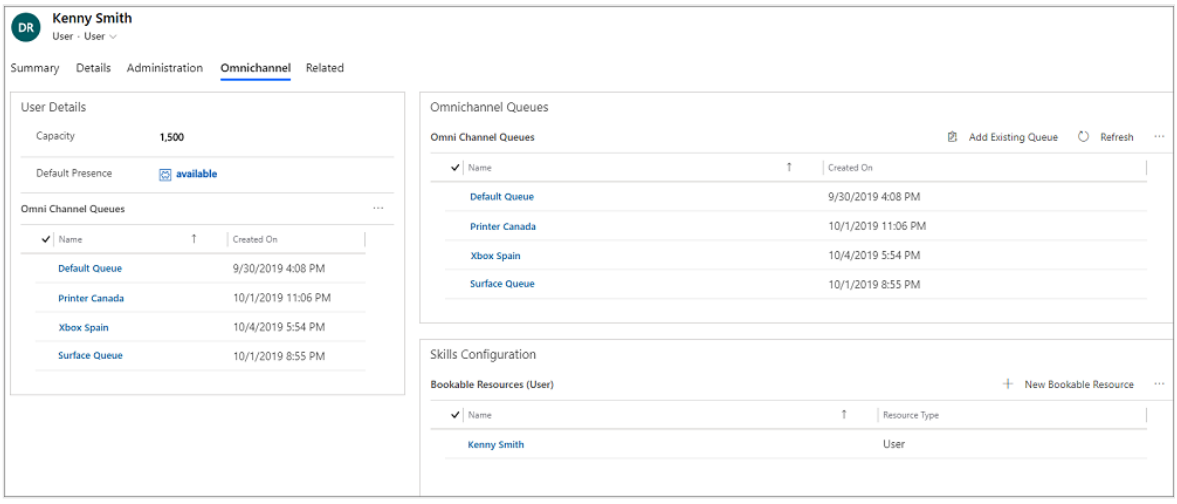
   b. On the **Omnichannel** tab of the **Bookable Resource** page for the user, select **New Bookable Resource Characteristic**.

   c. In **Skill Name**, search for and select a skill.

   d. In **Rating Value**, select the rating value that the user has on the skill.

   e. Save and close to return to the **Omnichannel** tab of the **User** page.

7. If capacity profile is configured, in the **Capacity** area, select **Add Existing Capacity Profile**, and select a profile in the list.



8. To use the user schedule for assignment, set up the bookable resource calendar. More information: Apply a calendar to a resource

9. Add the user to the required queue that's configured for unified routing. More information: Configure queues for unified routing

> **Note**
>
> Bots in a queue are modeled as a bookable resource and therefore will be considered for assignment. However, we recommend that you don't add bots to queues that are used for routing records.

All users who are assigned the **Omnichannel administrator**, **Omnichannel supervisor**, or **Omnichannel agent** security role can use Omnichannel for Customer Service.

For more information on how to create users and assign security roles, see Assign roles and enable users for Omnichannel for Customer Service.

For users to access the Omnichannel for Customer Service experiences, the roles that you map to personas in role persona mapping must be assigned to the users directly and not through team memberships. For more information about role persona mapping, see Role persona mapping.

Capacity

Capacity is the arbitrary scale that you choose and set for each of the work streams corresponding to the channels. The capacity assigned to the agent must be a multiplier of the capacity unit that you have defined for the associated workstream. Check the capacity unit defined for the workstreams to determine the value that must be assigned to your agents.

For example, if the capacity unit is 1 for a workstream and you want an agent to be able to take up to 3 conversations simultaneously, the capacity that you assign to the agent should be 3 units. Similarly, if your capacity unit is 5 for the work stream and you want the agent to be able to take up to 3 conversations simultaneously, you should assign 15 units as the capacity for the agent. You can also define capacity profiles. However, we recommend that you use either capacity units or capacity profiles in your environment, and not both. More information: Create and manage capacity profiles.

Configure custom limits in capacity profiles

Create and manage capacity profiles

Article • 10/23/2023

You can create capacity profiles and assign them to agents to define the types and amount of work they can take. Capacity profiles contain information, such as the amount of work, concurrent or daily capacity, and whether other channels are affected.

- Capacity management helps administrators create various capacity profiles and associate users with matching profiles. You can assign multiple capacity profiles to users.
- The administrator can block the assignment of extra work to the agents when they're working on certain channels, such as phone calls.
- The supervisor can override the agent's configured capacity and assign work to user manually.
- In the assignment rule, you can create a rule to find an agent whose capacity profile matches that of the work item.
- We recommend that you configure either capacity profiles or capacity units in your organization, but not both.
- The capacity isn't considered when an agent takes part in consult or monitors a conversation.

You might find it helpful to configure profile-based capacity in the following scenarios:

- Your agents vary in experience and skill set.
- Agents need an upper limit on the amount of work assigned to them.
- Work items are of different complexity and assigned from different channels.
- Assignment in one channel impacts the assignments of another channel. For example, you can't assign another work to agents who are on phone calls.

ⓘ Important

This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making—and should not be used to make—decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using Dynamics 365, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and,

as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

Create a capacity profile and assign to users

Create a capacity profile, and use it in a workstream for routing work items.

For a capacity profile, you can add or remove users and edit any setting except reset frequency. If you no longer require the profile, you can delete it.

1. Go to one of the admin apps, and perform the following steps.

   Customer Service admin center

   - In the site map, select **User management** in **Customer support**. The **User management** page appears.

2. Select the **Manage** option for **Capacity profile**.

3. On the **Capacity profiles** page, select **Create new**.

4. On the **Details** tab of the **Create capacity profile** dialog box, enter the following details:

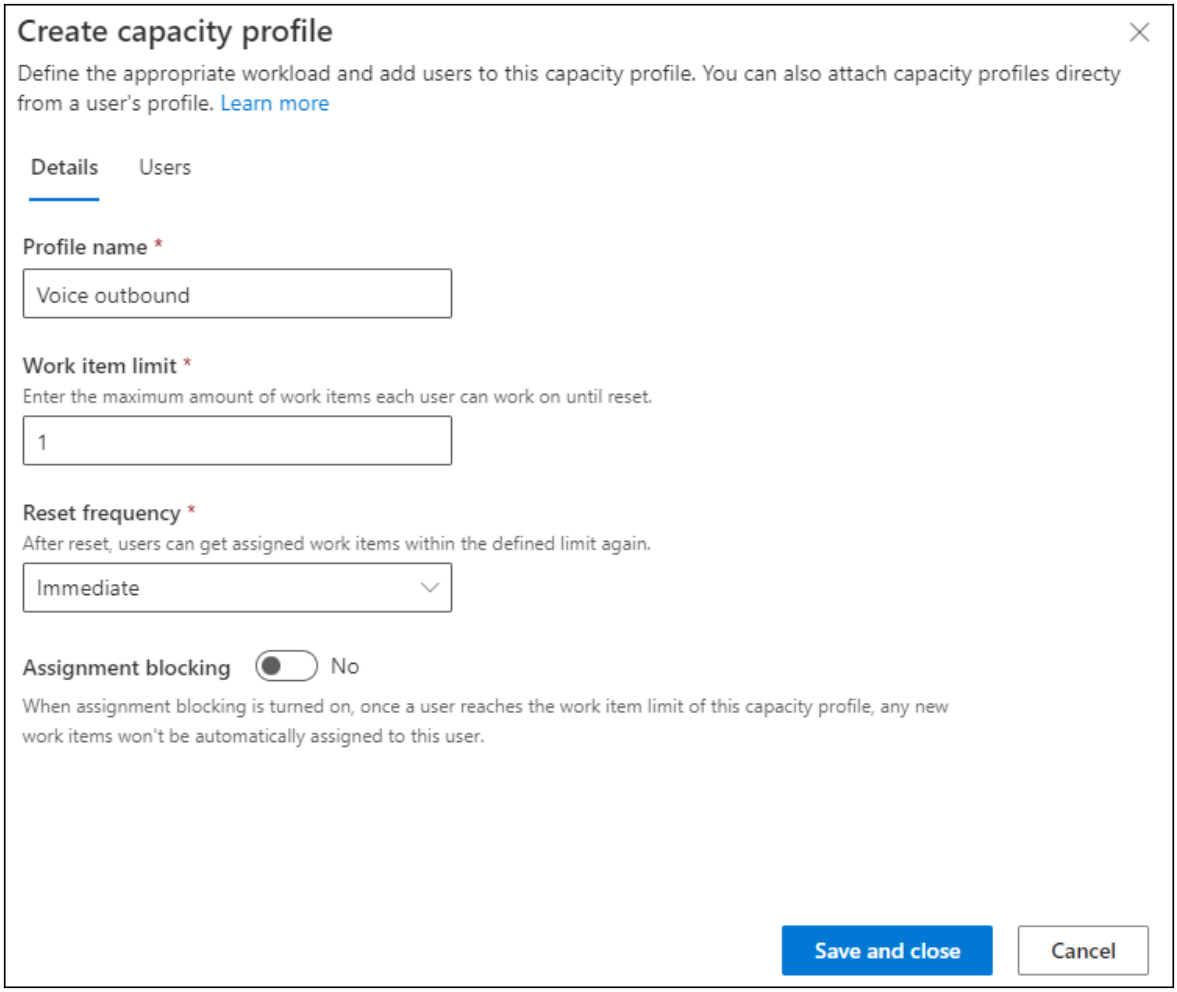
   - **Profile name**: Name for the capacity profile.

   - **Work item limit**: Number of units of the work type that you can assign to the agent.

   - **Reset frequency**: Period after which capacity consumption is reset for agents. Select one of the following options:
     - **Immediate**: Capacity is reset immediately.
     - **End of day**: Capacity is reset after the agent's shift ends even if all the assigned conversations aren't closed by the agent. The open conversations aren't counted in the work item limit and the agent is assigned new work items in their next shift.

     Once configured, you'll have to recreate the capacity profile if you want to change the reset frequency.

- **Assignment blocking**: Set the toggle to **Yes**. When the work item limit is met, the agent isn't assigned a new work item automatically.



5. On the **Users** tab, select **Add user**, and in the **Users** list, select the users. Alternatively, use the **Search** option to search for and add the user.

> **Important**
>
> Users must be configured as a bookable resource to be assigned the capacity profile. More information: **Manage users**.

6. Select **Add user**. The capacity profile is assigned to the user.

Configure agent-specific work limits in capacity profiles

Agents in your contact center might need different work item limits. You can allocate these limits to agents through capacity profiles.

For selective agents, you can define a work item limit that's different from the default limit by using the custom limit option in the capacity profiles.

To set the custom limits, do the following steps:

1. In Customer Service admin center, select **User management** under **Customer support**, and on the page that appears, select **Manage** for **Enhanced user management**.
2. In **Contact center users**, select the agents for whom you want to allocate a custom limit, and then select **Update user attributes** > **Update capacity profiles**.
3. On the **Update Capacity profiles** pane, in **Capacity profiles**, select a profile, and in **Custom limit**, enter a value according to your business need.
4. Select **Add to all**. The capacity profile with the custom limit is added to the users in the list.
5. Repeat the step 3 to update more profiles if you need to.
6. Save and close. The custom limit is denoted with an arrows icon to help visually differentiate among users with default and custom limits.
7. Inform the affected agents to refresh their browser to update their presence. The system assigns the work items based on the agents updated capacity and presence.
8. To reset the custom limit, set the custom limit field to empty and save the changes.

The configuration updates can take up to 15 minutes to sync.

You can customize the Agents report in the Omnichannel real-time analytics dashboard to see the custom limits.

How agent-specific limits work

Typically, the work assignment takes place according to the individual agent's default work item limit in the capacity profiles.

However, if you configure custom limits through capacity profiles, then agents receive work items according to the custom limit. More details are as follows:

- The custom limit might be lower or higher than the default limit and remains applicable for the selected agents until you manually reset it to the default limit.
- The system applies the custom limit to new work assignments only. If the custom limit is lower than the used limit, the system doesn't reassign the currently assigned work items for the agents.

- The other agents with the same capacity profile for whom the custom limit isn't configured have the default limit. Any changes in the default limit will affect these agents. However, the agents with custom limit will remain unaffected.

An example of the custom limit is as follows:

Ana, an agent at Contoso Coffee, is an expert in handling Return queries for Café A 100 machine. Henry, who has joined Contoso recently, is learning the nuances of Café A 100 machine. Eugene, the admin at Contoso has configured a capacity profile for “Return orders” with a default limit of two conversations per day. Eugene assigns the “Return orders” profile with the default limit to Henry. Eugene allocates a custom limit of five to Ana in the “Return orders” profile. Ana will receive maximum of five conversations per day from the “Return orders” profile while Henry will receive a maximum of two conversations only in a day for the same profile.

Update work limits using OData

Alternatively, you can use an OData call to update the custom limits by specifying a value for the msdyn_maxunits field in the msdyn_bookableresourcecapacityprofile entity. To reset the custom limit, specify the value as null for the msdyn_maxunits field.

A sample code block to update the custom limit as 5 is as follows.

```
var data = {msdyn_maxunits: 5} // the value denotes the custom limit
 Xrm.WebApi.updateRecord("msdyn_bookableresourcecapacityprofile", "<Bookable
Resource Capacity Profile ID>", data).then (
    function success(result) {
        console.log("Differentiated units updated");
    },
    function (error) {
        console.log(error.message);
        // handle error conditions
    }
);
```

Set capacity profiles for workstreams

After you create the capacity profiles, configure the following settings to assign work items to agents at runtime:

- Set the capacity profile in the work distribution settings. The system applies the profile to all the work items routed through the workstream. More information:

Configure work distribution

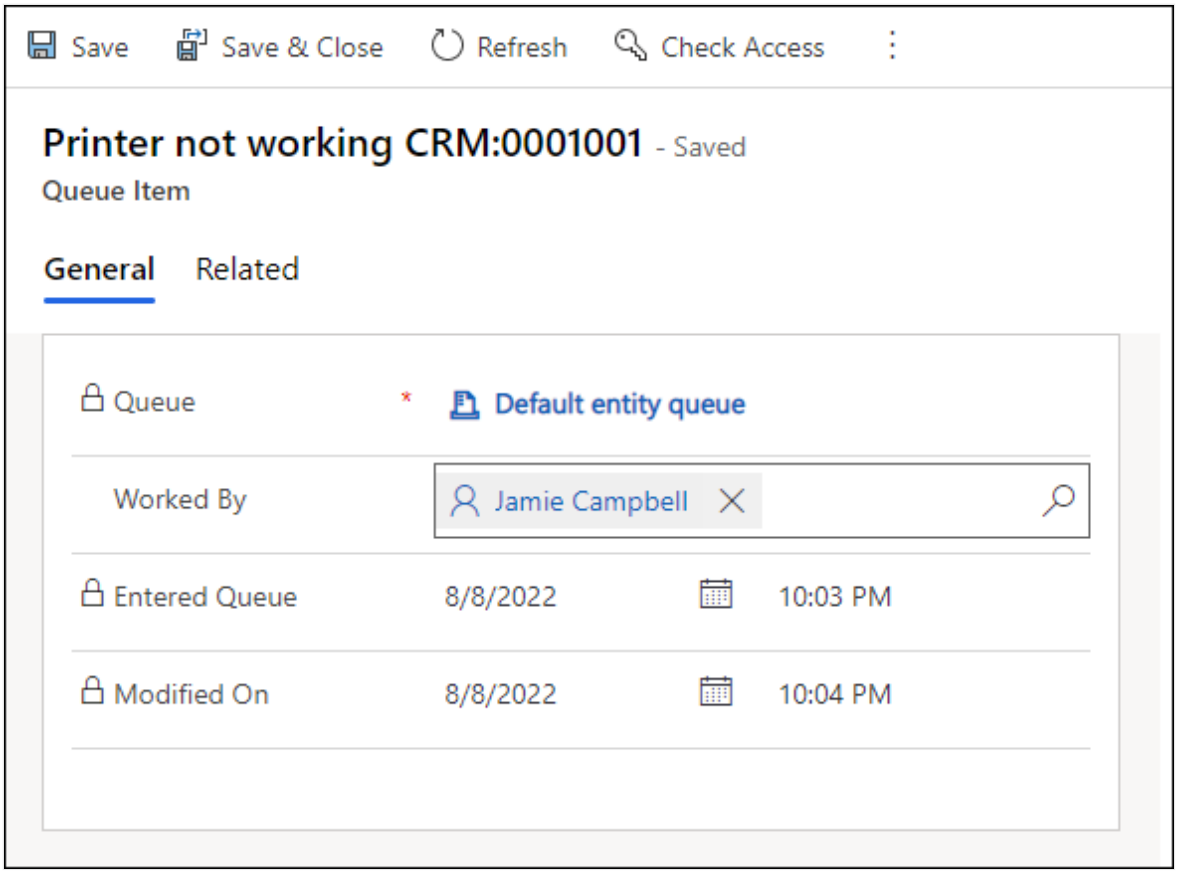
- Set the capacity profile in a classification ruleset for the workstream as a rule output. Append the new capacity profile to the work item. During assignment, unified routing will look for an agent who has available capacity in both the profiles, the default profile from the workstream and the appended profile from the classification. More information: Create classification rulesets based on capacity profiles

You need not define assignment rules specific to capacity profiles at queue level to find agents with matching capacity profiles. If capacity profile is attached to a work item, then the system will ensure that the assigned agent has the matching capacity profile.

Release capacity for agents

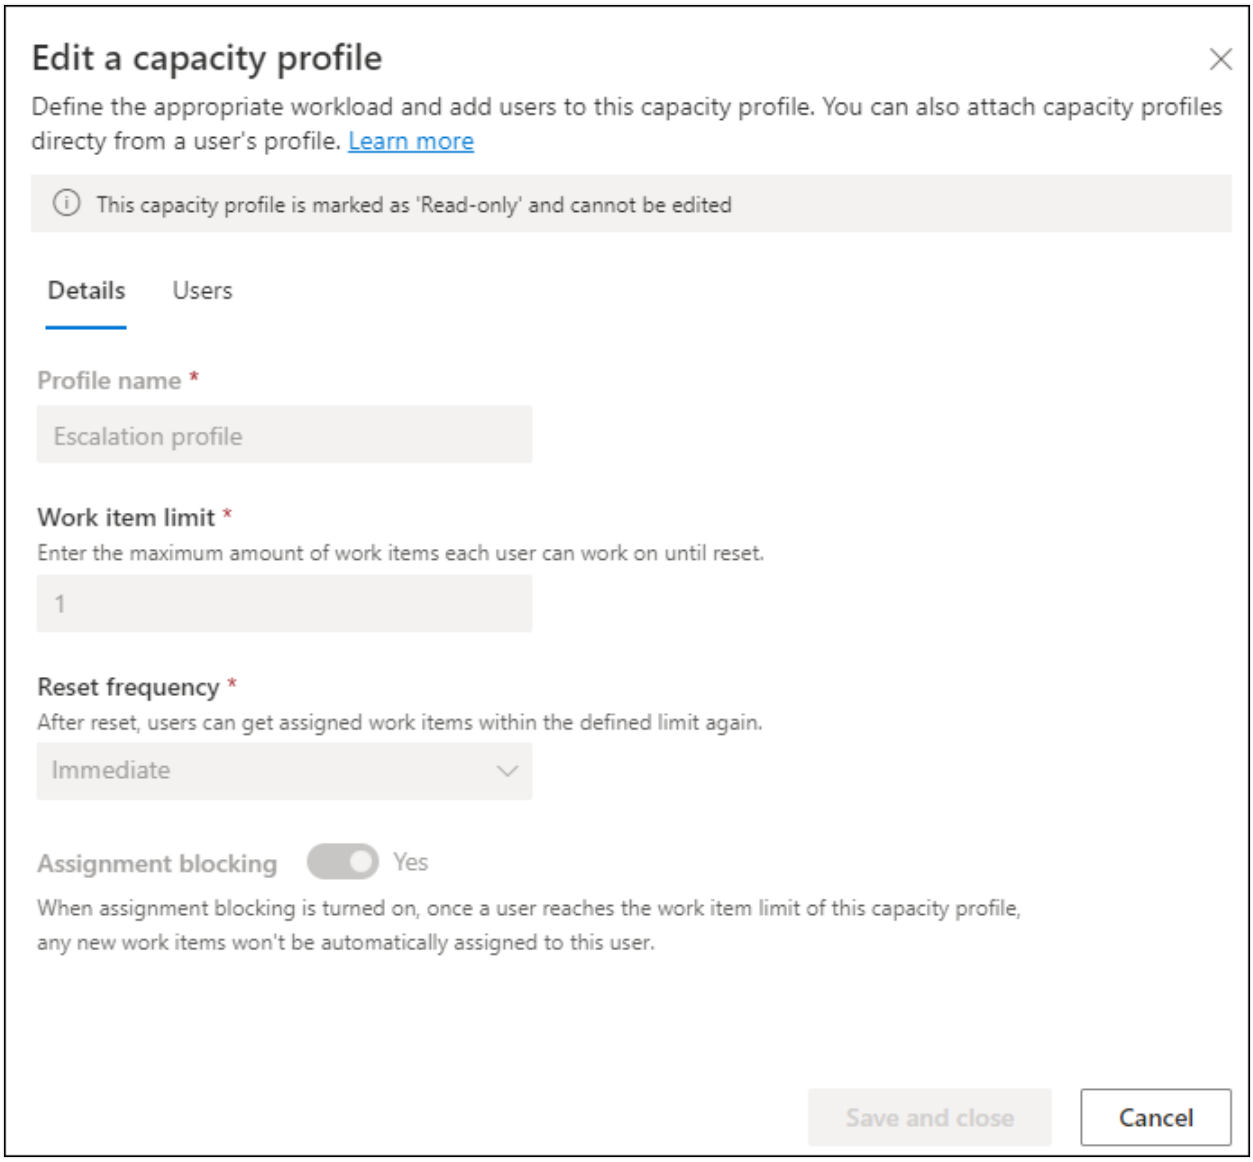
For the system to efficiently manage agent workload, you must automatically release the agent capacity when agents complete their assigned work items. Based on system settings, the agent capacity is released in the following manner:

- **Conversation**: When the agents end the conversation and close their session.
- **Case**: When the agent resolves the case. Capacity is also released automatically when agent cancels the case or removes their assignment by clearing their name from the **Worked By** field on the **Queue Item details** dialog.
- **All records and activities**: Capacity isn't released automatically for activities, such as email, that's configured for record routing. To release the agent capacity, do one of the following steps:
  - Deactivate the assigned queue item; the associated work item is closed.
  - If you need to keep the record open, go to the queue item dialog and remove the agent name from the **Worked By** field. The automatic assignment will try to reassign the item to an agent in the queue.



Escalation profiles

The escalation profile is used when a chat conversation is escalated to a voice or video call. This profile is available out of the box and can't be edited. When an agent escalates a chat to a voice or video call, a new session starts and an escalation profile is attached to the work item, so that the agent doesn’t receive a new chat or voice call until the current call with the customer is over. If the agent transfers the video or voice call to another agent, the escalation profile becomes applicable to the new agent.



How to set multiple capacity profiles in a single workstream

Let us take a scenario where you want to route cases as follows:

- Agents can work on maximum two high priority cases per day.
- Agents can work on maximum four cases of normal priority.
- But the agent should never be assigned more than five cases per day of high priority and normal priority.

1. Create the following profiles:

    - **High-priority profile**: Two cases per day, reset at the end of day
    - **Normal-priority profile**: Four cases per day, reset at the end of day
    - **Total-capacity profile**: Five cases per day, reset at the end of day

2. In the workstream, set the "Total-capacity profile" as the default profile.

3. Use the classification rules to set the capacity profiles for the work items as "High-priority profile" or "Normal-priority profile" according to the priority of the case.
4. Ensure that the agents have all the three profiles.

Runtime behavior of multiple capacity profiles in a single workstream

When a work item is labeled with multiple capacity profiles, the assignment strategy considers the agent who matches all the required capacity profiles.

1. When the high priority work item comes, it's labeled with "Total-capacity profile" and "High-priority profile".
2. An agent who has capacity in both these profiles only is selected. When the work item is assigned, capacity is consumed from both the profiles.
3. Similarly, for normal priority cases, the capacity is consumed from both "Total-capacity profile" and "Normal-priority profile".

Create and manage capacity profiles

Article • 10/23/2023

You can create capacity profiles and assign them to agents to define the types and amount of work they can take. Capacity profiles contain information, such as the amount of work, concurrent or daily capacity, and whether other channels are affected.

- Capacity management helps administrators create various capacity profiles and associate users with matching profiles. You can assign multiple capacity profiles to users.
- The administrator can block the assignment of extra work to the agents when they're working on certain channels, such as phone calls.
- The supervisor can override the agent's configured capacity and assign work to user manually.
- In the assignment rule, you can create a rule to find an agent whose capacity profile matches that of the work item.
- We recommend that you configure either capacity profiles or capacity units in your organization, but not both.
- The capacity isn't considered when an agent takes part in consult or monitors a conversation.

You might find it helpful to configure profile-based capacity in the following scenarios:

- Your agents vary in experience and skill set.
- Agents need an upper limit on the amount of work assigned to them.
- Work items are of different complexity and assigned from different channels.
- Assignment in one channel impacts the assignments of another channel. For example, you can't assign another work to agents who are on phone calls.

ⓘ Important

This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making—and should not be used to make—decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using Dynamics 365, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and,

as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

Create a capacity profile and assign to users

Create a capacity profile, and use it in a workstream for routing work items.

For a capacity profile, you can add or remove users and edit any setting except reset frequency. If you no longer require the profile, you can delete it.

1. Go to one of the admin apps, and perform the following steps.

   Customer Service admin center

   - In the site map, select **User management** in **Customer support**. The **User management** page appears.

2. Select the **Manage** option for **Capacity profile**.

3. On the **Capacity profiles** page, select **Create new**.

4. On the **Details** tab of the **Create capacity profile** dialog box, enter the following details:

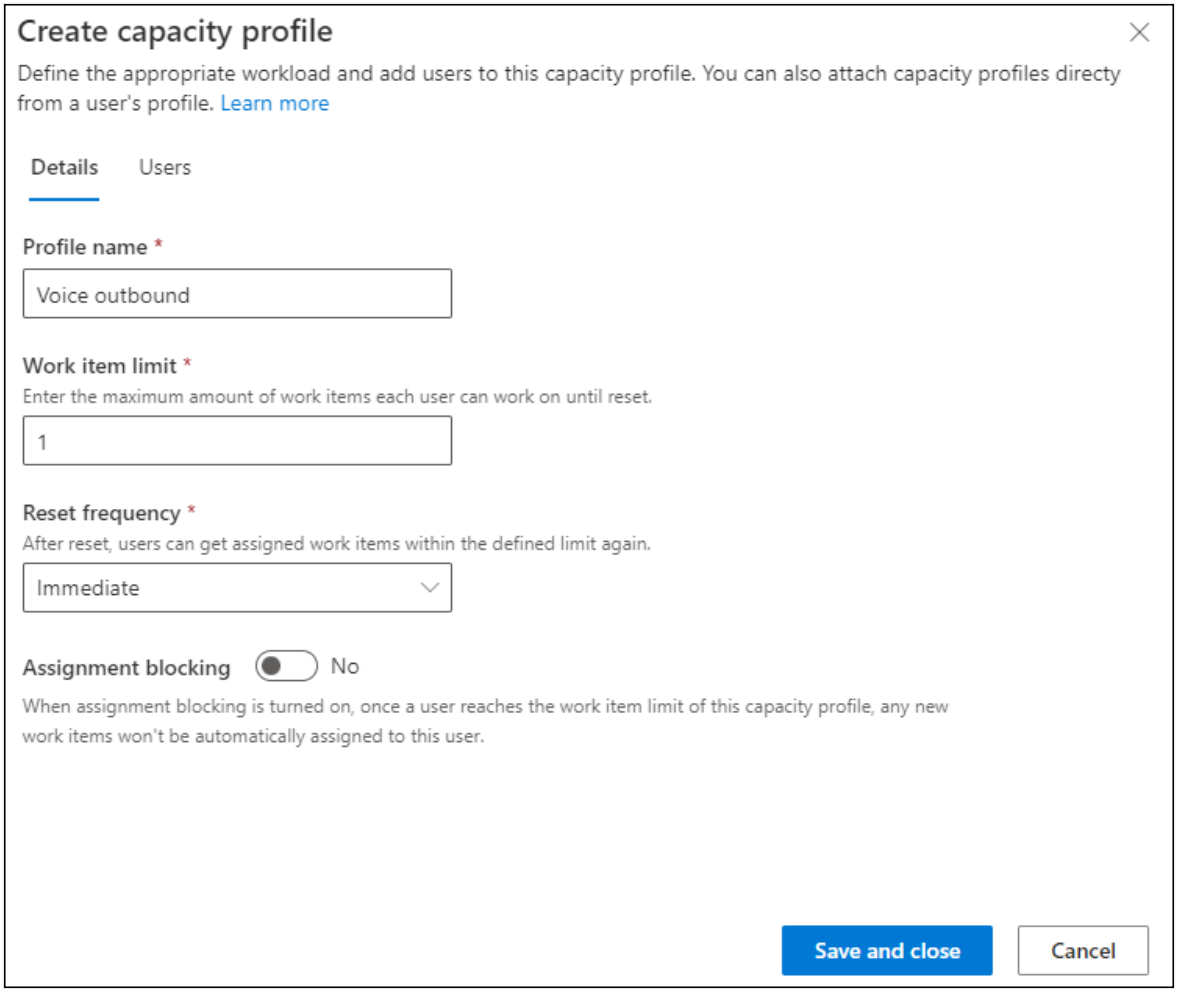
   - **Profile name**: Name for the capacity profile.

   - **Work item limit**: Number of units of the work type that you can assign to the agent.

   - **Reset frequency**: Period after which capacity consumption is reset for agents. Select one of the following options:
     - **Immediate**: Capacity is reset immediately.
     - **End of day**: Capacity is reset after the agent's shift ends even if all the assigned conversations aren't closed by the agent. The open conversations aren't counted in the work item limit and the agent is assigned new work items in their next shift.

     Once configured, you'll have to recreate the capacity profile if you want to change the reset frequency.

- **Assignment blocking**: Set the toggle to **Yes**. When the work item limit is met, the agent isn't assigned a new work item automatically.



5. On the **Users** tab, select **Add user**, and in the **Users** list, select the users. Alternatively, use the **Search** option to search for and add the user.

> **Important**
>
> Users must be configured as a bookable resource to be assigned the capacity profile. More information: **Manage users**.

6. Select **Add user**. The capacity profile is assigned to the user.

Configure agent-specific work limits in capacity profiles

Agents in your contact center might need different work item limits. You can allocate these limits to agents through capacity profiles.

For selective agents, you can define a work item limit that's different from the default limit by using the custom limit option in the capacity profiles.

To set the custom limits, do the following steps:

1. In Customer Service admin center, select **User management** under **Customer support**, and on the page that appears, select **Manage** for **Enhanced user management**.
2. In **Contact center users**, select the agents for whom you want to allocate a custom limit, and then select **Update user attributes** > **Update capacity profiles**.
3. On the **Update Capacity profiles** pane, in **Capacity profiles**, select a profile, and in **Custom limit**, enter a value according to your business need.
4. Select **Add to all**. The capacity profile with the custom limit is added to the users in the list.
5. Repeat the step 3 to update more profiles if you need to.
6. Save and close. The custom limit is denoted with an arrows icon to help visually differentiate among users with default and custom limits.
7. Inform the affected agents to refresh their browser to update their presence. The system assigns the work items based on the agents updated capacity and presence.
8. To reset the custom limit, set the custom limit field to empty and save the changes.

The configuration updates can take up to 15 minutes to sync.

You can customize the Agents report in the Omnichannel real-time analytics dashboard to see the custom limits.

How agent-specific limits work

Typically, the work assignment takes place according to the individual agent's default work item limit in the capacity profiles.

However, if you configure custom limits through capacity profiles, then agents receive work items according to the custom limit. More details are as follows:

- The custom limit might be lower or higher than the default limit and remains applicable for the selected agents until you manually reset it to the default limit.
- The system applies the custom limit to new work assignments only. If the custom limit is lower than the used limit, the system doesn't reassign the currently assigned work items for the agents.

- The other agents with the same capacity profile for whom the custom limit isn't configured have the default limit. Any changes in the default limit will affect these agents. However, the agents with custom limit will remain unaffected.

An example of the custom limit is as follows:

Ana, an agent at Contoso Coffee, is an expert in handling Return queries for Café A 100 machine. Henry, who has joined Contoso recently, is learning the nuances of Café A 100 machine. Eugene, the admin at Contoso has configured a capacity profile for “Return orders” with a default limit of two conversations per day. Eugene assigns the “Return orders” profile with the default limit to Henry. Eugene allocates a custom limit of five to Ana in the “Return orders” profile. Ana will receive maximum of five conversations per day from the “Return orders” profile while Henry will receive a maximum of two conversations only in a day for the same profile.

Update work limits using OData

Alternatively, you can use an OData call to update the custom limits by specifying a value for the msdyn_maxunits field in the msdyn_bookableresourcecapacityprofile entity. To reset the custom limit, specify the value as null for the msdyn_maxunits field.

A sample code block to update the custom limit as 5 is as follows.

```
var data = {msdyn_maxunits: 5} // the value denotes the custom limit
 Xrm.WebApi.updateRecord("msdyn_bookableresourcecapacityprofile", "<Bookable
Resource Capacity Profile ID>", data).then (
    function success(result) {
        console.log("Differentiated units updated");
    },
    function (error) {
        console.log(error.message);
        // handle error conditions
    }
);
```

Set capacity profiles for workstreams

After you create the capacity profiles, configure the following settings to assign work items to agents at runtime:

- Set the capacity profile in the work distribution settings. The system applies the profile to all the work items routed through the workstream. More information:

Configure work distribution

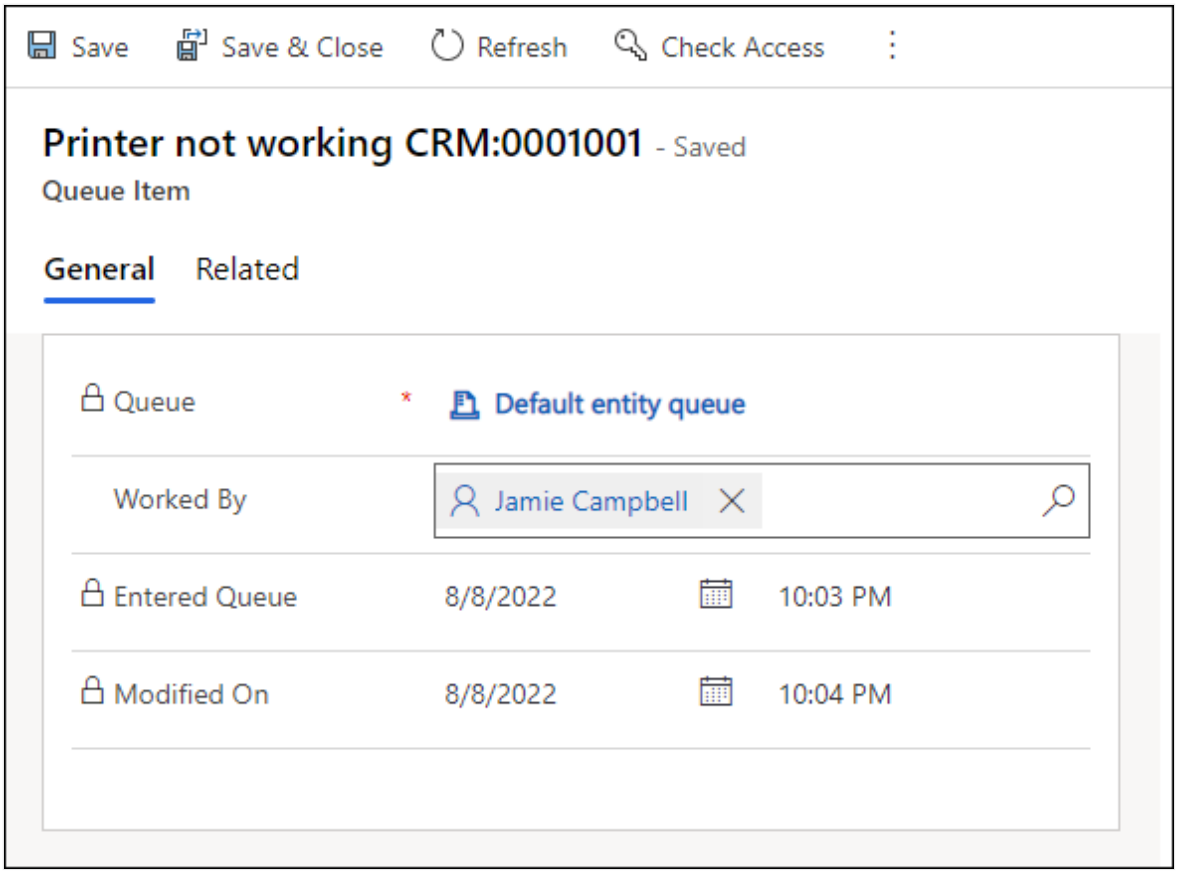
- Set the capacity profile in a classification ruleset for the workstream as a rule output. Append the new capacity profile to the work item. During assignment, unified routing will look for an agent who has available capacity in both the profiles, the default profile from the workstream and the appended profile from the classification. More information: Create classification rulesets based on capacity profiles

You need not define assignment rules specific to capacity profiles at queue level to find agents with matching capacity profiles. If capacity profile is attached to a work item, then the system will ensure that the assigned agent has the matching capacity profile.

Release capacity for agents

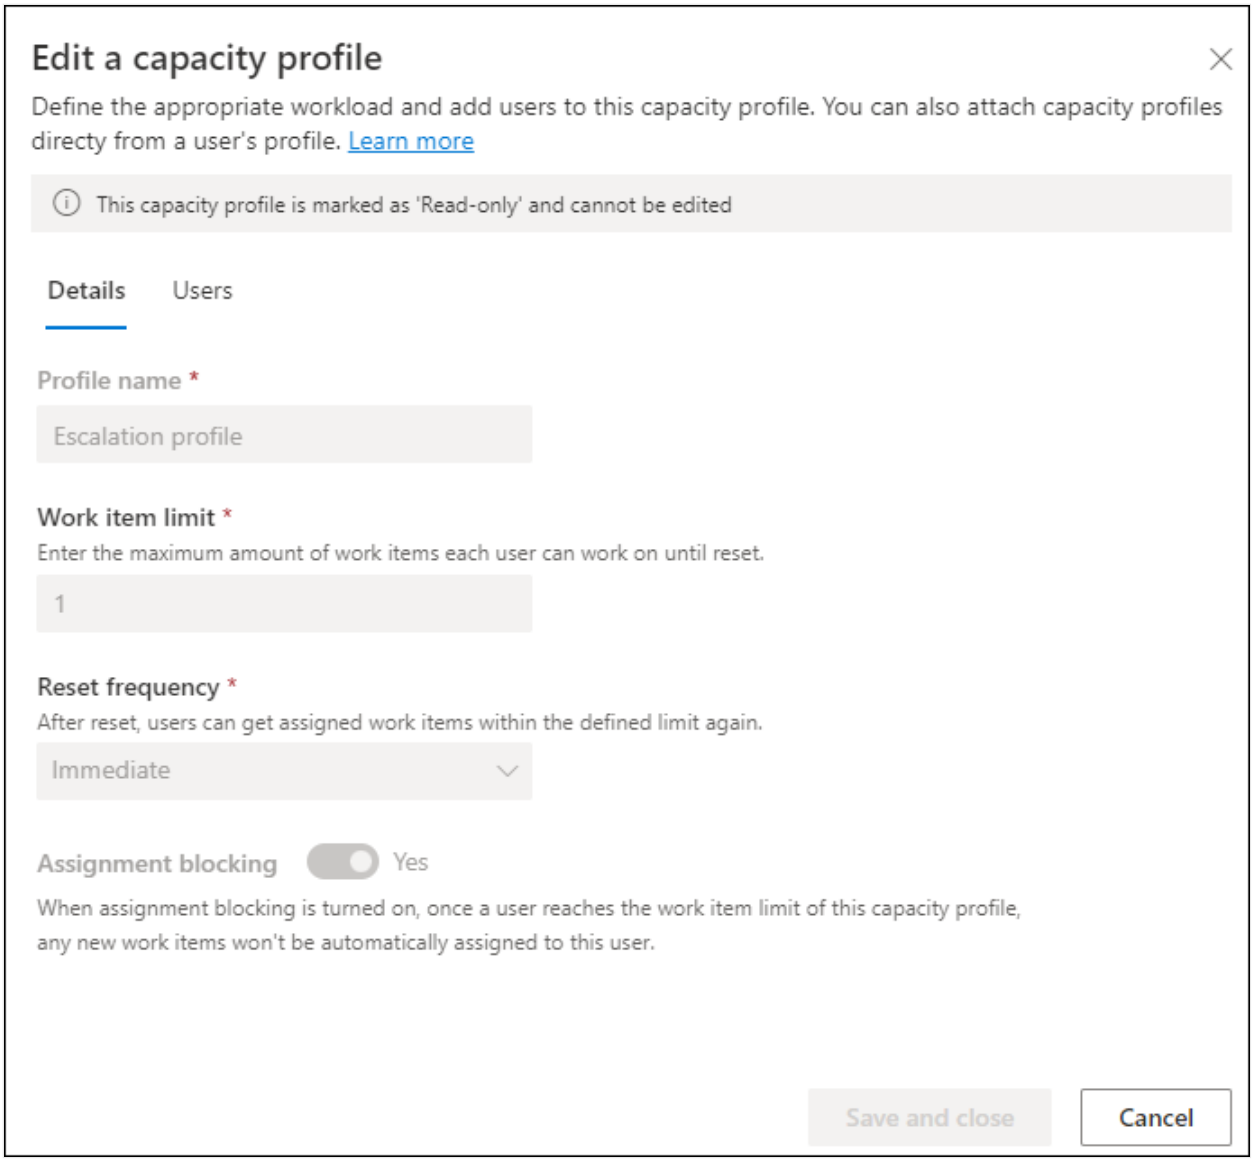
For the system to efficiently manage agent workload, you must automatically release the agent capacity when agents complete their assigned work items. Based on system settings, the agent capacity is released in the following manner:

- **Conversation**: When the agents end the conversation and close their session.
- **Case**: When the agent resolves the case. Capacity is also released automatically when agent cancels the case or removes their assignment by clearing their name from the **Worked By** field on the **Queue Item details** dialog.
- **All records and activities**: Capacity isn't released automatically for activities, such as email, that's configured for record routing. To release the agent capacity, do one of the following steps:
  - Deactivate the assigned queue item; the associated work item is closed.
  - If you need to keep the record open, go to the queue item dialog and remove the agent name from the **Worked By** field. The automatic assignment will try to reassign the item to an agent in the queue.



Escalation profiles

The escalation profile is used when a chat conversation is escalated to a voice or video call. This profile is available out of the box and can't be edited. When an agent escalates a chat to a voice or video call, a new session starts and an escalation profile is attached to the work item, so that the agent doesn’t receive a new chat or voice call until the current call with the customer is over. If the agent transfers the video or voice call to another agent, the escalation profile becomes applicable to the new agent.



How to set multiple capacity profiles in a single workstream

Let us take a scenario where you want to route cases as follows:

- Agents can work on maximum two high priority cases per day.
- Agents can work on maximum four cases of normal priority.
- But the agent should never be assigned more than five cases per day of high priority and normal priority.

1. Create the following profiles:

    - **High-priority profile**: Two cases per day, reset at the end of day
    - **Normal-priority profile**: Four cases per day, reset at the end of day
    - **Total-capacity profile**: Five cases per day, reset at the end of day

2. In the workstream, set the "Total-capacity profile" as the default profile.

3. Use the classification rules to set the capacity profiles for the work items as "High-priority profile" or "Normal-priority profile" according to the priority of the case.
4. Ensure that the agents have all the three profiles.

Runtime behavior of multiple capacity profiles in a single workstream

When a work item is labeled with multiple capacity profiles, the assignment strategy considers the agent who matches all the required capacity profiles.

1. When the high priority work item comes, it's labeled with "Total-capacity profile" and "High-priority profile".
2. An agent who has capacity in both these profiles only is selected. When the work item is assigned, capacity is consumed from both the profiles.
3. Similarly, for normal priority cases, the capacity is consumed from both "Total-capacity profile" and "Normal-priority profile".

Delete historical data of agent capacity updates

Article • 03/17/2023

The history of updates to your agents' capacity profiles is stored in Dataverse for Apps. To help you use your storage capacity efficiently, we recommend that you periodically delete the historical data.

Review your storage consumption. If the storage consumed is 50%–60% of the total capacity, consider moving the data to a different data store if you want to keep it. Otherwise, delete it.

> **⊗ Caution**
>
> Deleted data can't be recovered. We recommend that you verify the data isn't required before you delete it.

Manage personas and custom security roles in Customer Service

Article • 04/04/2022

Introduction

You can map security roles to personas to define user permissions for unified routing. Persona mapping gives your organization the option to add custom security roles alongside existing security roles in Customer Service and Omnichannel for Customer Service. The admin, supervisor, and agent personas are user archetypes that security roles can be mapped to. By mapping custom security roles to these personas, you can fine-tune data access and security across users and business units.

You can create and assign custom security roles in the Microsoft Dynamics 365 admin center. Persona mapping can be found in the Omnichannel admin center or Customer Service Hub in the **User attributes** section. For the custom security roles to be functional, perform the following steps:

1. Create custom security roles.
2. Map roles to personas.
3. Enable access to applications.
4. Enable access to forms and dashboards.

Personas for unified routing

Admin

The admin persona can set up end-to-end workflows to handle customer interactions using unified routing and can perform the following tasks:

- Create and manage classification and assignment rules for work items based on business rules.
- Create and maintain capacity profiles and schedules based on office hours.
- Configure basic and advanced routing for all work items.
- Create and maintain agent skills for efficient skill-based routing of work items.
- Manage users and their permissions by mapping the roles to the appropriate personas.
- Configure and maintain custom presence.

- Create and maintain targeted app experiences for agents and supervisors through app profiles, session templates, and notification templates.
- Enable diagnostics and insights on assignment flow.

Supervisor

The supervisor persona can manage agents and their work items through routing rules. The supervisor can perform the following tasks:

- Assign or reassign current work items to agents depending on the agent availability and service-level agreement (SLA) of the work item.
- Manage permissions on the data available to agents as part of the interactions (Record-level data permissions).
- Monitor agent interactions and provide help as required.
- Access insights related to agent performance and customer interactions.
- Access diagnostics for the routed records.

Agent

The agent persona can manage the work items that're assigned to them through custom or default rules set up by the admin persona. The agent can perform the following tasks:

- Manage their work items as follows:
  - Engage with the customers.
  - Reassign work to other agents in the group.
  - Decline interactions.
- Manage their skills.
- Manage their case queues.

Create custom security roles

Custom security roles can be created at an organizational or business unit level, and you can edit access level for records and tasks. The addition of custom security roles is optional. To ensure persona mapping works, perform the following steps:

1. Identify the tasks that a user will perform.

2. Create a copy of an existing role as your starting point. Custom security roles must have correct minimum access levels for the appropriate records to ensure feature functionality. You can copy one of the following predefined security roles:

- Omnichannel Administrator
- Omnichannel supervisor
- Omnichannel agent
- CSR Manager
- Customer Service Representative

3. Customize permissions and access levels for your new security role.
4. Save the security role with a name that will help you identify it during persona mapping.

For example, if your organization is expecting a large seasonal increase in chat service requests, you might hire some seasonal employees to exclusively handle chat channels. You can create a security role for the "seasonal service rep". First, you'd identify that users with this role are part of the agent archetype. Knowing that, you'll create a copy of the "Omnichannel agent" security role. By starting with a copied role, you are less likely to face user issues by under-granting privileges. As part of customizing, you might remove read access for records that're not related to chat, such as Survey feedback, SMS, or voice channels. Finally, you can save the new security role as "seasonal service rep".

Map roles to personas

After persona mapping is enabled, it'll automatically assign default roles depending on the Dynamics 365 services that're enabled for your environment. For an environment with Customer Service Enterprise license, the default mapping includes Customer Service Representative and CSR manager roles. For an environment with Omnichannel for Customer Service, the three primary security roles are mapped to personas. If both services are enabled, both sets of default mappings are included. The following table contains the mapping information for the roles in Customer Service and Omnichannel for Customer Service.

Service	**Admin persona default mapping**	**Supervisor persona default mapping**	**Agent persona default mapping**
Customer Service Enterprise	CSR Manager	CSR Manager	Customer Service Representative
Omnichannel for Customer Service	Omnichannel Administrator	Omnichannel supervisor	Omnichannel agent

Service	Admin persona default mapping	Supervisor persona default mapping	Agent persona default mapping
Customer Service Enterprise + Omnichannel for Customer Service	CSR Manager + Omnichannel Administrator	CSR Manager + Omnichannel supervisor	Customer Service Representative + Omnichannel agent

> **Note**
>
> - Customized mappings won't be reset if one of the services is added later.
> - Make sure that the roles you want to map to personas have been assigned to the users directly and not through team memberships.

Manage personas

You can customize the roles to persona mapping in the Customer Service admin center, Omnichannel admin center, or Customer Service Hub app.

To customize the role to persona mapping

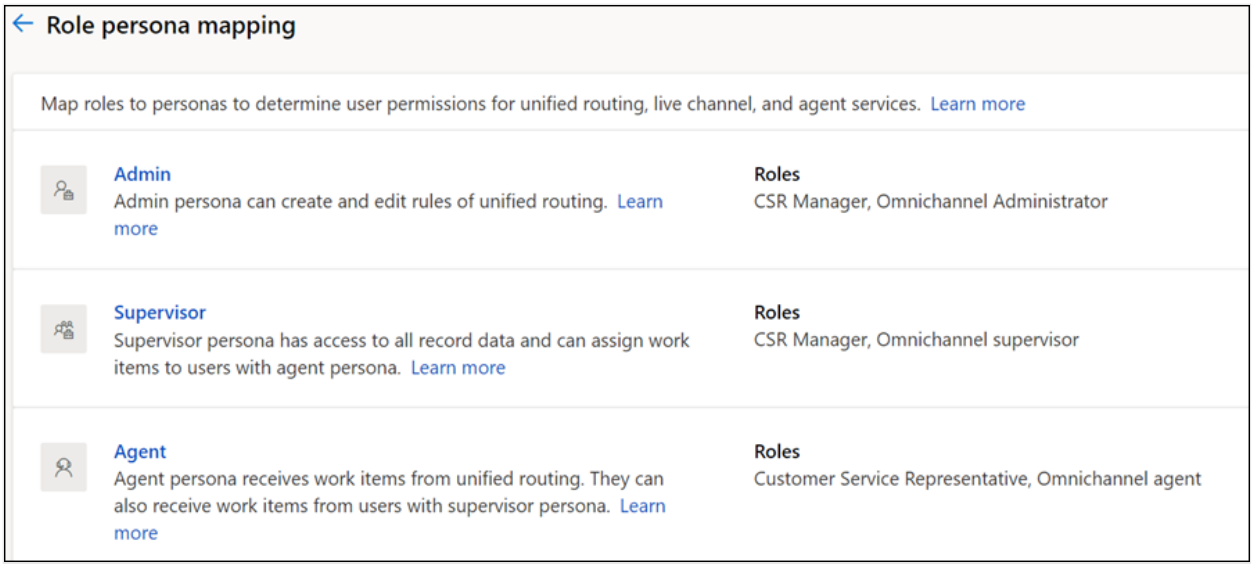
1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   - In the site map, select **User management** in **Customer support**. The **User management** page appears.

2. Select **Manage** for **Role persona mapping**.
3. Select the persona to add or remove security roles. The **Edit roles** pane displays the list of roles.
4. Select or clear the selection from the checkboxes for the required security roles.
5. Select **Save and Close**.

The updated set of roles are listed for the persona.



To assign a persona to the "seasonal service rep" role mentioned in the example, select the **Agent** persona. In the **Edit roles** pane, locate the "seasonal service rep" security role and select the checkbox. After you select **Save and Close**, the custom security role will be listed under the agent persona. With role to persona mapping completed, you can now grant access to any applications and forms they would use.

Enable access to applications

Users with security roles mapped to personas do not get automatic access to associated dashboards or applications. Access needs to be provided by administrators.

Perform the following steps to ensure that access and privileges are provided to users.

1. Create the required user role. More information: Create users and assign security roles
2. Add and edit user permissions and privileges as required.
3. Sign in to Dynamics 365.
4. Select the ellipsis in the application tile.
5. Select **Manage roles**.
6. In the dialog that appears, select the custom role that you want to grant permission to and select **Save**.

Enable access to forms and dashboards

To enable access to a form or dashboard, perform the following steps:

1. Sign in to Dynamics 365.
2. Go to **Advanced Settings** > **Settings**.
3. Select **Customizations** in **Customize the system**.
4. From the **Solution Default Solution** list, select **Entities** > **Characteristics**, and then **Forms**.
5. Open an active form, and select **Enable security roles**.
6. Select the role that you want to provide access to, and select **OK**.

Personas and privileges

Article • 05/31/2023

This topic lists the table privileges and recommended access levels for the administrator, supervisor, and agent personas in Customer Service and Omnichannel for Customer Service.

To know more about the various access levels, see Security roles.

For more information about how personas are mapped to roles, see Manage personas.

> **Note**
>
> If custom plug-ins and workflows are used in the system, then you must ensure that the required privileges are granted to the personas, otherwise your plug-ins won't work.

Persona: Administrator

The following table lists the privileges and recommended access levels for the admin persona.

Table name	Table unique name	Privilege name	Recommended access level
Activity	Activity	Append, Append To, Delete, Update	Local
		Assign	Deep

Agent experience profiles

Article • 04/07/2023

> **Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

Agent experience profiles enable you to create targeted app experiences for agents and supervisors, and are an alternative to building and maintaining custom apps. With the agent experience profiles, administrators can create custom profiles with specific session templates, conversation channels, and productivity tools. These profiles can then be assigned to users.

Agent productivity tools use intelligence and automation to enable agents to find answers to customer questions and help resolve customer issues quickly, improving satisfaction in service delivery. The productivity tools help in easy knowledge base search, suggestions for similar knowledge articles and cases, and agent scripts with macros to automate tasks in common workflows.

The profiles are available for agents and supervisors who use the Customer Service workspace or Omnichannel for Customer Service apps.

The system requirements for agent profiles and Customer Service workspace are the same. More information: System requirements for Customer Service workspace

How the agent experience profile works

Managing the agent experience profiles is as follows. The tasks in every step will be done by administrators who have different roles. It could be one administrator or a set of administrators.

1. Create users in Microsoft Dynamics 365 admin center.
2. Assign security roles, such as Customer Service Representative or Omnichannel agent.
3. Create business processes, such as work streams, queues, sessions, and productivity tools.
4. Create agent experience profiles.

5. Assign agent experience profiles to users.

For existing orgs, only steps 4 and 5 are required.

Thereafter, users with the required agent or supervisor role will be able to see and use the settings that are made available through the assigned agent experience profile. If you don't assign an agent experience profile, by default, the out-of-the-box agent experience profile will be assigned.

You can create and manage agent experience profiles in the Customer Service admin center app or in Power Apps.

Roles and privileges associated with app profile manager

Article • 06/09/2022

The following roles are available with the app profile manager:

- App Profile Manager Administrator
- App profile user

If your organization uses custom roles, and you want a user with the custom role to manage app profiles, then you can either assign the App Profile Manager Administrator role or manually add the privileges pertaining to the App Profile Manager Administrator role to the custom role.

Roles for Customer Service workspace

By default, the privileges pertaining to the App Profile User role have been added to the Customer Service Representative and CSR Manager roles out of the box. You need to manually provide the App Profile Manager Administrator role to the user who will create app profiles, templates, productivity tools, and channel provider configurations.

Roles for Omnichannel for Customer Service

Out of the box, for the Omnichannel administrator role, the privileges pertaining to the App Profile Manager Administrator role have been added, and for the Omnichannel agent and Omnichannel supervisor roles, the privileges pertaining to the App Profile User role have been added.

Roles and their privileges

The actions and privileges for the roles in app profile manager are as follows.

Role: App Profile Manager Administrator

The App Profile Manager Administrator has the following privileges.

Action	Privileges

Action	Privileges
Read/Append user	prvAppendUser prvReadUser

Create and use agent experience profiles

Article • 04/05/2023

> **ⓘ Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

By default, the following agent experience profiles are available out of the box for Customer Service workspace and Omnichannel for Customer Service. These profiles can't be deleted or modified. When you don't assign a custom profile to an agent, the default profile is assigned.

- Omnichannel for Customer Service - default profile
- Customer Service workspace - default profile
- Customer Service workspace + channels - default profile

You can configure agent experience profiles in Customer Service admin center or app profile manager. The app profile manager can be accessed through Power Apps.

Prerequisites

Make sure you have the App Profile Manager Administrator role. More information: Security roles

The Basic User role is also required to create profiles in Customer Service admin center.

Create agent experience profiles in Customer Service admin center

By using agent profiles, you can create targeted app experiences for agents and supervisors. Profiles help access the features that your agents and supervisors can use in their daily tasks to resolve customer issues.

1. Go to **Agent experience profiles** in **Agent experience** > **Workspaces**.

2. Select **New**, and enter the following details on the **Create a new agent experience profile** dialog.

   - **Name:** The app profile name.
   - **Unique name:** A unique identifier in the *<prefix>_<name>* format.
   - **Description:** A description for the profile.

3. Select **Create**. An agent experience profile is created.

Assign users, templates, configure productivity pane, channels

For the profile that you created, you can add users and configure option such as specific session templates, conversation channels, and productivity tools.

Go to **Agent experience profiles** and select the required agent experience profile. You can perform the following actions:

- Set an agent experience profile as the default profile. If you set a default profile, all the available users are associated with this profile. You can also assign a custom profile to a security role and assign a rank to the profile. More information: Add users to custom agent experience profiles

- In the **Users** section, specify the agents this profile must be associated with. Select **Add Users** to select users from the available users, or search for and add users to the profile.

- Select **Add entity session template** to link a session template to the profile. On the **Entity session templates** pane, you can select an existing template or create a new entity session template.

- In the **Productivity pane**, select **Turn on** to enable the productivity tools that the agents can access when they work on their assigned tasks. The following productivity tool options are available:
  - Default mode
  - Smart assist
  - Agent scripts
  - Microsoft Teams
  - Knowledge search

  Turn on the toggle against each option in the **Productivity Pane** to enable it for the agent.

- In the **Inbox** section, select **Edit** to enable the inbox view. This allows agents to view all their work items on one screen and helps them to prioritize tasks and efficiently work on multiple tasks.

- In the **Channel providers** section, select **Edit** to enable the channels and select third-party voice channel providers. On the **Channel providers** pane you can:
  - Turn on the **All active channels** toggle
  - Select a channel provider or create channel providers in the **Third party voice channel providers** section.

Add users to agent experience profiles

Article • 07/13/2023

When your organization has a large number of users, adding them to agent profiles can be time consuming. As an administrator, you can effectively assign users to agent experience profiles and provide a targeted app experience, based on their roles.

Set a custom agent experience profile as default

You can set a custom agent experience profile as the default profile. When you've set a default profile, all the options configured in the profile such as specific session templates, conversation channels, and productivity tools are available for all the users.

> **Note**
>
> - The custom agent experience profile that's set as the default isn't applicable to users who are assigned specific custom agent experience profiles.
> - You can't set the out-of-the-box agent experience profiles as the default.

For example, you've created a new agent experience profile, Contoso Agent profile, with knowledge search and agent scripts features enabled. If you set the Contoso Agent profile as the default profile, all the users in the organization can access knowledge search and agent scripts in the productivity pane.

You also have another agent experience profile, Datum Agent profile, with specific user, Angel Chiu. Only the smart assist feature is enabled for the profile.

In this scenario, Contoso Agent profile doesn't apply to Angel Chiu, and the user can access only the smart assist feature in the productivity pane.

To set the agent experience profile as a default profile, perform the following steps:

1. In **Customer Service admin center** select **Workspaces** in **Agent experience**.
2. On **Agent experience profiles** select a custom agent experience profile, and then select **Set as default**.

Switch default profiles

You can't set multiple profiles as the default profile. If you must change the default profile, use **Remove Default** to remove the default status and then set an alternate profile as the default profile.

Map security roles to agent experience profiles

When you have multiple user groups with different roles and privileges, you can assign agent experience profiles to a security role to provide customized app experiences for each group. The application assigns the agent profile to all the users with the specified security role.

If users have multiple security roles, the applications links the profile with the higher rank to the user.

For example, your organization has both Customer Service Representative and Omnichannel agent roles to which users are assigned. The table summarizes the mapping of agent experience profiles to the corresponding roles.

Agent experience profile	Rank	Security Role
Contoso Agent profile	1	Customer Service Representative
Datum Agent profile	2	Omnichannel agent

All the agents with the Customer Service Representative role get the options enabled in the Contoso Agent profile. Users with Omnichannel agent role see the options set in the Datum Agent profile.

The user, John Doe, has both the Customer Service Representative and Omnichannel agent roles assigned. The application assigns the Contoso agent profile to John Doe, as the rank of the profile is higher.

To add a security role and rank to an agent experience profile, perform the following steps:

1. In **Customer Service admin center** select **Workspaces** in **Agent experience**.
2. On **Agent experience profiles** select a custom agent experience profile, and then select **Set rank and roles**. You can't set security roles and rank to the out-of-the-box profiles.

When you set a custom profile as the default, the following changes occur:

- You can't set security roles and rank to the out-of-the-box profiles.
- You no longer can assign security roles to the default profile.

- Existing security roles will be removed.

1. In **Profile rank and roles assignment** specify the following:

    - **Rank**: Used to determine the custom agent experience profile that must be mapped to a user when multiple roles are assigned to a user.
    - **Roles**: The user roles that the custom agent experience profile can be mapped to.

Remove rank and roles assigned to a profile

Select the required agent experience profile and then select **Remove rank and roles** to remove the rank and roles assigned to the profile. If you select this option, all the roles mapped to the profile will be removed.

Manage users assigned to agent experience profiles

The application lets you set a default agent experience profile and assign security roles to a profile. However, if a profile is assigned a security role, the default agent experience profile isn't applicable to the users with the specific security role.

For example, you've set up your agent experience profiles and mapped users as summarized in the table:

Agent experience profile	Rank	Security Role	User
Contoso Supervisor profile	1	Omnichannel Supervisor	
Datum Agent profile	2	Omnichannel agent	Kendall Collins
Contoso Agent profile			Default
Datum Supervisor profile			Gabriel Diaz, Kayla Lewis

Here's how the application assigns the agent expereince profiles:

- Users with the Omnichannel Supervisor role are assigned the Contoso Supervisor profile.
- Users with the Omnichannel agent role are assigned the Datum Agent profile.
- Users with both the Omnichannel Supervisor and the Omnichannel agent role are assigned the Contoso Supervisor profile.
- User Kendall Collins is assigned the Datum Agent profile.
- Users Gabriel Diaz and Kayla Lewis are assigned the Datum Supervisor profile.
- All the remaining users are assigned the Contoso Agent profile.

> ⓘ **Note**
>
> If you haven't set a default custom profile or assigned an agent experience profile to a role, the application assigns the default out-of-the box profile to all the available users.

Configure the inbox

Article • 10/03/2023

As an administrator, you can configure the inbox setting so that when your agents open Customer Service workspace or Omnichannel for Customer Service, they can select the inbox icon to show all the cases and conversations that are assigned to them. The inbox is designed to help agents efficiently work on high velocity tasks, and promote inbox sessions to regular sessions when they need more time to resolve cases and complete their conversations.

You can configure the inbox settings for custom experiences only.

You can also configure and enable the inbox in app profile manager.

The following channels are supported in the inbox:

- Live chat
- Asynchronous chat
- Case
- Email
- Voice

The following asynchronized channels are available in the conversation inbox.

- SMS
- Persistent chat
- Facebook
- WeChat
- LINE
- WhatsApp
- Teams

Live chat and voice channel in inbox

The following are things to note about live conversation settings in the inbox:

- When an agent accepts a live work item, that item is then added to the relevant view in the inbox, whether or not the agent is using the inbox at the time of the live work item.
- Voice calls always open as a new session with the card added to the inbox for awareness.
- Live work item cards have a "live" visual indicator.

- Live work item unread counts accrue to the unread count on the view.

Configure the inbox setting for agents

You can configure the inbox in the Customer Service admin center by editing the agent experience profile to meet your preferred inbox settings.

1. Open the Customer Service admin center app.
2. In **Agent experience**, select **Workspaces**.
3. In **Agent experience profiles**, select **Manage**.
4. Select the profile for which you want to configure the inbox.

   > ⓘ **Note**
   >
   > Channel providers must have **All active channels** set to **On** to use and configure the chat setting in the inbox.

5. In **Inbox**, select the **Settings** icon, and then toggle **Inbox** to on.
6. You can either modify an existing view or create a new one by selecting **Edit**. The following fields can be configured:

   - **Name:** Specify a name that shows in the inbox. Alphanumeric values are valid names.
   - **Record Type:** Select the record types for which the settings need to be applied. You can select more than one record type.
   - **Chat Status**: Is available if you select the record type as chat. Select one or more of the following settings:
     - **Assigned**
     - **Unassigned**
     - **Resolved**
   - **Email**: Is available if you select the record type as Email. Select all the options that you want to enable.
     - Assigned to me:
       - Emails sent to me
       - Emails assigned to me
     - Unassigned:
       - Emails in my team
       - Emails in my queue(s)

    - Emails in a shared mailbox
- **Agent Visibility**: Select one of the following options to show or hide the view to agents:
    - **Show**
    - **Hide**

Preconfigured inbox views

The following views are supported out of the box in the inbox:

- **Cases**: Shows all cases that the user owns, including active and resolved cases.
- **Assigned Conversations**: Shows all conversations that have been assigned to the user, including active and closed conversations.
- **Resolved Conversations**: Shows all conversations that have been marked as closed, and where the user was the primary agent in the conversation.
- **Unassigned Conversations**: Shows all active conversations and emails in a team or queue in which the user is a member. The user is able to assign conversations to themselves and reply to emails directly from this view.

Inbox views are refreshed every five minutes. Agents can manually refresh the view by using the **Refresh** icon.

Configure custom views for the inbox

You can configure a customized view for the inbox so that agents can see their cases, conversations, emails, and voicemails all in a single view.

To configure multiple views for the inbox, complete the following steps.

1. Go to the agent experience profile for which you want to configure a custom view.

2. On the **Inbox** card, select **Edit**. The **Inbox** page is displayed.

3. Toggle **Enable Inbox** to **On** if it isn't already on, and then select **+ Add**. The **Add a new view** page is displayed.

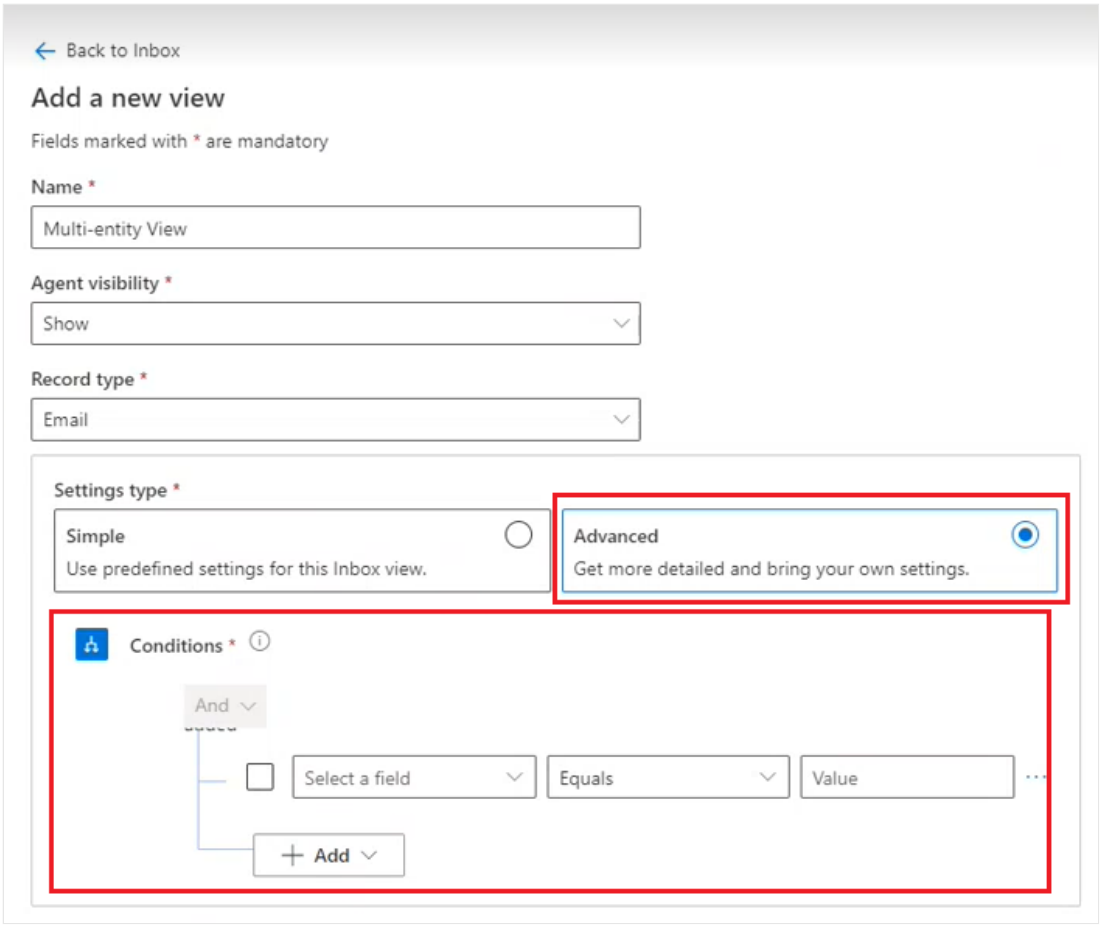
4. On the **Add a new view** page, enter the following details:

    - **Name**: Type a name for the view.
    - **Agent visibility**: Select whether to **Show** or **Hide** the view from agents.
    - **Record type**: Select the records that you want to include in the multi-entity view.

5. For each record type, choose one of the following settings. The settings are different for each record type.

   - **Simple** opens a dropdown menu where you can choose the type of records that appears in your multi-entity view. More information: Simple settings

   - **Advanced** opens a **Conditions** option where you can set the desired conditions for your multi-entity view. More information: Advanced condition builder



6. Select **Save**.

Simple settings

The following simple settings are available out of the box for the record types.

Record type	Simple settings
Email	- Emails sent to me - Emails assigned to me - Emails in my team(s) - Emails in my queue(s) - Emails in a shared mailbox
Chat	- Assigned - Unassigned - Resolved
Case	- Cases assigned to me - Cases in my team(s) - Case(s) in my queue(s)
Voicemail	- Assigned - Unassigned - Resolved

Real-time translation

For information about how to configure real-time translation for conversations in the inbox, see Enable real-time translation of conversations

Configure the agent calendar view

Article • 10/28/2023

As an administrator or a supervisor, you can help agents in your organization view their work schedules. The **My Schedule** view in the Dynamics 365 Customer Service workspace app lets agents quickly view their working hours, nonworking hours, breaks, and any scheduled time off.

The calendar view is a read-only visual that provides daily, weekly, and monthly views of an agent's schedule. It also has an agenda view that provides a list-type view of the agent's schedule.

Prerequisites

- You must have **Workforce Management for Customer Service** enabled in your environment.

  To enable Workforce Management, complete the following steps:

  1. Navigate to your environment in Power Platform admin center (PPAC).

     > **Note**
     >
     > You must have the System Administrator role to make changes to your environment.

  2. On the command bar, select **Resources** > **Dynamics 365 apps**. The Dynamics 365 apps page is displayed.
  3. Select **Install app**. The **Install Dynamics 365 apps** page is displayed.
  4. Scroll down to locate and select **Workforce Management for Customer Service**, and then select **Next**.
  5. You must agree to the terms of service, and then select **Install**.
  6. Wait until the **Workforce Management for Customer Service** shows as installed on the **Dynamics 365 apps** page.

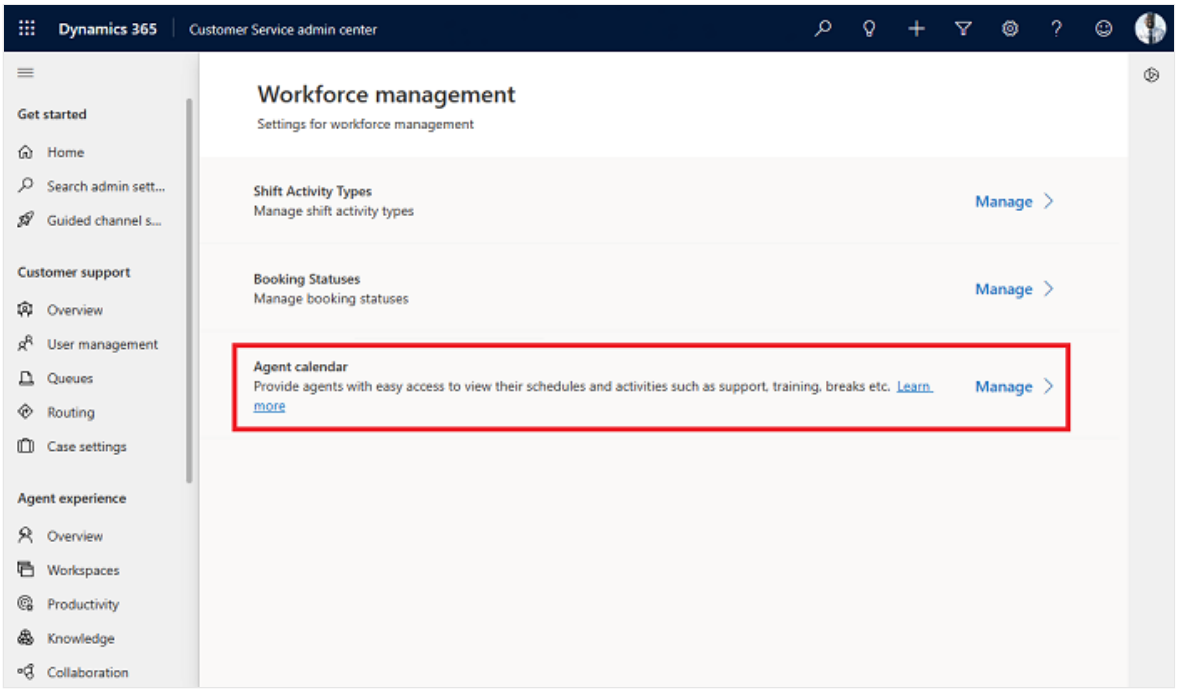
- To enable the calendar view for agents, you must have at least one of the following roles:
  - System Administrator

    - CSR Manager
    - Omnichannel administrator
    - Omnichannel supervisor

- You must have a third-party adapter configured to import agent bookings from an external system. Without an adapter in place, external bookings can't be surfaced in the agent calendar, and agents can't view their schedules.

Enable the agent calendar

1. In the Customer Service admin center site map, select **Workforce management**.
2. In the **Agent calendar** section, select **Manage**. The **Agent calendar** page is displayed.



3. Turn on the **Enable agent calendar** toggle.
4. Select **Save and close**.

Shift bookings view for supervisors

The shift booking list view lets supervisors view the bookings that are imported from their third-party workforce management system. Supervisors can use this view to access a consolidated list of bookings for all agents in their system. The shift bookings view offers a comprehensive breakdown of each agent's individual activities, including work hours, time off, lunch breaks, trainings, and more.

Administrators can utilize this view to verify the proper functioning of the third-party adapter booking sync process.

1. In Customer Service workspace, expand the site map, and then select **Shift Bookings**.

2. Select the **All Shift Bookings** view.

Get started with Customer Service workspace

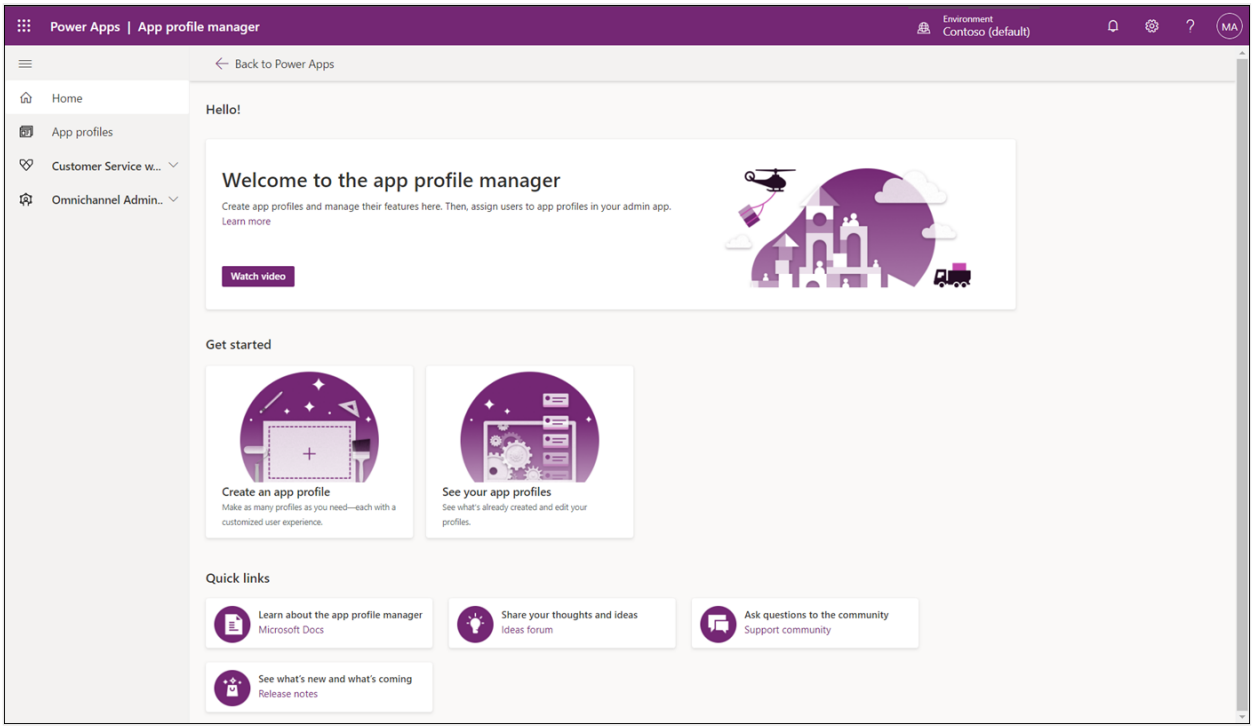
Use the agent calendar view

Experience for accessing templates and productivity tools

Article • 09/30/2022

> **Important**
>
> With the release of the Customer Service admin center app that consolidates admin experiences across the Customer Service suite, we announce that the following admin experiences are deprecated and no longer supported after April 2023.
>
> - Service Management area in the Customer Service Hub app
> - Omnichannel admin center
> - **App profile manager:** Is removed in April 2023.
>
> Also, starting in October 2022, the Omnichannel admin center and the service management area in Customer Service Hub will be hidden by default in newly created organizations and environments. You have the option to bring them back, but we recommend that you start using the Customer Service admin center app to perform tasks like manage cases, and configure unified routing, channels, and agent experience profiles. More information: **Get started with Customer Service admin center**

The app profile manager is an easy-to-use interface that helps you get started with what you can do on the page.

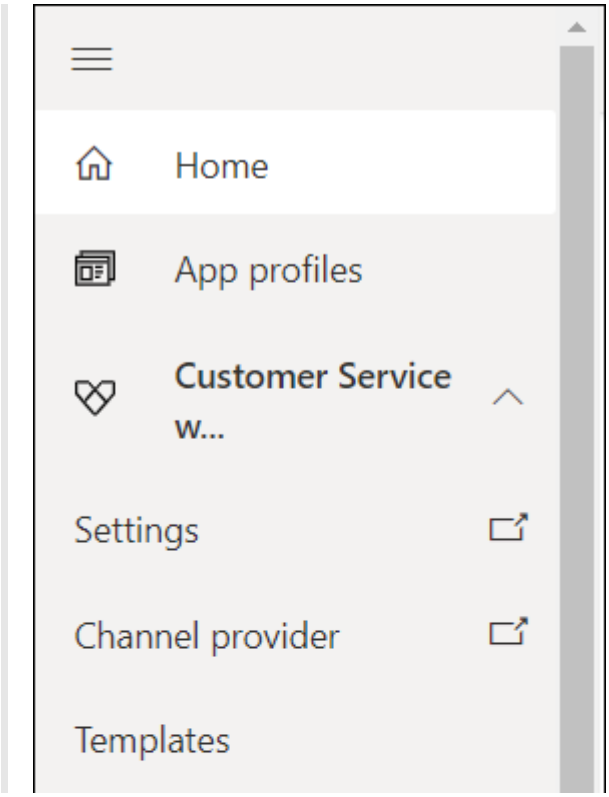


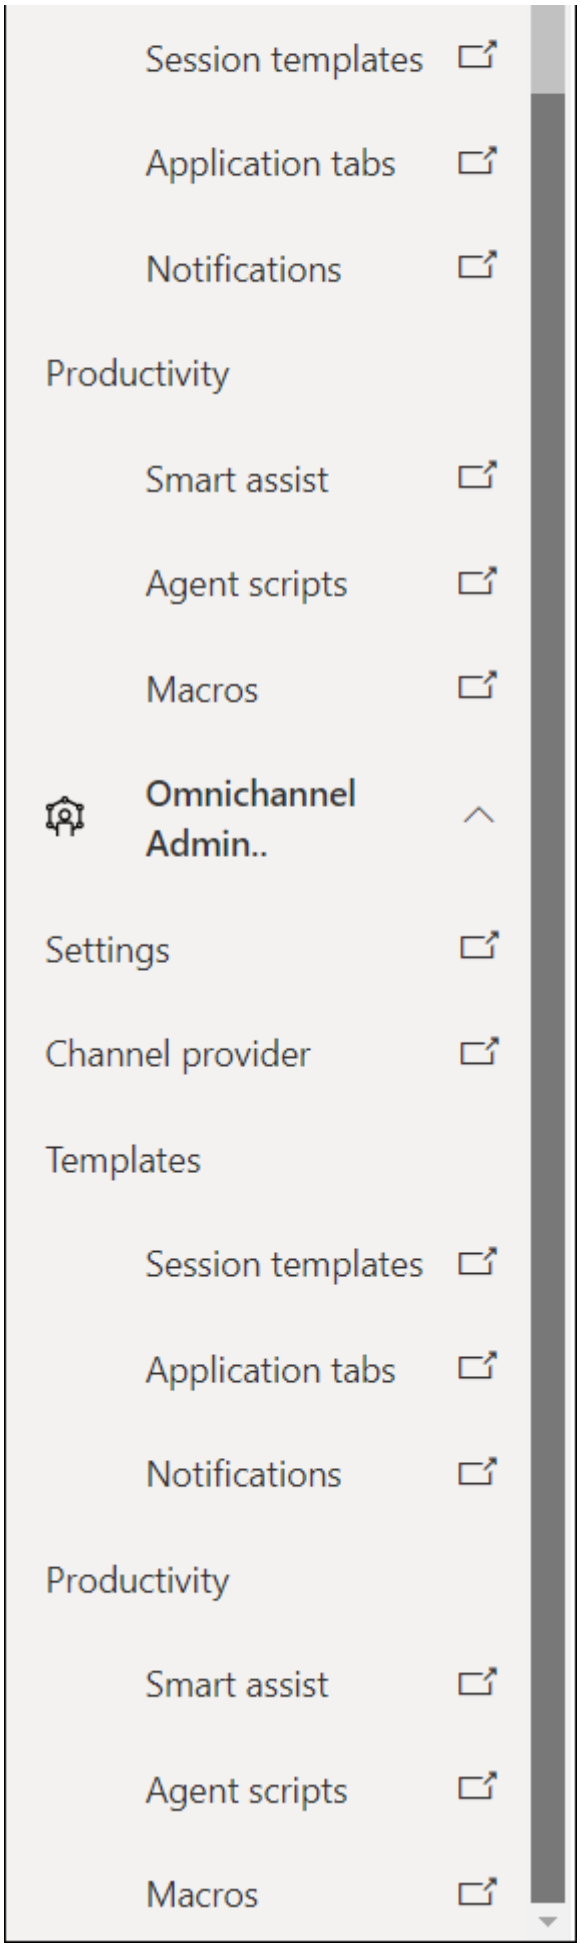
> **ⓘ Important**
>
> *Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the **Dynamics 365 Customer Service pricing overview** and **Dynamics 365 Customer Service pricing plan** pages.*

The options to access and manage the following entities are available on the left pane of the app profile manager:

- Settings
- Channel provider
- Templates
  - Session templates
  - Application tabs
  - Notifications
- Productivity
  - Smart assist
  - Agent scripts
- Macros

All these options are available in Unified Interface. Select any of the option to open it in a new tab.





Session templates
Application tabs
Notifications
Productivity
Smart assist
Agent scripts
Macros
Omnichannel Admin..
Settings
Channel provider
Templates
Session templates
Application tabs
Notifications
Productivity
Smart assist
Agent scripts
Macros

Irrespective of the path from where you navigate to any of the components, such as session templates or application tab templates, the templates that you've defined for Customer Service workspace and Omnichannel for Customer Service will be displayed because they're stored in a common library.

Settings

Select **Settings** in **Customer Service workspace** to open the **Queues** page on a new tab.

Select **Settings** in **Omnichannel Administration** to open the **Entity Records** page on a new tab.

Channel provider

The **Channel provider** option in **Customer Service workspace** or **Omnichannel Administration** opens the channels view on a new tab where you can configure a new channel or update the settings of the existing providers.

Templates

The following template types can be accessed:

- **Session templates:** Opens the Session templates page where the out-of-the-box templates and custom templates created by you're listed.
- **Application tabs:** Opens the application tab templates page to create and manage application tab templates.
- **Notifications:** Opens the notifications templates page to manage the templates.

Productivity

You can access the following options in the **Productivity** area:

- **Smart assist:** Opens the settings for AI-based suggestions for similar cases, knowledge articles, and ongoing conversations.
- **Agent scripts:** Opens the agent scripts page for you to create and manage scripts.
- **Macros:** Opens the macros page for you to create and manage macros.

Upgrade experience for existing Omnichannel for Customer Service

When you upgrade your existing environments, the settings for templates, productivity tools, and channels configuration in the out-of-the-box app profile will reflect the existing state of your environment. For example, if productivity pane is enabled and smart assist is configured, the settings will be retained in the out-of-the-box app profile.

Create an app profile

Article • 02/01/2023

> **ⓘ Important**
>
> With the release of the Customer Service admin center app that consolidates admin experiences across the Customer Service suite, we announce that the following admin experiences are deprecated and no longer supported after April 2023.
>
> - Service Management area in the Customer Service Hub app
> - Omnichannel admin center
> - **App profile manager:** Is removed in April 2023.
>
> Also, starting in October 2022, the Omnichannel admin center and the service management area in Customer Service Hub will be hidden by default in newly created organizations and environments. You have the option to bring them back, but we recommend that you start using the Customer Service admin center app to perform tasks like manage cases, and configure unified routing, channels, and agent experience profiles. More information: **Get started with Customer Service admin center**

Perform the following steps to create an app profile:

1. Sign in to Power Apps.
2. Select the environment in which you want to create the app profiles.
3. Do one of the following:

    - On the **Home** page, go to **Your apps** section.
    - In the left pane, select **Apps**.

4. Select **More commands** in **Omnichannel for Customer Service** or **Customer Service workspace**, and then select **App profile manager** on the menu that appears.
5. In the left pane, select **App profiles**.
6. On the **App profile manager** page, select **New profile**.
7. On the **New profile** pane, specify the following:

    - **Name:** The app profile name.
    - **Unique name:** A unique identifier in the *<prefix>_<name>* format.

        > **ⓘ Important**

The following are required for the unique name:

- The prefix can only be alphanumeric and its length must be between 3 to 8 characters.
- An underscore must be used between the prefix and name.

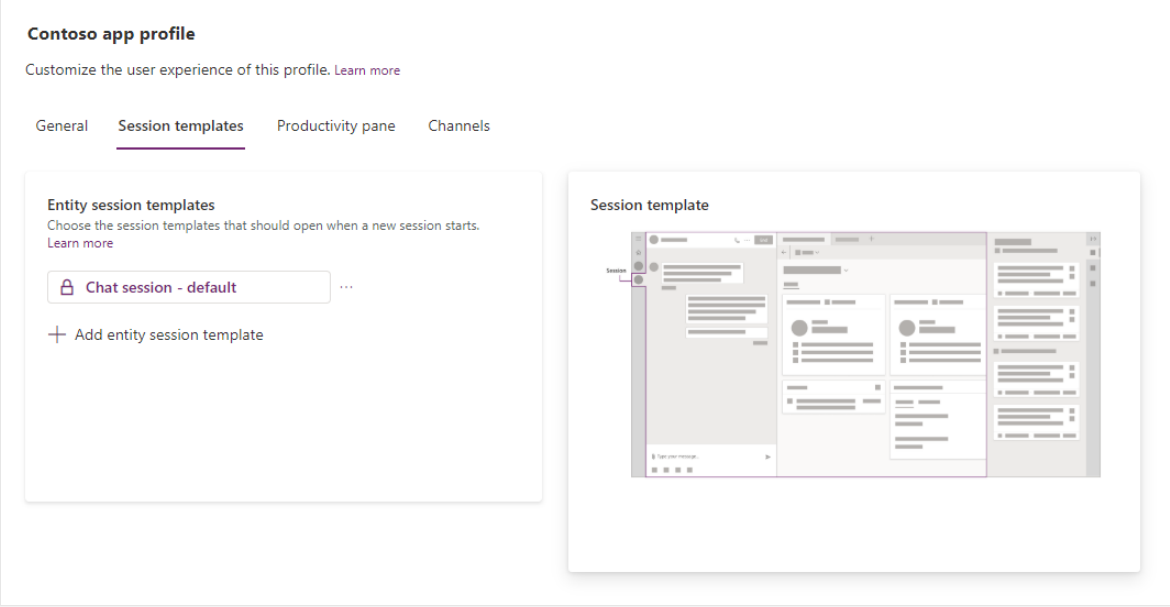
- **Description:** A description for the profile.

Assign templates and enable productivity pane and channels

For an app profile, you can add only one session template for each entity type. Typically, you'll add one session template for each entity type, such as one each session template for accounts, contacts, and cases.

The settings that you enable for the app profile will be available for agents and supervisor only when you configure the corresponding templates and settings in the Customer Service Hub or Omnichannel admin center app. For example, channels must be provisioned in Omnichannel for Customer Service and channel instances must be configured.

1. In the **App profiles** section, select the app profile to which you want to assign templates.
2. On the **Session templates**, select **Add entity session template**.
3. Search for the template you want to add and select it. Make sure that the selected template is based on **Entity** type. More information: Manage session templates



4. Do the following on the **Productivity pane** tab:

a. If you want to enable productivity tools, set the toggle to on for **Turn on productivity pane**.
b. Select the default mode as collapsed or expanded.
c. In the **Productivity tools** section, set the toggle to on for the following:

- **Smart assist tool configuration**
- **Knowledge search tool configuration**
- **Agent scripts** to allow access to smart assist configuration and agent scripts.

5. On the **Channels** tab, set the toggle to on for **All active channels**. The channels configured in Omnichannel for Customer Service will be available for the user to whom the profile is assigned.

> ⓘ Note
>
> The toggle for channels will be enabled in the out-of-the-box app profile for Omnichannel for Customer Service.

6. To add a third-party channel provider, in the **Voice channels** section, select **Add channel providers**, search for the configured channel, and select it.

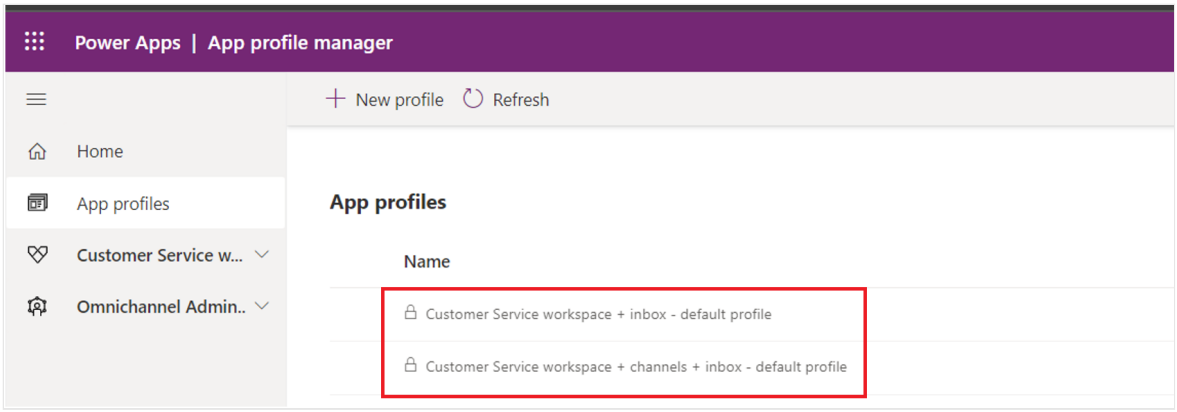
7. If a channel doesn't exist, select **Create a new channel provider in Unified Interface**. The channel configuration page opens on a new tab. More information: Configure channel provider using app profile manager

> ⓘ Note
>
> - Only telephony or voice channels are supported.
> - A number of voice channel providers can be configured at a time.

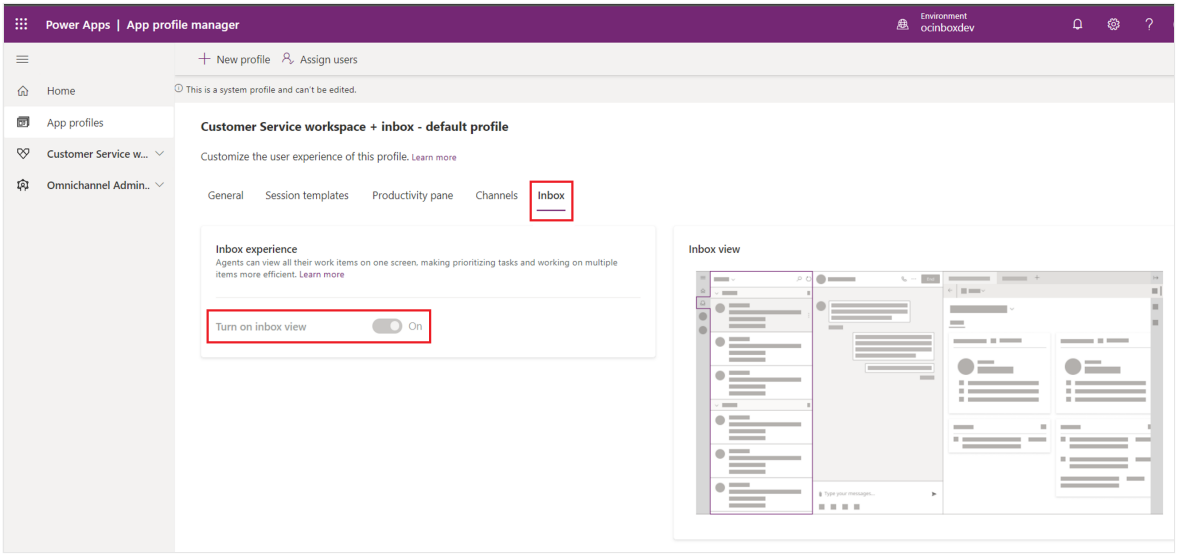
Configure the inbox view

For an app profile, you can enable the inbox view in the Customer Service workspace or Omnichannel for Customer Service apps. From the inbox, users can view their conversations and cases.

1. On the **App profiles** page, select the profile for which you want to enable the inbox.

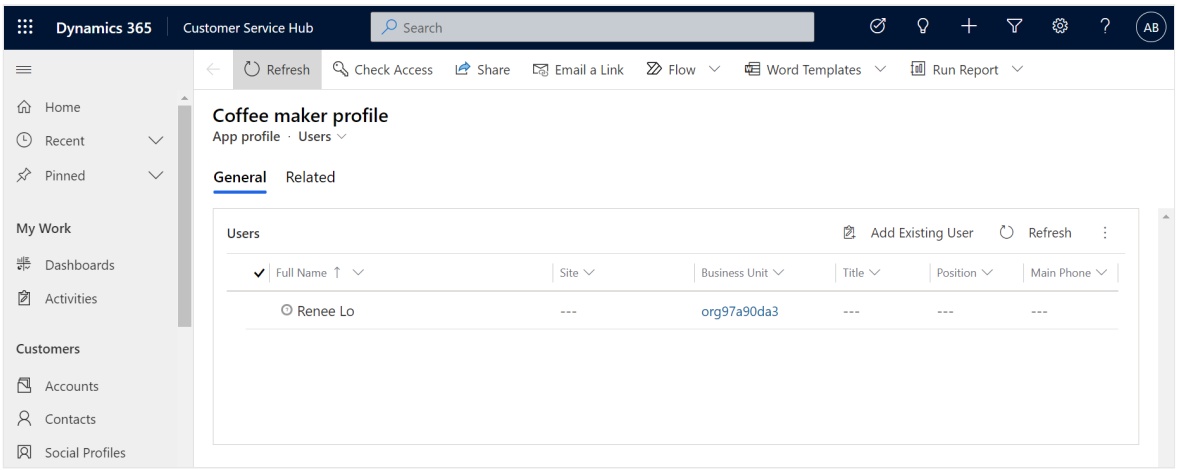


2. Select the **Inbox** tab, and then toggle **Turn on inbox view** to **On**.



Assign profiles to users

1. On the **App profiles** page, select the profile that you want to assign to a user.
2. On the <***profile_name***> page, select **Assign users** on the command bar, and select **OK** on the message dialog box. The profile opens on a new tab.



3. On the **General** tab, select **Add Existing User**.
4. On the **Lookup Records** pane, search and select the user.

> **Note**
>
> You can select **Assign users** on the <***profile_name***> page to view the list of users who have been assigned to the profile.

Default profile assignment

When users are assigned roles corresponding to Customer Service workspace or Omnichannel for Customer Service, the default app profiles are assigned as follows.

- **Customer Service workspace**: Users with the CSR Manager and Customer Service Representative roles.
- **Omnichannel for Customer Service**: Users with the Omnichannel administrator, Omnichannel supervisor, and Omnichannel agent roles.

More information: Roles and privileges associated with app profile manager

Agent experience profiles

Article • 04/07/2023

> **Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

Agent experience profiles enable you to create targeted app experiences for agents and supervisors, and are an alternative to building and maintaining custom apps. With the agent experience profiles, administrators can create custom profiles with specific session templates, conversation channels, and productivity tools. These profiles can then be assigned to users.

Agent productivity tools use intelligence and automation to enable agents to find answers to customer questions and help resolve customer issues quickly, improving satisfaction in service delivery. The productivity tools help in easy knowledge base search, suggestions for similar knowledge articles and cases, and agent scripts with macros to automate tasks in common workflows.

The profiles are available for agents and supervisors who use the Customer Service workspace or Omnichannel for Customer Service apps.

The system requirements for agent profiles and Customer Service workspace are the same. More information: System requirements for Customer Service workspace

How the agent experience profile works

Managing the agent experience profiles is as follows. The tasks in every step will be done by administrators who have different roles. It could be one administrator or a set of administrators.

1. Create users in Microsoft Dynamics 365 admin center.
2. Assign security roles, such as Customer Service Representative or Omnichannel agent.
3. Create business processes, such as work streams, queues, sessions, and productivity tools.
4. Create agent experience profiles.

5. Assign agent experience profiles to users.

For existing orgs, only steps 4 and 5 are required.

Thereafter, users with the required agent or supervisor role will be able to see and use the settings that are made available through the assigned agent experience profile. If you don't assign an agent experience profile, by default, the out-of-the-box agent experience profile will be assigned.

You can create and manage agent experience profiles in the Customer Service admin center app or in Power Apps.

Manage session templates

Article • 04/05/2023

A session template is a combination of attributes and application tab information that can be reused.

In Omnichannel for Customer Service app, when an agent accepts an incoming conversation request from a customer, a session is started. The system opens the **Active Conversation** application that you (an administrator) defined as an **Anchor Tab** in the application tab panel. The **Anchor Tab** can't be closed. Simultaneously, the system expands the communication panel for you to exchange messages with the customer.

Session templates are used to define the aforementioned session experience, such as:

- which application must be opened as an anchor tab in the application tab panel;
- what are the additional application tabs that must be opened when a session is started;
- what must be the default mode of the communication panel when a session is started.

You can create session templates in Customer Service admin center or use the out-of-the-box templates. In your environment, as an administrator, you can create multiple session templates.

> ⓘ **Note**
>
> You can't customize the out-of-the-box session templates; instead, you'll need to create your own custom templates.

The out-of-the-box session template for using in Customer Service workspace is Case entity session - default template.

The following out-of-the-box session templates are of the generic type and are for use in the Omnichannel for Customer Service app:

- Case entity session - default template
- Chat session - default
- Voice call session - default
- Custom messaging session - default
- Entity records session - default
- Facebook session - default
- LINE session - default

- SMS session - default
- Teams session - default
- Twitter session - default
- WeChat session - default
- WhatsApp session - default

Create a session template

1. In the site map of Customer Service admin center, select **Workspaces** in **Agent experience**.
2. On the **Workspaces** page, select **Manage** for **Session templates**.
3. Select **New** on the **Active Session Templates** page.
4. Specify the following on the **New Session Templates** page.

Tab	Name	Value description	Example
General	Name	Specify the name of the session. This name won't be visible to the agents at the runtime.	Chat session
General	Unique Name	A unique identifier in the *<prefix>_<name>* format. **IMPORTANT** The following are required for the unique name: • The prefix can be alphanumeric only and its length must be between 3 to 8 characters. • An underscore must be there between the prefix and name. You can select the light bulb icon, and then select **Apply** to verify whether the name you've entered meets the requirements.	msdyn_chat_custom

Tab	Name	Value description	Example
General	Type	Select one of the following: • **Entity:** If you select entity, the **Entity** field is displayed. • **Generic:** Select when the template is required to be assigned to any channel.	Entity
General	Entity	Select an entity from the list. **Note:** The option is displayed only when **Type** is entity.	Case
General	Title	Provide the title of the session that you want agents to see at the runtime.	{customerName}
General	Communication panel mode	Select the default mode of the panel when a session is started. Choose one of the following: • **Docked**: The panel will be in expanded mode. • **Minimized**: The panel will be in minimized mode. • **Hidden**: The panel will be hidden. **Note**: For an entity routing session—that is, for a case session—the communication panel mode is hidden.	Docked
General	Session Icon	Select an icon to represent the channel from which the conversation is initiated so that your agent can visually identify the channel. **Note**: • Is available for generic type of templates only. • A web resource file for the icon must be deployed. • You can use a web resource file only and not slugs to customize the session icon. • GIF files aren't supported.	WhatsApp.ico

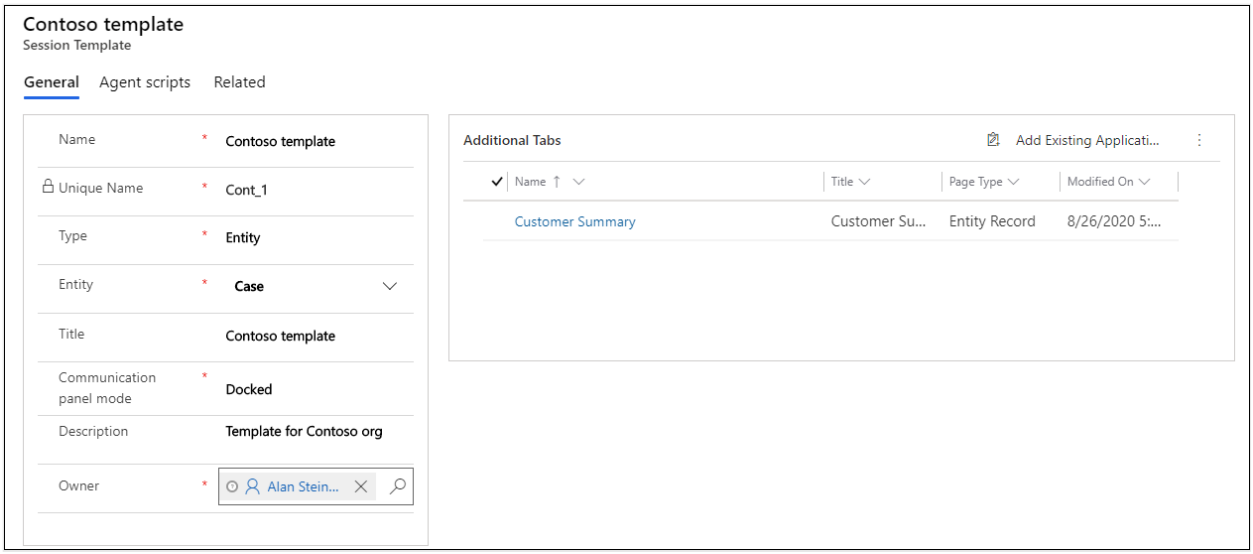
Tab	Name	Value description	Example
General	Description	Provide a description for your reference.	The session template is used for a conversation request from Chat channel.
General	Owner	Search and select an owner. By default, the user who is creating the template is set as the owner	Alan Steiner
General	Anchor tab	Select an application from the list. The application is opened by default when the session starts and can't be closed. **Note:** The anchor tab option is displayed only when **Type** is generic.	Customer summary

5. Select **Save**.

Associate application tabs, agents scripts with session templates

You can associate application tabs that need to open when a session is started. Agents can't close these application tabs. You can also associate agents scripts; however, you must first configure the agent scripts. More information: Agent scripts

1. Go to the session template that you want to modify.
2. In the **Additional Tab** section, Select **Add Existing Application Tab Template**. The **Lookup Records** pane appears.
3. Type the application tab names in the search box and select the search icon. A list of records appears. Select the application tabs, and then select **Add**. The application tabs are added to the session template.
4. Select the **Agent scripts** tab, and set the **Enable build expression** toggle to **Yes** to define the expression to set an agent script as default for a particular session template.
5. Build the expression, and then select **Save and close**. To learn more, see Set default agent script for agents.
6. Select **Save**.



The session template is configured. Now, you must associate the session template with a workstream. To learn more, see Associate templates with workstreams.

Manage application tab templates

Article • 10/20/2023

An application tab template in Customer Service lets you specify the type of applications that can be opened when agents start a session in the Customer Service workspace or Omnichannel for Customer Service app.

The vertical bar on the left panel shows the list of sessions. The panel will always show the **Home** session that can't be closed or customized.

Every session has at least one application tab, called the "Anchor tab", that can't be closed or customized. When you start a session, the corresponding application page and any other additional pages are opened based on your configuration settings.

Using the application tab template, you can define applications that are available for a session, and then associate those applications with the session. For example, you can create the **Active Conversation** page tab and associate it with a chat or SMS session. Now, when an agent accepts a notification from the chat or SMS channels, a session starts and the **Active Conversation** page opens.

As an administrator, you can create multiple application tab templates.

> ⓘ **Note**
>
> You can't customize the out-of-the-box templates, but can create your own custom templates.

Create application tab templates

1. Select one of the following tabs, and perform the steps.

   Customer Service admin center

   a. In the site map, select **Workspaces** in **Agent experience**.
   b. On the **Workspaces** page, select **Manage** for **Application tab templates**.

2. Select **New** on the **Active Application Tab Templates** page.

3. Specify the following on the **New Application Tab Template** page.

Tab	Name	Description	Example
General	Name	Specify the name of the application tab. This name isn't visible for the agents at runtime.	Knowledge article search
General	Unique name	Provide a unique identifier in the *<prefix>_<name>* format. **IMPORTANT** The following are required for the unique name: • The prefix can only be alphanumeric and its length must be between 3 and 8 characters. • An underscore must be added between the prefix and name. You can select the light bulb icon, and then select	contoso_application_tab

Tab	Name	Description	Example
		Apply to verify whether the name you've entered meets the requirements.	
General	Title	Provide a title for the application that you want the agents to see at runtime.	Knowledge article search
General	Page type	Select a page type from the list.	Web resource
General	Description	Provide a description for your reference.	The page type is used to display a knowledge base search page.

4. Select **Save**. The **Parameters** section displays the parameters for the page type that you selected.

   > ⓘ Note
   >
   > Whenever you edit the application tab template, save the changes so you see the corresponding fields in the **Parameters** section.

5. Select the **Value** field of a parameter that you want to edit and provide the value.

6. Select **Save**.

Page types

The following page types are available.

- Dashboard
- Entity list
- Entity record
- Search
- Third-party website
- Web resource
- Control (for internal use only)
- Custom

Dashboard

This page type is used to display the dashboard as an application. The following parameter is available for the dashboard page type.

Parameter	Description	Required	Supported values	Example
`dashboardId`	GUID of the dashboard	Yes	String	`d201a642-6283-4f1d-81b7-da4b1685e698`

> ⓘ Note
>
> If the target dashboard isn't included in the app module definition, the default dashboard is displayed instead.

Entity list

This page type is used to display an entity view that defines how a list of records for a specific entity is displayed. The following parameters are available for the entity view page type.

Parameter	Description	Required	Supported values	Example
`entityName`	Logical name of the entity	Yes	String Slugs	account `{anchor._customerid_value@Microsoft.Dynamics.CRM.lookuplogicalname}`
`viewId`	GUID of the view	No	String	`00000000-0000-0000-00aa-000010001031`

> **Note**
>
> If the target view doesn't exist or isn't included in the app module definition, the default entity view is displayed instead.

Entity record

This page type is used to display an existing record or open a form to create a new record.

The following parameters are available for the entity record page type when an existing record is opened.

Parameter	Description	Required	Supported values	Example
`entityName`	Logical name of the entity	Yes	String Slugs	account `{anchor._customerid_value@Microsoft.Dynamics.CRM.lookuplogicalname}`
`entityId`	GUID of the entity record	No	String Slugs	`d49e62a8-90df-e311-9565-a45d36fc5fe8` `{anchor._customerid_value}`
`formId`	GUID of the form instance	No	String	`915f6055-2e07-4276-ae08-2b96c8d02c57`

The following parameters are available for the entity record page type when an entity form is opened to create a new record:

Parameter	Description	Required	Supported values	Example
`entityName`	Logical name of the entity	Yes	String Slugs	contact `{anchor._customerid_value@Microsoft.Dynamics.CRM.lookuplogicalname}`
`data`	Data to be prepopulated in the form	No	JSON	`{"subject":"Task created from {anchor.ticketnumber}","description":"Follow-up needed with customer","prioritycode":"2","scheduledend":"06/12/2023", "regardingobjectid": [{"id": "{anchor.incidentid}", "name": "{anchor.title}", "entityType":"{anchor.entityName}"}]}`

Parameter	Description	Required	Supported values	Example
`formId`	GUID of the form instance	No	String	`915f6055-2e07-4276-ae08-2b96c8d02c57`

Search

The following parameters are available for the entity search page type.

Parameter	Description	Required	Supported values	Example
`searchType`	Define to use Relevance search or Categorized search. The possible values are: • **0** for Relevance search • **1** for Categorized search	No	Number	0

`searchText`	Define the string you want to search.	Yes	String
			Slugs
			OData
				contoso
				`{anchor.title}`
				`{anchor._customerid_value@OData.Community.Display.V1.FormattedValue}`
				`{$odata.incident.title.?$filter=incidentid eq '{anchor.incidentid}'&$select=title}`

Third-party website

This page type is used to display third-party websites as an application. You can use this type to host only those websites that are compatible with iframe hosting. If your website isn't compatible with iframe hosting, an error message that the website refused to connect is displayed. The application tab template parses the URL and data parameters to format the URL address to be displayed.

Parameter	Description	Required	Supported values	Example
`url`	The website URL to be displayed in the app tab	Yes	String	`https://www.bing.com/search?q=`

`data`	Additional data parameter to be parsed with the `url` parameter	No	String
			Slugs
			OData
				contoso
				`{anchor.title}`
				`{anchor._customerid_value@OData.Community.Display.V1.FormattedValue}`

Parameter	Description	Required	Supported values	Example
				`{$odata.incident.title.?$filter=incidentid eq '{anchor.incidentid}'&$select=title}`

> **Note**
>
> When an agent switches from the third-party website type of tab template to another tab, and then switches back to the third-party website tab template, the page will be refreshed to the initial state. For more information, see the "Third-party application tab refreshes when focus is changed" section in the Known issues document.

How parsing works

These examples are based on a scenario where the case was opened as the Anchor tab in a new session with ticket number: `CAS-01003-P3B7G1`.

`url` parameter: `https://www.bing.com/search?q=`
`data` parameter using slugs: `{anchor.ticketnumber}`
Expected URL: `https://www.bing.com/search?q=CAS-01003-P3B7G1`

`url` parameter: `https://www.bing.com/search?q=`
`data` parameter using OData: `{$odata.incident.ticketnumber.?$filter=incidentid eq'{anchor.incidentid}'&$select=ticketnumber}`
Expected URL: `https://www.bing.com/search?q=CAS-01003-P3B7G1`

> **Note**
>
> The `url` parameter requires the correct URL format using 'https://'.

Web resource

This page type is used to display web resources that represent files, which are used to extend the web application such as HTML files, JavaScript, CSS, and several image formats. The following parameters are available for the web resources page type.

Parameter	Description	Required	Supported values	Example
`webresourceName`	Name of the web resource to open	Yes	String	`new_myresource.html`

`data`	Provide string or key value pair, according to the requirement	No	String
			Slugs
			OData
				contoso
				`{anchor.title}`
				`{anchor._customerid_value@OData.Community.Display.V1.FormattedValue}`
				`{$odata.incident.title.?$filter=incidentid eq '{anchor.incidentid}'&$select=title}`

Parameter	Description	Required	Supported values	Example
	of the web resource.			

> **Note**
>
> When an agent switches from the web resource type of tab template to another tab, and then switches back to the web resource type of tab template, the page will be refreshed to the initial state. For more information, see the "Third-party application tab refreshes when focus is changed" section in the **Known issues document**.

Custom

This page type is used to display custom pages on the application tab. You can use this tab template type to host custom pages that are available in the corresponding app module. For more information about custom pages, see Overview of custom pages for model-driven apps.

The following parameters are available for custom pages.

Parameter	Description	Required	Supported values	Example
`entityName`	Logical name of the entity	No	String	incident
			Slugs	`{anchor.entityName}`
`name`	Unique name of the custom page	Yes	String	`new_mycustompage`
`recordId`	GUID of the entity record	No	String	`d49e62a8-90df-e311-9565-a45d36fc5fe8`
			Slugs	`{caseId}`
				`{anchor.incidentid}`
			OData	`{$odata.incident.title.?$filter=incidentid eq '{anchor.incidentid}'&$select=title}`

Out-of-the-box application tab templates

The following out-of-the-box application tab templates are available.

Template name	Description	Application type
Active Conversation	Displays the Active Conversation page in the tab.	Entity Record
Entity record	Displays an entity record in the tab.	Entity Record
Knowledge Search	Displays the knowledge article search page in the tab.	Web Resource
Omnichannel Conversations Dashboard	Displays the Omnichannel Conversations Dashboard in the tab.	Dashboard
Omnichannel Intraday Insights	Displays a Power BI report in the tab.	Control

Template name	Description	Application type
Quick Reply Preview	Displays a quick reply in the tab.	Control
Rich Message Preview	Displays a rich message in the tab.	Control
Search	Displays the Omnichannel search page in the tab.	Control

Manage notification settings and templates

Article • 10/16/2023

When a notification is sent to an agent, it displays certain information, such as the customer from who the conversation request is coming, the timeout period after which the notification will disappear, and accept and reject buttons. Each organization has varied business requirements and wants the notifications to show relevant information to the agents.

As an administrator, system integrator, or partner, you can use the out-of-the-box templates for notifications or create your own. A notification template is a combination of notification-related, reusable information. The template is used to configure what information needs to be displayed to the agents and supervisors for an incoming conversation, escalation, transfer, or consult.

Desktop notifications

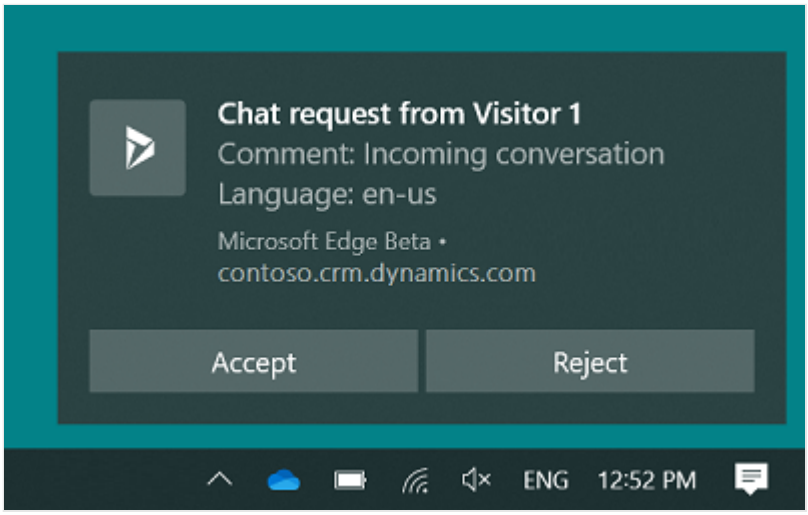
For optimal functioning of desktop notifications, make sure that you are using the latest supported browsers as specified in the system requirements.

Desktop notifications help ensure that agents won't miss any conversation requests. Based on your configuration, agents can receive notification alerts on their desktop always or when the Customer Service workspace or Omnichannel for Customer Service app isn't in focus. Some scenarios where the app isn't in focus might include:

- The agent has minimized the app.
- The agent is working in another browser window.
- The agent is working on another tab of the browser.
- The agent is using two screens, and is on the screen that doesn't have either the Customer Service workspace or Omnichannel for Customer Service app.

> **Note**
>
> - The **Always(preview)** option for **Show Desktop Notifications** is in preview. To use this feature, it must be turned on and the license terms must be accepted. **What are Preview features and how do I enable them?**.

- The legacy version of Microsoft Edge is not supported for desktop notifications.



Agents can accept or reject the conversation request by selecting a button on the desktop notification. When an agent accepts the conversation, the app is made active and displayed to the agent, and a session is started.

If the agent selects the notification message body and not a button, the app is made active and the notification is displayed to the agent in the app. Then the agent can choose to accept or reject the conversation by selecting the appropriate button.

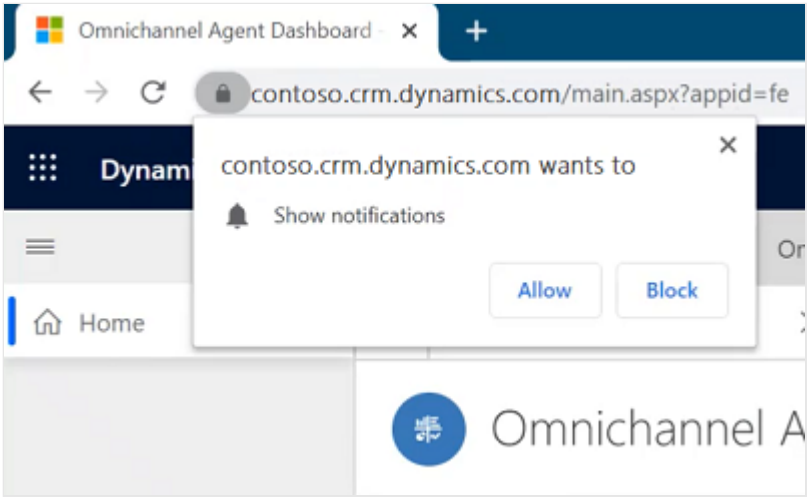
You can configure the wait time and the notification is displayed for the agent according to this time, but wait time isn't displayed on the notification. The desktop notification theme is based on the Windows operating system theme and settings.

> ⓘ **Note**
>
> - Desktop notifications will not work when the browser is opened in incognito mode or if focus assist is turned on in your Windows 10 operating system.
> - If the native browser notification option is disabled, the notification will be shown in a different user interface.

Allow a browser to show notifications

To get desktop notifications, agents need to allow their browser (Microsoft Edge or Google Chrome) to show them. When an agent gets a browser notification, they need to select **Allow**. Based on your requirements, you can enable or disable notifications in the browser settings.

Also, as an administrator, you can set the browser notification permission by using group policy.



Notification fields

The fields that are shown in the notification are based on the notification template configuration. To learn more, see Slug for notification field header and Create a notification template.

Slugs for notification field header

A slug is a replacement parameter that is populated at runtime based on the context variables.

The notification shows certain fields and values, called **Field header** and **Value** respectively.

For example, a customer Kenny Smith initiates a conversation. When the agent sees the notification, it displays **Customer Name** as **Kenny Smith**.

Here, **Field header** is **Customer Name** and the **Value** is **Kenny Smith**.

For the application to identify the name of the customer as **Kenny Smith**, as an administrator, you must configure slugs as the value. The Omnichannel system replaces the slug with the actual value that is extracted based on the context variables.

The application supports the following slugs.

Slug	Description
`{customerName}`	Name of the customer who initiates the conversation.

Slug	Description
`{caseId}`	GUID of a case. The case ID is displayed only if a case is linked to the conversation.
`{caseTitle}`	Title of the case. The title of the case is displayed only if a case linked to the conversation.
`{queueId}`	GUID of a queue.
`{visitorLanguage}`	The language in which the customer initiates the conversation.
`{visitorDevice}`	The device of the customer who initiates the conversation.
`{entityRoutingLogicalName}`	Name of the entity if the notification is for entity records.
`{entityRoutingRecordId}`	GUID of the entity record if the notification is for entity records. To learn more, see Entity records routing.
`{customerEntityName}`	Name of the entity (contact or account entity) if the customer is authenticated.
`{customerRecordId}`	GUID of the entity (contact or account entity) if the customer is authenticated.
`{<name of the pre-chat survey question>}`	All the pre-chat survey questions that are configured for a work stream can be used as the slug. The format is same as the question.

Manage templates

Out-of-the-box notification templates

For the supported channels, Customer Service provides you with out-of-the-box notification templates that you can use in your environment. When you attach the out-of-the-box notification template, the default settings are used in the notifications. For customers whose record exists in Dynamics 365, the settings in the authenticated template for notifications are used. If the customer details are not available in Dynamics 365, the settings in the unauthenticated template are used for displaying the notifications. For information on the notifications behavior and what the notifications display for agents, see notifications for agents.

The out-of-the-box templates are as follows.

Channel/Entity	Consult	Authenticated	Unauthenticated	Transfer	Other
Chat	Chat - consult - default	Chat - incoming authenticated - default	Chat - incoming unauthenticated - default	Chat - transfer - default	
Custom messaging	Custom messaging - consult - default	Custom messaging - incoming authenticated - default	Custom messaging - incoming unauthenticated - default	Custom messaging - transfer - default	
Facebook	Facebook - consult - default	Facebook - incoming authenticated - default	Facebook - incoming unauthenticated - default	Facebook - transfer - default	
LINE	LINE - consult - default	LINE - incoming authenticated - default	LINE - incoming unauthenticated - default	LINE - transfer - default	
SMS	SMS - consult - default	SMS - incoming authenticated - default	SMS - incoming unauthenticated - default	SMS - transfer - default	
Microsoft Teams	Teams - consult - default	Teams - incoming authenticated - default	Teams - incoming unauthenticated - default	Teams - transfer - default	
Twitter	Twitter - consult - default	Twitter - incoming authenticated - default	Twitter - incoming unauthenticated - default	Twitter - transfer - default	
WeChat	WeChat - consult - default	WeChat - incoming authenticated - default	WeChat - incoming unauthenticated - default	WeChat - transfer - default	
CDS entity					CDS entity - Default assigned
Customized					Customized notification template

Channel/Entity	Consult	Authenticated	Unauthenticated	Transfer	Other
Sentiment					Sentiment threshold alert - supervisor
Voice	Voice call - consult - default	Voice call - incoming authenticated - default	Voice call - incoming unauthenticated - default	Voice call - transfer - default	Voice call - supervisor assign - default

> **Note**
>
> - You can't customize the out-of-the-box notification templates; instead, you'll need to create your own custom templates.
> - If you use custom notification templates for record routing, we recommend that you do not add a reject option. By design, the record will be assigned to the routed agent even if you provide the option to the agent to reject the assignment.

Create a notification template

To create the notification template

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Workspaces** in **Agent experience**.
   b. On the **Workspaces** page, select **Manage** for **Notification templates**.

2. On the **Templates** tab, select **New Notification Template** in the **Active Notifications Templates** area.

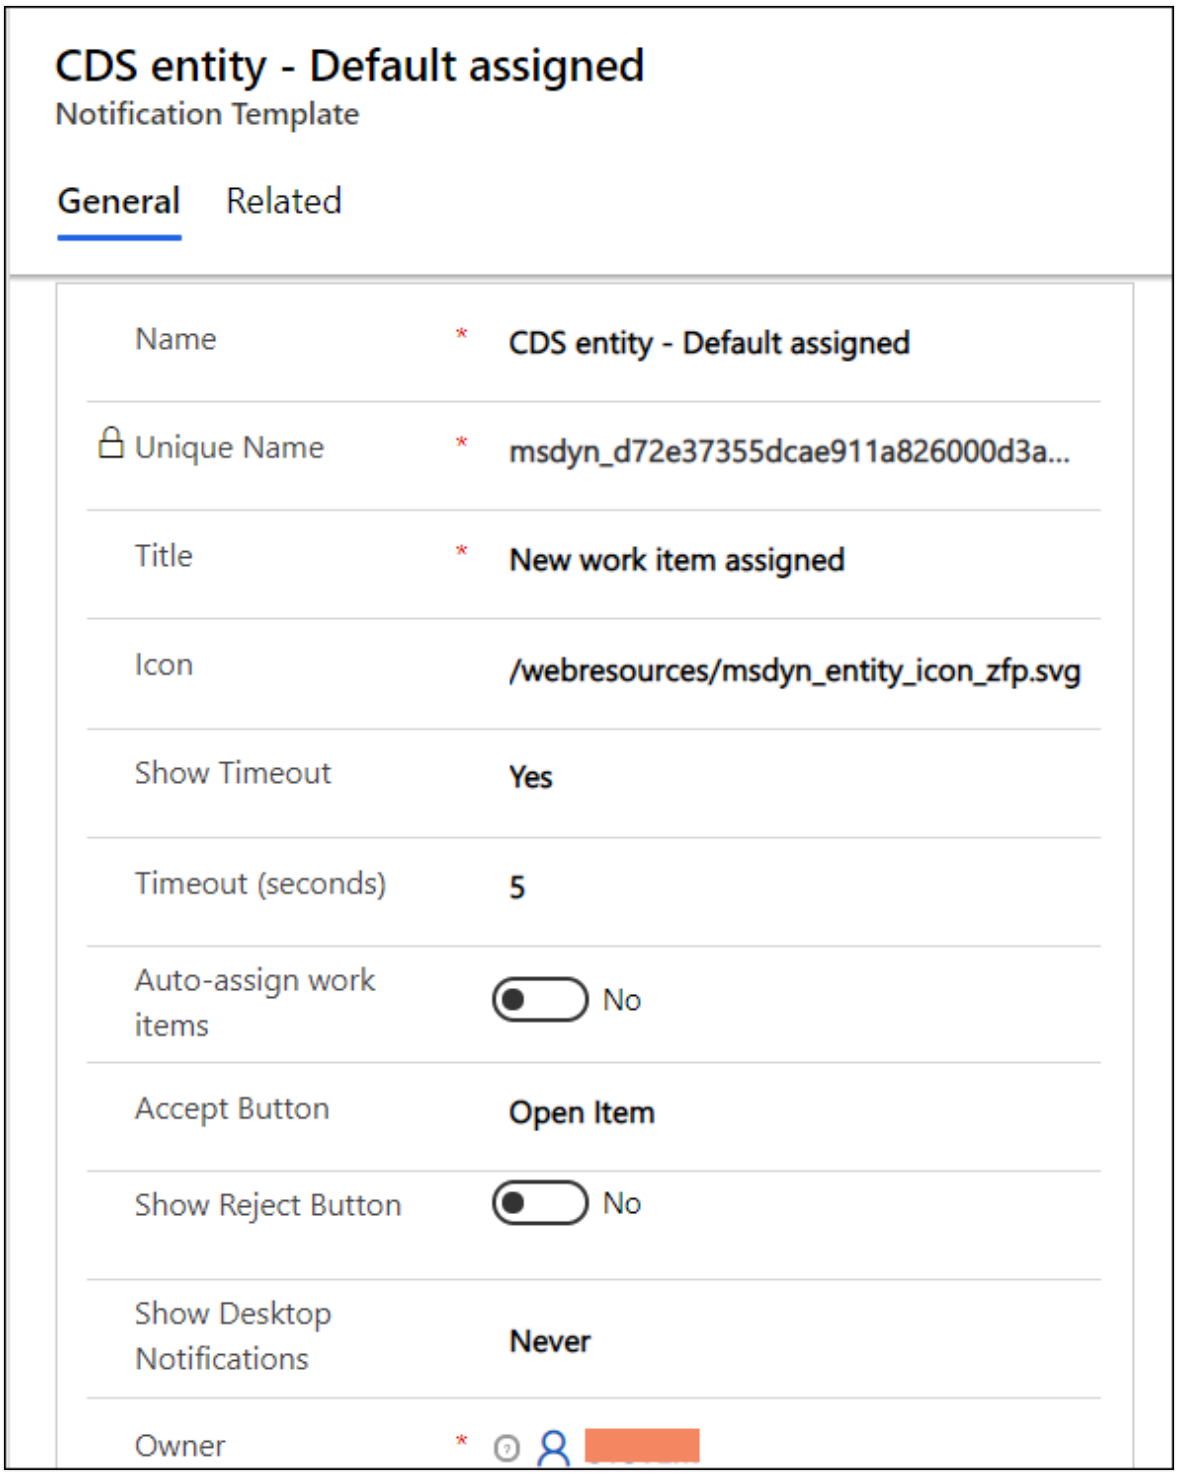
3. Specify the following in the **New Notification** page.

Tab	Name	Value, description	Example
General	Name	Specify the name for the notification. This name wouldn't	Authenticated chat notification

Tab	Name	Value, description	Example
		be visible for the agents at the run-time.	
General	Title	Provide a title to the notification that you want the agents to see at the run-time.	Incoming chat conversation
General	Icon	Select web resource path to add an icon.	/webresources/msdyn_chat_icon_zfp.svg **Note:** - This is the default value. You can change the icon as your requirement. - If you enable the **Show desktop notifications** option, and if you use svg icon format, then the svg icon won't be shown in the desktop notifications.
General	Show timeout	Yes	Set **Yes** to show the timer in the notification, or **No** to hide the timer in the notification for the agents. **Note:** - Irrespective of whether you set **Yes** or **No** to show or to hide the timeout value for the agent, the timer runs, and after the timeout duration, the notification disappears. - **Yes** is the default value for the templates when you get the latest release of Omnichannel for Customer Service. - When you upgrade from previous to the latest release of Omnichannel for Customer Service, then existing notification templates will show no value for this field in the user interface. However, the notification templates consider the values as **Yes**, and display the timer to the users at the runtime. - If you enable the **Show desktop notifications** option, then the timer won't be shown in the desktop notifications.
General	Countdown (seconds)	Provide a duration in seconds; after this duration elapses, the	120. **Note:** This is the default value. You can

Tab	Name	Value, description	Example
		notification disappears.	change the duration as per your requirement.
General	Auto-assign work items	Set to **Yes** to automatically assign the incoming conversation.	The default value is **No**. **Note:** This setting is in preview. More information: Enable automatic acceptance of conversations.
General	Auto-accept voice/chat calls	This option is displayed only if **Auto-assign work items** is enabled. Set to **Yes** for an agent to automatically accept a conversation.	The default value is **No**. **Note:** This setting is in preview. More information: Enable automatic acceptance of conversations.
General	Accept Button	Specify a text for the accept button. This text appears for the agents to accept a conversation request.	The default value is **Accept** that changes to **Open** when the **Auto-assign work items** value is **Yes**. You can change the text as per your requirement.
General	Reject Button	Set the toggle to yes if you want to show the reject button to agents. After you set the toggle to **Yes**, the default label for the button appears.	Reject **Note:** This is the default value. You can change the text as per your requirement. The **Reject Button** is disabled when the **Auto-assign work items** value is **Yes**.
General	Show desktop notifications	Specify **Always(preview)** to show notifications always or **When app is in background** to show notifications only if the Customer Service workspace or Omnichannel for	When app is in background **Note:** The default value is Never. To learn more, see Desktop notifications and Receive notifications when app is in background.

Tab	Name	Value, description	Example
		Customer Service is not in focus.	



4. Select **Save**. The template is saved, and the **Notification Fields** section appears on the page.

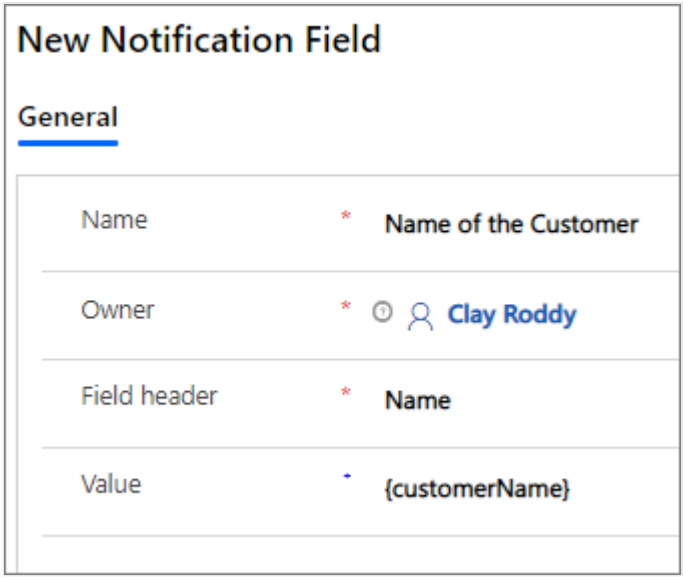
5. Select **Add Existing Notification Field** in the **Notification Fields** section. The **Lookup Records** pane appears.

6. Select the search icon in the **Look for Records** box. If no records are available, you will see a message: **No records found. Create a new record.**.

7. Select **New** to create a notification field. A confirm dialog box appears, asking whether you want to leave the page. Select **OK**.

8. Specify the following in the **New Notification Field** page.

Tab	Name	Value, description	Example
General	Name	Specify the name for the notification. This name won't be visible to the agents at the runtime.	Name of the customer
General	Field header	Provide a name to the field header. This appears in the notification that agents see at the runtime.	Name
General	Value	Provide a slug value that appears against **Field header** in the notification. To learn more, see Slug for notification field header.	{customerName}



9. Select the back arrow on the browser to go to the notification template you created. Alternatively, you can select **Notifications** in the sitemap, and then select the template you created.

10. Select **Add Existing Notification Field** in the **Notification Fields** section. The **Lookup Records** pane appears.

11. Select the name of the notification field you created, and then select **Add**. For example, **Name of the customer**.

12. Repeat steps 6 through 11 to add more notification fields.

13. Select **Save**.

After saving the notification, sign in to the Omnichannel for Customer Service app as an agent, and you can view the notification as per your configuration when a work item is routed.

To learn more, see View notification.

Edit a notification field

As an administrator, you can edit the value of a notification field header in the grid.

1. Select the notification you want to edit on the **Active Notifications** page.
2. Select a notification field you want to edit and then select the record to edit it.
3. Select the save icon in the grid.

Customize a notification

Let's see a scenario: In the Contoso Pvt Ltd customer service center, every case notification that is shown to an agent needs to have the following:

Title of the notification: A new case is assigned.

Notification fields:

- **Case priority:** Priority of the case such high or low.
- **Case title:** Title of the case.
- **Device:** Device from which the case was created by the customer.
- **Language:** Language of the customer.

As an administrator, you need to customize the notification template to show the title and notification fields.

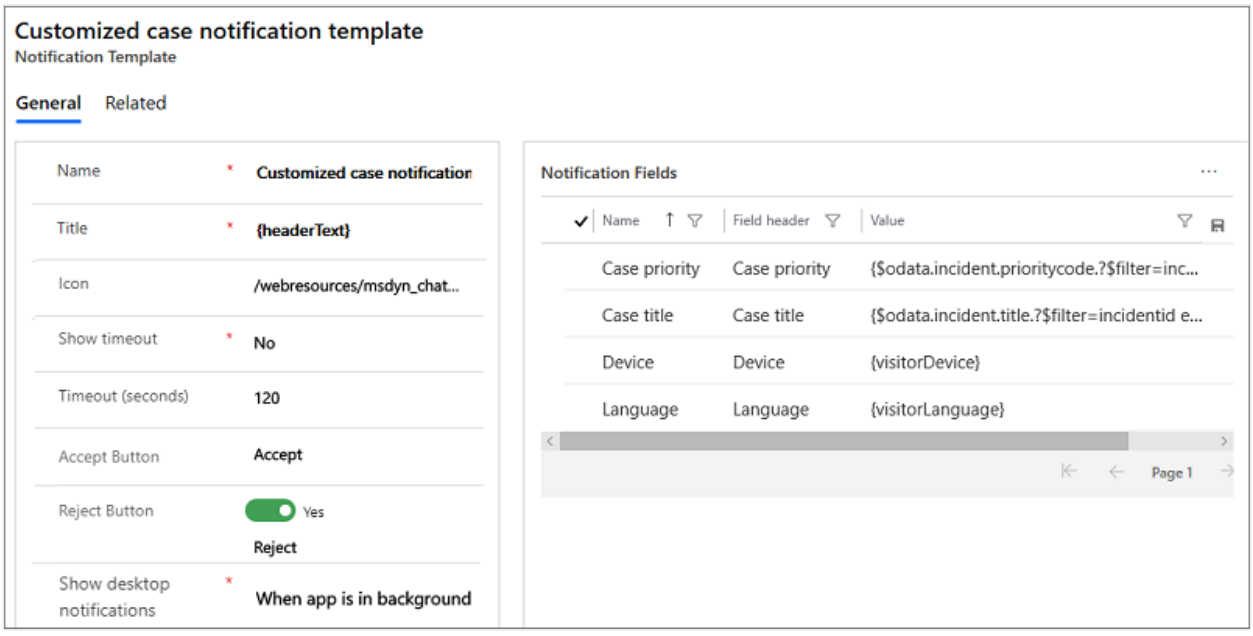
Step 1: Create a notification template with the following values

Tab	Name	Value
General	Name	Customized case notification template
General	Title	A new case is assigned
General	Icon	The default value is **/webresources/msdyn_chat_icon_zfp.svg**.
General	Show timeout	No

Tab	Name	Value
General	Timeout (seconds)	The default value is **120**.
General	Auto-assign work items	The default setting is **No**.
General	Accept Button	The default value is **Accept**.
General	Reject Button	The default value is **No**. When you set the toggle to **Yes**, the **Reject** label appears.
General	Show desktop notifications	The default setting is **Never**. Set to **When app is in background**.

Step 2: Create the notification fields with the following values

Name	Field header	Value
Case priority	Case priority	`{$odata.incident.prioritycode.?$filter=incidentid eq '{caseId}'&$select=prioritycode}`
Case title	Case title	`{$odata.incident.title.?$filter=incidentid eq '{caseId}'&$select=title}`
Device	Device	`{visitorDevice}`
Language	Language	`{visitorLanguage}`



Step 3: Save the changes

Associate templates with workstreams

Associate templates with workstreams

Article • 06/15/2022

The session, notification, and application tab templates that you create need to be associated with a workstream so that the Omnichannel system uses the corresponding templates for an incoming conversation.

After an agent accepts the conversation request, a session starts for which the session template is used. In the session, certain application tabs are required such as dashboard, knowledge article search, and case pages. These application tabs are configured using the application tab templates and are associated with a session.

Associate templates with workstreams in Omnichannel admin center

After you create a workstream, you can modify the default templates that are attached to the workstream.

Perform the following steps:

1. Go to the workstream for which you want to modify the template, and expand the **Advanced settings** section.
2. Select **Edit** beside **Sessions**, and on the **Sessions** panel that appears, select a template in the **Default template** list.
3. Select **Save and close**.
4. Select **Edit** beside **Agent notifications**, and on the **Agent notifications** panel that appears, select a template for each of the following types of notifications:
    - Incoming unauthenticated
    - Incoming authenticated
    - Consult
    - Transfer
    - Supervisor assign
5. Select **Save and close**.

Associate templates with workstreams in Omnichannel Administration

> **Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

You can attach only generic type of templates to work streams. By default, the out-of-the-box templates are associated based on the channel. However, you can replace the default templates with the ones that you create.

1. Sign in to the Omnichannel Administration app.
2. Select **Work Streams** under **Work Distribution Management**.
3. Select a work stream for which you want to associate the templates.
4. Select the **Templates** tab in the work stream. You can see the **Sessions** and **Notifications** sections.
5. You can accept the default session template or select the search icon in **Look for Session Templates**.
6. In the list of templates that you created, select a template.
7. In the **Notifications** section, for each of the following fields, you can accept the default notification template or select the search icon in **Look for Notification Templates**, and select a template.
    - Incoming authenticated
    - Incoming unauthenticated
    - Consult
    - Transfer
    - Supervisor Assign
8. Select **Save** to save the changes to the work stream.

Overview of productivity tools

Article • 04/05/2023

The Dynamics 365 Productivity Tools app provides capabilities that help users perform day-to-day operations in a fast, efficient, and process-compliant manner and deliver value to customers.

The Dynamics 365 Productivity Tools app contains the following functionality to help with repetitive and monotonous tasks, such as greet customers and fill forms. The tool also helps with displaying AI-based suggestions for knowledge articles and similar cases to agents, and thereby helps users perform day-to-day operations in a fast, efficient, and process-compliant manner.

> **Note**
>
> The productivity pane and productivity tools are not available in Omnichannel for Customer Service on Unified Service Desk.

Macros

With macros, agents can perform repetitive, monotonous tasks—Open model-driven app forms, pre-populate fields with details, send an email to a customer, take notes, and much more—all in a single click. A macro is a set of sequential actions that tells the system how to complete a task. When an agent runs a macro, the system performs each action, and this helps save time and gives agents the freedom to handle more customer issues. Also, macros provide preciseness, clarity, and consistency to the tasks that agents perform.

Agent scripts

Agent scripts provide guidance to agents about what to do when they get a customer issue. The scripts ensure that only accurate, company-endorsed information is being shared, while also safeguarding the organization in regard to legal-compliance issues. Agent scripts help organizations to be unified, accurate, and effective while being quick and efficient in handling customer needs.

Smart assist

Smart assist is an intelligent assistant that provides real-time recommendations to agents, helping them take actions while interacting with customers. You can use the AI-based suggestions for knowledge articles and similar cases by enabling the feature. You can also build a custom bot to interpret the conversation context and provide suggestions to agents. These recommendation cards are displayed on the agent user interface based on the context of the current conversation.

The smart assist feature can be enabled across all channels like Chat for Dynamics 365 Customer Service, SMS, and Facebook, except entity records, making it a consistent experience for agents.

Microsoft Teams

Microsoft Teams is a tool that can help agents more easily collaborate with colleagues by using the capabilities of Teams within Dynamics 365. Agents can view their chats, and with admin setup, can view chats that are relevant to certain records, also known as connected chats. Connecting all of their chats in one place helps agents work without switching context or leaving the application. Admins can also configure an optional introduction note that agents can use to provide further context when collaborating on Teams.

Custom productivity tools (preview)

The productivity pane supports custom productivity tools developed as custom pages or Power Apps component framework controls. You can create multiple custom productivity tools and make them available to your users with agent experience profiles.

Manage smart assist

Article • 06/09/2023

The new-age customer service industry is moving toward the vision of being intelligent rather than process-driven while interacting with customers. Pivoting on intelligence capabilities helps unleash the productivity of agents to perform better on key performance indicators and—at the same time—deliver better customer experience.

Smart assist is an intelligent assistant that provides real-time recommendations to agents, helping them take actions while interacting with customers. It allows organizations to build a custom bot and plug-in to their environment. These custom bots interpret conversations in real time and provide relevant recommendations such as knowledge articles, similar cases, and next-best steps to the agent's user interface.

The smart assist feature can be enabled across all channels, such as Chat for Dynamics 365 Customer Service, SMS, and Facebook (excluding Entity Records Channel), making it a consistent experience for agents.

> **ⓘ Important**
>
> The smart assist recommendations are displayed only after the agent sends a message.

Value proposition

- Contextual recommendations are generated based on real-time conversations.
- Plug-in organization-specific recommendations are displayed to agents in real time.
- Action-oriented recommendations are displayed for agents to send responses or run automated actions.
- Intelligence is powered by using Microsoft Azure or third-party capabilities.
- Agents can achieve improved average handling time and first call resolution.

Prerequisites

- Productivity pane must be enabled. Out of the box, productivity pane is enabled by default.

- Smart assist must be enabled.
- One of the following:
  - AI-suggested similar cases and knowledge articles should be enabled by your administrator.
  - Develop a smart assist bot and integrate it with Omnichannel for Customer Service. The smart-assist bot interprets the conversation context in real time and provides suggestions to agents. For information: Build a smart assist bot using Azure Bot Service.

> **Note**
>
> Power Virtual Agents bots aren't supported as smart assist bots.

Enable AI suggestions for similar cases and knowledge articles

To enable AI-suggested similar cases and knowledge articles, see Enable AI suggestions for similar cases and knowledge articles.

Enable smart assist for the bot framework in Omnichannel for Customer Service

To enable smart assist for the bot framework in Omnichannel for Customer Service, perform the following steps:

1. Create a bot user
2. Add smart assist bot to a workstream

Create a bot user

Create a bot user in the application to work as a smart assistant to the agent. A bot user is created as an application user and assigned the **Omnichannel agent** role. If your bot needs to search for knowledge base articles, then you need to provide either the **Customer Service Manager** or **Customer Service Representative** role.

You can create an application user only in the web client. Use the bot application ID of the smart assist bot to create the bot user. More information: Create a bot user

Add a smart assist bot to a workstream

After you create a bot user, you need to add the bot to the workstream so that agents who use the channel of this workstream can see the suggestions.

1. In Customer Service admin center, go to **Workstreams** in **Customer support**, and select the workstream in which you want to add the smart assist bot.
2. Expand **Advanced settings**, and select **Add bot** in the **Smart Assist bots** area.
3. In the **Add from existing** panel, select a bot user from the list, and then select **Add**.

You can add multiple bots to a workstream based on your business requirements.

Agent scripts

Guide agents with scripts

Article • 06/09/2022

In the customer service industry, agents need to deal with continuous updates both to products and processes. Even after agents have been rigorously trained, recurrent human errors and delays in service delivery occur due to a lack of guidance in real-time customer scenarios. These issues lead to lower productivity and thus negatively affect customer satisfaction levels. To avoid errors and ensure that processes are adhered to, agents need guidance.

Agent scripts provide guidance to agents about what to do when they get a customer issue. The scripts ensure that only accurate, company-endorsed information is being shared, while also safeguarding the organization in regard to issues of legal compliance. Agent scripts help organizations to be unified, accurate, and effective while also being faster and more efficient in terms of customer handling.

Agent scripts reduce the human errors involved, because agents know which actions they need to perform next while they interact with a customer, enabling agents to adhere to the business process. This, in turn, leads agents to provide quick resolutions for the issue (low average handling time) and improve customer satisfaction.

Value propositions

- Minimization of human errors
- Adherence to business processes
- Lower average handling time
- Improved customer satisfaction

Prerequisites

- Ensure that you have the **Productivity tools administrator** security role. To learn more, see Assign roles and enable users.
- Ensure that agents and supervisors are assigned the **Productivity tools user** security role. To learn more, see Assign roles and enable users.

Create agent scripts

Create agent scripts in the Customer Service admin center, Omnichannel admin center, Omnichannel Administration, or Customer Service Hub app. The following procedure is

an example of an agent script for a chat session. You can modify the procedure for other types of sessions your agents are likely to come across.

1. Sign in to Power Apps, and go to the app profile manager page.
2. In the left pane, under **Productivity**, select **Agent scripts**. The Unified Interface page opens on a new tab.
3. On the page that appears, select **New**.
4. On the **New Agent script** page, specify the following:

Field	Description	Value
Name	A name for the agent script.	Chat session script
Unique Name	A unique identifier in the *<prefix>_<name>* format. **Important:** The following are required for the unique name: • The prefix can only be alphanumeric and its length must be between 3 to 8 characters. • An underscore must be there between the prefix and name.	Contoso_script
Language	A language from the list. The languages that are enabled in Microsoft Dataverse appear in the list.	English
Description	Description for the agent script.	This agent script is used for chat sessions.

5. Select **Save**. The **Agent script steps** appears.
6. In the **Agent script steps** section, select **New Agent script step**. **Quick Create: Agent script step** appears.
7. Specify the following fields in the quick-create form.

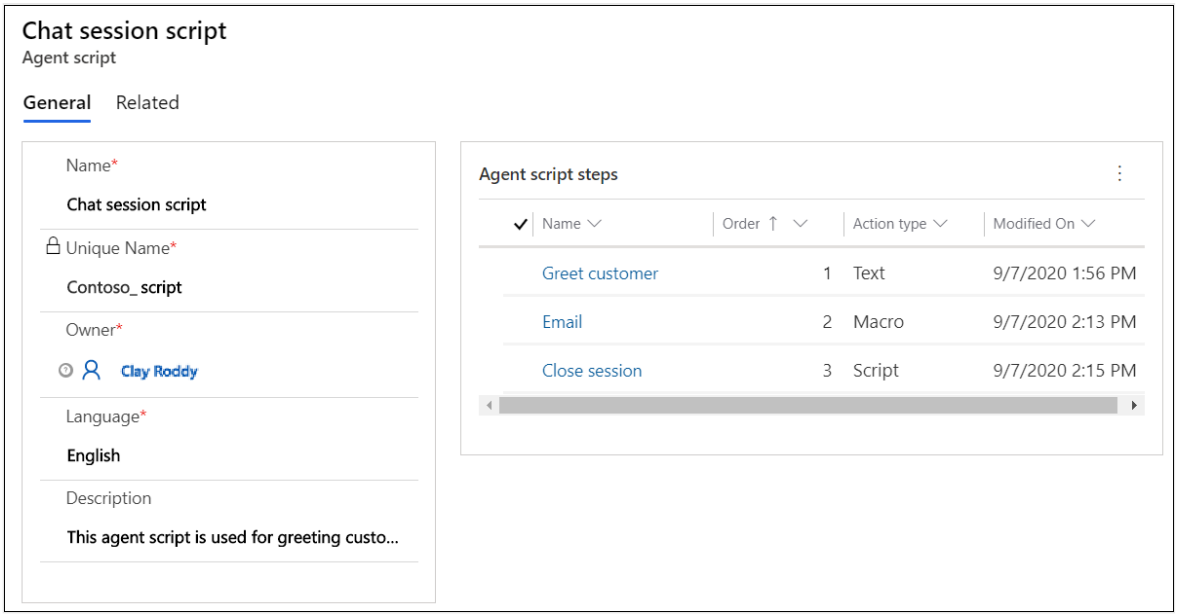
Field	Description	Example Value
Name	Provide a name for the agent script step; this appears for the agent at runtime. You can use slugs for specifying the name of the step. To learn more, see Slugs.	Example 1: Greet the customer. Example 2: Hi {customer}

Field	Description	Example Value
Unique Name	A unique identifier in the <*prefix*>_<*name*> format. **Important:** The following are required for the unique name: • The prefix can only be alphanumeric and its length must be between 3 to 8 characters. • An underscore must be there between the prefix and name.	Greet_script
Owner	By default, the signed in user is displayed as the owner.	Clay Roddy
Agent script	The agent script for which the script step is being created.	Chat session script
Order	Specify the order number based on which step is displayed to the agent.	1
Action Type	Select an action type from the list: • Text instruction • Macro • Script	
Description	Describe the step briefly for your reference.	This step opens a draft email to send the customer links to knowledge articles. **Note:** This field appears only when you select the **Action Type** value as **Target Macro** or **Target script**.
Text instruction	Specify the text instructions the agent needs to follow and execute. This is a text field. Additionally, you can pass parameter values by using the slugs and OData queries. More information: Pass parameter values **Note:** This field appears only if you select the **Text** value for the **Action Type** field.	Greet the customer with the welcome message from the quick reply repository.

Field	Description	Example Value
Target macro	Type the name of the configured macro in the text box, and then select the macro from the lookup results. **Note:** This field appears only if you select the **Macro** value for the **Action Type** field.	Email
Target script	Type the name of the configured script in the text box, and then select the script from the lookup results. **Note:** This field appears only if you select the **Script** value for the **Action Type** field.	Close the session

8. Select **Save and Close** to add, save, and close the quick-create form.

9. Select **Save** to save the changes.



The agent script is now configured.

Associate an agent script with a session template

After you configure the agent script and add the field to a form, you need to associate the agent script with a session template so that the agent script will load for agents based on the type of session they've opened.

1. Select one of the following apps, and perform the steps.

   Customer Service admin center

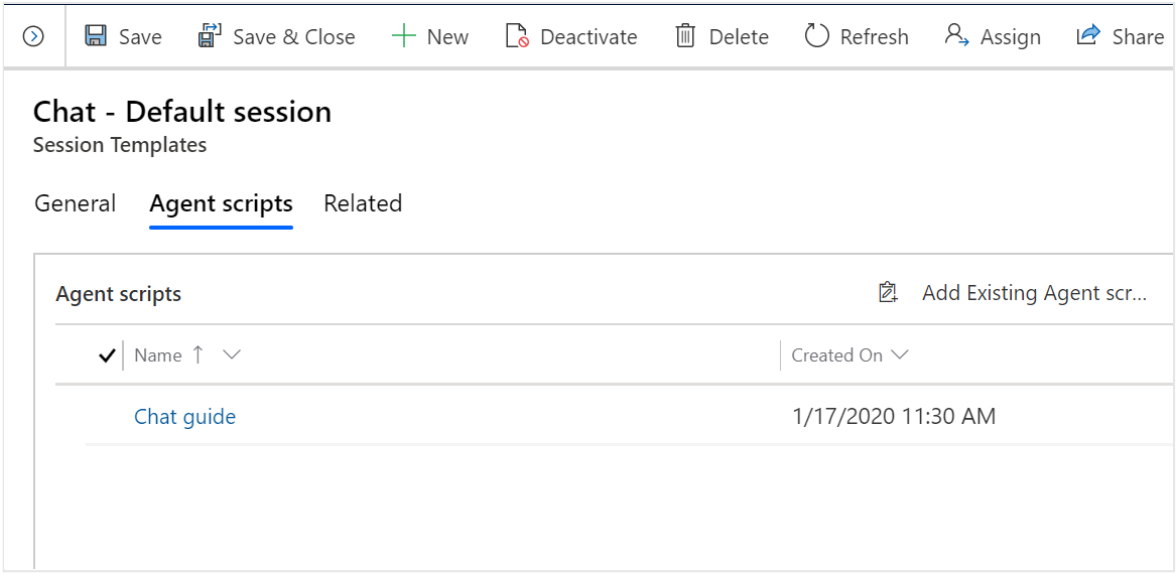
   In the site map, select **Session templates** in **Workspaces**.

2. Select a template from the list for which you want to associate the template. For example, select the **Chat - Default Session** template.

3. Select the **Agent scripts** tab.

4. In the **Agent scripts** section, select **Add Existing Agent script**. The **Lookup Records** pane appears.

5. In the **Look for Records** box, select the search icon. Select the agent script from the list, and then select **Add**.



6. Select **Save**.

The agent script is associated with the session template.

Set the default agent script for agents

As an administrator, you can set different default agent scripts for agents who handle different services, customers, or products. You need a way to show these agents a script that's appropriate for the context of the conversation between them and the customer. With the agent script expression builder, you can define the conditions that define which script an agent is shown by default in Omnichannel for Customer Service.

Based on these conditions, when an agent accepts an incoming conversation, the agent script control selects a script from the different scripts that were made available for that particular session type and shows the script to the agent. In addition, agents can manually select a script from the list of available agent scripts if they need to switch between different scripts.

Enable and build the expression

You can build the expression in the **Agent scripts** tab in the sessions template.

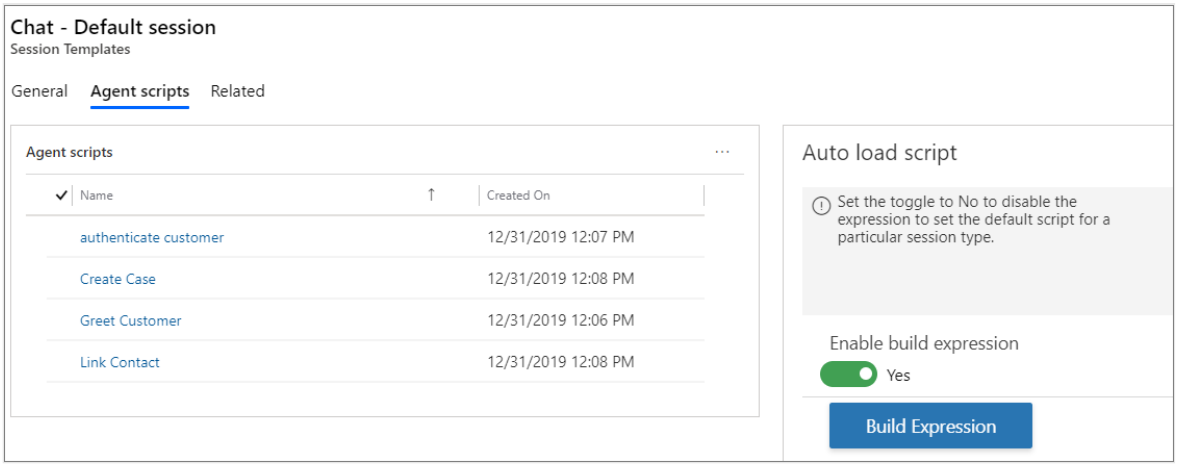
1. Select one of the following appss, and perform the steps.

   Customer Service admin center

   In the site map, select **Session templates** in **Workspaces**.

2. Go to the **Agent scripts** tab.

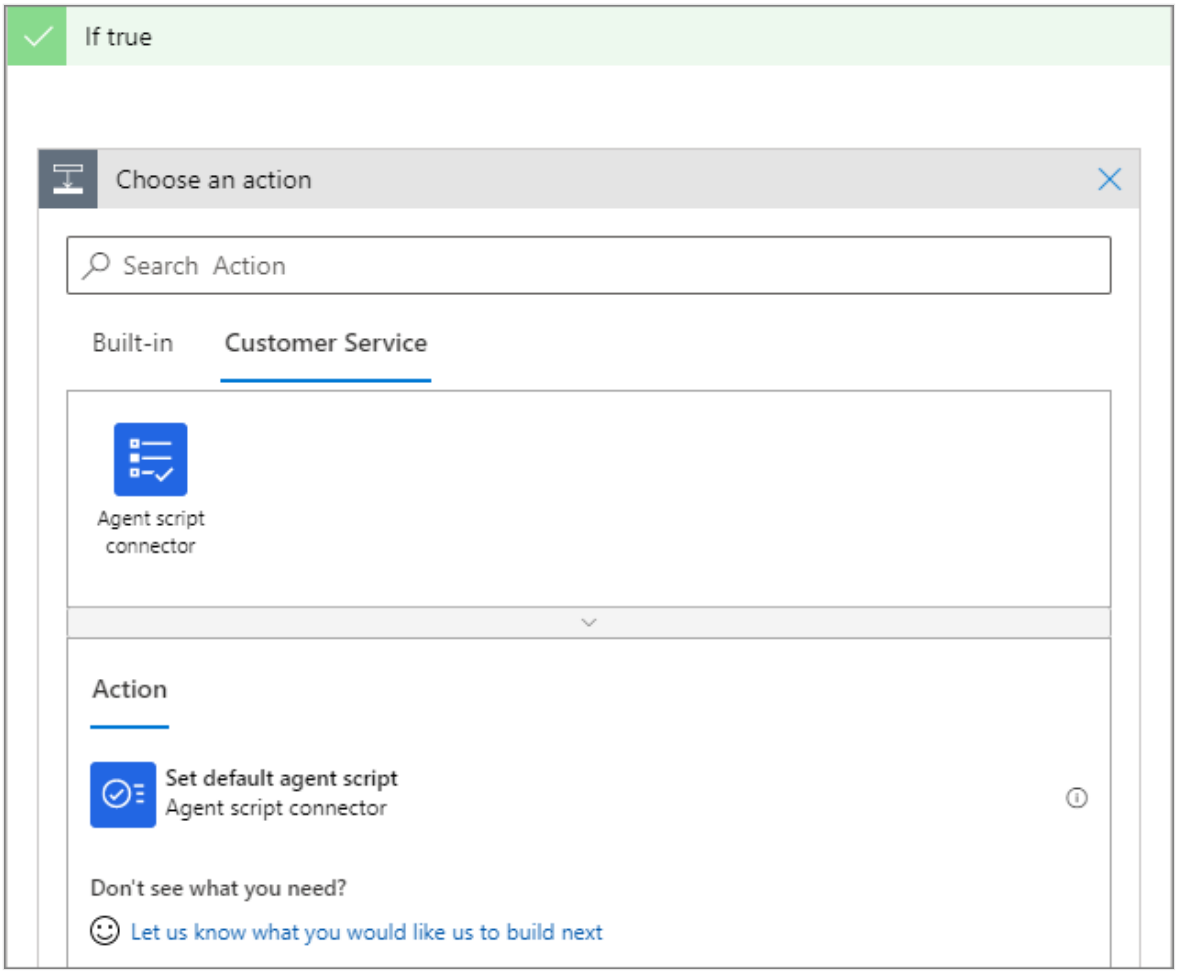
3. Set the **Enable build expression** toggle to **Yes**, and then select **Build Expression** to define the expression. The **Expression builder** page is displayed.



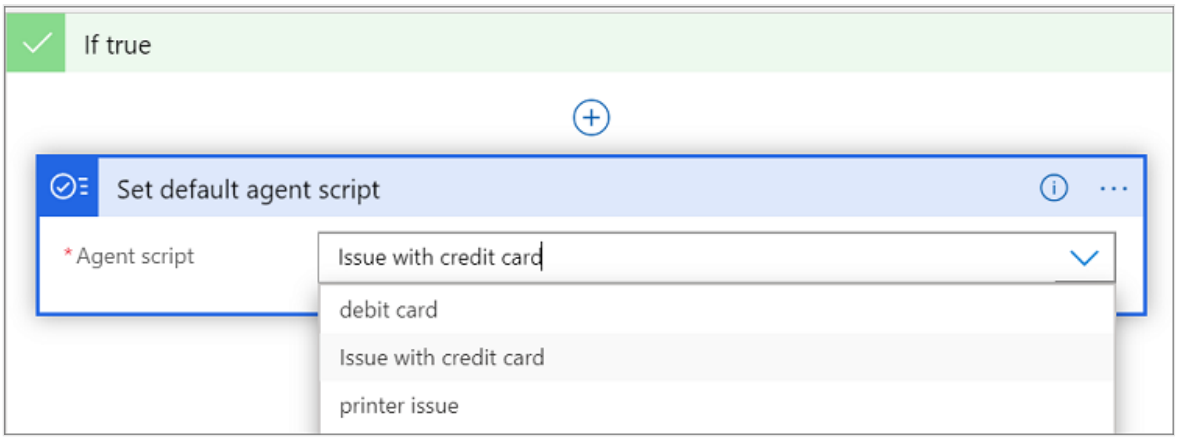
4. Select the **Condition** step, and then create the condition.

5. In the **If true** step, select **Add an action**. The **Condition** step is displayed. To learn about conditions, see Use the automation dictionary to pass context data parameters.

6. Select the **Customer Service** tab, and then select **Set default agent script**.



7. Select a script from the **Agent script** list.



8. Follow steps 4 through 7 for the **If false** step.

9. Select **Save and close** to save the expression and close the builder.

Now, you've built the expression.

Use the automation dictionary to pass context data parameters

As an administrator, you need to configure the condition by using the automation dictionary based on the evaluation of the condition. A script is set as default, and this script is displayed to the agent at runtime.

The automation dictionary provides you certain data parameter keys that you can use to build your condition. These parameter keys are resolved and replaced by contextual values at runtime.

To learn about the slugs for productivity tools, see Slugs.

To learn more, see Use the automation dictionary to pass data parameter keys.

Automate tasks with macros

Article • 06/16/2023

In the customer service industry, agents have to click often to perform simple tasks, such as open a form, fill, and save it, and many repetitive and monotonous actions, such as greeting and verifying a customer, sending acknowledgment mail, and taking notes. These clicks and repetitive tasks can lead to human errors when agents copy and paste the data across different operations.

Macros are a set of sequential actions that are performed by a user. They enable users to perform daily operations efficiently in a fast and process-compliant manner. You can reuse macros with different sessions based on the context parameters that are specific to the session.

The value propositions of the macros are as follows:

- Automate repetitive and monotonous tasks with a single click.
- Minimize human errors.
- Adhere to business processes.
- Lower average handling time.
- Improve customer satisfaction.
- Create contextual and reusable macros.

The macros in Customer Service workspace have the following:

- Predefined automation actions
- Built-in control

Prerequisites

- Install Dynamics 365 Productivity Tools solution.
- Ensure that you have the **Productivity tools administrator** security role. More information: Assign roles and enable users
- Ensure that agents and supervisors are assigned the **Productivity tools user** security role. More information: Assign roles and enable users

Predefined automation actions

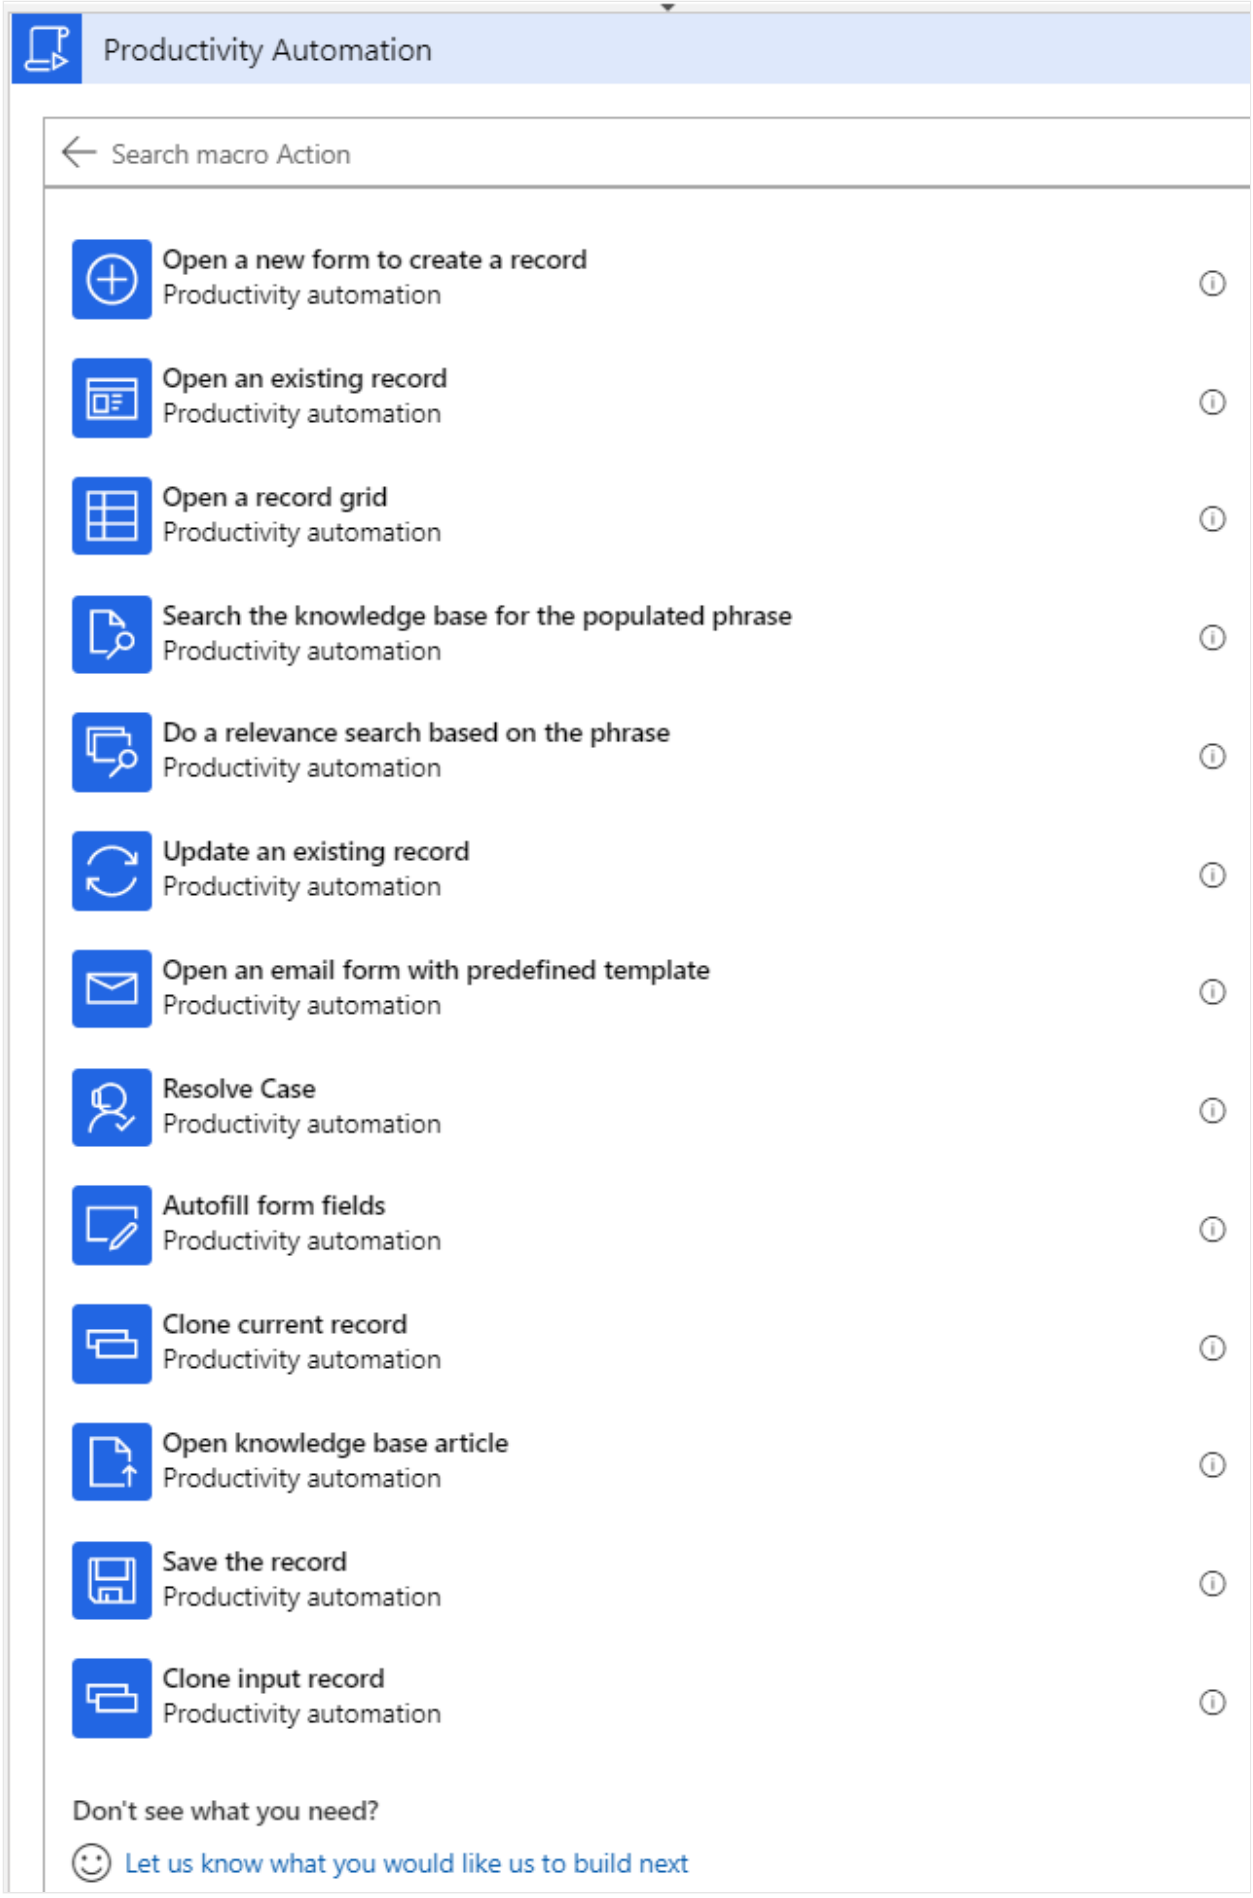
In Customer Service, macros provide three connectors:

- Productivity automation: Provides actions to perform model-driven app operations.
- Session connector: Provides actions to perform session-related operations.
- Omnichannel connector: Provides actions to perform Omnichannel for Customer Service–related operations.

Productivity automation

As an administrator, you can use the actions any number of times across different macros to automate and perform model-driven app operations.

The following screenshot shows the actions that are explained in the subsequent sections.



Open a new form to create a record

This action is used to open a new form to create a record. The action contains the following fields.

Field	Description	Parameter
Entity logical name	Specify the logical name of the entity that you want to open. This is a mandatory field.	incident
Entity form ID	Specify the form ID. This is an optional field.	
Attribute Name	Specify the attribute logical name. You need to provide the attribute name to prepopulate the field with a value.	
Attribute Value	Specify the attribute value. You need to provide the attribute value to prepopulate the attribute field.	

Open an existing record

This action is used to open an existing record form. The action contains the following fields.

Field	Description	Parameter
Entity logical name	Specify the logical name of the entity that you want to open. This is a mandatory field.	incident
Entity record ID	Specify the entity record ID. This is a mandatory field.	
Entity form ID	Specify the form ID. This is an optional field.	

Open a record grid

This action is used to open a record grid. The action contains the following fields.

Field	Description	Parameter
Entity logical name	Specify the logical name of the entity for which you want to open the grid. This is a mandatory field.	incident
View ID	Specify the ID of the view that you want to open. This is a mandatory field.	

Field	Description	Parameter
View type	Specify the view type. This is a mandatory field.	

Search the knowledge base for the populated phrase

This action is used for searching knowledge articles based on the populated phrase. The action contains the following field.

Field	Description	Parameter
Search string	Provide the phrase based on which you want to search for knowledge articles. You can provide the context data. For example, the context data parameter can be a case title.	
Tab Label	Specify the tab label.	

Do a relevance search based on the phrase

This action is used for searching knowledge articles based on the populated phrase. The action contains the following field.

Field	Description	Parameter
Search string	Provide the phrase based on which you want to do a relevance search. You can provide the context data. For example, the context data parameter can be a case title. This is a mandatory field.	

Update an existing record

This action is used to update an existing record. The action contains the following fields.

Field	Description	Parameter
Entity logical name	Specify the logical name of the entity that you want to update. This is a mandatory field.	incident
Entity record ID	Specify the entity record ID. This is a mandatory field.	

Field	Description	Parameter
Attribute Name	Specify the attribute logical name you want to update.	
Attribute Value	Specify the attribute value that will be updated for the above-mentioned attribute.	

Set Agent Script focus

This action is used to set the focus on an agent script that needs to run next. The agent script will be set in focus in the **Agent scripts** dropdown on the app side pane. For example, if the agent needs to process a refund complaint. The agent will use different scripts to greet, initiate a complaint request, and process the refund. You can define macros that will set the focus on the agent scripts that need to be run for each stage of the refund process. The action contains the following field.

Field	Description	Parameter
Agent Script Unique Name	Specify the agent script that needs to be in focus.	The unique name of the agent script.

Open an email form with predefined template

This action is used to open an email with a predefined template. The action contains the following fields.

Field	Description	Parameter
Entity logical name	Specify the logical name of the entity. This is a mandatory field.	incident
Entity record ID	Specify the entity record ID. This is a mandatory field.	
Email recipients	Specify the recipients to whom you want the mail to be sent. This is a mandatory field.	
Template ID	Specify the ID of the template that must displayed in the email. This is a mandatory field.	

Resolve a case

This action is used to resolve a case. The action contains the following fields.

Field	Description	Parameter
Billable time	Specify the time that is billable. This is a mandatory field.	incident
Incident ID	Specify the ID of the case that you want to close. This is a mandatory field.	
Resolution	Specify the reason to resolve the case. This is a mandatory field.	

Autofill form fields

This action is used for updating the form attribute (field). The action updates the attribute of a form if that form is currently in focus and has the same entity type as mentioned in action. If the action is run for any other entity, then the action will fail. Also, the action only updates the field and doesn't save the record. The action contains the following field.

Field	Description	Parameter
Entity logical name	Specify the logical name of the entity that you want to update. This is a mandatory field.	incident

Clone current record

This action is used for cloning an existing record that is open in the current tab. The action only copies the fields and does not save the record. The action contains the following field.

Field	Description	Parameter
Record title	Specify the title of the record that you want to clone. This is a mandatory field.	

Open knowledge base article

This action is used to open the knowledge base article. The action contains the following field.

Field	Description	Parameter

Field	Description	Parameter
Entity record ID	Specify the entity ID of the knowledge base article that you want to open. This is a mandatory field.	

Save the record

This action saves the record after you've entered data in all the mandatory fields. The action fails if the mandatory fields aren't entered or are left blank.

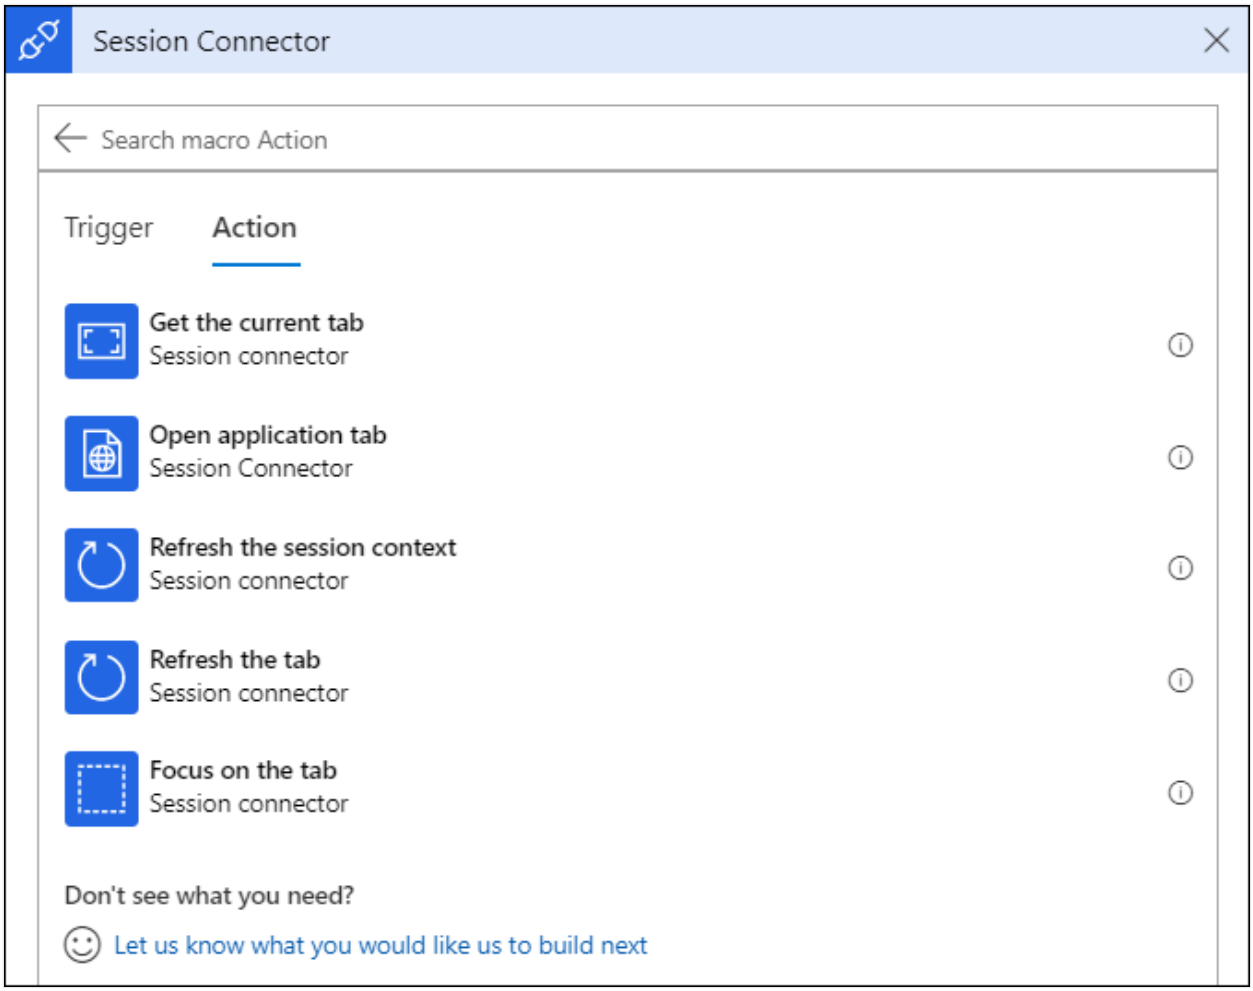
Clone input record

This action clones an existing record. The action only copies the fields and does not save the record. The action contains the following fields.

Field	Description	Parameter
Entity logical name	Specify the logical name of the entity that you want to clone. This is a mandatory field.	
Entity record ID	Specify the ID of the entity record. This is a mandatory field.	
Record title	Specify the record title.	

Session connector

As an administrator, you can use the actions any number of times across different macros to automate and perform operations related to a session in Customer Service workspace.



Get the current tab

This action gets the details of the current tab in Omnichannel for Customer Service. The action retrieves the Tab ID that could be used in the **Refresh tab** and **Focus tab** actions.

Open application tab

This action opens the specified application in a new tab with the attributes that you define. The action contains the following fields.

Field	Description	Parameter
Page type	Specify the application type to be opened. More information: Page types This is a mandatory field.	
Application Template ID	Specify the ID of the application template. This is a mandatory field.	
Attribute Name	Specify the attribute logical name you want to update.	
Attribute Value	Specify the attribute value that will be updated for the above-mentioned attribute.	

Refresh the session context

This action refreshes the session context in Customer Service workspace for entity sessions. For example, if you launch an entity session for a case record, the session context variables will be defined when the session starts. However, if you update the case title, the session context will not be updated. Therefore, macros will use the cached information. You can add the **Refresh the session context** step after starting the macro run to use the latest information.

Refresh the tab

This action refreshes a tab in the Customer Service workspace session. This action contains the following field.

Field	Description	Parameter
Tab ID	Specify the ID of the tab that you want to refresh. This is a mandatory field.	

Focus on the tab

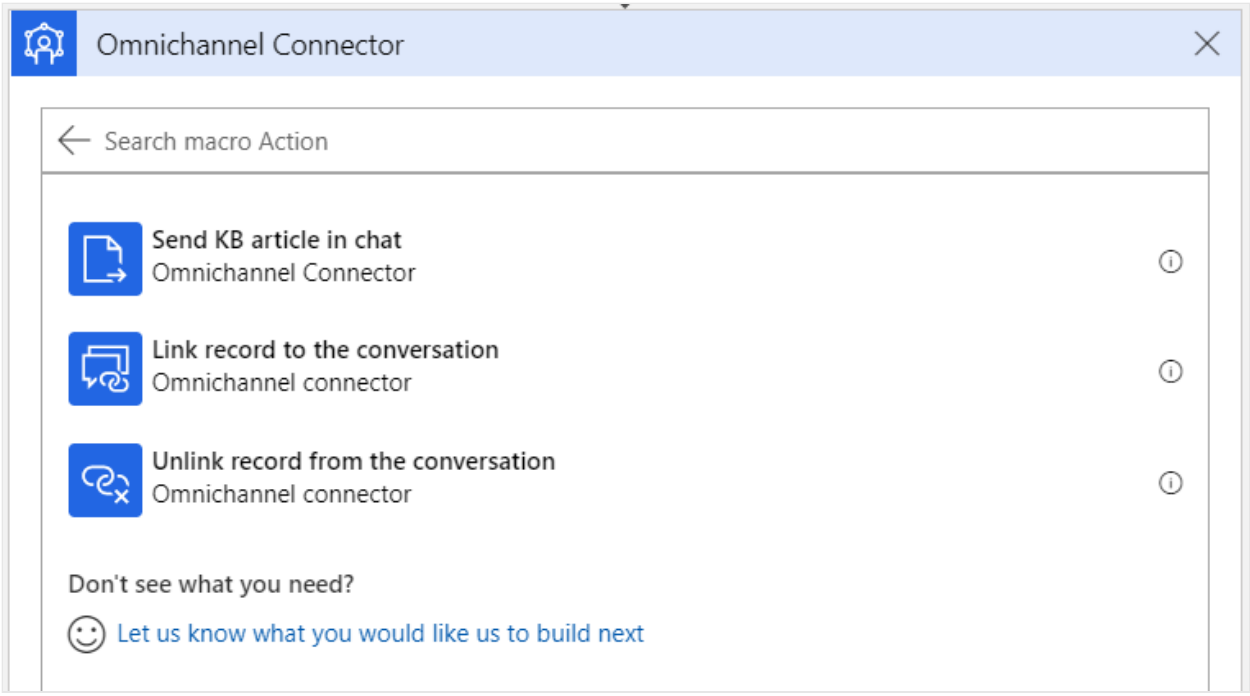
This action focuses on a tab in the Customer Service workspace session. This action contains the following field.

Field	Description	Parameter
Tab ID	Specify the identifier of the tab that you want to give focus to. This is a mandatory field.	

Omnichannel connector

As an administrator, you can use the actions any number of times across different macros to automate and perform operations related to Omnichannel for Customer Service.

> **Note**
>
> Macro actions for the Omnichannel connector is available if Customer Service workspace in Omnichannel for Customer Service is installed.



Send knowledge base article link in chat

This action sends a knowledge base article link to the conversation chat window. It must be used with the **Search knowledge base for the populated phrase** action. Make sure that your admin has switched the **Use an external portal** toggle to **Yes**. More information: Set up knowledge management

The action contains the following field.

Field	Description	Parameter
Entity record ID	Specify the ID of the entity record. This is a mandatory field.	

Link record to the conversation

This action links a record to the conversation when the customer is communicating with the agent in the Omnichannel for Customer Service session. This action contains the following fields.

Field	Description	Parameter
Entity Logical Name	Specify the logical name of the entity that you want to link. This is a mandatory field.	incident
Entity record id	Specify the entity record ID of the entity that you want to link. This is a mandatory field.	

Field	Description	Parameter
Entity primary Name	Specify the primary name of the entity that you want to link. This is a mandatory field.	

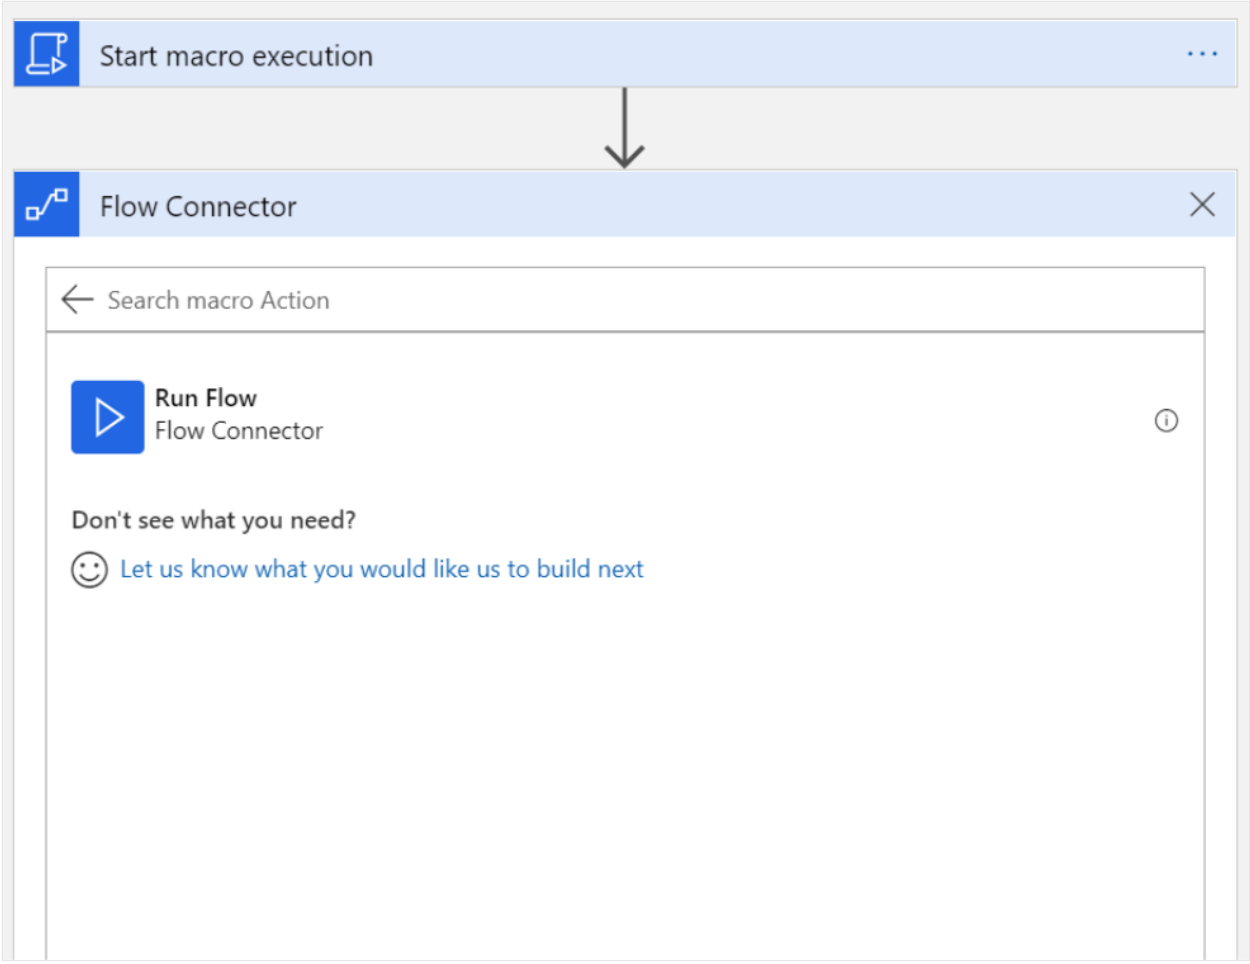
Unlink record from the conversation

This action unlinks a record from the conversation when the customer is communicating with the agent in the Omnichannel for Customer Service session. This action contains the following fields.

Field	Description	Parameter
Entity Logical Name	Specify the logical name of the entity that you want to unlink. This is a mandatory field.	incident
Entity record id	Specify the entity record ID of the entity that you want to unlink. This is a mandatory field.	
Entity primary Name	Specify the primary name of the entity that you want to unlink. This is a mandatory field.	

Flow connector

As an administrator, you can use the actions any number of times across different macros to automate and perform operations related to Omnichannel for Customer Service and Customer Service workspace.



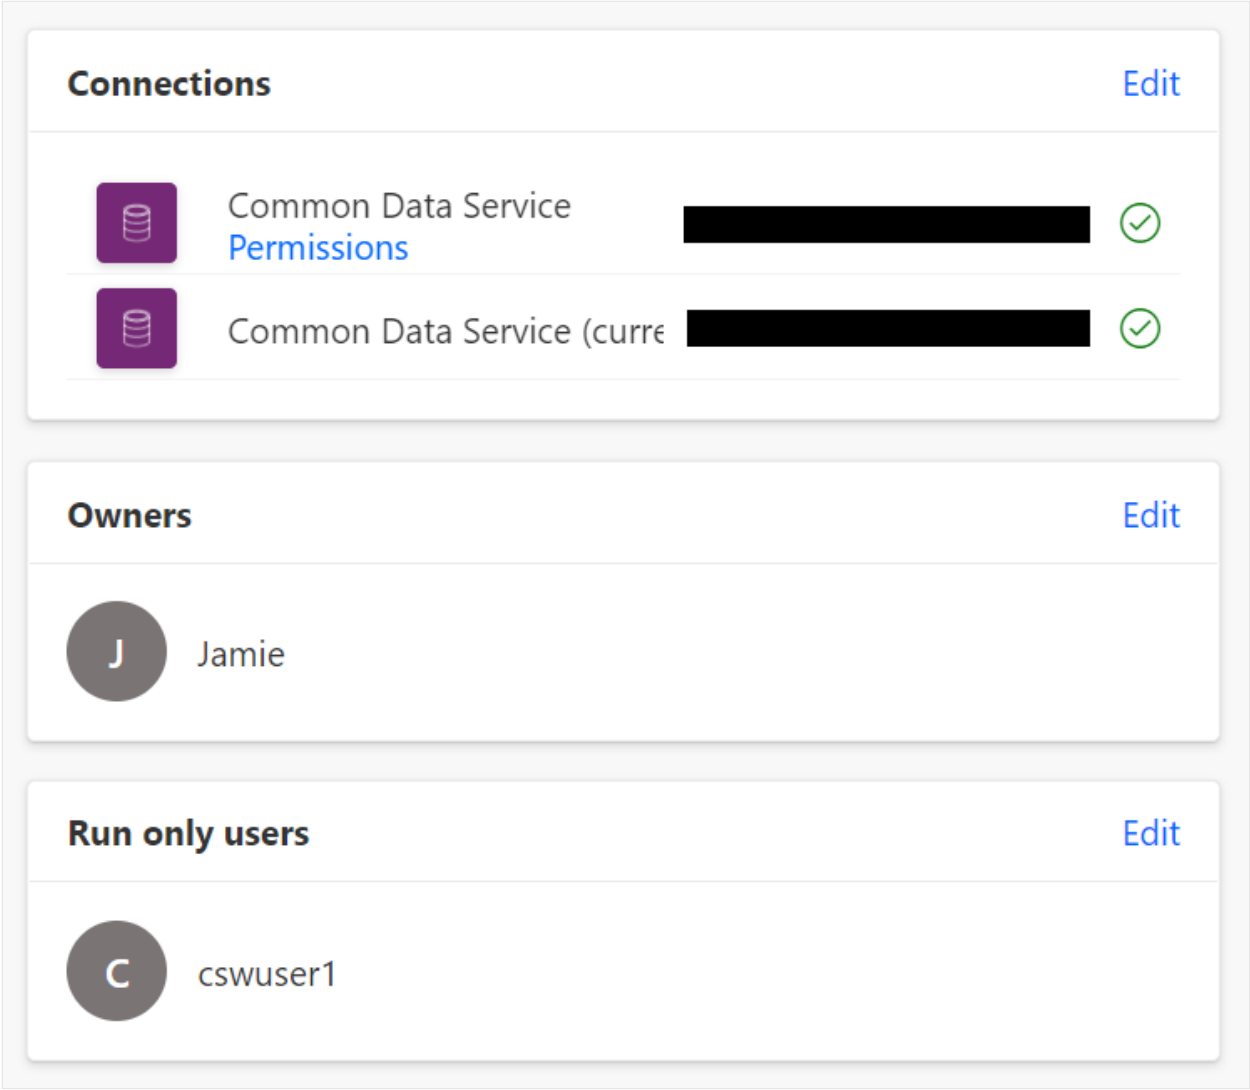
Run Flow

This action triggers Power Automate flows using macros in agent scripts. This action contains the following fields.

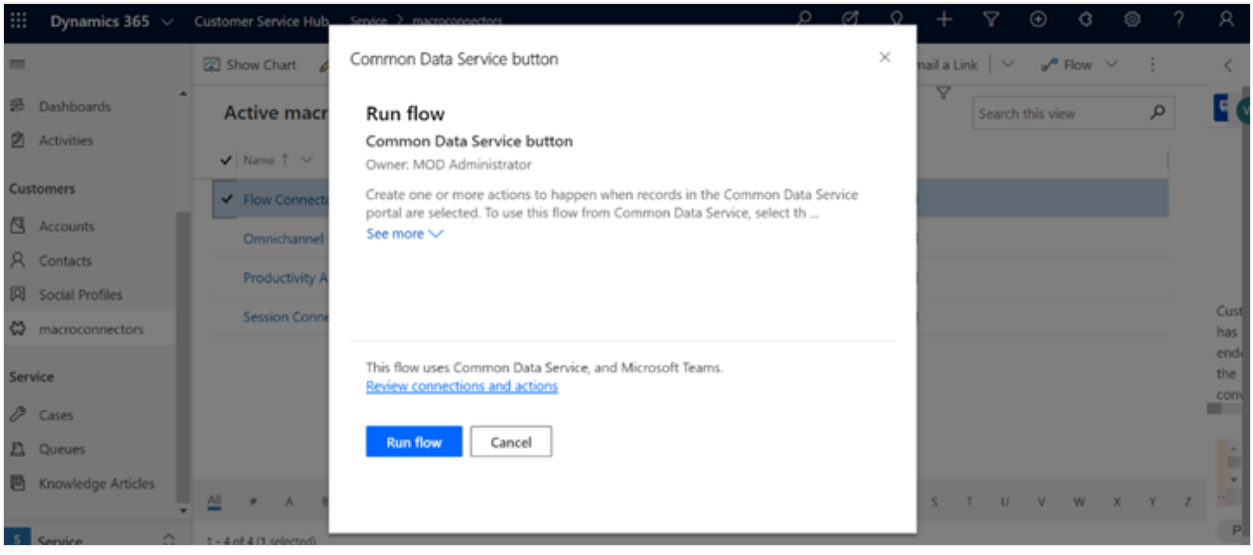
Field	Description	Parameter
Entity logical name	Specify the logical name of the entity that you want to link. This is a mandatory field. Any Microsoft Dataverse entity, such as Account, can be used based on business needs.	account
Entity record id	Specify the entity record ID of the entity that you want to link. This is a mandatory field. Ids or slugs, such as {customerRecordId}, can be used. While this field is labeled as entity record id, any value to be processed can be passed. While the field is required, values do not have to be functional unless required for the flow logic.	{customerRecordId}
Select flow	Specify or select the Power Automate flow to be run by this action. Requires instant cloud flows with *When a record is selected* flow triggers. Existing flows with proper permissions will be detected and displayed in the drop-down list.	

Power Automate flow permissions

Referenced flows require valid connection and run permissions for the Omnichannel for Customer Service and Customer Service workspace tenant and agents that run the flow from within agent scripts.

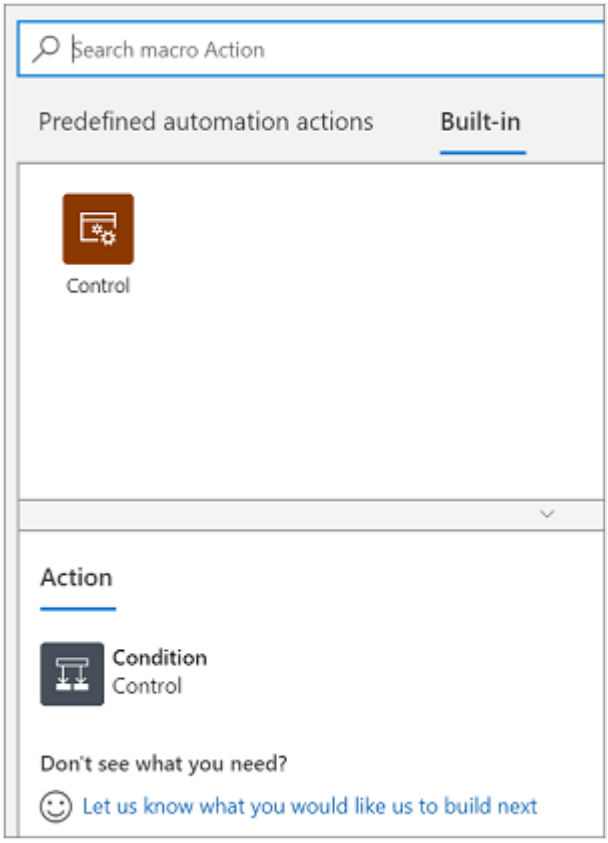


When you run the **Run flow** action, flows are run within the embedded flow widget on Omnichannel for Customer Service.



Built-in

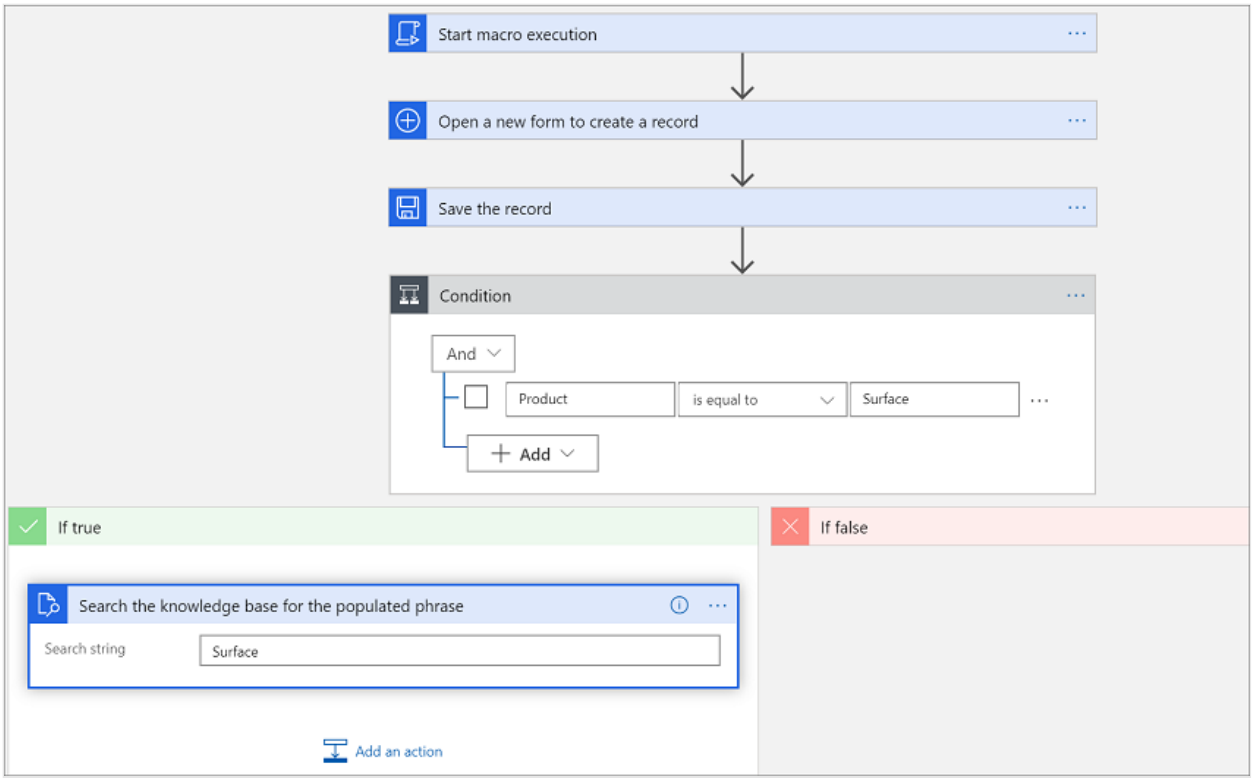
The Built-in control allows you to run a macro action step based on the conditions. The **Built-in** category connector has a **Condition** action.



To use the **Built-in** category, you first need to have a trigger (predefined automation actions). That is, select a predefined automation action first, and before or after a step, you can define the condition. You can also create nested conditions as per your requirements.

Using the **View run history** option for a particular macro, you can see the condition that was run and whether it succeeded.

For example, you want to open a new form and save it after entering the fields. If the **Product** field in the form has **Surface** as the value, evaluate it as true and then perform the knowledge base article search with the search phrase as **Surface**. If it is evaluated as false, don't perform any further actions.



Use the automation dictionary to pass macro context data parameters

Macros are a set of configured actions that are run on demand by users. As an administrator, you need to configure the actions that a macro must perform. To configure the actions, you need to provide certain data parameters keys. When an agent runs the macro, these data parameters keys are replaced by contextual values.

To learn about the slugs for productivity tools, see Slugs.

To learn more, see Use automation dictionary to pass data parameter keys.

Create a macro

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, in **Agent experience**, select **Productivity**.

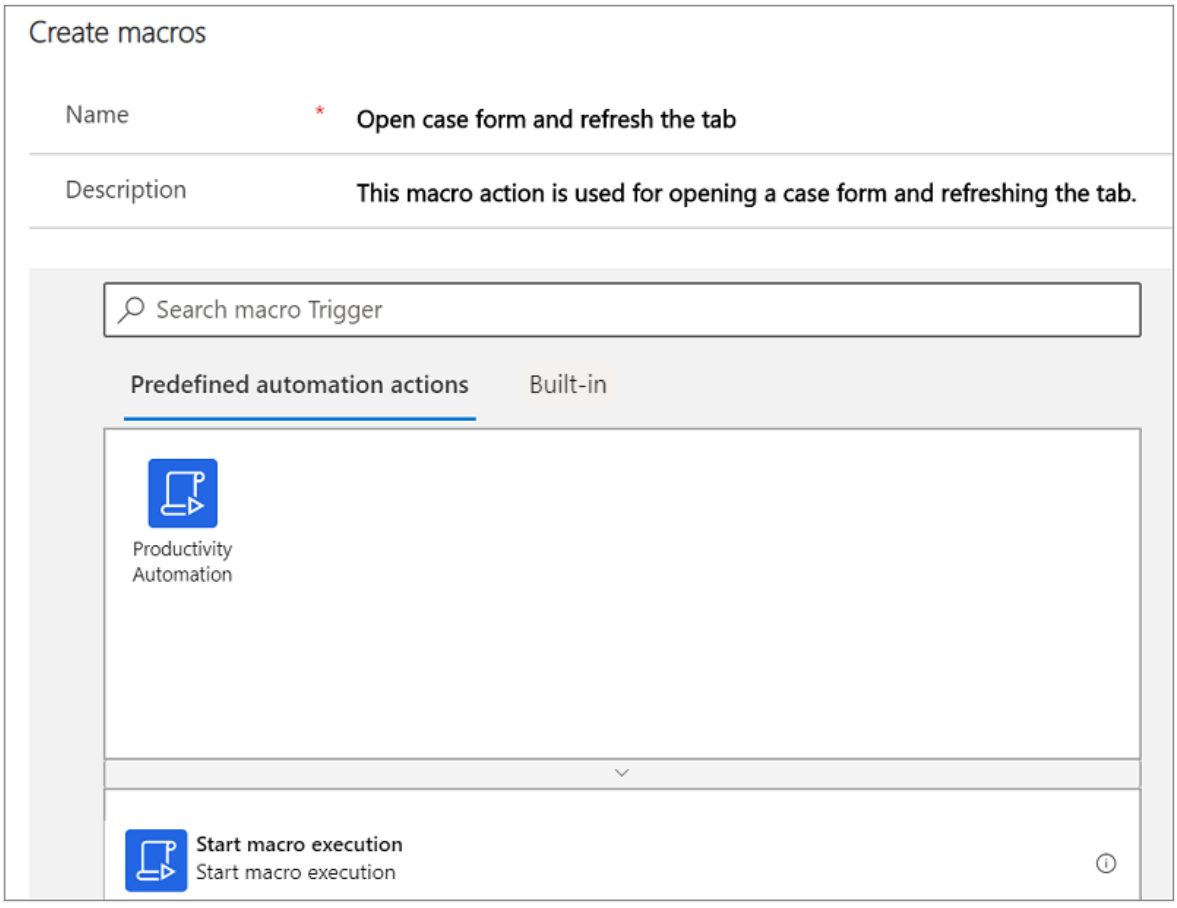
   b. For **Macros**, select **Manage**.

2. On the page that appears, select **New**.

3. On the **Macros** page, specify the following.

Field	Description	Example value
Name	Provide a name to the macro. The name is displayed to the agent at runtime.	Create case
Description	Describe the purpose of the macro. The description is displayed to the agent at runtime.	This macro action is used to create a case.

4. On the **Preferred automation actions** tab, select **Start macro execution**, and then select **New step**.



a. Select a connector from the list. The following connectors are available:

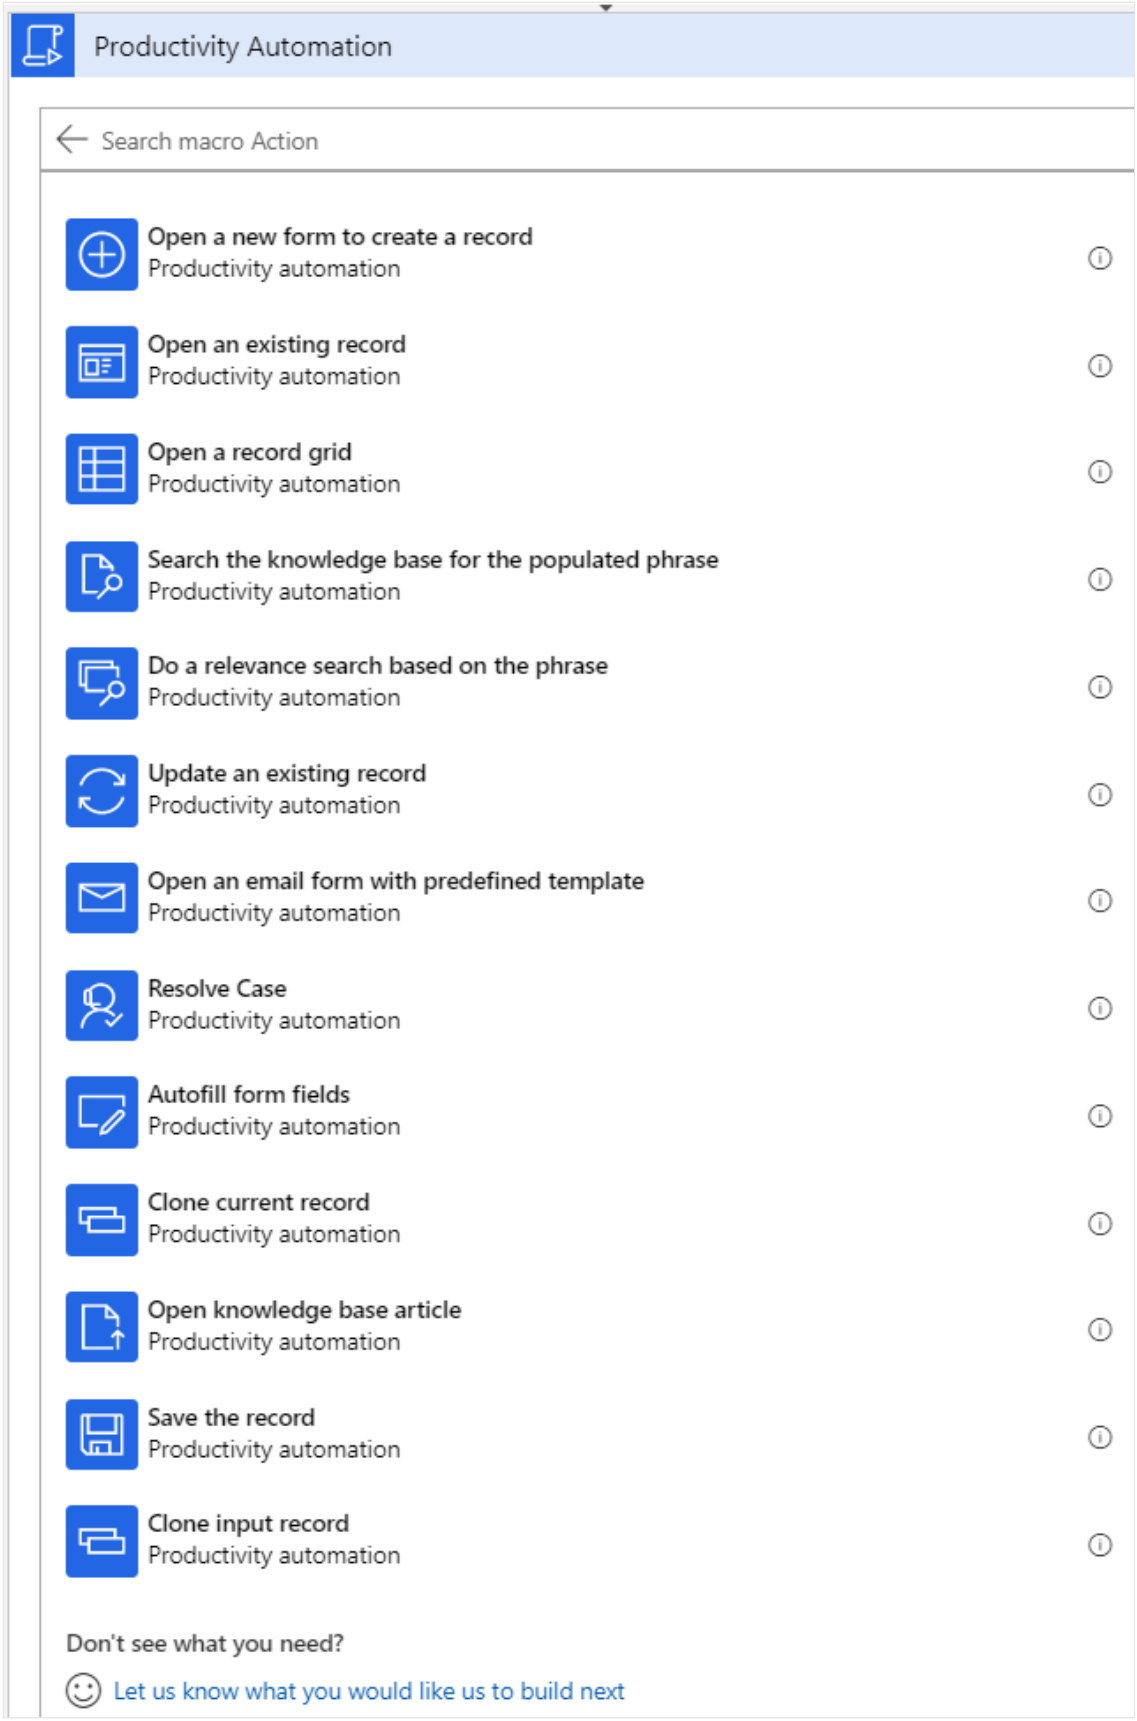
- Productivity Automation
- Session Connector
- Omnichannel Connector

b. Select an action from the list of actions. You can add as many actions as you need, based on your business requirements.

If you select **Productivity Automation**, you'll see the following actions.

Purpose	Action name

Purpose	Action name
Open a new form to create a record	Create new
Open an existing form	Open form
Open a record grid	Open grid
Search the knowledge base for the populated phrase	Search knowledge articles
Do a relevance search based on the phrase	Search
Update an existing record	Update record
Open an email form with predefined template	Open email
Resolve a case	Resolve case

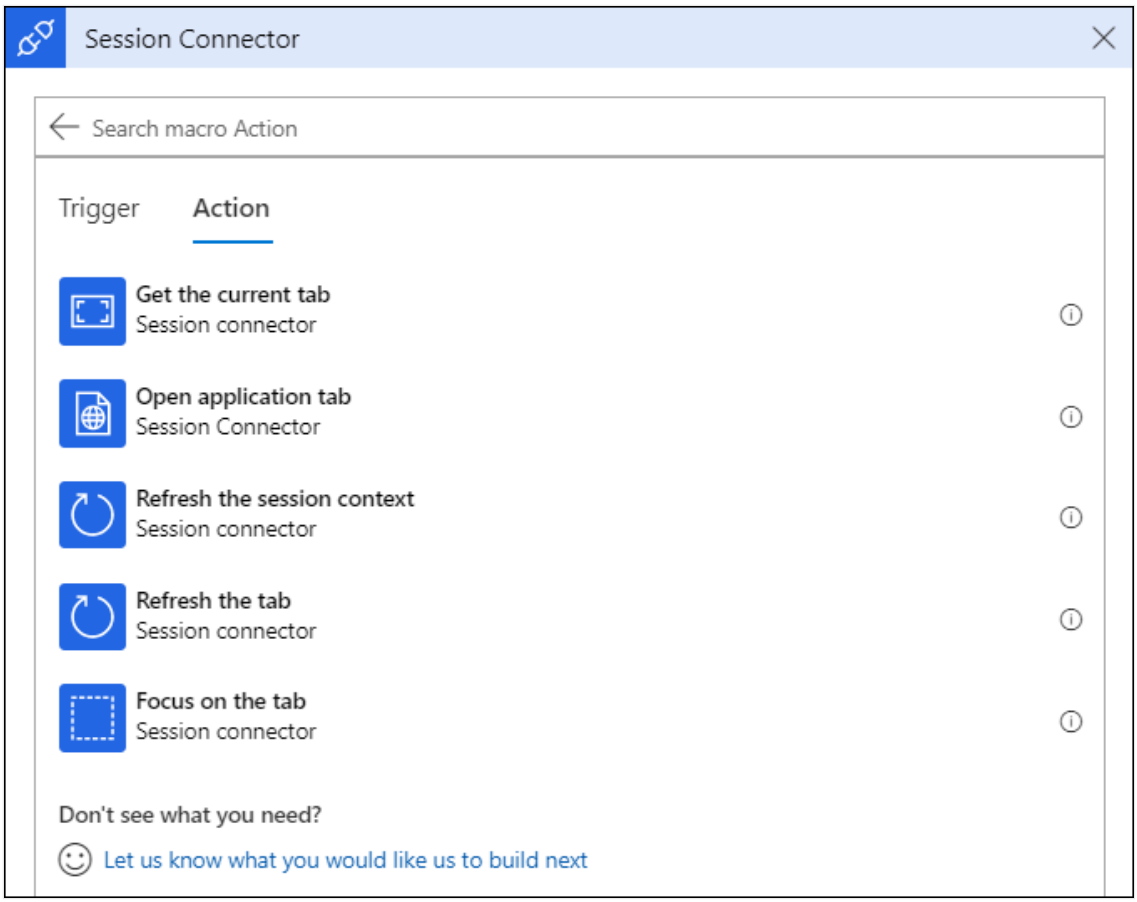


For example, select **Open a new form to create a record**, and the step appears. More information: Productivity automation.

If you select **Session connector**, you'll see the following actions.

Purpose	Action name

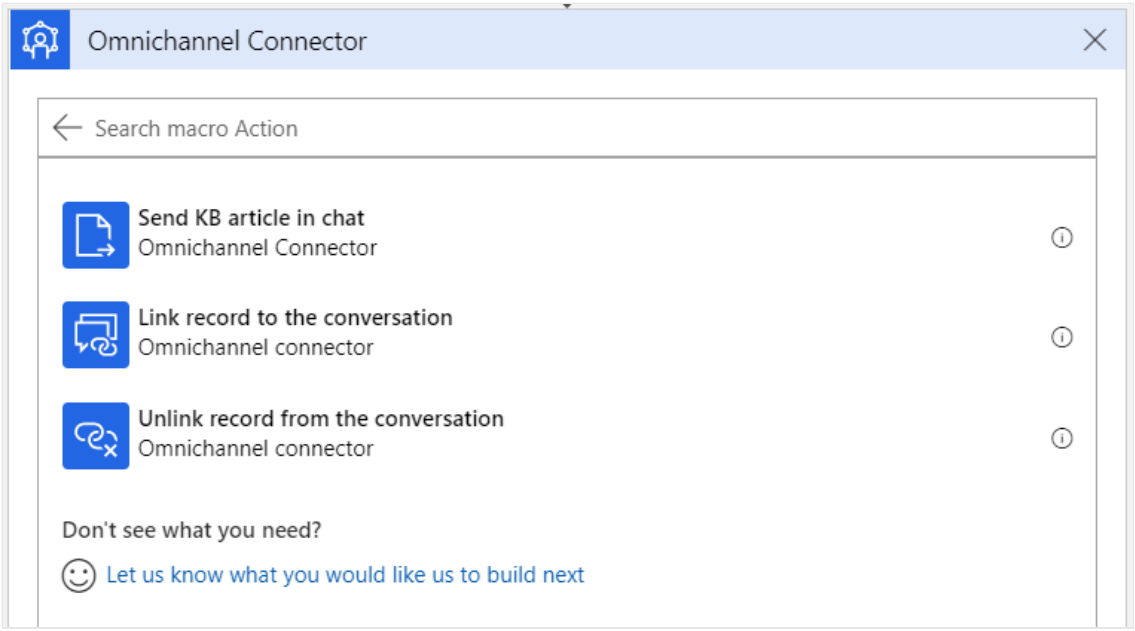
Purpose	Action name
Refresh the application tab	Refresh tab
Focus on a particular application tab from another application tab	Focus tab
Get the details of the current application tab	Get current tab



More information: Session connector

If you select **Omnichannel connector**, you'll see the following actions.

Purpose	Action name
Link a record to the conversation while interacting with the customer	Link record to the conversation
Unlink a record from the conversation while interacting with the customer	Unlink record from the conversation

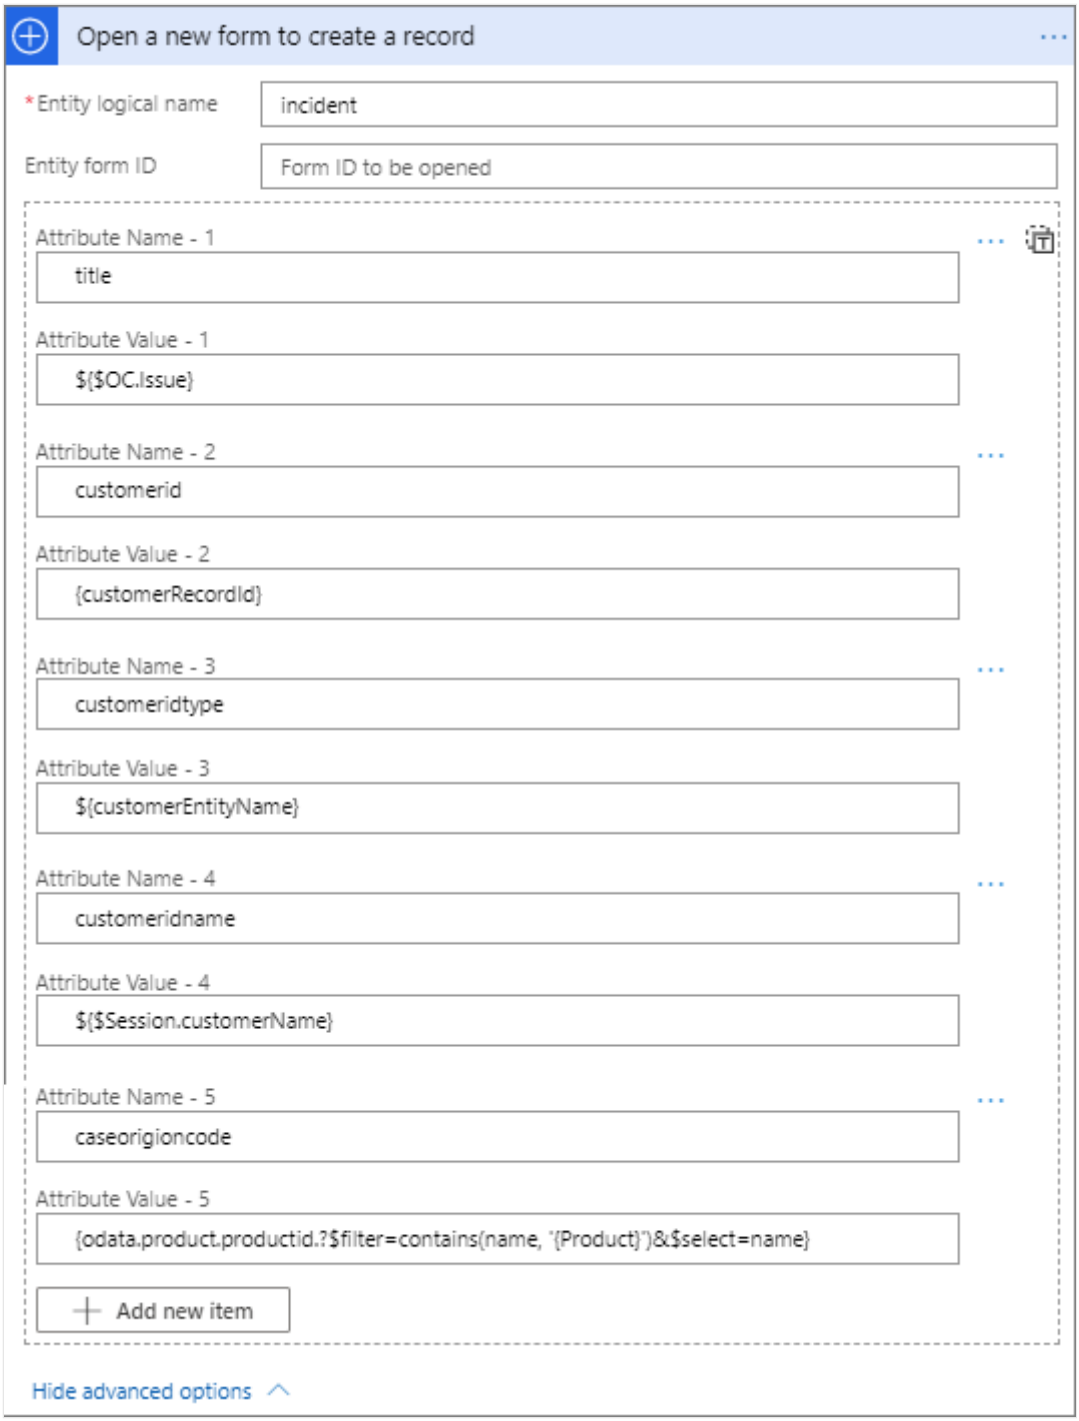


More information: Omnichannel connector

> **Note**
>
> Omnichannel connector is not available in Customer Service workspace.

5. Specify the values in the fields. To learn how to specify the values, see Use automation dictionary to pass data parameters keys.

   If you selected **Open a new form to create a record**, you can select **Show advanced options** to add the attributes and values you want. If required, you can select **Add new item** to add more attributes.



6. After you add an action step, to define conditions, select the **Built-in** tab, and select **Control**.

7. Select **Condition** to define the conditions. The condition has **If true** or **If false**. Define the condition as per your requirement.

8. To add another action step, repeat step 7 and optionally step 8.

9. Select **Save and close**.

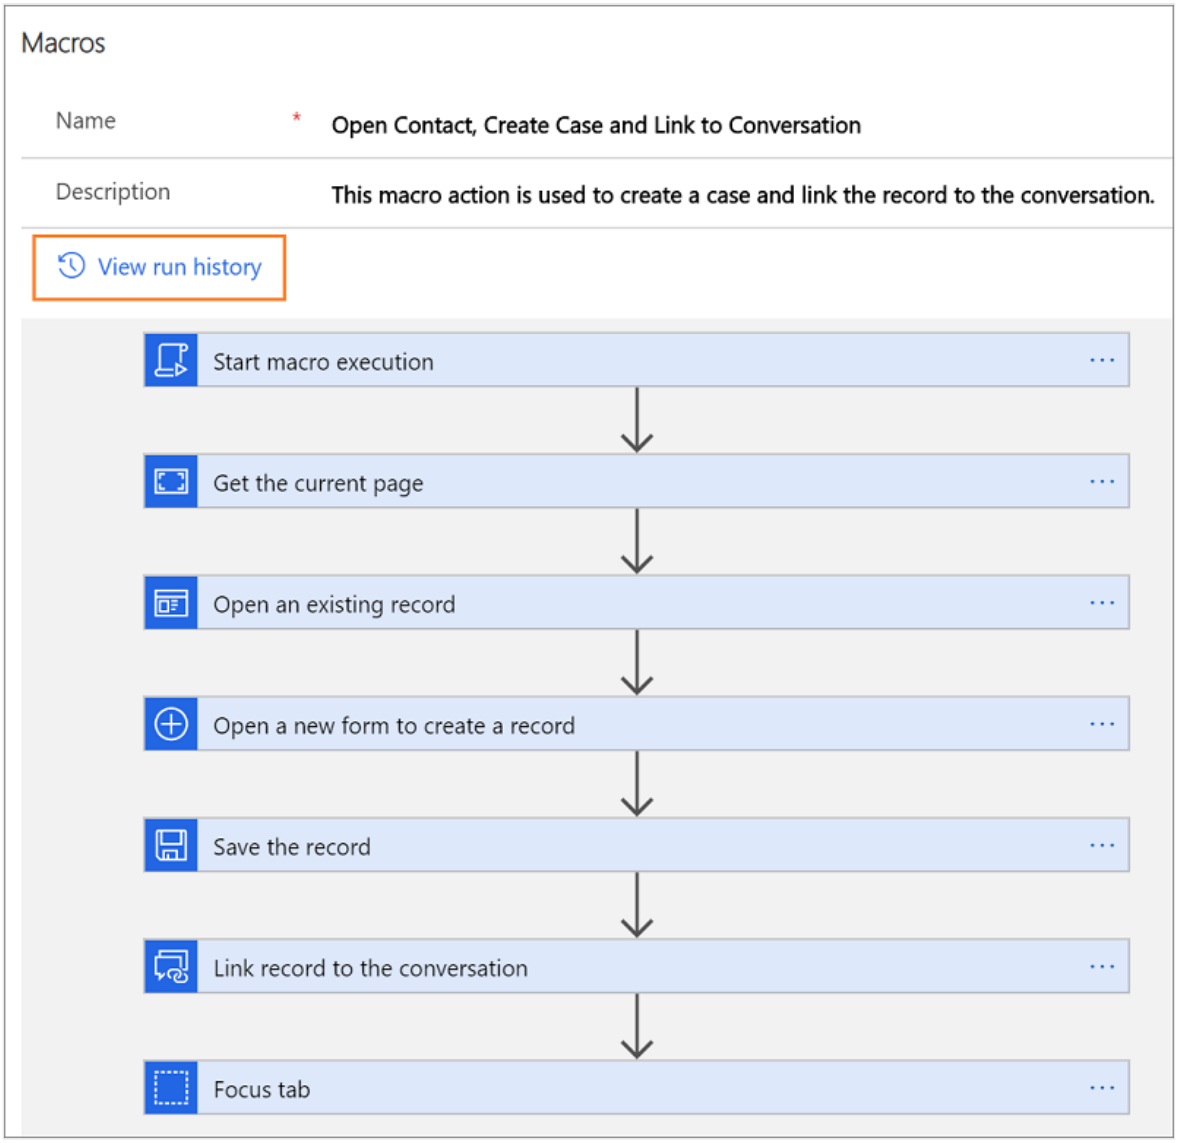
Now, when the agent runs the macro, the actions will be run by fetching the data parameter keys according to the context available from the sources. More information: Use automation dictionary to pass data parameters keys.

View macro run history

> **Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

As an administrator, you can view the macro run history, which shows how many times a macro has been run, along with the success or fail status. When you select a macro that failed, you can view the exact action step at which the failure occurred.

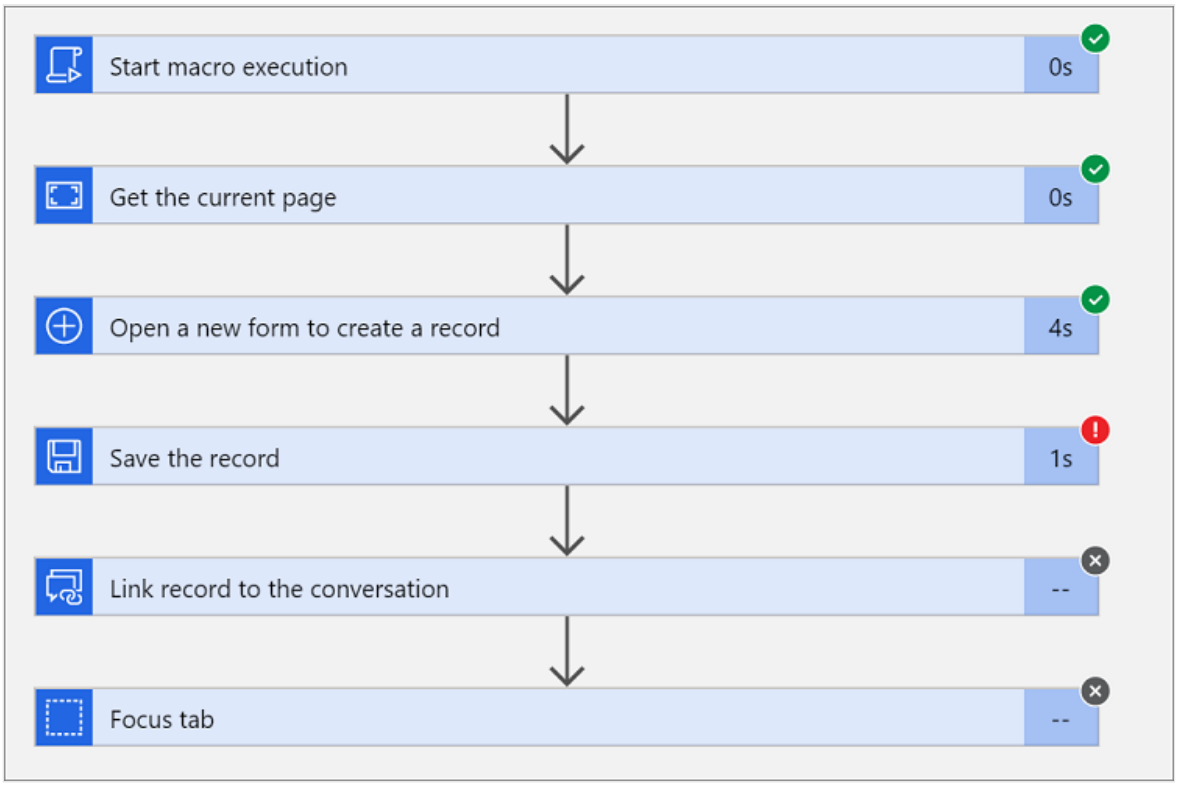
1. Go to the **Macros** page, and select the macro for which you want to view the history.
2. Select **View run history**.



3. Select the macro that failed from the list.

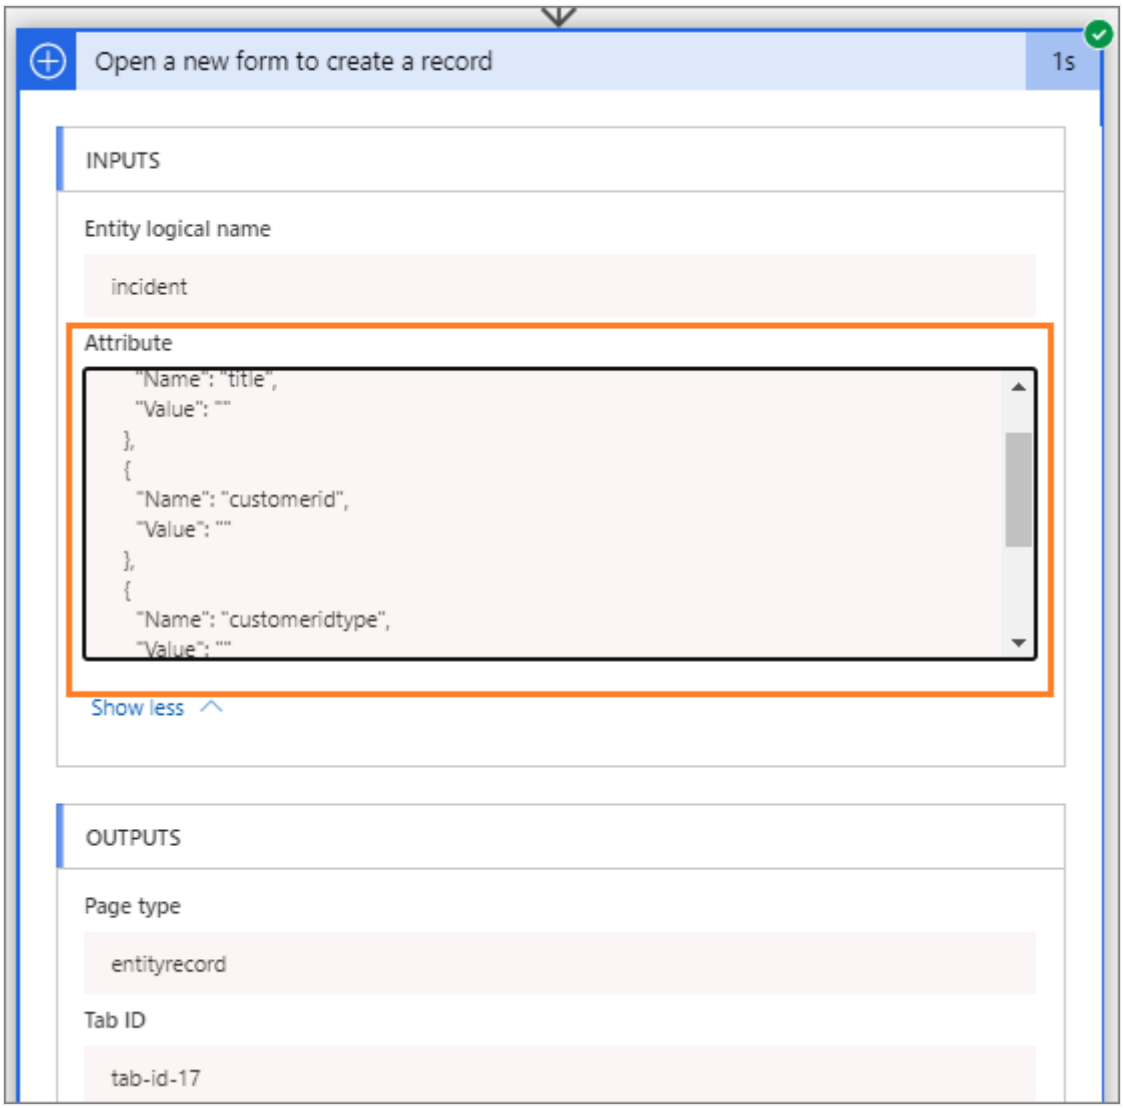
Name	User	Macro status	Executed on
Open Contact, Create	Kenny Smith	Succeeded	1/17/2020 10:42 AM
Open Contact, Create	Kenny Smith	Succeeded	1/17/2020 9:17 AM
Open Contact, Create	Kenny Smith	Succeeded	1/17/2020 1:13 AM
Open Contact, Create	Kenny Smith	Succeeded	1/16/2020 4:46 PM
Open Contact, Create	Kenny Smith	Failed	1/16/2020 3:53 PM
Open Contact, Create	Kenny Smith	Succeeded	1/16/2020 3:51 PM
Open Contact, Create	Kenny Smith	Failed	1/16/2020 3:50 PM
Create Case and Link	Kenny Smith	Failed	1/16/2020 3:44 PM
Create Case and Link	Kenny Smith	Succeeded	1/16/2020 9:42 AM
Create Case and Link	Kenny Smith	Failed	1/14/2020 6:50 PM
Create Case and Link	Kenny Smith	Failed	1/14/2020 6:48 PM

4. See the macro action step that caused the failure. Review the previous step for any issue in the slug data parameters that might've been passed incorrectly or slug data parameters that were updated incorrectly.



For example, when you select on the **Open a new form to create a record** step, select **Show more**, and you can view that the mandatory fields don't have values,

which are mandatory to save the record. Due to this reason, the macro run failed at the **Save the record** step.



5. Fix the macro step action that you think might have caused the failure, and then try running it again. For example, since the values are not resolved, go to the macro designer and then check on the slugs, and then try running the macro again.

> **Note**
>
> If the issue persists, contact Microsoft support.

Manage custom productivity tools (preview)

Article • 04/05/2023

> **ⓘ Important**
>
> To use this feature, it must be turned on and the license terms must be accepted. **What are Preview features and how do I enable them?**
>
> A preview feature is a feature that is not complete, but is made available before it's officially in a release so customers can get early access and provide feedback. Preview features aren't meant for production use and may have limited or restricted functionality.
>
> We expect changes to this feature, so you shouldn't use it in production. Use it only in test and development environments.
>
> Microsoft doesn't provide support for this preview feature. Microsoft Dynamics 365 Technical Support won't be able to help you with issues or questions. Preview features aren't meant for production use and are subject to a separate **supplemental terms of use**.

The productivity pane supports custom productivity tools developed as custom pages or Power Apps component framework controls. You can create multiple custom productivity tools and make them available to your users with agent experience profiles.

Prerequisites

Ensure that the following prerequisites are met:

- You have the **Productivity tools administrator** security role. To learn more, see Assign roles and enable users.
- Agents and supervisors have the **Productivity tools user** security role. To learn more, see Assign roles and enable users.
- A custom page or a Power Apps component framework control to be hosted as a custom productivity tool. To learn more, see Overview of custom pages for model-driven apps and Power Apps component framework.

Configure a custom productivity tool

1. In Dynamics 365, go to Customer Service admin center.
2. In the site map, select **Productivity** in **Agent experience**.
3. On the page that appears, select **Manage** for **Productivity tools (Preview)**.
4. Select **New**, enter the following details on **New Pane tool configuration**:
    - **Name**: The display name of the custom productivity tool.
    - **Unique Name**: A unique name.
    - **Type**: Select **Control** or **Custom Page**.
        - **Custom Page Name**: The name of the custom page.
        - **Control Name**: The name of the control.
    - **Icon**: The web resource containing the target icon to be displayed in the productivity pane (optional).
    - **Description**: A description of the productivity pane (optional).
    - **Learn More Link**: A link to the help page for the custom productivity tool (optional).
5. Save the changes.
6. In the site map, select **Workspaces** in **Agent experiences**, and select **Manage** for **Agent experience profiles**.
7. Select the agent experience profile that you want to modify, and select **Edit** for **Productivity pane** on the page that appears.
8. Enable the custom productivity tool, and save the changes.

> ⓘ **Note**
>
> - Custom productivity tools hosted in the productivity pane are not contextually bound to the session.
> - Custom productivity tools don't have a mechanism to retrieve information from the session context.

Use automation dictionary to pass parameter keys

Article • 02/13/2023

> **Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

The automation dictionary maintains the contextual data for sessions. You can use the keys from the automation dictionary to pass the parameter in an action.

While creating templates and macros in the admin app, you can pass parameter keys such as title of a session, title of notification, title of an application tab template, and custom parameter values for application tab types. These keys are replaced based on the contextual information available at the time of execution.

Pass data parameter in templates

Let's take a scenario for templates with the notifications.

The notification shows certain fields and values, which are called **Field header** and **Value**, respectively.

Kenny Smith, a customer, initiated a conversation and when the agent sees the notification, it displays **Customer Name** as **Kenny Smith**.

Here, **Field header** is **Customer Name** and the **Value** is **Kenny Smith**.

For templates to identify the name of the customer as **Kenny Smith**, you (the administrator) must pass the parameter as keys.

Similarly, for session and notification titles, you can pass the data parameters. More information: Automation dictionary formats to data parameter keys

The system replaces these parameter keys with the actual values based on the context of the session, channel provider, Microsoft Dataverse, and user actions. More information: Types of context data parameters

Pass data parameter in macros and agent scripts

Macros are a set of configured sequential actions that are run on demand by the user. As an administrator, you need to configure the actions that a macro must perform. To configure the actions, you need to pass the data parameters. More information: Automation dictionary formats to pass data parameter keys

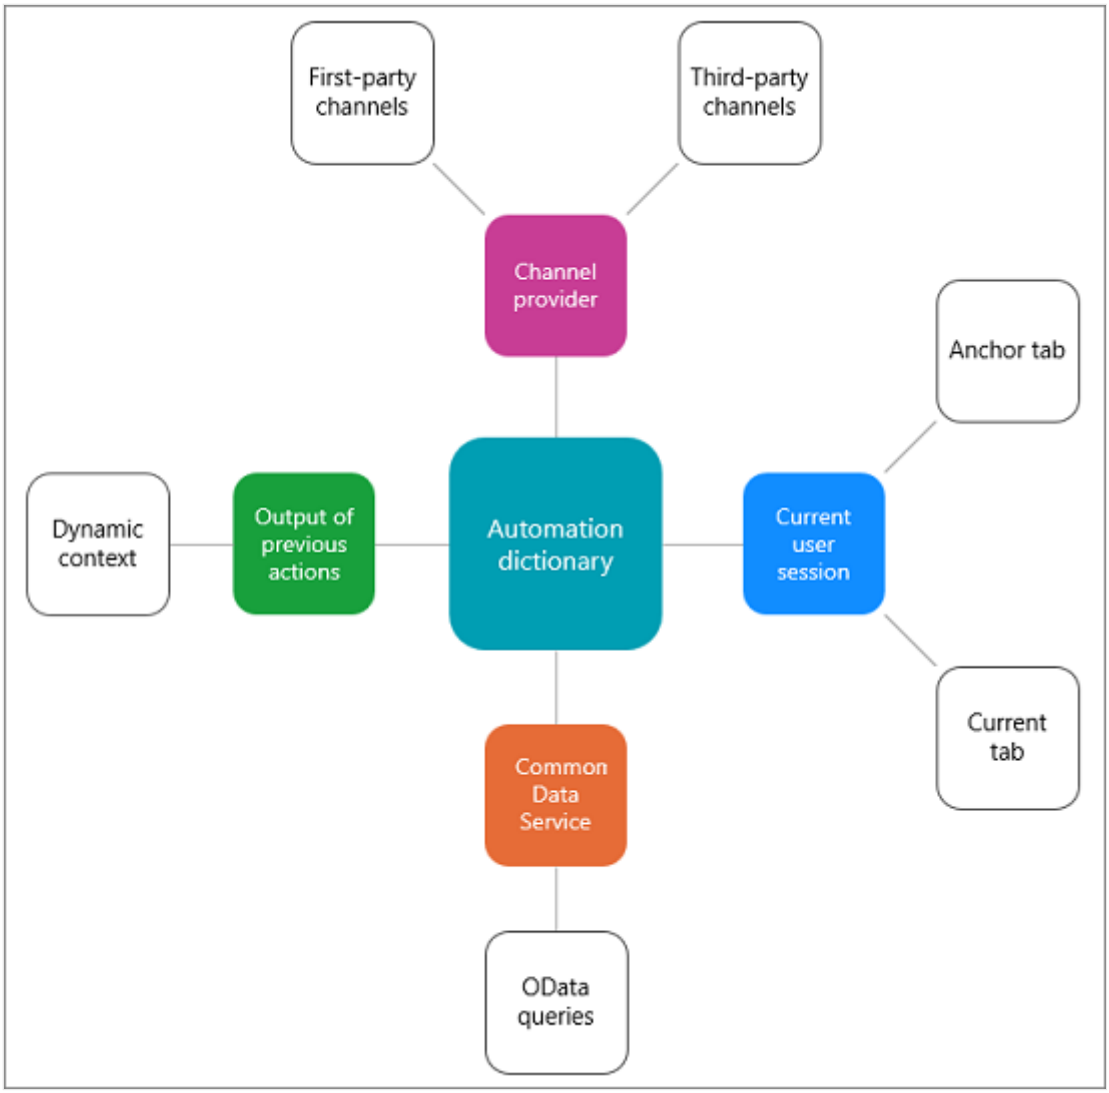
When the agent runs the macro, the system replaces these parameter keys with the actual values based on the context of the session, channel provider, Dataverse, and user actions.

When the context is from a session, the macro action is run based on the information for a current session, where the information is obtained from an Anchor tab or current tab that's in focus. For example, to create a case, you need to define the actions that contain the incident entity form and the GUID of the form (optional). More information: Types of context data parameter

Types of context data parameters

The automation dictionary uses the context data parameters that are available from the following sources:

- Context data from the channel provider
- Context data from user actions
- Context data from Dataverse
- Context data from other macro actions



Context data from the channel provider

This context data is from the first-party channel provider such as Omnichannel for Customer Service or a third-party channel provider that uses the widget exposed by Dynamics 365 Channel Integration Framework. The context data from Omnichannel for Customer Service are pre-conversation survey, visitor portal navigation, and so on.

Context data from user actions

This data is populated as and when agents perform some activities in the session. An example is opening a new customer record, case, and so on.

Context data from Dataverse

The organizational data is stored in Dataverse, and you can fetch the data with the use of OData queries. More information: OData queries

Context data from other macro actions

An *action* in a macro generates context data that is consumed by other actions in that macro.

For example, there are two action steps in the following order:

1. Open a new form to create a record.
2. Open an email form with a predefined template.

While creating the **Open an email form with predefined template** action, you can get the context data parameter keys from the **Open a new form to create a record** macro action step.

The context data parameter from the first macro action are as follows:

- Entity Logical Name
- Page Type
- Tab Id

> **Note**
>
> The context data parameters from other macro actions are specific to macros, and aren't applicable to templates.

Automation dictionary formats to pass data parameter keys

The automation dictionary maintains the contextual data for sessions. The keys in the automation dictionary can be passed as parameters to the action in macros. The system replaces these parameter keys with the actual value based on the context of the session, channel provider, Dataverse, and user actions.

The automation dictionary supports the following formats:

- Slugs
- OData queries
- Static values

Slugs

A *slug* is a replacement parameter that the system populates at runtime based on context. Use the following list of slugs only for macros and agent scripts, and to set an agent script as the default by using the agent script expression builder. More information: Productivity tools

Slugs for productivity tools (macros and agent scripts)

Macros and agent scripts support the following slugs:

Slug	Description
`${customerName}`	The name of the customer who initiated the conversation.
`${caseId}`	The unique ID of a case. The system displays the case ID only if a case is linked to the conversation.
`${caseTitle}`	The title of the case. The system displays the title of the case only if the case is linked to the conversation.
`${LiveWorkItemId}`	The unique ID of the conversation.
`${queueId}`	The unique ID of a queue. This alphanumeric string is displayed in the queue page URL.
`${visitorLanguage}`	The language of the customer who initiated the conversation.
`${visitorDevice}`	The device of the customer who initiated the conversation.
`${entityRoutingLogicalName}`	The name of the entity, if the notification is for an entity record.
`${entityRoutingRecordId}`	The unique ID of the entity record, if the notification is for an entity record. More information: Entity records routing
`${customerEntityName}`	The name of the entity (contact or account), if the customer is authenticated.
`${customerRecordId}`	The unique ID of the entity (contact or account), if the customer is authenticated.
`${<name of the pre-conversation survey questions>}`	All the pre-conversation survey questions that are configured for a workstream will have the slug name as the name of the question.

> **Note**
>
> Only the `${anchor.<attribute_name>}` slug is supported in the macros and scripts for Customer Service workspace.

Slug for reconnection link

The following slug is used to generate a reconnection link that can be shared with customers to connect back to the same agent and conversation. More information: Configure a reconnection to a previous chat

Slug	Description
`{ReconnectUrl{ReconnectID}}`	Used in quick replies to generate the reconnect link.

Format for slugs for productivity tools

The `${Slug}` parameter format that retrieves the context from the channel provider, current user session, output of other macro actions, or Dataverse.

Productivity automation context

When you want to execute a slug in the productivity automation context, which is used to perform operations related to model-driven apps in Dynamics 365, use the ${</slug/>} format. For example: `${customerName}`

Session connector context

When you want to execute a slug in the session context, you must use the `${$session.<slug>}` format. For example: `${$session.customerName}`

Slugs that are available for session context include:

- `${$session.visitorDevice}`
- `${$session.visitorDevice}`
- `${$session.entityRoutingLogicalName}`
- `${$session.entityRoutingRecordId}`
- `${$session.<name of the pre-chat survey questions>`

Omnichannel connector context

When you want to execute a slug in the Omnichannel for Customer Service context, you must use the `${$oc.<slug>}` format. For example: `${$oc.customerName}`

The `Session.CurrentTab.<Attribute>` and `Session.AnchorTab.<Attribute>` parameters provide context data based on the current session and the anchor tab or the current tab in focus. The following are the supported attribute types:

- EntityName

- EntityId

Examples:

- `Session.CurrentTab.<EntityName>`
- `Session.CurrentTab.<EntityId>`
- `Session.AnchorTab.<EntityName>`
- `Session.AnchorTab.<EntityId>`

> **Note**
>
> The `Session.CurrentTab.<Attribute>` and `Session.AnchorTab.<Attribute>` parameters are only applicable to macros and aren't applicable to templates.

Slugs for templates

The list of supported slugs are:

Slug	Description
`{anchor.<attribute_name>}`	Is used to access attributes of the record that is loaded in the anchor tab.
`{customerName}`	The name of the customer who initiated the conversation.
`{caseId}`	The unique ID of a case. The system displays the case ID only if the case is linked to the conversation.
`{caseTitle}`	The title of the case. The system displays the title of the case only if the case is linked to the conversation.
`{queueId}`	The unique ID of a queue. This alphanumeric string is displayed in the queue page URL.
`{visitorLanguage}`	The language of the customer who initiated the conversation.
`{visitorDevice}`	The device of the customer who initiated the conversation.
`{entityRoutingLogicalName}`	The name of the entity, if the notification is for an entity record.
`{entityRoutingRecordId}`	The unique ID of the entity record, if the notification is for an entity record. More information: Entity records routing
`{customerEntityName}`	The name of the entity (contact or account), if the customer is authenticated.

Slug	Description
`{customerRecordId}`	The unique ID of the entity (contact or account), if the customer is authenticated.
`{<name of the pre-chat survey questions>}`	All the pre-chat survey questions that are configured for a workstream will have the slug name as the name of the question.

Format for slugs for templates

The `{Slug}` parameter format that retrieves the template context from the channel provider, current user session, or Dataverse. For example: `{caseId}`

OData queries

You can use OData queries to get the contexts that are available from Dataverse.

The OData query format is:

`{$odata.<entityName>.<entityAttributeName>.<?options>}`

Examples:

- `{$odata.account.name.?$filter=accountid eq '{customerRecordId}'}`
- `{$odata.incident.prioritycode.?$filter=incidentid eq '{caseId}'&$select=prioritycode}`
- `{$odata.incident.title.?$filter=incidentid eq '{caseId}'&$select=title}`

Static values

These are hard-coded values that you update based on your business requirements. For every hard-coded attribute you choose, follow the format type for the particular attribute.

Example (Macro):

You want a case title to always be appended with **Contoso -**. You use the **Open a new form to create a record** action with following fields.

Parameter	Value
Entity Logical Name	incident
Attribute Name	Case title

Parameter	Value
Attribute value	`Contoso - {caseTitle}`

Here, **Contoso -** is the hard-coded static value.

Example (Templates):

For an incoming chat request, you want to provide the static title to the session and notification template that agents see at runtime.

Notification title = `New chat request`

Session title = `Chat conversation`

Overview of Community

Article • 01/28/2022

Welcome to Dynamics 365 Customer Service Community, a new app that offers a suite of capabilities that are designed to help your organization invite customer suggestions and crowd source portfolios of outside-in ideas. Community can help fuel your business transformation, build customer trust with process transparency, and drive timely follow-up for suggestions.

In addition to providing feedback to organizations, end users use Community to collaborate on a social scale, and rally behind suggestions from others to help shape the future of the products they use.

The following two separate installations are required to use Customer Service Community:

1. **Dynamics 365 Customer Service Community**: The installation requires at least one Customer Service Enterprise license in your organization tenant. Dynamics 365 Customer Service Community provides community managers and moderators with the necessary capabilities to capture and evaluate ideas and demonstrate care with closed loop, applying their organization brand across user interaction points. This installation allows you to do the following tasks:

    - Configure of the modern Community portal to fit your organization brand, including colors, custom header and footer, and quick links.
    - Enforce acceptance of your terms of use and privacy statement by end users.
    - Create and manage idea forums.
    - Manage content, including content moderation and merge of duplicate ideas.
    - Update the status and respond to community feedback.
    - Manage users and assign security roles on a forum level.

2. **"Modern Community" portal template**: This template offers delightful end-user experiences that are available out of the box. End users can share new ideas with organizations and collaborate on a social scale. This installation lets your end users do the following tasks:

    - Browse, search, filter, and sort idea lists.
    - Post new ideas. This flow includes autosuggestion of existing ideas to prevent duplicates.
    - Collaborate and engage in a community that includes upvoting, commenting, sharing, and following ideas.
    - Flag inappropriate content.

- Track the status of ideas users engaged with in own personalized space.

Install Customer Service Community

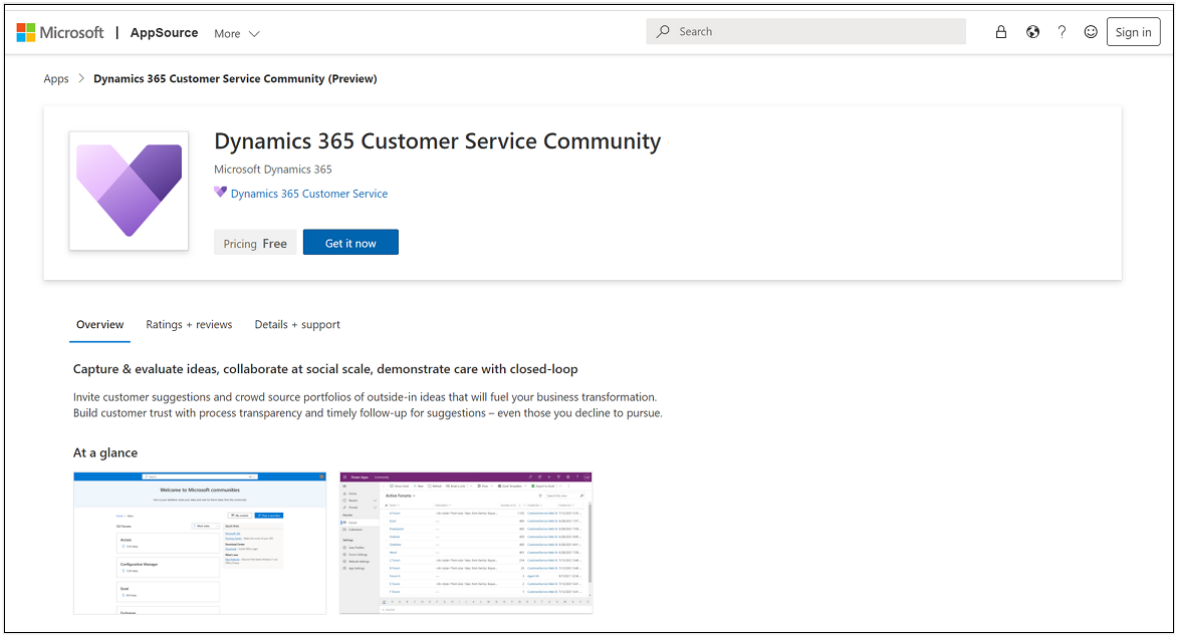
Article • 10/03/2023

The Customer Service Community app allows your organization to invite customer suggestions and crowd source ideas to help shape the future of products they use.

> **Note**
>
> To install Customer Service Community, you must have a Dynamics 365 organization and ensure that the organization tenant has at least one Customer Service Enterprise license.

To install Dynamics 365 Customer Service Community:

1. Go to the Microsoft AppSource Dynamics 365 Customer Service Community download page.
2. Select **Get it now**, and then sign in with your Dynamics System Admin account.



3. Select the environment where you want to install Customer Service Community, accept the terms, and select **Install**.

Provision Modern Community website

1. Confirm that Customer Service Community successfully installed in the previous procedure.
2. Go to Power Pages, and then select the environment where you installed Customer Service Community.

3. Go to **Templates** tab, and then select the **Dynamics 365** tab.
4. Select **Modern Community** > **Choose this template**.
5. Select **Done**. Site provisioning typically takes a few minutes, and then when it completes, it's displayed in the **Active Sites** list under **Home**.

When your Modern Community site has been created, you can view the Community home page by going to https://<name>.powerappsportals.com/d365community.

Create a Community forum

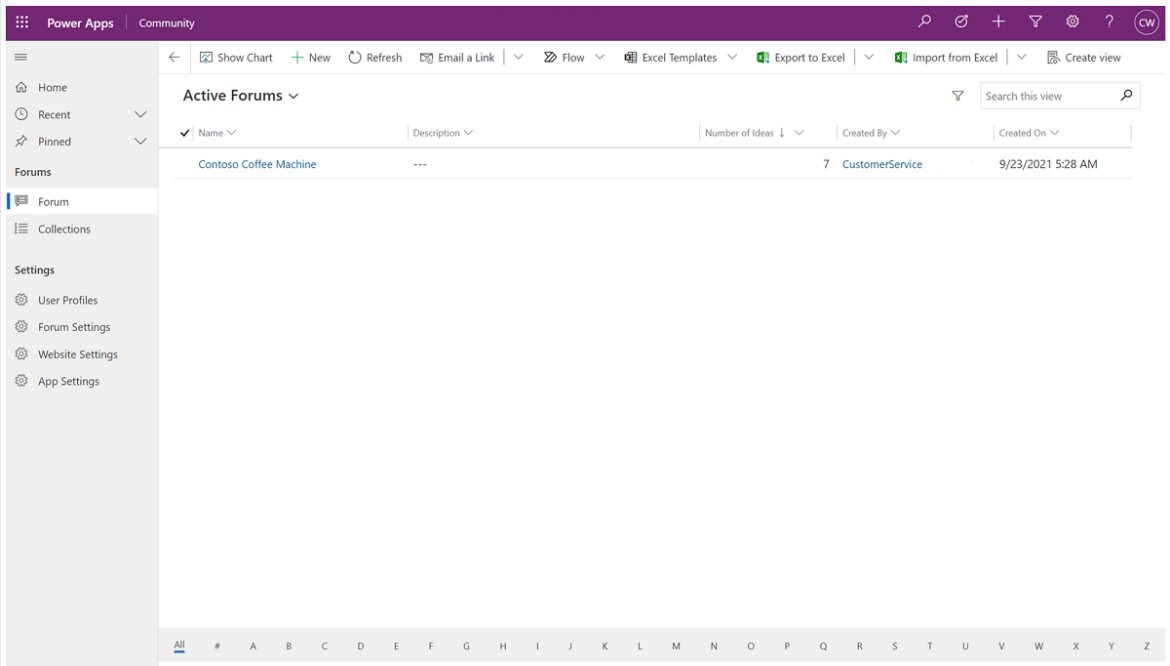
Article • 01/28/2022

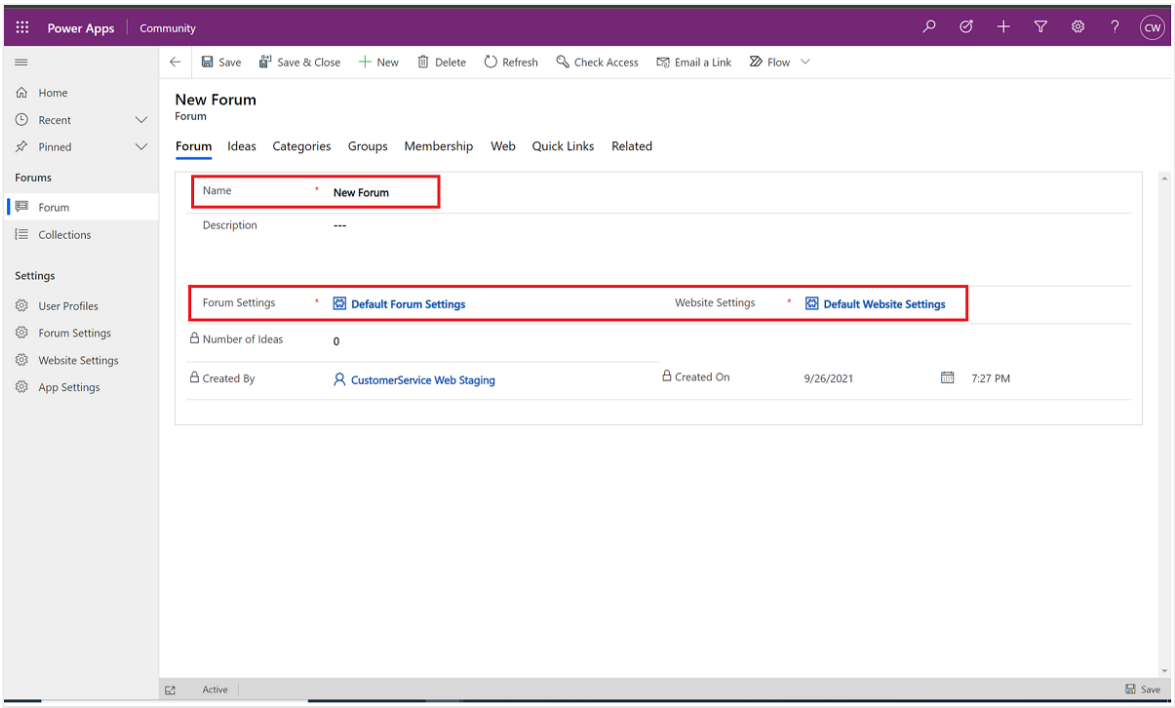
In Customer Service Community, a forum is a container of ideas and the entity where security boundaries are applied. The user who creates a forum automatically becomes the owner, and can assign community roles and membership in the forum, as well as other metadata, like categories and groups.

Create a forum

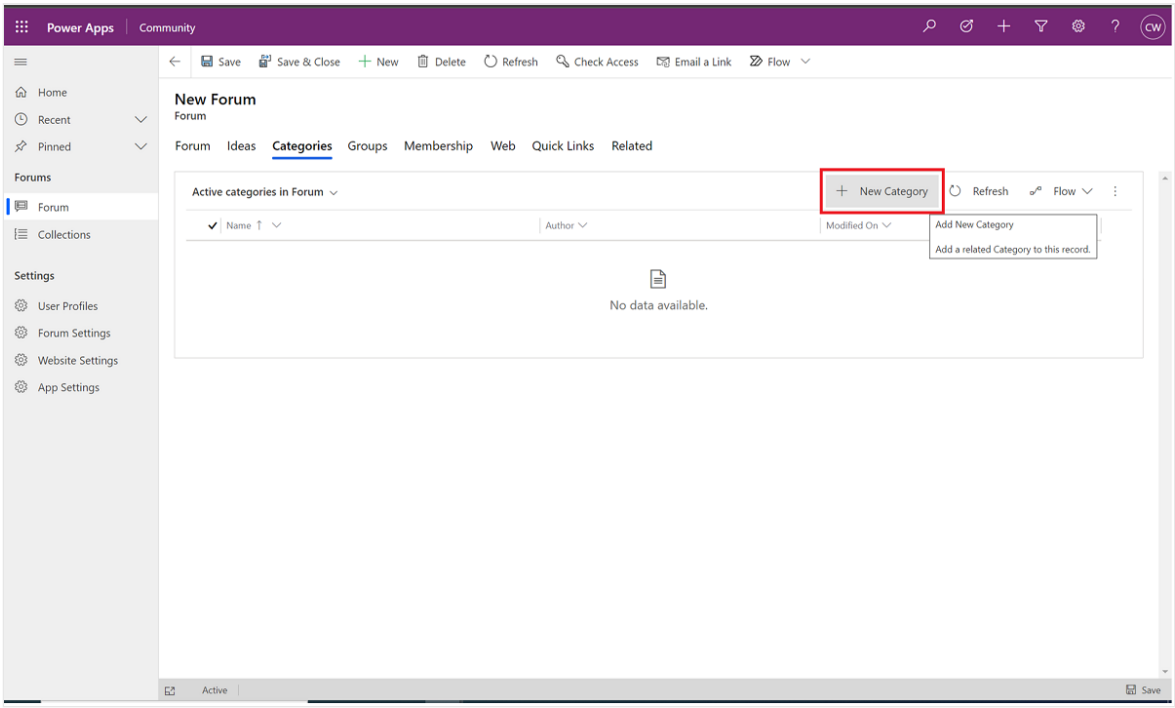
1. On the left-side navigation panel, select **Forum**, and then select **New**.



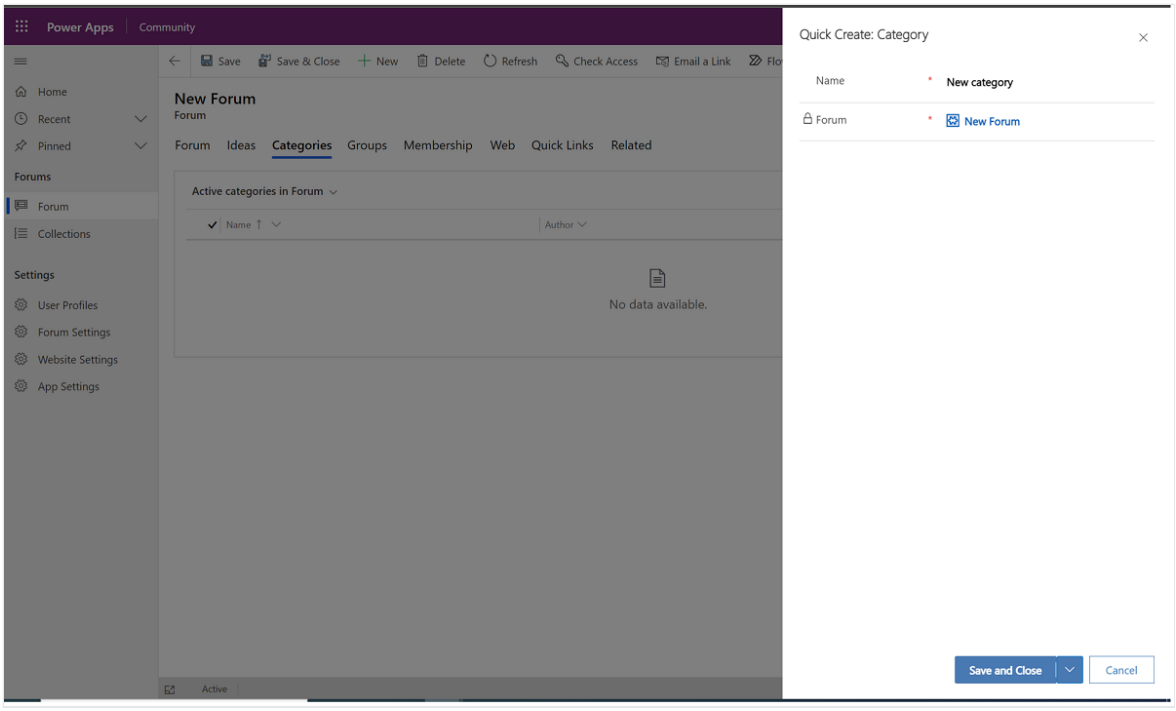
2. Enter a **Name**, then select the **Forum Settings** and **Website Settings** you want to apply to the forum. Settings are managed by your administrator.



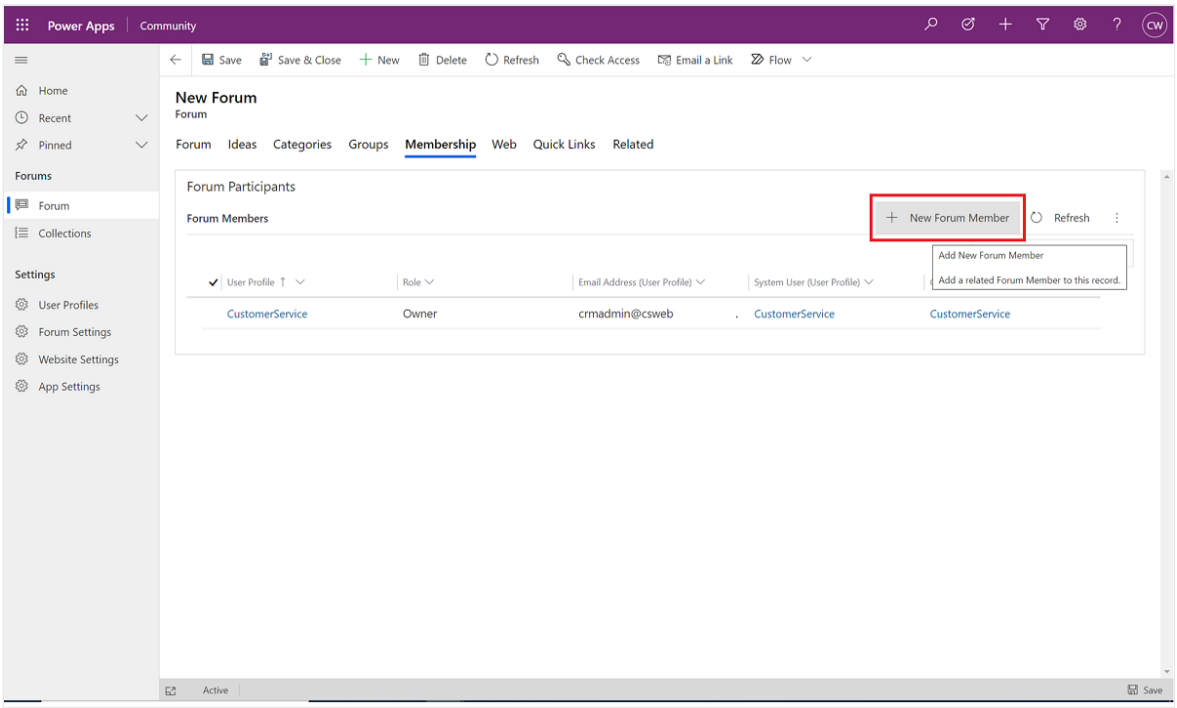
3. Select the **Categories** tab, and then select **+ New Category**. Categories you define here will be available for end-users to select when they create a new idea in this forum.



4. Enter a **Name** for the category, and then select **Save**.

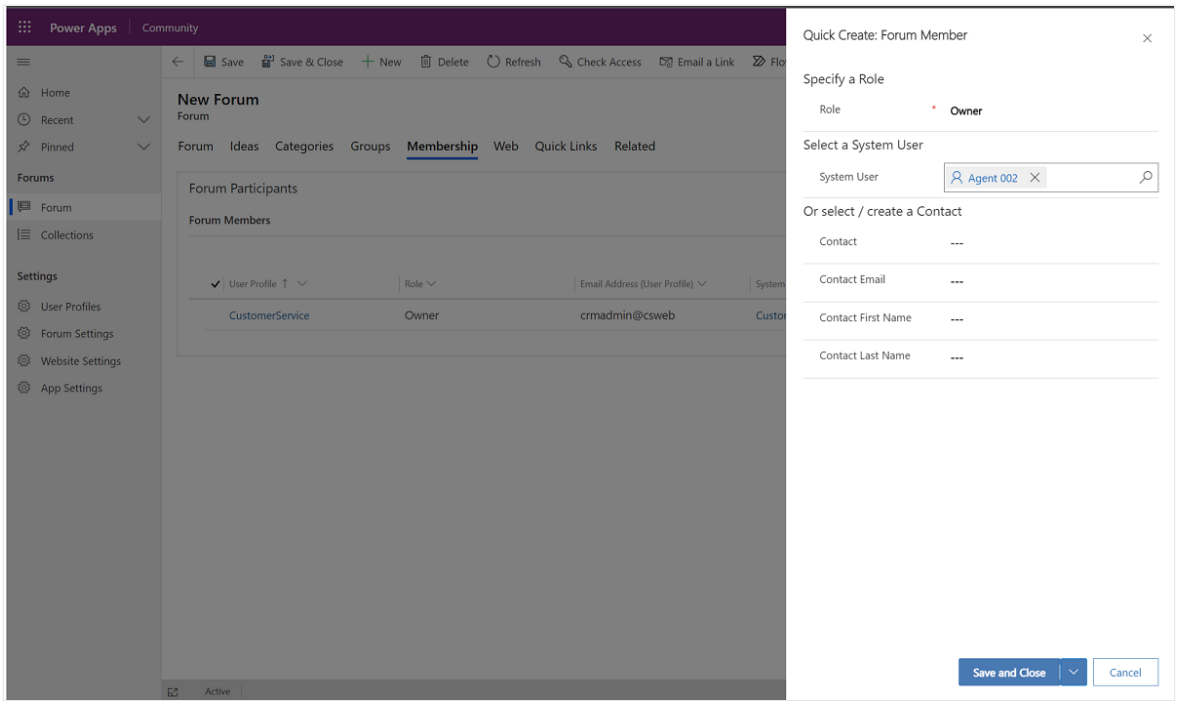


5. To add more categories, repeat steps 3 and 4 above.
6. When you are finished, select **Save and Close**.
7. Go to the **Groups** tab and select **+ New Group**. The groups you define here will be available for end-users to select when they create a new idea in this forum.
8. Enter a group name, and then select **Save**.
9. To add more groups, repeat steps 7 and 8 above.
10. Go to the **Membership** tab to add members to your forums. You'll see that you are already added as owner. The **Membership** tab is where you add forum owners and moderators.
11. Select **+ New Forum Member**.

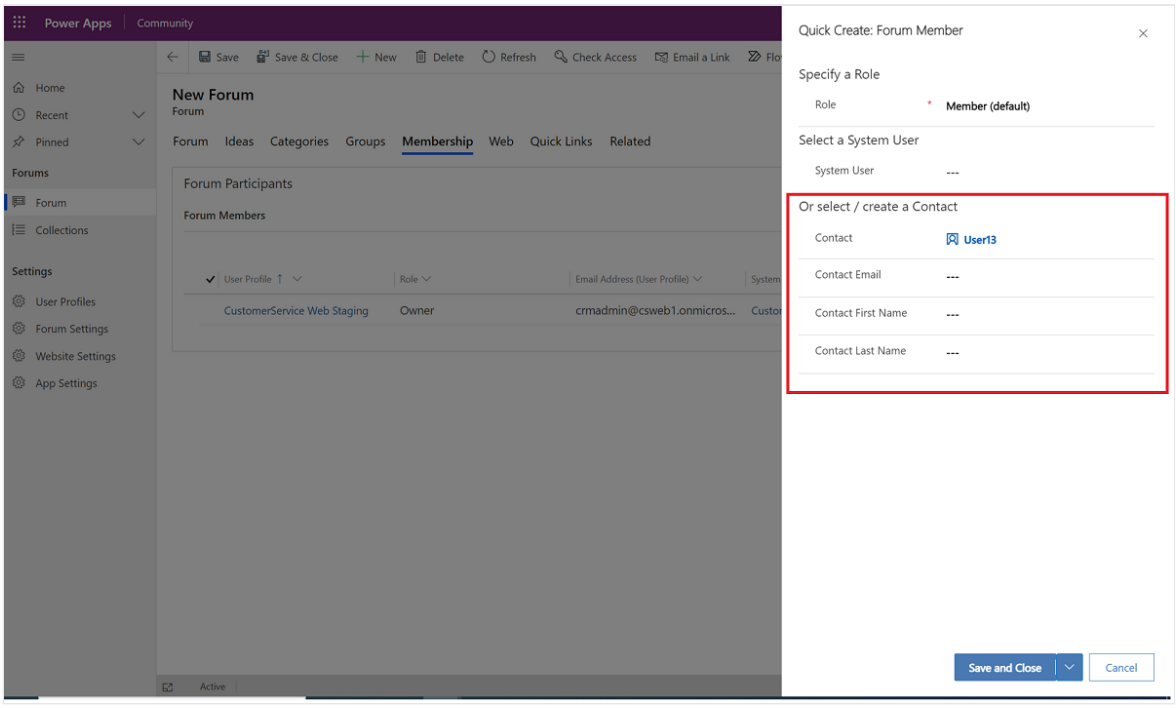


12. In the **Role** dropdown menu, select **Owner** or **Moderator**, then in **System User**, search and select the user you want.

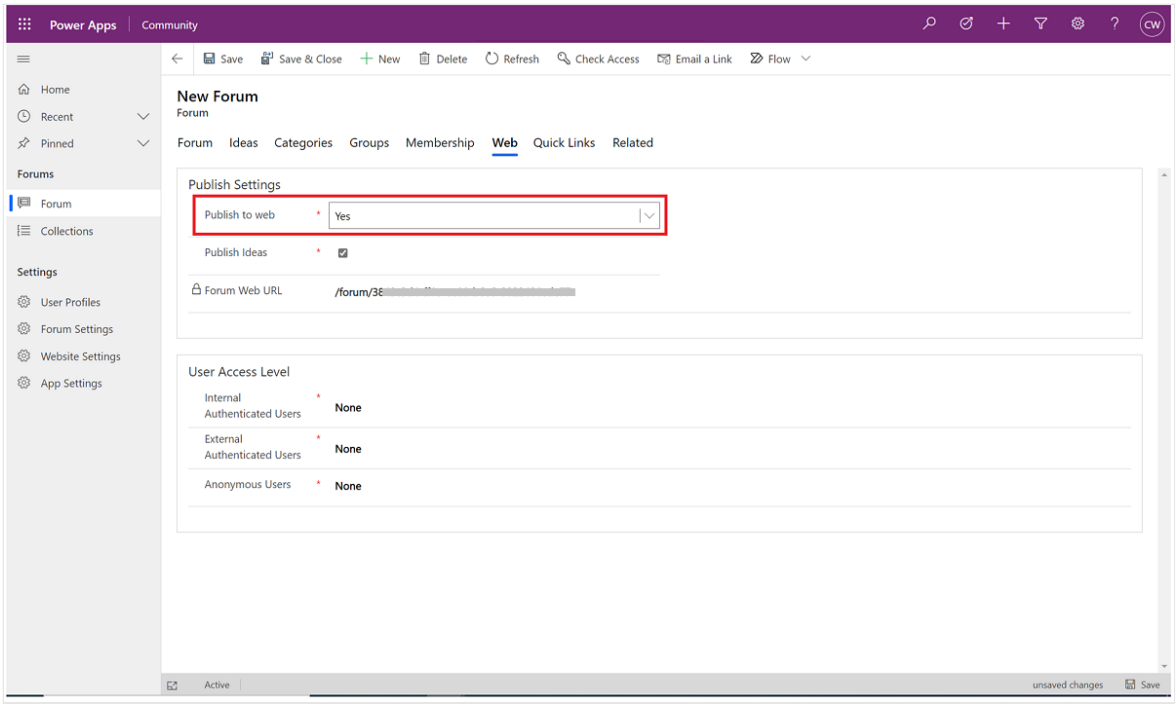
13. Select **Save**.



14. To add other owners or moderators, repeat steps 11-13.
15. (Skip this step if your forum is public.) If your forum is private (for example, accessible to "by-invitation" members only), you'll need to add those individuals as contacts. Select **+ New Forum Member**, select **Member** in **Role**, and then either search for the existing contact in **Contact** or add information for a new contact in **Contact Email**, **Contact First Name**, and **Contact Last Name**. Repeat this step to add all by-invitation members.



16. To publish your forum to the web, go to the **Web** tab, and then select **Yes** in the **Publish to web** dropdown menu.



17. Under the **User Access Level**, select the access level for your users in public forums. The default values are **None** for all three configurations. **Important**: For private forums, leave the default settings set to **None**.

    - **Internal Authenticated Users**: Select the access level for users who are authenticated with email domains specified by your admin.
    - **External Authenticated Users**: Select the access level for non-internal authenticated users.
    - **Anonymous Users**: Select the access level for non-authenticated users.

18. Go to the **Quick Links** tab to define links that show to end-users in the forum. You can choose whether to include quick links that the admin added to the portal home page.
19. To add a forum **Quick Link**, select **+ New Quick Link**, and then enter the following values:

    - **Display Label**: Refers to how the link will be displayed in the portal.
    - **URL**: The webpage URL.
    - **Description**: An optional field where you can provide additional information to describe this link to users.
    - **Group label**: An optional field where you can specify the name of the group under which the link will be listed.

Community FAQs

Content moderation and management

Article • 01/28/2022

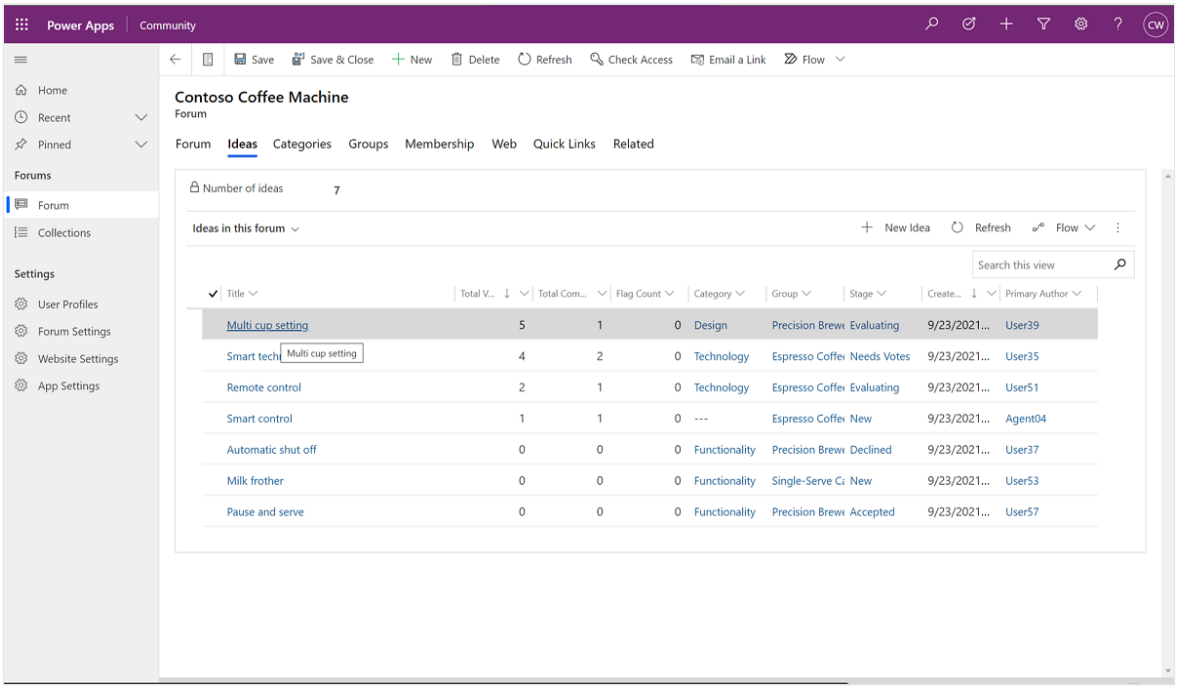
Moderate content in Customer Service Community

Forum owners and moderators will use Customer Service Community to manage and moderate content, and can do the following tasks:

- Edit a forum's name and description
- Edit the idea name and description, and update fields, including category, group, and stage
- Add a new moderator response to an idea
- Manage comments, including adding a moderator response to a comment, and manage comment flags
- Manage idea votes
- Manage idea flags

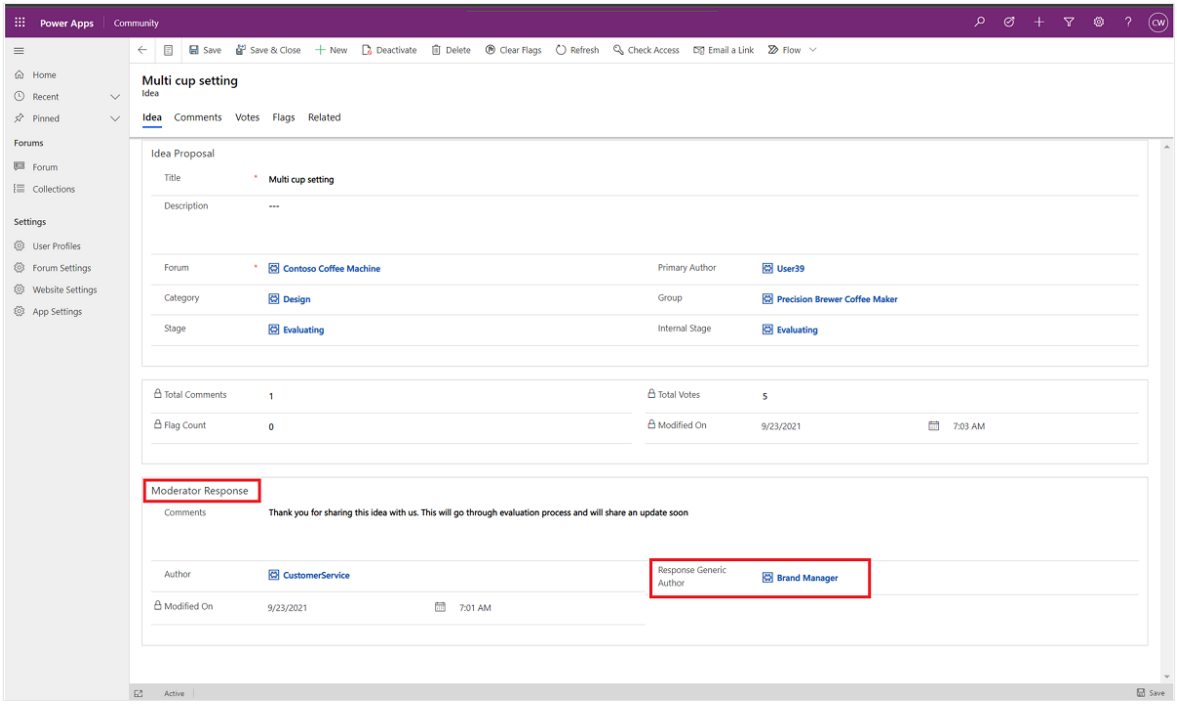
Follow these steps to moderate Community content:

1. Navigate to the forum, and then select the **Forum** tab.
2. Update the forum **Name** and **Description**.
3. Select the **Ideas** tab, and then select the idea you want to edit.

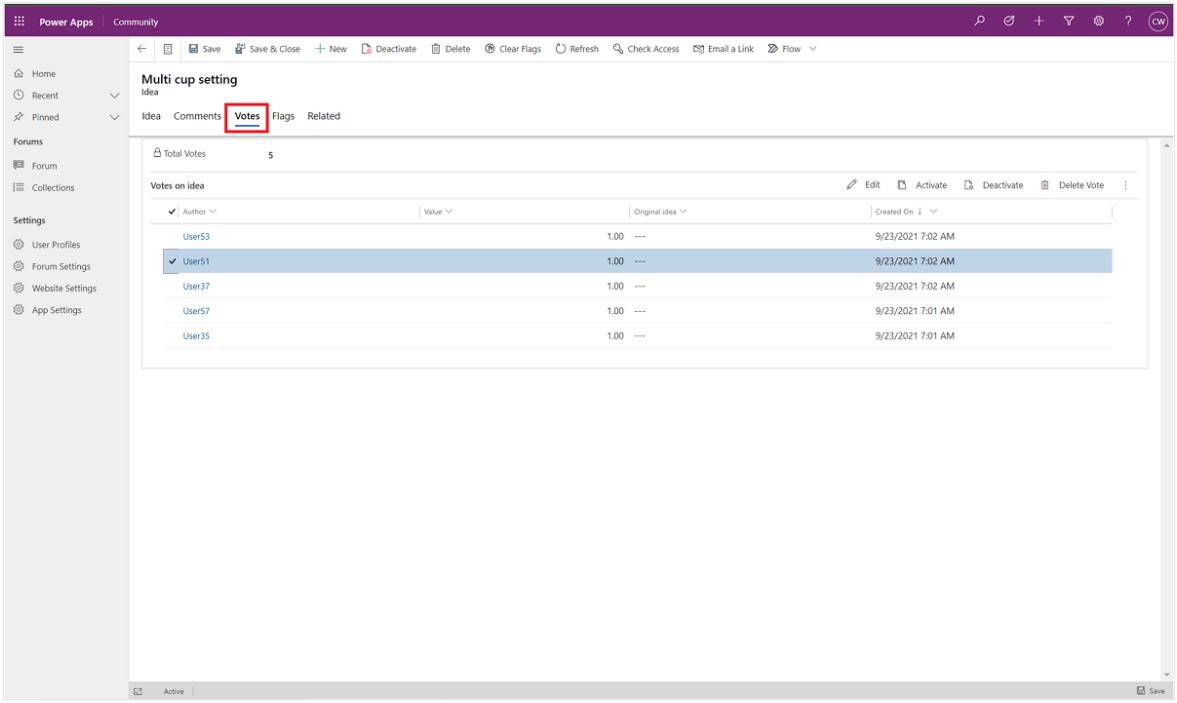


4. Update the fields as desired. You can also add a **Moderator Response** and select **Response Generic Author**. **Response Generic Author** enables you to associate a

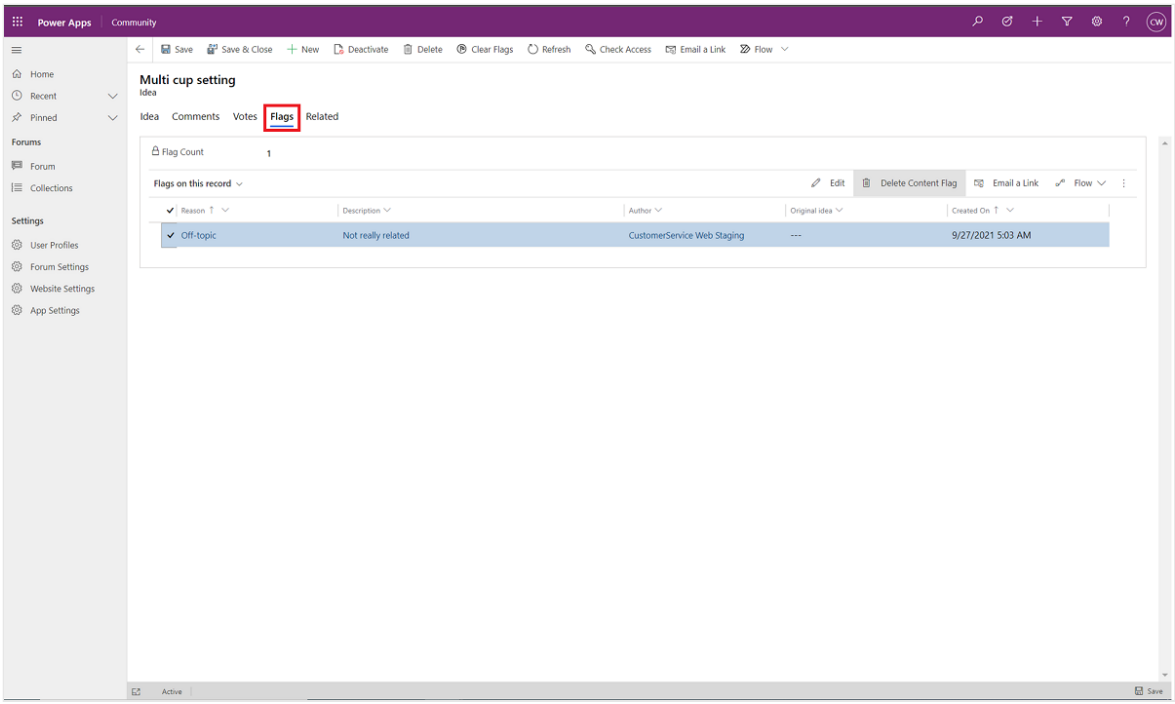
generic role to your response in portal, rather than show your name. The list of generic roles is managed by your admin.



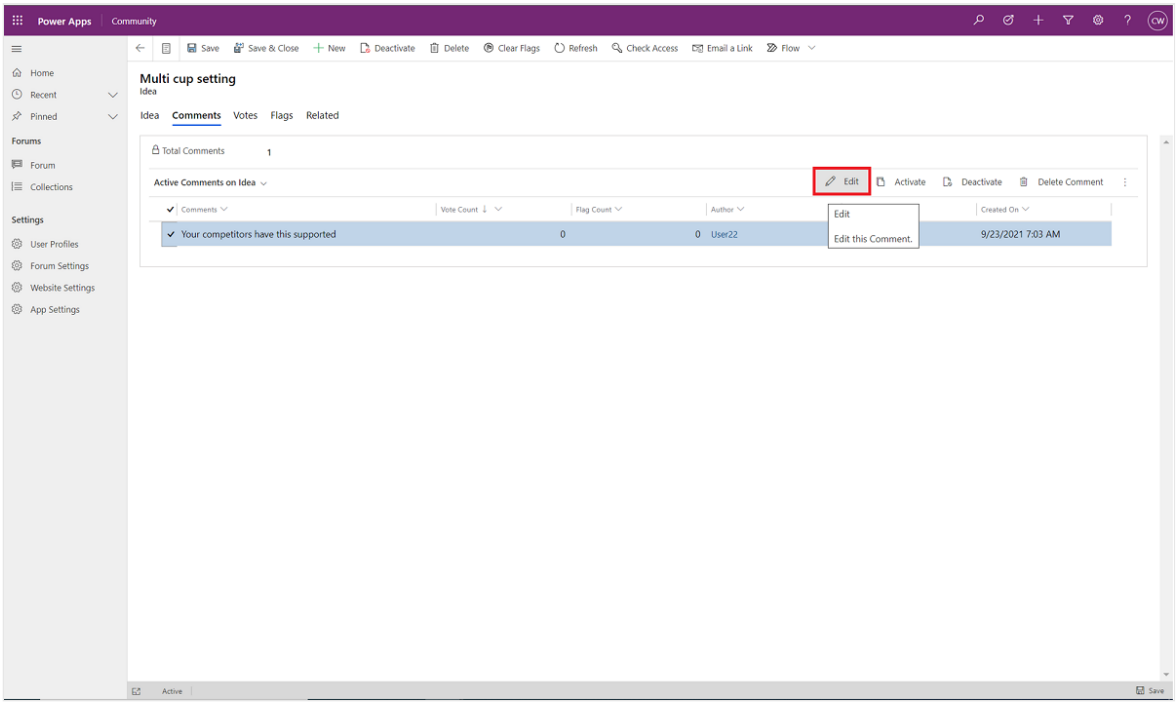
5. To manage idea votes, select the **Votes** tab. A vote value can be either 0 (no vote) or 1 (a single upvote).



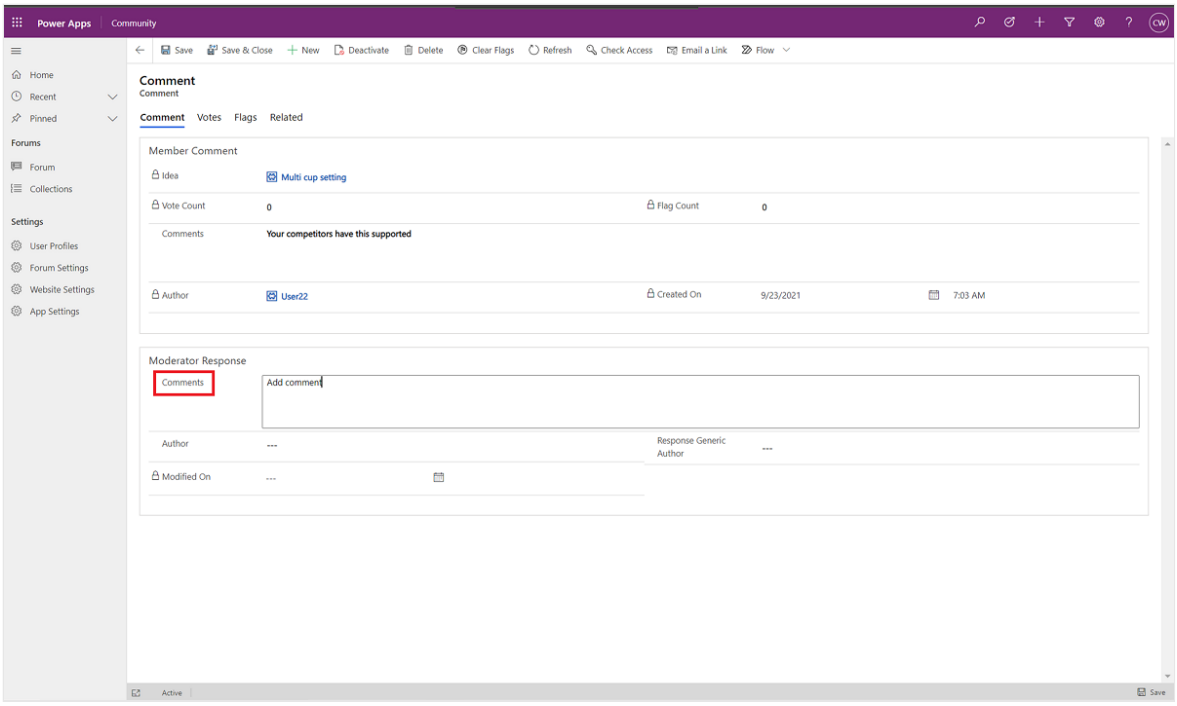
6. From the portal, end-users can flag ideas as inappropriate. Forum owners and moderators can go to **Flags** tab to view and manage idea flags.



7. Go to the **Comments** tab to manage end-user comments. Under **Active comments on idea**, select the comment you want to edit, and then select **Edit**.



8. Under **Moderator Response**, in the **Comments** field, type the desired response. Go to the **Flags** tab to manage flags on this comment.

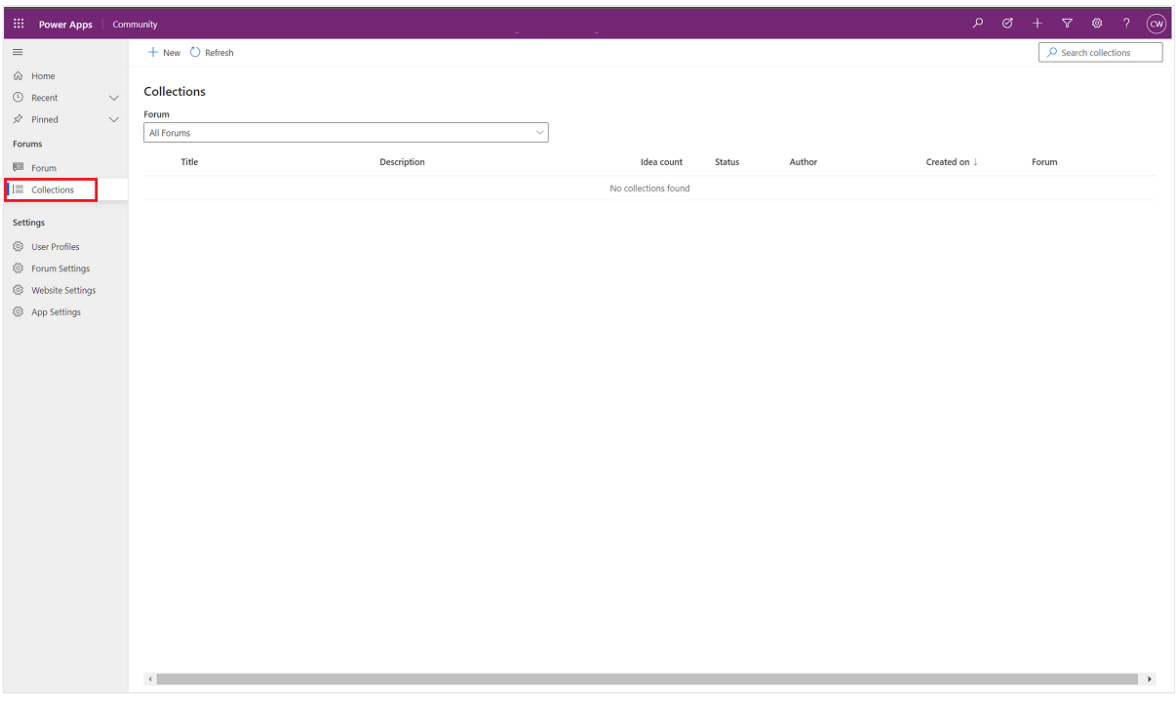


Create collections

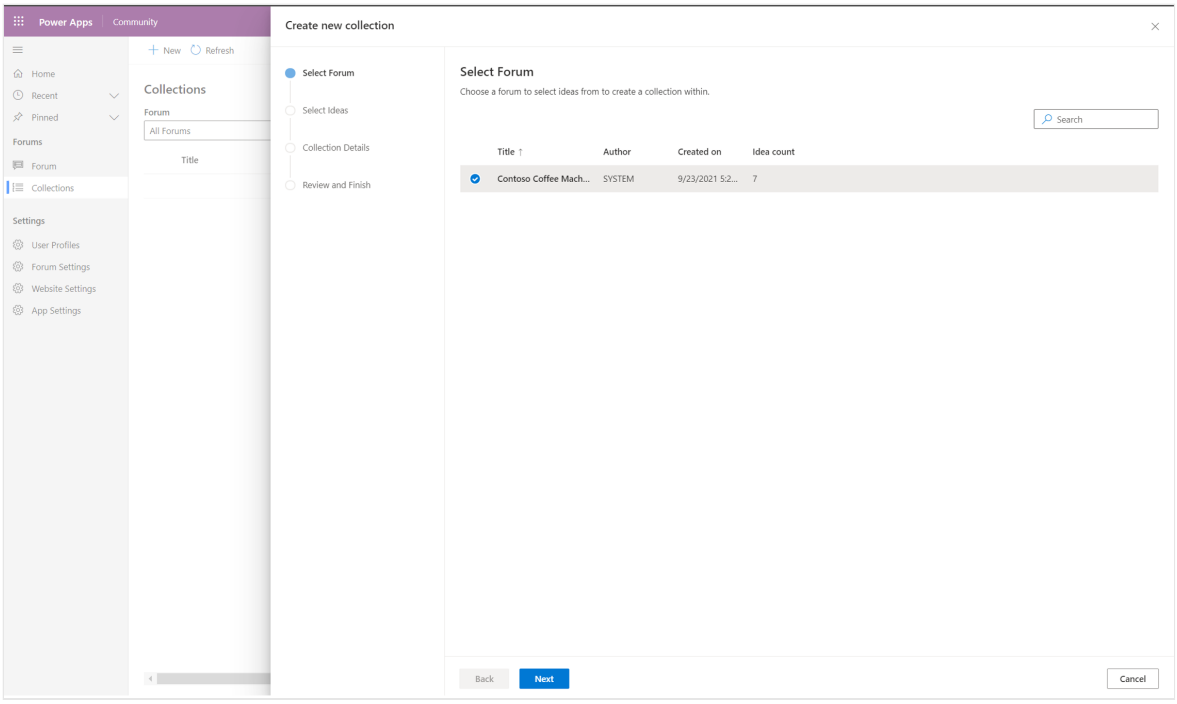
To combine duplicate or related ideas, forum owners and moderators can create a collection. Successfully created collections will show in the portal, and all the associated ideas (also called "children ideas") will be removed. Users who contributed to the children ideas can still view them (read only) on the **My Content** page.

Follow these steps to create a collection:

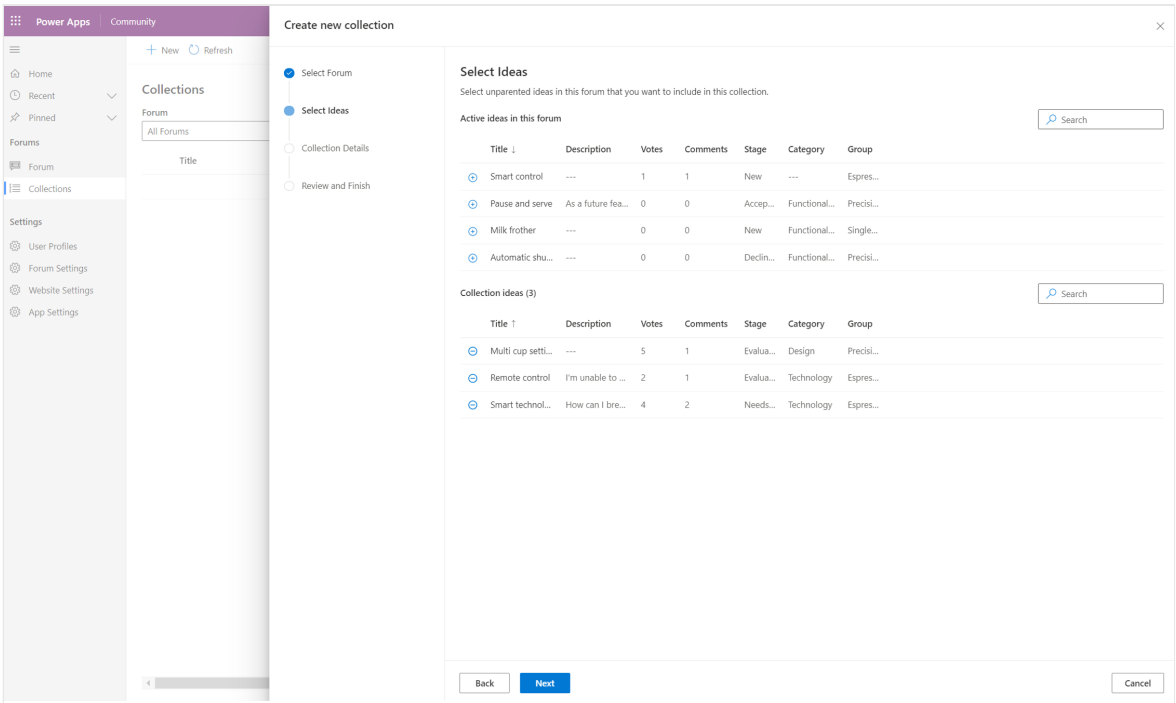
1. On the left-side navigation pane, select **Collections**, and then select **+ New**.



2. Select the forum you want to combine ideas from, and then select **Next**.



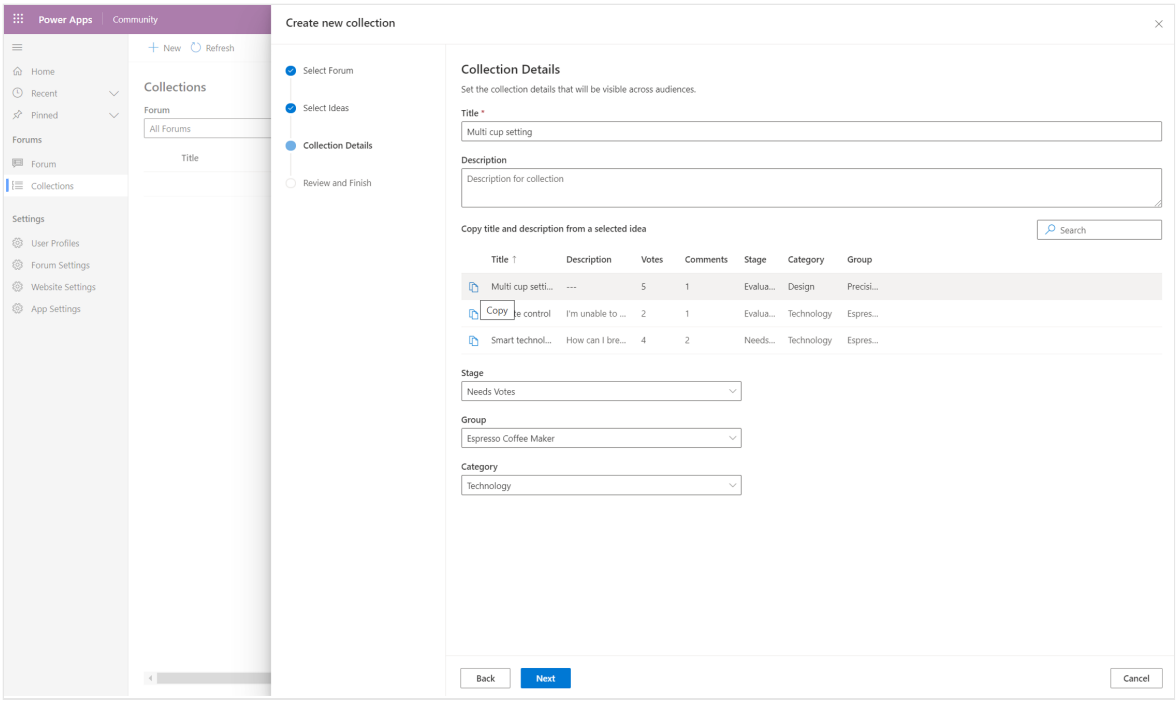
3. Select the plus sign (+) to add ideas from **Active ideas in this forum** list to the collection. Utilize search in long lists. Added ideas will show in the **Collection ideas** list.



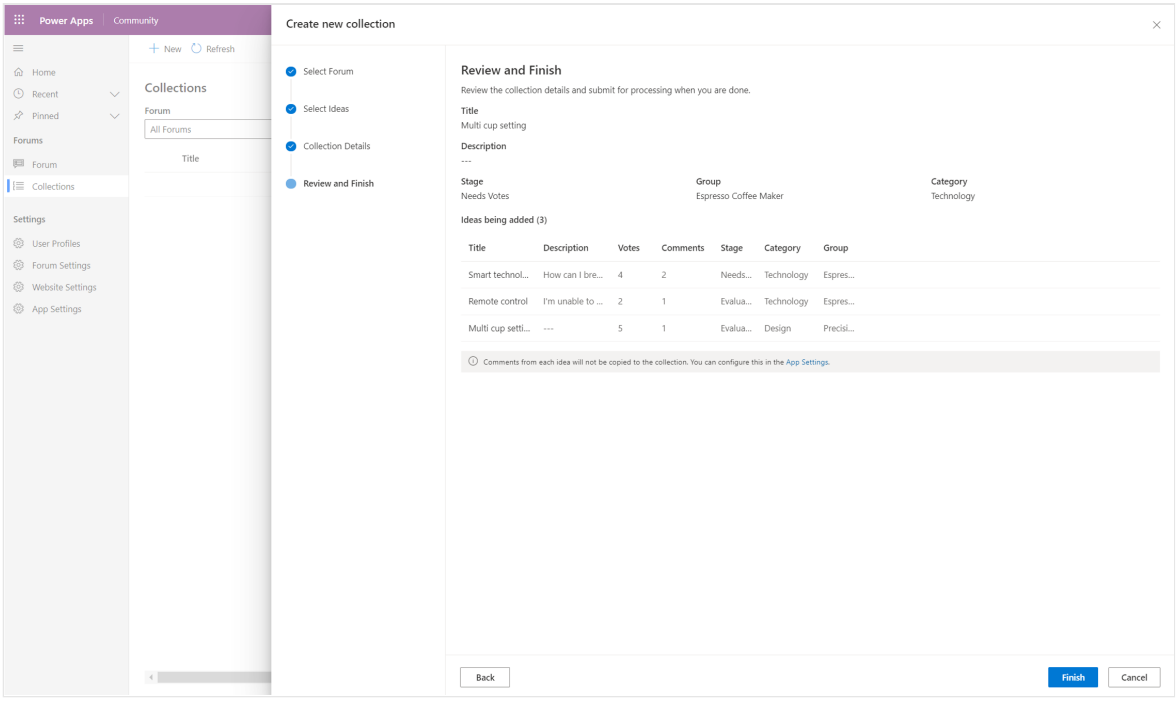
4. When you're done adding ideas, select **Next**.

5. Add a **Title** and **Description** for the new collection. You can also copy these fields from one of the child ideas.

6. Optional: You can select the **Stage**, **Group**, and **Category**, and then select **Next**.



7. Confirm that the details are correct, and then select **Finish**.



8. Wait for the status of the new collection to change from **In-progress** to **Success**. Refresh the page to get the latest status.

Community FAQs

Article • 06/23/2023

I'm unable to install Community. What should I do?

To install Community, make sure that you have at least one Dynamics Customer Service Enterprise license in your tenant.

Is Community available in all clouds?

No. Community is currently only available in the public cloud.

How long does it take for community manager and moderator updates in Dynamics Customer Service Community to reflect in the portal?

It takes up to 15 minutes for these updates to reflect in the portal.

How do I contact Dynamics Customer Service for support on Community?

To post questions for our team, use the Dynamics 365 Customer Service Community forum.

To share feedback and ideas for how we can improve Customer Service, go to the Dynamics 365 Customer Service ideas forum and select the relevant category.

Overview of unified routing

Article • 05/31/2023

Unified routing is an intelligent, scalable, and enterprise-grade routing and assignment capability that can direct the incoming work item to the best-suited queue and agent by adhering to work item requirements and matching them with the agent's capabilities.

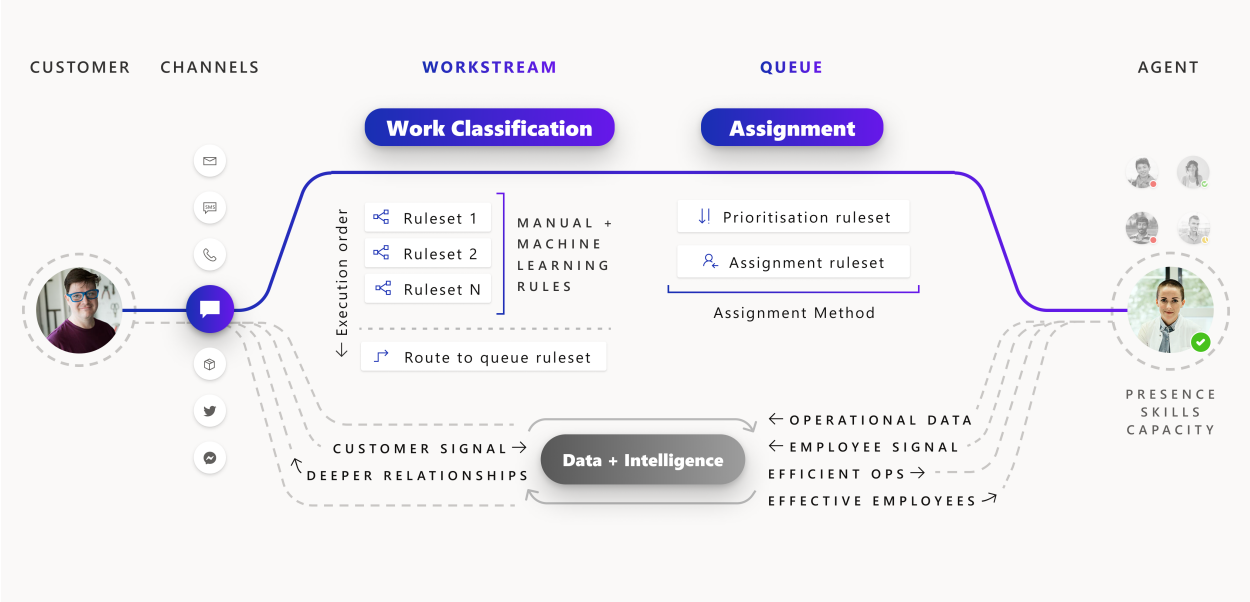
The unified routing infrastructure can be used to route service requests on all channels. This creates a unified view of workforce utilization across multiple channels, and thus helps to optimize distribution of work across the workforce. It works in a truly omnichannel way by ensuring that work items on all the channels are routed in a consistent and similar manner. It takes the agent engagement on different channels into account before any new work is assigned to them.

Unified routing has two main stages: classification and assignment.

In the classification stage, rules and machine learning (ML) models can be used to add information on the work item, which can be used to find the best-suited agent.

During the assignment stage, the service requests are prioritized and then assigned to the agents based on the nature of the work, related entities, agent skills, and the current state of the agent workforce in terms of availability and workload.

For instance, an organization receiving an incoming chat will add information on the work item—such as skills required, urgency level, category of customer, and importance level—in the classification stage, based on certain conditions that are met as part of the configured rules. In the assignment stage, an organization might want to first prioritize the incoming chats based on highest urgency level and importance, and then assign them to the agents by matching the skills required, current workload status, and availability.



How unified routing helps achieve business efficiency

Unified routing optimizes businesses in the following ways:

- Connecting end-customers with the best-suited agent to provide the right outcome upon first contact.
- Routing work items to the best queue by using attributes in a related entity, thereby saving an admin from creating a custom workflow.
- Using skills-based routing to automatically assign incoming work, matching to the best agent and decreasing resolution time.
- Adding more context to the incoming work item using conditions on work item attributes and related-entity attributes, and then further using that information to route to a particular queue and also while assigning to the right agent.
- Using machine-learning models to predict skills and assigning incoming work items to the best agent using skills to avoid writing manual declarative skill-identification rules.
- Prioritizing work items within a queue using work item attributes, added context, or related entity attributes so as to ensure the business is able to use the agent's time on the most important work items first as per the business need.
- Assigning work items within a queue by matching agent attributes against work item requirements dynamically, thereby assigning agents as per the business requirement.

System requirements, supported geographical regions

Unified routing is supported in the same geographical regions as those supported by Omnichannel for Customer Service. More information: International availability of Omnichannel for Customer Service

The requirements for unified routing are same as those that are applicable for Omnichannel for Customer Service. More information: System requirements for Omnichannel for Customer Service

For the languages that are supported in unified routing, see Supported languages.

You can configure unified routing only through the Customer Service admin center, Omnichannel admin center, and Customer Service Hub apps. Agents must use the Customer Service workspace or Omnichannel for Customer Service app only to be assigned work through unified routing.

The intelligent skill finder depends upon the custom AI Builder category classification model. Therefore, AI Builder should be available in the geographical region where you want to use intelligent skill finder. The languages supported in the intelligent skill finder are determined by the languages that AI Builder supports. For more information, see the following:

- Availability of AI Builder
- Supported languages

> **Note**
>
> Unified routing is not supported in Unified Service Desk.

How to set up unified routing

Article • 11/18/2022

Introduction

You can set up unified routing in Customer Service Hub or Omnichannel admin center.

Typically, you'll use Customer Service Hub to set up routing of records, such as case.

You'll use Omnichannel admin center to route work items that come through different channels, such as live chat or Microsoft Teams.

In this article, we'll take you through the high-level process of configuring unified routing in both the apps.

> ⓘ **Note**
>
> We recommend that you familiarize yourself with the UI because you'll perform the steps and procedures on different pages.

Prerequisites

The following prerequisites are applicable:

- The latest release of Customer Service must be installed. More information: What's new in Customer Service
- The System Administrator role to set up unified routing for records and work items.
- To route records, you must enable the record for routing using the records channel configuration. More information: Records routing

Set up unified routing for records in Customer Service Hub

The sequence of the tasks that you'll need to perform for setting up unified routing are outlined in the following table.

Step	Task	Description

Step	Task	Description
1	Provision unified routing for Customer Service	Turn on unified routing in Service Configuration Settings.
2	1. Create users in Microsoft 365 admin center 2. Set up the user as a bookable resource	Create users in Microsoft 365 and configure them in Customer Service.
3	Create and manage queues for unified routing	Set up queues in advanced queues section and add users.
4	Set up unified routing for records	Configure a record for routing.
5	Create workstreams for record routing	Configure a workstream for record routing
6	Enable routing diagnostics	Turn on routing diagnostics

Try the runtime experience in Customer Service workspace

Make sure that you have the Customer Service Representative role to try the runtime experience and do the following:

1. Perform the steps in Create a case.
2. Go to the case details page, and select **Save & Route** on the window.

Set up unified routing for channels in Omnichannel admin center

The high-level process to set up unified routing for a channel is as follows.

Step	Task	Description
1	1. Create users in Microsoft 365 admin center 2. Set up the user as a bookable resource	Create users in Microsoft 365 and configure them in Customer Service.

Step	Task	Description
2	Create a workstream for unified routing	Create a workstream for routing conversations
3	Create and manage queues	Configure queues for conversations
4	Configure routing rules	Configure routing rules for conversations
5	Configure assignment rules	Configure assignment rules for routing conversations.

Additional settings

Optionally, you can configure the following settings.

Task	Description
Configure and publish the skill model to use machine learning work classification. More information: Set up intelligent skill finder model	To route records and work items from channels
Configure capacity profile to use capacity profile-based classification. More information: Create and manage capacity profiles	To route records and work items from channels

See also

FAQ on unified routing

Create and manage workstreams

Article • 05/05/2023

> **ⓘ Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

A workstream is a container to enrich, route, and assign work items, and can be associated with a channel, such as live chat, voice, or case.

The workstream can belong to multiple channels of the same type, like multiple chat channels. In this case, all the conversations from these channels inherit the routing and work assignment settings of the workstream they belong to.

The workstream can be one of the following types:

- **Messaging**: To route conversations from live chat, SMS, social, and Microsoft Teams channels.
- **Record**: To route records, such as case, email, and activity.
- **Voice**: To route calls made to support numbers listed on the customer portal. More information: Introduction to the voice channel

> **ⓘ Important**
>
> - Unified routing must be enabled in the service configuration settings in Customer Service Hub for records to be routed using unified routing. More information: **Provision unified routing**
> - Workstreams that you created in the Omnichannel Administration app can't be modified in the Omnichannel admin center app. You'll need to migrate the existing workstreams and then manage them in the Omnichannel admin center app. More information: **Migrate workstreams created in Omnichannel Administration**

Create a workstream

You can create workstreams for unified routing in the Customer Service admin center, Omnichannel admin center, or Customer Service Hub app.

1. Go to one of the apps, and perform the following steps:

   Customer Service admin center

   - In the site map, select **Workstreams** in **Customer support**.

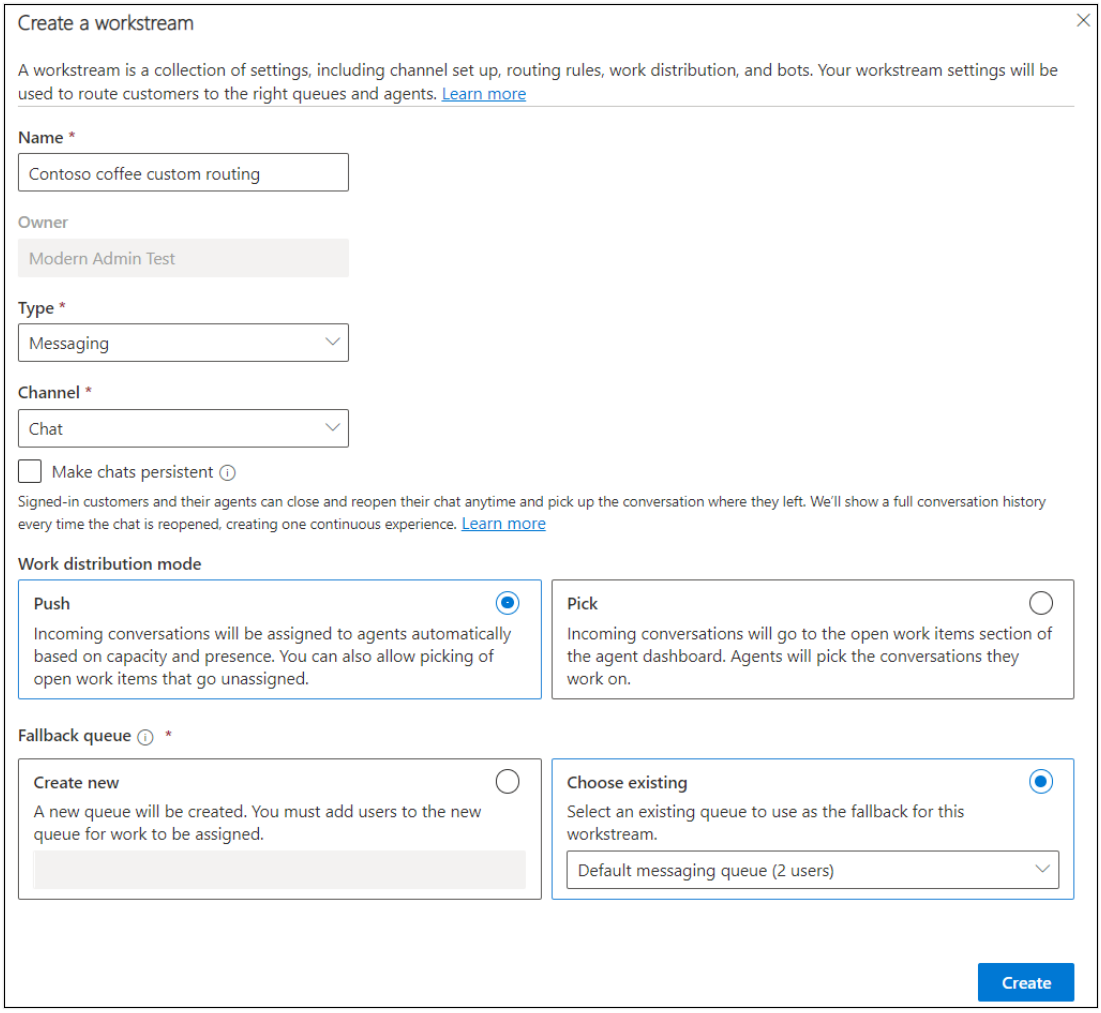
2. Select **New workstream**.

3. In the **Create a workstream** dialog, enter the following details:

   - **Name**: Enter an intuitive name, such as **Contoso chat workstream**.
   - **Type**: Select one of the following types:
     - **Messaging**
     - **Record**
     - **Voice**
   - **Channel**: This box appears if you've selected the type as **Messaging**. Select a channel from the list. If you select **Chat**, the **Make chats persistent** checkbox appears. Select the checkbox if you want to configure persistent chat. Also make sure that you select **Keep same agent for entire conversation** in the **Work distribution** settings of the workstream. More information: Configure persistent chat
   - **Record**: This box appears if you've selected the type as **Record**. Select the record from the list. More information: Set up record routing
   - **Work distribution mode**: Select **Push** or **Pick**. You can't edit this setting later.
     - In **Push** mode, a work item is dispatched to agents automatically using a message alert. You can configure the push work item to be explicitly picked up. For voice, only push mode is available.
     - In **Pick** mode, a work item is dispatched to agents when they explicitly pick the work item from the **Open work items** in the agent dashboard.
   - In **Fallback queue**, select one of the following options:
     - **Create new**: Enter a queue name to which work items will be sent when no queue is identified in the the route-to-queue rules. You'll need to add users to the queue after creating the workstream.
     - **Choose existing**: Select an existing queue from the dropdown list. By default, the out-of-the-box queue for the selected channel type is

selected.

More information: Fallback queues



4. Select **Create**. The workstream that you created is displayed with the option to configure the selected channel instance.

5. Perform the steps outlined in one of the following sections depending on the channel that you've selected.

   - Configure a chat widget
   - Configure a voice channel
   - Configure a Facebook channel
   - Configure a WeChat instance
   - Configure a LINE channel
   - Configure a WhatsApp channel
   - Configure a Microsoft Teams channel
   - Configure an SMS channel using Azure Communication Services
   - Configure an SMS channel for TeleSign
   - Configure an SMS channel for Twilio
   - Configure a custom messaging channel

- Configure record routing

> **Note**
>
> If asynchronous plug-ins are installed but disabled in your organization, ensure that you set the value of "DisabledForAsyncProcessing" to "No" to avoid issues when you're creating workstreams.

Configure routing rules

Routing rules for a workstream consist of work classification rules and route-to-queue rules. To learn about configure routing rules, see the following articles:

- Configure work classification rules
- Configure route-to-queue rules

Configure work distribution

In the **Work distribution** area of a workstream, you can either accept the default settings or select **See more** and update the following options:

- **Auto-close after inactivity**: Select a time period after which inactive conversations will be moved to the closed state automatically. This option is available for only persistent chat, SMS, social, and Microsoft Teams channels.
- **Work distribution mode**: The option that you selected in step 3 is displayed and can't be edited.
- **Capacity**: Select one of the following options. More information: Create and manage capacity profiles
  - **Unit based**: Enter a value if your organization has configured unit-based capacity.
  - **Profile based**: Specify a profile in the list if your organization has configured profile-based capacity.
- **Block capacity for wrap up**: Select a duration to block capacity when the agent is in **Wrap-up** state, such as **1 minute** or **60 minutes**. After the specified duration, agent capacity is released and presence is automatically reset. By default, **Always block** is selected, where agent capacity is blocked as long as the conversation is in **Wrap-up** state. You can also select **Don't block**, where agent capacity is released immediately, when the conversation moves to the **Wrap-up** state.

> **Note**
>
> If you've selected **End of Day mode** in capacity profile, agent capacity won't be reset when the duration selected in the **Block capacity for wrap up** field is over.

- **Allowed presences**: Select the presences in which agents will be assigned.
- **Default skill matching algorithm**: Select **Exact Match**, **Closest Match**, or **None**.
- **Keep same agent for entire conversation**: Set the toggle to **Yes** if you want the conversation to remain assigned to the originally assigned agent. More information: Agent affinity

Configure advanced settings

For a selected workstream, expand **Advanced settings** to configure the following options:

- Sessions
- Agent notifications
- Context variables
- Smart assist bots
- Quick replies

Add a bot to a workstream

To add a bot to a workstream, the bot must be configured and available for selection.

For Power Virtual Agents bots, see Connect omnichannel to your Power Virtual Agents bot. For Azure bots, see Integrate Azure bots with Omnichannel for Customer Service.

To add the bot to the workstream

1. In Customer Service admin center or Omnichannel admin center, go to **Workstreams**, and select a workstream.
2. For the selected workstream and channel, in the **Bot** area, select **Add bot**.
3. In the **Add a bot** dialog, select the required bot from the **Name** dropdown list, and then select **Save and close**.

When a work item needs to be assigned, the classification rules are run and the work distribution system checks and routes the work item to the bot, if the selected

workstream has a bot. After a bot is added to the workstream, the incoming work item is first routed to the selected bot at runtime.

> ⓘ **Note**
>
> - Bots can receive conversations only if they're added to push-based workstreams.
> - We recommend that you don't add bots to workstreams that are meant for record routing.

Manage workstreams

You can manage workstreams on the workstreams page of any of the Customer Service admin apps.

Select a workstream to perform any of the following actions:

- **Edit**: Lets you edit the workstream, such as add a new channel or update the existing settings.
- **Copy**: Lets you create a copy of the workstream with all the properties, such as the rules, so that you can reuse the configured workstream in another organization. The copied workstream name is prefixed with "Copy of "`<workstream>`.
- **Delete**: Lets you delete the workstream if you no longer need it in your organization. You can't delete workstreams that are used in intake rules for record routing. You'll be prompted to remove the dependencies and then try to delete the workstream.
- **Fallback queue**: Select an existing queue or create a queue to set as the fallback queue. More information: Fallback queues

Agent affinity

The agent affinity feature ensures that work items are assigned to the agents based on their work history. Agent affinity ensures that conversations are automatically reassigned to the same agent, irrespective of the agent's capacity and presence.

The feature is enabled by default for persistent chat, SMS, social channels, and Microsoft Teams. In these channels, when a conversation moves from the waiting to active state, it might not get assigned to the same agent who had previously handled it. You can set the **Keep same agent for entire conversation** toggle to **Yes** when you configure the work distribution for the workstream to reassign the conversation to the agent. This

helps save the effort to reorient the agent or set the context about the customer issue again.

However, for live chat, there's no waiting state. So, when the state of the conversation changes from active to open state, it'll be reassigned to the same agent. The agent can, however, choose to reject the assigned conversation via the notification pane.

> **Note**
>
> Agent affinity is applicable only for push type of work distribution.

Associate templates

You can keep the default templates for sessions and notifications or update to use custom templates. More information: Associate templates with workstreams

Create and manage queues for unified routing

Article • 10/31/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

In Customer Service, queues are used to collect and distribute workload among agents. Workload includes records such as cases, and conversations such as chat or SMS. Agents are added as members to the queues and the workload is distributed among the agents based on assignment methods.

How work items are routed to queues

You can create separate queues for each line of business such as billing, investment, and products. When a customer query is raised for any of the areas, it's routed to the corresponding designated queue based on how you define route to queues in the classification. You can also set up a customer support availability matrix by using a combination of queues, operating hour schedules, and routing rules.

In an enterprise scenario, you can have various supervisors handling different issues, and therefore, different types of queues are required to handle the various scenarios. Accordingly, routing rules are set up based on the complexity of issues that need to be handled.

To simplify the routing experience for administrators and supervisors, queues are categorized based on the channel types as follows:

- **Messaging**: To route all messaging conversations pertaining to the live chat, SMS, and social channels.
- **Records**: To route work items pertaining to records, such as cases and emails.
- **Voice**: To route calls made to support phone numbers listed on the customer portal.

The queue types allow issues to be routed correctly and help avoid cross-queue assignments. When you configure workstreams and routing rule items, the queues that

are available for selection are based on the channel type for the workstream. For example, for routing rules for a live chat workstream, only messaging type queues are shown for selection. Similarly, you can transfer a chat conversation only to a messaging queue, and a case only to a record queue.

Assign a group number that helps you organize your queues in the list view. The group number doesn't affect the priority of the queue or incoming conversations.

Create a queue for unified routing

1. In Dynamics 365, go to one of the apps, and do the following steps:

   Customer Service admin center

   a. In the site map, select **Queues** in **Customer support**.

   b. On the **Queues** page, select **Manage** for **Advanced queues**.

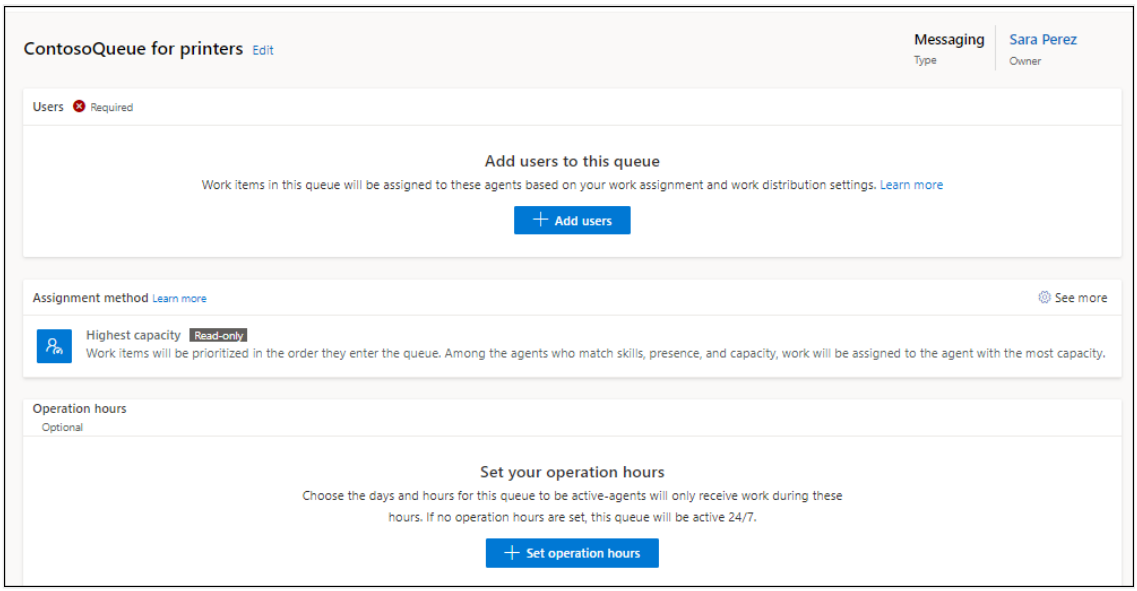
2. On the **Queues** page, do the following steps:

   a. Select **New**.

   b. In the **Create a queue** dialog, enter the following details:

   - **Name**: A name for the queue.
   - **Type**: Select **Messaging**, **Record**, or **Voice**.
   - **Group number**: A number to organize the queue.

   c. Select **Create**. The queue that you created is displayed.



3. Select **Add users**, and in the flyout menu, select the users who should be part of the queue, and then select **Add**. The users are added to the queue.

4. In **Assignment method**, select any of the following options:

    - **Highest capacity**: Assigns a work item to an agent with the highest available capacity. This agent has the skills that are identified during the classification stage and presence that matches one of the allowed presences in the workstream.
    - **Advanced round robin**: Assigns a work item to the agent who matches the criteria for skills, presence, and capacity. The initial order is based on when a user is added to the queue. Then, the order is updated based on assignments.
    - **Least active**: Assigns a work item to the agent who has been least active among all the agents who match skills, presence, and capacity.
    - **Create new**: Lets you create a custom assignment method. The custom assignment method lets you use your own rulesets and rules to configure priority, severity, and capacity for choosing the queues to which work items need to be routed by setting up the rulesets for prioritization and assignment. For more information about the custom assignment method, see Create custom assignment method.

5. To manage overflow of queues, in **Overflow management**, select **Set overflow conditions**, and perform the steps described in Manage overflow of queues.

6. To set the operating hours, in **Operation hours**, select **Set operation hours**. If you don't set operation hours, the queue is considered to be available round the clock. You must configure the operating hour record before you can set it for the queue. More information: Configure operating hour record

7. On the **Set operation hours** dialog that appears, select an operating hour record in the **Name** list.

8. Select **Save and close**. The operating hour record that you selected is configured for the queue.

Manage queues for unified routing

You can manage queues on the **Queues** page, and perform operations such as search, edit, copy, and delete the queues.

- Select a queue to edit the users, assignment methods, or operating hour record.

- Select a queue on the **Queues** page, select **Copy** on the command menu, and then select **Copy** in the *<queue_name>* dialog. The queue is copied and inherits the settings of the queue you copied from, including its name, prefixed with **Copy of**.

> **Important**
>
> If unified routing is enabled, make sure that the **Queue** form, which is the default form, exists and hasn't been removed through customization. Otherwise, you aren't able to create a basic queue in Customer Service Hub.

How fallback queues work

To efficiently manage the work items, you can configure a fallback queue per workstream that acts as a safety net. You can set an existing queue as the fallback queue or create a fallback queue with the required settings when you're creating a workstream.

For existing workstreams, you can configure the fallback queue on the workstream page. If you choose to create a queue, you need to add users. By default, the assignment method for the fallback queue is highest capacity.

If any overflow settings exist, they are overruled and work items are routed to the fallback queues in the following scenarios:

- Work item encounters an error during classification.
- Work item encounters an error when running a route-to-queue rule.
- Work item doesn't match any route-to-queue rules.

How default queues work

Default queues are a finite set of system-defined queues that help you manage work items when other queues aren't available for routing them. All agents who have the Omnichannel agent role are a part of the default queues. Out of the box, the following default queues are available:

- **Default entity queue** for routing entity records.
- **Default messaging queue** for routing all messaging conversations pertaining to live chat, SMS, Microsoft Teams, and social channels.
- **Default voice queue** for routing all voice calls.

For a workstream, you can set any queue as a fallback queue, including a default queue but vice versa isn't possible. You can update the assignment method only for the default queues. However, we recommend that you always create advanced queues and define

the assignment strategy instead of using the default queues. No other settings are available to edit.

Configure work classification rulesets for unified routing

Article • 04/26/2023

In unified routing, work classification lets you define rules to add detailed information to incoming work items that can be used to route and assign the work items optimally.

Typically, rules are written in the format of "if defined condition satisfies, then set the output attributes to certain values," but can also be surfaced through machine learning models. They are optional and can be used to add additional information to the incoming work items that are then used for more precise routing and assignment.

Work classification rules can be written by using the logical declarative decision list or by using machine learning models.

> **Important**
>
> You can create 10 rulesets per workstream, and for each ruleset, you can create up to 100 rule items.

How classification rulesets work

A classification ruleset is an ordered list of multiple work classification rulesets and route-to-queue ruleset. During evaluation, the work classification rulesets are run first, followed by route-to-queue ruleset.

The work classification rulesets will be run in the order they are listed. Within a ruleset, rule items will be run in the order they are listed. As soon as one of the rule item conditions matches the output section of the rule item is run, and the system evaluates the rules in the next ruleset if it is configured.

After all the work classification rulesets have been run, the system evaluates the route-to-queue ruleset in which all the rule items will be run in the order they are listed. This is unlike the classification rules, where control passes to the next ruleset when one of the rule items in a ruleset condition matches.

In work classification rulesets, the values set in one of the rule items of a ruleset can be used in the next rulesets' rule items. For example: If in output section of one of the rule items of ruleset 1, priority is set to High; then any next ruleset rule item can use the

priority variable and corresponding value "High" to set value for another attribute, such as, "If Priority equals High, set severity to critical".

For a rule item, you can set the output values for up to five attributes.

Prerequisite

You need the CSR Manager or Omnichannel administrator role to configure the work classification rules for a workstream.

Create work classification rulesets

Logical classification rules are run to update work item attributes. They are written in the format of "if defined condition satisfies, then set the output attributes to certain values." You can create conditions to define rules based on multiple entity attributes. Routing rules are written as rulesets that consist of rule items.

To create a logical work classification ruleset, do the following steps:

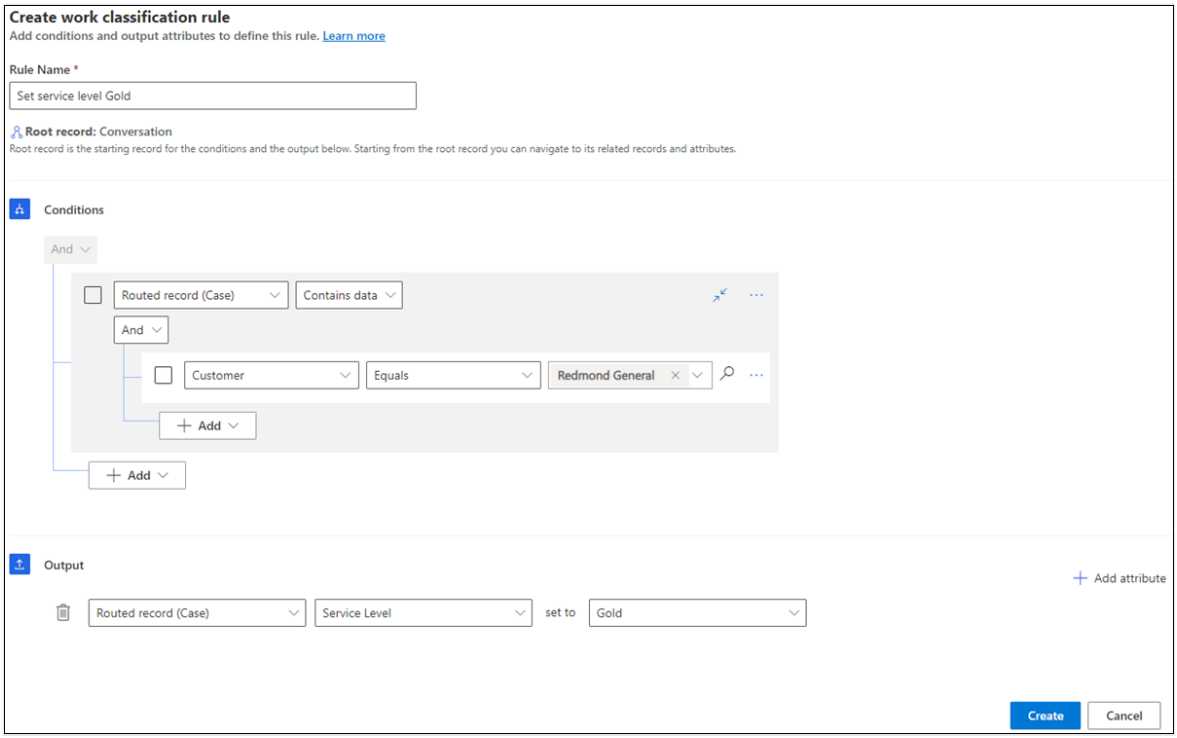
1. In Customer Service admin center or Omnichannel admin center (deprecated), select a workstream, and in the **Routing rules** area, for the **Work classification (optional)** option, select **Create Ruleset**.

2. On the **Work classification** page, select **Create new**, and in the **Create work classification ruleset** dialog, select **Logical rules** in **Rule type**, and enter a name and description. By default, the root record is selected and displayed at the top of the condition builder for ease of reference and visibility of the record for which you are creating the rule.

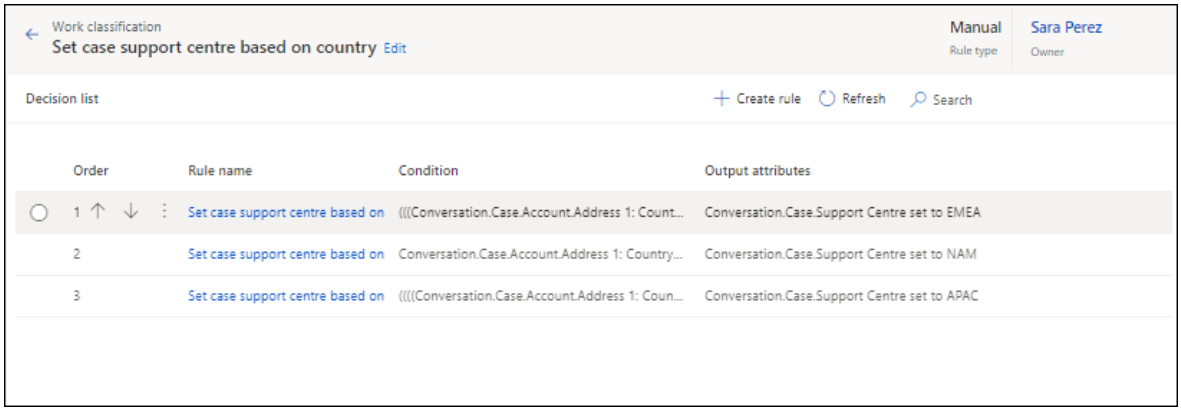
3. In the **Decision list** area, select **Create Rule**, and on the **Create work classification rule** dialog, enter a name.

4. In the **Conditions** area, define the conditions according to your business needs. If you are creating classification rules for records, then the top-level condition is automatically populated. You can define conditions for up to two levels of the related records and attributes.

5. In the **Output** area, select the attribute for which value needs to be set if the conditions are met.



6. Repeat steps 3 through 5 to create the demand rules.



Create logical skill classification rulesets

Skill attachment rules are a sub-type of logical work classification rules and are defined to attach skills to the work item. They are written in the format of "if defined condition satisfies, then attach defined skills to the work item."

Follow these steps to create a logical skill classification ruleset:

1. For the selected workstream, in the **Routing rules** area, for the **Work classification (optional)** option, select **Create Ruleset**.

2. On the **Work classification** page, select **Create new**.

3. In the **Create work classification ruleset** dialog, select **Logical rule** in **Rule type**, and enter a name and description.

4. Select **Create Rule**, and on the **Create work classification rule** dialog, enter a name.

5. In the **Conditions** area, define the conditions as per your business needs:
   a. Select **Add row**, and select **Skills** from the list box.
   b. Select the required operator, and then select the skills for the condition.
   c. Repeat the steps to define any other conditions.

6. In the **Output** area, select the attribute whose value will be set if the conditions are met.

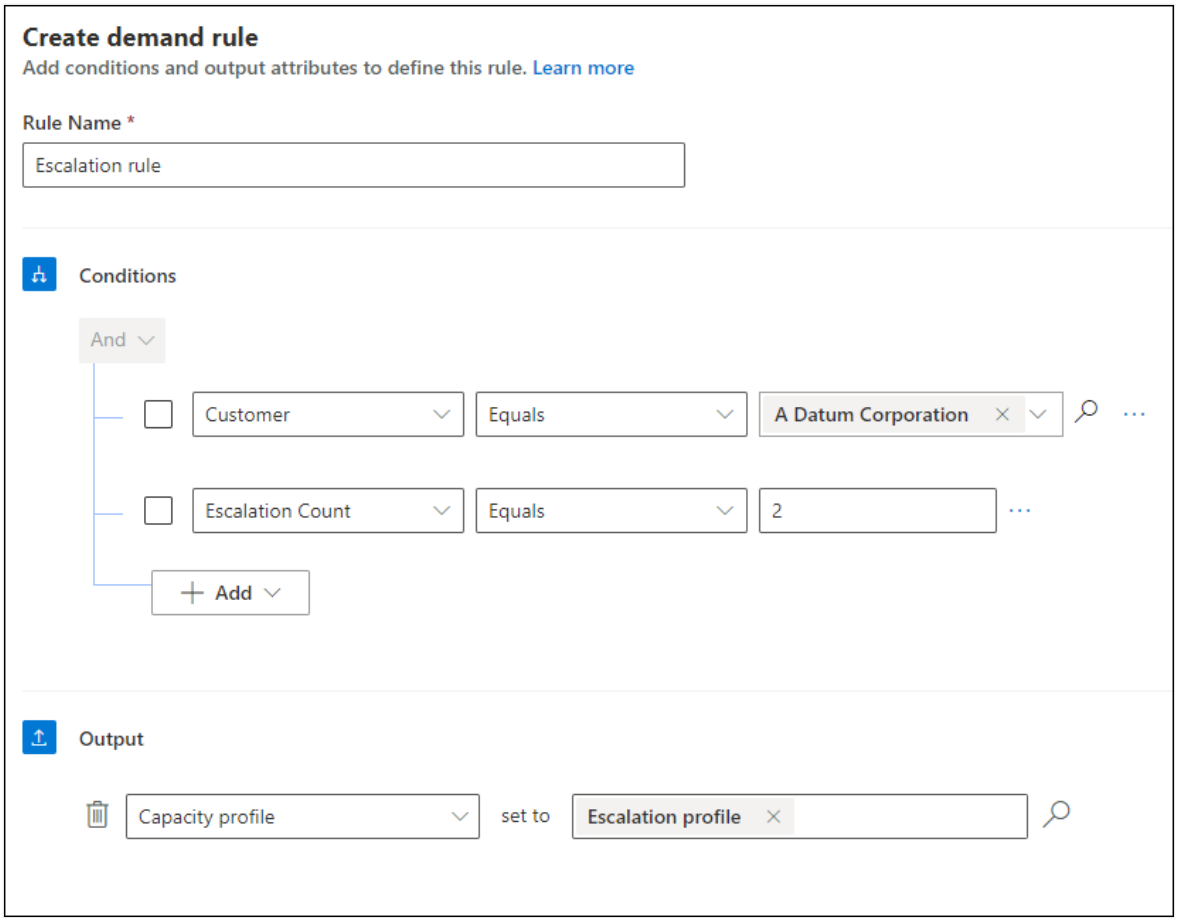
7. If you want to set up the skill attribute, in the **Conditions** area, define the conditions, and select the required value in the **Output** area for the skill that needs to be set.

> ⓘ **Note**
>
> - Ensure that the rating model that you choose for a skill in the work classification rule is same as the rating model that's defined for the skill attached to the agent. Also, ensure that you don't attach the same skill with two different rating models.
> - When you reroute a work item, new skills are appended to the existing ones if any.

Create classification rulesets based on capacity profiles

Create work classification rulesets that are based on capacity profiles to route work items to agents based on capacity.

1. Perform the steps 1 through 5 in Create logical skill classification rulesets.
2. In the **Output** area, select **Capacity profile**, and choose a capacity profile whose value should be set if the conditions are met.



Create machine learning-based skill classification rulesets

Machine learning model-based rules are a sub-type of work classification rules, and are rules defined to attach skills to the work item using the AI Builder text classification machine learning model created as part of the intelligent skill finder bootstrapping experience. They are written in the format of "send work item selected attributes to the published model and attach the returned tags from the model as skills on the work item."

To configure a skill classification ruleset by using the machine learning option, you must have configured the intelligent skill finder models. More information: Set up intelligent skill finder model

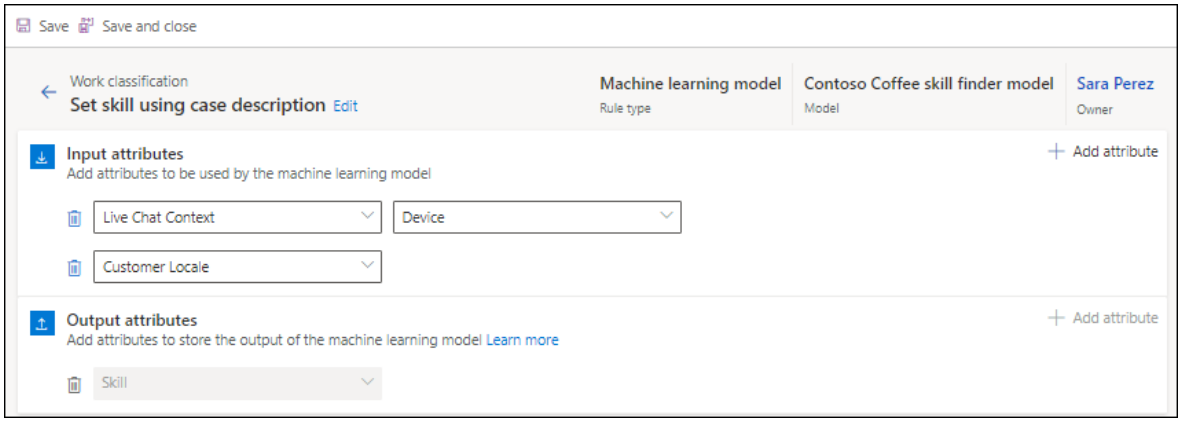
Do the following to configure a machine learning-based ruleset:

1. In Customer Service admin center, Omnichannel admin center, or Customer Service Hub, select a workstream, and in the **Routing rules** area, for the **Work classification (optional)** option, select **Create Ruleset** or **See more**.

2. On the **Work classification** page, select **Create new**.

3. In the **Create work classification ruleset** dialog, select **Rule Type** as **Machine learning model**, and enter a name and description.
4. Select a model in the **Select skill identification model** list, and select **Create**.
5. On the page that appears, in the **Input attributes** area, select **Add attribute**, and select the attributes from the **Attributes** or **Related Entities** category. For an incoming work item, these attribute values will be concatenated and sent to the machine learning model for skill prediction.

> **Note**
>
> Skill is the default selection for output attributes and can't be edited or deleted.



Create rulesets based on sentiment prediction model (preview)

> **Important**
>
> This section is pre-release documentation and is subject to change.

You can create rules that are based on the sentiment prediction model to classify work items. More information: Use sentiment prediction.

Create rulesets based on effort estimation model (preview)

> **Important**

This section is pre-release documentation and is subject to change.

You can create rules that are based on the effort estimation model to classify work items. More information: Use effort estimation.

Options available for rulesets

After you create the rules, you can change the order in which the rules should be evaluated, search for rules, and view the condition that's been used for each rule by hovering the mouse over the condition. You can also create copies of the rules and update only the necessary information to avoid writing the conditions from scratch. You can hover the mouse over a condition to view it without having to navigate to each condition.

Configure route-to-queues rules for a workstream

Article • 02/24/2023

Queue routing rules send the work item to the right queue. The rules are written in the format of, "If defined condition satisfies, then route the work item to the defined queue." If no rules are defined or no rules match, then the incoming work item will be routed to the fallback queue of the respective workstream.

The route-to-queue ruleset is run after all the work classification rulesets are run.

A workstream can have only one route-to-queues ruleset.

After you configure the rules, the system matches the rule conditions, and overflow handling of the corresponding queue to assign a work item to a queue. If more than one rule matches the required condition and the corresponding queues aren't overflowing, then the queue corresponding to the first rule in the list is selected for assignment. If all the queues corresponding to the rules are overflowing, the work item is assigned to the queue that will be available first.

The routing diagnostics gives a detailed view of the matched and applied rules in the route-to-queue stage. More information: Diagnostics for unified routing

Percentage-based allocation of work to queues

To balance the workload optimally and distribute it across multiple contact center vendors, organizations can configure percentage-based routing. The routing of work items to queues is controlled using percentage allocation. Percentage-based allocation of work items is an optional setting that can be configured in the route-to-queue rules as discussed in the following section.

When you configure this feature, the system picks a queue from the available list of queues in the route-to-queue rule, as per the configured percentages. The final queue that's selected, however, is also dependent on the ruleset evaluation logic, such as queue overflow and override overflow settings.

Configure rules in route-to-queue ruleset

1. In Customer Service admin center, select a workstream.

2. In the **Routing rules** section, select **Create ruleset** next to **Route to queues**, and then select **Create Rule** in **Decision list**.

3. In the **Create route to queue rule** dialog, enter a name in **Rule Name**. By default, the root record is selected and displayed at the top of the condition builder.

4. In **Conditions**, define the set of conditions. If you're creating rules for records, then the top-level condition is automatically populated. You can define conditions for up to two levels of the related records and attributes.

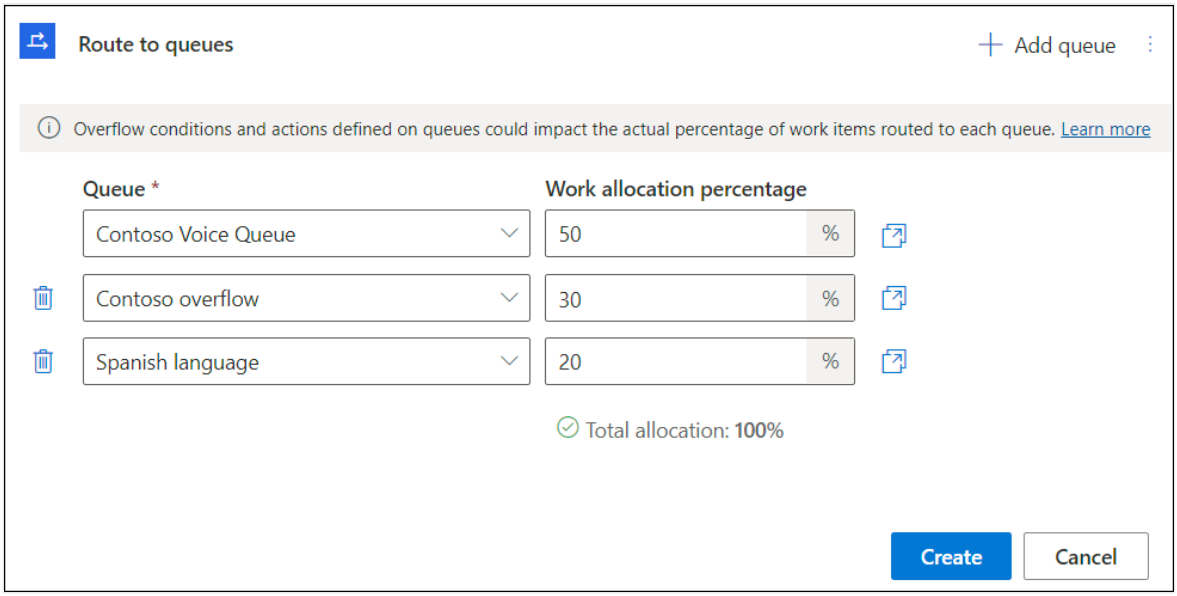
5. In **Route to queues**, select the queue to which the work items will be routed if the conditions are met.

6. To configure percent allocation, select **Add queue** and do the following:

   a. **Queue**: Select a queue in the dropdown list.

   b. **Work allocation percentage**: Enter a value that denotes the percentage of work allocation for the queue.

7. Repeat **Step 6** to define the percentage allocation for up to five queues. The total percentage allocation for all the queues should sum up to 100.



8. Use the **Remove allocations** option that's available in the **More commands** ellipses to remove the percentage-based routing. When you update the percentage-based settings, you must ensure that the allocation totals to 100.

9. Repeat **Steps 2 through 6** to define the rules to cater to your business needs.

10. Optionally, after you create the required rules, reorder them in the ruleset by selecting the arrows in the **Order** column on the **Decision list** page.

Options available for rules

The following options are available for the rules:

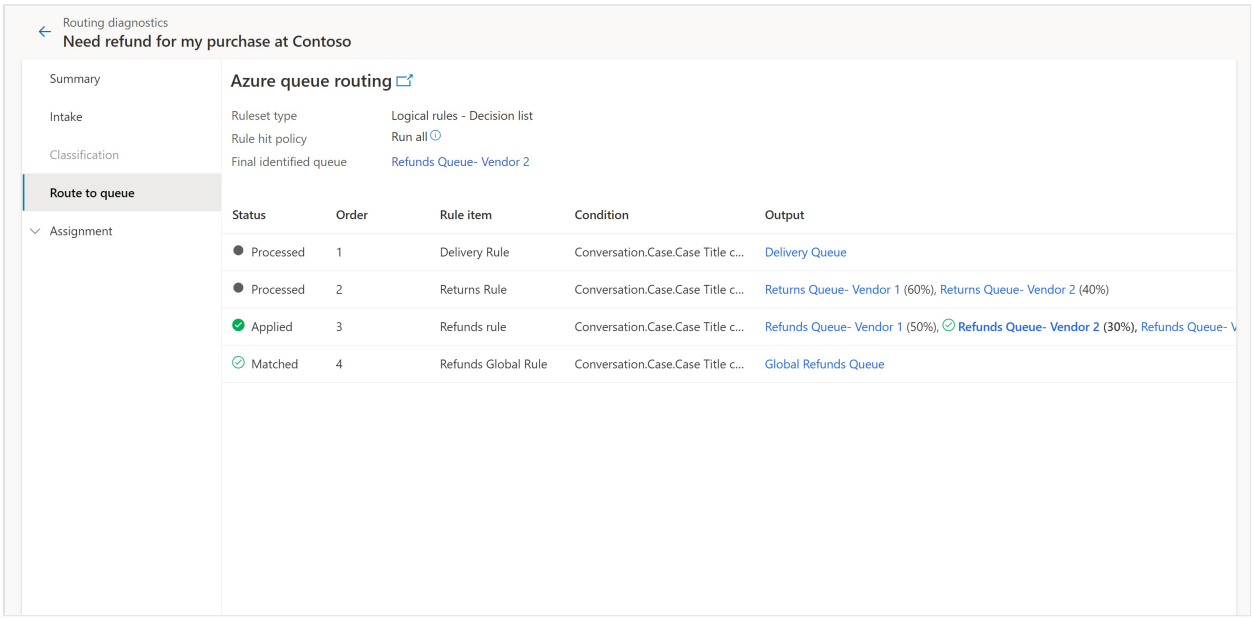
- Change the order in which the rules should be evaluated
- Search the rules
- View the condition that's been used for each rule by hovering the mouse over the condition.
- Create copies of the rules and update only the necessary information to avoid writing the conditions from scratch.

Diagnostics for percentage-based allocation

The route-to-queue stage of the diagnostics displays the following information about the rules:

- The rules that are matched.
- The final rule that's applied and the queue to which the work item is routed.

For each of the matched or applied rules, the corresponding queue is also displayed. For the percentage-based rule, the queue that's picked up from the set is highlighted.



The runtime allocation percentages might deviate slightly from the allocation that you've configured in the rules. The margins tend to be negligible as the number of work items increases.

Engagement context for asynchronous channels

You can configure routing rule conditions for the social channels, such as Facebook and WhatsApp based on the attribute values. The attributes are listed channel wise as follows:

- **Microsoft Teams**: Use the **Teams Engagement Context** entity to set a condition on the **Customer name** attribute.
- **Facebook**: Use the **Facebook Engagement Context (Conversation)** entity to set conditions on the following attributes:
  - **Customer name**: The customer name is shown in the format "first name, last name".
  - **Locale**: For a list of locales, go to Facebook developer documentation.
  - **Timezone**: Timezone is shown as a number relative to GMT, for example, “5.5”.
  - **User Page Scoped Id**: This is shown as a number string.
- **Google's Business Messages**: Use the **Google's Business Messages** entity to set conditions on the following attributes:
  - Entry point
  - Place id
  - Resolved locale
  - User device locale
- **Apple Messages for Business**: Use the **Apple messages for business** entity to set conditions on the following attributes:
  - Group id
  - Intent id
  - Locale
- **LINE**: Use the **LINE Engagement Context** entity to set conditions on the **Customer name** attribute.
- **WeChat**: Use the **WeChat Engagement Context** entity to set conditions on the following attributes:
  - Customer name
  - Gender
  - City
  - Province
  - Country
- **WhatsApp**: Use the **WhatsApp Engagement Context (Conversation)** entity to set conditions on the **Customer Phone Number** and **Customer First Message** attributes. The **Customer First Message** attribute lets you create a pre-filled message that will automatically appear in the text field of a customer chat.

- **Twitter**: Use the **Twitter Engagement Context (Conversation)** entity to set conditions on the following attributes:
  - Customer name
  - Customer screen name
  - Followers count
  - Friends count

- **SMS**: Use the **SMS Engagement Context** entity to set conditions on the following attributes:
  - Customer phone number
  - Org phone number
  - Locale
  - Provider
  - Provider display name

Assignment methods in unified routing

Article • 10/09/2023

Use assignment methods to determine how to assign work items. You can use the out-of-the-box assignment methods or build custom assignment rules by configuring the prioritization rules and assignment rulesets.

How auto assignment works

The auto-assignment process in unified routing matches incoming work items with the best-suited agents based on the configured assignment rules. This continuous process consists of multiple assignment cycles and a default block size of work items.

Each cycle picks up the top unassigned work items in the applicable default block size and attempts to match each work item with an appropriate agent. Work items that aren't assigned to agents because of unavailability of agents or right skill match wasn't found are routed back to the queue.

The next assignment cycle picks up the next block of the top-priority items that includes new work items.

When eligible agents aren't found for the work items, the assignment cycle keeps retrying to assign the top number of default sized block items as applicable for the channel.

For digital messaging and voice, the default block size is 100 work items of top priority.

For records channel, each assignment cycle prioritizes up to 2000 work items and processes them in a block size of 500.

> **Note**
>
> Queue prioritization isn't available in unified routing.

For more information, see best practices to manage queues.

Types of assignment methods

The following assignment methods are available out of the box:

- **Highest capacity**: Assigns work item to the agent with the highest available capacity. This agent is from among those agents who have the skills that are identified during the classification stage and presence that matches one of the allowed presences in the workstream. The work items are prioritized in the first-in, first-out manner—that is, the work item that was created first is assigned first. If more than one agent is available with the same capacity, the work item is assigned based on the round-robin order of the agents whose highest capacity is the same.

  If you want to use skill-based routing and set the default skill-matching algorithm for the workstream as exact match and choose highest capacity as the assignment method, then the system filters agents using exact skill match, workstream's presence, and capacity requirements, and order the filtered agents by available capacity.

  If **Default skill matching algorithm** in the workstream is **Closest Match**, then the system filters agents based on the workstream's presence and capacity requirements and orders the filtered agents by closest match and not available capacity. More information: Closest match

  If you need to distribute work fairly among agents, then you should consider switching to a round robin assignment strategy.

- **Round robin**: Assigns a work item to the agent who matches the criteria for skills, presence, and capacity. The initial order is based on when a user is added to the queue. Then, the order is updated based on assignments. Similar to how work items are assigned in the highest capacity method, in round robin assignment, the work items are prioritized in the first-in, first-out manner—that is, the work item that was created first is assigned first.

  In scenarios when multiple agents match the work item requirement, and there's a tie in the "order by", like, multiple matched agents with the same available capacity, the system resolves the assignment using round robin based on the earliest time of the last assignment.

  For example, three agents, Lesa, Alicia, and Alan, are available with the coffee refund skill and can handle up to three chats at a time. Their last assignment time stamps are 10:30 AM, 10:35 AM, and 10:37 AM, respectively. A work item about a coffee refund arrives in the queue at 10:40 AM. With the order by set to "profile-based available capacity", all the agents at 10:40 AM have the same available capacity of 2 each. To break the tie between the agents, the system uses round robin. Therefore, the incoming chat is assigned to Lesa because her last assignment was the earliest at 10:30 AM. Later at 10:45 AM, if another coffee refund work item comes in, the system assigns it to Alicia. This is also based on the

round robin order of assignment between Alicia and Alan because their available capacities are 2 each and Alicia had an earlier assignment than Alan at 10:35 AM.

- **Most idle (preview)**: Assigns a work item to the agent who has been idle the most among all the agents who match skills and capacity.

  The assignment method uses the time since last capacity is released for a voice call to determine the agent to whom the next incoming call should be routed. For example, if two agents are configured in a queue, and both receive calls one after the other, the agent who finishes their current call first and is available is assigned the next call. The wrap-up settings that are configured for the workstream are accounted for in determining the most-idle agent. The agent presence statuses aren't used in determining the most-idle agent.

  Routing to the most-idle agent assignment strategy helps in better use of agents with a more fair distribution of work items across agents. This strategy provides higher agent satisfaction and improved customer satisfaction.

  > **ⓘ Important**
  >

  >
  > This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making—and should not be used to make—decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements.

> Customers are solely responsible for using Dynamics 365, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

You can also create a custom assignment method to suit your business needs.

- **Create new**: Lets you create and use your own rulesets and rules to configure priority, severity, and capacity for choosing the queues to which work items need to be routed. You can create the following rulesets:
  - **Prioritization rulesets**: Lets you define the order in which the work items are assigned to agents when they're available to take more work.
  - **Assignment rulesets**: Represent a set of conditions that are used to select agents and use an order by option to sort the matching agents.

> ⓘ **Important**
> - You must configure presence, capacity, and skill-matching rules in the custom assignment method because the default settings defined for the workstream won't be used in custom assignment method.
> - The out-of-the-box assignment strategies don't consider the agent operating hours. You must write a custom assignment method by using the "is_working" operator in the rule definition.

Assignment cycle

Assignment cycle is prioritization of work items, their selection, and their assignment to the best-suited agent based on the assignment rules. Unified routing optimizes the assignment cycles across the multiple queues in the organization for best performance.

The assignment cycle starts with one of the following triggers:

- Arrival of a new work item in the queue.
- Change to agent presence.
- Updates to agent capacity.
- Addition of an agent to the queue.

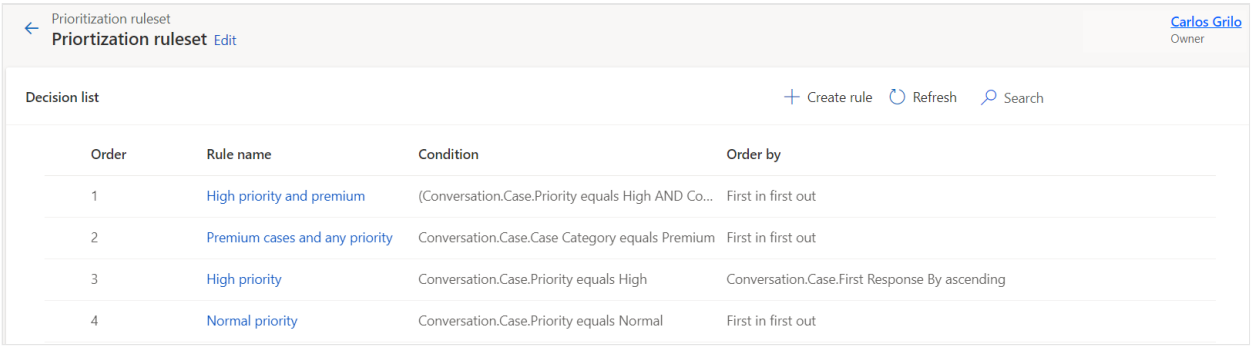
- Periodic trigger every five minutes for record type of work item.

How prioritization rulesets work

A prioritization ruleset is an ordered list of prioritization rules. Every prioritization rule represents a priority bucket in the queue. In a prioritization rule, you can specify a set of conditions and order by attributes. During evaluation, the prioritization rules are run in the order they're listed. For the first prioritization rule, the work items in the queue that match its conditions is put in the same priority bucket. In the priority bucket, the items are further sorted by the order specified in the prioritization rule. The second rule runs on the rest of the items in the queue, to identify the next priority bucket, and sort that bucket by the order by attribute until all rules are evaluated.

You can create only one prioritization ruleset per queue.

As an example, consider the prioritization ruleset as seen in the following screenshot with four rules.



- During any assignment cycle, this prioritization ruleset runs, and the rules within the ruleset run in the order they're listed.

- The first rule, "High priority and premium," finds all work items in the queue where the associated case priority is "High" and the case category is "Premium". The system creates the top priority bucket with those work items and sorts them in the "First in and first out" manner as specified in the **Order by** attribute. The first work item to be assigned from the queue is the oldest item in this bucket.

- The next priority bucket is the work items where case category is "Premium". The work items with "Premium" case category and "High" priority have already been put in top bucket as per the preceding rule, so this rule only considers other work items with "Premium" case priority. The **Order by** attribute in this case also is "First in and first out".

- The next priority bucket consists of work items where case priority is high and they haven't been bucketed already. Here the work items are ordered by their "First

Response By" field in the ascending order—that is, the work items that require the first response at the earliest are prioritized first.

Some important points about prioritization rules are as follows:

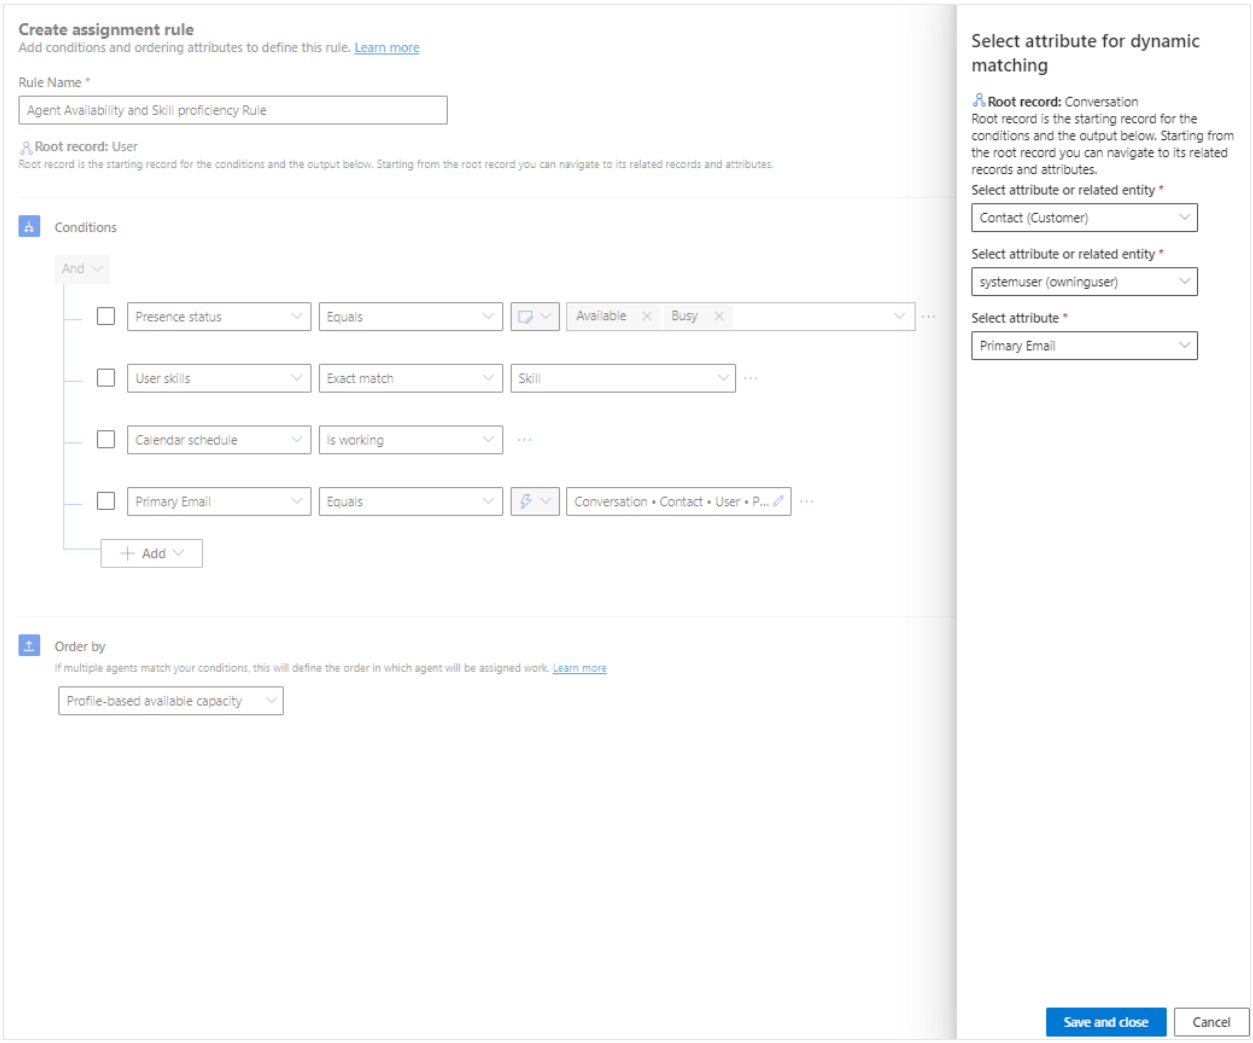
- You can create only one prioritization ruleset per queue.
- Prioritization rules are run during every assignment cycle. If you change any attributes of the work item, such as the priority of the case, that change is considered during the next assignment cycle.
- By default, the queue is sorted on a "first in and first out" manner. If you don't create a prioritization rule, then the oldest work item is assigned first.
- In normal scenarios, when a sufficient number of agents are available to take up the work items, the processing period is a couple of seconds only. The agents are assigned work items in the priority order. However, if work items pile up because of fewer eligible agents, and then an agent becomes available during the processing period, the agent is offered the next work item according to the priority order. This strategy might create a perception that the highest priority item wasn't assigned; especially after some top-priority items are attempted for assignment and yet remain in the queue.
- The work items that don't match the criteria of any of the prioritization rulesets are kept in the last priority bucket, and are ordered by "first in first out".
- Prioritization rules are skipped for affinity work items and such work items is assigned before other work items in the queue. For information about affinity, go to Agent affinity.

How assignment rulesets work

The assignment ruleset is an ordered list of assignment rules. Each assignment rule represents a set of conditions that is used to determine the agents to select and an order-by field to sort the matching agents. At runtime, the assignment rule with the top order is evaluated first. The agents are matched as per the conditions specified in the rule. If more than one matching agent exists, they're sorted by the order by field, and the top agent is assigned the work. If no agents are matched, then the next assignment rule in the ruleset is evaluated. This method can be thought of as a gradual relaxation of constraints in the assignment, such that first, the strictest criteria are applied, and then the conditions are reduced so that the best agent is found. If no matching agents are found, then the work item remains in the queue.

In the assignment rule, the system user attributes are matched with the requirement of the work item. When you select static match, the condition is formed on the System User entity attribute and static values. When you select dynamic match, the conditions

on the left are based on the system user root entity and the conditions on the right are based on the conversation root entity. You can drill down to two levels on the conversation root entity to form the rule conditions. An assignment rule with the dynamic match and static match is as follows.



Components of an assignment rule

The assignment rules are composed of the following items:

- **Order**: Specifies the order in which the assignment rule is evaluated in a ruleset. The lower-order rules are run first. If any rule results in matching a user, then the next set of rules isn't evaluated.
- **Name**: The unique rule name.
- **Condition**: The expressions that are evaluated to match the users with the attributes of incoming work. The conditions have three parts:
  - **User attribute**: Properties of the users that can be used for comparing the user with the incoming work. The user attributes can be one of the following:
    - **Select attributes on the System User table.**

- **Presence Status**: Maintained by the unified routing service based on user workloads and manual selection.
- **Capacity**: Maintained by the unified routing service based on user workloads and manual selection.
- **User skills**: Represents the skills associated with the user that can be used for doing skill-based assignment.
- **Calendar Schedule**: Schedule of the user as represented in the user service scheduling calendars.
- **Bot attributes**: Can be used only when you have configured bots as users and want to do some comparisons on them.

- **Operators**: Define the comparison relationship between the User attribute and incoming work item attributes.

  Unified routing filters the attribute-specific operators for you to choose from. Some special operators that are available for the attribute types are as follows.

Attribute type	Operator	Definition
Presence Status	Equals, Does not equal, Contains data, Does not contain data	Use an operator to find agents who have matching presence status as specified in the work item.
Capacity	Equals, Does not equal, Contains data, Does not contain data	Use an operator to compare if the agent has enough capacity to work on the specified items.
User skills	Exact match	Use an operator to find agents who have all the skills which the incoming work item requires.
User skills	Custom match	Use the operator to find agents whose skills match at runtime based on the selected lookup attribute on the work item.
Calendar schedule	Is working	Use this operator to find agents who are working as per their service scheduling calendars.

- **Value**: The user attributes are compared against this value to find the right agent. The value can be static, such as Address 1: County equals "USA". The value can also be dynamic, so that you can compare the user attribute dynamically with the values on the work item. In dynamic values, you can select any attribute on the work item or related records. For example, the following

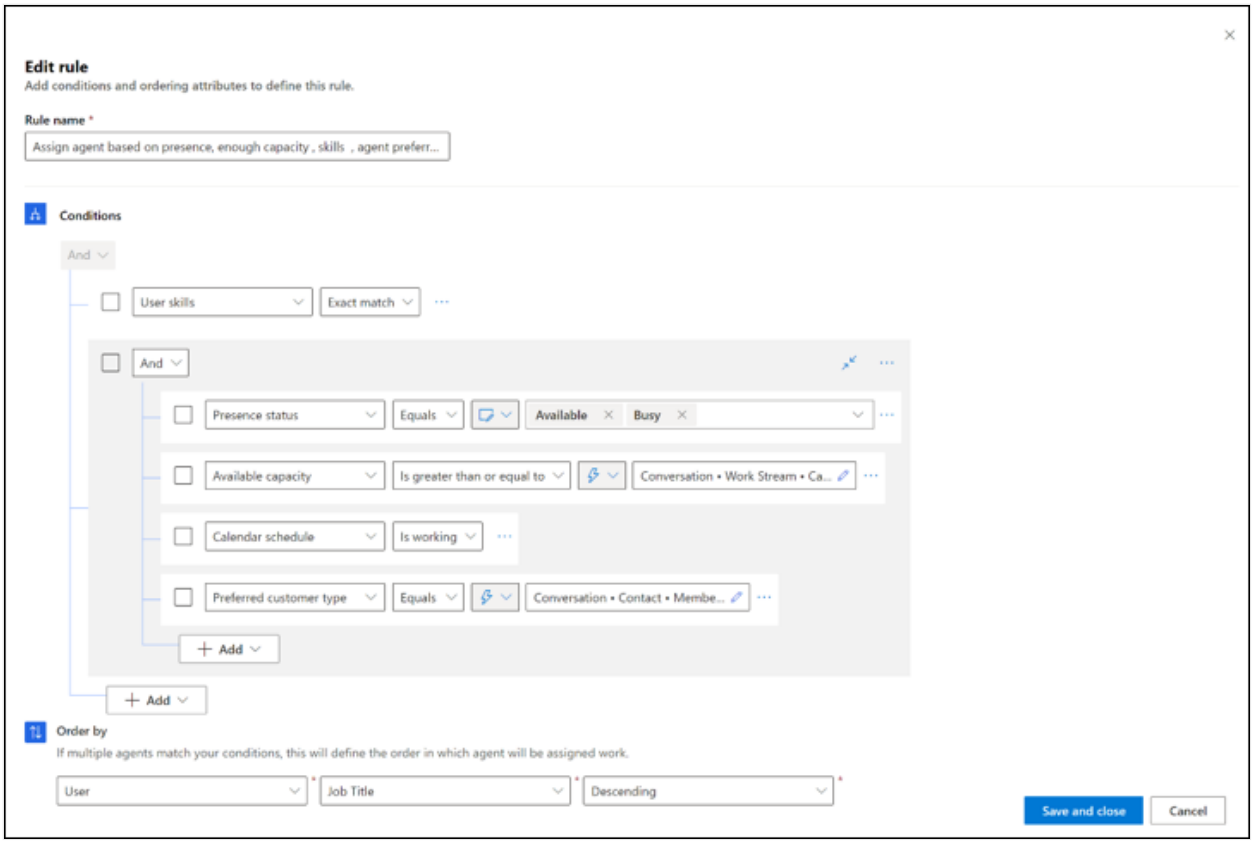
condition finds users whose country is the same as that of the customer associated with the case.

For some operators, values aren't required. They can be conditions, such as "Contains data," "Does not contain data," and "Calendar schedule: is working."

For user skills, the values are predefined for the operators. More information: Set up skill-based routing

- **Order by**: If multiple agents match the conditions in a rule, you can use the "Order by" clause to find the best-suited one. You can specify the following order by clauses:
  - **Ordering Attributes**:
    - **Most idle (preview)**: In preview release, this option is available for voice channel queues only. The work item is routed to the agent who is idle the most among all the agents who match skills and capacity. For more information, see the Types of assignment methods section.
    - Round robin
    - Unit-based available capacity
    - Profile-based available capacity
    - Proficiency
    - Skill count
  - **User Attributes**: These attributes are defined on the system user entity.

A sample assignment rule is explained in the following scenario with a screenshot.



The first condition specifies the "user skills" on which the operator is an exact match. Then the user attributes are evaluated. The different user attributes are specified with operators, and values for each attribute, such as the **Presence status** attribute, should be equal to "Available" or "Busy". On the right of the operator, you can specify the value that you want the attribute to be matched against. The values can be "static," such as "presence status equals Available or Busy". If you specify "dynamic," the condition is matched at runtime based on the expression you specify. For example, if you specify "Preferred Customer Type Equals Conversation.Contact.Membership Level," the "preferred customer type" of every agent is matched against the dynamically calculated membership level of the customer associated with the chat.

Dynamic match reduces the effort of having to write and maintain multiple static rules for each permutation and combination of the possible value.

Limits on offering a work item repeatedly to an agent

When agents are offered a work item through automatic assignment, they typically can accept or decline. Both rejection and time out of the notification is considered as a decline. An agent who declines the same work item thrice won't be considered for further auto assignment for the specific work item. The system tries to offer the declined work item to other agents in the queue if they're eligible.

For example, agent Serena Davis rejects a chat from customer Ana Bowman twice and the assignment notification times out in the third attempt. The system considers it as

three declines and auto assignment won't offer the same chat to Serena Davis again. But the system offers the chat from Ana Bowman to other eligible agents. Also, Serena Davis is considered for other incoming conversations except the declined chat from Ana Bowman.

> **Note**
>
> If all matching agents decline the work item because agent availability is low or the work requires a very specific skill and proficiency, the work remains in the queue. Similarly, if 100 agents decline a particular work item, auto assignment won't consider the work item in further assignment cycles. It can be manually assigned by supervisors or can be picked up by agents including those who rejected it.

You can update the default limit of three declines to a value between one and five based on your org requirement. The limit is applicable to all channels in the org.

You can make an OData call as follows to check the limit for your organization.

```
<org-url>/api/data/v9.0/msdyn_omnichannelconfigurations?$select=msdyn_number_of_declines_allowed
```

If this OData call returns the null value, it means that the decline limit is set to a default value of 3.

You can update the OData call as follows to modify the limit.

```
var data = { "msdyn_number_of_declines_allowed": 3 } // update the record
Xrm.WebApi.updateRecord("msdyn_omnichannelconfiguration", "d4d91600-6f21-467b-81fe-6757a2791fa1", data).then( function success(result) { console.log("Omnichannel Configuration updated"); // perform operations on record update }, function (error) { console.log(error.message); // handle error conditions } );
```

Configure assignment methods and rules for queues

Article • 04/10/2023

After creating queues, if you want to use custom assignment methods, you'll create assignment rulesets comprising rules.

You can create the custom assignment methods in the Omnichannel admin center and Customer Service Hub apps.

In unified routing, the process of creating assignment rulesets involves the following steps:

1. **Create assignment rulesets**: For each assignment ruleset, you'll configure the conditions and order by option.
2. **Create selection criteria**: If you create more than one assignment ruleset, you'll need to define the rules for the selection criteria. The selection criteria determines the ruleset that should be run out of the many that exist. More information: Configure selection criteria.

Create an assignment method and configure rules

Follow the steps to create a custom assignment method:

1. In Dynamics 365, go to one of the admin apps, and do the following steps.

   Customer Service admin center

   a. In the site map, select **Queues** in **Customer support**.

   b. On the **Queues** page, select **Manage** for **Advanced queues**.

2. Select a queue, and on the **Assignment method** page, select **Create New**.
3. In the **Create work assignment** dialog, enter a name and description for the ruleset, and select **Create**.

4. Select the ruleset, and select **Edit**. The options to configure prioritization rulesets and assignment rulesets are displayed.

5. Do the following to set up prioritization rulesets:

   a. On the **Create Prioritization Ruleset** dialog, enter a name and description for the ruleset, and select **Create**.

   b. On the **Decision list** page, select **Create rule**, and on the **Create prioritization rule** dialog, enter a rule name and define the conditions when the rule should be run. By default, the root record for which you're creating the rule is selected and displayed at the top of the condition builder.

   c. To route the work item to agents, select the attribute on which you want to define the order by.

   d. Create as many rules as needed.

   > **Note**
   >
   > For routing records, we recommend that you manage the custom prioritization rules through the UI only and not create or update them through scripts.

6. To create an assignment ruleset, on the **Assignment method** page, select **Create ruleset**.

7. Enter a name and description for the ruleset, and select **Create**. The ruleset is created.

8. On the **Assignment ruleset** page that appears, select **Create rule**.

9. In the **Create assignment rule** dialog, do the following to add conditions and order by attributes:

   a. **Rule Name**: Enter a rule name.

   By default, the root record is selected and displayed at the top of the condition builder.

   b. **Conditions**: Select **Add** to select an attribute or related entity and define condition. You can define conditions for up to two levels of the related records and attributes.

c. **Order by**: Select an attribute to define the order of work assignment if multiple agents match the condition.

- **Ordering Attributes**:
  - **Most idle (Preview)**: in preview release, this option is available for voice channel queues only. Work item is routed to the agent who is idle the most among all the agents who match skills and capacity. For more information, see Types of assignment methods.
  - Round Robin
  - Unit-based available capacity
  - Profile-based available capacity
  - Proficiency
  - Skill count
- **User Attributes**: These attributes are defined on the system user entity.

d. Select **Create**.

e. Repeat the steps a through d to configure multiple rules.

> ⓘ **Note**
>
> We recommend that you reduce the granularity of the conditions for the assignment rules in a descending order.

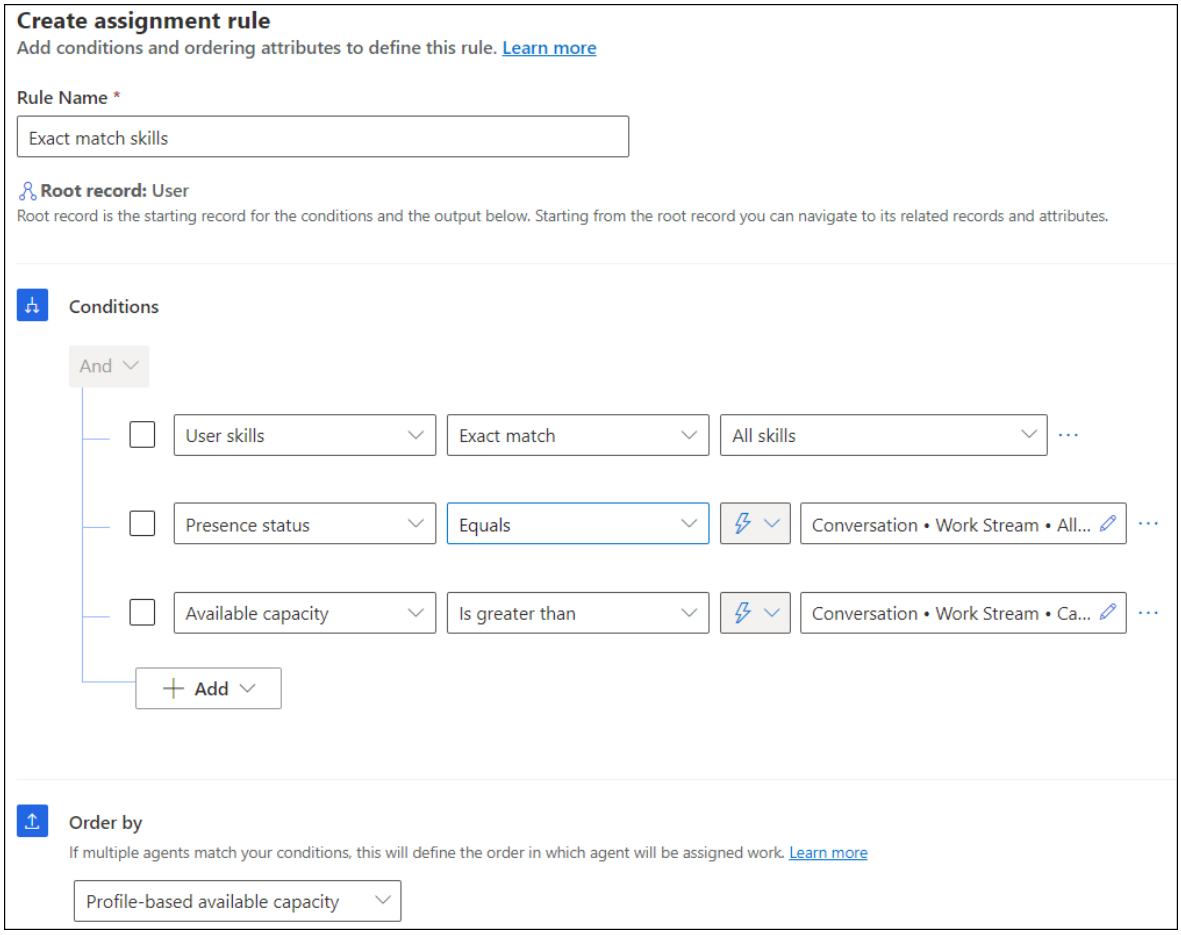
10. You can sort the order in which the rules should be evaluated during work assignment. For other tasks that you can do, such as copy, edit, and delete, see Options available for rulesets.

11. If you create more than one assignment ruleset, a warning message is displayed that alerts you to define the selection criteria to run the rulesets.

    Create a sample assignment rule with the following conditions.

Attribute	Operator	Match type	Attribute value
User skills	Exact match		All skills
Presence status	Equals	Dynamic match	Conversation.Workstream.Allowed Presences
Available capacity	Is greater than	Dynamic match	Conversation.Workstream.Capacity

> **Note**
>
> If you want to define a condition on unit-based capacity of users, then use the Available capacity attribute only as suggested in the example. Use the "is greater than" operator to ensure that available capacity is more than the required capacity.



Configure selection criteria

The selection criterion lets you define a set of conditions to determine the ruleset to be run when the condition is met. You should define the selection criteria when you configure more than one ruleset in the custom assignment method. After the ruleset is picked up by the work assignment engine, if no rule matches in the selection criteria or if no selection criterion is met, the system runs the default ruleset.

Follow these steps to configure the selection criteria for the assignment rulesets:

1. For the assignment method, in the **Assignment** section, select **Create rule**, and in the **Decision list** area, select **Create rule**.

2. In the **Create selection criteria rule** dialog, enter a rule name, and define the conditions.

3. In **Execute ruleset**, select the assignment ruleset that must be run when the conditions are met, and then select **Create**. The rule is listed in the **Decision list** area.

4. Define as many rules as the number of assignment rulesets.

Configure routing to preferred agents

Article • 03/13/2023

For a more personalized experience, Dynamics 365 Customer Service gives you the option to route work items from a specific contact to the customer's preferred agents or relationship managers.

You can configure contacts and their preferred agents in the Customer Service admin center. If a contact isn't configured, then you can't assign a preferred agent to the contact. You can map agents to contacts only.

Prerequisites

- You must have one of the following roles to configure preferred agent routing:
  - **For Customer Service**: CSR Manager
  - **For Omnichannel for Customer Service**: Omnichannel Administrator
- You must be able to access the Contact entity. More information: Contact
- If you have a custom role, you must also have access to the msdyn_preferredagent and msdyn_preferredagentcustomeridentity entities.
- Ensure that the agent you want to assign to a contact is a member of the queue to which work items will be routed.

Configure preferred agent for contacts

1. In the Customer Service admin center site map, select **Routing**.
2. On the page that appears, select **Manage** next to **Preferred agent routing**.
3. Turn on **Enable preferred agent routing**.
4. Select who should get the work item if preferred agent is unavailable:
   - **Next best agent based on assignment logic**: The work item will be routed based on the assignment rules. We recommend that you use this option for live chat conversations and voice channel calls.
   - **No one. Let the work remain unassigned in the queue**: The work item will remain in the queue until an agent picks it up or it's manually assigned to

another agent. We recommend that you use this option for asynchronous channel conversations.

5. Select contacts and their preferred agents in the **Preferred agents matrix** area by doing the following steps:

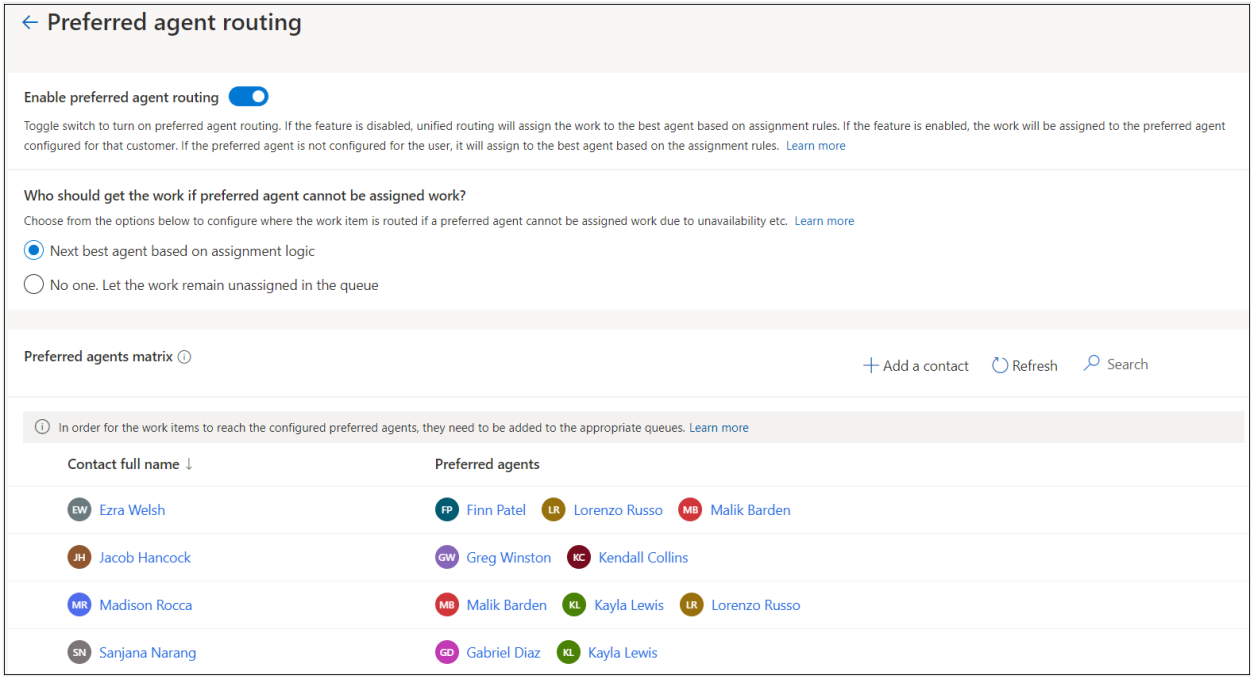
   a. Select **Add a contact** to add a contact.

   b. In **Contact full name**, enter a contact name, and select a value from the dropdown list.

   c. Select **Add user** to map agents to the contact.

   You can map up to three preferred agents to a contact. The order in which the agents are listed is the order in which they'll receive a work item if an agent earlier in the list isn't available. You can sort the agent order by selecting an agent in the list and using the **Move up** or **Move down** option.

6. Save and close.



How routing to preferred agent works

If a preferred agent exists for a contact, the system will try to directly assign the conversation to an available preferred agent whose presence matches with one of the allowed presence configured in the workstream. The check for capacity, skills, and assignment rules will be skipped. If no preferred agents are available for a contact and **Next best agent based on assignment logic** is selected as the fallback option, then the

system will try to find a matching agent according to the configured assignment strategy.

Check diagnostics for routing to preferred agents

If you've turned on routing diagnostics, the work item's diagnostics page will include information about preferred agent routing under **Agent assignment trace**. The **Assignment criteria** section shows whether the setting is turned on. The **Assignment trace** section displays the reason information. More information: Diagnostics for unified routing

Update contacts and preferred agents

In the **Preferred agents matrix** section, use the edit and remove options to modify contacts and their preferred agents.

For each contact, you can map a maximum of three agents, but ensure that at least one agent is mapped to the contact.

Identify contacts in supported channels

To find the preferred agent for an incoming work item, the contact should be identified. For supported channels, use the information mentioned in the following table to identify customers as contacts.

Channel	Customer record
Record	• **Case**: Use the **Customer** field to store the contact ID. • **Email, phone, fax, letter, appointment**: Use the **Regarding** field to store the contact ID.
Digital messaging: Chat, voice, and other channels	• **Chat**: Authenticated users are automatically identified as contacts. For unauthenticated users, use the pre-conversation survey to set the survey question name as **Name**. • **Voice**: Authenticated with the phone number. • Other channels: Social profiles.

Add multiple preferred agent records

You can add multiple preferred agents to contact records at a time using the createRecord call to update the preferred agent entities, msdyn_preferredagent and

msdyn_preferredagentcustomeridentity.

If you want to add multiple preferred agent routing records through the script, ensure that you map only three unique agents to a contact. If you add more than three agents, though the application displays all the mapped agents, work items are routed only to the top three agents. Agents are ordered based on the preference rating. If agents have the same preference rating, the application orders the agents based on the record creation timestamp.

You can also update or delete records using the updateRecord or deleteRecord calls.

> **Important**
>
> We recommend that you add the contact and preferred agent routing through the Preferred agent routing page.

Manage overflow of work items in queues

Article • 08/10/2023

When a new work item gets routed with unified routing, the system tries to find the best-suited agent to work on the work item. Sometimes all eligible agents are at maximum capacity. In scenarios like these, you can configure overflow conditions to handle the surge and unassigned work items to ensure customer satisfaction. You can also send notifications to the customer about their waiting state or when their query will be resolved.

For work items, such as calls, conversations, and cases, you can address the following scenarios:

- When an incoming work item exceeds a defined number of conversations or calls that can wait in the queue.
- Calls and conversations are received during non-business hours of the call center.
- The wait time is high for customers and you want to reduce it.

If you don't configure overflow, by default, the work item will stay in the queue until it gets routed based on the routing rules configured for the workstream.

How queue overflow is evaluated

The overflow conditions and actions are run only if the route-to-queues rule is configured. The overflow evaluation takes place before a work item is routed to a queue and after the route-to-queues rules are evaluated. Any manual actions like agent transfer or supervisor assign won't trigger overflow actions.

The following factors are considered during the overflow evaluation:

- If multiple queues match in the route-to-queues rules, the system routes the work item to the first queue that's not overflowing.

- If all matched queues are overflowing, one of the following actions takes place:
  - The system routes to the queue that's operational and the overflow action is triggered.
  - If none of the queues are operational, the system routes the work item to the queue that will be operational at the earliest and the overflow action is triggered.

- If percentage-based routing is configured, the overflow conditions are evaluated after percentage-based routing identifies the queue.
- If the matched queue is overflowing due to multiple conditions:

  The system evaluates the action that's defined for the operating hours condition first, followed by the other conditions in the order they've been defined.
- If a work item is routed to a fallback queue because of errors or no route-to-queue rule has matched the requirement, the overflow settings for the fallback queue aren't considered and work item is assigned to the queue.
- If a bot is configured for the workstream, the overflow settings are evaluated only after the bot escalates the conversation to human agents.
- If multiple bot escalations happen before the conversation is escalated to a human agent, the overflow settings are evaluated and triggered after the first bot escalation.

When you add an operating hour record to a queue, the system assigns a default overflow condition as **Out of operation hours**, and its action as **Assign to queue anyway**. You can't edit the condition but can set another action for it.

The channel-specific operating hour setting that's configured in the workstream doesn't affect the overflow settings.

The following table lists the condition and action pairs available for different channel types.

Channel	Condition	Action
Voice	• Out of operating hours • Work item limit exceeds • Average wait time	• Assign to queue anyway • Direct callback • End call • Transfer to a different queue • Transfer to an external number • Voicemail
Live chat and other messaging channels	• Out of operating hours • Work item limit exceeds	• End conversation • Transfer to a different queue • Assign to queue anyway

Channel	Condition	Action
Record	• Out of operating hours	• Assign to queue anyway • Transfer to a different queue

Prerequisites

For overflow to work correctly, the following prerequisites must be met:

- Agents should be configured for the queues.
- To transfer calls, make sure that external phone numbers with outbound calling are available.

Configure overflow conditions

In the Customer Service admin center app, do the following steps:

1. In the site map, select **Queues** in **Customer support**.
2. On the **Queues** page, select **Manage** for **Advanced queues**.
3. Select the queue for which you want to manage overflow.
4. In **Overflow handling**, select **Add condition-action pair**. The **Overflow handling** dialog displays the options to configure conditions and actions.
5. Select **Add condition-action pair**. The **Condition** and **Action** fields are displayed.
6. For the record, messaging, and voice queues, you can set the **Out of operation hours** condition and one of the following actions:

   - **Assign to queue anyway**: The work item is routed to the queue although it's in the overflow state.
   - **Transfer to a different queue**: Select a queue in the dropdown list.

   For the **Out of operation hours** condition, the following extra actions are available for the messaging and voice queues:

   - **End call**: For voice queues only. An automated voice message is presented to the caller and the call ends.
   - **End conversation**: For messaging queues only. The conversation is routed to the queue and ended.

- **Transfer to a different queue**: Select a queue from the dropdown list that appears. The work item is transferred to the selected queue.
- **Transfer to an external number**: For voice queues only. Enter the number to which the call must be transferred.
- **Voicemail**: For voice queues only. Customers can choose to leave a voicemail that the agents will receive to act upon.

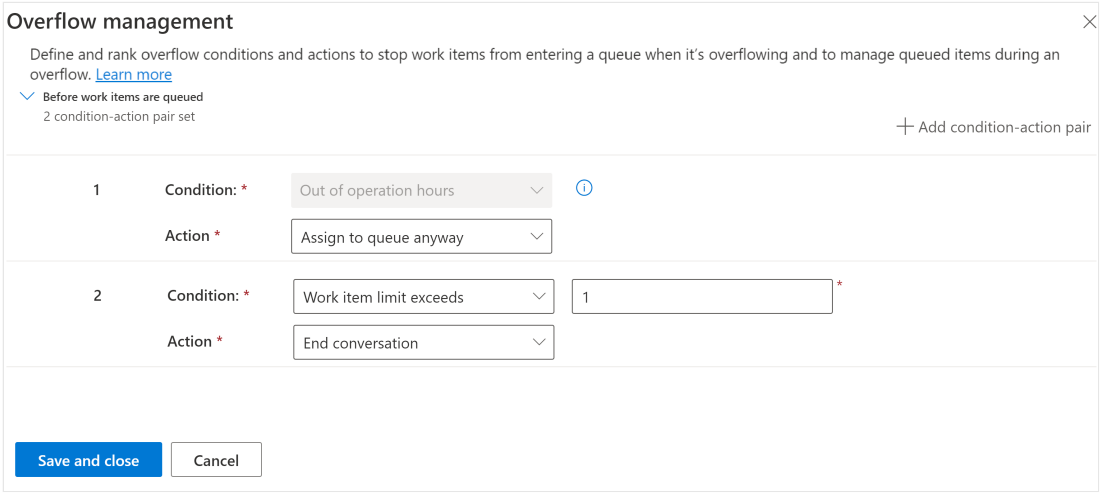
7. For the messaging and voice queues, you can set the following extra conditions and actions:

    - **Work item limit exceeds**: Enter a value between 1 and 100 to denote the maximum number of work items that can be in the open state before overflow is reached. For example, if you enter 2 as the value, then two items should be open in the queue for the third item to trigger one of the following actions:
        - **Direct callback**: For voice queues only. Customers can choose to receive callback from agents that's presented to them by the automated message. The work item stays in the open state and is routed to the next available agent to call back the customer.
        - **End call**
        - **End conversation**
        - **Transfer to a different queue**
        - **Transfer to an external number**
        - **Voicemail**

    - **Average wait time**: This condition is available for voice queues only. Enter a value between 30 seconds and 60 minutes to denote the wait time. If the predicted wait time for the queue is more than what you have configured, the system triggers one of the following overflow actions for the work item instead of adding it to the overflowing queue:
        - **Direct callback**
        - **End call**
        - **Transfer to a different queue**
        - **Transfer to an external number**
        - **Voicemail**

        > ⓘ **Note**
        >
        > The average wait time is calculated for a queue by taking the average of the wait times for the previous 48 hours and a minimum of 50 conversations in the queue.
        > For example, if a customer calls on a Thursday at 5:00 PM, the wait time

is calculated by taking the average wait time of all the calls from 5:00 PM, Tuesday that denotes the previous 48 hours, provided 50 or more calls are in queue. If the number of calls is less than 50, the "Average wait time" overflow condition isn't evaluated because it doesn't meet the criteria to calculate the wait time.

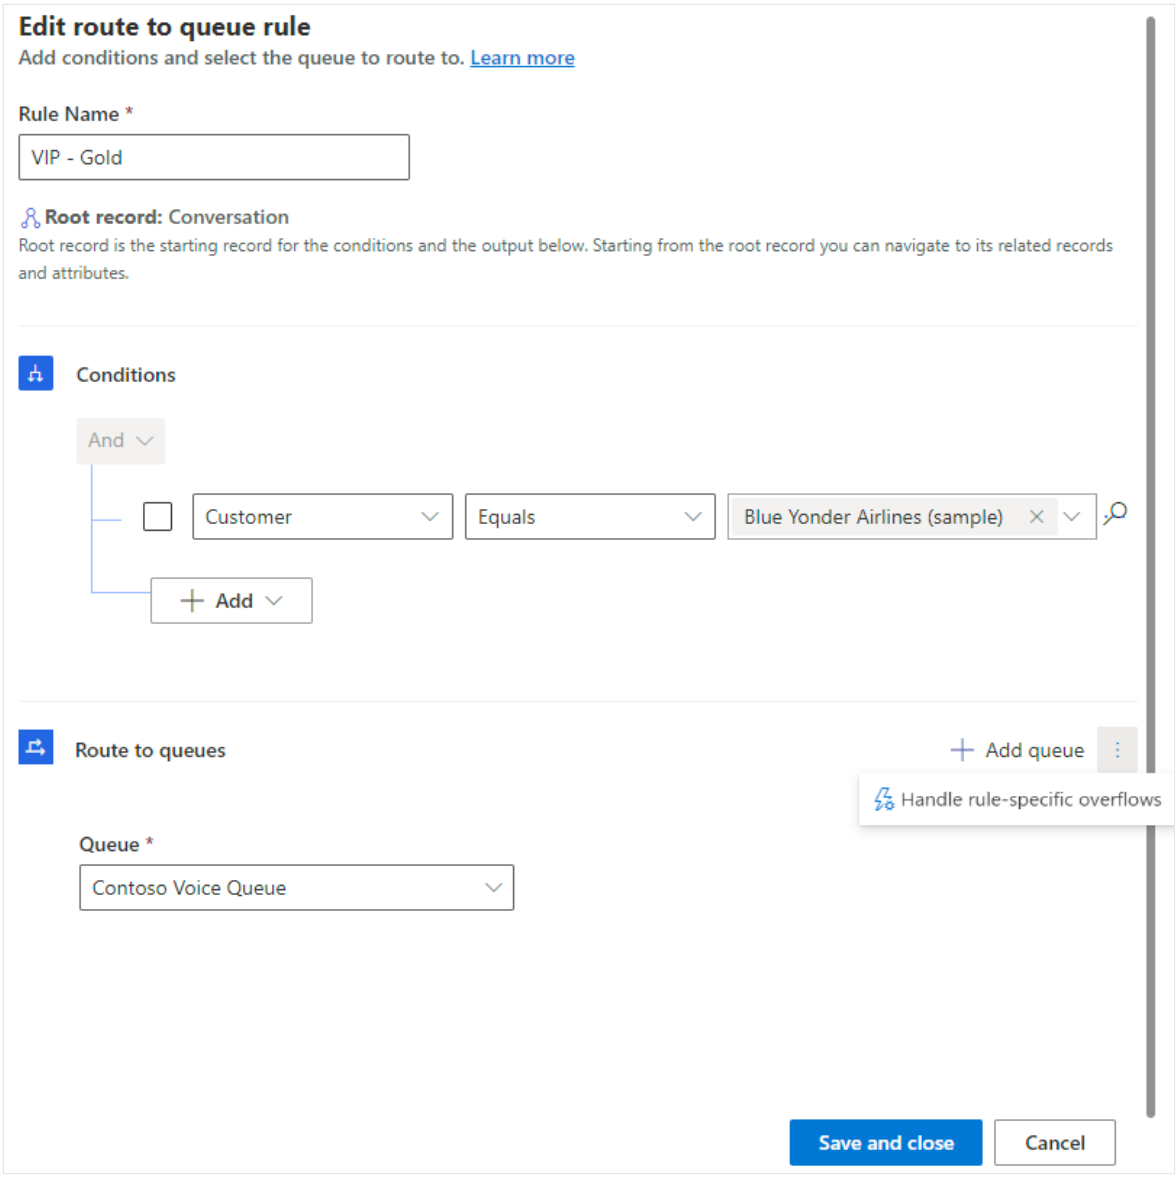


Configure rule-specific overflows

Sometimes, you might not want an overflow action to run for specific types of work items or for priority customers. For example, a priority customer raises an issue and the queue to which it's routed could be overflowing as "end call" or "keep waiting in queue". This action might not meet the service-level agreement (SLA) that you have with your customer. To handle such a scenario, you might want to configure rule-specific overflow conditions for those queues in the route-to-queue rules for a workstream.

1. In the Customer Service admin center, go to the workstream and select the route-to-queue rule in which the queue is configured.

2. In the **Route to queues** area, select the **More commands** ellipses next to **Add queue**.

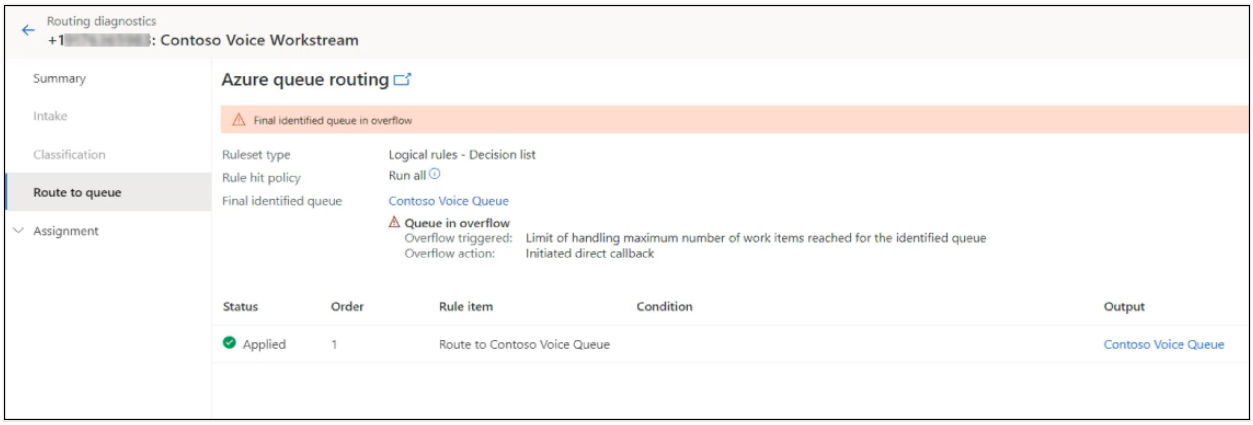


3. Select **Handle rule-specific overflows**.

4. Do the steps to add condition and action pairs and set the action for each condition that you define as listed in the **Configure overflow actions** section in this article.

View diagnostics for overflow

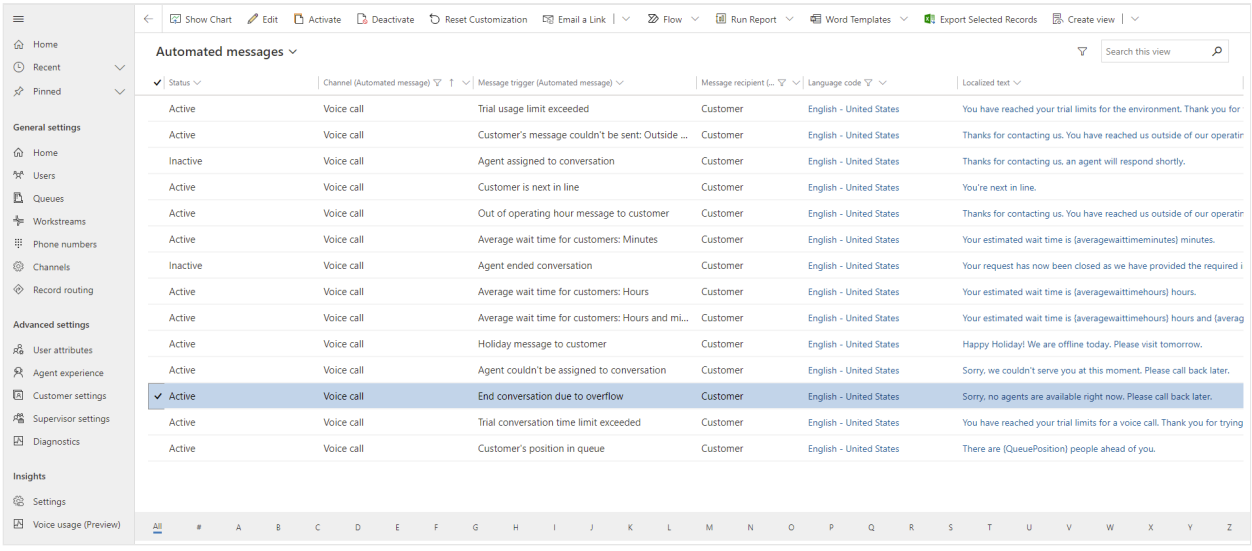
Whenever a work item is handled by the overflow action instead of being assigned to an agent, you can view its status in the **Route to queue** stage of the diagnostic page.



Edit automated messages for end call overflow action

If you have set **End call** as an overflow action for the voice queue, an automated message will be delivered to the customer to let them know that the conversation will end. You can edit the message that the customer will hear.

1. In the Customer Service admin center site map, go to **Customer settings** in **Customer support**, and select **Automated messages**.
2. Find the automated message for the **Voice** channel where the message trigger is "Voice call ended".
3. Edit the value in the **Localized text** column as needed.



More information: Customize automated messages

Provision unified routing for Customer Service

Article • 08/11/2023

Perform the steps mentioned in this topic to provision unified routing in Customer Service. By default, unified routing is not enabled.

Prerequisites

- Ensure that the provisioning user has the following permissions:
  - Microsoft 365 Global admin role. More information: Assign admin roles to user in Microsoft Office 365
  - Customer Service Representative or CSR Manager to be able to set up configuration.
  - Dynamics 365 System Administrator role on the root business unit for your organization. More information: Assign security roles to a user in Power Platform and Create or edit business units
  - Read-Write access in the Client Access License Information (CAL). More information: Create a Read-Write user account in Power Platform
- **License required for unified routing**:
  With the Customer Service Enterprise license, you'll get unified routing for tables, such as Cases, Leads, and custom tables. The license for Chat and Digital messaging includes unified routing for chat, SMS, and messaging channels, and the Teams channel. More information: Dynamics 365 Licensing Guide

Provision unified routing for only Customer Service

To provision unified routing in Customer Service, do the following:

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Routing**. The **Routing** page appears.

   b. Select **Manage** for **Turn on Unified Routing for Records**.

2. If consent is already provided by the tenant administrator, go to **Step 5**.

   If consent to access is not provided by the tenant administrator, in the **Unified routing** section, the following message with a link to the consent page will be displayed:

   "Unified routing requires application permissions. A tenant administrator must provide consent before it can be turned on. Provide consent."

3. Select **Provide consent**. The following consent form is displayed on a new tab.

   For information on consent, see Consent to access data to provision Omnichannel for Customer Service

4. Select **Consent on behalf of your organization**, and select **Accept**.

5. After access is granted, you can close the page to return to the **Service Configuration Settings** page.

6. Set the toggle to **Yes** for **Turn on unified routing**. A message that unified routing is being provisioned appears.

After unified routing is provisioned, **Unified routing successfully provisioned** message appears on top of the toggle key.

Provision unified routing in Customer Service with Omnichannel for Customer Service

When Omnichannel for Customer Service is available but not deployed, in the **Service Configuration Settings** page, the following message will appear:

"Some required services need to be installed before unified routing can be turned on. Please contact Microsoft Support."

When Omnichannel for Customer Service doesn't have the required solutions, the following message will appear:

"Before unified routing can be turned on, Omnichannel needs to be updated. Please contact Microsoft Support."

> ⓘ Note
>
> **Unified Routing** also appears in the site map if you install or upgrade Omnichannel for Customer Service.

Set up unified routing for records

Article • 09/20/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

You can configure routing for records in Customer Service admin center, Customer Service Hub, or Omnichannel admin center. However, unified routing can be configured only in Customer Service Hub or Omnichannel admin center.

If you only have Dynamics 365 Customer Service, then the options to configure unified routing will be available only after you enable unified routing in the service configuration settings.

Important

- After you enable the unified routing feature in **Service Configuration Settings**, you can't disable it. You'll need to contact Microsoft Support to disable the feature.
- Provisioning unified routing might impact runtime operations on account of solution import that can impact SQL load.
- If you're upgrading your environment and Omnichannel for Customer Service is also installed, you might have existing workstreams for record routing. We recommend that you provision unified routing only after recreating those workstreams for record routing in your admin app.
- If you're an existing customer, we recommend that you configure and test unified routing in a test or development environment before configuring it in your production environment.
- If you're routing, updating, or deleting multiple records at a time, and facing any technical or performance-related issues with unified routing, we recommend that you contact Microsoft Support to troubleshoot the issues.

Prerequisites

- To set up record routing for Customer Service, unified routing must be enabled in your environment. More information: Provision unified routing for Customer Service
- To route records, you must enable the record for routing using records channel configuration. More information: Records routing
- You must have the System Administrator role to configure record routing.
- You must have users configured as bookable resource. More information: Set up the user as a bookable resource

Configure unified routing for records

1. In Dynamics 365, go to one of the apps, and perform the following steps:

   Customer Service admin center

   a. In the site map, select **Routing** in **Customer support**. The **Routing** page appears.

   b. Select **Manage** for **Record routing**.

2. On the **Record routing** page, select **Add**.

3. In the **Add a record type** dialog, select a record from the **Record type** list, and select **Add**. The record is added and listed on the **Record routing** page.

4. Configure the following:
   a. Workstreams
   b. Intake rules

Create workstreams for record routing

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Workstreams** in **Customer support**.

   b. Select **New workstream**.

2. In the **Create a workstream** dialog, enter the following details:

- **Name**: Enter an intuitive name, such as **Contoso case workstream**.
- **Work distribution mode**: Select **Push** or **Pick**.
- **Type**: Select **Record**.
- **Record type**: Select a record from the list.

3. Select **Create**. The workstream is created.

Configure intake rules

Intake rules for a record help determine the workstream to be picked up to assign an incoming work item.

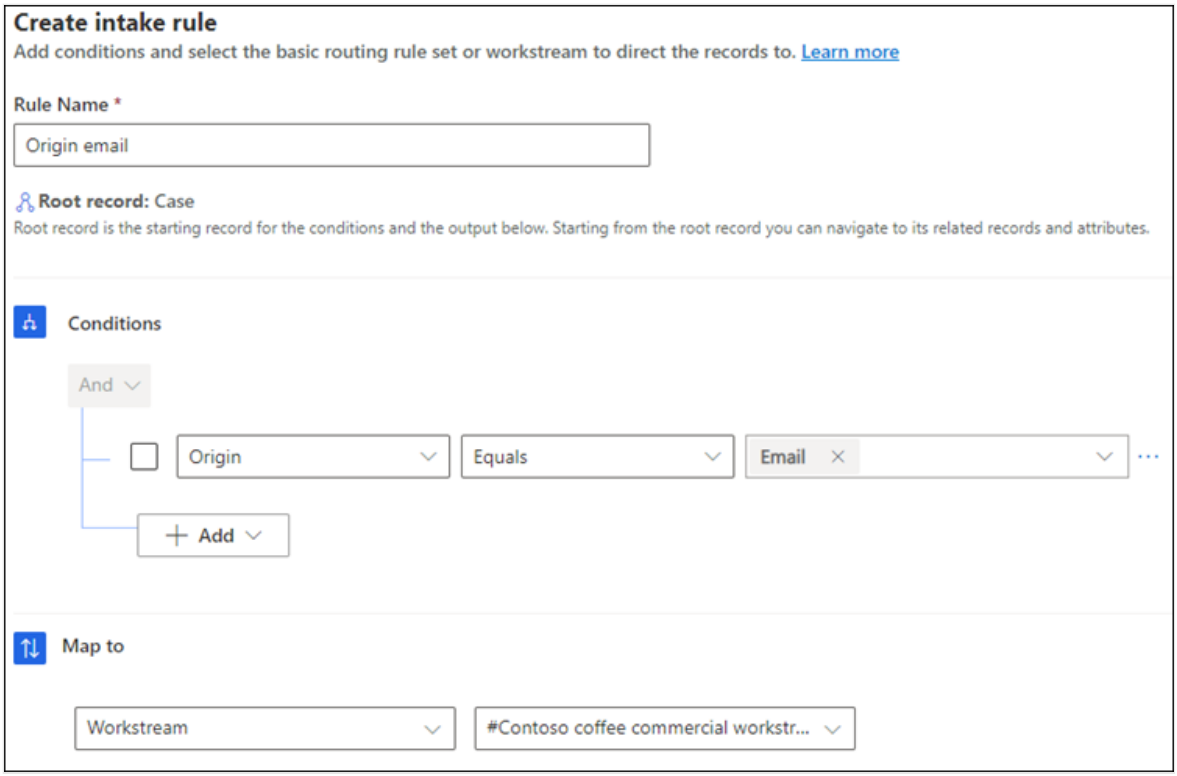
You can create intake rules independently and map them to basic routing rulesets also. However, on any workstream details page, only those intake rules will be displayed that are mapped to the workstream. Therefore, if you want to prioritize the runtime evaluation of the intake rules, you'll need to select **See more** on the workstream details page, and reorder the rules in the **Decision list**.

Perform the following steps:

1. Select the workstream that you configured for routing records, such as the case.

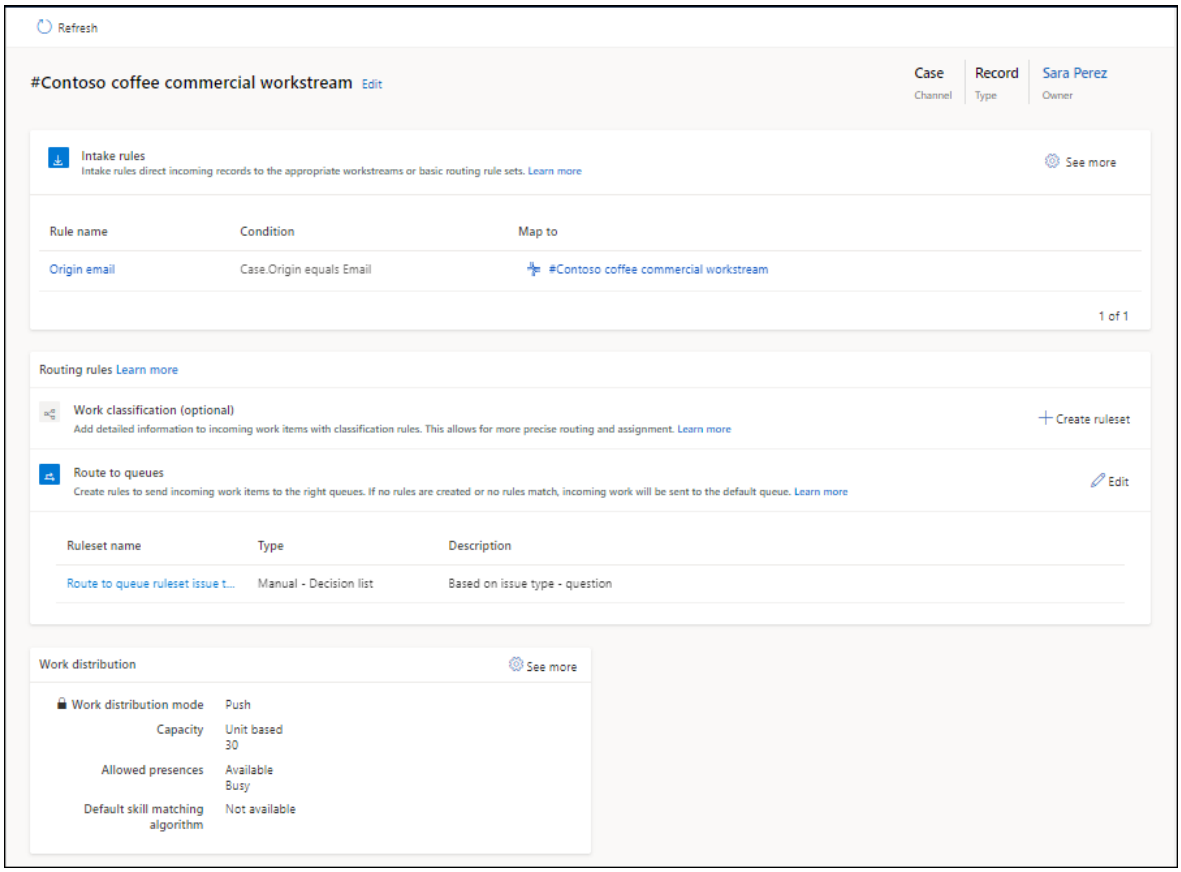
2. In the **Intake rules** area, select **Create rule**.

3. In the **Create intake rule** dialog, enter a name and define the conditions for the rule. By default, the root record is selected and displayed at the top of the condition builder for ease of reference and visibility of the record for which you are creating the rule. You can define conditions for up to two levels of the related records and attributes.

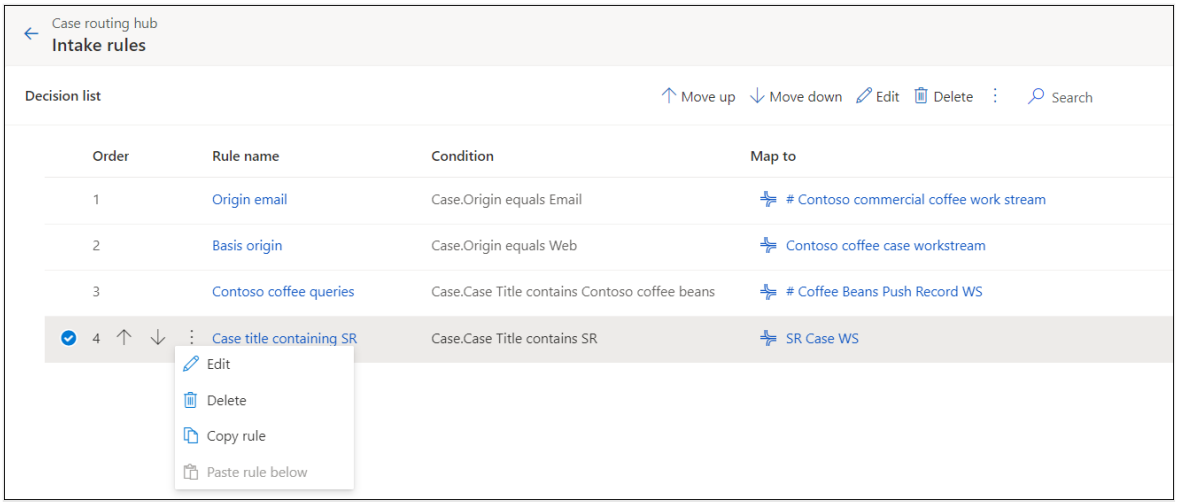


4. Select **Create**.

   The following screenshot shows a workstream with the required intake rule and route to queues.



You can reorder the rules and create copies to meet your business requirements.



Configure routing rules

Routing rules for a workstream consists of work classification rules and route-to-queue rules. For the steps to configure routing rules, see the following:

- Configure work classification rules
- Configure route to queues

Configure work distribution and advanced settings

1. In the **Work distribution** area, you can either accept the default settings or select **See more**, and update the following options:

    - **Capacity**: Select one of the following options:
        - **Unit based**: Enter value if your organization has configured unit-based capacity.
        - **Profile based**: Specify a profile in the list if your organization has configured profile-based capacity. More information: Create and manage capacity profiles

    - **Allowed presences**: Select the presences in which agents will be assigned. If you want to route records in Customer Service Hub, make sure that you add all the required presences to be able to route work items as required.

    - **Default skill matching algorithm**: Select **Exact Match** or **Closest Match**.

2. Expand **Advanced settings** to configure the following options:

    - Sessions
    - Agent notifications

> **Note**
>
> - The agent notifications that you configure for routing of records based on unified routing will be displayed in the Customer Service workspace and Omnichannel for Customer Service apps only.
> - Ensure that the agents in the queues have correct permissions to handle the incoming work items in the queue. If an agent doesn't have permissions to an assigned work item, the assignment will be stopped, and the conversation will be closed to protect it.

Enable tables for queues in unified routing

Article • 07/25/2023

Any record that you want to enable for routing needs to be enabled for queues.

Enable a table for queues

1. In Power Apps, select the environment that contains your solution.
2. Select **Tables** and then select the required table such as **Account** or **Email** for which you want to enable queues.
3. In **Table properties**, select **Properties**.
4. Select **Advanced options**, and then select **Can be added to a queue** in the **Rows in this table** section .
5. Select **Save**.

> **Note**
>
> - You can't disable the table, if you enable it for a queue. The app disables the **Can be added to a queue** checkbox after you select it.
> - If you enable the option **When the rows are created or assigned, move them to the owner's default queue**, in the table customization, then the record won't be automatically distributed to the agents. You must clear the checkbox to automatically distribute the records.

Route records automatically using custom flow

Article • 02/17/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Set up custom flow to automatically route records

As an administrator, you can route records automatically using Power Automate. Set up a custom flow to automatically route records based on certain conditions, such as when a record is created or updated. Let's see how to set up a custom flow for the create condition.

> **Note**
>
> By default, for all of the cases created from the user interface, the **Route Case** field is set to **No**. So, routing for these cases is not triggered.
> For case records, an out-of-the-box trigger is shipped to route the cases automatically. The routing is based on the **Route Case** field value in the case record. When a case record is created, it is either routed or not routed based on the **Route Case** field value of **Yes** or **No**.

To enable automatic routing of records:

1. Sign in to Power Automate and select the environment for which you want to create the flow.
2. Select **My flows** on the site map, then select **New flow**. Under the **Build your own from blank** option, select **Automated cloud flow**. The **Build an automated cloud flow** dialog box appears.
3. Select **Skip**. A list of all connectors and triggers is displayed.

4. Select **Microsoft Dataverse**. In the corresponding list of triggers that appears, select **When a row is added, modified or deleted**.
5. Specify the following values for the **Change type**, **Table name**, and **Scope** fields.
    - **Change type**: Create
    - **Table name**: Email Messages
    - **Scope**: Organization
6. Select **New step**. The **Choose an operation** dialog box appears.
7. Select **Perform an unbound action** from the **Actions** list. The **Perform an unbound action** dialog box appears.
8. Enter **msdyn_ApplyRoutingRuleEntityRecord** in the **Action Name** field as a custom value.
9. In the **Target** field, enter the entity collection name and unique identifier of the record as follows:

    `<entity collection name>(unique identifier of the entity)`, such as **emails(Email Message)**

    To get the entity collection name for a particular entity:
    a. Open your browser and go to `https://<org_name>/api/data/v9.0/EntityDefinitions(LogicalName='<entityname>')`. For example: `https://contoso.dynamics.com/api/data/v9.0/EntityDefinitions(LogicalName='email')`.
    b. Search for `LogicalCollectionName` to view the entity collection name for a particular entity.
    For example: `"LogicalCollectionName":"emails"`.
    Here, `emails` is the entity collection name.
10. Select **Save**.

Now, based on the flow that is defined, whenever a record (in this example, an email) is created, the flow applies the **msdyn_ApplyRoutingRuleEntityRecord** action to the record. Similarly, you can create a custom flow based on your business scenarios.

You can also perform other actions in the flow, such as filtering out certain records that you don't want to route and performing data transformation.

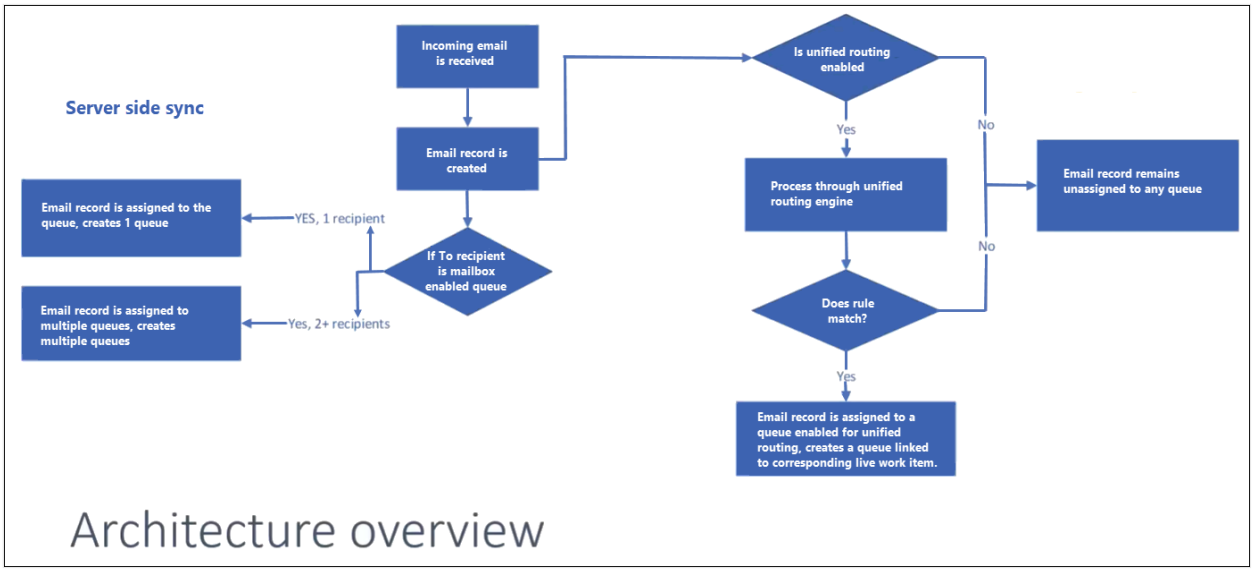
Set up unified routing for email records

Article • 08/29/2022

With unified routing, you can route any activity in Dynamics 365 Customer Service. Emails are one such example of the activity type that you can turn into work items and add them to queues for agents to work on.

A high-level overview of unified routing with email records is as follows.



Route email as a case

1. Set up rules to create or update records automatically.
2. Save and route the case on the case form.

Route email as a record

1. Set up a dedicated mailbox and share the email ID with customers. When a customer emails the ID, the email is converted to a case and routed to the queue that's associated with the mailbox.
2. Set up server-side sync to create the email record and queue item.
3. Create a flow to automatically route the work item to agents.
4. Create workstreams and set up classification and route-to-queue rules.
5. Set up intake rules to identify the workstream to route the email record.
6. Create queues and set up assignment methods.

> **Note**
>
> You must ensure that the agent capacity is released after the agent completes their work on the email record. More information: **Release agent capacity**

Overview of skill-based routing

Article • 03/08/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Note**
>
> The data such as but not limited to skills, rating model, and rating value that is created, updated, and used in Omnichannel for Customer Service is shared with other model-driven apps (Field Service and Project Service Automation) installed in your environment. Similarly, the data that are created, updated, and used in other model-driven apps are available for use in Omnichannel for Customer Service.

In the customer service center, your agents have different skill sets and abilities. The customers who reach out to the contact center might have different needs. Skill-based routing lets your customer service center distribute work items (conversations) to the agent who is most qualified to solve the issue. Skill-based routing improves the quality of customer service by automatically distributing work items to the agent who has the skills necessary to do the work.

You can also associate skills with bots and route work items using skill-based routing.

For example, for an incoming conversation related to **Xbox** from Spain, the skill required is knowledge of the **Xbox** product and **Spanish** language. Now, with skill-based routing, the system identifies the agents with those specific skills and distributes the conversation to one of them.

Skill-based routing allows you to easily match the conversation with the agent that's most proficient in dealing with it while maintaining the workload of the agent. You can associate distinct skills with each agent on your team and create rules to make sure that conversations matching those skills are always assigned to them.

You can also enable your agents to update skills for the work items assigned to them. Agents can assess, add, remove, and update skills required for a particular work item, based on their abilities and experience. Now, if your organization uses machine learning model for skill prediction, you can use the updated skill information to retrain your skill

finder model, so that the system is later able to efficiently and effectively route the work items (conversations) to the agent best suited for the work. More information: Retrain skill finder model

Value proposition of skill-based routing

- Assign conversations to agents who are best qualified to address the issue.
- Minimize overheads in queue maintenance.
- Use agent skills effectively.
- Enhance productivity.
- Effectively manage skills based on the CSAT and KPIs.
- Resolve conversations faster.

Prerequisites

If your environment has scheduling solutions, then you must have version 9.0.0.0 or later.

Set up skills, create a rating model, and assign agents

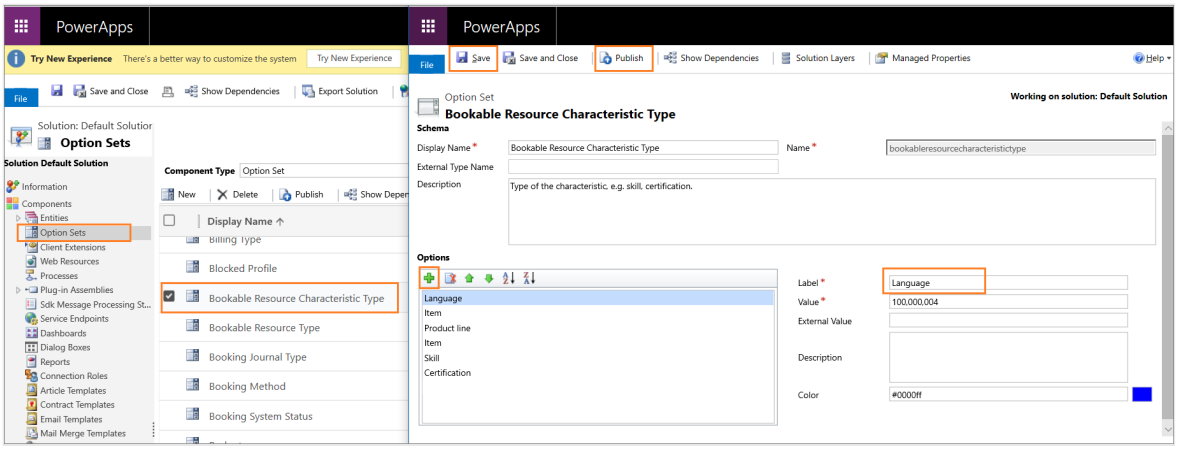
Article • 06/07/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

As an administrator, to create skills, you need at least one skill type in the system. For example, to add **Spanish** as a skill, you need a skill type called **Language**. You must first create a skill type and then create skills.

Create skill types

1. Sign in to the Dynamics 365 instance.
2. Select **Settings** > **Customizations** > **Customize the System**.
3. Select **Option Sets** from the left pane.
4. Double-click the **Bookable Resource Characteristic Type** from the list. A new window opens.
5. Select the **Add** icon under the Options container.
6. Type a name for the Label field. For example, **Language**.
7. Select **Save** to save the skill type.
8. Create as many skill types as required.
9. Select **Publish** to publish the customization changes.



Manage skill settings in skills hub

Skills hub in Customer Service admin center helps you seamlessly create and assign skills to your agents. Use the **Skills hub** page to create and edit, add and remove users to skills and manage their proficiency.

1. In Dynamics 365, go to Customer Service admin center.
2. In the site map, select **User management** under **Customer Support**.
3. Select **Manage** for **Skills hub**. The Skills hub page displays the skills, skill types, proficiency scales, and intelligent skill find models.

Manage proficiency scales

Create or update proficiency scales that are used to rate agent proficiency in the assigned skills.

1. On the **Skills hub** page, select **Manage** in **Proficiency scale** area.
2. To create a proficiency scale, on the **Proficiency scale** dialog, select **Create**, and do the following:

   - **Scale name**: Enter a scale name.
   - **Minimum rating value**: Enter the minimum value.
   - **Maximum rating value**: Enter the maximum value.

> ⓘ **Note**
>
> You can enter positive values only as minimum and maximum rating values.

- **Level names**: Enter names for each rating value, such as average, good, and excellent.

3. Select Create.

If you'd created proficiency scales in the classic experience, you can update them in the classic experience only.

Create skills in skills hub

1. On the **Skills hub** page, select **Manage** in the **Skills** area.
2. On the **Skills** page, select **Create**.
3. On the **Create Skill** dialog, select a skill type in the **Skill type** list, and then enter a name for it in **Skill name**.
4. To add the skill to users, in the **Users** section, select **Add**, and then select the users.
5. Select **Add selected users**.
6. To add proficiency, select the users who will be assigned the same proficiency, select **Update proficiency**, and select a value from the dropdown list. The proficiency value is assigned for the selected users.
7. Select **Create**. The skill is created and assigned to the selected users.
8. To update the users for a skill, select a skill, and on the **Edit Skill** dialog, perform the steps to add users and attach a proficiency value.

Create skills using the classic experience

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   - In the site map, select **User management** in **Customer Support**.

2. For **Skills**, select **Manage**.
3. Select **New**.
4. Specify the following in the **New Skill** page.

Field	Description	Example value
Name	Specify the name of the skill.	Spanish **Note:** The name must be unique.
Type	Select a skill type from the dropdown list.	Language
Description	Provide a description of the skill.	This record is used to define the skill level of the Spanish language.

5. Select **Save**.

After you save, the **Users (Agents)** section appears. In this section, you add the agents and rating value. More information: Assign agents to the skill

Rating value of skills

When you add a skill to an agent, you also need to rate the proficiency of the skill. This enables the system to do an exact or closest match against the requirement of a conversation and distribute the conversation accordingly. You can use the default rating model, edit it, or create a new one to match the needs of your organization.

You must provide the minimum and maximum rating value. Also, in the **Rating Values** section, you must create rating value text against each score between the minimum and maximum rating value. This text appears when you're updating an agent's skill and proficiency.

Create a rating model

You can create rating models in the Customer Service admin center, Omnichannel admin center, or Customer Service Hub apps.

1. Perform the steps by using one of the following apps.

    - In the site map of Customer Service admin center, select **Insights** in **Operations**.
    - In the site map of Omnichannel admin center, select **User attributes** in **Advanced settings**.
    - In the site map of Customer Service Hub, go to **Service Management**, and select **User attributes** in **Unified Routing**.

2. In the **Skill-based routing** section, select **Manage**.
3. On the **Omnichannel Configuration** page, in the **Rating Model** section, select **New Rating Model**.
4. Specify the following in the **New Rating Model** page.

Tab	Field	Description	Example value
General	Name	Specify a name for the rating model.	Language rating model
General	Min Rating Value	Provide a minimum rating value.	1
General	Max Rating Value	Provide a maximum rating value.	10

5. Select **Save**. The **Rating Values** section appears.
6. Select **New Rating Value**. The **New Rating Value** page appears.
7. Specify the following.

Field	Description	Value
Name	Specify a name for the rating value.	★★★★★★★★★★ **Note:** This is an example value.
Value	Provide a value.	10 **Note:** This is an example value.

8. Select **Save and Close** to save and add the rating value to the grid.
9. Select **New** to add other rating values and repeat steps 4 and 5.
10. Select **Save** to save the rating model changes.

Recommended proficiency level

We recommend that you use a rating model with minimum value as 1 and maximum value as 10, and define the rating values accordingly.

For example:

Rating value name	Value

Rating value name	Value
★★★★★★★★★★	10 star
★★★★★★★★★	9 star
★★★★★★★★	8 star
★★★★★★★	7 star
★★★★★★	6 star
★★★★★	5 star
★★★★	4 star
★★★	3 star
★★	2 star
★	1 star

Add agents as bookable resource in the classic experience

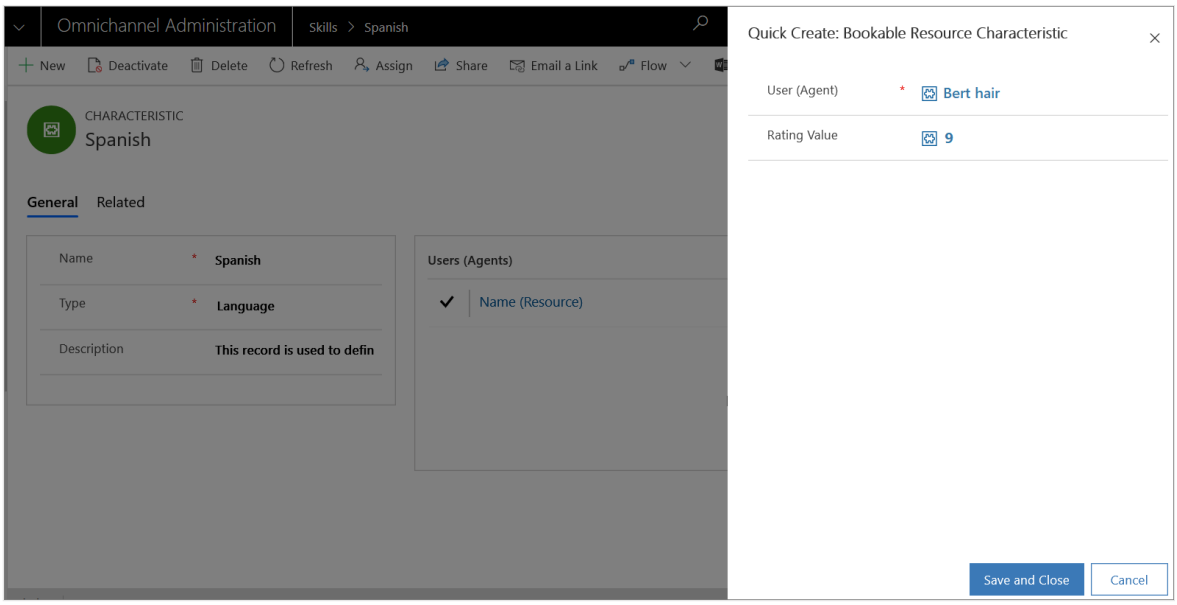
Add the agents as a bookable resource so that you can assign skills to them. This task is required for classic experience only and not for the new skills hub experience.

1. Go to the users page in any of the administrator apps.
2. Select a user from the list and select the **Omnichannel** tab.
3. Select **New Bookable Resource** in the **Skills Configurations** section. The **New Bookable Resource** page appears.
4. Specify the name of the user in the **Name** field.
5. Select **Save**.

Assign agents to skill

> **ⓘ Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

1. In the site map of Omnichannel admin center, select **User attributes** under **Advanced settings**, and then select **Manage** for **Skills**.
2. Select a skill from the list for which you want to assign the agents.
3. Select **New Bookable Resource Characteristic** in the **Users (Agents)** section. The **Quick Create: Bookable Resource Characteristic** pane appears.
4. Select an agent name for the **User (Agent)** field. Only the name of the agents who are added as Bookable Resources appears in the dropdown list.
5. Select a rating value from the list. The values that appear are based on the rating model and rating values that you created. More information: Rating value of skills.
6. Select **Save and Close**. The agent you added is displayed in the grid.



7. Repeat steps 3 through 6 to add more agents to the skill.
8. Select **Save**.

Alternatively, you can also add a skill to the user (agent). More information: Manage users.

Model data tables as skills

Enable agents to update skills

Article • 03/08/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

By default, skill-based routing is enabled. You can create skills to attach to agents and define proficiency levels by using a rating model. You can also enable your agents to add or remove skills for their assigned work items at runtime. To do this, you must enable the update skill control toggle in the Customer Service admin center or Omnichannel admin center app.

> **Note**
>
> By default, the skill control is available only for messaging channels. For the records channel, you'll need to customize the form to add the skill control. More information: **Add a skill control for routed records**

Prerequisite

To ensure that the skill control is loaded and displayed properly for the routed records, you must allow access to these websites.

Enable agents to update skills at runtime

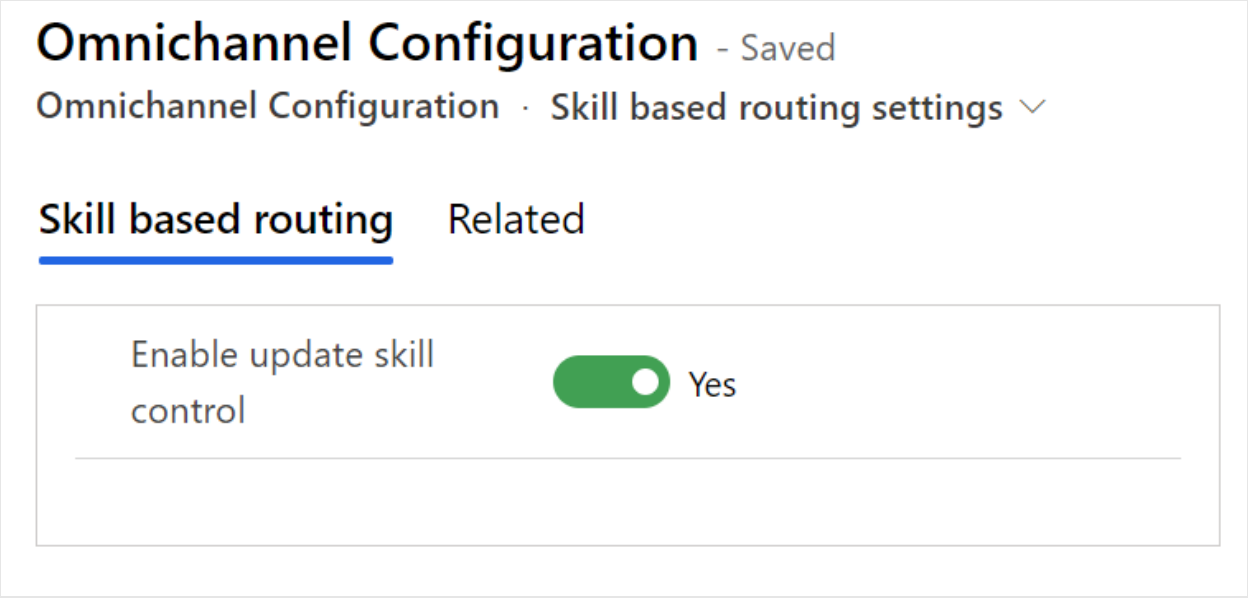
1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   - In the site map, select **User management** in **Customer support**. The **User management** page appears.

2. Select **Manage** for **Skill-based routing**.

3. On the **Skill based routing** tab, set the **Enable update skill control** toggle to **Yes**.



By enabling your agents to evaluate and update skills required for their work items, you make use of your agents' experience to identify the actual skills that are required for the work items. These skills are also used in training the skill finder model. Accurate data on skills improves the model accuracy and prediction. More information: Retrain skill finder model

Overview of skill-based routing
Set up skills and assign agents

Set up skill-based routing in unified routing

Article • 09/19/2023

The steps to configure skill-based routing are as follows:

1. Create a rating model.
2. Create skill types and skills.
3. Assign agents to skills.
4. Set exact or closest match as the default skill-matching algorithm for a workstream.
5. Choose one of the following skill-classification methods:

    - Author logical classification rules to attach skills for a workstream.
    - Set up intelligent skill finder model and author machine learning-based classification rules to attach skills.

6. Choose out-of-the-box assignment method or author a custom assignment method for a queue.
7. Enable skill control for the agent.

How skills are matched

This section explains how the default skill match algorithm works when you set the value as exact match or closest match in a workstream. When the work classification skill rules attach skills and proficiency level, the assignment method matches the required skill with the skills of the agent. Then the system assigns the conversation to an agent based on the chosen skill criteria.

The default skill-matching algorithm works with the out-of-the-box assignment method only. If you use the custom assignment method, then you'll need to write the conditions to achieve skill-based routing. The rules written for custom assignment override the algorithm in the work distribution settings of the workstream.

You can achieve the following skill matching based on the business requirements:

- Exact skill match
- Closest or nearest skill match

When you select one of these skill-matching types, you must configure the skill attachment rules for the conversation to be routed to the correct agent.

Exact match

In exact skill matching, the assignment logic searches for an agent with the required skills and proficiency.

Exact match filters all matched agents whose rating value is greater than or equal to the required value, and then orders them based on the higher available capacity, capacity profile, or round robin as per the selected order by attribute.

If an agent isn't available with all the required skills and corresponding proficiency, then the conversation remains unassigned in the queue.

You can configure exact skill match in one of the following ways:

- In the work distribution settings of the workstream, set the value for **Default skill matching algorithm** as **Exact Match**. In the assignment method of the queue, choose highest capacity or round robin assignment method. The exact match algorithm is not applicable to work items if custom assignment method is applied to a queue. You'll need to write rules to achieve exact match for the custom assignment method.

- Create a custom assignment method and create rules on attribute user skills:

  In exact skill match, as part of custom assignment method, you can write rule conditions to enable assignment logic to search for agents who match all the required skills or match all skills within a skill type. The matched agents can be ordered using the following order by options:
  - Nearest proficiency
  - Nearest proficiency within skill type
  - Most proficient
  - Most proficient within skill type
  - Skill count
  - Skill count within skill type
  - Round robin
  - Capacity

  For example, order by nearest proficiency or most proficiency will have the agent with skill proficiency nearest to required proficiency or highest proficiency at the top accordingly. It can be configured within a skill type as well.

  The following table lists a few examples of how skills are matched and results are ordered when the algorithm is "exact match".

Skills required	Agent characteristics	Scenario description	Rule condition	Order by/Result
◦ Cafe A-100 (Type: Product); Proficiency required: 2 ◦ Spanish (Type: Language); Proficiency required: 3	◦ Name: Carlos; Capacity: 100; Cafe A-100 (2); Spanish (3) ◦ Name: Eric; Capacity: 200; Cafe A-100 (3); Spanish (4)	Exact match all skills	Agent.User skills. Exact match.All skills AND (optional) Agent.PresenceStatus Equals Conversation.Work Stream.Allowed Presences AND Agent.Available capacity >= Conversation.Work Stream.Capacity	Choose from one of the Order by options: ◦ **Available capacity**: Eric ◦ **Nearest Proficient**: Carlos ◦ **Most Proficient**: Eric
◦ Cafe A-100 (Type: Product); Proficiency required: 2 ◦ Spanish (Type: Language); Proficiency required: 3	◦ Name: Carlos; Capacity: 100; Cafe A-100 (2); Spanish (3) ◦ Name: Eric; Capacity: 200; Cafe A-100 (3); Spanish (4)	Exact match language skill only	Agent.User skills.Exact match.Skill type: Language AND (optional) Agent.PresenceStatus Equals Conversation.Work Stream.Allowed Presences AND Agent.Available capacity >= Conversation.Work Stream.Capacity	Choose from one of the order by options: ◦ **Available capacity**: Eric ◦ **Nearest Proficient**: Carlos ◦ **Most Proficient**: Eric

Closest Match

When finding an agent at the earliest is more important than waiting for an agent with exact required skills, unified routing provides with an option to order agents using proficiency or skill count and thereby achieving closest skill match.

Closest match orders all agents based on their closeness to the required skill and proficiency. For example, if the required skills are four, then agents with four skills will be put on top (exact qualified), then agent with five skills (overqualified), followed by agent with three skills (under qualified).

If no agent is available with any of the required skills, then the conversation might be assigned to an agent without any required skills.

You can achieve closest skill match in one of the following ways:

- In the work distribution settings of the workstream, set the value for **Default skill matching algorithm** as **Closest Match**. In the assignment method of the queue, choose highest capacity or round robin assignment method.

  In this scenario where closest match is chosen as the skill matching algorithm at workstream level, and round robin or highest capacity assignment method is chosen; if more than one agent with same skill score is there; the system won't order them by round robin or highest capacity. The system will continue to assign all the incoming work items to the same agent until other constraints like capacity and presence are satisfied.

- Create a custom assignment method and create order by using proficiency or skill count to achieve closest match.

  You need to select order by > Proficiency > All skills or skill type > Nearest Proficient.

  In closest skill matching as part of custom assignment method, you can choose from the following order by options:
  - Nearest proficiency
  - Nearest proficiency within skill type
  - Most proficiency
  - Most proficiency within skill type
  - Skill count
  - Skill count within skill type

  The following table lists a few examples of how the skills are matched and results are ordered when the default skill-matching algorithm is "closest match".

Skills required	Agent characteristics	Scenario description	Rule condition	Order by/Result
◦ Cafe A-100 (Type: Product); Proficiency required :2 ◦ Coffee machine (Type: Product); Proficiency required: 3 ◦ Spanish (Type: Language);	◦ Name: Carlos; Cafe A-100 (2); Coffee machine (3); Spanish (3) ◦ Name: Eric; Cafe A-100 (5); Coffee machine (4); Spanish (1) ◦ Name: Jamie; Cafe A-100 (1);	Closest match all skills	Agent.PresenceStatus Equals Conversation.WorkStream.Allowed Presences AND Agent.Available capacity >= Conversation.WorkStream.Capacity	Choose from one of the order by options: ◦ Nearest Proficient: Carlos > Eric > Jamie ◦ Most Proficient: Eric > Carlos > Jamie

Skills required	Agent characteristics	Scenario description	Rule condition	Order by/Result
Proficiency required: 3	Coffee machine (2); Spanish (1)			
◦ Café A-100 (Type: Product); Proficiency required: 2 ◦ Coffee machine (Type: Product); Proficiency required: 3 ◦ Spanish (Type: Language); Proficiency required: 3	◦ Name: Carlos; Cafe A-100 (2); Coffee machine (3); Spanish (3) ◦ Name: Eric; Cafe A-100 (5); Coffee machine (4); Spanish (1) ◦ Name: Jamie; Cafe A-100 (1); Coffee machine (2); Spanish (1)	Closest match product skill only	Agent.PresenceStatus Equals Conversation.Work Stream.Allowed Presences AND Agent.Available capacity >= Conversation.Work Stream.Capacity	Choose from one of the order by options: ◦ Nearest Proficient: Carlos > Eric > Jamie ◦ Most Proficient: Eric > Carlos > Jamie
◦ Café A-100 (Type: Product); Proficiency required: 2 ◦ Coffee machine (Type: Product); Proficiency required: 3 ◦ Spanish (Type: Language); Proficiency required: 3	◦ Carlos Cafe A-100 (2); Coffee machine (3); Spanish (3) ◦ Name: Eric; Cafe A-100 (5); Coffee machine (4) ◦ Name: Jamie; Cafe A-100 (1)	Closest match with all skills using skill count	Agent.PresenceStatus Equals Conversation.Work Stream.Allowed Presences AND Agent.Available capacity >= Conversation.Work Stream.Capacity	Order by option: Skill count: Carlos > Eric > Jamie
◦ Cafe A-100 (Type: Product); Proficiency required: 2 ◦ Coffee machine (Type: Product); Proficiency required: 3	◦ Name: Carlos; Cafe A-100 (2); Coffee machine (3); Spanish (3) ◦ Name: Eric; Cafe A-100 (5); Coffee machine (4);	Closest match product skill only using skill count	Agent.PresenceStatus Equals Conversation.Work Stream.Allowed Presences AND Agent.Available capacity >= Conversation.Work Stream.Capacity	Order by: Skill count: System will randomly pick from Carlos or Eric

Skills required	Agent characteristics	Scenario description	Rule condition	Order by/Result
◦ Spanish (Type: Language); Proficiency required: 3	◦ Name: Jamie; Cafe A-100 (1);			

> **Note**
>
> We recommend that you use the same rating model across skills. However, if skills that belong to different rating models are there, then the system will normalize and calculate the skill scores.

FAQ on unified routing

Set up intelligent skill finder model

Article • 09/19/2023

To configure machine learning-based skill classification rulesets, you can configure intelligent skill finder models that can be used for predicting skills.

You can create, test, and train machine-learning models that use AI to determine the necessary skills for new work items and by using the data in Microsoft Dataverse. However, if you're trying to set up the model in a new organization or if skill-based routing wasn't in use, you might not have the needed skill data. In such conditions, you can use data from another application by using the **Import from Excel** option in the skill finder model.

Intelligent skill finder depends upon the custom AI Builder category classification model. Therefore, AI Builder should be available in the geographical region where you want to use intelligent skill finder. More information: Availability of AI Builder.

> **ⓘ Important**
>
> If you want to import skill finder models from one environment to another, make sure that you import and export between environments of the same type. A model trained in test environment will work in another test environment only and not in a production environment.

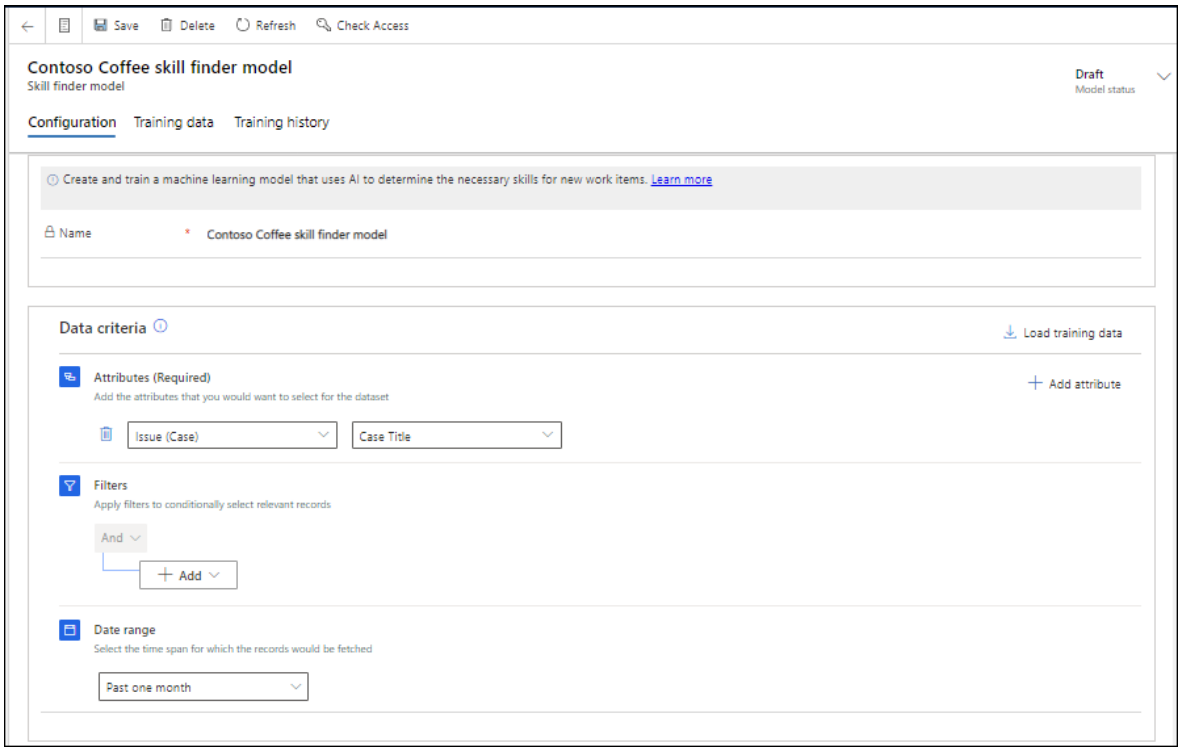
Create skill finder models

You can create as many intelligent skill finder rating models as your business requires.

1. In the Customer Service admin center site map, select **Insights** in **Operations**. The **Insights** page appears.
2. In the **Intelligent skill finder** section, select **Manage**.
3. On the **Intelligent skill finder models** page, select **New**, and on the **Configuration** tab of **New skill finder model** page, enter a name.
4. In **Data criteria**, enter the following to form the dataset records:
    - **Attributes (Required)**: Select attributes in the Attributes and related list to form the training dataset. The corresponding attribute values will be merged

in the sequence they are added and will be used to form the input string for the model training data.

- **Filters**: Optionally, apply filters to conditionally select the relevant records.
- **Date range**: Select a value to set the time period for which the records need to be loaded.



5. Select **Save**, and then select **Load training data**. The **Training data** tab appears and displays the data load status.

6. After the load is complete, review the data, and edit the records if you want to modify the tags.

7. In the **Training data** section, select the checkbox for **Input data** to select all the records, and select **Approve**. You must approve a minimum of 50 records for the model to be trained.

8. Select **Train model**, and select **Train model** again on the confirmation dialog.

9. After the status changes to training completed, select the rows that you want to publish, and select **Publish model**. The skills model is ready for use.

Test the model

You can test your model to determine if it's working as expected. Perform the following steps to view the performance and accuracy of the model.

1. In Power Apps, select the environment that contains your solution.

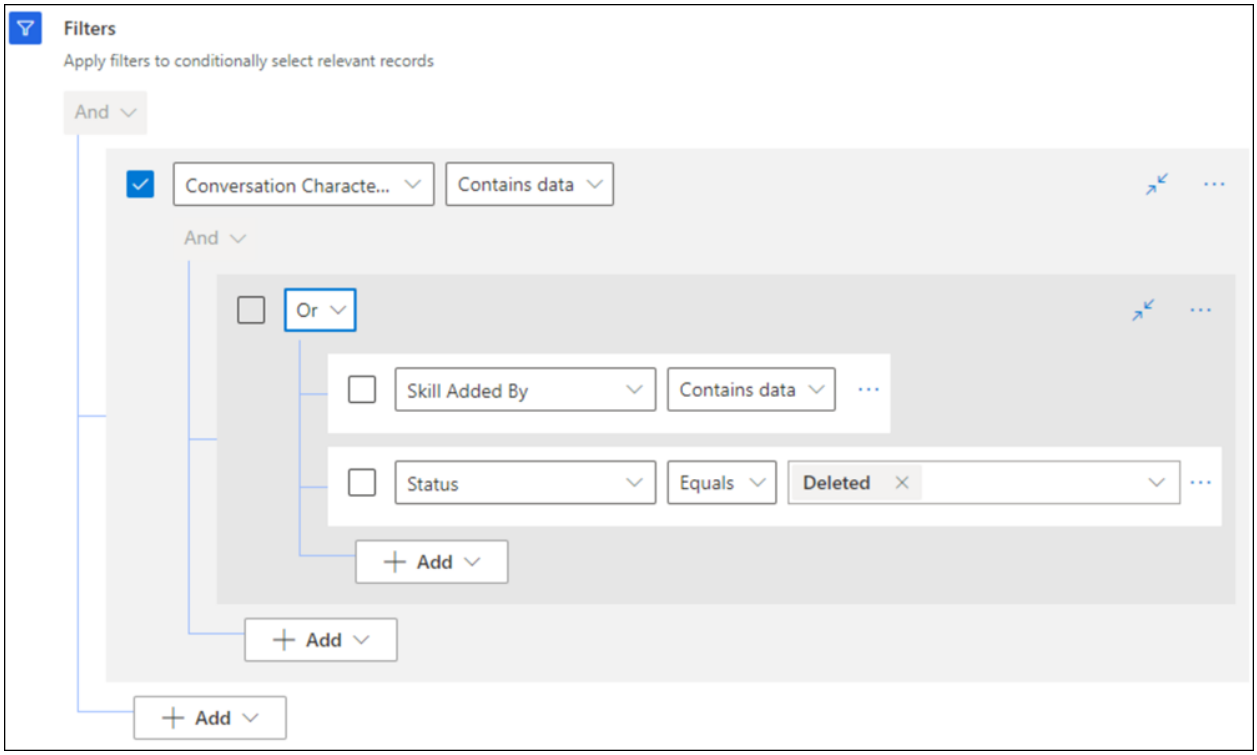
2. Select **AI models**. You can view the models you've created in **My models** and the models that are shared to you in **Shared with me**. Select the required model.
3. Select **Quick test**. To get model related information, select vertical ellipsis beside **Quick Test** button, and then select **Download detailed metrics**. The metrics file contains information about model's performance, accuracy, and precision. For more information, see Understand category classification model performance
4. In **Text**, enter the required text, and then select **Test**. The predicted tags appear in **Suggested tags and confidence**.
5. When the model runs, if the predicted tags match with available skills in the organization, the corresponding skills are linked to the model.

Retrain the model iteratively

You should retrain your published model iteratively to improve the model with new data in Microsoft Dataverse. For example, model retraining can be done by using the records in which agents have updated the skills for records or conversations. When you retrain the model to include the skills added by agents, review the training data records after loading it to make sure it meets the required skill criteria.

For information about how your agents can update skills, see Manage skills. To enable your agents to update skills at runtime, see Enable agents to update skills.

You can define the conditions as seen in the following screenshot.



Use training data from the Excel file

If you don't have data to train your model, you can populate skills and attributes data in Excel files and upload them to the application by using the import feature of Microsoft Dataverse.

To use the data from the Excel files, you must make sure of the following:

- The model name in the application should match the name in the Training record column of the Excel file.
- Name the files as msdyn_ocsitrainingdata.csv and msdyn_ocsitdskill.csv.
- Ensure that the input data string is less than or equal to 5000 characters to avoid truncation.

A sample of each file is as follows. You can select the links to download the sample files.

msdyn_ocsitrainingdata.csv

Skill finder model	Training record name	Input data
CCSFM01-Contoso Coffee skill finder model	CCSFM01-Contoso Coffee training data A10001	Hi, I work at Trey Research. One of the automatic espresso machines is becoming overheated and starts giving a burning smell after 30 minutes of usage. Please help! Yes. No.
CCSFM01-Contoso Coffee skill finder model	CCSFM01-Contoso Coffee training data A10002	Hi, I recently bought Café A-100 coffee machine and its top plate is getting heated after 15 minutes of usage. Please resolve this at the earliest.
CCSFM01-Contoso Coffee skill finder model	CCSFM01-Contoso Coffee training data A10003	Hi, I am unable to start my recently bought espresso machine, looks like the electrical plug provided with it is not functioning.
CCSFM01-Contoso Coffee skill finder model	CCSFM01-Contoso Coffee training data A10004	Hi, I work at Trey Research. I am looking for replacement of coffee machine purchased 3 months ago. Even after raising complaints earlier about overheating the issue still persists. Please help!
CCSFM01-Contoso Coffee skill finder model	CCSFM01-Contoso Coffee training data A10005	Hi, my recently bought Café A-100 machine is not in the color I ordered. Please replace the same.

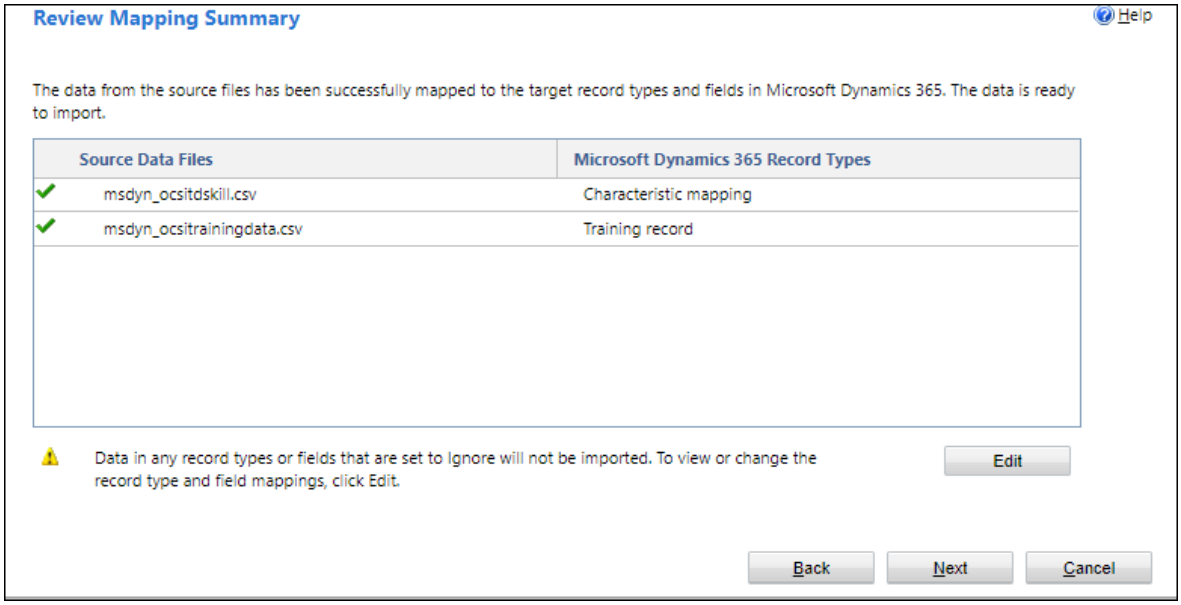
msdyn_ocsitdskill.csv

Training record	Characteristic mapping	Characteristic
CCSFM01-Contoso Coffee training data A10001	Café A-100	Café A-100

Training record	Characteristic mapping	Characteristic
CCSFM01-Contoso Coffee training data A10001	Heating	Heating
CCSFM01-Contoso Coffee training data A10001	Electrical	Electrical
CCSFM01-Contoso Coffee training data A10002	Café A-100	Café A-100
CCSFM01-Contoso Coffee training data A10002	Heating	Heating

Perform the following steps to upload the data for training your model:

1. On the **Skill finder model** page, enter a name for the model, and then save the form.
2. Select the **Training data** tab, and select **Import Excel**.
3. Select the .csv files to upload in the import tool.



4. Review the upload settings, and select **Finish** after you go through the stages. The data upload starts. The time taken for the data upload depends on the number of records.
5. Optionally, you can select **Refresh** to see the updated status of the data upload.
6. Perform steps 5 through 8 in Create skill finder models to approve, train, and publish your model.

Set up skill-based routing in unified routing

Model existing tables as skills

Article • 06/26/2023

Organizations can use existing data tables and model them as skills to perform skill-based routing. With this approach, you can avoid recreating data definitions as skills in Dynamics 365, and you won't need to write classification rules to stamp skills on the incoming work items. By modeling existing tables as skills, managing data becomes easier. The following examples illustrate two common scenarios.

- **Example 1**: Use an existing system table to model a skill

  A customer calls a company's support line for help with a product. An agent creates a case in Dynamics 365 Customer Service. The case is created with “Product” as one of the fields. The relationship between product name and product type is already established in the system. Agents are trained to troubleshoot issues with the company's products—that is, they're "skilled" on the product. Therefore, the company can model "Product" in the Cases table as a skill and assign product types as skills to its agents.

- **Example 2**: Use an existing custom table to model a skill

  A company has created a column called "Operating market" in a custom table in live chat. Whenever a customer starts a chat with a support agent, "Operating market" automatically stores the customer's location. Agents are trained to manage the expectations and requirements of customers in specific operating markets—that is, they're "skilled" on those markets. Therefore, the company can model "Operating market" in the custom table as a skill and assign markets as skills to its agents.

How modeling tables as skills differs from traditional skill-based routing

Say you have multiple product categories and attributes already configured in your system, such as all your cases populated with "Product" and "Customer" information. To use traditional skill-based routing, you would:

- Enter all your products and customers as skills.
- Assign those skills to agents.
- Create classification rules to add "product" and "customer" skills to incoming work items.

Whenever you added a new product or customer, you'd have to:

- Create a new skill for the new product or customer.
- Assign the new skill to agents.
- Update your classification rules.

Traditional skill-based routing results in duplicated data and effort because you're creating skills from product and customer data you've already entered.

However, if you model the "Product" and "Customer" columns in your tables as skills, you eliminate duplication of both data and effort—and you don't need to write classification rules.

How to model a table as a skill

To model data in a table as a skill, you'll need to do the following steps:

1. Create a column for the new skill.
2. Add the column to the Skill Main form so that it's visible in the Customer Service admin center app.
3. Assign a value to the skill and assign the skill to agents.
4. Finally, add the skill as a condition in an assignment rule.

In this example, we model a skill on data in the **Products** table.

Create a skill column

1. Sign in to Power Apps, and then select the environment that contains your default solution.

2. In the left navigation pane, select **Solutions**, and then select **Default Solution**.

3. In the left panel, select the **Tables** object, and then select the **Characteristic** table.

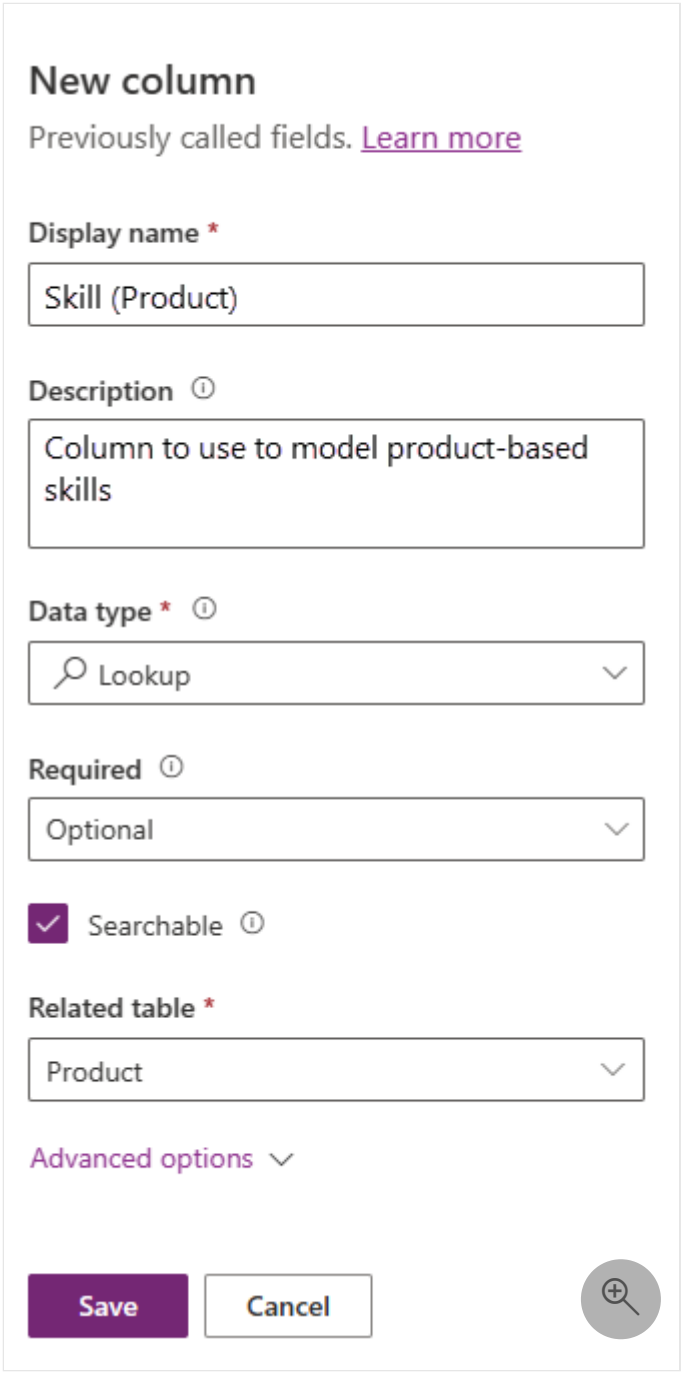
4. Under **Schema**, select **Columns**.

5. Select **New column**.

6. Enter a name and description. In this example, we've named the column **Skill (Product)** to indicate the skill is based on products, but you can enter any name that's meaningful.

7. In the **Data type** list, select **Lookup** > **Lookup**.

8. In the **Related table** list, select the table that contains the column you use to model the new skill.



9. Save the new column.

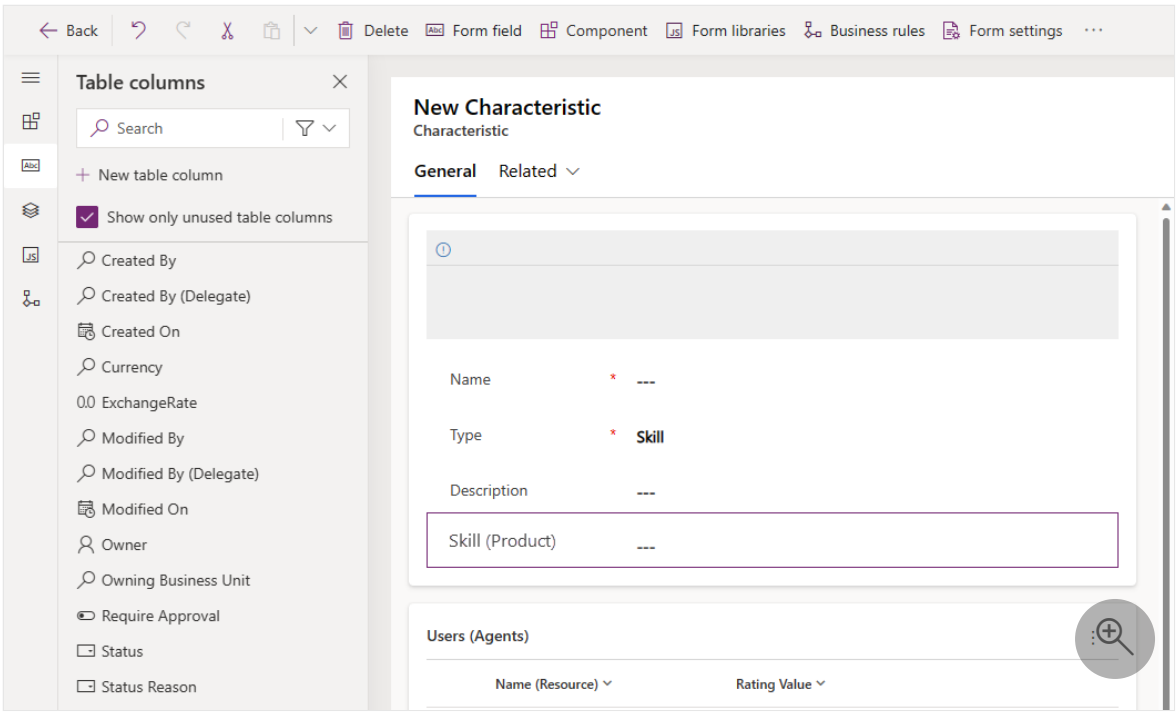
10. Return to the **Solutions** page and select **Publish all customizations**.

Add the column to the Skill Main form

1. In Power Apps, in the left navigation pane, select **Tables**, and then select the **Characteristic** table.

2. Under **Data experiences**, select **Forms**, and then select the **Skill Main Form**.

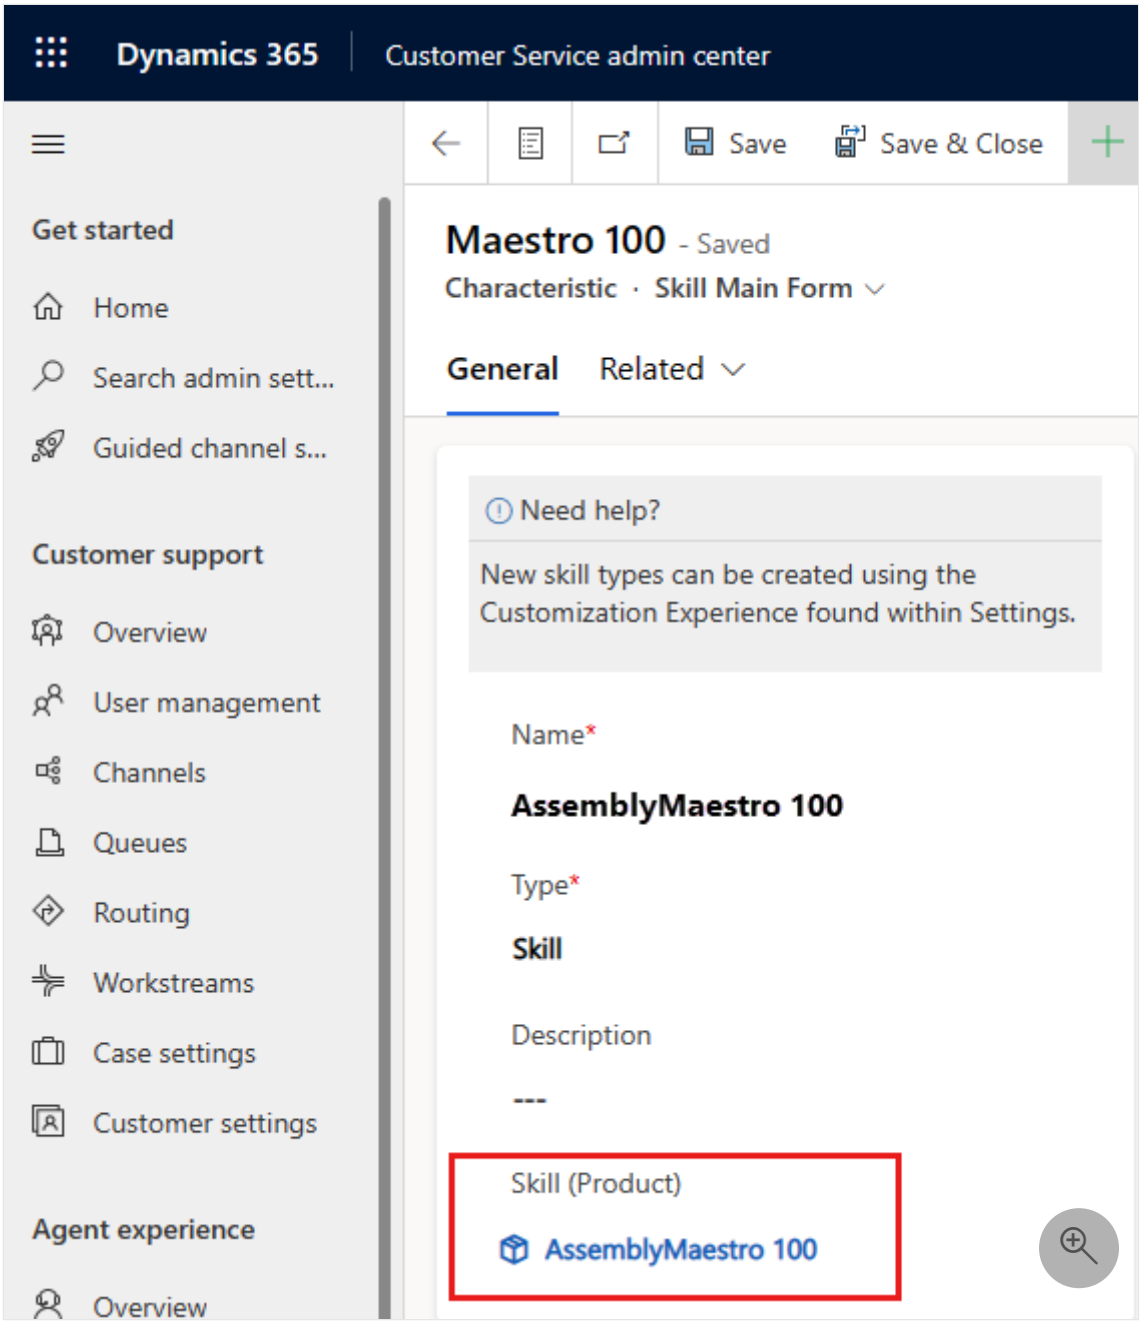
3. Drag the new column from the list of table columns in the left panel to the form.



4. Save and publish the form.

Assign a value to the skill

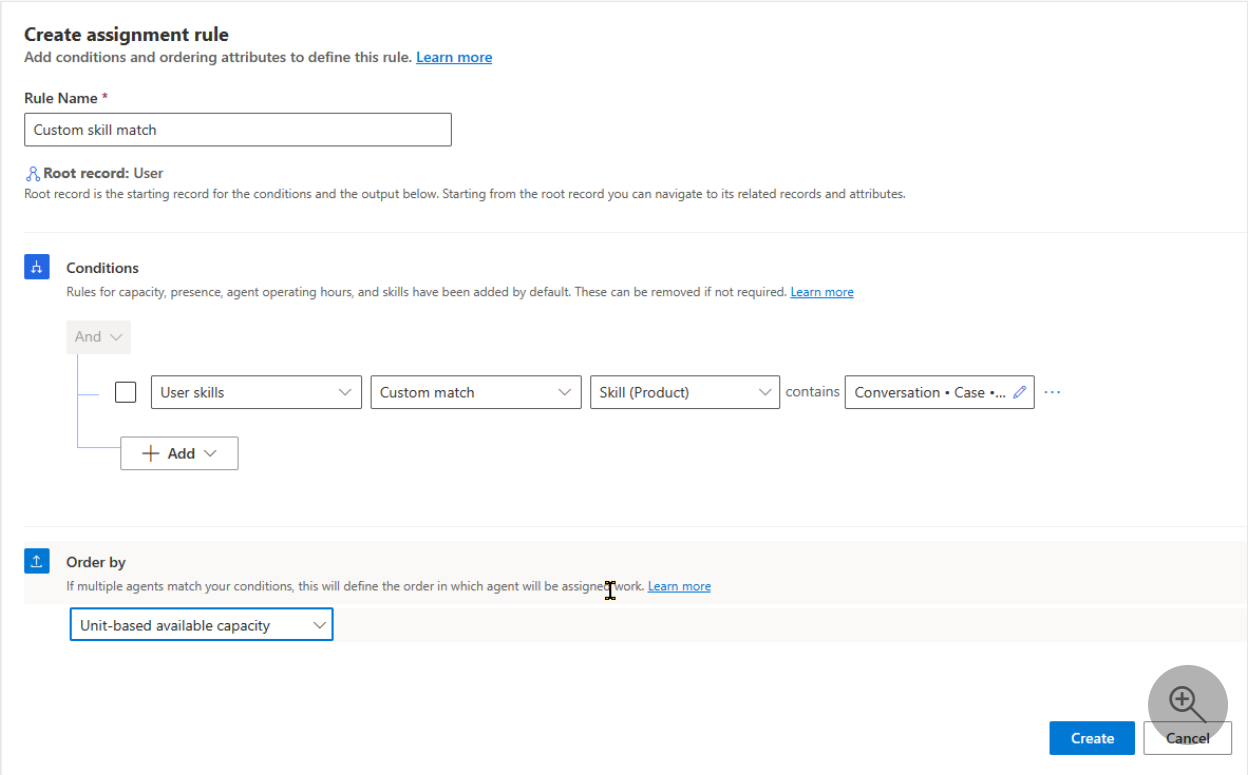
1. Open Customer Service admin center. Under **Customer Support**, select **User management**.
2. To the right of **Skills**, select **Manage** to open the **Active Characteristics** view.
3. Select **New**.
4. Enter a name, and optionally a description, for the new skill.
5. In the **Type** list, select **Skill**.
6. In the skill column lookup, search for and select a value. In our example, we've selected the product **AssemblyMaestro 100**.



7. Select **Save**.

8. Assign the skill to agents as needed.

Finally, add a condition based on the new skill to an assignment rule.



Model other data as skills

You can model as a skill any attribute or category you like and match agents with work items using them. You won't have to write classification rules for each skill, saving time and effort in maintenance, especially when attributes or categories change frequently. Using this approach, you can maintain the modeled skills at agent level and change the lookup to the new or updated value when it changes.

Things to consider

- Intelligent skill finder doesn't predict custom attributes that are modeled as skills.
- Modeled skills aren't included in skill analysis reports and they don't appear as skills in the agent skill control.
- Out-of-the-box assignment methods don't support skill match for modeled skills.
- Routing diagnostics don't display modeled skills that were matched during assignment.
- Modeled skills must be of the "lookup" data type.
- Order by proficiency isn't supported for modeled skills.

Introduction

Sentiment prediction for routing enables organizations to use the end customer sentiment scores as a factor in classifying work items to route to agents.

By using sentiment prediction for routing, you can write rules to classify work items and assign them to agents who are best equipped to handle them.

The sentiment prediction uses the following seven-point scale that allows organizations flexibility to build nuanced rules while maintaining simplicity.

- Very positive
- Positive
- Slightly positive
- Neutral
- Slightly negative
- Negative
- Very negative

The sentiment model is configured to look for and use the messages provided by the customer and doesn't consider agent chat strings.

Enable sentiment prediction

To enable sentiment prediction

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   - In the site map, select **Routing**. The **Routing** page appears.

2. Select **Manage** for **Sentiment prediction for routing**.

3. On the **Sentiment Prediction for routing (preview)** page, set the **Enable sentiment prediction for routing** toggle to **Yes**.

Dry run of sentiment prediction

You can optionally test the sentiment model by using the dry run option. You can test using real phrases that you expect to see when customers contact support. It helps you understand what the sentiment prediction on those might look like. You can see key information, such as the sentiment category on the seven-point scale, the sentiment score that is scaled from zero to 100, and keywords from the phrase that influenced the sentiment score.

To test the sentiment model

1. On the **Sentiment Prediction for routing (preview)** page, select **Dry run**.

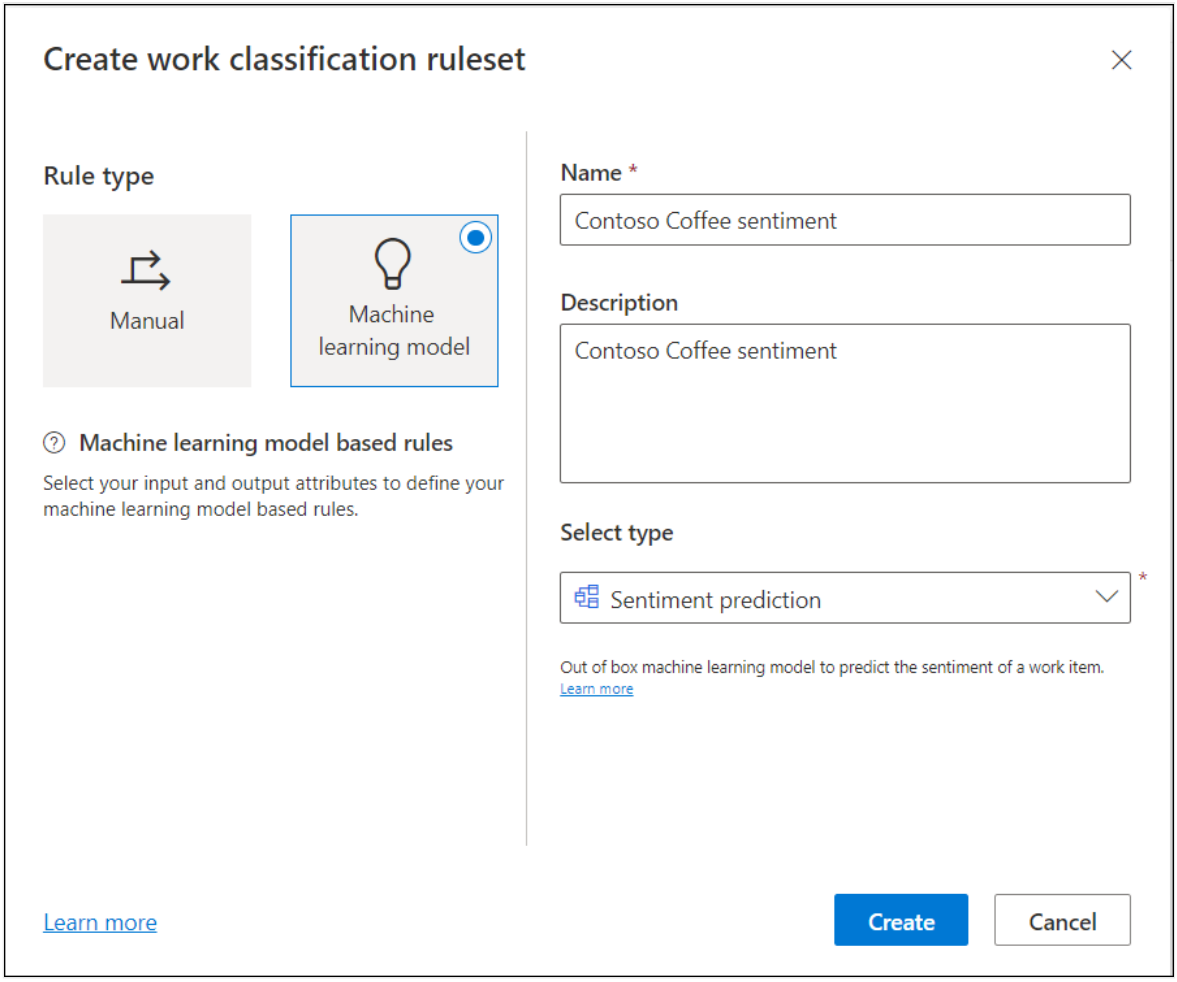
2. On the **Dry run** panel, enter a word or phrase, such as "I am frustrated", and select **Test**. The model predicts the sentiment score, category, and the keyword that helped determine the score.

Create classification rules based on sentiment prediction model

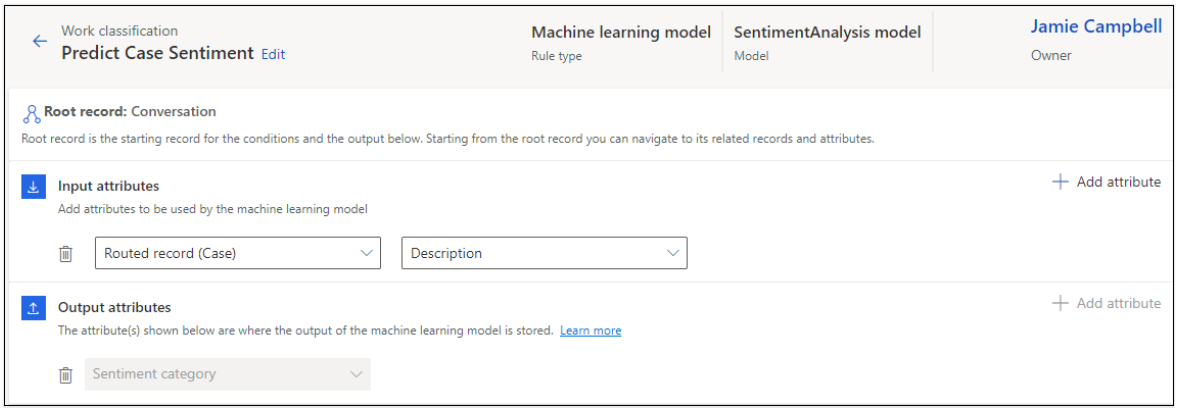
After you enable sentiment prediction, you can create a classification rule based on the machine learning model, and select the type as **Sentiment prediction**. You can use the rule with other rules to help categorize the work items to be routed to the right agents who will help with the customer issue.

To create a rule based on sentiment prediction

1. Create or edit a workstream. More information: Create workstreams
2. Go to the **Work classification (optional)** section to create a classification rule. More information: Configure work classification rulesets
3. In the **Create work classification ruleset** dialog, select the rule type as **Machine learning model**, and then select type as **Sentiment prediction**.



4. Select the input attribute in which the customer sentiment is most likely to be found. For example, for a case workstream, you can select the related entity **Routed record (Case)**, and the attribute as **Description** that might typically contain keywords indicating the sentiment.



For a messaging channel, you'll typically set the related entity as **Context item value (Conversation)**, and then select the attribute. The bot context variables should be set or pre-conversation survey must be set up to be able to use the input attribute. Frame the pre-conversation survey questions such that they elicit the customer sentiment. For example, you could use a question such as "How has been your experience with the product?" or "How can we help you?".

You can define up to 10 attributes, whose values can be used to build the prediction model. At least one attribute, the first one, is mandatory and can't be deleted.

5. Save and close.

While the application doesn't prevent you from creating more than one rule that's based on the sentiment prediction model, a warning message is displayed when you try to create another rule based on the same model.

Additional work classification rules can then be created using the output from the sentiment prediction rule. The output is stored in the **Sentiment Category** attribute. You can use any of the values on the seven-point sentiment output to build the rule.

Create route-to-queue rules

Create route-to-queue rules to route the work items based on the sentiment prediction.

To create route-to-queue rules

1. For the workstream in which you created the rule based on sentiment prediction, in **Routing rules**, select **Create ruleset** or **See more** for **Route to queues** to create a rule. More information: Configure route-to-queues rulesets and rules

2. Create a rule to define conditions. The **Sentiment Category** output attribute contains the sentiment prediction for the work item, and should be used in the rule builder to define the rule.

> **Note**
>
> If you've defined a condition on a routed record, make sure that you use the **Add row** option that's independent of the **Routed record** group.
>
> >

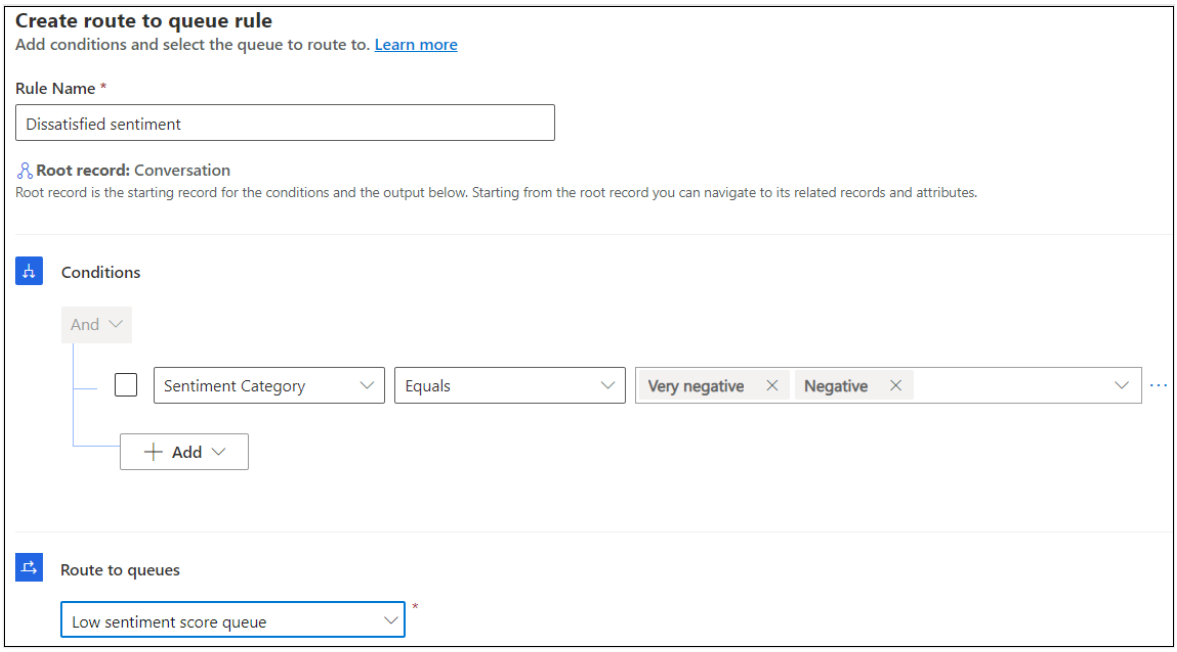
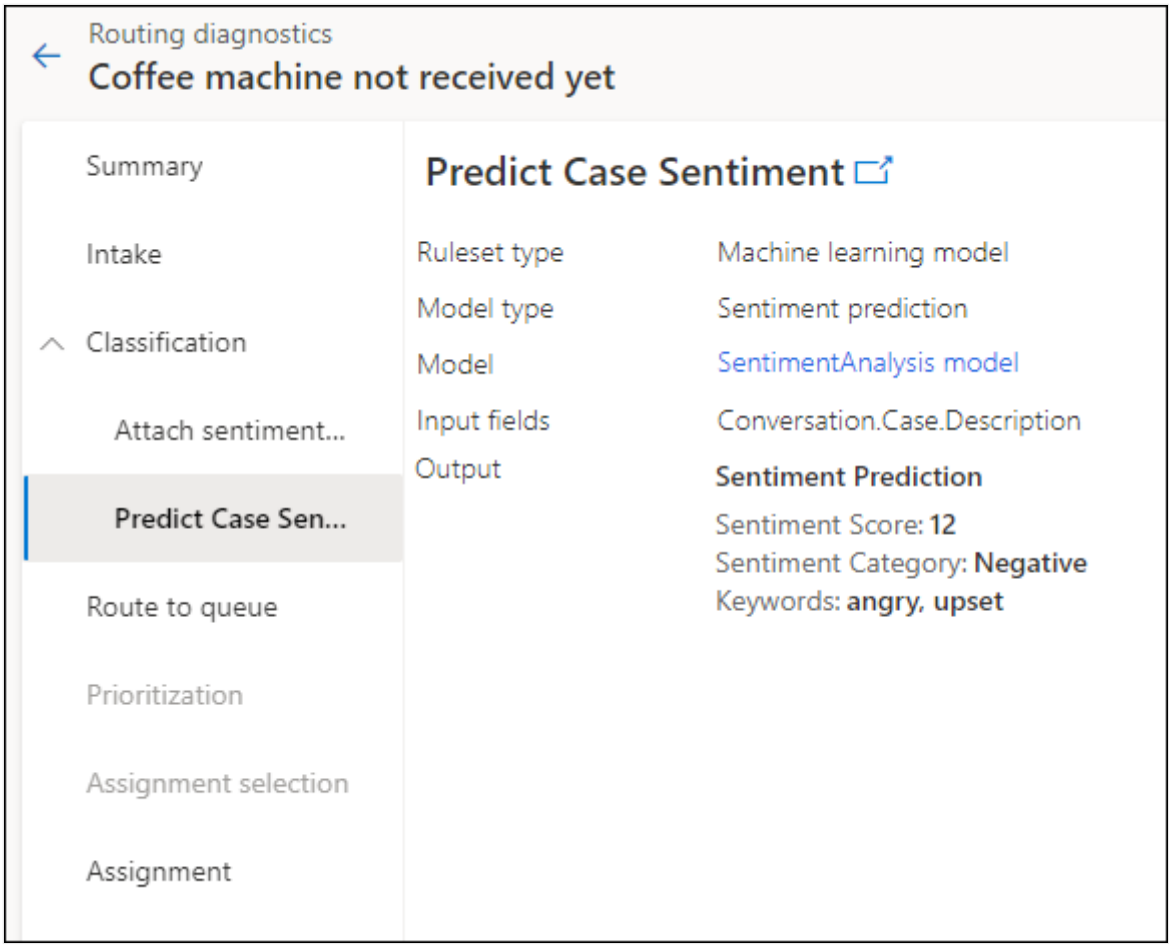
3. Select the queue to which the work items need to be assigned when the conditions are met.



Use diagnostics to analyze the efficacy of sentiment prediction

Routing diagnostics help you see how the work items have been classified and routed after you've configured the rules.

You can view how the sentiment prediction model was used to route a work item.



Language support for sentiment prediction models

All Azure Cognitive Services supported languages are supported in sentiment prediction-based routing. More information: Language support - Translator - Azure Cognitive Services

You can use the effort estimation model to classify and route work items.

You can use the estimation technique to understand how much time it will take to address a work item, and based on that estimation, route it to the agent who has the bandwidth to manage it.

Effort can be defined as the length of time that's necessary to either resolve a work item or amount of time spent on a work item before it is moved to the next stage as defined by the organization.

Some examples of how effort can be defined are as follows:

- Estimate time for an agent to respond to a customer response through email and assign accordingly
- Estimate time for an agent analysis and assign accordingly
- Estimate time for a full case resolution and assign accordingly

Create effort estimation models

You can create the effort estimation models for any record that is enabled for unified routing. You can provide the context to the model for training by selecting the attributes. At least two attributes are mandatory, and you can specify up to 10 attributes. Attributes that indicate severity and priority are useful.

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

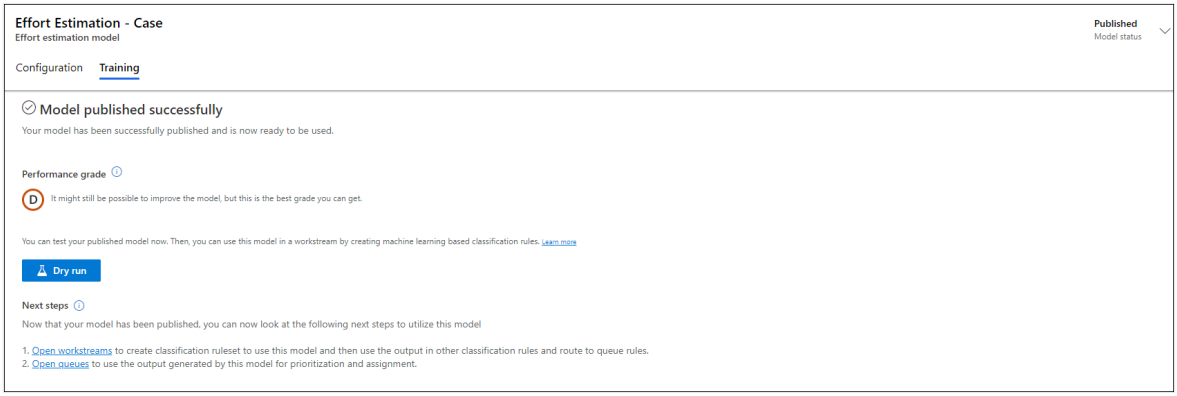
   - In the site map, select **Routing**. The **Routing** page appears.

2. Select **Manage** for **Effort-based routing**.
3. On the page that appears, select **New**.
4. On the **New effort estimation model** page, do the following:
   - **Name**: Enter a name for the model.
   - In **Data summary**, select the record, such as Issue (Case), for which you want to create the model.
   - In the **Attributes** section, select values for the **Categorical description** and **Detailed description** fields. You can add up to 10 attributes to be used to train the model.
   - In **Actual effort calculation**, select one of the following options to determine the time to address an incoming work item:
     - **Single duration field**: Select a single work item attribute where time is captured and the time unit.
     - **Calculated duration**: Select values to indicate the start and end times that define effort.
     - **SLA KPI instance**: Use the SLA KPI instance to calculate the effort. This option enables users to use SLAs as the effort definition where the

timestamps that are captured when a work item that meets its SLA success criteria serves as the effort definition.

- Optionally, define the filter conditions to select only relevant records.
- Optionally, select the date range for the records to be fetched.

5. Review and save the model.
6. Select **Train AI Model**. The **Training** tab displays the status of the training, which could take a couple of hours and depends on the conditions used. After the model is trained, the **Model published successfully** message appears on the page.



7. Optionally, use **Dry run** and select an input value to test the model. The following details are available:

   - **Effort value (minutes)**: The time in minutes that is estimated for the work item to be addressed.
   - **Confidence score**: The degree of confidence in a percentage value of the effort prediction.

Performance grade

The performance grade of the model is indicated by A, B, C, D, E, or F. The letters indicate the quality of the model in the descending order. More information: Prediction models performance

Create classification rules based on effort estimation model

After you train the effort estimation models, you can create classification rules based on the models and use the rules with other rules to help categorize the work items to be routed to the right agents who will help with the issues.

1. Create or edit a workstream. More information: Create workstreams

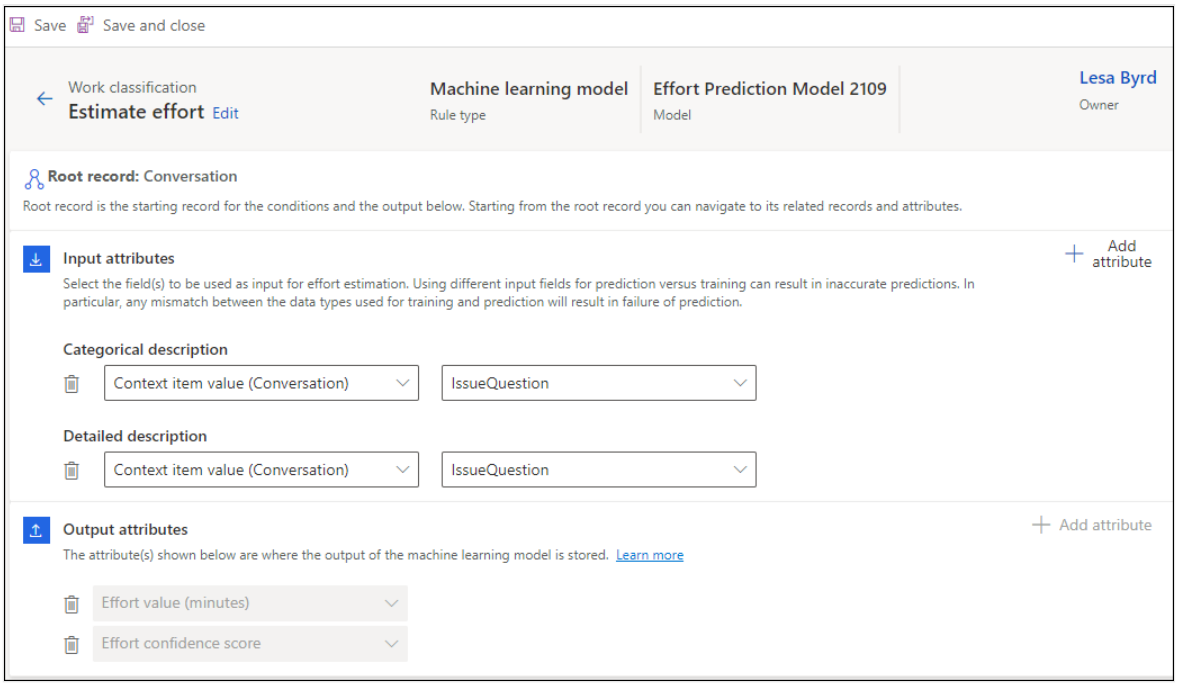
2. Go to the **Work classification (optional)** section to create a classification rule. More information: Configure work classification rulesets

3. In the **Create work classification ruleset** dialog, select the rule type as **Machine learning model**, and then select type as **Effort estimation**.

4. In **Select effort estimation model**, select the model that you want to use for the prediction, and select **Create**.

5. On the page that appears, select the input attributes to use for effort estimation. While you can use up to 10 attributes, the **Categorical description** and **Detailed description** fields are mandatory. By default, the output attributes are **Effort value (minutes)** and **Effort confidence score** and can't be edited.

   For the messaging channels, the bot context variables should be set or a pre-conversation survey must be set up to be able to use the input attributes.



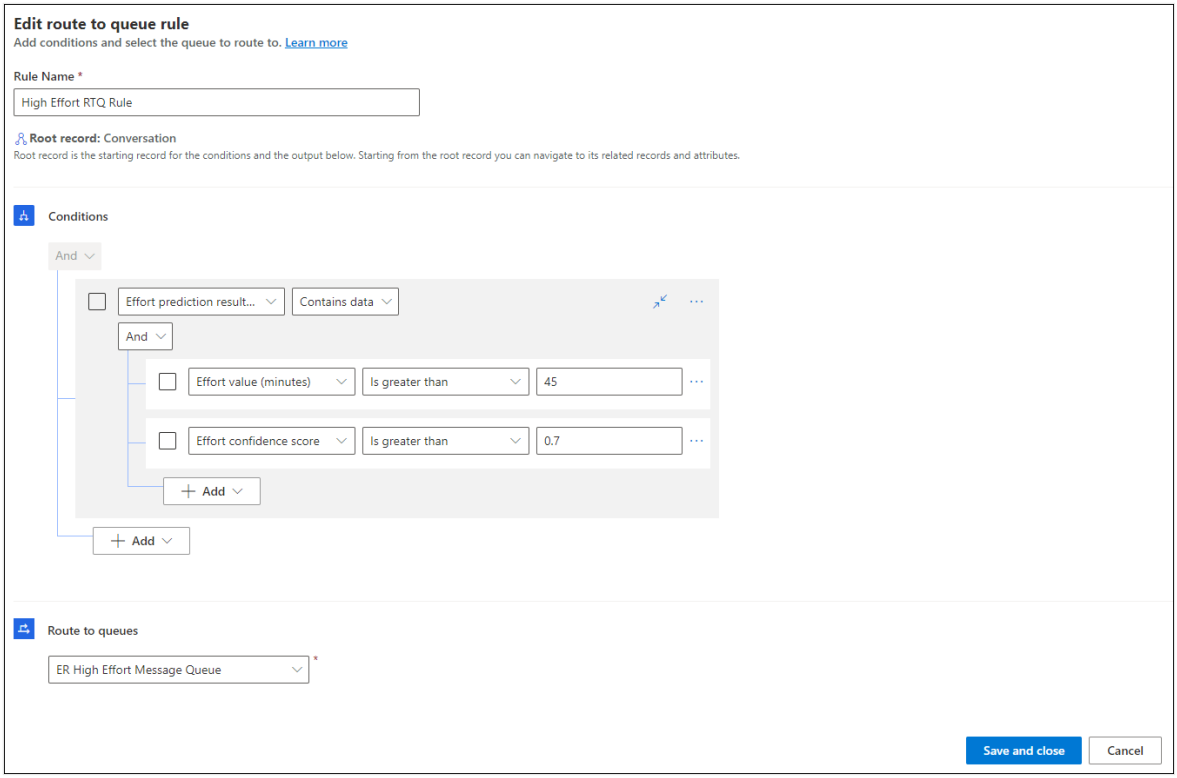
> **Note**
>
> You can have only one effort estimation rule per workstream.

Create route-to-queue rules

Create the route-to-queue rules based on the effort estimation.

1. For the workstream in which you created the rule based on effort estimation, in **Routing rules**, select **Create ruleset** or **See more** for **Route to queues** to create a rule. More information: Configure route-to-queues rulesets and rules

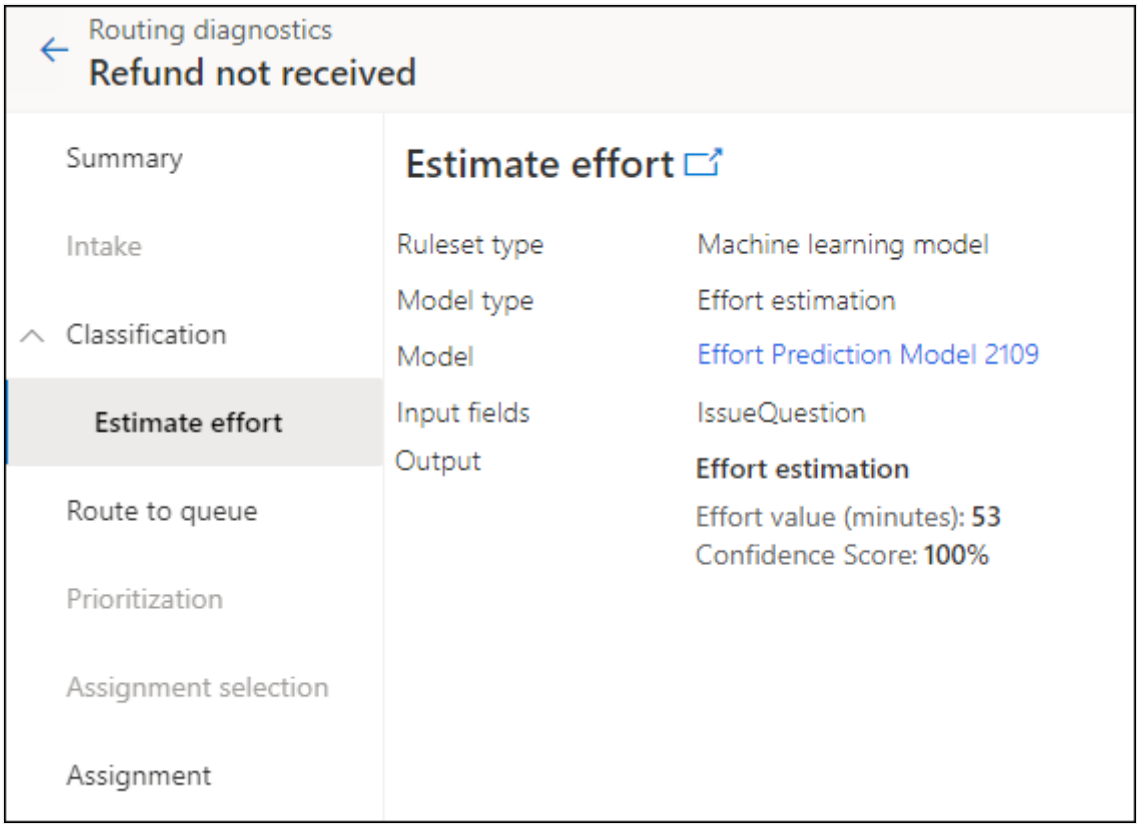
2. Create a rule to define conditions and select the queue to which the work items need to be assigned when the conditions are met.



Use diagnostics to analyze the efficacy of effort estimation models

Routing diagnostics help you see how the work items have been classified and routed after you've configured the rules.

You can view how the effort estimation model was used to route a work item.



Language support for effort estimation models

Effort estimate-based routing is supported only in the following languages:

- Arabic
- Danish
- Dutch
- English
- French
- German
- Italian
- Japanese
- Spanish

In Dynamics 365 Customer Service, *queues* are containers used to store anything that needs to be completed or requires an action such as completing a task or closing a case. Queues help you to organize, prioritize, and monitor the progress of your work.

Queues can be useful in:

- Having a centralized list of pending work that needs attention.
- Sorting tasks by type, or by people assigned to complete them.

Types of queues

By default, a queue is created for each user and team in Customer Service. You can use this default queue to track all your work items, or you can set up queues to reflect your organization's structure, business processes, or both. For example, you can create separate queues for first tier and second tier product support teams that reflect their differing levels of expertise, or Gold and Silver queues to reflect differing priorities based on service contracts that customers have with your organization.

You can use queues to prioritize your activities and cases, and categorize them based on:

- products or services
- subscription levels (regular, premium customers)
- activity categories

- geography

You can create both basic and advanced queues (for unified routing). More information: Create and manage queues for unified routing

Based on who can view the queues, you can create:

- **Public queues** To let everyone in the organization view the queue and its work items
- **Private queues** To let a small group of members view the queue and its work items. Private queues display work items for members of that queue and help remove clutter from other users' views. Private queues don't restrict access to the records they contain. Therefore, to prevent unauthorized access to sensitive data, ensure that you set up security models based on your organization needs. More information: Dynamics 365 security model

> **Note**
>
> - You must manually add new team members as members of private queues.
> - You must manually add new Microsoft Entra ID team members to the team's default queue.

Prerequisites

Make sure that you have the Sales or Marketing Manager, Customer Service Manager, System Administrator, or System Customizer security role or equivalent permissions.

Check your security role

- Follow the steps in View your user profile.
- Don’t have the correct permissions? Contact your system administrator.

Create a queue

1. Go to one of the admin apps, and perform the following steps:

   Customer Service admin center

   a. In the site map, select **Queues** in **Customer support**.

b. On the **Queues** page, select **Manage** for **Basic queues**.

2. To create a queue, select **New**. To edit a queue, select the queue in the list of queues, and then select **Edit** on the command bar.

3. Enter the following information in the **Summary** tab:

   - In the **SUMMARY** section, do the following:
     - **Name**: Enter the name of the queue.
     - **Type**: Select whether the queue is a private or public queue. If you're creating a private queue, you'll need to add members to this queue manually. In the **Members** section, select **Add** to add members to the queue. Only these members will be able to work on the items in this queue.
     - **Incoming Email**: Enter the email address that'll receive all messages sent to the queue.
     - **Description**: Enter a description.

   - In the **EMAIL SETTINGS** section, you can do the following:
     - Select a value in the **Convert Incoming Email To Activities** dropdown list to set the type of messages that you want to track as activities.
     - Set the email signature template. This signature is added to the email by default when you send messages from a queue or reply to messages sent to the queue. More information: Add a default signature for a queue

4. In the **Omnichannel** section of the **Conflicts Tab**, you can do the following:

   - Set **Automatic work distribution** to **No** (default option), and then select **Save** to create a basic queue.
   - Set **Automatic work distribution** to **Yes** to enable unified routing, and then select **Save** to create an advanced queue.

   > **ⓘ Important**
   >
   > You can update a basic queue to an advanced queue and enable it for unified routing by setting **Automatic work distribution** to **Yes**. However, once set, you can't revert the advanced queue to basic queue. You'll need to create a basic queue, and set the **Automatic work distribution** to **No**.

After you have saved the queue, the following changes happen in the SUMMARY tab:

- In the **Mailbox** field of the **EMAIL SETTINGS** section, a mailbox record for the queue is automatically created and selected. To update the mailbox, select the mailbox name More information: Create forward mailboxes or edit mailboxes

- If you selected the queue type as private, the **MEMBERS** section appears.
  - Select **Add Existing User**. Only those users that you add can work on the items in this queue. If you add a team as a member, only the existing team members can access the queue. New team members must be added manually to the queue to be able to access it.
  - The **QUEUE ITEMS** and **RECORD CREATION AND UPDATE RULES** sections appear.

Set up default views for routing dialogs

To optimize agent efficiency, you can set up custom views that contain a filtered list of queues. These queues are relevant to the type of cases that the agents handle. You can then set the view as the default from which agents can pick a queue or user to route the work items.

1. In the Customer Service admin center app, go to **Customer support** in the site map and select **Queues**.

2. On the page that appears, select **Manage** for **Routing dialogs**.

3. On the **Queues** > **Routing dialogs** page, do the following:

   - **Add to queues**: Set a default view that'll appear for the agents when they open the **Add to Queue** dialog to route a case from the case page.
   - **Route queue item**: Set a default view that'll appear for the agents when they open the **Route Queued Item** dialog to route a case on the **Queues** page,

4. Save and close.

At runtime, your agents will see the views that you have set for them.

For information on how to create custom views, see Create and edit public views.

View queue items for a queue

The **QUEUE ITEMS** section lists all activities that are either routed automatically by the routing rules or manually assigned to the queue.

Set up rules for creating or updating records automatically

In the **RECORD CREATION AND UPDATE RULES** section, you can create rules for automatically creating records for cases from incoming emails. More information: Automatically create or update records

Route items to basic queues

For all cases that are automatically created from incoming email and social posts, create routing rules to route the cases to queues. Then, assign the items in the queue to appropriate agents. More information: Create rules to automatically route cases

Alternatively, you can manually add cases and activities to queues. More information: Add a case to a queue

Assign items to agents

Queues share cases or activities as a group until they're removed from the queue or accepted by a customer service agent who assumes responsibility for handling them. Agents can pick the items for themselves, or a customer service manager can manually route these cases to the agents, or to other queues, users, and teams.

To assign items in the queue to agents, select **Assign** after selecting one or more items in the queues grid. In the **Assign Queue** box, you can choose to assign to other users or teams.

> **Note**
>
> - When two agents simultaneously add cases to the queue, the system creates two queue items instead of a single queue item.
> - If you've created workflows or used custom API to assign cases to agents and if the same case is assigned to two agents at the same time, then the system creates two queue items instead of a single queue item.
> - When an agent picks a case created by another agent and releases it from the queue, the case gets assigned to the queue owner and not to the agent who created the case.

Create a queue in legacy Service Management

To create or edit a queue

1. Make sure that you have the Sales or Marketing Manager, Customer Service Manager, System Administrator, or System Customizer security role or equivalent permissions.

   ### Check your security role

   - Follow the steps in View your user profile.
   - Don’t have the correct permissions? Contact your system administrator.

2. Go to **Settings** > **Service Management**.
3. Select **Queues**.
4. To create a new queue, select **New**. To edit a queue, select the queue from the list of queues, and then select **Edit** on the command bar.
5. Enter the following information in the **Summary** tab.
   - In the **SUMMARY** section:
     - **Name**: Enter the name of the queue.
     - **Type**: Select whether the queue is a private or public queue. You can use a private queue to allow only a specific set of people to work on activities in this queue.
     - **Incoming Email**: Enter the email address that'll receive all messages sent to the queue.
   - In the **EMAIL SETTINGS** section:
     - **Convert Incoming Email To Activities**: From the dropdown list, select a value depending on the type of messages that you want to track as activities.
     - **Mailbox**: A mailbox record for the queue is automatically created and selected as soon as you save the queue record. To update the mailbox details, select the mailbox name. More information: Create forward mailboxes or edit mailboxes

- In the **Record creation and update rules** section, add a **Record Creation and Update Rule** record. By using these rules, you can automatically create or update system or custom records with incoming activities such as emails, social activities, or other custom activities. More information: Set up rules to automatically create or update records

> **Important**
>
> - This is a central place to manage rules across all supported activities including out-of-the-box and custom activities associated with the queue.
> - The **Record creation and update rules** section displays rules using the **Email Activity Conversation Setting** or **Social Activity Conversation Setting** and that have the same queue ID as the queue.
> - Multiple rules with the same source type and same queue can exist. So when you select **Email Activity Conversion Settings** or **Social Activity Conversion Settings**, the rule with the latest **Last Modified On** date is applied.

6. Select **Save**.

Route cases using basic routing rulesets

Article • 03/20/2023

> **Tip**
>
> If you'd like to try Dynamics 365 Customer Service for free, you can sign up for a **30-day trial**.

> **Note**
>
> We recommend that you enable and use unified routing for automatically routing records in Customer Service. More information: **Overview of unified routing**.

Use routing rules in Customer Service to route cases to the right agents at the right time without any manual intervention. You can also use routing rules to route cases that are escalated to specific queues.

Routing rules are solution-aware entities. You can export routing rules from one environment to another by using the solution import export tool. However, rules are mapped to a queue, user, or team that's not solution-aware data. Therefore, after exporting the data, you'll need to edit mappings of each rule item to correspond to the queue, user, or team in the target environment.

Add routing rulesets site map for custom apps

In custom apps, you might not have routing rulesets in your site map. To add routing rulesets to the site map, follow these steps:

1. Sign in to https://`<org>`.dynamics.com/apps, and go to App Designer.
2. Select the **More Options** ellipses (...) on your custom app, and then select **OPEN IN APP DESIGNER**. The **App Designer** page appears.
3. Select the pencil icon beside **Site Map**. The **Customer Service Hub** page appears.
4. Select the area in which you want to add the routing ruleset entity, such as **Service Management**, select **Add**, and then select **Subarea**. The **SUB AREA** section appears in the right pane.
5. On the **Properties** tab, in **General** section, do the following:

- **Type:** Select **Entity**.
- **Entity:** Select **Routing Rule Sets**.

6. Save and publish the site map.

   The site map is created with the routing ruleset. Go to your custom app to locate routing rulesets in the site map.

More information: Create a site map for an app using the site map designer

Create a routing ruleset

You can create routing rulesets in Customer Service to automatically route cases. This capability is also available in Dynamics 365 Customer Engagement (on-premises) 9.1. More information: New features in Dynamics 365 Customer Engagement (on-premises)

Prerequisites

Review the following prerequisites before creating a routing ruleset:

- Verify that you have the Customer Service Manager, System Administrator, System Customizer security role, or equivalent permissions.

  Check your security role

  - Follow the steps in View your user profile.
  - Don't have the correct permissions? Contact your system administrator.

Create routing rulesets to route cases

When creating routing rulesets, you can add multiple rule items and arrange them in the required order. The rule items are evaluated in the order of their definition. Rule items are evaluated from top to bottom. If a rule item is evaluated as true, the case gets routed to the destination agent and skips further evaluation. If a rule item is evaluated as false, further rule items are evaluated.

To create the routing ruleset

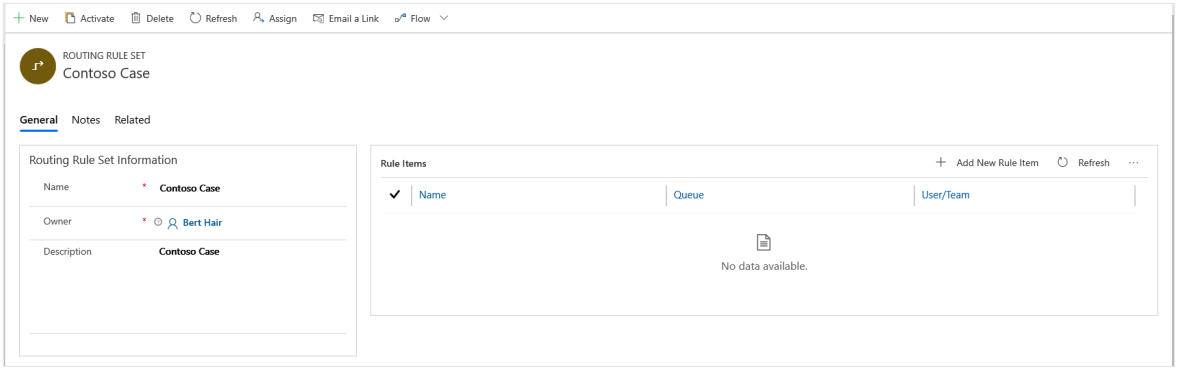
1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

a. In the site map, select **Routing**. The **Routing** page appears.

b. Select **Manage** for **Routing rule sets (basic)**.

2. Select **New** on the command bar.
3. On the **General** tab, in **Routing Rule Set Information**, Enter **Name** and **Description** for the routing ruleset.
4. Select **Save**. The routing ruleset is saved, and the **Rule Items** section is displayed.



5. In the **Rule Items** section, select **New Rule Item**. The **New Rule Item** dialog box appears in which you can specify conditions that will be evaluated for routing cases to a queue, an agent, or a team.

   a. On the **General** tab, in **Rule Item Information**, enter a **Name** and **Description**.

   b. In **Rule Criteria**, you can specify the conditions in one or a combination of the following to be evaluated for routing cases:

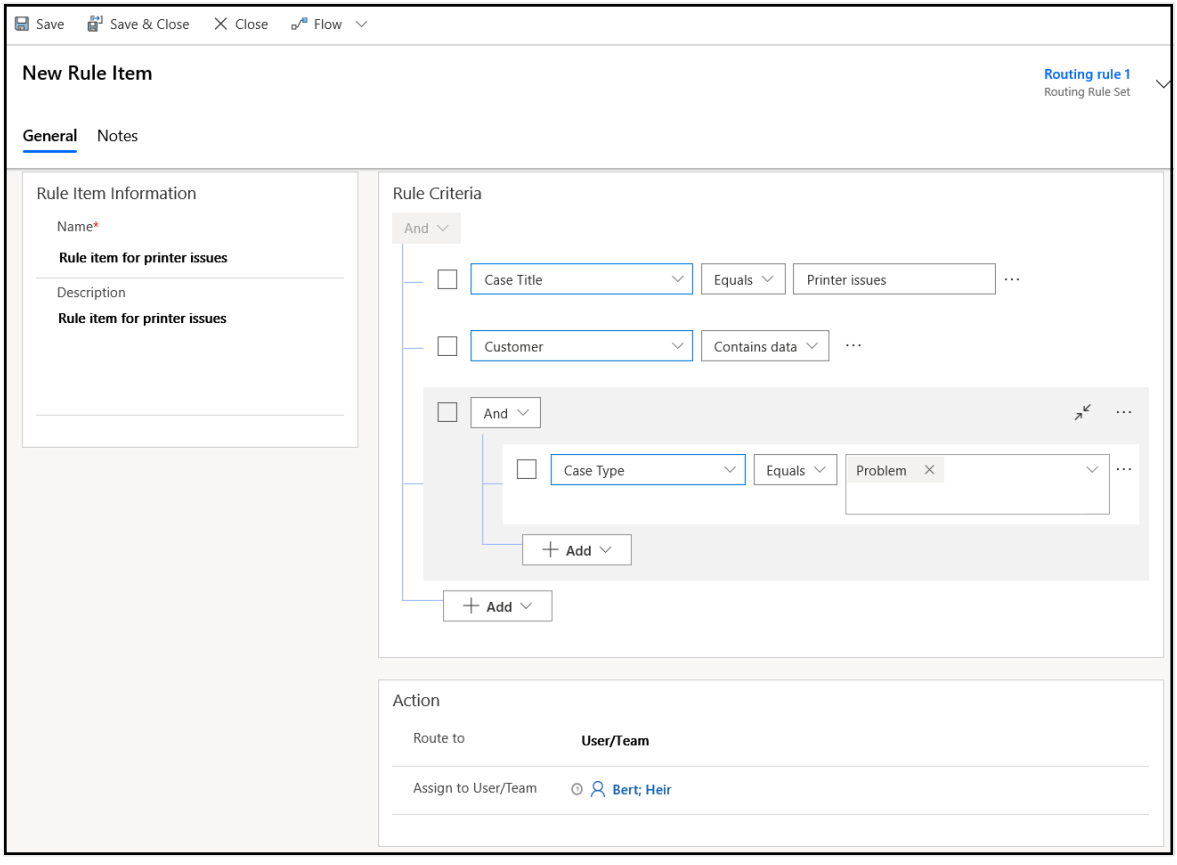
   - **Add Row:** Select ... to group multiple rows of conditions into one group.
   - **Add Group:** Select ... to ungroup a group of conditions.
   - **Add related entity:** Select to add a condition for a specific entity.

> ⓘ **Note**
>
> The following limitations are applicable when you define a rule criteria in apps based on Unified Interface:
> - You can't select a time value for the Date and Time data type. If you try to edit an existing rule item that was created in the web client, the time will be set to 00:00.
> - Only one level of the related entity hierarchy is supported though the application lets you select nested related entities.

- The related entity inside a group of the and/or clause is not supported.
- By design, the attribute with "Multi Select Option Set" data type is not supported.
- The "in" and "not in" operators for the Single Line of Text and Multiple Lines of Text data types and the "not-on" operator for the Date data type are not supported.
- For the lookups data type, only the "equal", "not equal", "null", and "not null" operators are supported.
- In the Add related entity list, the "One to Many" and "Many to Many" options are not supported even though the application lets you select them.
- If you use the same related entity more than once in the rule conditions, though the rule will be evaluated at runtime, you can't edit the rule in the app and an error message will be displayed.

c. In **Action** > **Route to**, select queue or user/team.

For example, all cases about printer issues from customers should be routed to an agent named Bert Heir, who is the subject matter expert in the team. The rule item for the condition can be configured as shown in the screenshot.



d. Select **Save & Close** to save and close the rule item.

6. In the **Routing Rule Set** record, select **Activate**. The ruleset is applied to cases that match the conditions in the rule.

> ⓘ Note
>
> - When unified routing is not enabled, only one routing ruleset can be active at a time. If you try to activate a rule when another rule is active, it will deactivate the currently active rule. You can activate or deactivate only the rules that you own.
> - If you want to edit an active routing ruleset, you must deactivate it. To successfully import a solution that includes an active routing ruleset into an organization where a rule exists with the same ID, deactivate the rule in the organization.

Create a routing ruleset (Customer Service app)

1. Make sure that you have the Customer Service Manager, System Administrator, or System Customizer security role or equivalent permissions.

   When you create and activate a routing ruleset, internally a corresponding workflow is also created. Whatever action you do on the routing ruleset, such as creating or assigning the rule, you must have privileges to perform the same action on workflows. For the rule to work, you must have sufficient privileges to run a workflow. The routine ruleset is applied in context of the privileges that the owner of the routing ruleset has.

Check your security role

- Follow the steps in View your user profile.
- Don’t have the correct permissions? Contact your system administrator.

2. go to **Settings** > **Service Management**

3. Select **Routing Rule Sets**.

4. To create a new routing ruleset, select **New**.

   -OR-

To edit a routing ruleset that you already have, in the list of records, select the rule that's in the Draft state, and then on the command bar, select **Edit**.

5. Fill in your information. Use the handy tooltips as a guide.

6. After you enter information in all the required fields, select **Save**.

7. In the **Rule Items** section, select the **Add Rule Item** button + to specify conditions for routing cases to a queue.

   You can add multiple conditions here and arrange them in the desired order. The rule items are run in the same order. As soon as an applicable rule item (based on the If Conditions) is applied on the case, the other rule items are not run on the case.

   a. In the Rule Item form, type a descriptive name for the rule item.

   b. Under **Rule Criteria** in the **If Conditions** section, specify the conditions for which the case will be routed.

      For example, to route all cases that have the **IsEscalated** field set to **Yes** to the **Tier 2 support** queue, specify the conditions as shown here:

      
   c. Under **Then Conditions**, specify the queue to which the cases will be routed or the user or team to which the cases will be assigned if the conditions in the **If Conditions** section are met.

> **Tip**
>
> To group conditions in the criteria, use the **Group And** or **Group Or** options.

8. Select **Save and Close**.

9. In the routing ruleset record, select **Activate** so that the ruleset is applied to the cases matching the conditions in the rule.

Note

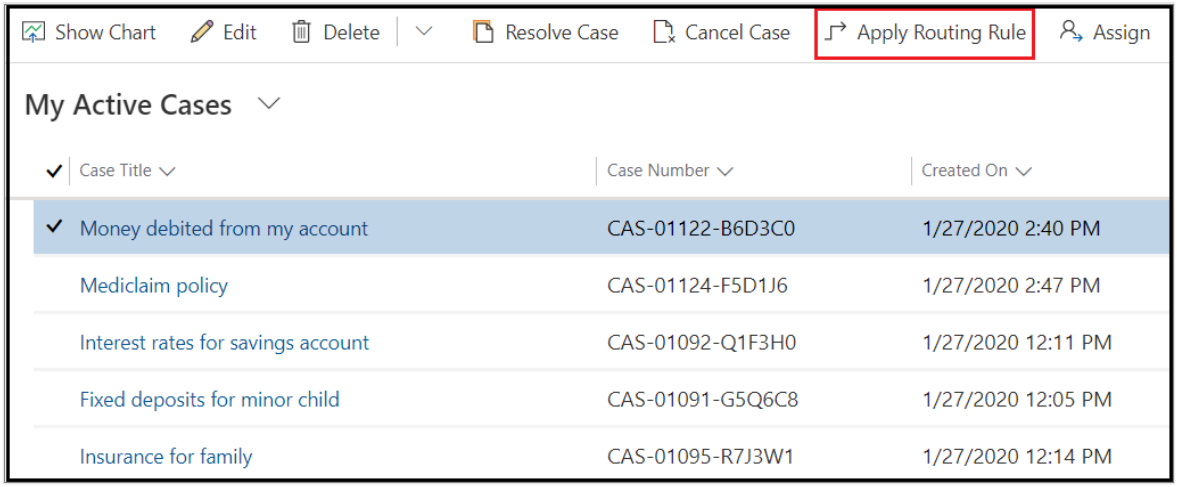
- Only one routing ruleset can be active at any point of time. If you try to activate another rule when one rule is already active, it will deactivate the currently active rule. You can activate or deactivate only the rules that you own.
- You can't edit an active routing ruleset. Therefore, if you're importing a solution that includes an active routing ruleset into an organization where the rule already exists with the same ID, the solution import will fail.

Apply a routing ruleset

You can apply the routing rule when creating a case using the **Save & Route** button. For more information, see Create a case.

Perform the following steps to manually apply the rule to any existing or manually created cases:

1. In the Customer Service Hub, go to the list of cases in the **My Active Cases** view.
2. Select the cases that you want to route using this rule, and on the command bar, select **Apply Routing Rule**.



Note

- If you're importing bulk records, and don't want the routing rules to be applied to the cases that you're importing, add a column **Route Case** to the spreadsheet used for importing the records, and add the value **No** for all the cases that you don't want to route.

- Cases can be created and routed programmatically. If you want to override this behavior, set the value for the RouteCase attribute to "No".

Recommendation to upgrade solution

Perform the following steps before you upgrade a solution:

1. Deactivate the routing rulesets which are brought through the previous version of the solution. The state of routing rulesets changes to draft.
2. Upgrade your solution as required.
3. After the successful upgrade of the solution, activate the routing rulesets as required.

Create and manage queues

View diagnostics for unified routing

Article • 08/09/2023

Unified routing helps you assign a work item to the best suited agent or queue to handle it, based on the agent skills and the entities that are related to the work item. Routing diagnostics gives a granular view of each of the routed records to help you understand and diagnose issues that occur in the classification and assignment of work items.

The diagnostics data is stored in Microsoft Dataverse and this data can affect the storage capacity. The data for routed records might consume more space in comparison to other types of work items. More information: Manage routing diagnostics data

> **Important**
>
> Your supervisors can access the routing diagnostics for records and conversations that are handled through unified routing. However, if you don't want them to view or select the links on a diagnostic record or conversation, or view rules and other configurations, ensure that you assign read-only permissions on the roles such as the Omnichannel supervisor or any other custom roles that you use for managing access in your organization.

Manage routing diagnostics

To see data related to work items and their status, you need to enable routing diagnostics. The diagnostics setting can take up to 15 minutes to take effect after you enable it.

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Routing**. The **Routing** page appears.
   b. Select **Manage** for **Routing diagnostics**.

2. On the **Routing diagnostics** page, select **Turn on routing diagnostics**.

3. In the confirmation message that appears, select **Yes**.

You'll see that a list of new work items starts to appear. However, the work items may not appear on your screen immediately.

4. To disable diagnostics, select **Turn off diagnostics**.

Understand routing stages and diagnostics

A diagnostics work item is a log record containing the details of events that occur through the different routing stages for a work item before it's assigned to an agent. The **Routing diagnostics** page displays a list of work items with details and the stage each work item is in. A brief description of the attributes is as follows:

- **Work item**: The name of the work item. Work items can be searched and sorted by selecting the dropdown next to the work item column.
- **Routing status**: The stage the work item is in.
- **Routing started on**: The date and time when the routing began.
- **Routing duration**: The duration for which the work item has been in its current stage.
- **Work stream**: The name of the workstream that the work item was assigned to.
- **Queue**: The name of the queue that the work item was routed to.
- **Routed agent**: The agent to whom the work item was assigned.
- **Rule hit policy**: Depending on the stage, displays the rule information, such as first match or run all, that helps you understand how the rules were processed in the stage.

Routing diagnostics flow

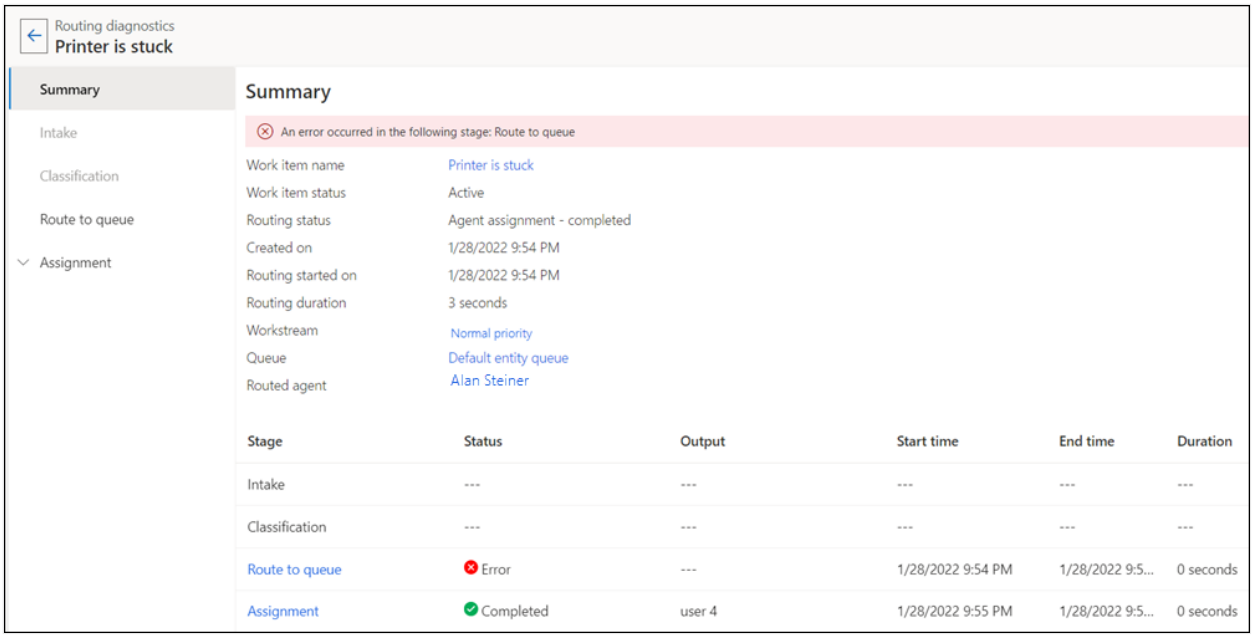
Each work item needs to pass through a set of stages before its routing stage can be assigned as completed. You can create multiple workstreams and assign work items based on their severity and priority. The diagnostics flow displays information based on the flow each work item goes through.

Intake ➞ Classification ➞ Route to queue ➞ Assignment

> ⓘ **Note**
>
> If a work item skips a stage in the flow, the stage is depicted as disabled.

Summary

You can select a work item on the **Routing diagnostics** page to view the detailed information, such as when the work item was created, its current stage, and the duration of each stage. You can also select and open the work item to see the associated case. If the work item isn't assigned or no rule item meets the criteria of the work item, error messages are displayed. You can select any of the stages to see further details and diagnose the issues.



Intake

> **Note**
>
> The intake stage is applicable for record routing only.

When a work item comes in, it goes to the first workstream in the Intake table, and is checked for whether it meets the conditions of the rule set. The work item moves to the second workstream and checks for a match with that rule set, and so on. When a work item matches the rule set, the work item is run. You can create multiple workstreams to handle work items based on their priority. This is called the **Intake** stage of the workflow.

After a work item passes the **Intake** stage, it's then classified through several rule sets and rule items.

A work item passes through three stages.

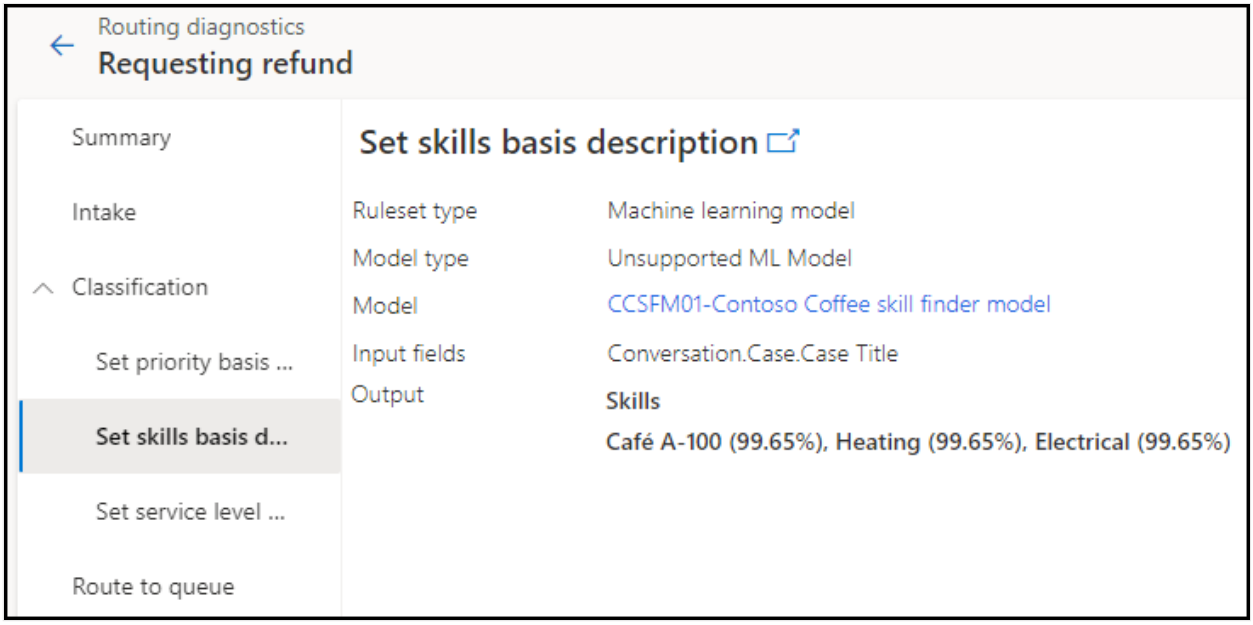
- **Processed** : Work item has passed through a rule set but didn't match with the rule set and is therefore not run.
- **Matched**: Applicable to route-to-queue rules only; displays with a green check mark if the rule condition is true.

- **Applied** : Work item has passed through a rule set and matched with the conditions of the rule set.
- **Not processed**: Work item didn't pass through a rule set.

Classification

If a work item doesn't run through a particular rule set in the **Classification rulesets** list, the **Run status** check mark is displayed in red. When the work item runs a particular rule set, the **Run status** check mark is displayed in green. A work item runs all rule sets, but it doesn't run all rule items within the rule set.

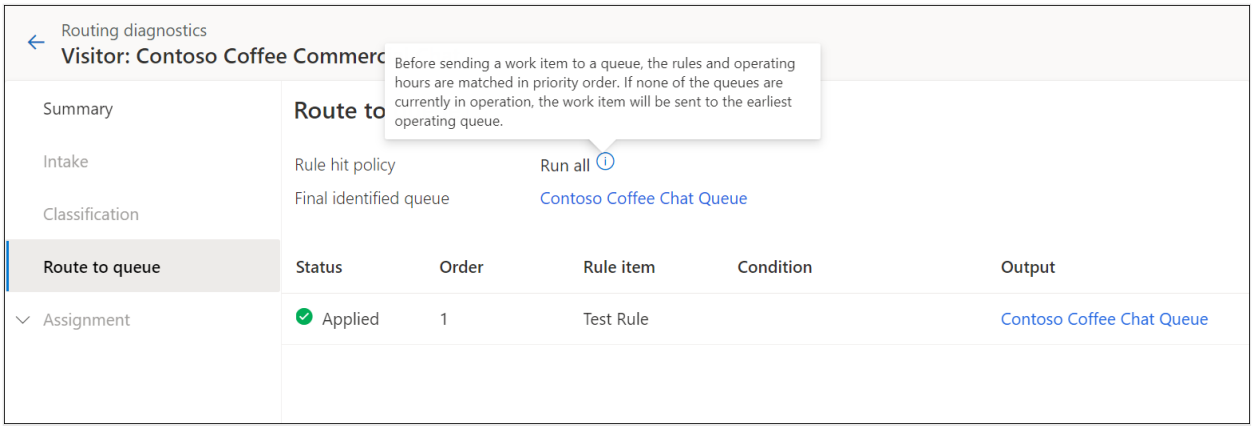
If machine learning-based skills identification, effort estimation (preview), or a sentiment prediction (preview) model is used, the details of the model that's used are displayed in the **Classification** section.



Route to queue

Queue routing rules are formulated to send the work item to the correct queue. More information: Configure route-to-queues rules

The queue name to which the work item is routed is displayed on the route to queue page.



If no queue matches the requirement, the work item is assigned to the default queue.

Assignment

Each work item is assigned to an agent or is sent to a queue based on the **Assignment** rule set. Assignment rule sets contain conditions for which work items need to be assigned to agents. In routing diagnostics, the assignment stage helps understand how the assignment of the work item was handled, such as how the prioritization was done and what assignment selection criteria was applied.

The following stages are available:

- **Prioritization**: Lists the prioritization rule that was applied if any. Work items are routed according to their priority. More information: Configure assignment methods and rules for queues
- **Assignment selection**: Displays information about the conditions that determined in selecting an agent. If more than one assignment rule set exists, selection criteria defines the order in which the rule sets are to be evaluated. The assignment selection criteria determines the rule set that has the closest match and the rule that should be run out of the many rules.
- **Assignment ruleset**: Displays information about the rule sets that were processed.
- **Agent assignment trace**: Provides details about the assignment criteria and assignment trace:
  - **Assignment criteria**:
    - **Preferred agent**: Displays whether the setting is enabled or disabled. (This feature is in preview.)
    - **Assignment method**: Displays "Highest", "Round robin", or "custom".
    - **Capacity**: Displays the capacity information.
    - **Presence**: Displays the presence used.
    - **Skills**: Displays the skills that were matched if any.

Manage routing diagnostics data

Article • 10/13/2023

The diagnostics data for unified routing is stored in Dataverse for Apps Database Capacity. We recommend that you periodically delete the routing diagnostics data to manage the storage capacity.

You can use the information in this section to define an effective strategy to manage your diagnostics data.

The following table lists the analysis of the average data consumption of some of our large customer organizations. The values are based on the assumption that each stage has one ruleset only.

Data consumption	Size/Record in kilobytes (average)	Description
Data consumed per ruleset within a diagnostic work item	13.27[1]	The average data that's consumed by a single ruleset in a routing stage for the diagnostics item generated for a routed work item.
Data consumed per diagnostics work item	53.08	The average data consumed by the diagnostics item that's generated for a routed work item.

[1] The average values can vary based on factors, like the number of rules, conditions defined within a ruleset, and size of the conditions (number of characters).

Let's take an example in which each routing stage has a single ruleset with a couple of rules and moderately complex rule conditions. If you route 500 work items per day, it generates 500 diagnostics work items that consume approximately 25.64 MB of data. For information about routing stages, see Understand routing stages.

Delete routing diagnostics data

> **Note**
>
> We recommend that you do the following actions before you perform the delete operation:

- Verify and ensure that the data isn't required because delete operations are irreversible.
- Turn off the diagnostic feature.

1. Perform the steps in the Capacity page details article to view the storage consumption of the diagnostics records mentioned in step 2.

2. Perform the steps in the Use bulk deletion to remove large amounts of data article to delete the following routing diagnostics data in the specified order.
   a. Search for "Routing diagnostic items" for the msdyn_unifiedroutingdiagnostic entity. More information: msdyn_unifiedroutingdiagnostic

   a. Search for "Routing diagnostics" for the msdyn_unifiedroutingrun entity. More information: msdyn_unifiedroutingrun

Use best practices to set up unified routing in Customer Service

Article • 07/11/2023

This article discusses some of the important aspects to successfully deploy and manage unified routing and focuses on the most common areas where you might have questions.

Set up unified routing

Verify service limits and default quotas

Dynamics 365 Customer Service relies on shared cloud resources for data and processing. You must check the service limits and default quotas for the resources before you provision unified routing. If you need a higher limit on a measure that's indicated as adjustable, contact Microsoft Support to check whether the limit can be increased. More information: Service quotas

Manage users

Use the following guidance to set up users in bulk:

- Follow a specific sequence to set up users in bulk using Dataverse API calls.
- Limit the number of change requests when setting up users in bulk using Dataverse API calls.

Follow a specific sequence to set up users in bulk using Dataverse API calls

To manage the users in bulk, follow these steps:

1. Create or import users to enable them.
2. Add the users to queues. More information: Create and manage queues
3. Create bookable resources. More information: Manage users
4. Add skills. More information: Set up skills
5. Assign capacity profiles. More information: Create and manage capacity profiles
6. Assign required roles. More information: Assign roles

If you don't follow the recommended order, inconsistencies in the user information might occur, such as missing users or missing skills and capacity profiles.

Limit number of change requests when setting up users in bulk using Dataverse API calls

Customer Service lets you make API calls to set up users in bulk. A single change request is any add or update operation like defining a single skill, capacity profile, or role per user.

We recommend that you make 500 change requests every 15 minutes for the system to process the changes optimally without getting throttled. Beyond this recommended rate for bulk updates, you might see inconsistencies in user data, such as skills not updated as expected, after the update is over.

For example, let's say you manage a contact center that has 1,000 agents working in it and need to set up each agent by assigning two skills, one capacity profile, and one role. The total number of requests to configure these settings is 4,000.

Based on our recommendation of 500 requests per 15 minutes, you'll need to make these requests in eight batches as follows:

Change request type	Number of requests	Number of batches
Two skills per agent	250 requests per batch	Four
One capacity profile per agent	500 requests per batch	Two
One role per agent	500 requests per batch	Two

For information on using the API, see Use the Microsoft Dataverse Web API.

Monitor agent capacity

You can view details such as the agent's presence, current conversations, and the sentiments of those conversations, and an agent's available capacity across different capacity profiles. You can use the **Agents insights** report to monitor the agent capacity. You can also create a custom report per your business requirements to monitor the agent capacity using the following entities:

- The agent status entity for the latest capacity profile and presence status of an agent.

- The status history entity for the history or audit trail of the presence and capacity profile changes for an agent.

Manage queues

- Manage automatic assignment if the top 100 work items have extended wait times.
- Use skill-based routing to distribute work items to the most qualified agents.
- Set up single or multiple queues with skill-matching to manage different types of work.

Manage auto-assignment if top 100 work items have extended wait times

The auto-assignment process in unified routing matches incoming work items with the best-suited agents based on the configured assignment rules. This continuous process is made up of multiple assignment cycles. For information about the auto-assignment process, see How auto assignment works.

If you have a scenario in which agents aren't available to be assigned the top 100 work items for an extended time, we recommend the following options:

- To minimize the wait time, use features like overflow management to manage high load or custom assignment rules to gradually relax rules to expand the eligible agent pool.
- Review agent availability and schedules to evaluate staffing more agents.
- If there are items lower in priority that might have eligible agents, then contact Microsoft Support with your business scenario to determine if the block size can be increased.

> **Note**
>
> A block size that's larger than the default one might affect performance and accuracy of prioritization. Therefore, we recommend that you share your business scenario with the queue backlog and queue staffing projections to help Microsoft Support recommend the most optimized block size for your use case.

Use skill-based routing to distribute work items to the most qualified agents

Skill-based routing lets your contact center distribute work items (conversations) to the agent who is most qualified to solve the issue. However, the need to use skill-based routing is determined by your business scenario.

For example, to address the following scenario in your contact center, we recommend that you configure skill-based matching to assign work items to the agent who has the necessary skills to handle the cases:

- My service team supports two types of work items—order delivery issues and refund requests. However, most of the users will have the skills for one type only.
- During standard operations, the team will have two subgroups, and each group will handle one type of incoming work items.
- During peak load, certain users can handle work items from both types.

Skill-based routing helps reduce the number of queues to be managed in your organization.

Supervisor view of historical analytics for unified routing

Article • 11/02/2021

Introduction

Historical analytics for unified routing helps supervisors, customer service managers, administrators with insights into the effectiveness of the routing configurations. Using these analytics, they can optimize their routing strategy to improve their customer satisfaction and workforce efficiency.

The historical analytics reports must be enabled and provisioned for you to be able to view the metrics.

View the historical analytics reports for unified routing

For the records that are routed using unified routing, the CSR Manager can view the historical analytics in Customer Service Hub and Customer Service workspace. Similarly, the Omnichannel supervisor can view the conversations-specific report in Customer Service workspace and Omnichannel for customer service.

In these reports, you can view the performance of the routed items and queues. By looking at the metrics, you can determine why a particular work item has landed in a queue, why an agent got one service request over the other, and why one of the queues has unwarranted load, while other is starved. You can then check the diagnostics reports for the corresponding work items, such as cases and conversations, to view and understand how they have been routed. Routing diagnostics provide information on the classification and assignment rules that were used to classify and assign the work items.

Access diagnostics for unified routing

Article • 10/07/2021

Introduction

Supervisors can access the routing diagnostics for records and conversations that are handled through unified routing.

Prerequisites

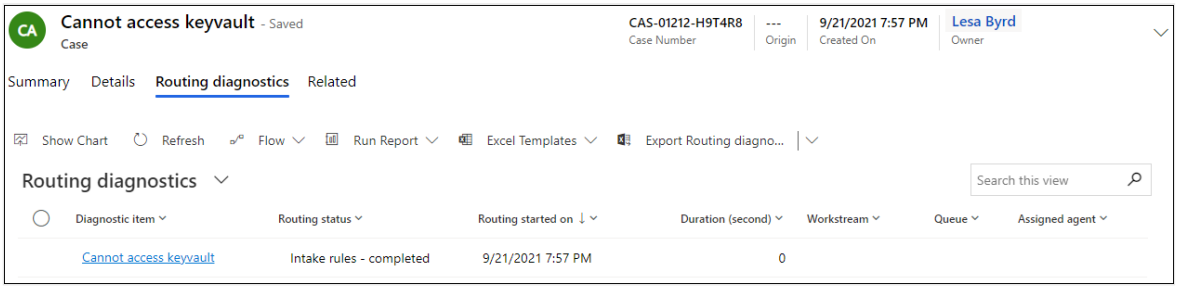
To access the diagnostics for records, such as cases, you must have the CSR Manager role. To access the diagnostics for conversations, you must have the Omnichannel supervisor role.

Access diagnostics for work items handled through unified routing

As a supervisor, you can access and view diagnostic reports of work items that have been routed through unified routing.

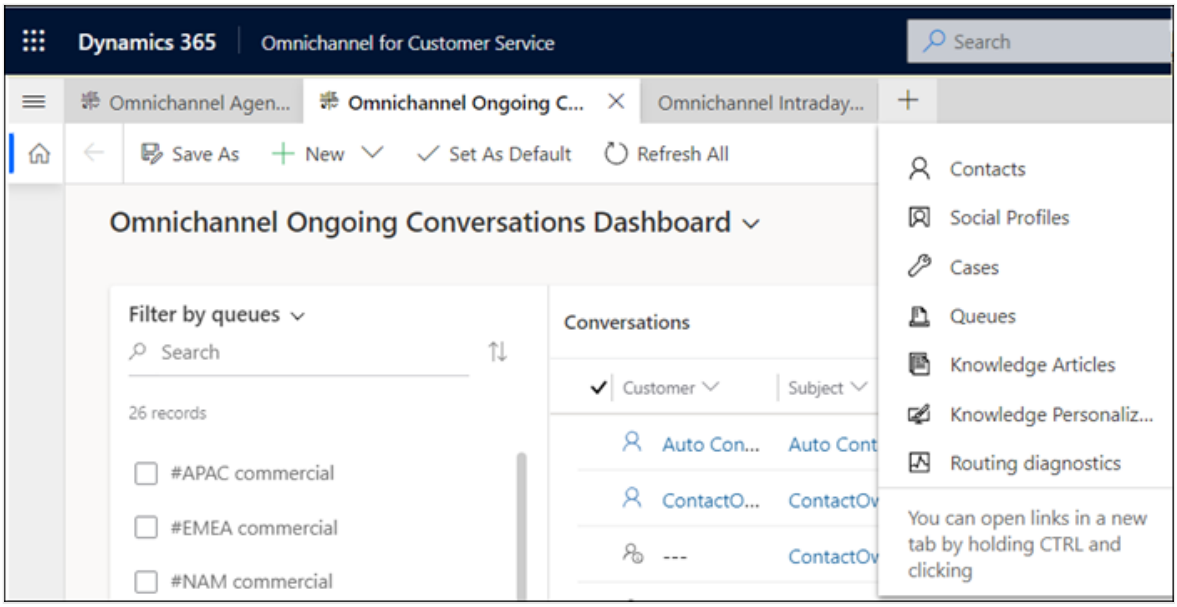
To view the diagnostics reports in Customer Service workspace

1. For a record such as case, in Customer Service workspace, go to the case details page.
2. On the page that appears, select **Related**, and then select **Routing diagnostics**. The diagnostics information for the case is displayed on the **Routing diagnostics** tab.



To view the diagnostics reports in Omnichannel for Customer Service app

1. For conversations, in the Omnichannel for Customer Service app, select the plus (+) icon, and then select **Routing diagnostics**.



2. On the **Routing diagnostics** page, select the item for which you want to view the report.

Route records manually using unified routing

Article • 07/24/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Route records using Save & Route or Apply Routing Rule options

After you set up and enable a record for routing, you can start routing a record manually, either by:

- Selecting a record on the home page grid and then selecting **Apply Routing Rule** on the toolbar.
- Opening a record form and then selecting **Save & Route** on the form command bar.

> **Note**
>
> The **Apply Routing Rule** button doesn't display on the home page grid of Activities.

To manually route records:

1. Sign in to your model-driven app.
2. Select the record you want to route on the home page grid and then select **Apply Routing Rule**. Alternatively, open the record form and select **Save & Route** on the form command bar.

   The **Route Case** dialog box appears.
3. Select **Route**. The record is routed based on the record routing configuration.

If unified routing is enabled, on the **Customer Service Agent Dashboard** page, you must use the system view **Cases Available to Work On** to pick cases to work on.

Work with queues

Article • 03/17/2023

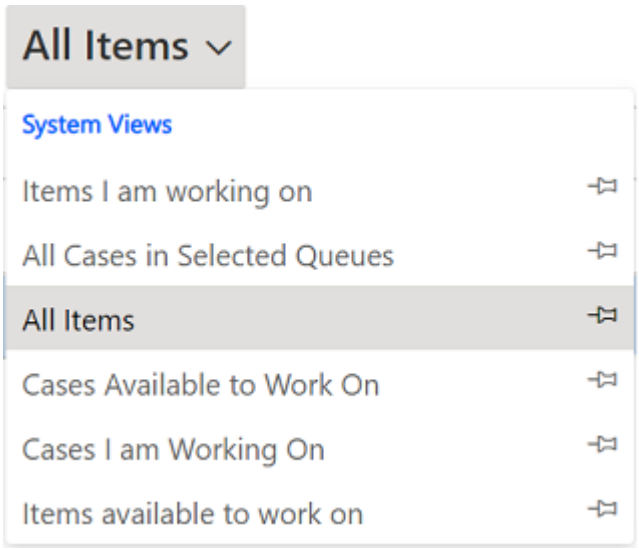
Use queues to organize, prioritize, and monitor the progress of your work. In Dynamics 365 Customer Service, queues are containers used to store anything that needs to be completed or requires an action, such as completing a task or closing a case. To know more about creating and managing queues, see Create and manage queues.

The option for agents to manage their queues and items is also available in Dynamics 365 Customer Engagement (on-premises) 9.1. More information: New features in Dynamics 365 Customer Engagement (on-premises)

Find the queue item

Use the view list and queue list to filter and find items in queues.

1. Go to **Service** > **Queues**.
2. Select a view, and then select a filter to see the items you want.



3. From the **All items** dropdown list, select the pin icon to pin the view that you want to appear on your dashboard.

Find all items in queues

1. To see all cases from a selected queue, in the view list, select **All Items in Selected Queues**.

2. In the queue list, choose one of the following options to filter cases based on queues:

    - <Individual queues>
    - All Queues
    - All Public Queues
    - Queues I'm a member of

Find cases that are available to work on

1. To see cases that no one else is working on, in the view list, select **Cases Available to Work On**.

2. In the queue list, choose one of the following options to filter cases based on queues:

    - <Individual queues>
    - All Queues
    - All Public Queues
    - Queues I'm a member of

Find cases that you're working on

1. To see only the cases that you're currently working on, in the view list, select **Cases I'm Working On**.

2. In the queue list, choose one of the following options to filter cases based on queues:

    - <Individual queues>
    - All Queues
    - All Public Queues
    - Queues I'm a member of

Find items available to work on

1. To see only items (activities and cases) that no one else is working on, in the view list, select **Items available to work on**.

2. In the queue list, choose one of the following options to filter cases based on queues:

- <Individual queues>
- All Queues
- All Public Queues
- Queues I'm a member of

Find items that you are working on

1. To see only items that you're currently working on, in the view list, select **Items I am working on**.

2. In the queue list, choose one of the following options to filter cases based on queues:

    - <Individual queues>
    - All Queues
    - All Public Queues
    - Queues I'm a member of

Pick an item to work on

1. Select **Service**.

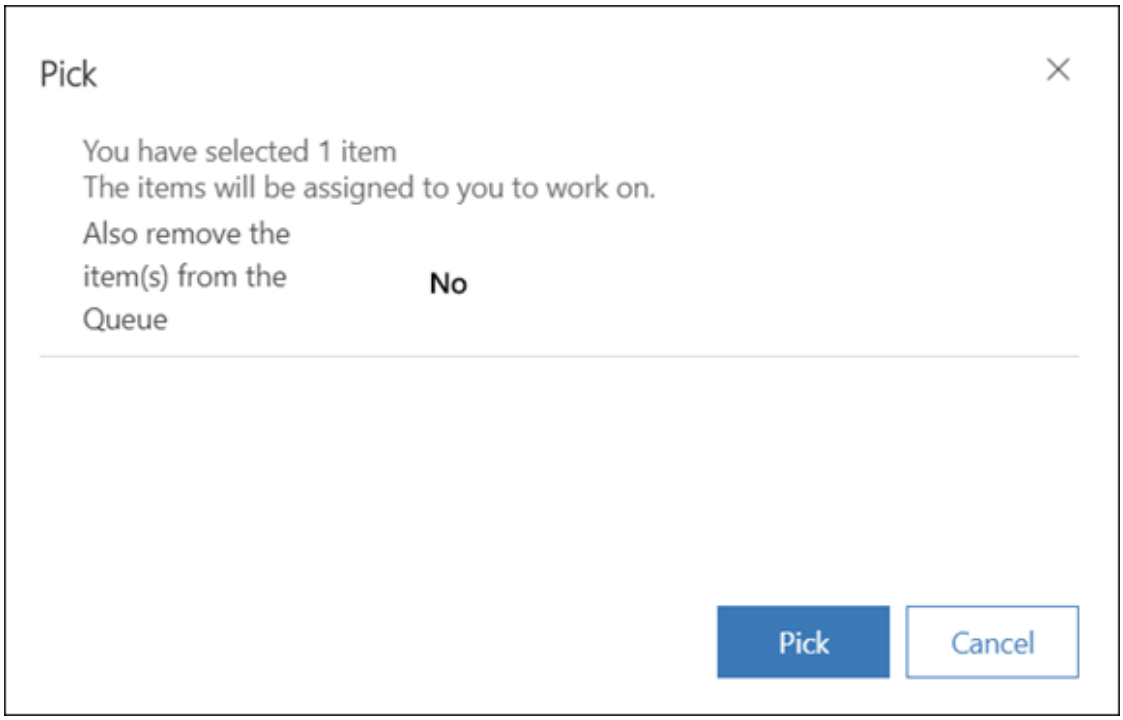
2. Select **Queues**.

3. Select a view from the System Views menu.

4. Select the queues from the menu.

5. Select the checkbox next to the item title to select the item.

6. Select **Pick** from the command menu. The **Pick** dialog appears.



7. Optionally, select **No** to change it to **Yes** if you want item from the queue.

8. Select **Pick**. The item is assigned to you and removed from the queue if you had selected **Yes** in the previous step. Also, the following updates will happen if the item is in an advanced queue and is tracked through unified routing:

    - The **Worked By** attribute of the queue item will be updated with your user ID. The unified routing system takes this as an indicator of work assignment. To manually add another user or team, select the lookup for the **Worked By** field from **Queue Item details** and then select the user. If the queue item is assigned to a private queue, the lookup displays only the members of that queue.

    - Your capacity will be updated. If the work item indicated capacity consumed in units, the corresponding units will be reduced from your total available

capacity. If capacity profile is configured for the work item, the available units of capacity in that profile for you will be deducted by one.

- Your work schedule, assignment rules, skills, presence, or capacity constraints won't be evaluated during a manual pick. For example, even if you don't have enough capacity available as requested by the work item, you'll still be able to pick the work item and start working on it. This ability to manually override pre-configured capacity is to ensure that you're able to pick up work beyond your normal capacity during contingencies. More information: Capacity profiles

- Your presence will be updated. If you have further capacity left, your presence will be set to "Busy". If you have no capacity left, your presence will be set to "Do not disturb".

> **Note**
>
> Remove the items from the queue can't be set for work items in an advanced queue.

Release an item or case that you're working on

1. In the **View** list, select one of the views that show the items or cases that you're working on.

2. Select the case or item that you want to release, and on the command bar select **Release**.

   When you release an item, your name is removed from the **Worked By** field, and the item is no longer assigned to you; it's assigned to the queue owner.

Route an activity or case to another queue or assign to a different user or team

1. Select the case that you want to move to another queue, and on the command bar, select **Route**.

2. To move an activity or case to a different queue, select **Route**, and select a queue.

   -OR-

To assign the activity or case to another user or team to work on, select **User/Team**, and select the user or team. When you assign the activity or case to someone else to work on, the **Worked By** field is set to that user or team. You also have the option to remove the item from the queue.

After the item is released, the following updates will happen if the item is in an advanced queue and is tracked through unified routing:

- Your capacity will be updated based on whether capacity profile or capacity units have been configured.
- Your presence will be updated to "Busy" or "Available" based on your available capacity.

Remove a record from a queue

1. In the **View** list, select one of the views that show the items you want to remove.
2. Select the activity or case, and on the command bar, select **Remove**.

Assign an activity to a user or queue

If you want another person in your organization to work on an activity, you can assign the activity to that person or move it to another queue.

Assign to another user or team

1. Go to **Activities**.
2. Select the activity you want, and on the command bar, select **More Commands** •••, and then select **Assign**.
3. In the **Assign to another user or team** field, select **Lookup**, and select the user or team you want to assign the activity to.

   If you don’t see the user or team you're looking for, select **Lookup**, and then select **Look Up More Records**. From the **Look for** dropdown list, select **User** or **Team**. In the **Search** box, type the name, select the search button, select the name, and then select **Add**.
4. Select **Assign**.

Add to a queue

1. Go to **Activities**.
2. Select the activity you want, and then select **Add to Queue**.
3. The **Queue** field displays the queue the activity belongs to. The queue lookup displays only the queues that the activity can be added to.
4. Select the queue you want to route the activity to, and then select **Add**.

Pick a view for your queues

1. Go to **Activities**.
2. Select the activity you want, and then select **Add to Queue**.
3. In the **Queue** field, select **Search**, and then select **Advanced lookup**.
4. On the **Choose queue** dialog, select the **Business Queues(default)** dropdown menu to see the complete list of queues views available to you.

The table lists the views with their descriptions.

View	Description
Queues Lookup View, All Queues	Lists all queues.
Business Queues	Default view. Lists all the queues that aren't marked as default queues by users or teams.
Private Queues Lookup View, Local User Queues	Lists all the private and active queues.
Entity Queues	Lists all active queues that are created for records, such as case or email.
My Active Queues	Lists active queues owned by the currently signed-in user.
Omnichannel queues	Lists the active queues pertaining to Omnichannel for Customer Service or unified routing.
Omnichannel queues for Entity	Lists the active queues pertaining to Omnichannel for Customer Service or unified routing and are created for records, such as case or email.
Omnichannel queues for messaging	Lists the active queues pertaining to Omnichannel for Customer Service or unified routing and are created for messaging (chat).
Active Queues	Lists the queues that are in the active state.

View	Description
Inactive Queues	Lists the queues that are in the inactive state.
Queues: Primary Email (Pending Approval)	Lists the queues for which the primary email address is in pending approval state.

You can also select a view for your queues by navigating through Queues. You must select an item and then select **Route** to add the required view for your queues.

Case queues and routing

Article • 04/05/2023

Customer Service allows you to add a case to a queue, save case records, and route them to a queue.

Add a case to a queue

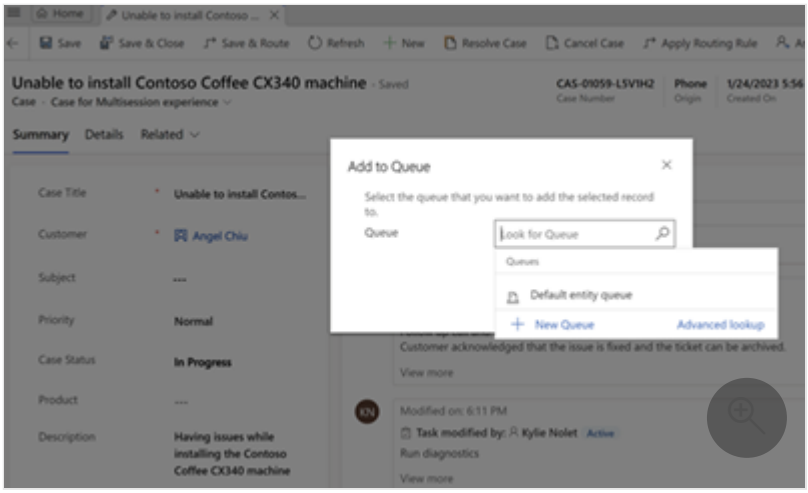
If you think another group in your team has expertise on the subject, you can move the case to a queue so that someone else can pick it up.

To add a case to a queue, perform the following steps:

1. Go to **Service** > **Cases**.
2. In the list of cases, select the case that you want to add to a queue.
3. On the command bar, select **Add to Queue**.
4. In the **Queue** field, select the queue that you want to add the case to, and then select **Add**.

   If a case is already added to a queue, the **Queue** field displays the current queue by default.

   
   The lookup for the **Queue** field displays only the queues that are configured for a specific entity. Voice and messaging queues aren't displayed in the lookup results since cases can't be added to those queues.



5. Select the queue you want to add the case to, and then select **Add**.

To know more about queues, see Work with queues.

Save and route a case

To save a case record and route it to a queue in a single action, use the **Save & Route** option.

1. From the list of cases, open a case record.
2. Make any changes, and on the command bar, select **Save & Route**.
3. In the **Route Case** dialog, select **Route**.

   The case will be routed based on the active routing rule set.

> **Important**
>
> The **Save & Route** button is available only on active cases.

Manage skills

Article • 03/08/2023

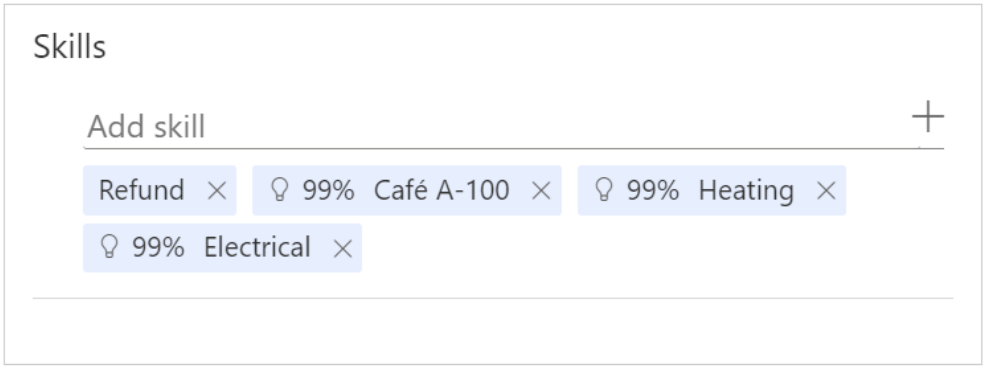
Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Dynamics 365 comes with an out-of-the box skill control for messaging channels. When added to the case or conversation forms, the skill control enables you to view and update skills. Your administrator can enable the setting that allows you to update skills at runtime.

> **Note**
>
> For the record type entity, you'll need to customize the case form to add the skill control. More information: **Add a skill control for routed records**

When you receive a work item in your queue, you can view the skills required to do the work in the **Skills** field of your case or conversation record. For each work item, you can view skills that have been attached by the manual skill classification rules and those that were identified by the machine-learning skill finder models.

In the following screenshot, **Refund** is a skill attached by the manual skill classification rules, whereas skills with percentage rating such as **99% Heating** and **99% Electrical** are those that have been identified by the machine-learning model.



> **Note**

If you aren't able to view the skill control on the case or conversation forms, try clearing your browser cache.

Add and remove skills

If upon assessing the work item, you think that the relevant skills are missing or incorrect, you can choose to update the skills.

To add skills, select the **Add skill** field and enter a skill name. As you enter one or more letters, a list of skill names are suggested in the dropdown list; select the relevant skill from the dropdown list. Add as many skills as you think are appropriate for the work item.

To remove skills, select **X** next to each skill that you want to delete.

The skill updates you make for your assigned work items can then be used to retrain the machine learning-based skill finder models and help with accurate work assignments. More information: Retrain skill finder model

Understand how unified routing affects queue items and live work items for routed records

Article • 05/26/2023

Whenever you route a record using unified routing, a live work item entity record (msdyn_ocliveworkitem) is created to track the workstream settings for allowed presence, matched skills, and available capacity. The unified routing engine uses these settings to route records to the appropriate queues based on route-to-queue rules, and to the available agent based on presence, skills, and capacity.

After the record is routed to the queue, a queue item (queueitem) is created. The following three fields are updated in the queue item:

- the queue to which the queue item belongs
- the worker ID or agent assigned to the queue items
- the state of the queue item, whether active or inactive

Unified routing updates the following details when a record is automatically assigned to an agent or is picked by the agent:

- Agent as the record owner
- Agent in the live work item
- Worker ID in the queue item

Unified routing automatically synchronizes these updates from the queue item to the live work item, but not vice-versa. So, any updates from the live work item aren't automatically reflected in the queue item. If you'd like to make these updates manually, we recommend that you update only the queue item so that the live work item gets updated automatically by the unified routing engine.

You can update only one field of the queue item at a time. For example, if you need to update both the queue and the worker ID fields of the queue item, then ensure that you either update the queue or the worker ID field at a time, but not both.

> **Note**
>
> - Unified routing automatically sets the record's owner to a user. We recommend that you don't overwrite or update the ownership.

- We recommend that you don't add any custom logic on live work items as Microsoft uses them in unified routing services.

How unified routing affects queue items, live work items for routed records

This section describes how queue items and live work items are updated when you change the status of a queue item with unified routing.

What happens when you change the Queue field

- When you change the **Queue** field from an advanced queue to another advanced queue—by selecting **Add to Queue** on the record (via the AddToQueue action) or by selecting **Route To** on the queue item (via the RouteTo action), then the associated queue for the live work item (msdyn_ocliveworkitem) also gets updated to the same destination queue. This action then updates the unified routing services that maintain agent presence and capacity with the corresponding changes.

- When you change the **Queue** field from an advanced queue to a basic queue by selecting **Add to Queue** on the record (via the AddToQueue Action) or by selecting **Route To** on the queue item (via the RouteTo action), then the associated live work item (msdyn_ocliveworkitem) and the entity record are closed, and the queue item is no longer considered or picked by the unified routing engine. This action then updates the unified routing services that maintain agent presence and capacity with the corresponding changes.

- When you change the **Queue** field of a queue item from a basic queue to an advanced queue, then you must reroute the queue items using **Save & Route** so that the corresponding live work item can be picked up by the unified routing services. If you change a basic queue to an advanced type of queue while the queue item is still assigned to the basic queue, then the queue item won't be considered for routing by the unified routing engine.

What happens when you update the Worked By field

- When you update the **Worked By** field of queue items by selecting **Route To** on the queue items list (via the RouteTo action) or by manually updating the **Worked**

By field on the QueueItem details form, then the live work item (msdyn_ocliveworkitem) also gets assigned to the same agent.

- When automatic assignment routes the record and the record is assigned to the agent, then the **Worked By** field is set to the agent that's assigned in the queue item, the agent field in the live work item, and the owner field in the record.

> **⊗ Caution**
>
> If you run a custom script, flow, or action that updates the queue item, live work item, or record at the same time as the automatic assignment, then you might experience assignment errors. We recommend that you run any custom scripts or flows before or after the automatic assignment.

What happens when you delete or deactivate a queue item

- When you delete a queue item by selecting **Remove** (via the RemoveFromQueue action), or by deleting or closing the underlying record, the associated live work item (msdyn_ocliveworkitem) is also closed. This action then updates the unified routing services that maintain agent presence and capacity with the corresponding changes.

- When you deactivate a queue item, the associated live work item (msdyn_ocliveworkitem) is also closed. This action then updates the unified routing services that maintain agent presence and capacity with the corresponding changes. If the record needs to be reopened, then you must reroute it using **Save & Route**, and not reactivate the queue item. The rerouting creates a new live work item and a new queue item, ensuring all the information needed for routing is available again.

- When you update a queue item using unified routing, you can't remove it from the queue by selecting **Pick** (PickFromQueue action) or **RouteTo action** on the queue item.

- When you resolve a case, the corresponding queue item that gets deactivated can't be activated again.

> **ⓘ Note**

- Unified routing works upon the underlying entity record for the owner field also. Therefore, ensure that you provide Read privileges to the agents for that entity and any other dependent entity. For information on how to provide the accesses to different roles for the entities, see **Manage user accounts, user licenses, and security roles**.
- To get the capacity released for the agents for entities other than incident (via incident resolution or cancellation), add a custom logic to deactivate the corresponding queue item. More information: **Create and manage capacity profiles**
- For non-case records, we recommend that you deactivate the associated queue item before deleting it.

Add a skill control for routed records

Article • 03/04/2022

Dynamics 365 provides a custom control that you can embed in your forms to view the skills of any routed record. To display the skill control for the routed record in the Customer Service workspace or Omnichannel for Customer Service app, add the control to the multisession form.

Prerequisites

- To add the skill control, you must have the System Administrator or System Customizer security role, or equivalent permissions. For more information about your security role, go to View your user profile.
- To ensure that the skill control is loaded and displayed for the routed records, you must allow access to these websites.

Add skill control

In the following example, to add a skill control named **Skills** to the case form:

1. In Dynamics 365, go to **Advanced Settings** and select the **Case for Interactive experience** form for the **Case** entity.

2. Drag and drop a **One Column** section on to the form. Then, from the **Field Explorer** pane, drag and drop a field that supports a single line of text such as **Case Title**.

3. Select **Change Properties** on the **Home** tab, and in the **Field Properties** dialog that opens, do the following:

    - On the **Display** tab, enter a label name for the field, such as **Skills**.
    - On the **Controls** tab, select **Add Control**. The **Add Control** dialog opens.
    - Select the **CC_OCRoutedEtnRelatedRecordsControl** custom control from the dropdown list, and then select **OK**.

4. Save and publish the solution.

At runtime, your agents will be able to view the skill control on all routed case records in Customer Service Hub.

Though we don't recommend setting up parameters for the skill control, if you want to manually enter the logical collection name or the relationship name of the record, you can use the following OData queries to get the information.

- **Logical collection name**: Run the following OData query and enter the same in the **Value** field of the **CC_OCRoutedEntityName_value** property.

  ```
  GET [Organization_URI]/api/data/v9.1/EntityDefinitions(LogicalName='{EntityLogicalName}')?$select=LogicalCollectionName,LogicalName
  ```

- **Relationship name**: Run any of the following OData queries for one-to-many, many-to-one, or many-to-many relationships, and enter the same in the **Value** field of the **CC_OCRoutedEntityRelationshipName_value** property.

  ```
  GET [Organization_URI]/api/data/v9.1/EntityDefinitions(LogicalName='incident')/OneToManyRelationships
  ```

  ```
  GET [Organization_URI]/api/data/v9.1/EntityDefinitions(LogicalName='incident')/ManyToOneRelationships
  ```

  ```
  GET [Organization_URI]/api/data/v9.1/EntityDefinitions(LogicalName=%27incident%27)/ManyToManyRelationships
  ```

How to close live work items or deactivate queue items

Article • 02/17/2022

You can use the following sample code in your Console App (.NET framework) of Visual Studio to trigger the closure of live work items by deactivating the associated queue item.

For information about how you can modify the sample code to suit your environment, go to Quickstart: Organization service sample (C#).

C#

```
 static void Main(string[] args)
 {
     // e.g. https://yourorg.crm.dynamics.com
     string url = "<your environment url>";
     // e.g. you@yourorg.onmicrosoft.com
     string userName = "<your user name>";
     // e.g. y0urp455w0rd
     string password = "<your password>";

     string conn = $@"
     Url = {url};
     AuthType = OAuth;
     UserName = {userName};
     Password = {password};
     AppId = 51f81489-12ee-4a9e-aaae-a2591f45987d;
     RedirectUri = app://58145B91-0C36-4500-8554-080854F2AC97;
     LoginPrompt=Auto;
     RequireNewInstance = True";

     using (var svc = new CrmServiceClient(conn))
     {

         WhoAmIRequest request = new WhoAmIRequest();

         WhoAmIResponse response = (WhoAmIResponse)svc.Execute(request);

         Console.WriteLine("Your UserId is {0}", response.UserId);

         try
         {
             //Provide queueitem id as the second parameter which has to be
deactivated.
             svc.UpdateStateAndStatusForEntity("queueitem", new
Guid("6f15a7f0-8788-eb11-a812-000d3a593524"), 1, 2);
         }
         catch (Exception ex)
```

```
        {
            Console.WriteLine(ex.Message);
        }

        Console.WriteLine("Press any key to exit.");
        Console.ReadLine();
    }
}
```

Route non-case records using a plug-in

Article • 03/17/2023

You can trigger routing for non-case records such as email messages programmatically, using the IPlugin interface.

You can use the following sample code in your Console App (.NET framework) of Visual Studio. The code checks for the following two conditions and if they're met, it triggers the msdyn_ApplyRoutingRuleEntityRecord action.

- whether the Web service message is to create a record
- whether the record is an email message.

C#

```
public class SamplePlugin : IPlugin
{
    public void Execute(IServiceProvider serviceProvider)
    {
          // Obtain the tracing service
        ITracingService tracingService =
(ITracingService)serviceProvider.GetService(typeof(ITracingService));
        // Obtain the execution context from the service provider
        IPluginExecutionContext context =
(IPluginExecutionContext)serviceProvider.GetService(typeof(IPluginExecutionC
ontext));
            // Check if create message
            if (context.MessageName.ToLower().Equals("create"))
            {
                // The InputParameters collection contains all the data
passed in the message request
                if (context.InputParameters.Contains("Target") &&
context.InputParameters["Target"] is Entity)
                {
                    // Obtain the target entity from the input parameters
                    Entity entity =
(Entity)context.InputParameters["Target"];
                    // Target is an email
                    if (entity.LogicalName.ToLower().Equals("email"))
                    {
                        try
                        {
                            // Obtain the organization service reference
that you'll need for web service calls
                            IOrganizationServiceFactory serviceFactory =
(IOrganizationServiceFactory)serviceProvider.GetService(typeof(IOrganization
ServiceFactory));
                            IOrganizationService service =
serviceFactory.CreateOrganizationService(context.UserId);
                            // Execute msdyn_ApplyRoutingRuleEntityRecord
```

```
request
                                OrganizationRequest request = new
OrganizationRequest("msdyn_ApplyRoutingRuleEntityRecord");
                                request["Target"] = new EntityReference("email",
entity.Id);
                                service.Execute(request);
                            }
                            catch (Exception ex)
                            {
                                tracingService.Trace("SamplePlugin: {0}",
ex.ToString());
                                throw;
                            }
                        }
                    }
                }
            }
        }
```

Overview of case management

Article • 02/17/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Case management is the core record that tracks individual customer service issues across channels and agents over time. Customers want to have a long and happy relationship with brands over time, and throughout that relationship they may have several support inquiries through more than one support channel. To achieve this goal, Dynamics 365 Customer Service provides enhanced case configuration and improved case analytics for supervisors.

A case typically represents a situation or incident that's reported by a customer and requires a resolution. Cases are designed to track the process from the initial intake of an incident, through the remediation process, to the final resolution. Dynamics 365 Customer Service has several components that work together to provide an end-to-end case management solution that not only helps identify cases but also routes each case to the most appropriate agent who can provide guidance and resolve the case. Here are some of the most commonly used components:

- **Cases:** A case represents a single incident of service. In other words, it represents anything, in the context of a customer interaction, that requires some type of resolution or answer. Multiple cases can be associated with a single customer at any time.
- **Activities:** An activity typically represents an interaction with a customer, like a phone call. Multiple activities can be associated with a single case.
- **Entitlements:** Entitlements specify the amount of support services that a customer is entitled to. Think of them as support contracts.
- **Knowledge articles:** The knowledge base is a repository of informational articles that help customer service representatives resolve cases.
- **Queues:** A queue is a place to organize and store activities and cases that are waiting to be processed.

- **Service-level agreements (SLAs):** SLAs are a way to track and define what should happen when a case is opened, like how long it should take to respond to a customer.
- **Record creation and update rules:** Record creation and update rules can be applied to different activity types to automatically create Dynamics 365 records.
- **Routing rules:** Routing rules are applied to cases to automatically route them to a specific queue or user.
- **Business process flows:** A business process flow represents a guided process that has different stages and steps that are used to resolve a specific item, like a case.

As your organization tracks metrics on the types of cases that come in, you can create queues, routing rules, and flows to triage cases in the most efficient way.

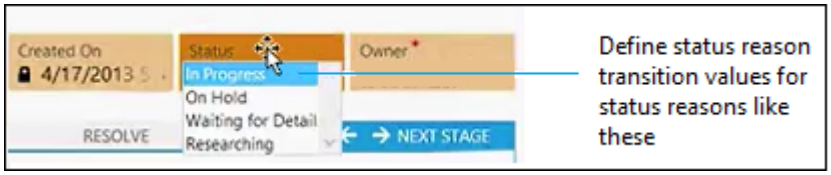
Define status reason transitions for case management

Article • 02/18/2022

If you're in charge of incident management for an organization, it's important to provide a simple model for customer service representatives responsible for entering and updating case status. In Dynamics 365 Customer Service, there are two fields in the Case entity (record type) that work together to provide information about case status: the **Status** field and the **Status Reason** field. The **Status** field for the **Case** entity has three possible values: **Active**, **Resolved**, or **Canceled**. The **Status Reason** field stores a reason for a specific status value. For example, for a case with an **Active** status, a status reason could be **In Progress**, **On Hold**, **Waiting for Details**, or **Researching**.

Big organizations often have a large number of combinations for the **Status** and **Status Reason** fields. This can make it difficult for customer service reps to choose the correct next status reason. You can define status reason transitions to add another level of filtering for what the status reason value can be changed to for each status reason. Limiting these values to just allowed status reasons can help customer service representatives make the right choices.



1. Make sure that you have the System Administrator or System Customizer security role or equivalent permissions.

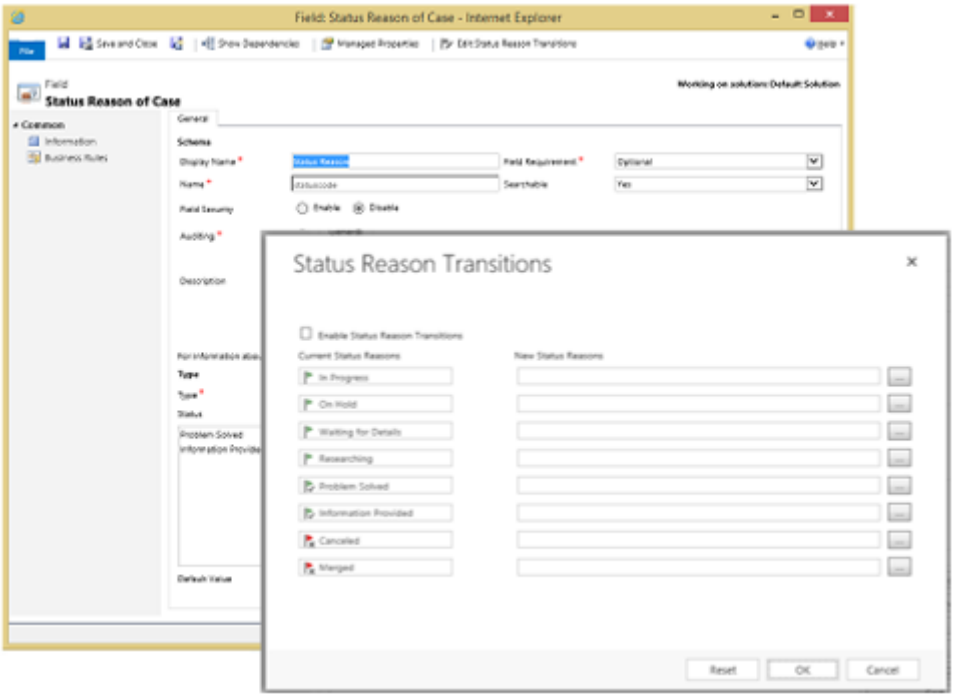
2. Go to **Settings** > **Customizations**.

3. Select **Customize the System**.

4. In the solution explorer, in the left navigation pane, expand **Entities**, expand the **Case** entity, and then double-click **Fields**.

5. Go to the second page of fields, and then open the **statuscode** (Status Reason of Case) field.

6. In the **Field: Status Reason** dialog box, click **Edit Status Reason Transitions** at the top of the dialog box.



7. In the **Status Reason Transitions** dialog box, under **New Status Reasons**, click one of the **Enter Value** buttons … corresponding with one of the existing status reasons.

8. In the **Select Status Reason** dialog box, in the **Available Values** list, select the values you want to add, and then click the chevron button » to add to the **Selected Values** list. Click **OK** when you're done with that status reason.

9. Click another **Enter Value** button … to modify other status reasons. When you're done, click **OK**.

   > **Note**
   >
   > Each status reason option for an active status must allow at least one path to an inactive status. Otherwise, you could create a condition where it would not be possible to resolve or cancel a case.

10. In the **Status Reason Transitions** dialog box, select the **Enable Status Reason Transitions** check box to apply the defined status reason transitions to case records. The list of available status reasons will be filtered for each case record based on the defined transitions.

Define parent and child case settings

Article • 10/10/2023

In Dynamics 365 Customer Service, you can track multiple issues for a customer, or track the same issue that's affecting multiple customers, using parent and child cases. For example, you could track a case where work needs to be done by other departments. The primary case or issue is called the **Parent** case. Any related cases are called **Child** cases. Before your service team can start using this feature, you need to go to **Service Management** and set up a few rules about how information is inherited.

Prerequisites

Make sure that you have the Customer Service Manager, System Administrator, or System Customizer security role or equivalent permissions.

Follow the steps in View your user profile. Don't have the correct permissions? Contact your system administrator.

Set parent and child case attributes

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Case Settings** in **Customer Support**. The **Case Settings** page appears.

   b. Select **Manage** for **Parent child case settings**.

2. In the **Case Settings** dialog, enter the following details:

   a. In **Select the attributes**, select the **Case Title** and **Customer** attributes that are mandatory and any other case attribute, which the child case will inherit.

   You can view **Available** and **Selected** attributes in two lists; use the arrows >, <, >>, and << to move the attributes from one list to another.

   b. In **Specify closure preference**, select a case closure setting that defines how parent and child cases are closed. Select one of the case closure options for parent and child cases:

- **Close all child cases when parent case is closed**: As soon as the parent case is closed, all the child cases are also closed.
- **Don't allow parent case closure until all child cases are closed**: The parent case can't be closed until all the child cases are closed.

c. In **Maximum number of child cases**, specify a number that denotes the number of child cases a parent case can have.

> ⓘ Note
>
> We recommend that you specify a smaller value for **Maximum number of child cases** to avoid performance issues when cases are resolved or merged.

3. Select **Save**.

Set parent and child case attributes (Customer Service app)

1. Make sure that you have the Customer Service Manager, System Administrator, or System Customizer security role or equivalent permissions.

   - Follow the steps in View your user profile. Don't have the correct permissions? Contact your system administrator.

2. On the nav bar, choose **Microsoft Dynamics 365** > **Settings**.

3. Choose **Settings** > **Service Management**.

4. Select **Parent and Child case settings**.

5. In the **Case Settings** dialog box, select the attributes that the child case will be inherit from the parent case.

6. Using the Parent and Child case settings, specify the information that will be inherited from a parent case to the child case. You can also select a case closure setting that defines how parent and child cases are closed. Select one of the case closure preference for parent and child cases:

   - **Close all child cases when parent case is closed**: The parent case can't be closed until all the child cases are closed.

   > ⓘ Note

If you choose **None**, parent and child cases are closed independently of each other. This is the default setting.

7. When you're done, select **OK**.

Create and manage parent and child cases

Use advanced similarity rules to view similar case suggestions

Article • 06/28/2022

Quickly support your customers by viewing similar cases suggestions in the Customer Service Hub. As an administrator, you can now configure criteria using advanced similarity rules, so that agents can view cases similar to their current case and resolve customer issues in first contact and within minimal time frame. This helps to reduce operational cost and in turn increase customer satisfaction.

If an agent is working on a support case, they can view similar cases in the **Related** section of the current case, and resolve their case quickly. With the help of Relevance search, they can use keywords or key phrases in a service case to quickly find related cases and use them to resolve customer issues.

Similar case suggestion scenario

Gilda is resolving an issue where a customer isn't able to book a travel package on the portal. To assist the customer quickly, Gilda seeks guidance by looking for similar cases in the **Similar cases** tab in the **Related** section of the current case.

Based on configured data input, the Relevance search mechanism filters the cases using key phrases and suggests a list of cases. Gilda selects a relevant case and glances through the details. Gilda is able to resolve the customer issue with this suggested case and can also link the case to the current case for future reference.

Create a new similarity rule to view similar cases

Set up automatic suggestion of similar cases by creating advanced similarity rules. The rules you create use the Relevance search mechanism.

More information: Use Relevance Search for faster, comprehensive search results

> **ⓘ Important**
>
> It is recommended to enable Relevance search for your org to see the most accurate suggestions for similar cases. More information: **Understand how relevance search impacts search results**

1. Make sure you have the Customer Service Manager, System Administrator, or System Customizer security role or equivalent permissions.

   ### Check your security role

   - Follow the steps in View your user profile.
   - Don't have the correct permissions? Contact your system administrator.

2. Navigate to the Customer Service admin center or Customer Service Hub app, and perform the following steps:

   Customer Service admin center

   a. In the site map, select **Case Settings** in **Customer Support**. The **Case Settings** page appears.
   b. In the **Advanced similarity rules** section, select **Manage**.

   The **All Advanced Similarity Rules** page is displayed.

3. Select **New** on the command bar to create an advanced similarity rule.

4. Enter the following on the **Details** tab:

   - **Name** (required): The rule name.
   - **Source Entity** (required): Select Case entity for similar cases suggestions.
   - **Description**: A description of the similarity rule.
   - **Noise Key phrases**: Provide noise key phrases separated by a semicolon (;). These phrases will be filtered out in the search for a similar case.
   - **Filter Result by Status**: Filter records by status. If you set the value to **Active**, then only similar cases with active status will be retrieved. If you don't set a value, then it will retrieve similar cases that are in all statuses.

5. Select **Save** to save the rule.

6. On the **Match Fields** tab, select **New Text Analytics Entity Mapping** to add a related text analytics entity mapping record to the rule.

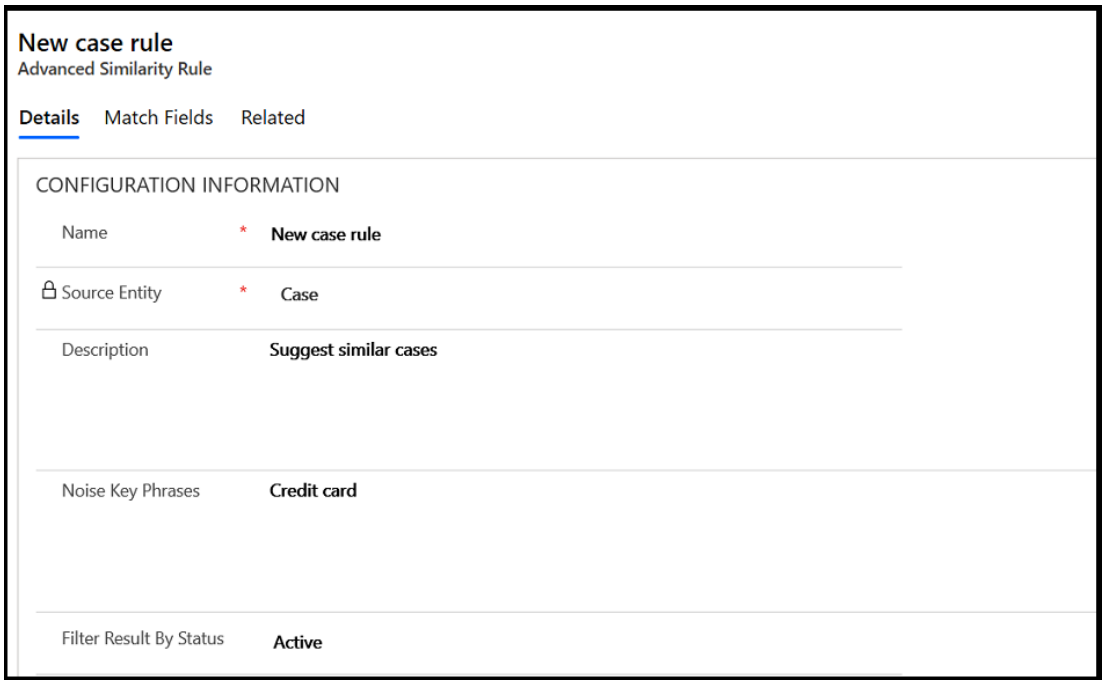
7. On the **Details** tab, enter the following values. These values are used to determine the keywords or key phrases from source records using relevance search to match with target records using text search. This helps to achieve keyword-based similarity between source and target records.

- **Criteria**: Select **Text match** if you want text in these fields to be used for finding key phrases to match. For example, if you select **Case Title** or **Description**, text in these fields will be matched. Select **Exact match** if you want all fields except single-line and multi-line text fields to be enabled for exact match. More information: Enable a field for exact matching of similar records

- **Entity** (required): Choose an entity from the drop-down list to be used to create a text search rule to find matching records in Dynamics 365 apps.

- **Field** (required): Choose the field to be used to create a text search rule to find matching target records.

  Two types of fields are used for similarity analysis:
  - **Structured**: Used for exact match on a field to field basis. All fields except Multiple Lines of Text are available for exact match. Each field can be used only once.
  - **Text**: Fields of type Text or Option Set only are available. For Option Set, the corresponding label in the language of the user is used. Text fields are used for fuzzy match in similarity analysis with keywords/key phrase extraction. Each field can be used only once.



8. Select **Save** to save the rule.

9. Select **Activate** from the command bar to activate the rule.

Similarly, add more mappings to view a comprehensive search of related records.

Understand how relevance search impacts search results

See the below table to understand how search results are impacted when Relevance search is enabled or disabled.

Relevance search disabled	Relevance search enabled
Considering similarity rules, search is performed across primary field of an entity.	Considering attributes configured in similarity rules, search is performed on entity attributes configured for relevance search.
For example, if similarity rules are configured on Title and Category, comma-separated attribute text is passed to look for a match in the Case title of case entity.	For example, if similarity rules are configured on Title and Category, and Relevance search is enabled on Description, the search is performed for Title and Category in the Description field of case entity.

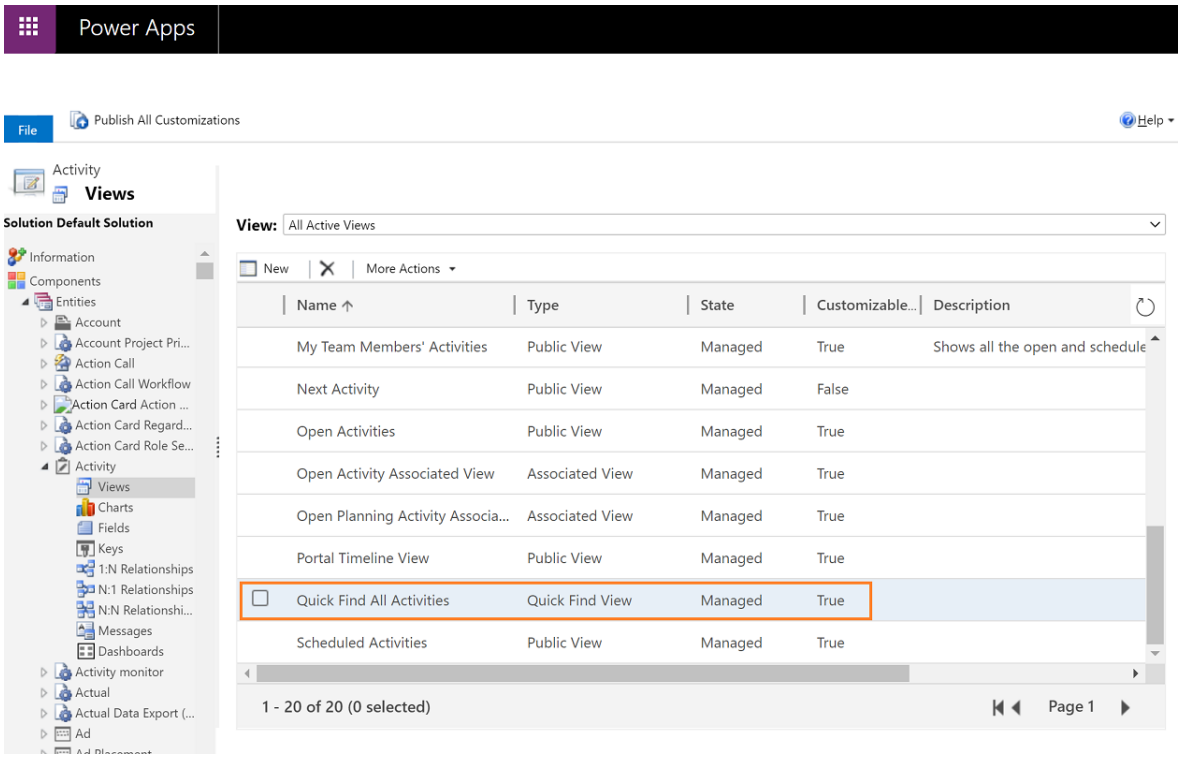
Enable a field for exact matching of similar cases

Follow the below steps to enable a field for exact match of similar cases.

1. Go to **Settings** > **Advanced Settings**.
2. Select the **Settings** > **Customizations**.
3. On the **Customizations** page, select **Customize the System**.

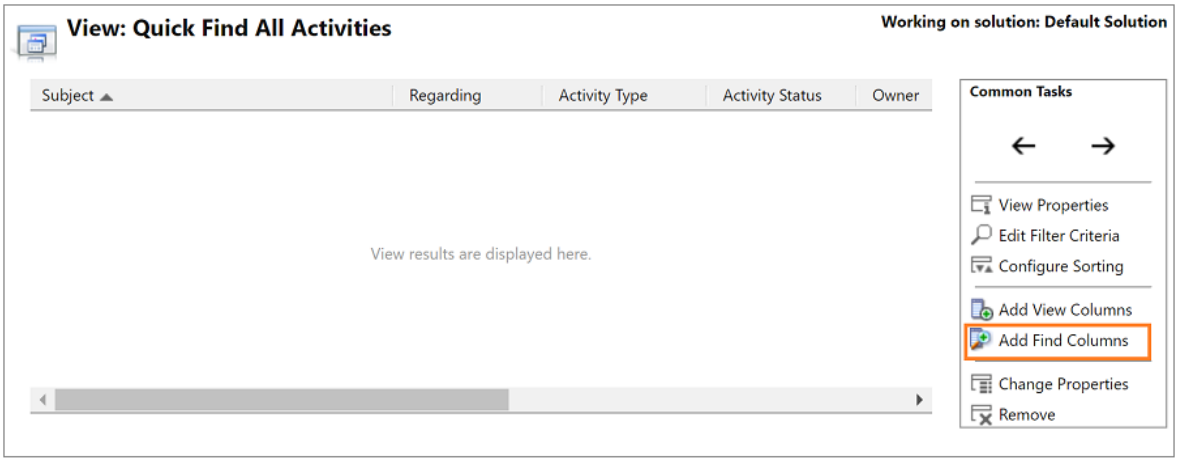
   The **Information** page is displayed.
4. In the left pane, expand **Entities**, go to the entity you want to customize, expand it, and then select **Views**.

   A view page with a list of items is displayed.
5. Double-click **Quick Find </entity name>** for the entity. (Note: You might need to scroll down to find this option.)



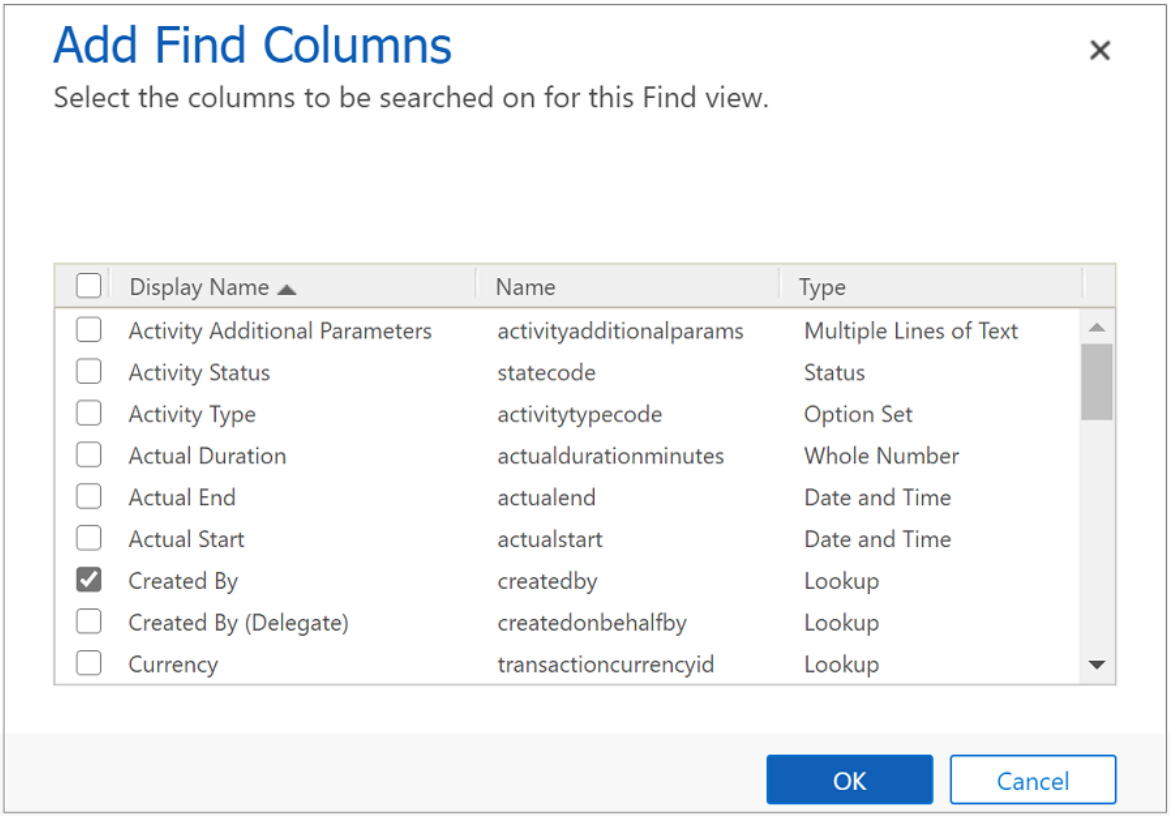
A view page is displayed.

6. On the right-hand side, select **Add Find Columns**.



The **Add Find Columns** page is displayed.

7. Select the checkbox for the entity you want to be an exact match field.



8. Select **OK**

   You're returned to the **Quick Find </entity name>** page.

9. Select **Save and Close**.

   You're returned to the **Settings** page.

10. Select **Publish All Customizations** to finish enabling exact matching for the field.

> **Note**
>
> For a field to be eligible for exact matching, it must meet the following criteria:
>
> - It can't be a Primary Key.
> - It can't be these types: String, Memo, Picklist, Boolean, Whole Number, Two Options, Date and Time, or Floating Point Number.
> - It can be these types: Lookup, OptionSet, Customer, Owner, Status, State, Status Reason.

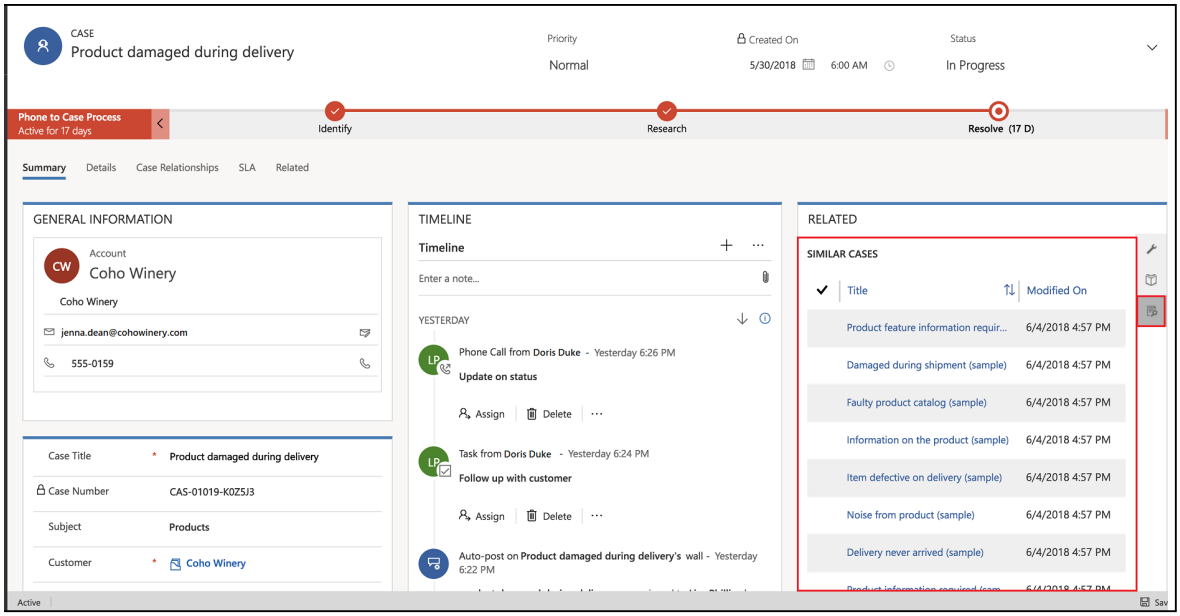
See similar case suggestions in the Customer Service Hub

You can view the similar case suggestions in the Related section of the Customer Service Hub.

More information: See and manage related records in the Related section

1. In the Customer Service Hub, navigate to **Service** > **Cases** and open a case from the **My Active Cases** view.

2. Select the **Similar Cases** in the **Related** section to view cases similar to the current case.



> **Note**
>
> The "similar cases" action is not available in the business process flow in Customer Service Hub. As a workaround, you can customize the business process flow to add the action. For information about customizing the business process flow, see **Add an action to a business process flow**.

Create and manage subjects in a subject tree

Article • 08/01/2023

Dynamics 365 Customer Service includes a subject organizational structure that lets you group service cases and knowledge base articles. By using the subject hierarchy, you can classify service cases to quickly provide service to your customer.

The search control for the subject tree entity is available by default for out-of-the-box and custom forms. If you'd like to disable the search control, please contact Microsoft support.

> **Note**
>
> The availability of search control by default is an early access feature. You can opt in early to enable these features in your environment, which will allow you to test these features and then adopt them across your environments. For information about how to enable these features, see **Opt in to early access updates**.

Create or edit a subject

Make sure that you have the Customer Service Manager, System Administrator, or System Customizer security role or equivalent permissions.

You can create or edit a subject in the Customer Service admin center or Customer Service Hub app.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

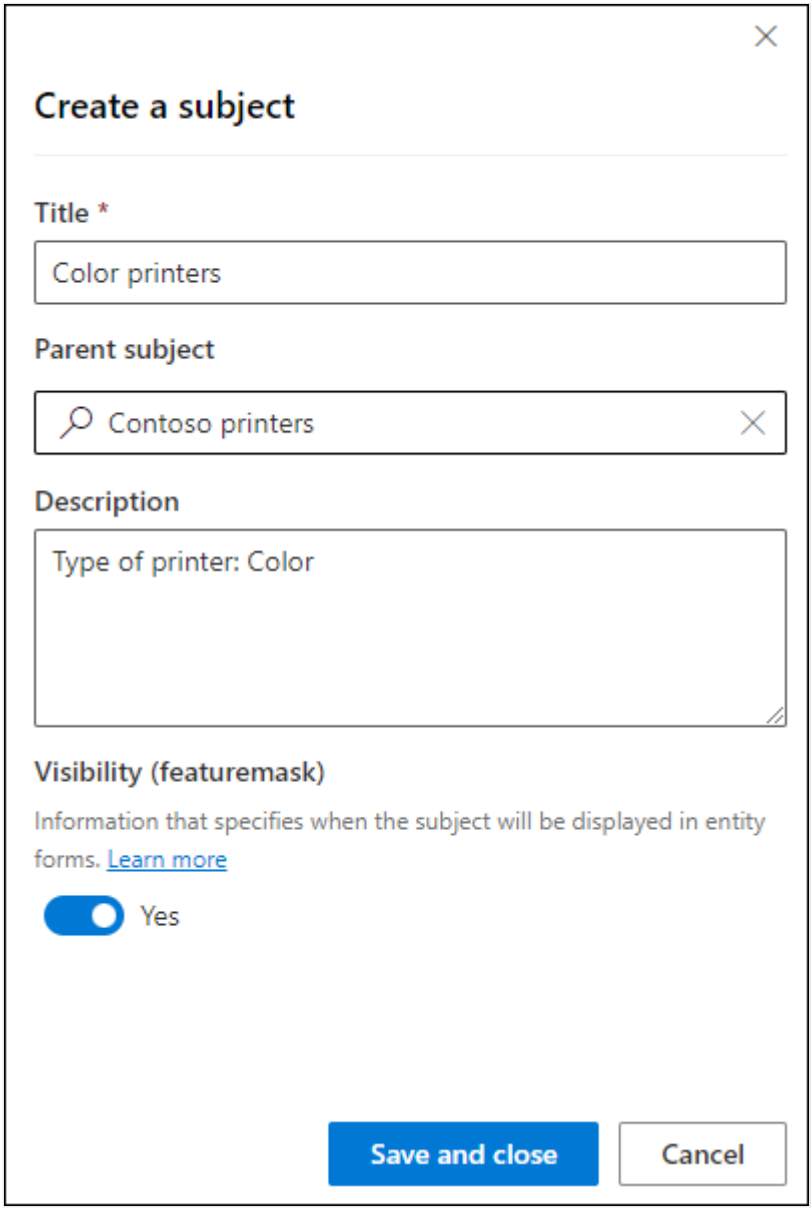
   a. In the site map, select **Case Settings** in **Customer Support**. The **Case Settings** page appears.
   b. In the **Subjects** section, select **Manage**.

2. On the **Subject tree** page, in the **Subject tree management** area, select **Add**.

3. In the **Create a subject** dialog, enter the following information:

   - **Title**: Type a name for the subject.

- **Parent subject**: Search for and select a parent subject. Leave it blank if you want the new subject to be a parent subject.
- **Description**: Type a descriptive statement about the subject.
- Switch the **Visibility** toggle on if you want the subject to be available for the agent.



4. Select **Save and close**.
5. To edit a subject, select a subject, and then select **Edit**. You can also select **More commands** to display the actions, such as **Edit** or **Add**, that you can take for the selected subject.

> ⓘ Note
>
> If you select a subject in the subject tree and select **Add**, clear the selection in the **Parent subject** box to make it a parent subject. Otherwise, the new subject

will be added as a child of selected subject.

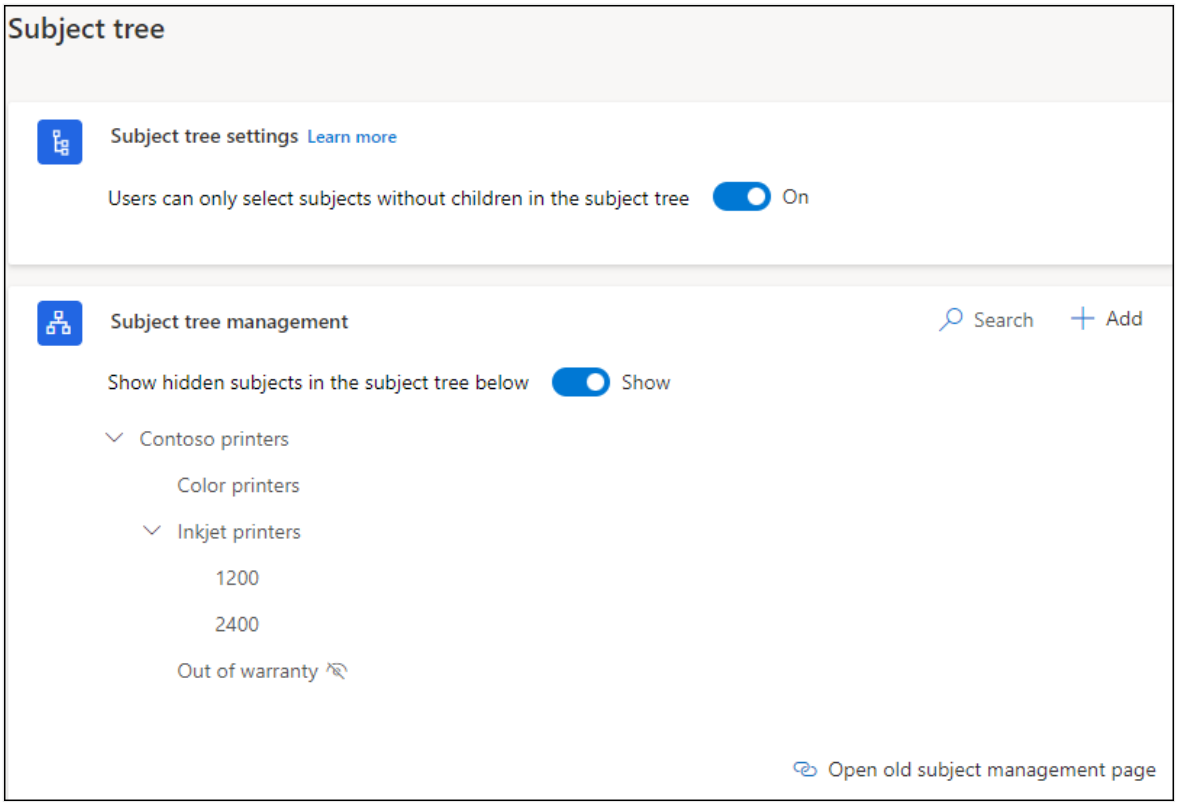
Delete a subject

To delete a subject from the subject tree, select the subject and select **Delete**.

Manage the subject tree

The following options are available for subjects:

- **Users can only select subjects without children in the subject tree**: Switch the toggle on. At runtime, users will be able to select only those subjects that don't have child subjects. This setting allows administrators to make sure that agents select only specific subjects.
- **Show hidden subjects in the subject tree below**: Set the toggle to **Show**. In the subject tree, the subjects that are marked as hidden are displayed with the hidden icon. This setting allows administrators to preview the runtime functionality of the visibility of subjects to agents.
- **Search**: Use the search option to search for a subject by name and perform the different actions that are allowed for the subject. The subject that you search fo is highlighted and displayed in the subject tree. This setting allows you to easily locate the subject and child subjects instead of manually scrolling through the subject list.



You can select **Open old subject management page** to use the older experience. However, to revert to the new experience, you'll need to navigate to **Subjects** from the site map.

> **Note**
>
> We recommend that you create not more than 1,000 subjects including child subjects to avoid performance issues.

Enable case grids

Article • 07/03/2023

Increase your agent's productivity by providing quick access to information, such as the last customer interaction, case age, and the next SLA breach, with modernized case grids. The modern UI presents data in an intuitive manner that helps you and your agents perform inline edits and quick operations with minimal clicks, thereby facilitating decision-making.

Key features

The following are some of the key features of the modernized case grids:

- A view called **Enhanced Active Cases**, which includes a set of predefined columns where you can:
  - View icons for **Priority** and the **Origin** channel.
  - View avatars for the assigned **Owner**.
  - View key data, such as **Case Age**, **Next SLA**, and **Last Interaction** with attachments.
- The ability to perform inline edits and update data for columns. For example, you can double-click the **Priority** column to change the priority of the case or set the toggle to **Yes** or **No** in the **Is Escalated** column. The updated data is automatically saved only when you move to the next row. Currently, inline editing for the **Status reason** column isn't supported.
- The ability to use quick navigation to respond to the latest interaction.

Enable the grid control for the Case entity

To make the **Enhanced Active Cases** view accessible to agents, you must enable the **Power Apps grid control** option on the Power Apps portal.

1. Go to the https://make.powerapps.com . portal.
2. Select **Solutions**. The **Solutions** page appears.
3. On the **Solutions** page, select **Default Solution**.
4. On the left pane on the **Default Solution** page, select **Tables**, and then select **Case**.
5. Select **Switch to classic**.

6. On the **Case** page, in the **Controls** section, select **Add Control**.

7. In the **Add Control** dialog, select **Power Apps grid control** > **Add**.

8. On the **Controls** tab, do the following:
   a. In the **Controls** section, for **Power Apps grid control**, select **Web**, **Phone**, and **Tablet** radio button/options.
   b. In the **Property** section in the **Customizer Control** field, select **Edit**. The **Configure property "Customizer Control Name"** dialog appears.
   c. In the **Configure property "Customizer Control Name"** dialog, select **Bind to a static value option**. For **Singleline.Text**, select **MscrmControls.CustomCellControl.CustomCellControl**, and then select **OK**.
   d. To enable inline editing, do the following:
   e. In the **Property** section in **Enable editing**, select **Edit**. The **Configure property Enable Editing** dialog appears.
   f. In the **Configure property Enable Editing** dialog, select **Bind to static options**, select **Yes** from the dropdown list, and then select **OK**.
   g. Set **Enable OptionSet colors** to **Yes** to display color coded case status fields.

   > ⓘ Note
   >
   > Any changes made by Microsoft to the default color palette won't be available automatically if you've customized the colors that appear on the case status field.

9. Select **Save**, and then select **Publish**.

> ⓘ Note
>
> New columns that have been introduced as part of a solution will be available in the environment, after the solution is installed. The user's experience of these columns will depend on whether the modernized grids have been enabled.

Enable the Enhanced Active Cases view in Customer Service workspace

To make the **Enhanced Active Cases** view accessible to agents in Customer Service workspace:

1. Go to your environment by using your organization link.

2. In the Customer Service Workspace Model Driven App, from the list of apps, select **More Options**, and then select **Open in App Designer**.
3. Go to **Components** > **Entity Assets** > **Views**, and then select the **Case** entity.
4. On the Components tab, search for **Enhanced Active Cases** view, and then select the checkbox.
5. Select **Save**, and then select **Publish**.

Customize the case grid

Add columns to the case grid

1. Go to the https://make.powerapps.com portal.
2. Select **Solutions**. The **Solutions** page appears.
3. On the **Solutions** page, select **Default Solution**.
4. On the left pane on the **Default Solution** page, select **Tables**, and then select **Case**.
5. On the **Case** page, select **Views**.
6. Select the case type that you want to update, for example, **All Cases**.
7. On the **View** page, select **+ View** column.
8. In the **View column** dialog, search for the column that you want to add—for example, the **Last Interaction** column. The **Last Interaction** column now appears on the **View** page.
9. Select **Save**, and then select **Publish**.

Add new icons for Origin and Priority Columns

In the following example, you add a new **Option Set Value** for the **Priority** and **Origin** column.

1. Go to https://make.powerapps.com portal.
2. Select **Solutions**.
3. Select the solution in which you want to add the web resource.

4. Select **New** > **More** > **Web resource**.

5. In the **New web resource** dialog, enter the following:
   a. Upload your file by selecting the **Upload file** option.
   b. In the **Display name** field, enter a display name.
   c. In the **Name** field, enter the name in the format: **Incident/Priority/{Option Set Value}PriorityIcon.{File Extension}** or **Incident/Origin/{Option Set Value}OriginIcon.{File Extension}**. For example, **Incident/Priority/100000000PriorityIcon.png**.

6. Select **Save**.

Troubleshoot issues in SLAs

Customize the case resolution experience

Article • 04/19/2023

Customize the case resolution experience in Power apps as follows:

- When agents try to close a case with open activities, the application displays a warning message with a redirect link. You can configure the tab agents view when they select this link.
- Choose to display the legacy **Resolve case** dialog instead of the default minimal **Resolve case** dialog when an agent closes a case with open activities.

Redirect users to a specific tab to close the open activities for a case

You can configure the tab users must be redirected to when they select the open activities link on the **Resolve Case** dialog. You'll need to add and configure the **Redirect user to the specified tab to close open activities** setting definition in Power Apps to set the tab at an environment level or for a specific app.

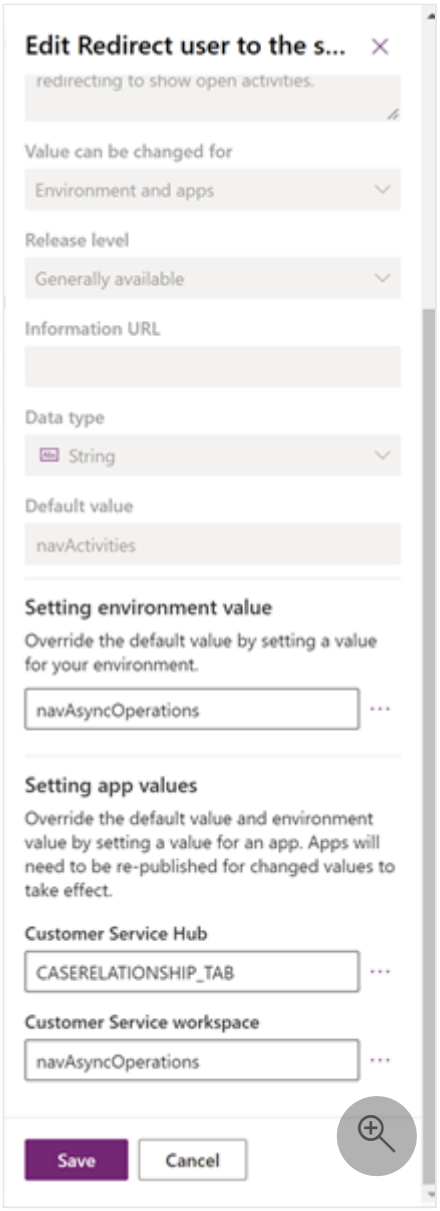
1. In Power Apps, add the **Redirect user to the specified tab to close open activities** setting definition. More information: Add an existing setting definition.

2. You'll need to update the setting definition with the tab name. To find the tab's name, perform the following steps:

    - Navigate to a form which has the required tab.
    - Select the tab, and then copy the value in **Name** in **Display options**.

3. In the **Edit Redirect user to the specified tab to close open activities** pane, paste the name in the **Setting environment value** option. More information: Update a setting definition.

4. Optionally, in the **Setting app values** section, or a required app, you can set the tab in **New app value**. The tab set at the application level overrides the environment level setting.



5. Select **Publish All Customizations**.

Disable the minimal case resolution dialog

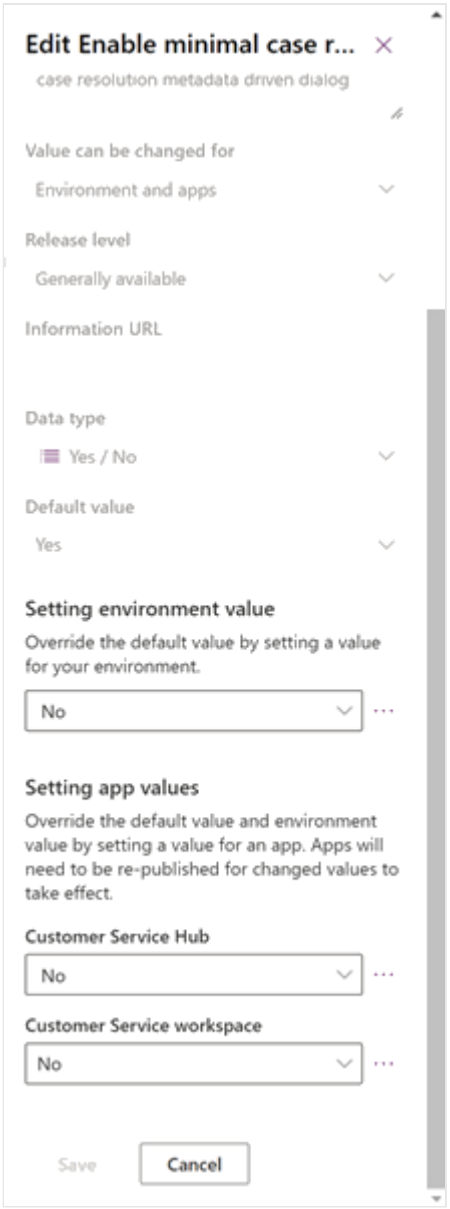
You can choose to display the legacy case resolution dialog box that appears when an agent selects **Resolve case**. You'll need to add and configure the **Enable minimal case resolution dialog** setting definition in Power Apps to revert to the legacy case resolution dialog.

> ⓘ Note
>
> - You can revert to the legacy case resolution dialog only if the **Case settings** > **Other settings** > **Resolve case dialog** is set to **Standard dialog** in Customer Service admin center.

- If **Resolve case dialog** is set to **Customizable dialog** or **Quick create dialog**, to add **Duration**, **Billable TIme**, **Total Time** and other customizations, perform the steps in **Modify the case resolution dialog**.

Perform the following steps:

1. In Power Apps, add the **Enable minimal case resolution dialog** setting definition. More information: Add an existing setting definition.
2. In the **Edit Enable minimal case resolution dialog** pane, set the **Setting environment value** option to **No**. More information: Update a setting definition.
3. Optionally, in the **Setting app values** section, for a required app, you can set the value to **No** in **New app value**. The tab set at the application level overrides the environment level setting.



4. Select **Publish All Customizations**.

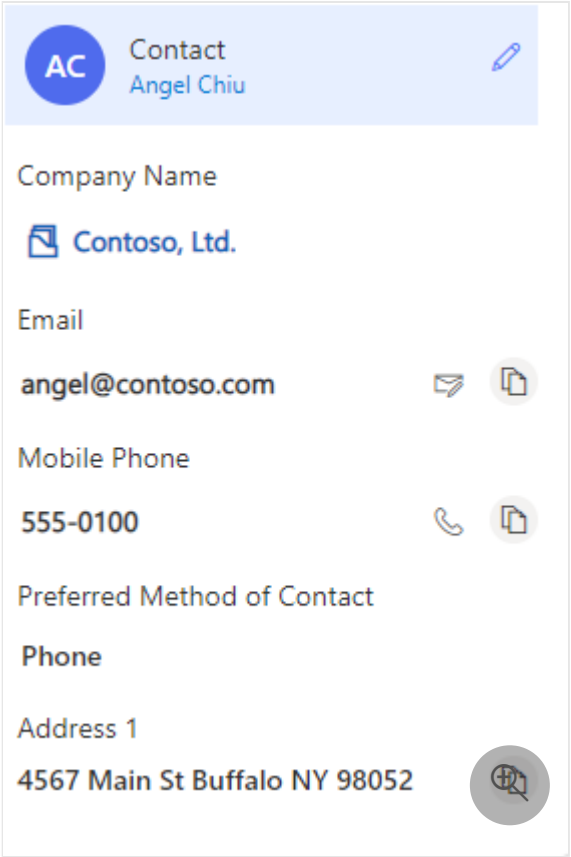
Configure components to display customer details and recent records

Article • 04/27/2023

Use the **Customer 360** and **Recent records** components to display the customer details and related records for a case.

Add the Customer 360 component to a case form

After you add the **Customer 360** control to a case form, when an agent selects a customer in the Customer field, the customer details are displayed as follows:



Do the following tasks to add the control. You can use these steps to display customer records on any entity where the Customer lookup is available.

Step 1: Add the **Customer 360** component to forms in the **Account** and **Contact** tables.
Step 2: On the **Case** form, add the **Account** and **Contact** forms on which the component was added. More information: Edit related table records directly from another table's main form.

You can add the **Customer 360** card to a custom form in Customer Service workspace and Omnichannel for Customer Service. Perform the steps in View the customer details in an app side pane on a custom form section to add the Customer 360 card to a customized form.

Step 1: Add the Customer 360 component to Contact and Account forms

1. In Power Apps, select the environment that contains your solution.
2. Select **Tables**, select **Account**, and then select the **Forms** area.
3. Create a new form or use an existing form. More information: Create, edit, or configure forms using the model-driven form designer.

   > **Note**
   >
   > You must hide all the elements that are already available on the form.

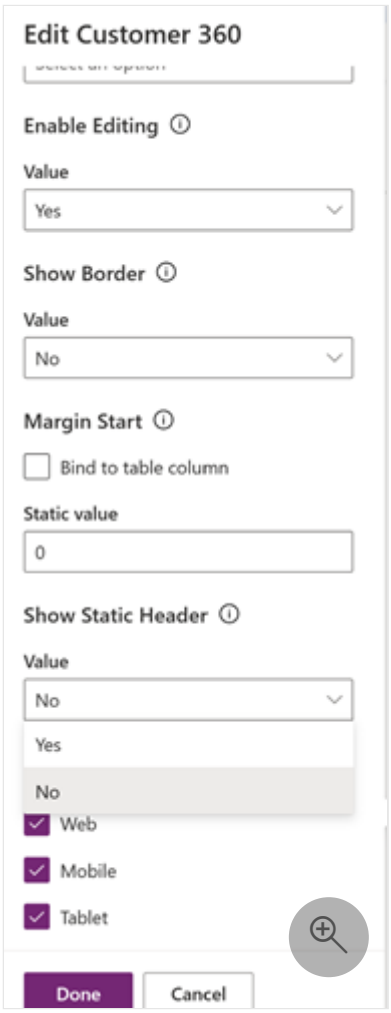
4. In the form designer, select **Components** from the left navigation, and then select **Customer 360**.
5. Drag it to the form.
6. On the **Properties** panel, do the following actions:

   - Select the attributes from the table that must be displayed as fields on the form to the user. You can select up to seven simple and three composite attributes.
   - Specify if the users can edit the fields in the card in the **Enable Editing** drop down. This field is set to **Yes** by default.
   - The control header displays the contact name or account name when a contact or account is selected from the customer lookup on the form. If you want the control header to display a static header, specify **Static Value** and set **Show Static Header** to **Yes**.
   - Set the **Enable Rich Text Editor for Multiline Text Fields** to **Yes** for the rich text editor control to be enabled for multi-line text columns.

   > **Note**
   >
   > If the multi-line text field is defined as rich-text on other forms, you can enable the rich text editor for this field on Customer 360 component. If you

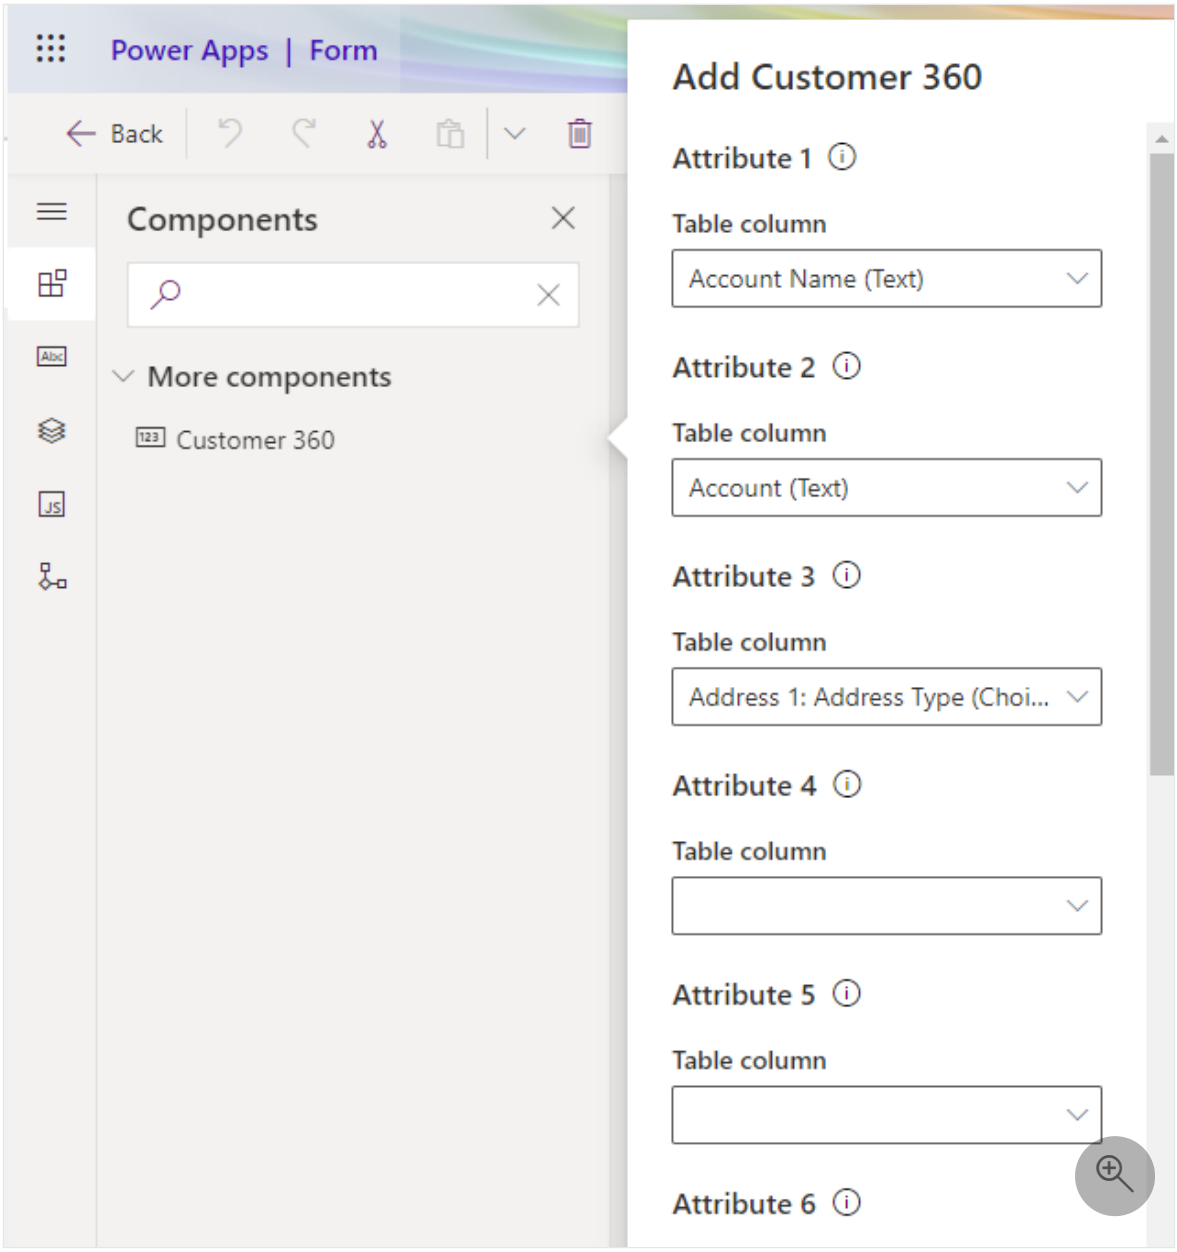
don't enable this, users might see html tags in the field if the field has formatted content.

- If you'd like to add advanced configuration for the rich text editor control, specify the **Custom Rich Text Editor Configuration URL**. More information: Create and use advanced configuration for the rich text editor control



- Save and publish the form.

7. Repeat steps 3 to 6 for the **Contact** table.



Step 2: Add the Customer or Account form with the Customer 360 component to the Case form

1. In the same environment, select **Case** from **Tables**, and then select the **Forms** area.
2. Select the required form.
3. In the form designer, select **Table columns** from the left navigation, clear the **Show only unused table columns** checkbox.
4. Select **Customer**, and then drag it on the form.
5. In the **Properties** section of the **Customer** lookup, do the following:
   a. Select **Components**, and then select **Add Component**.
   b. Select **Form**.
   c. On **Add Form**, select **Related form**. The **Add related form** flyout appears. Specify the following:

      - **Related table**: Account

- **Related form**: The form with the **Customer 360** component.

d. Do the steps above to add the **Contact** table and the new form with the **Customer 360** component.
e. Save and publish the changes.

View the customer details in an app side pane on a custom form

Perform the following steps to view the customer details in an app side pane, when the agent changes the customer or account name.

1. In Power Apps, you must add the event handler function for the On Change event of the **Customer** or **Account**. More information: Add or remove event handler function to event using UI.
2. Specify the following details in **Configure Event**:
   a. **Event Type**: **On Change**
   b. **Library**: **ModernCaseManagement/Incident/msdyn_ModernCaseManagement**. If this value isn't available in the Library dropdown, select **Add Library** and add the option.
   c. **Function**: **ModernCaseManagement.ModernCaseManagementLibrary.onCustomerChange**
   d. Select **Enabled** and **Pass execution context as first parameter**.
3. Save and publish the changes.

Display customer details when an existing record is opened

If agents should see the customer details in an app side pane when they open an existing record with the customer or account name populated, add the following function to your customer script for the On Load event: `ModernCaseManagement.ModernCaseManagementLibrary.onCustomerChange(executionContext);`.

Add the Recent records component

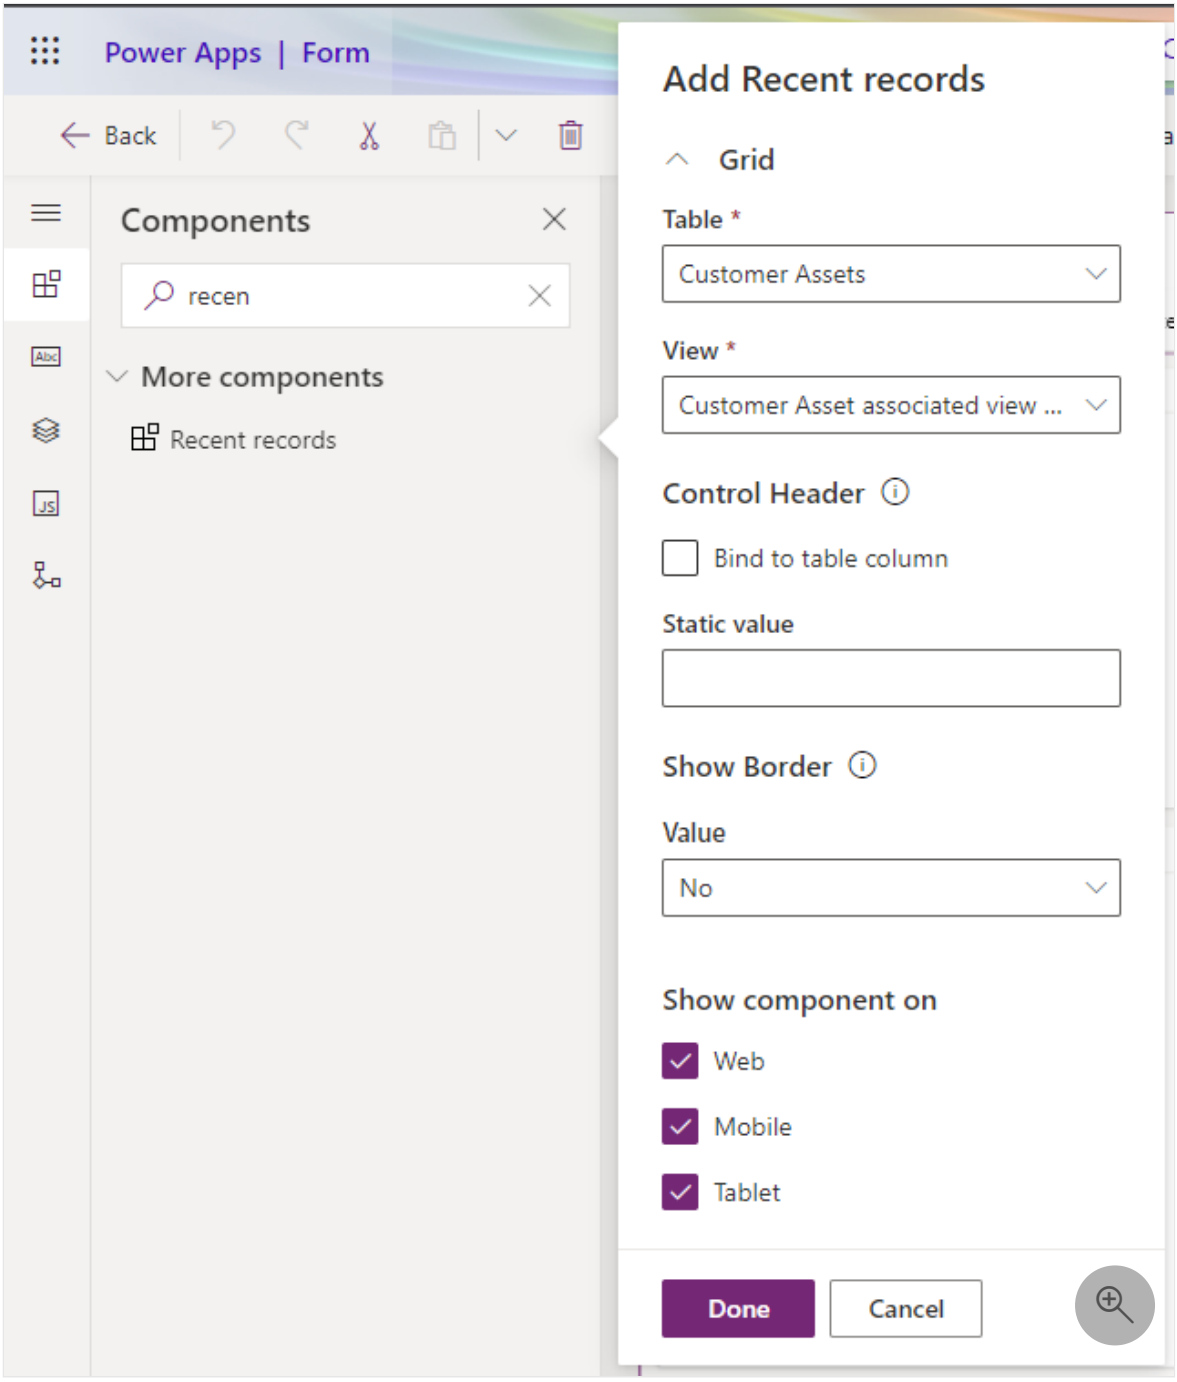
1. In Power Apps, select the environment that contains your solution.
2. Select **Tables**, select the required table, and then select the **Forms** area.
3. Select the required entity.

4. In the form designer, select **Components** from the left navigation, and then select **Recent records**.

5. Drag it onto the form.

6. On the **Properties** panel, do the following:

   - Specify the **Table** from which the records must be displayed.
   - Select the **Default view** and **Default chart**. The views and charts available in the table are displayed.
   - Specify the maximum number of rows the card must display when it loads. The default number of rows displayed is four.



7. Save and publish the changes.

The Recent records control displays the related records as follows, if you select **Case** in the **Table** field.

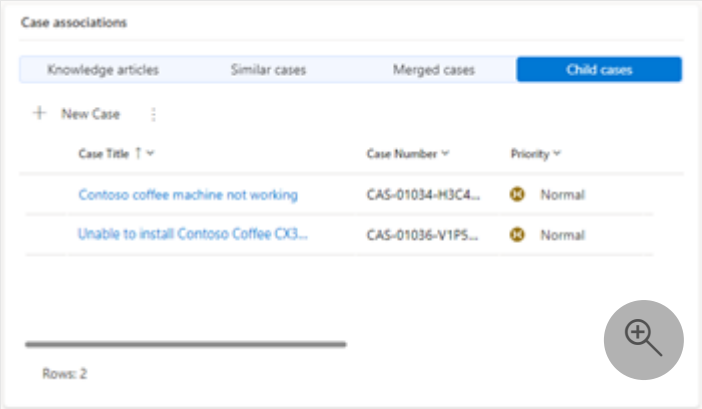
Configure components to display case associations

Article • 02/27/2023

The **Associated Grid Control** component helps you display details related to a record as subgrids. You can configure up to four subgrids using this component.

The following screenshot is an example of how you can display knowledge articles, similar, merged, and child cases related to a case using **Associated Grid Control** :



Add the component and configure the subgrid

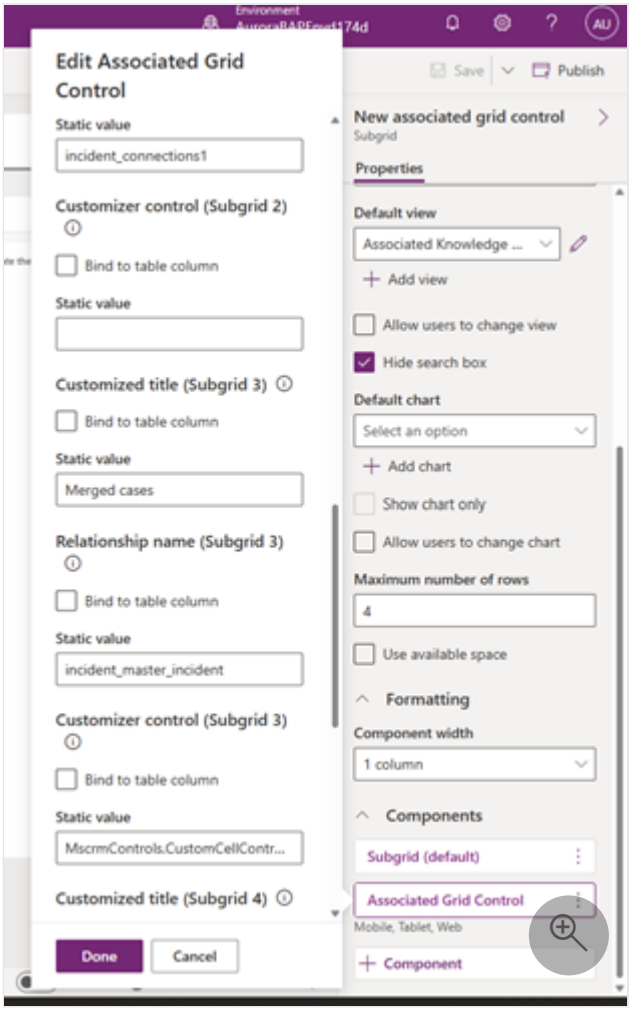
1. In Power Apps, select the environment that contains your solution.
2. Select **Tables**, select a table, and then select the **Forms** area.
3. Open the form to which you want to add **Associated Grid Control**.
4. In the form designer, select **Components** from the left navigation, and then select **Associated Grid Control**.
5. Drag it to the form.
6. On the **Properties** panel, specify the following details to populate the records to be displayed on the first subgrid.
    - Add **Table** and **Default view** from which the records must be displayed.
    - Select **Show related records** if you'd like to display only records that are related to the current record on the form and not all the available records. If you select this checkbox, the form displays only the related records in **Subgrid 1**.

7. To customize the subgrid further, select **Associated Grid Control** in **Components**. Specify the following values in the **Edit Associated Grid Control** pane that appears:

    - **Customizer control**: Specify the customizer control name for the entity. For example, you've configured a subgrid to display child cases. For the subgrid to display color-coded priority icons, you'll need to set the value of this field to **MscrmControls.CustomCellControl.CustomCellControl**. More information: Enable the grid control for the Case entity
    - **Customized title**: Specify the display name that appears as the subgrid's name when the card loads. The original view name is displayed by default if you don't specify a value for this field.

8. To configure subgrids 2 to 4, specify the values for **Table**, **Default View**, **Customizer control**, and **Customizer control** for the corresponding subgrids in the **Edit Associated Grid Control** pane.

9. You'll also have to specify the table relationship in **Relationship Name** to display the related records in **Subgrid 2** to **Subrgid 4**.



Configure related records for multiple subgrids

You can select **Show related records** check box to display the related records for only **Subgrid 1** in **Associated Grid Control**. To display related records in **Subgrid 2** to **Subgrid 4** you need to specify the corresponding table relationships in **Relationship name**. Table relationships allow for queries to retrieve related data efficiently. More information: Table relationships overview.

To find the relationship between tables, do the following steps:

1. In Power Apps, select the **Table** that contains the form you've added the **Associated Grid Control** to.
2. Select **Relationships** from **Schema**.
3. On the page that appears, find the table you've added to the subgrid in **Associated Grid Control**.
4. Copy the **Name** that's against the table.
5. Open the form where you've added the **Associated Grid Control**.
6. Specify the name as the **Relationship Name** in **Edit Associated Grid Control**.

Add an alternate grid control

Out-of-the-box, **Associated Grid Control** uses the Power Apps grid control that supports the latest Microsoft accessibility standards and is built to be performant, extensible for the future, and aligns with the latest guidance for fonts, sizing, and styling. However, you can choose to add an alternate grid control.

Perform the following steps:

1. In Power Apps, select the environment that contains your solution.
2. Select **Solutions**, and then select the required solution.
3. Select **Add Existing** > **More** > **Setting**.
4. On the **Add existing Setting Definition** pane, select the **Grid type for Associated grid control** option and then select **Next**.
5. Select **Add** on the **Selected Setting Definition** to add the **Grid type for Associated grid control** option to your solution.
6. Go to **Add Existing** > **App** > **Model-driven app**> **Add existing model-driven apps** pane.
7. Select the **Grid type for Associated grid control** option. The **Edit Grid type for Associated grid control** pane appears. The **Default value** is set to **Microsoft.PowerApps.PowerAppsOneGrid**.

8. Select **Add existing value** in **Setting environment value**. Specify **MscrmControls.Grid.PCFGridControl** to replace the default values for all the apps in your environment.

9. Optionally, select **New app value** for the app. For a specified app, the tab set at the application level overrides the environment level setting.

10. Select **Publish All Customizations**.

Overview of the model-driven form designer

Enable enhanced case forms for multisession apps

Article • 09/25/2023

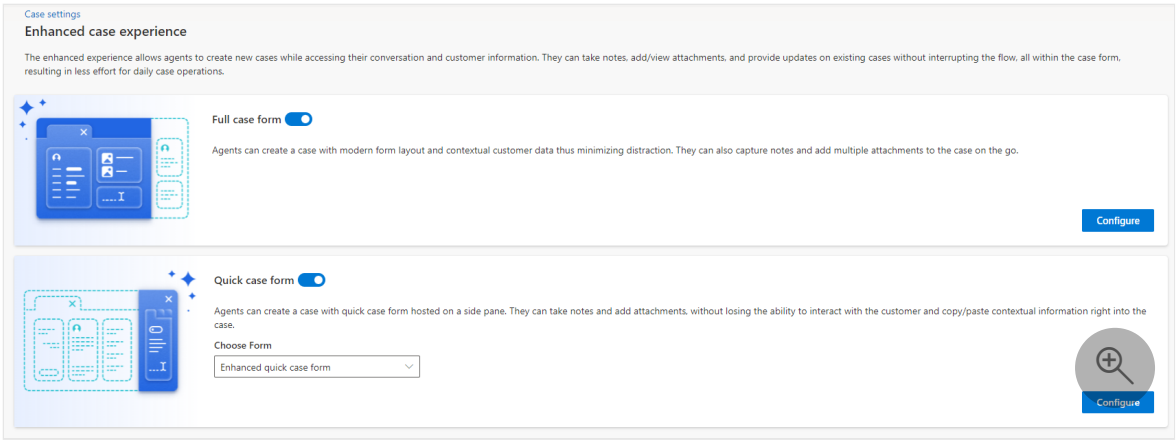
Enable the enhanced **Quick case form** and **Full case form** options, so that your agents can see the enhanced quick case form and full case form, when they create a new case in Customer Service workspace.

> **Note**
>
> The enhanced case creation experience is available in the Customer Service workspace app only.

Enable enhanced case experience

To enable the enhanced case forms, perform the following steps:

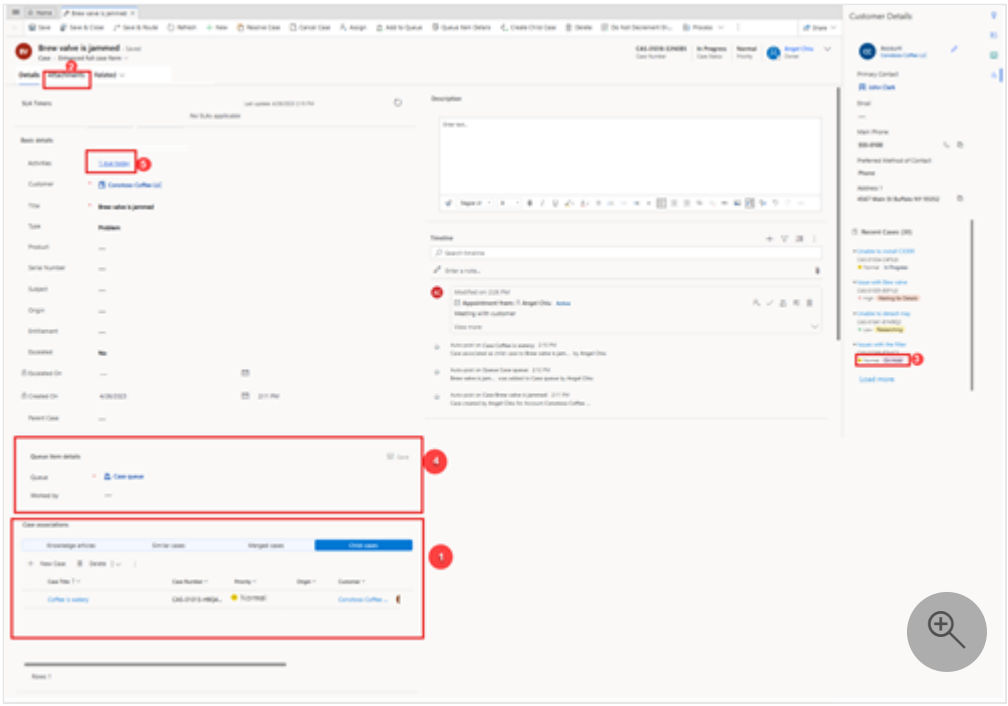
1. In Customer Service admin center, go to **Case Settings**.
2. Select **Manage** for **Enhanced case experience**.
3. Switch the **Enhanced case experience** toggle to **Yes**.
    - To enable the enhanced full case form:
        a. Set the **Full case form** toggle to **Yes**, for your agents to see the enhanced full case form when they create a new case. Additionally, if agents should see the enhanced case form when they access an existing case, set the enhanced case form as the default form.
        b. Select **Configure** to customize the form in Power Apps. The Power Apps form page opens on a new tab.
    - To enable the enhanced quick case form:
        a. Switch the **Quick case form** toggle to **Yes**.
        b. Select the option in the **Choose Form** dropdown. The selected main form appears as the side pane when the agent creates a new case. By default, this is set to **Enhanced quick case form**.
        c. Select **Configure** to customize the form in Power Apps. The Power Apps form page opens on a new tab.



> [!NOTE]
> - If the enhanced full case form has a higher form order than the default case form, agents might see the enhanced full case form even if you haven't enabled the enhanced case experience. If you'd like agents to see the default case experience, set the form order of the enhanced form lower than that of the default form. More information: **Set the form order**.
> - Agents can use the form selector to navigate from **Enhanced case form** to other forms. For agents to go back to the enhanced case form, ensure set the **ShowInFormSelector** is set to **True**.

View and use default components available on enhanced full case form

The following components are available out of the box in the enhanced full case form. You can use these components to customize other forms. When you add the components to a form, the runtime experience is as follows:



Legend	Component	Description	Entity	Additional actions	Additional information
1	**Associated Grid Control**	Displays the relevant records linked to the current record as subgrids. You can configure up to four subgrids using this component.	Available for all entities.	Not Applicable.	Configure components to display case associations
2	**Attachment Control**	Enables you to upload and display attachments.	You can add this control on a case form to upload attachments to a case and to display attachments uploaded directly,through email, notes, and conversations. For all other entities, add this component to display the attachments uploaded	For a case entity, set the **Table Column** in the component to **Pre Create Entity Attachment Id**.	Use Attachment Control to customize forms

Legend	Component	Description	Entity	Additional actions	Additional information
			through email and notes.		
3	**OptionSet Wrapper**	Displays the selected option set values as color-coded options on the form. For example, if you add **Priority** on a case, the application displays color-coded priority icons. If you add **Case Status**, color-coded status options are displayed.	Available for all entities.	Specify the required optionset in **Table Column**.	
4	**Queue Item Control**	Displays the current queue a record belongs to and the **Worked by** field. You can edit the **Worked by** and save the changes.	Available for queue enabled entities.	Specify a value in **Table Column**.	
5	**Due open activities control**	Displays the activities that are due today or are overdue.	Available for all entities.	**Table** must be set to **Activities**.	Use the Due open activities control to customize forms
	Notes Control	Allows you to take notes on a form before saving a record. The rich text editor tool is	Available for case entity only.	- Set the **Table Column** in the component to **Pre Create Notes Id**. - To configure advanced rich

Use the attachment control to customize forms

Article • 05/03/2023

You can add the **Attachment Control** component to case forms so that agents can view and upload attachments. You can also add the component to other entity forms, such as Account or Contact, so that agents can view attachments uploaded through notes or emails.

> **Note**
>
> Agents can upload attachments directly only for cases and not on other entities.

Upload and view attachments on case forms

If you've enabled the enhanced full case form or added the **Attachment Control** component to other case forms, the following actions are applicable:

- When agents create a new case, and before the case is saved, they can upload attachments to the case.

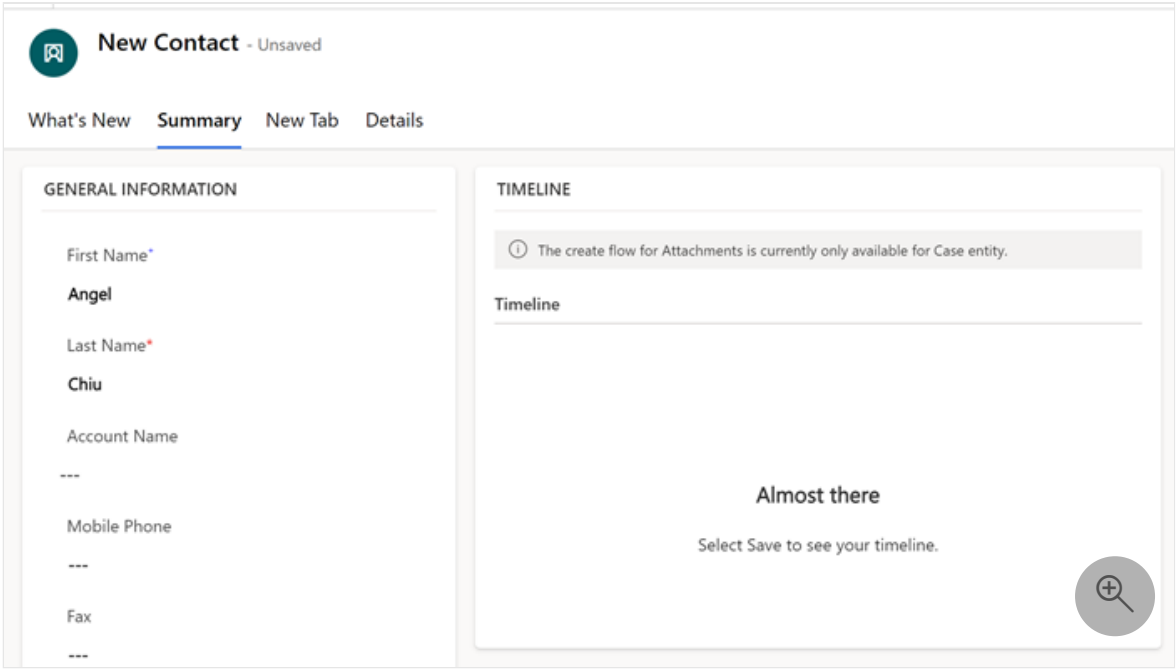
- After agents save a new case or if they open an existing case, the attachments grid is displayed. For more information on the actions agents can perform, see: View an existing case using enhanced Full case form.

If agents need to upload attachments, follow the steps in Create or edit a security role to manage access to grant permissions on the **Entity attachment** custom table to the applicable security role that's assigned to the agent.

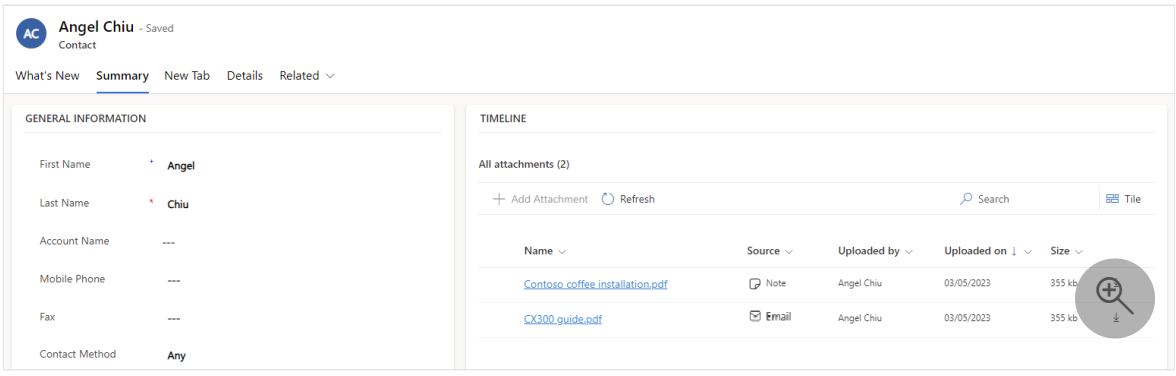
View attachments on other entity forms

When you add the **Attachment Control** component to other entity forms such as Account or Contact, agents can only view and download attachments that are uploaded through notes or email. They can't upload attachments directly to other entity records. The following actions are applicable:

- Agents can only view attachments for an entity record that's saved. When agents create a new entity record, before they save the record, attachments aren't displayed. The application displays the following message when agents create a new entity record, and haven't saved the record.



- After agents save a new record or open an existing record, the attachments grid is displayed as follows:



Customize forms with Attachment Control

On the required form, add the **Attachment Control** component. More information: Add components to a form. If you add the component to a case form, the following properties are available for further customization:

Property	Description
Table Column	For case forms, set this field to **Pre Create Entity Attachments Id**, for agents to be able to upload attachments to a new case, before they've saved it. For other entity forms this field can be set to any column, as attachments can't be uploaded directly to an entity record.
Show Control Title	Displays or hides the **Attachments** label, when a new case is created.
Show attachments from Conversation	Set this value to **Yes** or **No** to display or hide the attachments that were shared through conversations such as live chat and asynchronous messaging conversations.
Show attachments directly uploaded to entity	Set this value to **Yes** or **No** to display or hide the attachments that were directly uploaded when the case was created.
Show attachments from email	Set this value to **Yes** or **No** to display or hide the attachments sent through email, for any entity.
Show attachments from notes	Set this value to **Yes** or **No** to display or hide the attachments that were added to notes on the timeline, for any entity.

Use the Due open activities control to customize forms

Article • 05/03/2023

The **Due open activities control** helps agents see the activities that are either due today or overdue. The application displays the due or overdue activities as a hyperlink. This component is available out of the box on the enhanced full case form.

Customize forms with Due open activities control

You can customize other forms such as Account or Contacts, to display the due or overdue activities by performing the following steps:

1. In Power Apps, add the **Due open activities control** component to the required form. More information: Add components to a form.
2. On the **Due and Overdue Activities** subgrid, in **Properties** specify the following:

    - In **Table** select **Activities**.
    - Select the **Show related records** to display the activities related to the current record only.

3. Save and publish the customizations.

Specify tab to redirect users to view open activities

Configure the tab that the agents must be redirected to when they select the open activities link from the **Due open activities control**. You can set this at an environment level or for a specific app.

1. In Power Apps, add the **Due open activities control** component to the required form.

2. In **Edit Due open activities control**, set the **Static value** option to the required tab. To find the tab's name, perform the following steps:

    - Navigate to a form that has the required tab.
    - Select the tab, and then copy the value in **Name** in **Display options**.

3. Save and publish the customizations.

Work with cases

Article • 01/14/2022

Track your cases efficiently and act on them quickly in the Customer Service Hub application.

Creating and managing a case can't be any simpler. With the intuitive case form in the Customer Service Hub, you can do all your important tasks and actions without navigating to different parts of the application.

You can capture important information about customers, interactions you've had with them, and all related records of the current case in once single place.

Watch this video to learn more about case management in the Customer Service Hub: https://www.microsoft.com/en-us/videoplayer/embed/cde80c83-f592-4b15-b1a1-4fae13be93f9?postJsllMsg=true

Create a case

You can create a case in Customer Service workspace or Customer Service Hub.

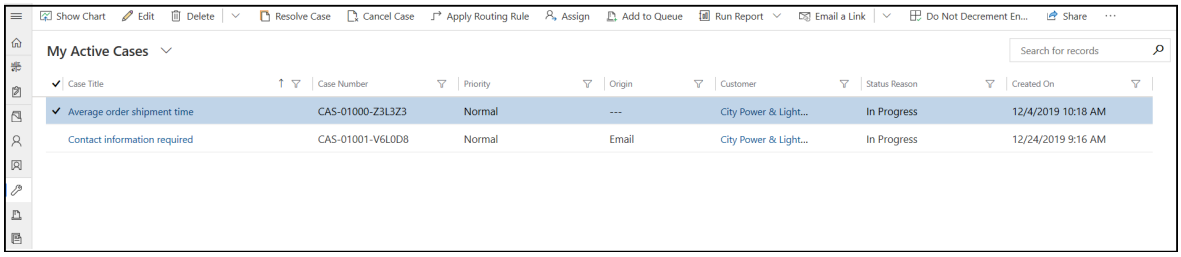
1. Make sure that you have the Customer Service Manager or Customer Service Representative role, or equivalent permissions.

2. In Customer Service workspace, go to the **Customer Service Agent Dashboard**. If you are using Customer Service Hub, in the site map, go to **Service** > **Cases**.

   - The **My Active Cases** view is displayed. You can switch between the different case views by selecting the current view.
   - Select **Show Chart** on the command bar to see the chart view.
   - Select **Open Dashboards** on the command bar to directly open the entity dashboard. To switch back to views, select **Open Views**.

   If you select a case record from the case view, you see these additional options on the command bar:

   - Select **Apply Routing Rule** to apply a routing rule on a selected case.
   - Select **Assign** to assign a case to another owner.
   - Select **Add to Queue** to add a case to a queue.



3. On the command bar, select **New Case**. Alternatively, you can quickly create a new case by selecting in the nav bar and selecting **Case**. This opens a vertical flyout towards the right side of the screen.

   View and update the **Priority**, **Status**, and **Owner** of the case. The **Created On** date is picked up as soon as you save the case.

4. Go to **Summary** and in the **Case Title** field, type a descriptive title to identify the case.

5. In the **Subject** field, select a subject. When you associate cases with subjects, you can search for cases with similar issues and find related articles. If you don't see the subject that you want in the list, ask your administrator to add it.

6. Find the customer:

   a. Select the **Customer** lookup button. By default, this field shows all customer records, accounts, and contact records. Or, type a few letters and select **Enter** to search for records that contain the letters. After you select an existing customer, the **General Information** section will show the contact card for the customer, along with recent cases in the Related section.

   b. If a customer record doesn’t exist, you can a add new customer record using the entity tab.

7. In the **Origin** field, select the channel through which this case was initiated.

8. In the **Product** field, select the product this case is for. You can’t select a product family, a draft product, or a draft product bundle.

9. To see what kind of support you should provide the customer, select the **Entitlements** lookup button and select an active entitlement. The **Entitlements** section in the case record lists all the active entitlements for the customer.

> **ⓘ Important**
>
> If an SLA is associated with an entitlement and the same entitlement is applied to a case, then the associated SLA becomes applicable for the case.

> ⓘ Note
>
> - When a case is created and an entitlement is applied to it (or when the case gets resolved), the entitlement terms from the associated entitlement are decremented. However, if you don't want the entitlement terms to be decremented for a case, on the command bar select **Do not decrement entitlement terms**.
> - When you update the **Customer** field, the value of the **Entitlements** field will be cleared.

10. Select in the **Description** field to enter to add a detailed description about the case.

11. Navigate to other tabs to provide or view more information about the case.

    - The **Details** tab tracks **Case Details**, **Additional Details**, **Social Details**, **Description**, and **Applicable SLA** of the case.

    - The **Case Relationships** tab shows a **Merged Cases** and **Child Cases** list. You can add an existing child case to the current case from the **Child Cases** list. If you want to create a new child case for the current case, select **Create Child Case** on the command bar.

      The **Case Relationships** tab also shows a list of knowledge articles associated with the case, in the Associated Knowledge Records sub-grid.

    - The **SLA** tab shows the related SLA KPI instance records for each SLA KPI that's tracked for the case.

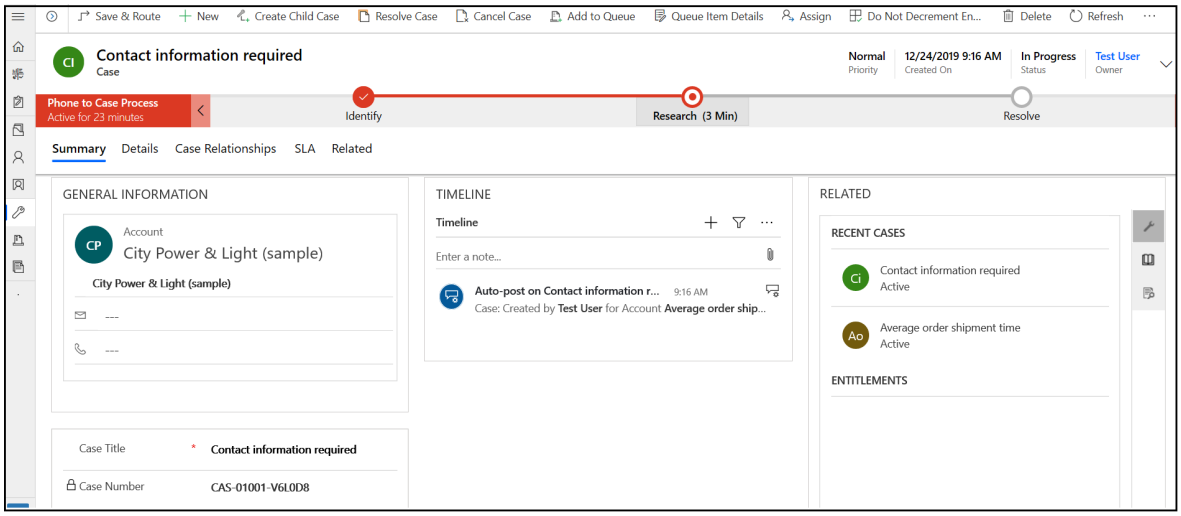
      > ⓘ Note
      >
      > By default, a timer for enhanced SLA is already added to your case form. If an enhanced SLA applies to the case you're working on, you will see a timer that shows the countdown to meet the SLA KPIs.

    - The **Related** tab shows the common associated entities like **Knowledge Base Records**, **Activities**, **Connections**, and **Work Orders**.

      Select on any one of the common associated entities and they open in a new tab, aligned horizontally.

12. When you're done, select **Save**.

    - After you save the case, the Timeline section appears and displays the post about case creation.
    - The Business Process flow bar appears and displays the process stages to guide your case towards completion. For more information, see **Business processes**.
    - On the command bar:
        - Select **Save and Route** to route the case by applying routing rules
        - Select **Create Child Case** to create a child case
        - Select **...** on the command bar to explore more options for the case.



> **Note**
>
> If you have previously installed any portal solution, to create a case in the Customer Service Hub or to use the Merge cases command, you must turn off the **Read-only in mobile** option for the Case entity. More information: **Turn off Read-only in mobile option**.

Use enhanced case forms to manage cases

Article • 04/05/2023

The enhanced case management experience in Customer Service workspace allows agents to verify and edit customer details without switching tabs, add updates to existing cases without interrupting the case creation flow, and avoids case duplication.

Create cases using quick create from

You can use a quick create form to create a new case from within a form without navigating to a different page.

For example, if you select **New Case** in the **Customer Service Agent Dashboard**, a quick create form for a new case appears as a flyout.

Depending on the settings enabled for you, you'll see the **Enhanced Quick case** form or **Default Quick case form: case** that are explained as follows:

Enhanced Quick case form

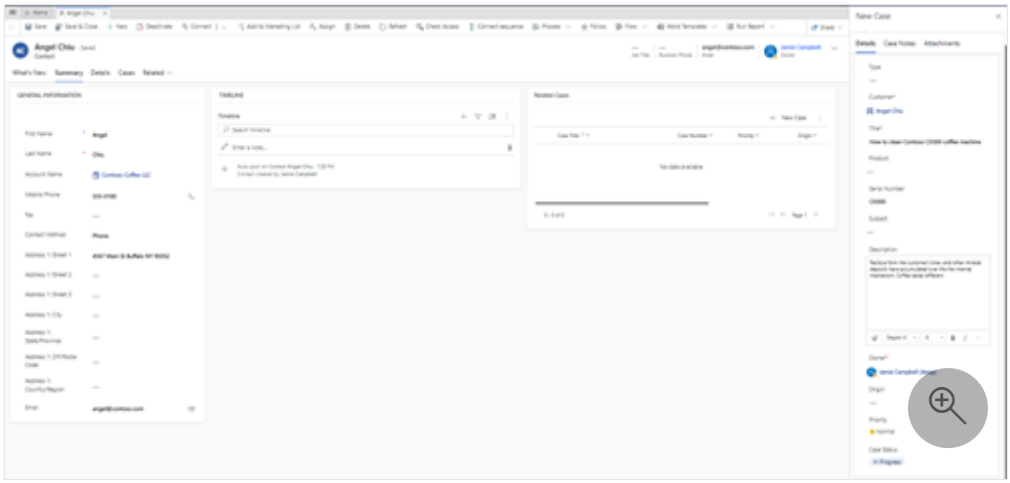
A few scenarios where the enhanced quick case form appears is when you select **New Case** in the following:

- Customer Service Agent Dashboard.
- AI-generated summary of a customer conversation.
- contact or account form
- Active conversation form
- **Child cases** subgrid on an existing case.

You can perform the following actions when the quick case form is open:

- Access, copy, or edit the information in the background form or view. You can also paste information from the background to the case form.
- On **New Case**, you can specify data in the following tabs:
  - **Details**:
    - Required fields such as **Customer** and **Title** of the case.
    - **Description**: Add information related to the case. The rich text editor toolbar helps you format text, add images and links to this field. You can also drag and drop files on to the description section.

    - Color coded **Case Status** fields and **Priority** icons.
  - **Case notes**: You can add relevant information such as the steps tried to resolve the issue or important details that have to be included as notes without having to save the case. The rich text editor toolbar helps you format text, add images and links in this field. You can use either the attachment icon to upload attachments or drag and drop files.
  - **Attachments**: Select **Add Attachment** to upload multiple attachments at once.
- If you'd like to provide additional information, you can switch to the main case form. All the details you've added to the case are added automatically when you switch to the main form.



Create a case from the main case form

You can create a new case from the main case form. Depending on whether your administrator has enabled the enhanced **Full case form** in **Customer Service admin center**, you'll see one of the following layouts.

Depending on the settings enabled for you, you'll see the **Enhanced full case form** form or **Default main case form: case** that are explained as follows:

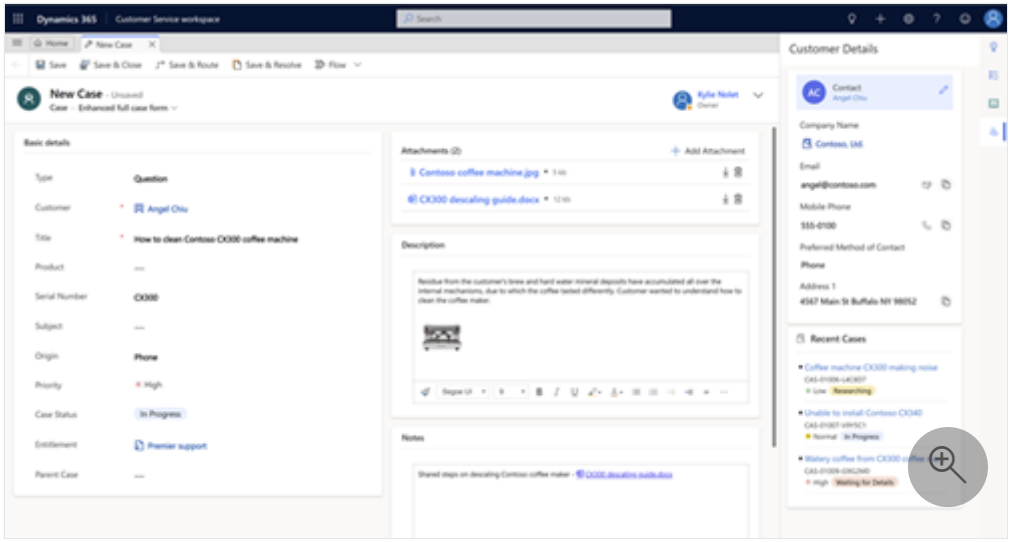
Enhanced full case form

On the enhanced full case form, you can perform the following actions:

- Specify the customer to display the relevant customer details and recent cases on **Customer Card** and **Recent cases**.
- Use **Case Notes** and **Description** to record notes and information related to the case. The rich text editor toolbar helps you format text, add images and

links to these field. You can also drag and drop files on to the description section.

- **Attachments**: Select + **Add Attachment** to upload multiple attachments at once.
- View color coded **Case Status** fields and **Priority** icons.
- **Save and Resolve**: The form has an additional option to save the case and initiate the case resolution process.



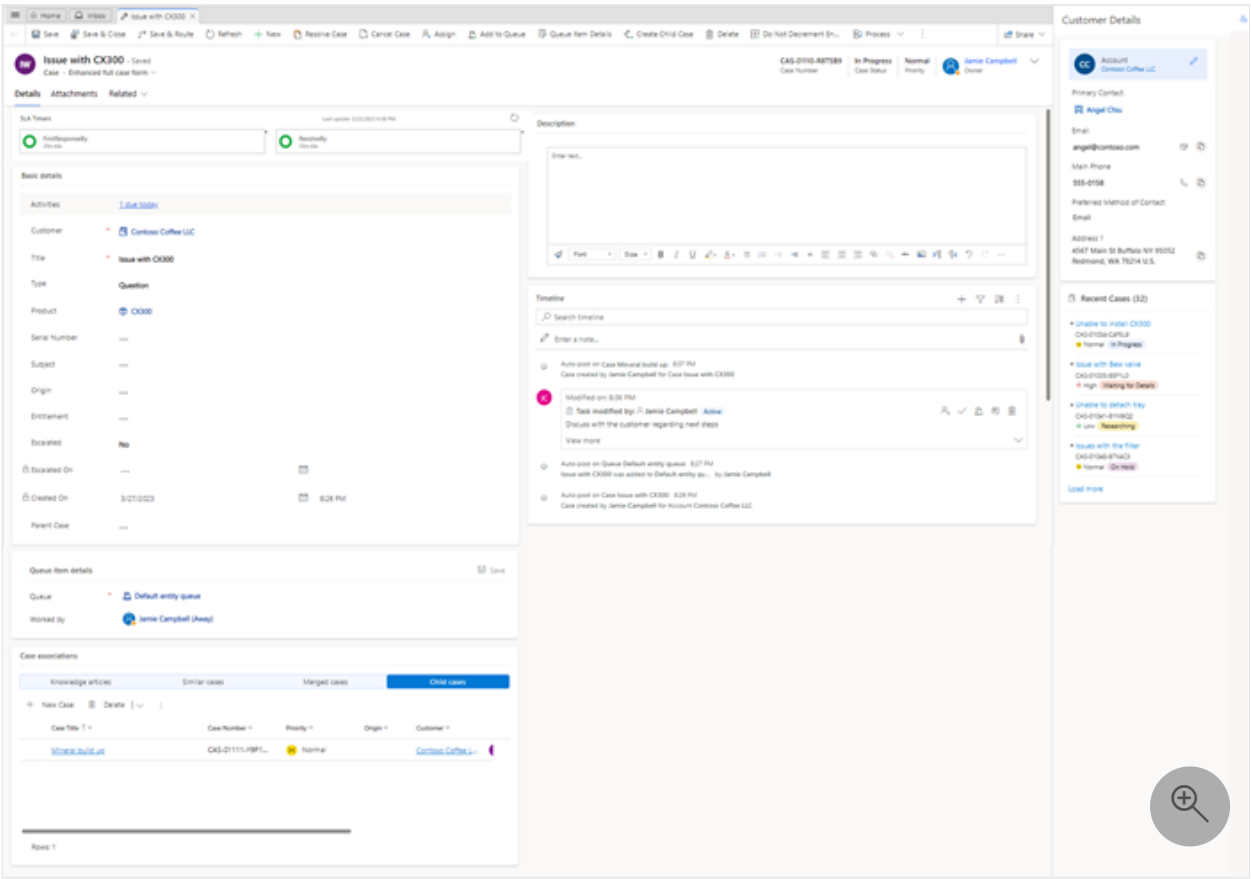
View an existing case using enhanced Full case form

If you save the case using the enhanced full case form, you'll see the following:

- An SLA timer that displays the time within which the agents must first respond to a customer and the time by which they must resolve the case.
- Links with the activities associated to the case that are either due that day or past their due date. You can select the link to view the open activities associated with the case on a tab your administrator has configured. By default, it displays open activities in the Activities tab. More information: Specify tab to redirect users to view the open activities for a case
- Related customer and recent case information on the **Customer details** side panel.
- The **Queue item details** displays the current queue the case belongs to and the **Worked by** field.
- View details of the relevant records associated to a case on **Case associations**.
- Timeline to view information related to the events that happened on the case.
- Upload and view attachments linked to the case on the **Attachment** tab. You can also:

- See the source of the attachment such as direct upload, attachments uploaded through notes, email, or shared through conversation and the user who uploaded the attachments.
- Use the dropdown list to switch between grid and tile views.
- Search for attachments
- Sort and filter attachments based on **Name**, **Size**, **Uploaded on**, **Uploaded by**, and **Source**.
- Select the attachment to preview the content of the attachment. This is only supported for pdf and image files.
- Download and delete multiple attachments at once.

> **Note**
>
> - You can delete only those attachments that have **Source** set to **Direct Upload**.
> - Attachments shared over a conversation will be displayed only if a case is linked to the conversation and the conversation has ended. The **Uploaded By** is set to **Omnichannel User** and **Uploaded on** is the time when the conversation ended.
> - You'll see the enhanced full case form when you open an existing case only if your administrator has set enhanced **Full case form** as the default form.



View customer details and recent cases

When you create a new case and specify a customer or an account, or open a case after saving it, the application displays the following details, based on your administrator's configurations:

- **Customer Details**: Displays the customer details configured by your administrator. You can edit the information inline, copy the information and initiate activities such as email or phone call. The activities open as a new quick create form on the main page.
- **Recent Cases**: Displays the recent cases linked to customer or account. More information: Configure components to display customer details and recent records.

Resolve, cancel, and reassign cases

Article • 04/27/2023

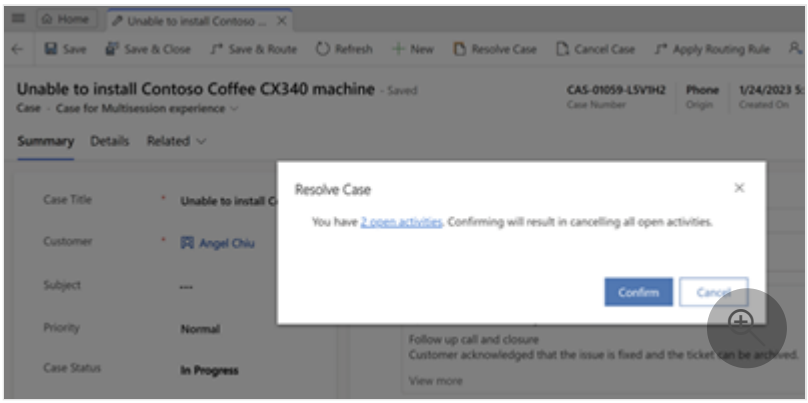
Customer Service provides you with the ability to resolve, cancel, and reassign cases.

Resolve a case

1. In the list of active cases, open the one you want to resolve.
2. On the command bar, select **Resolve case**. The status of the case is set to **Resolved** only when you select **Resolve Case** and the case gets resolved. You can't set the value of the **Case Status** field to **Resolved**

If you have open activities linked to the case, you'll see a message with the following actions:

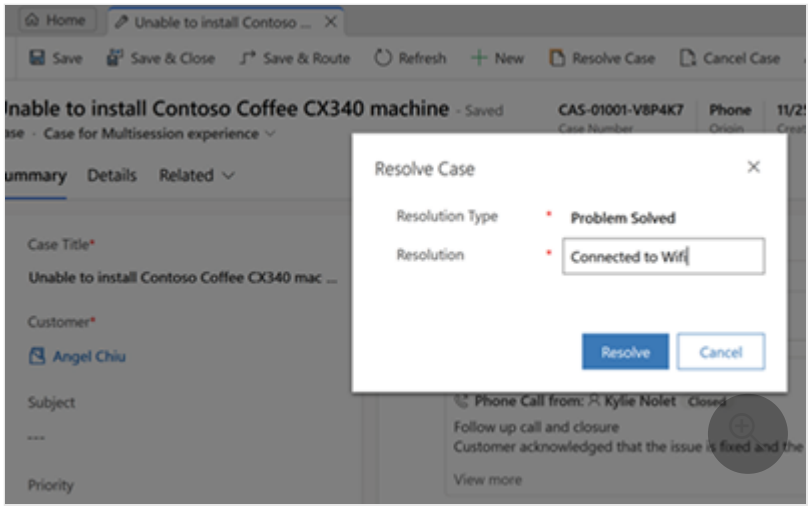
- A link with the number of open activities. You can select the link to view the open activities associated with the case on a tab your administrator has configured. More information: Enable the redirection link for Customer Service apps
- **Confirm**: If you select **Confirm** on the warning, the system automatically cancels the open activities when the case is resolved.



3. Depending on the settings enabled for you, you'll see the minimal case resolution dialog or legacy case resolution dialog that are explained as follows:

Default case resolution dialog

By default, you will see the **Resolution Type** and **Resolution** fields only on the **Resolve Case** dialog.



6. Select **Resolve**.

> ⓘ Note
>
> - We recommend that you resolve or close a case before deleting it.
> - While you can't edit or update through the UI any attribute of the case after it is resolved, you can configure an API or a Power Automate flow to be run if the setting in service configuration is enabled. More information: **Allow updates for resolved and canceled cases**
> - The "resolve cases" action is not available in the business process flow in Customer Service Hub. As a workaround, you can customize the business process flow to add the action. For information about customizing the business process flow, see **Add an action to a business process flow**.

Resolve a case with a parent and child relationship

> ⓘ Important
>
> Sometimes, resolving a case action might be blocked based on your current case status. This is because your admin may have set things up so that you only see a limited set of statuses to choose from based on the current status of a case. For more information about the available list of case statuses, contact your administrator.

Depending on your settings, a case with a parent and child relationship can be closed in one of the following ways:

- When all the child cases are resolved, you can then close the parent case.
- When you resolve the parent case, it will then resolve all the active associated child cases.
- A parent and child case can be closed independently of each other. This is the default setting.
- Before you resolve a parent case that has active child cases, make sure that all the case activities are closed. Otherwise, you'll get a message with the following actions:
  - A link with the number of open activities. You can select the link to view the open activities associated with the case on a tab your administrator has configured. More information: Enable the redirection link for Customer Service apps
  - **Confirm**: If you select **Confirm** on the warning, the system will automatically cancel the open activities when the case is resolved. Also, performance may be slow when you close a parent case with lots of active child cases associated with it.

Cancel a case

All case activities must be closed before you can cancel a case.

1. In the list of active cases, open the case you want to cancel, and then on the command bar, select **Cancel Case**.
2. In the **Confirm Cancellation** dialog box, select the case status:
   - **Canceled**: This means the case is canceled and it will no longer be assigned to you.
   - **Merged**: This means the case is merged with another case. When the case is merged, the case activities will be moved to the case it was merged with.
3. Select **Confirm**.

> **Note**
>
> If you are using a custom code or custom workflow to mark a case resolved or canceled, ensure that you set up appropriate validation to check if the case is

already resolved or canceled. If a custom workflow tries to resolve or cancel a case that is already resolved or canceled, you will see errors while executing the custom workflow.

Reassign a case

If you don't have enough information to resolve a case, or if you think another member in your team has expertise on the subject, you can assign the case to another user or team.

1. In the list of cases, select the case that you want to reassign, and on the command bar, select **Assign**.
2. In the **Assign to Team or User** dialog box, in the **Assign To** field, select **User or Team**, and then in the **User or team** field, select who you want to assign the case to.
3. Select **Assign**.

Case resolution history

Located on the right side of the form, is the case resolution sub-grid. Here you will find the case resolution history. Should a case need to be reopened, agents have the ability to view case history here.

Merge cases

Article • 05/31/2023

When a customer opens multiple cases about the same issue through different support channels or when multiple customers from the same account call in about the same issue, you can merge those cases into one case to eliminate redundancy.

When a case is merged, the state of the case is changed to canceled, and the status is changed to merged. This is because it is merged into another case and all of the case activities, emails, and attachments are now associated with the case it was merged into. By default you can merge up to 10 cases at a time.

A few things to remember when you merge cases with parent and child relationships:

- When you merge a case that has child cases, those child cases become child cases of the parent case they were merged into.
- You can only merge a child case into another child case if both of the child cases have the same parent case.

In the Customer Service Hub, you can merge cases from the dashboard streams or from the list of case records.

> ⓘ **Note**
>
> The **Merge Cases** dialog box uses the Merge Incident view of the Advanced Find view that can't be customized.

Merge cases from dashboard streams

1. In Customer Service Hub, select **Dashboards** in the site map.
2. Open the dashboard you want to look at.
3. Select at least two active case records that you want to merge using the **Bulk select** button .
4. Select the **More Actions** button , and then select **Merge Cases**.
5. In the **Merge Cases** dialog box, from the list of cases, select the case the other cases will be merged into, and then select **Merge**.

6. To see the merged case, open the case it was merged into. You'll find the merged case listed in the **Merged Cases** section on the **Case Relationships** tab.

Merge cases from a list of case records

1. In Customer Service Hub, select **Cases** in the site map. In Customer Service workspace, select the **My Active Cases** view on the **Customer Service Agent Dashboard**.

2. Select at least two active case records that you want to merge, and then on the command bar, select **Merge Cases**.

3. In the **Merge Cases** dialog, from the list of cases, select the case the other cases will be merged into, and then select **Merge**.

4. To see the merged case, open the case it was merged into. You'll find the merged case listed in the **Merged Cases** section on the **Case Relationships** tab.

Manage cases with case grids

Article • 07/03/2023

The modernized case grids help you increase your productivity by providing quick access to information, such as last customer interaction, case age, and the next SLA breach. You can perform inline edits and quick operations with minimal clicks, thereby managing cases quickly and efficiently. More information: Key features

Columns on the Enhanced Active Cases view

To be able to view the modernized case grids, your administrator must enable the **Enhanced Active Cases** view. More information: Enable case grids

> **Note**
>
> Enabling the **Enhanced Active Cases** view will alter the **modifiedon** and **modifiedby** fields on the case entity. We recommend that you avoid using these fields for reporting.

The following table explains the enhancements to the **Enhanced Active Cases** view columns when you enable the **Power Apps grid control**, compared with other grids, such as the **Read Only Grid**.

Column	Experience with Power Apps grid control	Experience with other grids
Origin	Shows the Origin Icon followed by the text for all the views on Case Grid. The Origin column is editable on double-click. You can sort and filter the data.	Only the text appears, without any icons.
Priority	Shows the color-coded Priority icon followed by the text for all the views on Case Grid. The Priority column is editable on double-click. You can sort and filter the data. **Note**: The colors displayed for the **Priority** and **Case status** fields have changed as an early access feature.	Only the text appears, without any icons.

Column	Experience with Power Apps grid control	Experience with other grids
Owner	Shows the profile image of the Owner, if available; otherwise shows the initials followed by the Owner name as text. The Owner column is editable on double-click. You can sort and filter the data.	Only the owner's name appears without any profile image or initials.
Last Interaction	Shows the last activity and the action performed on that activity—for example, **Note Added** for standard activities. For custom activities, only the created or updated status is shown. Selecting it opens the corresponding activity's form. This data is read-only. You can't sort or filter the data. Additionally, if the activity has an attachment, you can see an attachment icon next to the activity. Displaying the Last Interaction column doesn't affect the **modifiedon** and **modifiedby** fields.	No text appears.
Next SLA	Searches through all active, that is, non-canceled SLA KPI instances attached to the given case, filters, and then picks the SLA KPI instance that's in an unresolved state and has the earliest expiry time. If the expiry time is in the past, it indicates that there's an expired SLA instance associated with the case. The SLA KPI instance name isn't shown along with the timer control. The unsupported properties of the SLA timer control are negative timer, customized labels, upgrade frequency, and auto-refresh. The Next SLA column is read-only. You can sort the data but can't filter it. Calculating Next SLA for cases results in updates to the **modifiedon** and **modifiedby** fields on the case entity. If you want to disable Next SLA, you must contact Microsoft Support.	The SLA timer doesn't appear. Only the value assigned to **Next SLA** field in the back end appears, which includes details such as name of SLA instance and expiry/warning time.
Subject	Shows the subject associated with the case. You can edit the Subject column by double-clicking it. All the available options that you can select are listed. A hierarchical view isn't available. You can sort and filter the data.	The subject associated with the case appears as a text.
Is Escalated	Shows a toggle button reflecting whether the case has been escalated. The Is Escalated column is editable. You can sort and filter the data.	Escalation information in the form of **Yes/No** appears as text.

Column	Experience with Power Apps grid control	Experience with other grids
Case Age	Shows the static text with the duration for which the case has been active for active and resolved cases in the format {xx}d {yy}h or {xx}h {yy}m. For canceled cases, the column shows **Canceled**. For cases that were in the **Resolved** state before enabling modernized case grids, the column shows as **Resolved**. Calculated Case Age is refreshed every minute, but you must refresh the view to see the updated case age on the grid. The column shows **0h 0m** when a case is created, after which the column shows either **{xx}h {yy}m** or **{xx}d {yy}h**. This column is read-only. You can't sort or filter the data. To calculate case age for cases that are resolved after enabling modernized case grids, the **deactivatedon** attribute captures the date and time, when a case is resolved. Case age for resolved cases depends on the values of the **createdon** and **deactivatedon** attributes. Calculating case age for active or resolved cases won't affect the **modifiedon** and **modifiedby** fields.	Duration in minutes (whole number) for active and resolved cases appears. For canceled cases, **Canceled** appears.

Customize the Case grid

Depending on the information that you want to view, you can choose to add columns to the case grid and you can change the existing case grid views.

Add columns to the Case grid

Adding columns to the new **Enhanced Active Cases** view directly isn't supported. However, you can create a copy of the existing view and customize it.

To create a copy of the **Enhanced Active Cases** view and customize it to add a new column:

1. In the Customer Service workspace site map, open a new tab, and then select **Cases**.
2. From the dropdown list, select **Enhanced Active Cases** .
3. Select **Switch to classic**.
4. Enter a new name for the view. This saves it as a copy of the **Enhanced Active Cases** view.
5. From the list of views available for **Cases**, select the new view that you created.
6. Select **Column Options**.

7. In the **Edit columns** dialog, select **Add columns**. The Add columns dialog appears.
8. In the **Add columns** dialog, within **Case**, search for the column that you want to add.
9. Select the column, and then select **Close**. The new column that you have added appears in the **Edit columns** dialog.
10. Select **Apply**. If you want to change the sequence of the columns, select **Move up**, and then select **Apply**.

Make changes to existing case grid views

You can also add columns to your existing views. For example, if you want to add **Last Interaction** or any of the other new key data columns, perform the following steps:

1. In the Customer Service workspace site map, open a new tab, and then select **Cases**.
2. From the dropdown list, select any of the existing views.
3. Select **Column Options**.
4. In the **Edit columns** dialog, select **Add columns**. The **Add columns** dialog appears.
5. In the **Add columns** dialog, within Case, select **Custom** from the dropdown list.
6. Select **Last Interaction**, and then select **Close**. **Last Interaction** appears in the **Edit columns** dialog.
7. Select **Apply**. If you want to change the sequence of the columns, select **Move up**, and then select **Apply**.

View a social profile in social care sample application

Article • 05/23/2022

Track the high influencers and the customers for your business, and save them as contacts in Dynamics 365 Customer Service with their social profile information. You may want to get in touch with these resources later for marketing or brand-building purposes.

With the social care sample application, you can create a social profile and a corresponding contact automatically every time you create a case. You can also create social profiles for the authors of the posts who have a large number of followers or likes. These social profiles can be viewed in the **Services** area. If a social profile exists for the author of the post, a new profile is not created.

Every social profile has a corresponding contact in Dynamics 365 Customer Service. A contact can have several social profiles, but a social profile can't have several contacts.

> **Note**
>
> The social profile data in the application is read-only. You can only view, define a workflow, or change the owner of the record.

View a social profile

1. Go to **Service** > **Social Profiles**.

   The list of social profiles that are created in the application appears.

2. Double-click any social profile to see the complete details.

   The social profile form shows the name, profile link of the contact, and the cases associated with this social profile. You can also view the influencer score if it is included as part of the social feed.

Convert a case to a Knowledge article

Article • 12/14/2022

There are times when existing knowledge articles don't contain relevant information for resolving a case. You, as an agent, can now contribute to the knowledge base by turning all information that's been researched for a case into a knowledge article. You can convert one case into multiple knowledge articles.

1. Make sure you have Create permissions on the Knowledge Article entity.
2. In the list of active cases, open the one that has the information that you want to convert to a knowledge article.
3. On the command bar, select the ellipsis **(...)** and go to **Convert To** > **To Knowledge Article**.

   The **Convert to Knowledge Article** dialog box opens. The title, owner, and subject of the article are populated based on the title, owner, and subject of the case. The content of the article is automatically populated with the description of the case. If the case is resolved, the content field shows the case description, case resolution, and case resolution description.
4. If you want to open the newly-created article, select the **Open the new knowledge article** field to set it to **Yes**, and then select **Convert**. Otherwise, set it to **No**.
5. If you set **Open the new knowledge article** to **Yes**, a knowledge article form opens. Fill in the necessary information for the knowledge article, and then select the **Save** button. More information: Create and manage knowledge articles

The knowledge article is created regardless of whether you set **Open the new knowledge article** to **Yes** or **No**.

View AI-suggested similar cases and knowledge articles

Article • 08/01/2022

When you open an active case, you can view suggestions about similar cases that were previously resolved successfully and knowledge articles. With the use of AI, these features help you find the right solutions and provide better and faster service to customers. To understand how AI-suggestions work, see How AI suggestions for similar cases and knowledge articles work.

The AI suggestions are displayed in smart assist, an intelligent assistant that provides real-time recommendations to you, helping you take actions on active cases or during your interactions with customers in ongoing conversations. If similar cases and knowledge articles aren't displayed, your Administrator would've disabled the AI-suggestions for similar cases and knowledge articles features.

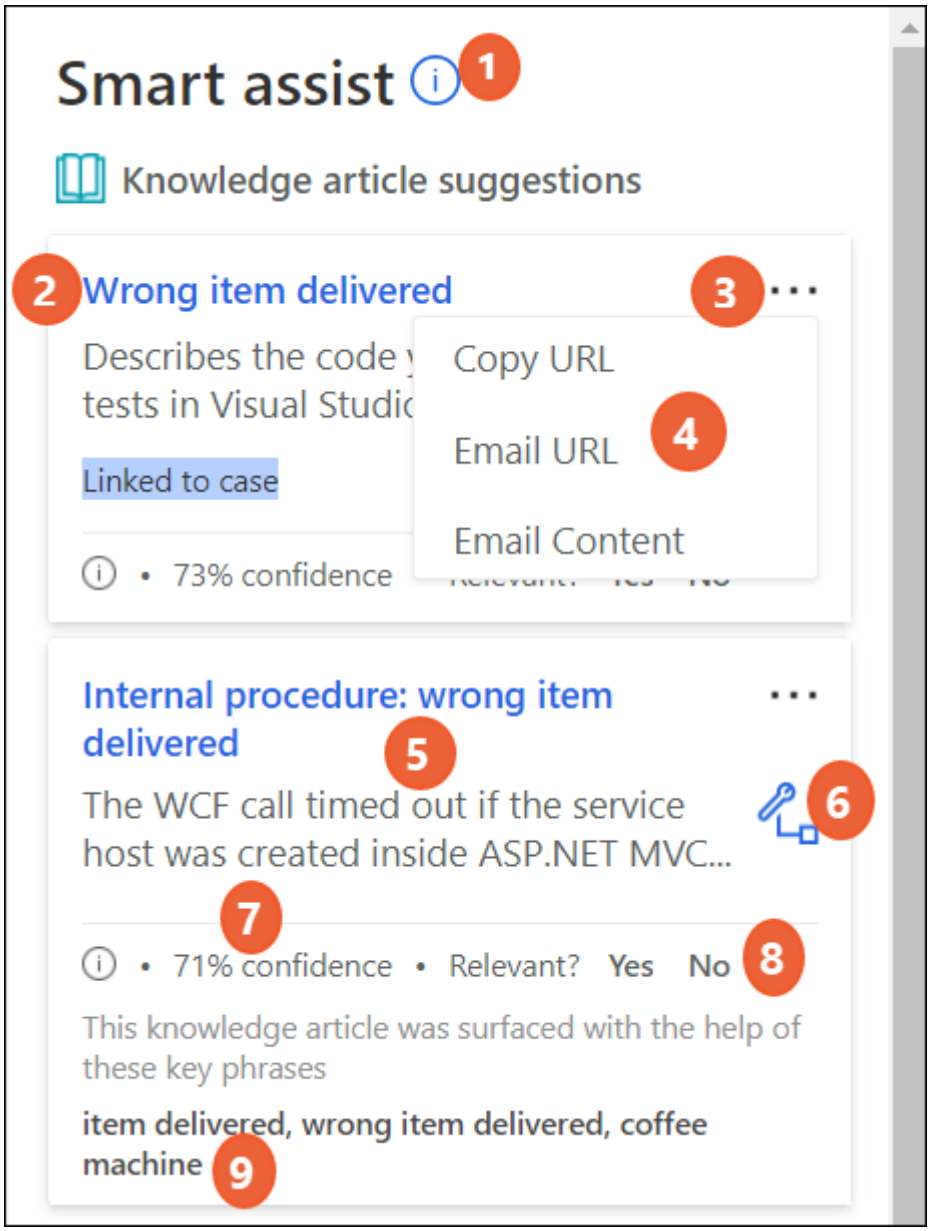
> **Important**
>
> The **Smart assist** pane is displayed only when you open the case in a new session tab. If you open to view a resolved case in an app tab when your in-progress case is open, smart assist will not be refreshed for the resolved case.

Prerequisites

- AI-suggestions for similar cases and knowledge articles should be enabled. This feature is enabled out of the box.
- Smart assist feature must be enabled by your administrator. More information: Smart assist in Customer Service Workspace
- The Productivity tools user role must be assigned to you.

Understand the knowledge article components in smart assist

When you open an active case to work on it, up to three top knowledge articles that match the case context are displayed in the **Smart assist** pane.



The following table lists the explanation of the smart assist card for AI-suggested knowledge articles.

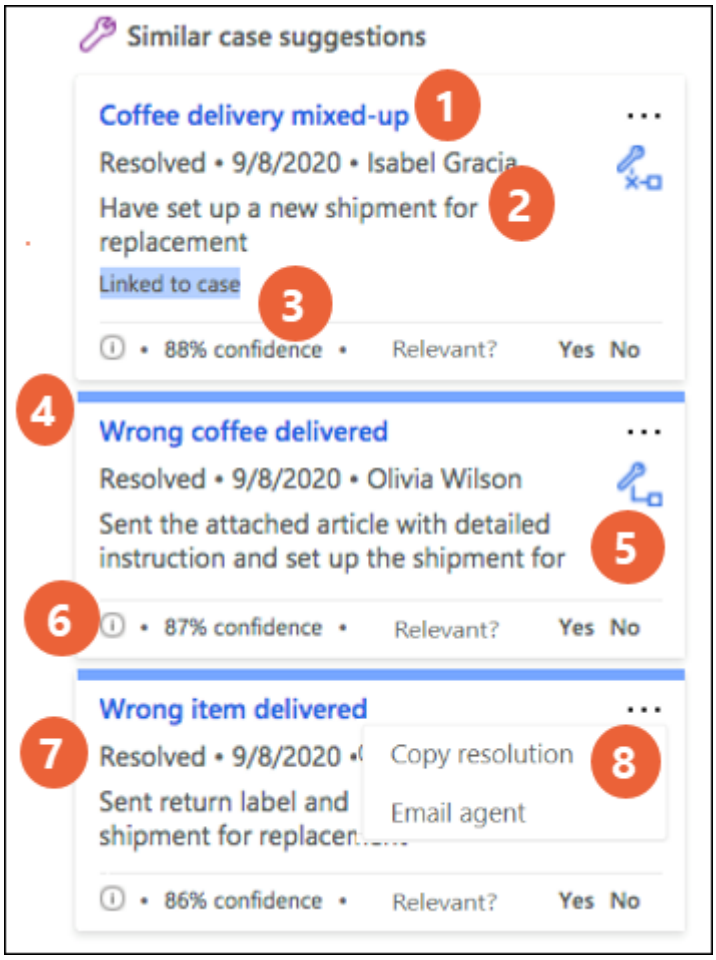
Label	Description
1	Displays the information about the cards when selected.
2	Title of the related knowledge article.
3	More commands
4	Displays the actions that can be performed when you select more commands.
5	A brief summary of the knowledge article that is generated by the AI model.
6	Option to link the article with the case as a related article.

Label	Description
7	Displays the confidence score based on which the knowledge article was selected by the AI model. Usually, the suggested knowledge articles are highly relevant to the context of conversations when the confidence score is above 80%; suggestions with lower confidence score may still be relevant based on the semantic meaning of some key words in the conversation. The minimum confidence score is 65%.
8	When user selects **Yes**, the label is highlighted and the card remains on the pane. If user selects **No**, the card is replaced with a new suggestion, if it exists. This feedback from agents is used by the AI model to retrain and improve the suggestions over time.
9	Displays information on the keywords that were used by the AI model to match the article.

If no knowledge articles match, then the card displays an appropriate message, such as "No suggestions found for knowledge article."

Understand the similar cases components in smart assist

When you open an active case to work on it, up to top three resolved cases that you have access to are suggested by the AI model and displayed in the **Smart assist** pane. By default, the suggestions are made based on case title and description. Your administrator may change the settings to use other text fields for the AI model to get the case context.



The following table lists the explanation of the smart assist card for AI-suggested similar cases.

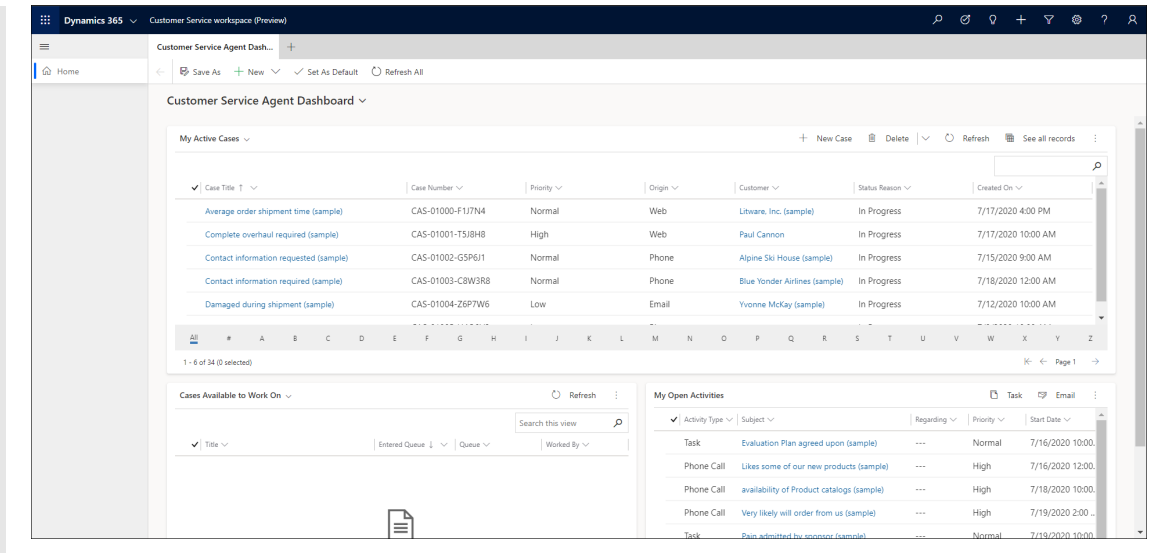
Label	Description
1	The title of the similar case.
2	Summary of the case resolution that is generated by the AI model.
3	Displays the confidence score based on which the knowledge article was selected by the AI model. Usually, the suggested cases are highly relevant to the context of cases when the confidence score is above 80%; suggestions with lower confidence score may still be relevant based on the semantic meaning of some key words in the cases. The minimum confidence score is 65%.
4	Blue bar indicates that the user hasn't interacted with the card yet.
5	When selected, links to the current active case or removes the link to the similar case.
6	When selected, displays information on the keywords that were used by the AI model to match the article.
7	Status of the similar case.
8	Displays the actions that can be performed when you select more commands.

If no cases match, then the card displays an appropriate message, such as "No suggestions found for similar cases."

View AI-suggested similar cases and related knowledge articles

Perform the following steps to view the similar cases and related articles for the case you are working on. The actions that you can perform with the options available in the suggestions are determined by the role assigned to you.

1. In Dynamics 365, select Customer Service Workspace. The **Customer Service Agent Dashboard** page appears.



2. In the **My Active Cases** list, select shift+mouse click the case you want to work on. The case opens in a session tab, and the **Smart assist** pane appears on the right. The Smart assist pane lists the top three knowledge articles and five similar cases suggested by AI based on the case context.

3. In the **Knowledge article suggestion** area, do any of the following:

   - Select an article title to go through and get relevant information. The selected knowledge article opens in a new application tab.
   - Select more commands to do the following:
     - **Copy Url:** Select to copy the knowledge article link to the clipboard.
     - **Email URL:** Select to open the email compose form with the link to the article pasted in the email body.
     - **Email:** Select to open the email compose form with the contents of the knowledge article pasted in the mail body.
   - Select the link icon to associate the article with the case as a related article.

4. In the **Similar case suggestions** area, do any of the following:

    - Select a case title to drill through the details of the resolved case.
    - Select more commands to do the following:
        - **Copy resolution:** Select to copy the resolution notes information from the resolved case to the clipboard.
        - **Email agent:** Select to open the email compose form to send your questions to the agent who handled the similar case. The mail form opens on a new tab with the pertinent information and link to the resolved case filled in.
    - Select the link icon to link or clear the link with the similar case.

Manage cases using interactive dashboards

Article • 07/14/2021

Use interactive dashboards to effectively manage service cases in the Customer Service Hub application.

Dynamics 365 Customer Service interactive experience dashboards are a one-stop workplace where you review your workload and take actions. The information in the interactive dashboard is shown in real time, coming from views and queues. The interactive dashboards with their modern and intuitive interface are optimized for the customer service experience. For example, instead of paging through the application looking for a case, you'll be able to open and update the case right from the dashboard. This will save you time, help to focus on tasks at hand, and get more work done. You'll need sufficient permissions to use the interactive dashboards. The permissions will be assigned to you by an administrator.

Watch this video to learn more about dashboards in the Customer Service Hub: https://www.microsoft.com/en-us/videoplayer/embed/2a9199d6-67b8-486d-a915-1ed2fb33c80c?postJsllMsg=true

Interactive experience dashboards overview

The interactive dashboards come in two flavors:

- Multi-stream dashboards
- Single-stream dashboards

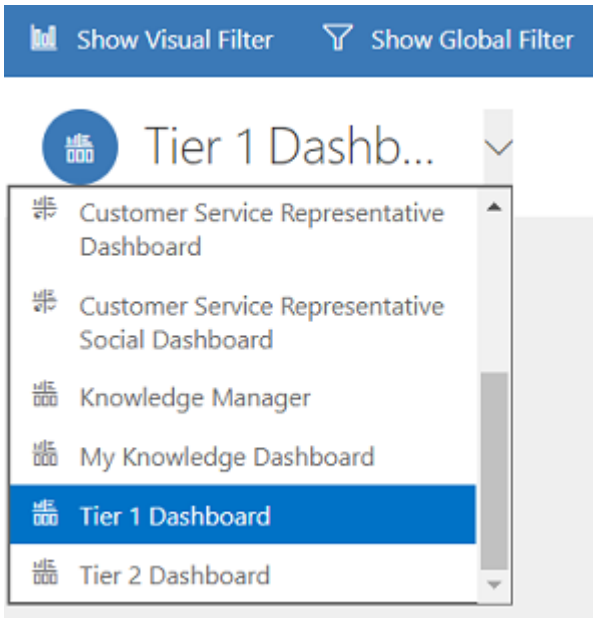
When you sign in to the Customer Service Hub, you're looking at the Tier 1 multi-stream default dashboard. A multi-stream dashboard displays data in real time over multiple data streams. The data in a stream is based on an entity's view or a queue, such as My Activities, My Cases, or Cases in the Banking Queue. While a stream always contains information only about one entity, each stream on the dashboard may contain information about a different entity. For example, you may be tracking cases in one stream and accounts in the other stream, but, you can't track cases and accounts in the same stream. In a multi-stream dashboard all streams may be displaying data based on the same entity.

You could also be using a multi-stream entity-specific dashboard, such as the Cases dashboard. To open a dashboard like this, navigate to **Service** and down to a specific

entity, such as **Cases**. The default **Cases** grid is displayed. To directly open the **Cases** dashboard from the cases grid, select 
from the command bar.

> ⓘ **Note**
>
> You can access entity dashboards from the command bar on home page grids via **Open Dashboards** command.

Multi-stream dashboards target Tier 1 support, where customer service representatives handle many support cases at the same time. An entity-specific dashboard can be useful for Tier 1 representatives or Tier 2 customer representatives that look at fewer, but, more complex cases. In the multi-stream dashboard, you can easily switch from a standard view to the tile view. The interactive tiles show an aggregated view of the data across the queues or views. You can also select the tile to drill down to the underlying records. The interactive dashboard application opens with the Tier 1 interactive dashboard. However, you can make another selection from the available dashboards, as shown here:



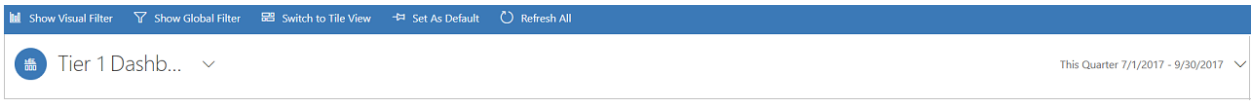
Single-stream dashboards display real-time data over one stream based on a view or queue. The tiles are positioned on the right side of the dashboards and are always shown. Single-stream dashboards are helpful to Tier 2 leads or managers, who monitor fewer, but more complex or escalated cases in a single view or queue.

Multi-stream and single-stream dashboards contain interactive charts that give you a count of relevant records, such as cases by priority or by status. These charts also act as visual filters.

You can apply additional filtering with **Global filters** and **Timeframe filters**. The Global filter works on streams and charts in the dashboard. You can sort the data in a stream based on different criteria, such as the priority, status, or the date when the record was created.

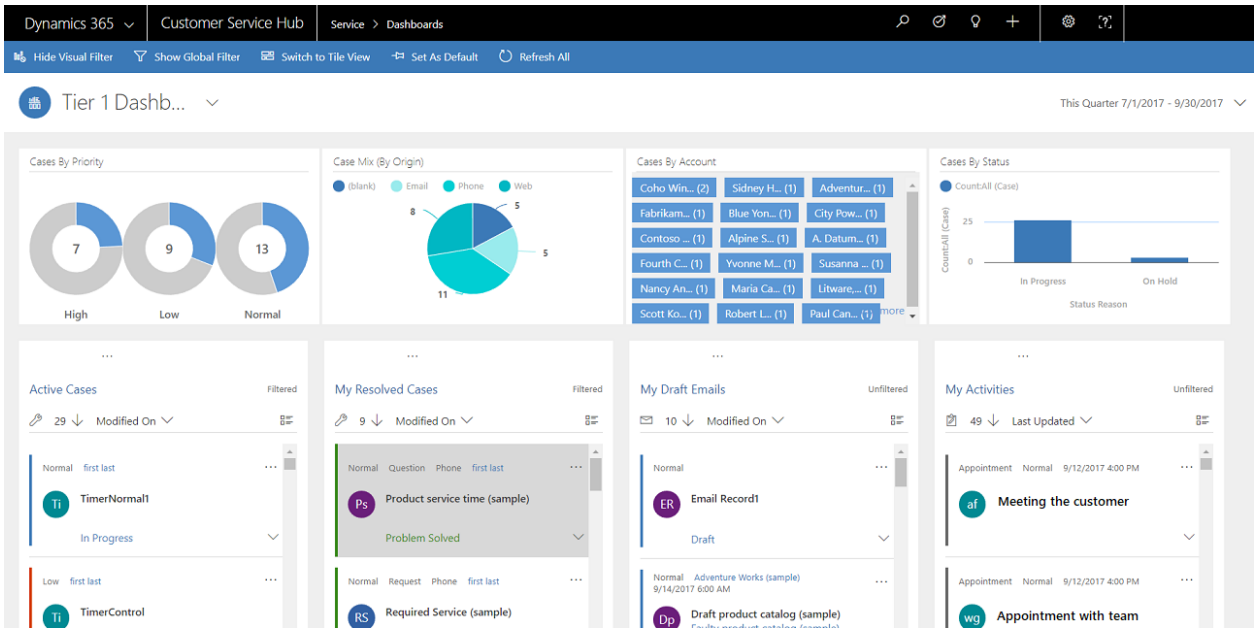
The illustrations given below show multi-stream and single-stream dashboards with the header pane. Below the header you see visual filters and streams. In the single-stream dashboard, you also see tiles. The dashboard header shown here contains the following controls and clickable buttons, from left to right:

- Dashboard selector
- Show Visual filter
- Show Global filter
- Switch to Tile view
- Set as Default
- Refresh All
- Timeframe filter



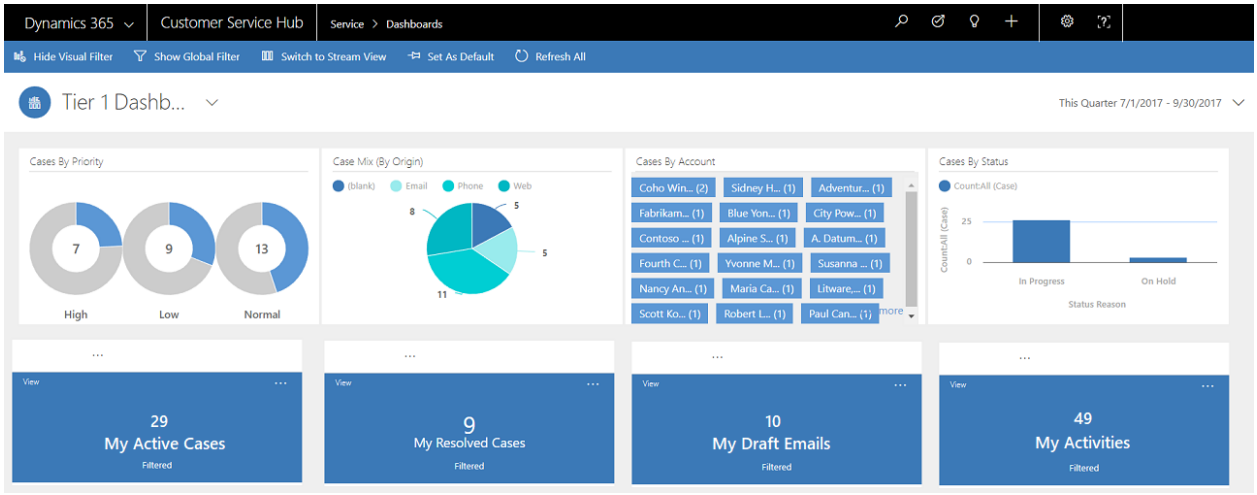
Multi-stream dashboard standard view (with visual filter)

In the multi-stream dashboard, when you select **Show Visual Filter**, you see a row of visual filters at the top with the data streams below.



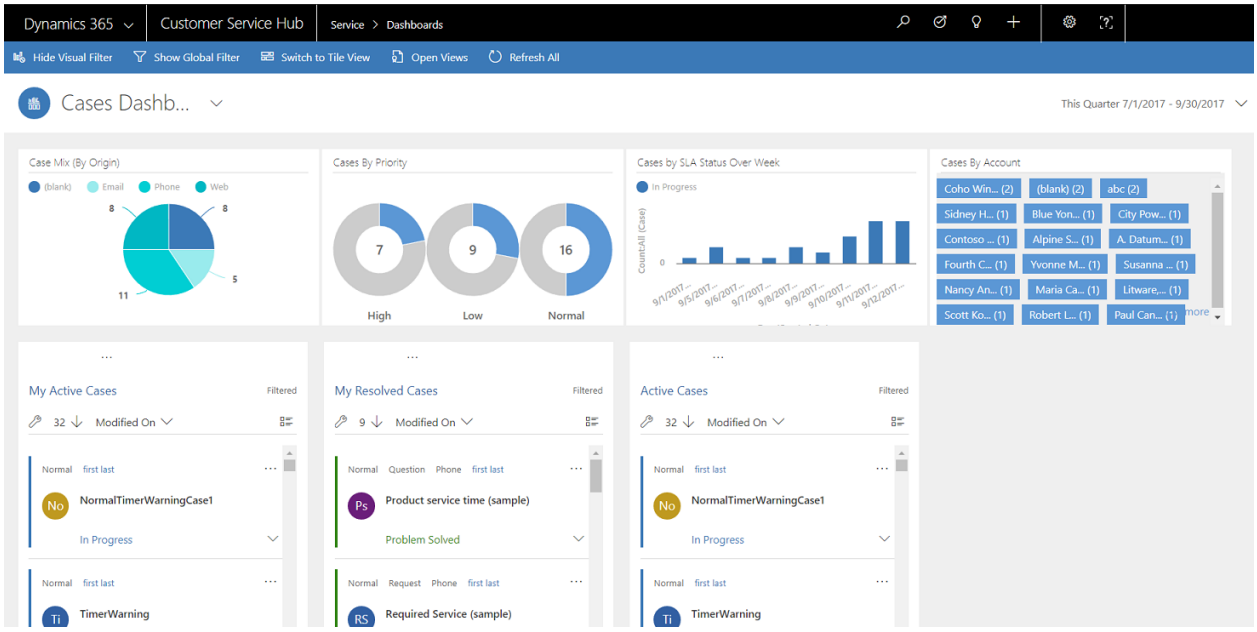
Multi-stream dashboard tile view (with visual filter)

The same dashboard, in the tile view.



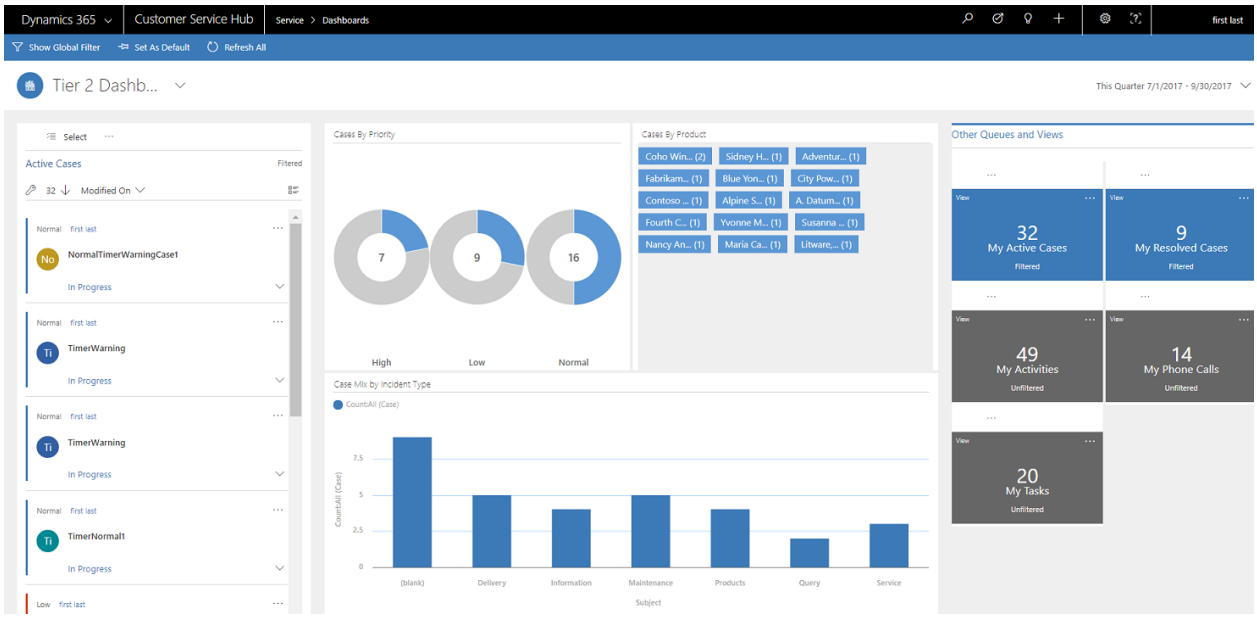
Multi-stream entity specific dashboard standard view (with visual filter)

The following illustration shows the entity specific dashboard for the **Case** entity, with enabled visual filter.



Single-stream dashboard

The single-stream dashboard contains the data stream on the left and visual filters and tiles on the right.



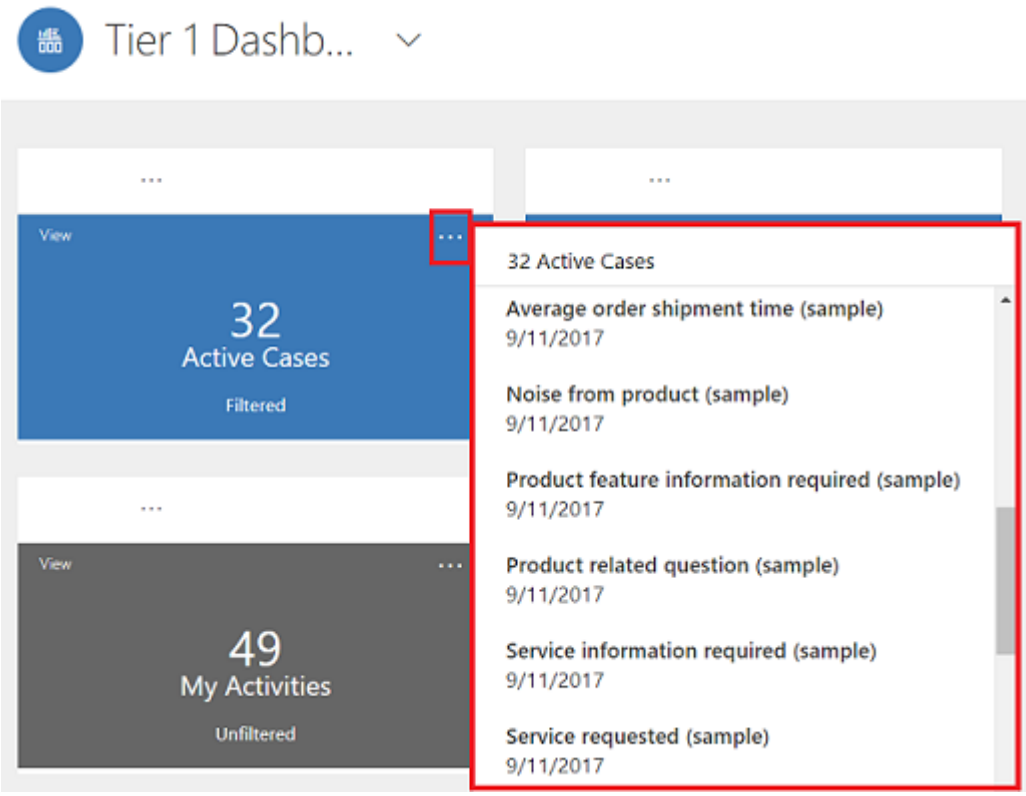
Interactive tiles

Interactive tiles provide an aggregated view of the information in the streams, across queues or views that interest you most. They help you monitor the volume of cases and quickly drill down to a particular case. In the multi-stream dashboard, you can switch from the standard view to the tile view by selecting 
given in the command bar.

If you have five streams in the multi-stream dashboard in the standard view, after you switch to tiles, you'll see five tiles. If a view that tracks your active cases contains 32 items, the corresponding **My Active Cases** tile will display a numerical number 32 in the center of the tile. To drill down to a particular case, do one of the following:

- Select the tile anywhere
- Select **View**
- Select **(...)** in the top right corner

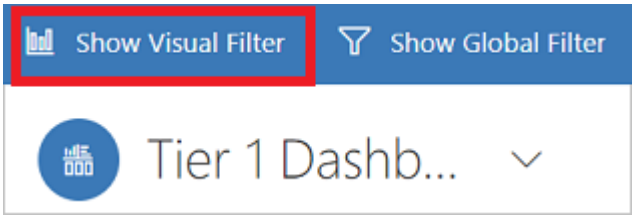
A flyout window will open. If there are too many cases to show, the window will have a scrollbar. You can navigate and select a particular case in the list, which will take you straight to the case form. The illustration shows the tiles and underlined cases in the list.



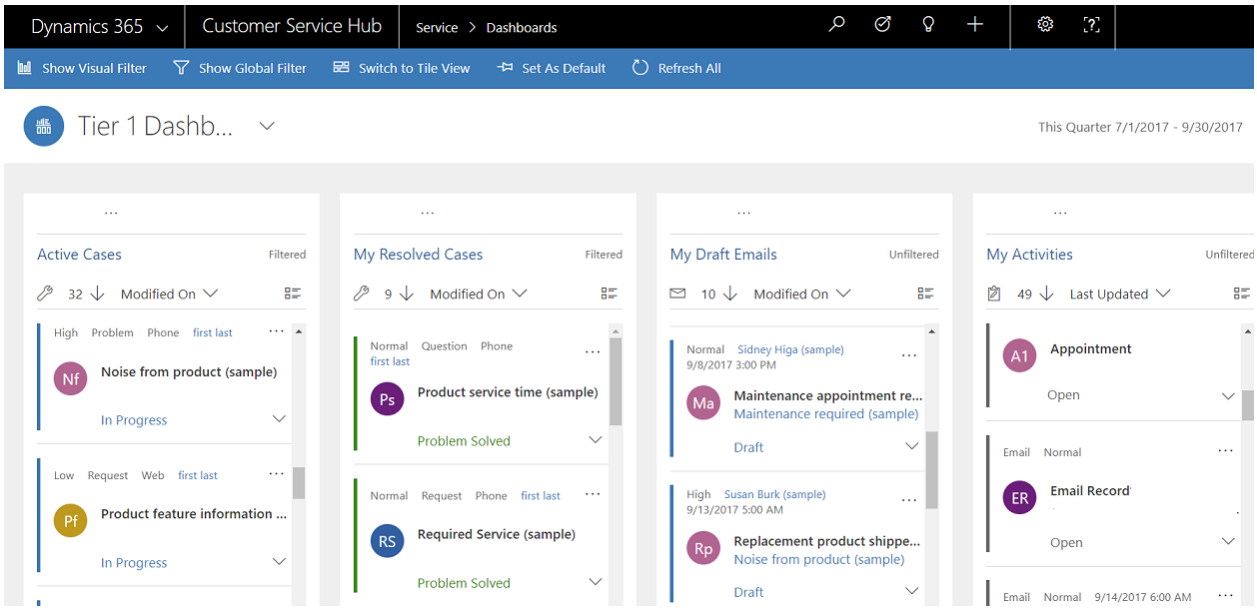
Visual Filter

Visual filters provide a visual snapshot of key metrics, such as cases by priority or by origin. They also help removing clutter from the screen and display information that interests you most. For example, if you select the **High Priority** circle in the **Cases by Priority** chart, the dashboard will refresh and you'll see only high priority cases in your data streams. You can find different types of charts on your dashboard, such as pie, bar, doughnut, or tag chart. Visual filters and tiles help you see the changes and patterns in data, and act quickly to address the most important issues.

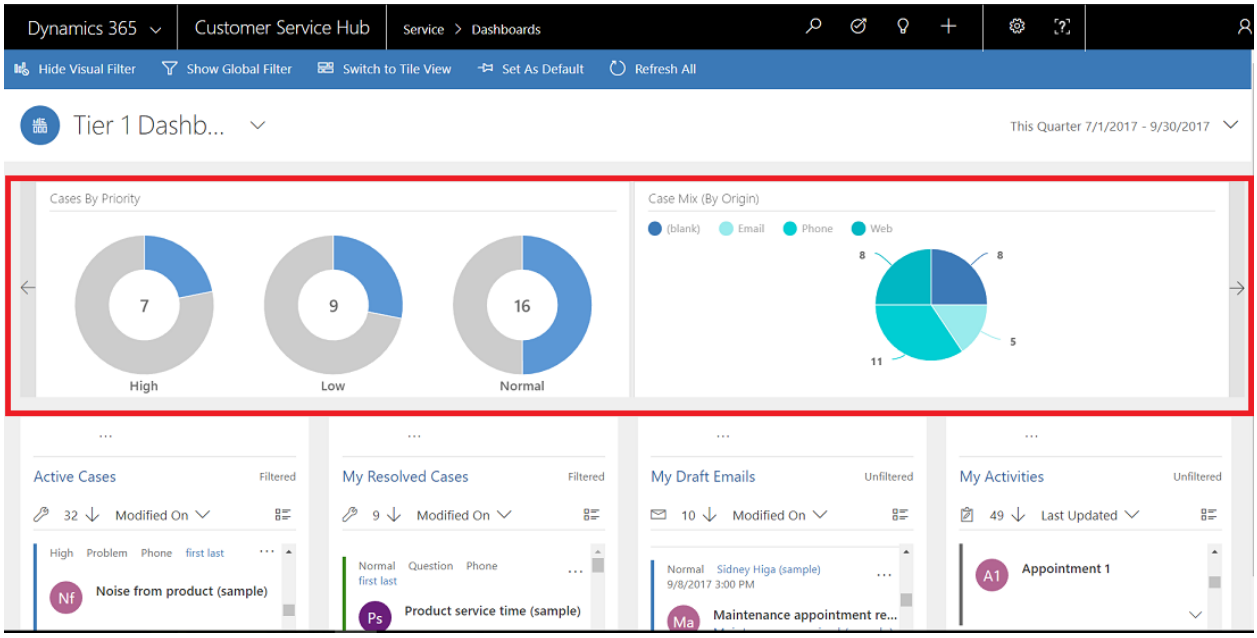
To display the charts on the dashboard, select the visual filter button in the dashboard header, as shown below. The clickable button acts as a toggle switch, to show or hide the visual filters on the dashboard. On the single-stream dashboard, the visual filters are always shown and can't be hidden from the view.



The following illustration shows the multi-stream dashboard without visual filters enabled:



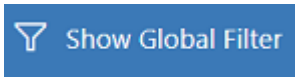
The following illustration shows the multi-stream dashboard with visual filters. You can use the arrows to move the view right or left to see all charts.



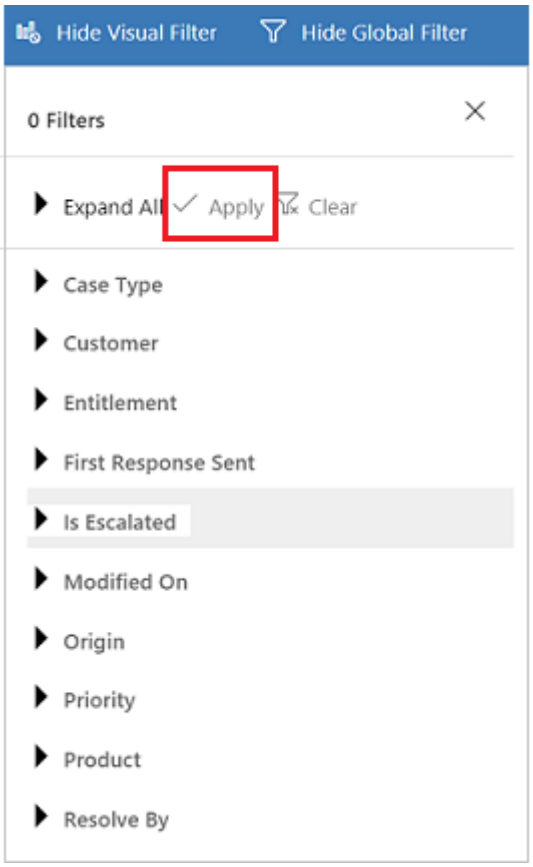
Global Filter

To add granularity to filtering data, you can use the Global filter. For example, you can apply the Global filter to show only escalated cases and the cases that are marked as "Request."

Select the **Show Global Filter** button in the command bar to view and apply global filters.



When you select the Global filter button, the filter flyout window opens. The entity fields that are preconfigured by your administrator appear in alphabetical order in the flyout window. You can select multiple values in a field, as well as values from multiple fields. Select **Apply** for the action to take place.



After you apply Global filters, the dashboard refreshes to show you only the cases in charts, streams, and tiles that are based on the filter entity (the filter entity is the entity that is used in the charts). To clear the Global filter, select **Clear** in the flyout window.

By using a combination of Visual and Global filters, you can drill down from a long list of cases to a more focused list.

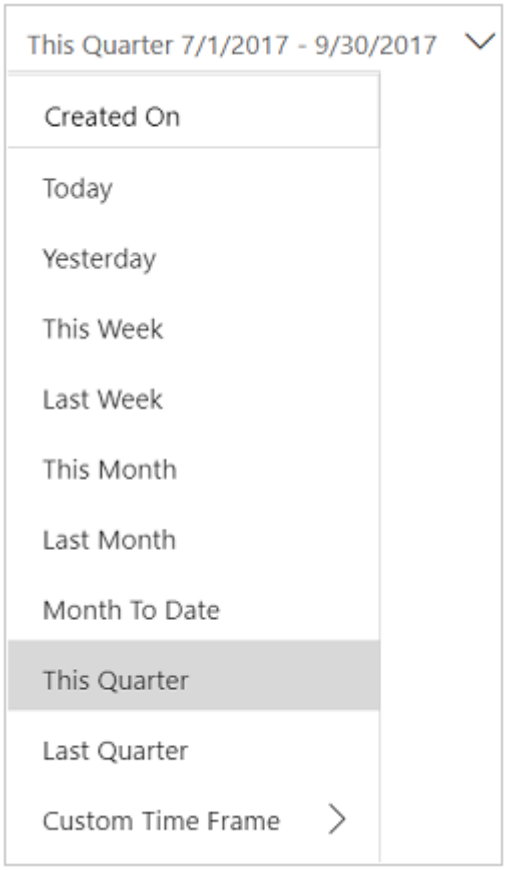
Clear the filters

Filtering helps remove the clutter on the screen and show only the work items that you want to focus on. However, if you want to see the entire unfiltered workload, select the specific filter button once again to clear the respective filter.

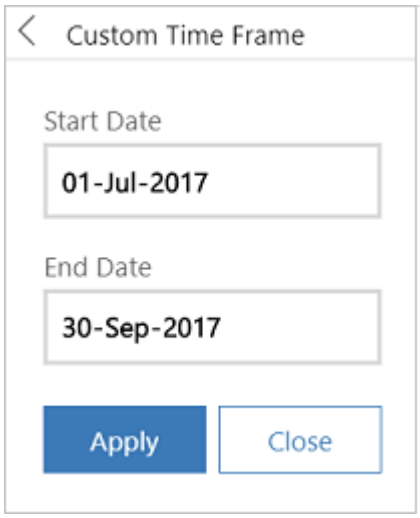
For example, select **Hide Visual Filter** to clear all visual filters applied on the records.

Timeframe filter

You can apply a specific timeframe to display cases in a specified period of time. The available timeframe filters are:

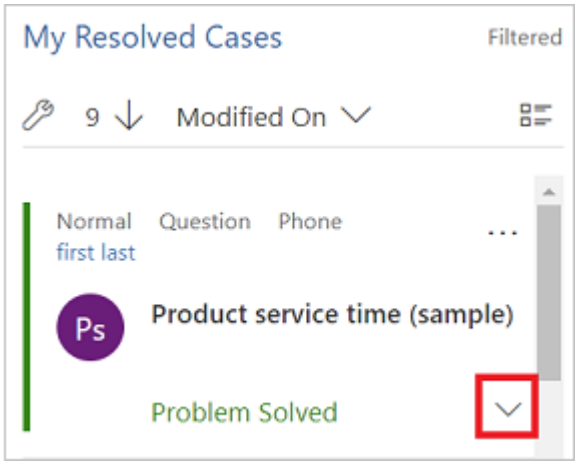


For example, you can choose to view cases created in **This Quarter**, or **Last Quarter**. You can also apply **Custom Time Frame** filter, where you can choose a particular start and end date to view the records created during a specific timeframe.



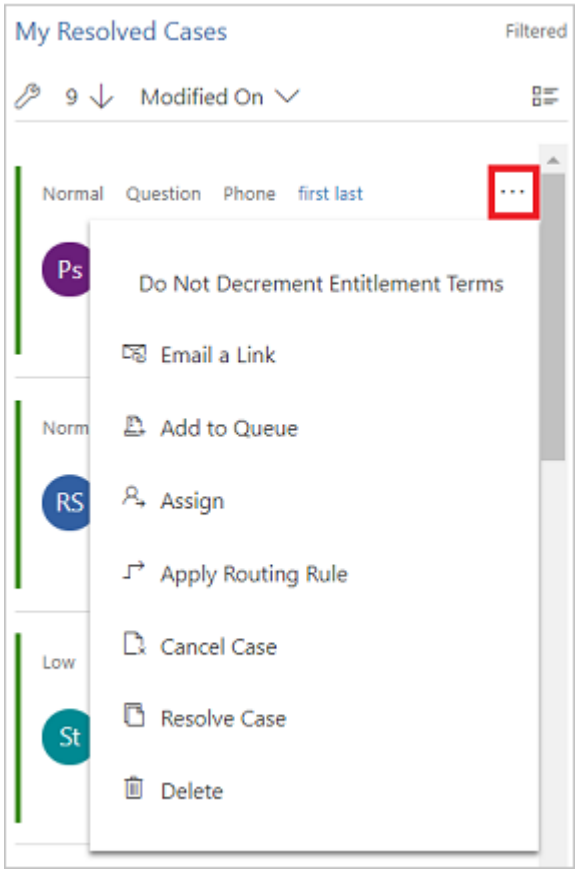
Collapse or expand work item description in the stream

To learn more about the work item, you can expand the work item description area. Select the arrow in the bottom right corner of the work item to expand or collapse the description, as shown here.



Show quick actions

Select the quick action menu (...) in the top right corner of the work item to open the quick actions menu. From this menu, you can directly resolve or cancel the work item, or assign the work item to another owner, as shown here:



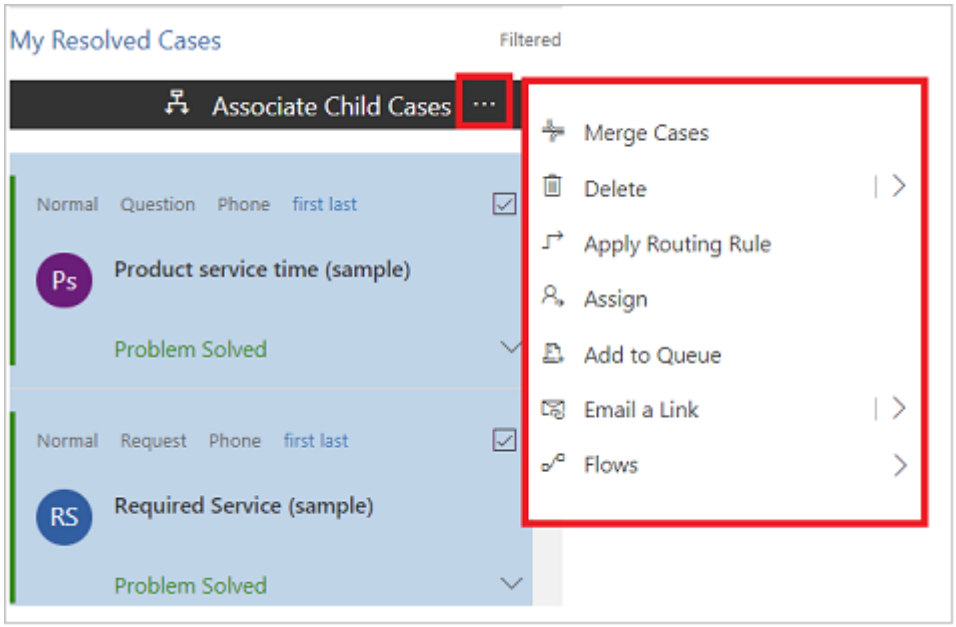
> ⓘ **Note**

The Quick action commands on the streams feature the full set of grid commands. These are configurable and are shared between dashboards and grids.

Apply Bulk Select

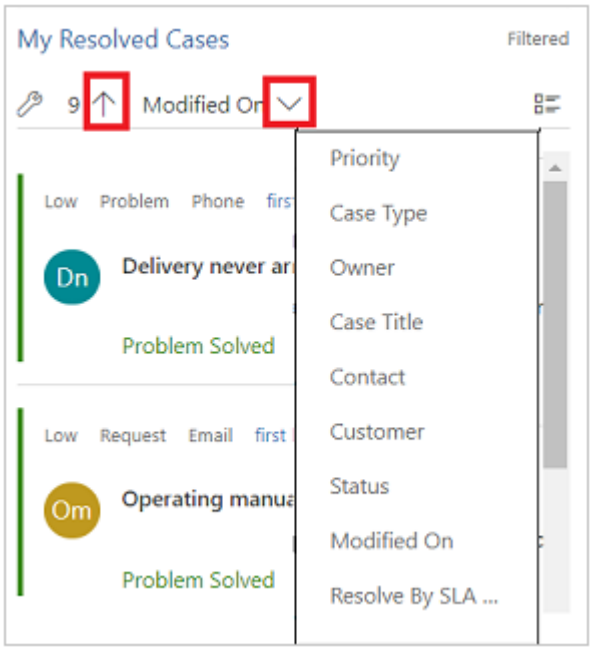
Benefit from the Bulk Select option, where you can select multiple records at one time and perform specific actions.

Select the Bulk Select icon and select multiple records by selecting the check box. Then select **(...)** to view the actions that can be performed on the selected records.



Change the sort order in the data stream

You can easily toggle the sort order in the stream by selecting the field name on which you want the data to be sorted. You can also sort the records by oldest or newest.



Color-coded data in streams and charts

The information in the charts and streams is color coded for the fields that contain a set of options. For example, a case type can be **Question**, **Problem**, or **Request**. A case's status can be **Resolve** or **In-progress**. Each of these options can be assigned a specific color. For example, cases that are **In-progress** can be shown in blue and **Resolved** cases can be shown in green.

In the streams, the color is depicted using the thin vertical line to the left of the work item description. You can work with your administrator to choose the colors you like for your dashboard data.

Allow updates for resolved and canceled cases

Article • 06/12/2023

Overview

Based on your business requirements, you might need to update case descriptions or other information after the cases have been resolved or canceled. For example, for General Data Protection Regulation compliance, you want to remove certain data from your case records. You can't update any details for cases if the status is resolved or canceled. However, you can update such case information by configuring and running flows in Power Automate or an API without having to reopen the case records in the UI.

> **Note**
>
> The option to update cases in resolved or canceled state is the default behavior.

Enable settings for allowing updates to cases in resolved or canceled state

Perform the following steps to enable modifications to cases that are in the resolved or canceled state:

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Case Settings** in **Customer Support**. The **Case Settings** page appears.

   b. Select **Manage** for **Other settings**.

2. In **Case update after resolution**, select **Resolved and canceled cases** in the **Allow updates for** list if it is not selected. You can also select only **Resolved cases**, **Closed cases**, or **Don't allow updates** based on your business needs.

3. Configure flows in Power Automate or use an API that can be run to update the case records.

Automatically create or update records in Customer Service Hub

Modify the case resolution dialog

Article • 06/12/2023

You can customize the case resolution dialog to suit your business needs. You can modify the dialog to add fields like **Resolution type** or remove fields like **Billable Time**, if they don't apply to your business scenarios. You can also create case resolution rules by adding custom status values. The following sections discuss the permissions you'll need to modify the case resolution dialog and how to enable the option to customize dialogs in Customer Service Hub. You'll also learn to customize the case resolution dialog and add custom case resolution rules using examples.

> ⓘ **Note**
>
> The option to customize the case resolution dialog is also available in Dynamics 365 Customer Engagement (on-premises) 9.1. More information: **New features in Dynamics 365 Customer Engagement (on-premises)**

Check permissions

Make sure that the CSR Manager and Customer Service Representative security roles have the following permissions set for **Environment Variable Definition**:

- **Customer Service Manager**: Create, Read, and Write
- **Customer Service Representative**: Read

If you've created custom security roles, you'll need to update the roles to use the modified case resolution dialog.

Customize dialogs

By default, the style of the **Resolve case** dialog is set to standard dialog. You can, however, change the style to **Customizable dialog** so that you can add custom fields and values.

To enable the Customizable dialog option

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

a. In the site map, select **Case Settings** in **Customer Support**. The **Case Settings** page appears.

b. Select **Manage** for **Other Settings**.

2. On the **Service Configuration Settings** page, scroll to the **Resolve case dialog** section, and then select **Customizable dialog** from the dropdown list.

3. Select **Save**.

Add or remove fields from the case resolution dialog

You can modify the case resolution dialog and remove a field so that it no longer appears at runtime for the user.

As an example, let's see how to remove the **Billable Time** field from the **Information** form.

> ⓘ **Note**
>
> - Ensure that the **Total Time** field is added to the case resolution dialog, for the **Billable Time** field to display the amount of time an agent worked on a case automatically.
> - Case resolution isn't supported if **Regarding** is added to **Case resolution dialog**.

1. In the solution explorer under **Components**, expand **Entities**, select **Case Resolution**, and then select **Forms**.

2. Open the form you want to edit. For this example, let's select the **Information** form. The form opens in the form designer.

3. In the form designer, do the following actions:

   a. Select **Billable Time**.

   b. On the command bar, select **Remove**.

4. Select **Save**, and then select **Publish**.

When the customer service representatives try to resolve a case, the case resolution dialog won't display the field that you removed.

Add custom values to the case resolution dialog

Let's understand how to add custom status values to the case resolution dialog with an example. Say, for example, you receive many similar business cases and you want to improve agent productivity and reduce case resolution time. You can add a case resolution rule where any case that's similar to a previously resolved case can be resolved by marking it as a "duplicate case".

1. Update the Case entity to add a new **Resolved** status type and assign a **Duplicate** custom value to it.
2. Update the resolution type of the Case Resolution entity with the same custom value to ensure that all duplicate cases are assigned the same resolution type.

> **ⓘ Important**
>
> If you change the value in **Case entity**, be sure to update the value in **Case Resolution entity** so they match. If the values don't match, an error might occur. If the values don't match in the customizable dialog, the values that you specified won't be displayed.

Update the case entity

1. In Dynamics 365, go to **Advanced Settings**, select **Customizations**, and then select **Customize the System**.

   If using Power Apps, go to **Settings**, and under **Power Apps**, select **Advanced Settings**, then select **Customizations** and **Customize the System**.

2. In the site map of the page that appears, under **Components**, expand **Entities**, select **Case**, and then select **Fields**.

3. On the page that appears, select the field you want to update. For this example, let's select **statuscode** in the **Name** column.

4. Double-click to select the **statuscode** field. The **General** tab of **Status Reason of Case** is displayed.

5. In the **Status** dropdown list in the **Type** section, select a status. For this example, let's select **Resolved** and then select **Add**. The **Add List Value** dialog is displayed.
6. In the **Label** field, enter **Duplicate** and note down the value listed in the **Value** field.
7. Select **OK**.
8. If you've preconfigured status reason transitions, select **Edit Status Reason Transitions** to set up new status reasons. For more information, see: Define status reason transitions.
9. Select **Save and Close**. You've successfully added a custom status type and status value to the case entity.

Update the case resolution entity

1. In the solution explorer under **Components**, expand **Entities**, select **Case Resolution**, and then select **Fields**.
2. On the page that appears, select the field that you want to update. For this example, let's select **resolutiontypecode** in the **Name** column.
3. Double-click to select the **resolutiontypecode** field. The **General** tab of **Resolution Type of Case Resolution** is displayed.
4. In the **Options** section, select the plus sign to add a new item to the **Label** and **Value** fields.
5. In the **Label** field, enter a value name; **Duplicate** in our example. In the **Value** field, enter the corresponding value you noted earlier in the case entity **statuscode** field.
6. Select **Save and Close**.

Continuing with the same example, let's now see how to use the **Duplicate** custom status value in case resolution, so that duplicate cases are automatically marked as resolved.

Automatically resolve duplicate cases

Now, let's see how to use the **Duplicate** custom status value in case resolution, so that duplicate cases are automatically marked as resolved.

1. In Customer Service workspace, open a case that you recognize as similar or duplicate of a previously resolved case. The **Summary** page with the case details

opens. If you're using Customer Service Hub, in the site map, go to **Service**, select **Cases**, and select a case.

2. To resolve the case, select **Resolve Case** on the command bar.

3. In the **New Case Resolution** dialog that opens, do the following:
   a. In the **Resolution Type** dropdown list, select **Duplicate**.
   b. In the **Resolution** field, add case resolution notes.

4. Select **Save and Close**.

The case is automatically marked as resolved and you'll see the resolved status for the case displayed on top of the case title.

Remove validation on contact and customer for cases in Customer Service

Article • 08/25/2021

Introduction

When you create or update a case record for a customer and contact, out of the box, the contact record must be associated with the customer record. However, based on your business requirements, you might need to select a contact record that doesn't belong to the customer organization. To meet your business needs, you can customize the case form to remove the form validation and thereby allow an unrelated contact be linked with the case.

Remove the validation on contact and customer for a case

Perform the following steps to disable the validation on contacts and customers:

1. Go to the Power Apps portal.
2. Select the required environment, select **Solutions** in the left pane.
3. On the **Solutions** page, select Default Solution.
4. On the top right, select All, and then select Environment variable in the list.
5. Select the ellipses for msdyn_IncidentShouldValidatePrimaryContact, and then select Edit.
6. On the flyout menu that appears, select **New value**, enter the number **0**, and select **Save**.

Now, when agents are creating or updating a case, they can select contacts who are not part of the customer organization.

Automatically create or update records

Article • 10/09/2023

> **Tip**
>
> If you'd like to try Dynamics 365 Customer Service for free, you can sign up for a **30-day trial**.

You can automatically create or update system or custom records from incoming activities, such as emails, social activities, and custom activities. In this section, you'll learn about creating rules for automatically creating records for cases from incoming emails.

> **Note**
>
> Modern automatic record creation and update rules isn't supported on on-premises environments.

Set up rules for creating or updating records automatically

Every organization has multiple applications to capture customer interactions. The ability to channel external data into Microsoft Dataverse records can significantly improve the efficiency of your sales, marketing, and service teams, and increase the quality of your data. You can now direct this data from various applications and external sources into Dataverse with the help of *record creation and update rules*.

A record creation and update rule consist of rule items. The rule items define the conditions for creating or updating records, and also define the actions or steps to be taken on the records.

When a case record is created through an automatic record creation rule, and the rule owner is a team, the owner of the case record will be the team's administrator user.

Activities and entities supported by rules for creating or updating records automatically

By default, Dynamics 365 Customer Service supports creating records from the following activities:

- Email
- Social activity
- Task
- Phone call
- Appointment
- Service activity
- Custom activity

These activities can be converted to any default (system) entity records or custom entity records. For example, you could create a lead, opportunity (system record), or incident (custom record) from an incoming email.

Prerequisites

Make sure that the following prerequisites are met:

- Permissions, roles, and the Power Automate license to create automatic record creation rules.
- Information on the queues for which you want to create the rules.

Configure rules for creating or updating records automatically

You can configure a rule that when active will be run for incoming emails. By using the feature to create rules, you can define the conditions for when a rule can be run.

You can configure the rules in the Customer Service admin center or Customer Service Hub app.

1. Go to one of the admin apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Case Settings** in **Customer Support**. The **Case Settings** page appears.
   b. In the **Automatic record creation and update rules** section, select **Manage**.

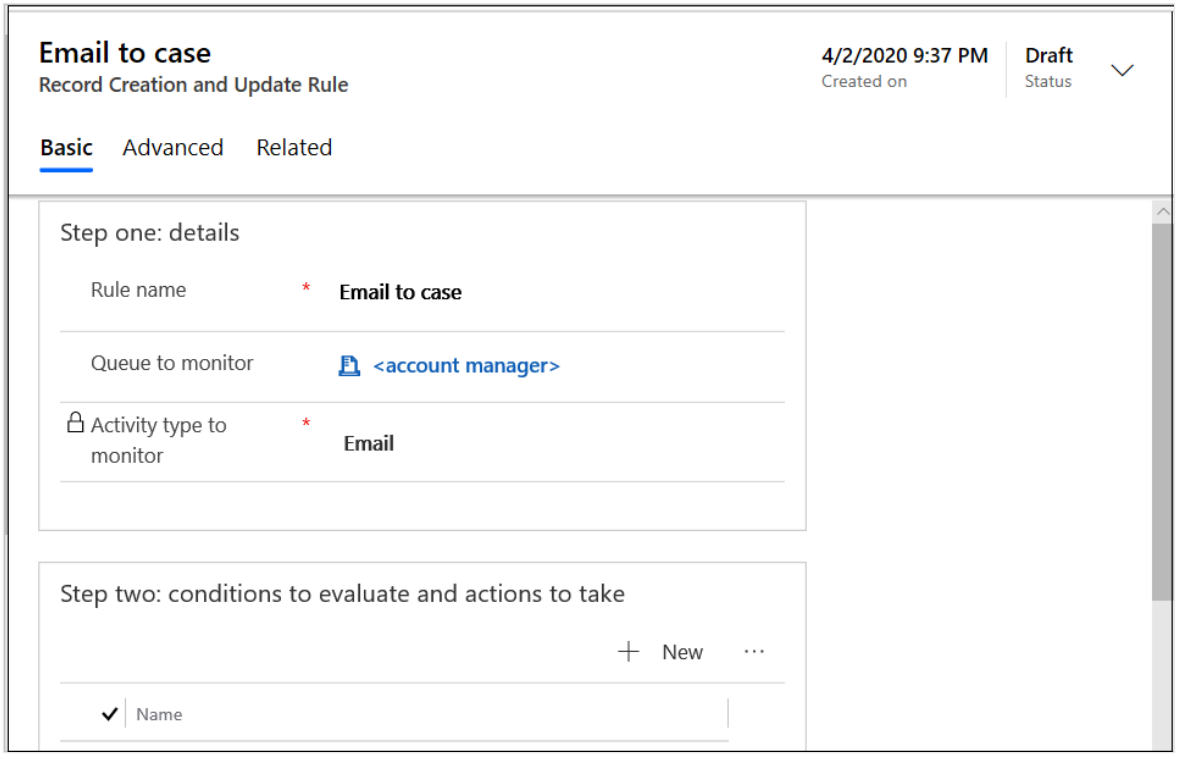
   The **All Record Creation and Update Rules** page is displayed.

2. Select **New**. The **New Record Creation and Update Rule** page is displayed.

3. On the **Basic** tab, in **Step one details**, enter the following details:

   - **Rule name**: Enter a name for the rule.
   - **Queue to monitor**: Select a queue on which the rule will be activated. For email activity, you must select a queue to be able to activate the rule.
   - **Activity type to monitor**: Select **Email** in the list.

4. Select **Save**. The **Step two: conditions to evaluate and actions to take** area is enabled.



5. In **Step two: conditions to evaluate and actions to take**, select **New**. The **Condition builder** page is displayed.

> **Note**
>
> You must add a minimum of one condition for the rule to run successfully.

6. Perform the following steps:

   a. In **Condition** > **Condition name**, enter an intuitive name.

   b. In **Condition that must pass to continue (pass if blank)**, select **Add**.

   c. Use the following options to define the criteria for the rule to be evaluated:

   i. Add row

ii. Add group

iii. Add related entity

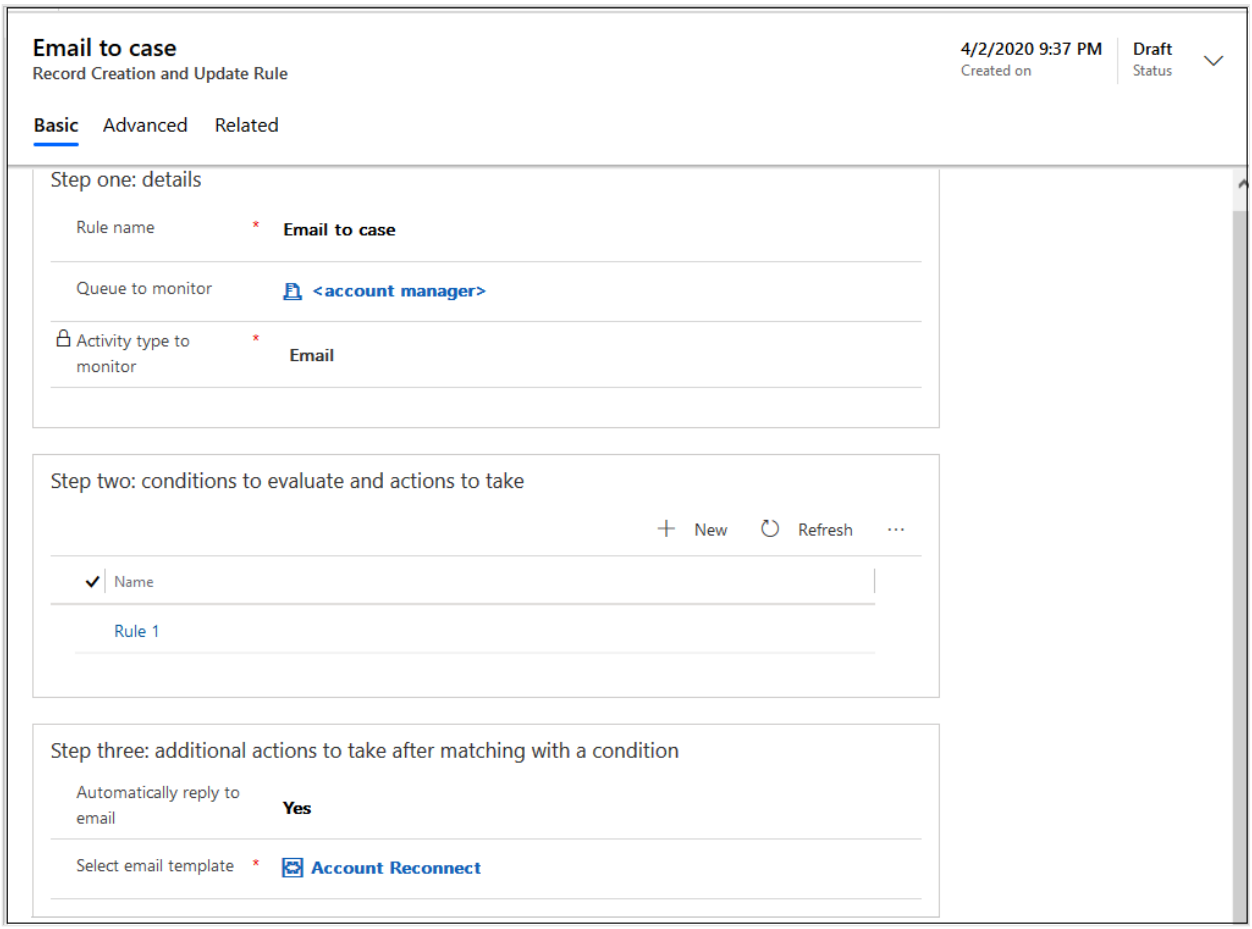
7. In **Actions to take** > **Record to create**, make sure the value is **Case**. A case will be created if the conditions specified are met for the email activity.

8. In **Configure in Microsoft Power Automate**, select **Save and open in Power Automate**. The Power Automate application opens in a new tab where you can configure criteria that must be evaluated for the email activity. To learn more about using Power Automate, see the documentation for Power Automate.

9. Select **Save & Close**. The condition builder is closed.

10. In **Step three: additional actions to take after matching with a condition**, select an option based on your requirement for **Automatically reply to email**.

11. If you select **Yes**, select an email template in the **Select email template** list box.



> **Note**
>
> The rule will be in the draft status until you activate it.

How do record creation and update rules work with queues

In a record creation and update rule, when you specify a queue for a source type, any incoming activity from that source is added as a queue item for that specified queue. That is, if a rule for a particular source activity and queue combination is active, the rule processes the incoming activity on that queue to create or update records. When an email is processed by an automatic record creation rule, a queue item is created. If the email has the queue's email in the blind carbon copy (Bcc) or carbon copy (Cc), a queue item is created from server-side sync. By default, two queue items are created if the email has the queue's mail in both the "To" and "Bcc" or "Cc" fields. To control the creation of the queue items, you can set the **CreateQueueItemForSynchronizingMailbox** toggle in your organization's configuration settings. More information: Create queue items from synchronized email messages

For an email source type, you must specify a queue. For all other source types including custom activities, it is optional.

> ⓘ **Note**
>
> When an automatic record creation rule is applied to an Email queue item, it gets deactivated.

Configure advanced settings for rules

On the **Advanced** tab of the **Record creation and update rule** page for a rule, you can configure actions that can be automatically performed before the conditions for the rule are evaluated.

1. On the **Automatic record creation and update rules** page, select the rule in the list that you want to update. The <*rule_name*> page appears.

2. Select the **Advanced** tab, and do the following in **Before evaluating conditions**:

    - **Allow emails from unknown senders**: Set it to yes if you want records to be created when email messages arrive from senders whose email addresses aren't present in any contact or account records.

      This option, with the Automatically create records in Dynamics 365 for Customer Engagement option in the rule owner's Personal Options,

determines whether a case and contact record is created. To learn more, see Set personal options.

- **Manage unknown senders by**: Select one of the following options:
  - **Creating a new contact automatically**: Specify if you want a contact to be created automatically.
  - **Mapping in Power Automate manually**: Specify if you want to evaluate and set up the resolution for the contact in Power Automate.

    > **ⓘ Important**
    >
    > If you select to map the contact manually, make sure that you create a mapping in Power Automate for the customer field. More information: **Manually map a contact in Power Automate**

- **Require a valid entitlement on the connected case**: If you select **Yes**, a case is created only if an active entitlement exists for the customer.

  If the sender of the email is a contact with a parent account, a record is created if the contact's parent account has a valid entitlement, and the contact is listed in the **Contacts** section of the entitlement or if the **Contacts** section is empty (which means the entitlement is applicable to all contacts for the customer).

- **Wait for a specific amount of time after the connected case has been resolved**: Select **Yes**, and then select a time value in the **Select the amount of time** box that appears. No new case will be created until the specified period of time lapses after a related case is resolved. For example, if you have set the value to yes and specify one hour, and a case exists for a printer issue, when a mail comes for the same printer issue, another case won't be created until one hour lapses after the existing printer issue case is resolved.

  The resolved case won't be re-opened automatically when the incoming email is associated with it. However, you can configure flows using Power Automate, to re-open a resolved case when an incoming email is associated with the resolved case.

  If set to **No**, no case will be created if a related case exists.

  > **ⓘ Note**

> If you want a case to be created without any time lapse, then set **Wait for a specific amount of time after the connected case has been resolved** to **Yes** and don't select any time duration in the **Select the amount of time** box.

3. In **Advanced settings**, by default the user who is creating the rule is listed in the **Owner whose permissions the rule uses to run** box. You can add more users or change the default value.
4. Select **Save** or **Save & Close**.

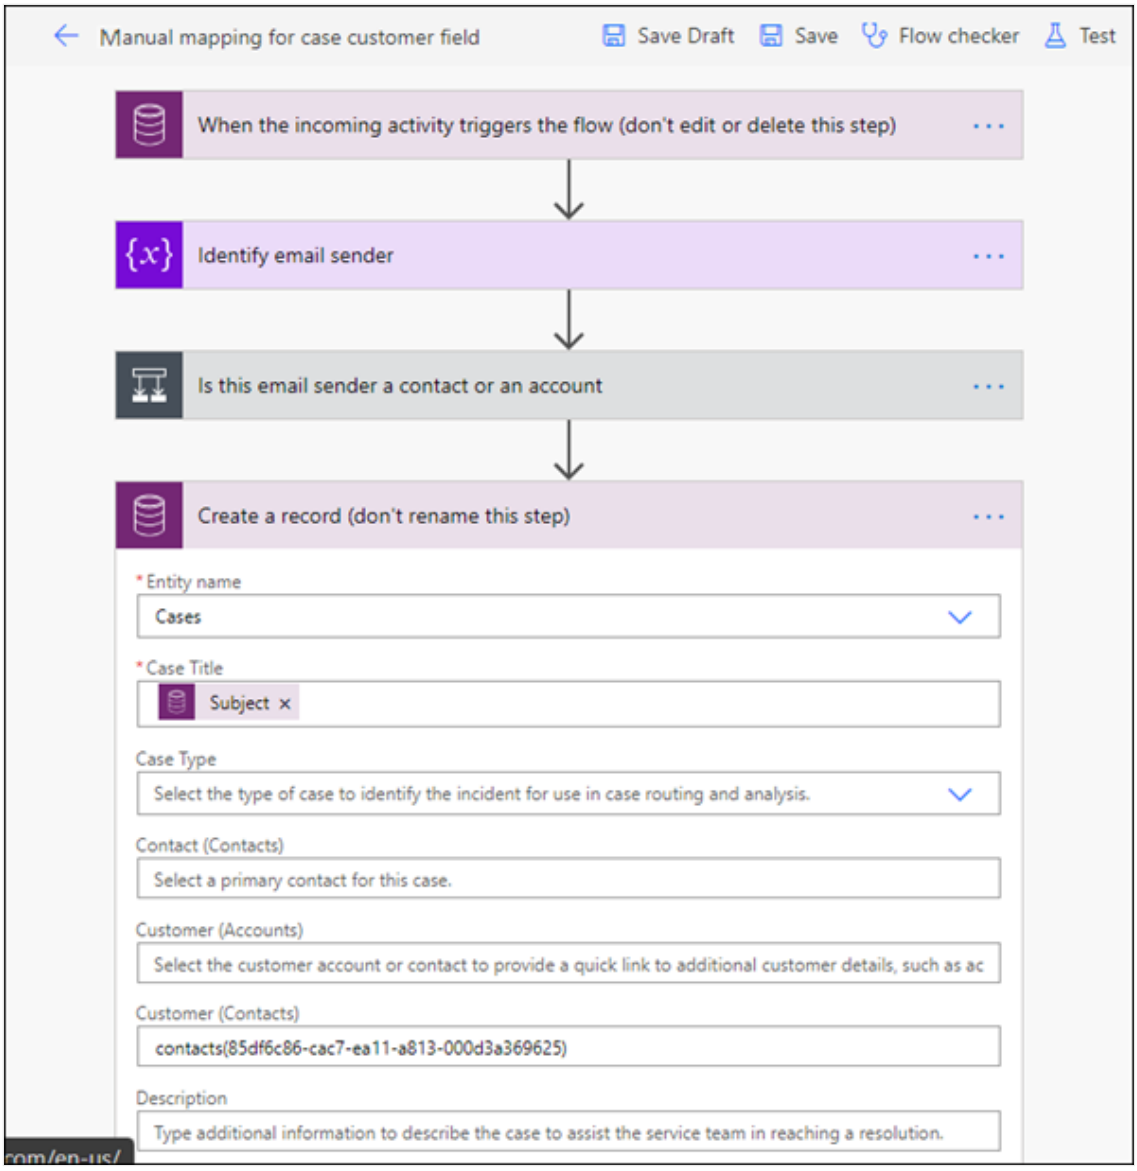
Change the order of rule items to be evaluated

The rules are run in the order they're listed in the rule items list. If the incoming activity matches the condition specified in the rule item one, the case is created and the rest of the rule items aren't evaluated. You can reorder the rule items when more than one rule item exists for a rule.

Manually map a contact in Power Automate

Perform the following steps to manually map a contact in Power Automate:

1. In the app in Customer Service, go to the automatic record creation and update rule feature, and then select the rule that you want to edit.
2. In the **Step two: conditions to evaluate and actions to take** area, select the rule item for which you want to manually map the contact in Power Automate.
3. On the page that appears, on the **Condition builder** tab, select **Save and open Power Automate**. The Power Automate workflow opens on a new tab.
    a. Accept the default connection settings, and select **Continue**.
    b. On the page that's displayed, in the **Is this email sender a contact or an account** step, for the **If no** option, select the ellipses for **Terminate when no valid customer found**, and select **Delete**.
    c. Select **OK** on the confirmation dialog.
    d. In the **Create a record (don't rename this step)** step of the workflow, specify the required value in the **Customer (Contacts)** box.
    e. Make sure that you remove the default mappings from **Contact (Contacts)** and **Customer (Accounts)**.



> **Important**
>
> If you want to map an account, make sure that you remove the default mappings from the **Contact (Contacts)** and **Customer (Contacts)** boxes and specify only an account in the **Customer (Accounts)** box for the workflow to run without errors.

f. Save and close.

Process emails from known senders only

To process emails from known senders only, do the following steps in Power Automate for the associated rule item:

1. On the Power Automate workflow page, accept the default connection settings, and select **Continue**.

2. On the page that's displayed, in the **Is this email sender a contact or an account** step, for the **If no** option, make sure that the **Terminate when no valid customer found** option is available.

3. Save the changes.

The mails from known senders only will be processed.

Create contacts for unknown senders

The steps in this section are applicable only when you select the option to manually map in Power Automate in the **Manage unknown senders by** field on the **Advanced** tab of the record creation and update rule.

The option to create the contact is based on the email recipient's permission. If the email recipient doesn't have permission to create a contact and you prefer to not give them this permission, you can configure an environment variable to use the permissions of the rule owner. More information: Create contacts for unknown senders using rule owner context

To create a contact for unknown senders of mail, configure the following options in Power Automate for the associated rule item:

1. In the **Is this email sender a contact or an account** step, for the **If no** option, delete the **Terminate when no valid customer found** action.

2. Select **Add an action**, and in the **Choose an operation** box, search for "Add a new row", and select it.

3. In **Table name**, select **Contacts**.

4. In **Email**, search for "From" in **Dynamic content**, and select it.

5. Select **Add an action** again, and in **Choose an operation** search for "Set variable", and select it.

6. In **Name**, select **Customer from email sender**.

7. In **Value**, search for "OData Id" in **Dynamic content**, and select it. "OData Id" is derived when you create a new contact record.

8. In the **Create a record (don't rename this step)** option, search for **Contact (Contacts)**, and use the following expression:

```
if(equals(triggerOutputs()?['body/_emailsender_type'], 'contacts'),
if(contains(variables('Customer from email sender'), triggerOutputs()?
['body/_emailsender_value']) , string(''), concat('contacts(',triggerOutputs()?
['body/_emailsender_value'], ')')), string(''))
```

9. Save the changes.

Create contacts for unknown senders using rule owner context

By default, a contact for unknown email sender is created with the email recipient's context. To switch to use the rule owner permissions to create the new contact, you can configure the msdyn_ArcCreateContactWithRuleOwner environment variable as follows:

1. Go to the Power Apps portal.
2. Select the required environment, and then select **Solutions** in the left pane.
3. On the **Solutions** page, select **Default Solution**.
4. Search for **Environment variables**, and select the **msdyn_ArcCreateContactWithRuleOwner** environment variable.
5. On the edit page that appears, set the **Current Value** as **1** to override the default value.
6. Save and publish the customization.

Activate a rule for creating or updating records automatically

For any record creation and update rule to apply to a matching incoming activity, after you add the rule items, you must activate the rule.

Manage automatic record creation and update rule from a queue form

You can create or manage an automatic record creation and update rule from a queue form. To learn more, see More information: Create or change a queue

Manage activity monitor to review and track rules

You can review and track the health of the automatic record creation rules and resolve issues around them. See: Manage activity monitor to review and track rules

Use activity monitor to review and track rules

Article • 10/09/2023

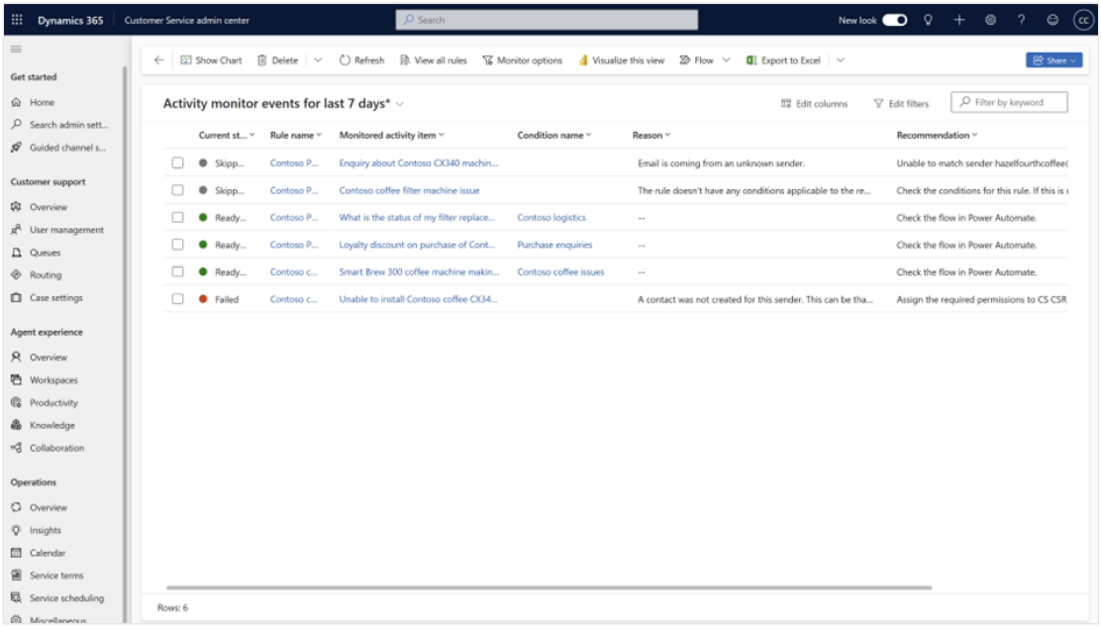
You can review and track the health of the automatic record creation rules and resolve issues around them. By default, the activity monitor captures all the states. You can customize the events that you want to monitor by deselecting the monitor options in the application.

> **Note**
>
> - The activity monitor works in online environments only, such as cloud applications.
> - The activity monitor tracks the rules until they're evaluated in Customer Service only and before the rule runs in Power Automate.

In Customer Service admin center, the Customer support overview page displays the number of activity monitor events that ran in the past week along with their status. You can use either the **Activity monitor events for last 7 days** or **All activity monitor events** to view the activity monitor details.

1. Navigate to the views as follows:

   - Select **Activity monitor events(past 7 days)** on Customer support overview to view the activity events for the last 7 days on the **Activity monitor events for last 7 days** page.



- Select **Case Settings** > **Automatic record creation and update rules** > **Record creation and update rules** and then select **View activity monitor** on the command bar to view the list of all the activity events on the **All activity monitor events** page.

2. The following details are available for the rules in the activity views:

   - **Current state:** Displays the state, such as, Failed, Skipped, or Ready for Power Automate.
   - **Rule name:** Name of the record creation rule.
   - **Monitored activity type:** Activity type, such as email, task, or appointment. By default this is not available on the **Activity monitor events for last 7 days** page. Use **Edit columns** to add the column to the view.
   - **Monitored activity item:** Displays the subject of the activity type.
   - **Condition name:** The name of the condition in which the issue occurred.
   - **Reason:** Displays information on how the rule was handled. For example, a case isn't created if the **Current state** for a rule is Skipped because an email is sent from an unknown sender who isn't added to **Contacts** and the rule condition, **Allow email from unknown senders** is set to No.
   - **Recommendation**: Displays the steps you can follow to resolve the issue. For example, if an email was sent from an unknown sender and the **Current state** for a rule is **Skipped** with **Reason**, Email is coming from an unknown sender, the application displays the recommendation to set **Allow email from unknown senders** to Yes.

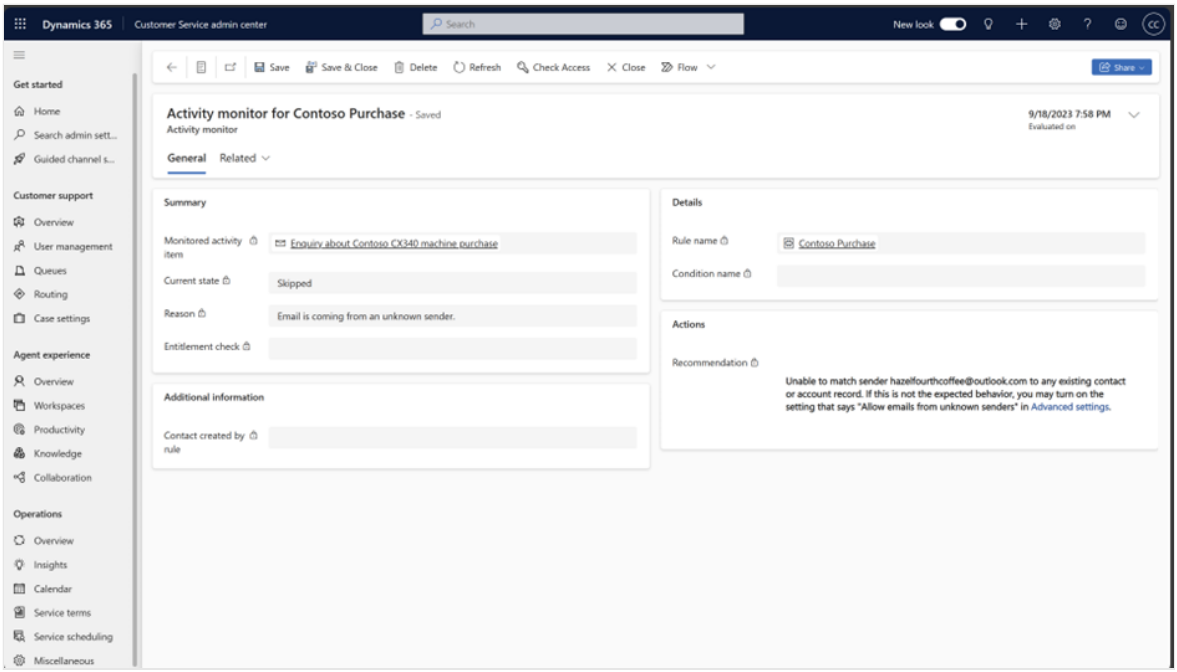
     > ⓘ **Note**
     >
     > The text in the **Recommendation** field doesn't display hyperlinks. Select the activity record to see the hyperlinks in the recommended resolution in the **Activity monitor** page.

   - **Evaluated on:** Displays the date and time of the issue.

3. Select a rule or activity to view the activity monitoring summary that is displayed on the **Activity monitor** <rule_name> page.

- If you navigate to an active rule from the activity monitor page, a message appears stating that the rule is active and therefore is read-only.

- The legacy rules will also be monitored and listed on the activity monitor view.



4. If you don't want to monitor any of the following states, you can clear the selection on the **Monitor options** dialog.

    - Ready for Power Automate / workflow
    - Failed
    - Skipped

Automatically create or update records

Set up rules to automatically create or update records in the legacy app

Article • 08/03/2023

> **Tip**
>
> If you'd like to try Dynamics 365 Customer Service for free, you can sign up for a **30-day trial**.

Every organization has multiple applications to capture customer interactions. The ability to channel external data into Microsoft Dataverse records can significantly improve the efficiency of your sales, marketing, and service teams, and increase the quality of your data. You can now direct this data from various applications and external sources into Dataverse with the help of *record creation and update rules*.

By using record creation and update rules in Dynamics 365 Customer Service, you can automatically create or update system or custom records from incoming activities, such as emails, social activities, or custom activities, without writing any code. For information on supported activities and entities, go to Activities and entities supported by rules for creating or updating records automatically. You can also set up the rule to convert the incoming activity into multiple records. For example, you can create a case and a lead from a single social activity.

A record creation and update rule consists of rule items that define the conditions for creating or updating records, and also defines what actions or steps to take on the newly-created records. The rule also contains channel properties that are used to define conditions for rules, and also for setting properties of the record you're creating or updating.

To enable the rule to update records, you must add an **Update** step to the rule. Only the entity that you select in the **Update** step is updated based on the properties you set.

Capture data from external sources

You can also capture more valuable customer information provided by an external application in the form of JSON (a collection of name-value pairs), and use it to enhance the quality of the target records and set various conditions in the record creation and update rules.

Every default (out-of-the-box) activity or custom activity has an Additional Parameters attribute. This attribute stores the JSON payload received from an external application.

To capture this information in Dataverse, you can define channel properties and associate them with a particular rule or share them across multiple rules of the same source type. For example, along with a social post, you can capture important information about the post, such as sentiment value. Sentiment value is the property of social activity, so you can use this property in any other record creation and update rule of type Social Activity.

Here's the correct format in which Dataverse should receive the JSON payload (data received as a name-value pair in JSON format) from the external application:

{"PropertyName1":"Propertyvalue1"; "PropertyName2":"Propertyvalue2"}

> **Note**
>
> Any configuration done in the channel properties is only valid if those name-value pairs exist in the JSON payload. Also, you must only use parameters received from the external application in the rule item conditions and as record properties.

Activate or deactivate a rule

For any record creation and update rule to apply to a matching incoming activity, after you add the rule items, you must activate the rule.

When a record creation and update rule is activated, a corresponding workflow is created automatically. You can use channel properties to define a workflow's conditions and operators in mapping the target entity attribute values. For complex scenarios, you may configure child workflows.

More information: Configure workflow steps

How do record creation and update rules work with queues?

In a record creation and update rule, when you specify a queue for a source type, any incoming activity from that source is added as a queue item for that specified queue. That is, if a rule for a particular source activity and queue combination is active, the rule processes the incoming activity on that queue to create or update records.

For an email source type, specifying a queue is mandatory. For all other source types including custom activities, it is optional.

> ⓘ **Note**
>
> When an automatic record creation (ARC) rule is applied to an Email queue item, it gets deactivated.

Rules in solutions

The record creation and update rules can be packaged as a part of Dataverse solution. Customizers and developers distribute solutions so organizations can use Dataverse to install and uninstall the business functionality defined by the solution.

Keep the following things in mind about using rules in solutions:

- Any rule that you created in Dynamics CRM Online 2015 Update 1 or later can't be exported to a previous release.
- Any rules upgraded to and edited in Dynamics CRM Online 2015 Update 1 or later can't be exported back to an earlier release.

Prerequisites

Before you can use automatic record creation rules, be sure your external application/social engagement system is already integrated with your Dataverse instance.

If your instance meets the prerequisites, all you need to do is set up rules in Dataverse that will automatically create or update a support case, lead, opportunity, appointment, task, and more from incoming activities.

Set up a rule to create and update records automatically in the legacy app

1. Make sure that you have the customer service, sales manager, or marketing manager role or equivalent permissions.

   ### Check your security role

- Follow the steps in View your user profile.
- Don't have the correct permissions? Contact your system administrator.

2. go to **Settings** > **Service Management**
3. Select **Automatic Record Creation and Update Rules**.
4. To create a record creation and update rule, select **New**.

   -OR-

   To edit an existing rule, in the list of rules, select and open the rule you want to edit.
5. Type or modify information in the fields.

   Hover over the field labels to see what to enter:

   - **Name**. Type the name of the rule.
   - **Source Type**. From the drop-down list, select the activity that's the source of the record.
   - **Queue**. Select the queue the rule applies to. Incoming activity arrives in the queue, and then the valid rule and rule item applies for creation or update of records.

     Here are a few things to consider:

     - For all activities and custom activities, except email, specifying a queue is optional. For all such activities you can have only one rule with an associated queue and one rule without an associated queue active at any given time. For example, for a Social Activity source type, you can have two active rules, one with a queue specified, and one without a queue.
     - If you selected Email as the source type for this rule, you can't activate the rule unless you select a queue.

     > **Note**
     >
     > You can associate only one rule per source type to a specific queue. For example: If you're creating a rule to convert an email to a case, make sure you specify an email address for this queue. Otherwise, automatic

record creation for email won't work. More information: **Create or change a queue**

6. Select **Save**.

Set Channel Properties

1. Under **Channel Properties**, in the **Additional Properties** box, select a channel property group.

> ⓘ **Note**
>
> When you select a property group for a record creation and update rule, you can use the channel property group's property items in the rule item conditions or while setting properties for the target record. After you activate a rule, you can't remove or change the selected property group. You can select another property group only after you remove the referenced property items of the previous property group from the rule items. When you try to select a new property group without removing the property references of the previous property group, you'll see an error.

To learn more about creating channel property groups and adding properties to them, see Set up channel properties later in this topic.

Set Email conditions

If the source type for the rule is set to **Email**, specify the conditions for converting the email to the target record.

1. **Create records for email from unknown senders**. If you select this check box, all email messages from unknown senders (a sender whose email address isn't present in any records) are converted to new records (based on the conditions you define). A contact record is also created for this unknown sender.

> ⓘ **Note**
>
> Dataverse determines what record to create based on the entity you select in the **Create Record** step under **Actions**.

If you don’t select this check box, records are created only for email messages that have a contact or account as the senders.

This option, in conjunction with the **Automatically create records in Dynamics 365 for Customer Engagement** option in the rule owner's Personal Options, determines whether a case and contact record is created (see Set personal options).

2. **Create case if a valid entitlement exists for the customer**. If you select this check box, a case is created only if an active entitlement exists for the customer.

   If the sender of the email is a contact with a parent account, a record is created if the contact’s parent account has a valid entitlement, and the contact is listed in the **Contacts** section of the entitlement or if the **Contacts** section is empty (which means the entitlement is applicable to all contacts for the customer).

3. **Create cases for activities associated with a resolved case**. If you select this check box, a case is created if the email is related to a resolved case. If the email is related to an active case, a new case won’t be created. However, if the email is related to a canceled case, a new case will be created.

4. **Create case when the case associated with the activity is resolved since**. If you select the **Create cases for activities associated with a resolved case** check box, select the duration here. A case is created only if the case is resolved earlier than the duration you specify. If the incoming email is related to a case resolved later than the specified duration, the incoming email is associated with the existing resolved case; a new case won’t be created. The resolved case won't be re-opened automatically when the incoming email is associated with it. However, you can configure flows using Power Automate, to re-open a resolved case when an incoming email is associated with the resolved case.

5. **Send automatic email response to customer on record creation**. Select this check box if you want to automatically send email responses to the sender of the email after a target record for the email is created.

6. **Select email template to respond to customer.** If you select the **Send automatic email response to customer on record creation** check box, select an email template (global email template or email template of any entity type). If you don’t select a template, an automatic response won’t be sent.

   > ⓘ **Note**

When mapping incoming email to a field that does not support HTML, you should remove HTML content from the email, so that the text is compatible with Dynamics and the content can be viewed without HTML tags. You can do this in the following ways.

1. Use a regular expression such as <[^>]*> to filter the HTML tags out of the email before mapping it to the field. Note that taking this approach will permanently remove the tags from the content.
2. If you want to maintain the HTML from the email, but don't want it to be displayed, customize the field CSS to use the textContent DOM node to have the browser only display the text from the email in the form.

Please note that these customizations are not supported by Microsoft. Try them on your sandbox environment to avoid any loss of production data.

Set Social Activity conditions

If the source type for the rule is set to Social Activity, specify the conditions for converting the social activity to the target record.

1. **Create records for blocked social profile**. If you select this check box, a target record is created or updated for the social posts (social activities) from social profiles that are blocked by you.

   > ⓘ **Note**
   >
   > Social posts appear in the application as social activities.

2. **Create records for direct messages only**. If you select this check box, the target record is created only when the social posts are sent as direct or private messages. If you clear the check box, records are created for all social posts including public messages (timeline).

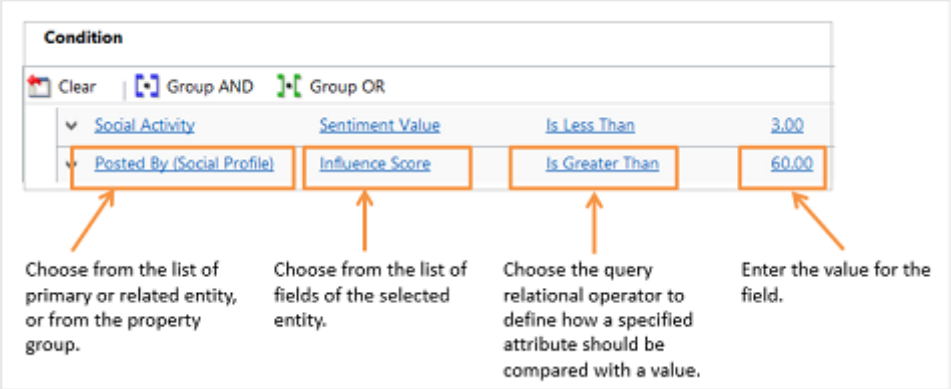
   > ⓘ **Note**
   >
   > Dataverse determines what record to create based on the entity you select in the **Create Record** step under **Actions**.

Set record creation details

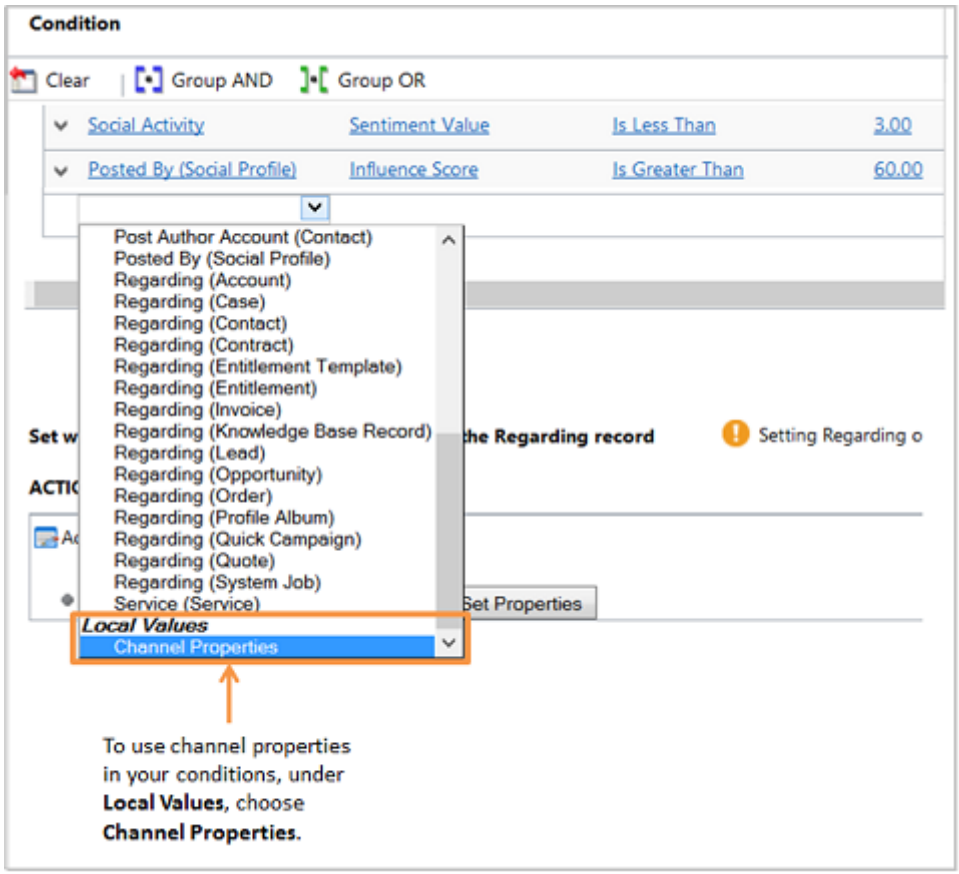
In the **Specify Record Creation and Update Details** section, select ➕ to define the conditions for creating or updating a record and specify the properties of the record.

1. In the **Name** box, enter a meaningful name for the rule item.
2. In the **Conditions** section, select the record, channel properties, fields, and relational query operators to specify when a target record should be created or updated.

   For example, to create a record from a social post (social activity) with a sentiment value of less than 3, an influence score greater than 60, and hashtags containing SilverCreditCard, you can add the following conditions:



> ⓘ **Note**
>
> You can also use channel properties in your conditions.



Here's the rule item after you add all the conditions:

3. Add steps to create or update records for the incoming activity that matches the conditions you defined earlier.

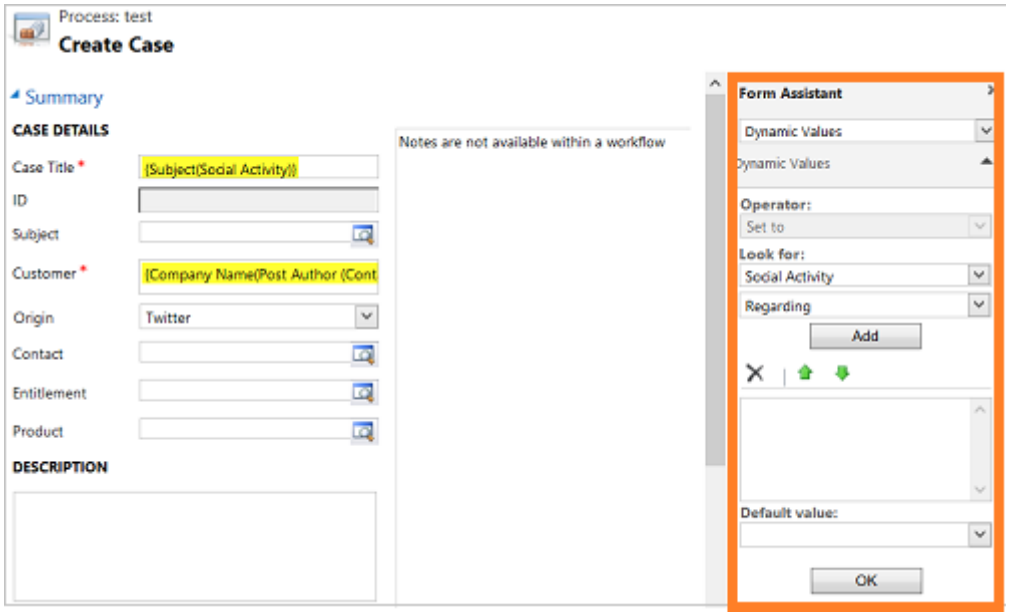
   a. Under **Actions**, select **Add Step** > **Create record**.

   b. In the **Create** box, select the record type for the record you want to create from the incoming activity. For example, if you want to create a case from the social activity, select **Case**.

> ⓘ Note
>
> If the incoming activity has a regarding object set, and if the regarding object entity and the entity selected in the **Create Record** step aren't the same, no workflow is applied and the actions defined in the rule are not executed.

c. Select **Set Properties**.

The entity form is displayed. You can map the target entity fields to the social activity record data, including channel properties. Some of the mappings are available out of the box: Case title, Customer, and Origin (highlighted in yellow). The out-of-the-box mappings can be changed and new mappings can be added using the **Form Assistant** control.



The new record that is created will be automatically set as the regarding record of the incoming activity record. There is only one regarding object to the social activity, so, only one **Create** record action is possible in the **Actions** section.

d. To add more actions, under **Specify Other Actions**, select **Add Step** > <Action>. The available actions are: Create Record, Update Record, Send Email, or Start Child Workflow.

Learn more about each of these actions in Configure workflow steps.

4. Select **Save and Close**.

> ⓘ Note
>
> - Data types "Option Set" and "Two Option" are not supported in string type conditions.
> - The property items for each of the supported data types need to have a default value. This requirement is important in scenarios where the configured property line items have a blank incoming web request. In

such cases, the property line item will take the default value when referred to in a workflow.

Turn on the rule

Turn on the rule so that records can be created or updated for incoming activities based on the defined conditions. More information: Activate or deactivate a rule.

> **Tip**
>
> Developers can also apply rules retroactively to the incoming records that might have been skipped while a rule was edited.

Set up channel properties

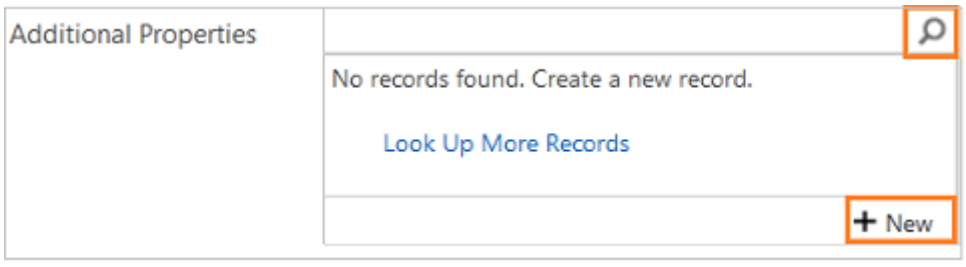
Every default or custom activity has an **Additional Parameters** attribute. This attribute stores the JSON payload received from an external application.

You can find these parameters in the **Additional Parameters** field of any incoming activity.

To capture this information in Dataverse and associate it with the record creation or update rule, you can define channel properties in a channel property group and associate them with a rule or share them across multiple rules. For example, along with a social post, you can capture important information about the post, such as rating or influencer score. Rating and influencer score are the properties of social channel.

Create channel property groups and add channel properties

1. After you save the record creation and update rule form, under **Channel Properties** section, in the **Additional Properties** box, select the lookup button, and then select **New**.



A channel property group form opens.

> **ⓘ Important**
>
> A property group record contains multiple property items.
>
> To fix this issue, first delete the properties from the conditions and steps that use the record, and then save or activate the rule.

2. Enter a meaningful name for the property group, so you can easily identify it while adding it to any record creation or update rule.
3. The **Source Type** field will be automatically set to the source type of the record creation and update rule.
4. Select **Save**.
5. In the **Channel Properties** section, select + to add in the group-specific channel properties.
6. In the **Channel Property** form, enter the following:

   a. **Name**. Type the property name as it appears in the activity's payload.

   > **ⓘ Note**
   >
   > The name can contain only alphanumeric and underscore characters and shouldn't be longer than 300 characters.

   To see properties received for an activity, go to **Sales** or **Service** or **Marketing** > **Activities**, and open the activity, and see the **Additional Parameters** field.

   > **ⓘ Note**
   >
   > This field isn't available on the activity form by default. A system customizer can add the field to the activity forms. The field will have the JSON payload only when the external application sends it for the activity.

> **Important**
>
> - Create a channel property for each name from the name-value pair that you want to use in your record creation and update rule. For example, you could use `influenceScore` as a property name.
> - The information in the JSON payload isn't very easy to read. To make it more readable, you can use online JSON parser that will provide a better output.
> - The property group doesn't support adding nested values in a JSON payload as channel properties. The following sample shows the "FollowersCount" under the user node as a nested JSON key-value pair.

b. **Data Type**. Select a data type for the channel property. For example, if the property is influence score, use the data type as Whole Number because its value can't be in decimals.

The selected data type will determine the relational query operators when you use the property to define conditions in the record creation and update rule items. Dataverse supports creating properties only of the following data types: Floating Point Number, Single Line of Text, and Whole Number.

> **Note**
>
> - Option Set and Two option data types are supported in conditions of type string. You'll have to type out the option set value in the conditions.
> - Dataverse sets a default value for property items for each of the supported data types. This is for scenarios when a channel property is

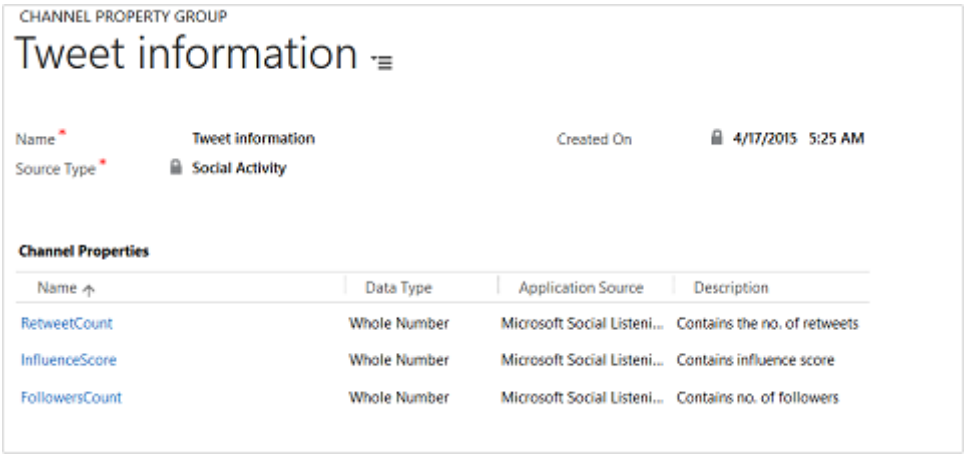
used in a workflow but the incoming payload has no value provided from the external channel; the workflow conditions in which the property is referred use a least the following default value: String: “”, Whole Number: -2,147,483,648, Float: -1e+011.

c. **Application Source**. Type the name of the application that this property is related to.

d. **Description**. Type details to further explain what the property is for.

7. When you’re done, select **Save & Close**.

   You can see all the properties in the channel property group form.



Activate a record creation and update rule

For any record creation and update rule to apply to a matching incoming activity, after you add the rule items, you must activate the rule.

To activate a record creation and update rule

1. Go to **Settings** > **Service Management**.
2. Select **Automatic Record Creation and Update Rules**.
3. Open the rule you want to activate, and on the command bar, select **Activate**.

> **Note**
>
> You can have two record creation and update rules active at a time for any source type, except email—one with queue and one without a queue. You can

have only one record creation and update rule active for the source type Email, and this rule should have a queue specified.

After the rule is active, the only way to change the rule is to first deactivate it. Open the rule, and on the command bar, select **Deactivate**.

Manage automatic record creation and update from a queue form

You can create or manage an automatic record creation and update rule from a queue form, too. To do this, open the queue record, and on the command bar, select **Email Activity Conversion Settings** or **Social Activity Conversion Settings**.

More information: Create or change a queue

Upgrade considerations

Here are a few things you should know if you're upgrading to the latest release, and have existing case creation rules for email and social activity.

Existing rules prior to upgrade	**What happens to the rules after upgrade?**
A rule that has rule items with conditions and properties defined	- The rule and rule items are upgraded and the properties and conditions in the existing rule items are preserved. - A new rule item is created with blank conditions. A new Create Record step (with Case selected) is added with out-of-the-box property mapping. The rule items are applied in an order and the newly-created rule item is considered last in the order.
A rule that has a rule items with conditions , but no properties defined	- The rule and rule items are upgraded and the conditions in rule items are preserved. - A new rule item is created with blank conditions. A new Create Record step (with Case selected) is added with out-of-the-box property mapping. The rule items are applied in an order and the newly-created rule item is considered last in the order.
A rule that has a rule items with no conditions or properties defined	- The rule and rule items are upgraded. - A new rule item is created with blank conditions. A new Create Record step (with Case selected) is added with out-of-the-box property mapping. The rule items are applied in an order and the newly-created rule item is considered last in the order.
A rule that has a rule items with properties, but no	- The rule and rule items are upgraded and the properties in the rule items are preserved.

Existing rules prior to upgrade	What happens to the rules after upgrade?
conditions defined	- A new rule item is created with blank conditions. A new Create Record step (with Case selected) is added with out-of-the-box property mapping. The rule items are applied in an order and the newly-created rule item is considered last in the order.
A rule with no rule items	- The rule is upgraded. - A new rule item is created with blank conditions. A new Create Record step (with Case selected) is added with out-of-the-box property mapping. The rule items are applied in an order and the newly-created rule item is considered last in the order.
An active case creation rule for social or email source types, with a queue specified	All such rules will be upgraded in an active state.
An active case creation rule for social or email source types, without a queue specified	All such rules will be upgraded and deactivated. This is because even in Dynamics CRM Online Spring '14, a case creation rule without a queue did not apply and create any record.

Recommendation to upgrade solution

Perform the following steps before you upgrade a solution:

1. Deactivate the Record Creation and Update Rules which are brought through the previous version of the solution. The state of Record Creation and Update Rules changes to draft.
2. Upgrade your solution as required.
3. After the successful upgrade of the solution, activate the Record Creation and Update Rules as required.

Automatically create a case from an email in web client

Article • 09/29/2023

Reduce the need for manually creating cases from incoming emails and increase the efficiency of customer service agents by creating automatic case creation rules in Dynamics 365 Customer Service. The conditions in these rules automatically convert emails to support cases.

Prerequisites

- Make sure that you have the Customer Service Manager, System Administrator, or System Customizer security role or equivalent permissions.

  When a case creation rule is activated, a corresponding workflow is created automatically. If you create or assign a rule, you must have permissions to perform the same action on workflows. The case creation rule is applied and a case is created in context to the permissions that the owner of the case creation rule has.

- Check your security role
  - Follow the steps in View your user profile.
  - Don't have the correct permissions? Contact your system administrator.

Create cases automatically using rules

1. Go to **Settings** > **Service Management**.
2. Select **Automatic Case Creation Rules**.
3. To create a new case creation rule, select **New**.

   or

   To edit an existing rule, in the list of rules, select a rule, and then on the command bar, select **Edit**.
4. Type or modify information in the fields.
   - **Name**: Type the name of the queue the rule is defined for.

- **Source Type**: Select **Email** to indicate that cases will be created automatically from email messages.
- **Queue**: Select the queue that the rule applies to. For example, if you want to convert email messages and then send them to the Support queue, select that queue here.

  > ⓘ Note
  >
  > You can associate only one rule per source type to a specific queue. If you're creating a rule to convert an email to a case, make sure you specify an email address for this queue. Otherwise, automatic case creation for email won't work. More information: **Create and manage queues**

5. In the **Specify Conditions for Case Creation** section, select the conditions for creating the case automatically. You can add multiple conditions here and arrange them in the desired order. The conditions are considered in the same order. Only one item that has conditions matching the incoming email is applied.

Specify conditions for email to case creation

a. **Create cases for email from unknown senders**: If you select this checkbox, all email messages from unknown senders (senders whose email addresses aren't present in Dynamics 365) are converted to cases. A contact record is also created for the unknown senders.

> ⓘ Note
>
> If this option isn't selected, cases are created only for email messages that have a contact or account as the senders. Email messages from senders that are present as other record types won't be converted to cases.

This option, in conjunction with the **Automatically create records in Microsoft Dynamics 365** option in the rule owner's Personal Options, determines whether a case and contact record is created (see Set personal options):

This table shows if a contact and case record is created based on the values set for the **Automatically create records in Microsoft Dynamics 365** field in Personal Options and the **Create cases for email from unknown senders** checkbox in the automatic case creation rule:

"Automatically create records in Dynamics 365 for Customer Engagement" option is set to:	If "Create case from unknown sender" option in this rule is set to:	Contact or case created?
Create Lead	Selected	Both, contact and case, created
Create Lead	Not selected	None
Create Contact	Selected	Both, contact and case, created
Create Contact	Not selected	Only contact created
None	Selected	Both, contact and case, created
None	Not selected	None

b. **Create case if a valid entitlement exists for the customer**: If you select this checkbox, the application creates a case only if an active entitlement exists for the customer.

   If the sender of the email is a contact with a parent account, the application creates a case if the contact's parent account has a valid entitlement and the contact is listed in the **Contacts** section of the entitlement or if the **Contacts** section is empty (which means the entitlement is applicable to all contacts for the customer).

c. **Create cases for activities associated with a resolved case**: If you select this checkbox, the application creates a case if the email is related to a resolved case. If the email is related to an active case, a new case won't be created.

d. **Create case when the case associated with the activity is resolved since**: If you select the **Create cases for activities associated with a resolved case** checkbox, select the duration here. The application creates a case only if the case is resolved earlier than the duration you specify. If the incoming email is related to a case resolved later than the specified duration, the application only associates the incoming email with the existing resolved case; a new case won't be created.

e. Under **Specify Autoresponse Settings**, select the **Send automatic email response to customer on case creation** checkbox if you want to automatically

send email responses to the sender of the email after a case for the email is created.

Select email template to respond to customer: If you select the **Send automatic email response to customer on case creation** checkbox, select an email template (global email template or email template of case entity type). If you don't select a template, an automatic response won't be sent.

6. Select **Save**.

7. In the **Specify Case Details** section, define the conditions for creating a case and specify the case properties.

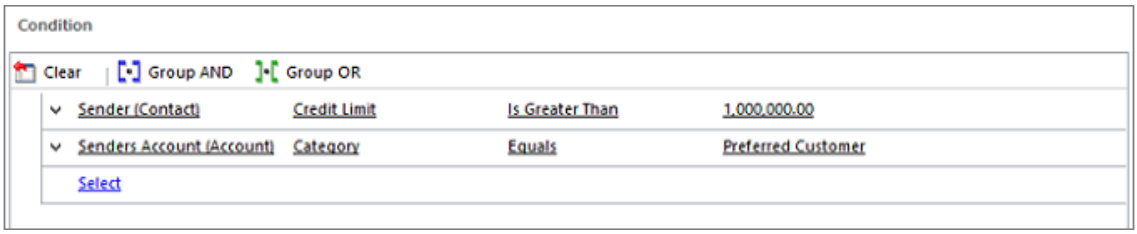
   By default, the **Title** field of the new case is set to the subject of the email and the **Customer** field is set to the sender of the email. If the sender of the email is a contact with a parent account, the **Customer** field is set to the parent account, and the **Contact** field is set to the sender of the email.

Specify case details

a. In the **Specify Case Details** section, select +, define the conditions for creating a case and specify the case properties.

b. In the **Conditions** section, specify when the case should be created.

   Here's how:



c. In the **Case Properties** section, set the properties for the case. The following example shows how to set the priority of all the automatically created cases to **High**:

   Once a case is created, the incoming email is removed from the queue.

> ⓘ Note

If there isn't a routing rule that routes the newly created case to another user or queue, the user who's the owner of the case creation rule will be set as the owner of the case, too.

Activate or deactivate a case creation rule

Cases are created automatically only when the case creation rule is active. To activate a rule, open it, and then on the command bar, select **Activate**.

Once the rule is active, you can't change it. To change a rule, open the rule and on the command bar, select **Deactivate**. You can then edit the rule.

Manage automatic case creation from a queue form

You can create or manage an automatic case creation rule from a queue form, too. To do this, open the queue record, and then on the command bar, select **Email to Case Settings**.

Create a new case when email subject changes

Article • 10/18/2023

When the email subject on a replied email changes, it doesn't create a new case in Dynamics 365. Administrators can use regex expressions to define whether a new case should be created when the email subject changes on a reply or a forwarded email that has a related active or resolved case.

When a customer replies to an email after modifying or removing the content in the subject, a new case isn't created in Dynamics 365. This behavior happens because the InReplyTo value of the replied email matches with the messageID of the previous email that's already in Dynamics 365. An email correlation is created, and the case associated with the previous email is linked with the replied email. As a result, the automatic record creation and update rule skips the case creation, even if the subject changes.

This topic describes the customization steps that you can perform to create a new case when email subject changes.

Prerequisites

Make sure to enable "Skipped" and "Ready for Power automate" monitored options for activity monitor in the Customer Service admin center app.

How it works

A new default Boolean field, named correlatedsubjectchanged, is available for the email entity. The field is populated as true or false for inreplyto-correlated emails, and detects changes in the subject field of the email. A default regex is available that ignores the prefixes "Re: ", "re: ", or "RE: " in the replied email, and then compares the subject with the correlated email's subject. If the subject matches, the boolean value, correlatedsubjectchanged, is set to false. However, the default regex doesn't ignore the prefixes "Fw: ", "FW: ", or "FWD: in the forwarded email, so the boolean value, correlatedsubjectchanged, is set to true in these cases, and if an email is forwarded, a new case is created. You can customize the default regex if it doesn't match your requirements. You can write regex expressions for multiple languages. For more information, go to: Regular Expression Language - Quick Reference. To edit the regex, use the OrgDbOrgSetting tool and follow the guidance.

Customization steps to create a new case

To define whether automatic record creation and update rules must create a new case, you can add a condition to check if the correlatedsubjectchanged field is true and create a case by performing the customization steps:

1. Go to https://make.powerautomate.com/ and select the environment in which you have automatic record creation and update rules configured.
2. Navigate to **My flows** from the site map, and then select **+New flow** > **Automated Cloud flow**.

   If using custom roles, the owner of the flow must have read/write/delete privileges to the activity monitor entity. The CSR manager and system administrator roles have the required privileges by default.
3. Name to flow, and then select the **When a row is added, modified or deleted** trigger.
4. Select **Create**.
5. Create a custom flow that is triggered when case creation is skipped for an email and there's an entry in the activity monitor table with the **Skipped** state.
6. Check for the email subject change within the flow and execute automatic record creation and update rules child flow to create the case.

   a. On step 3, select the following values for the fields:

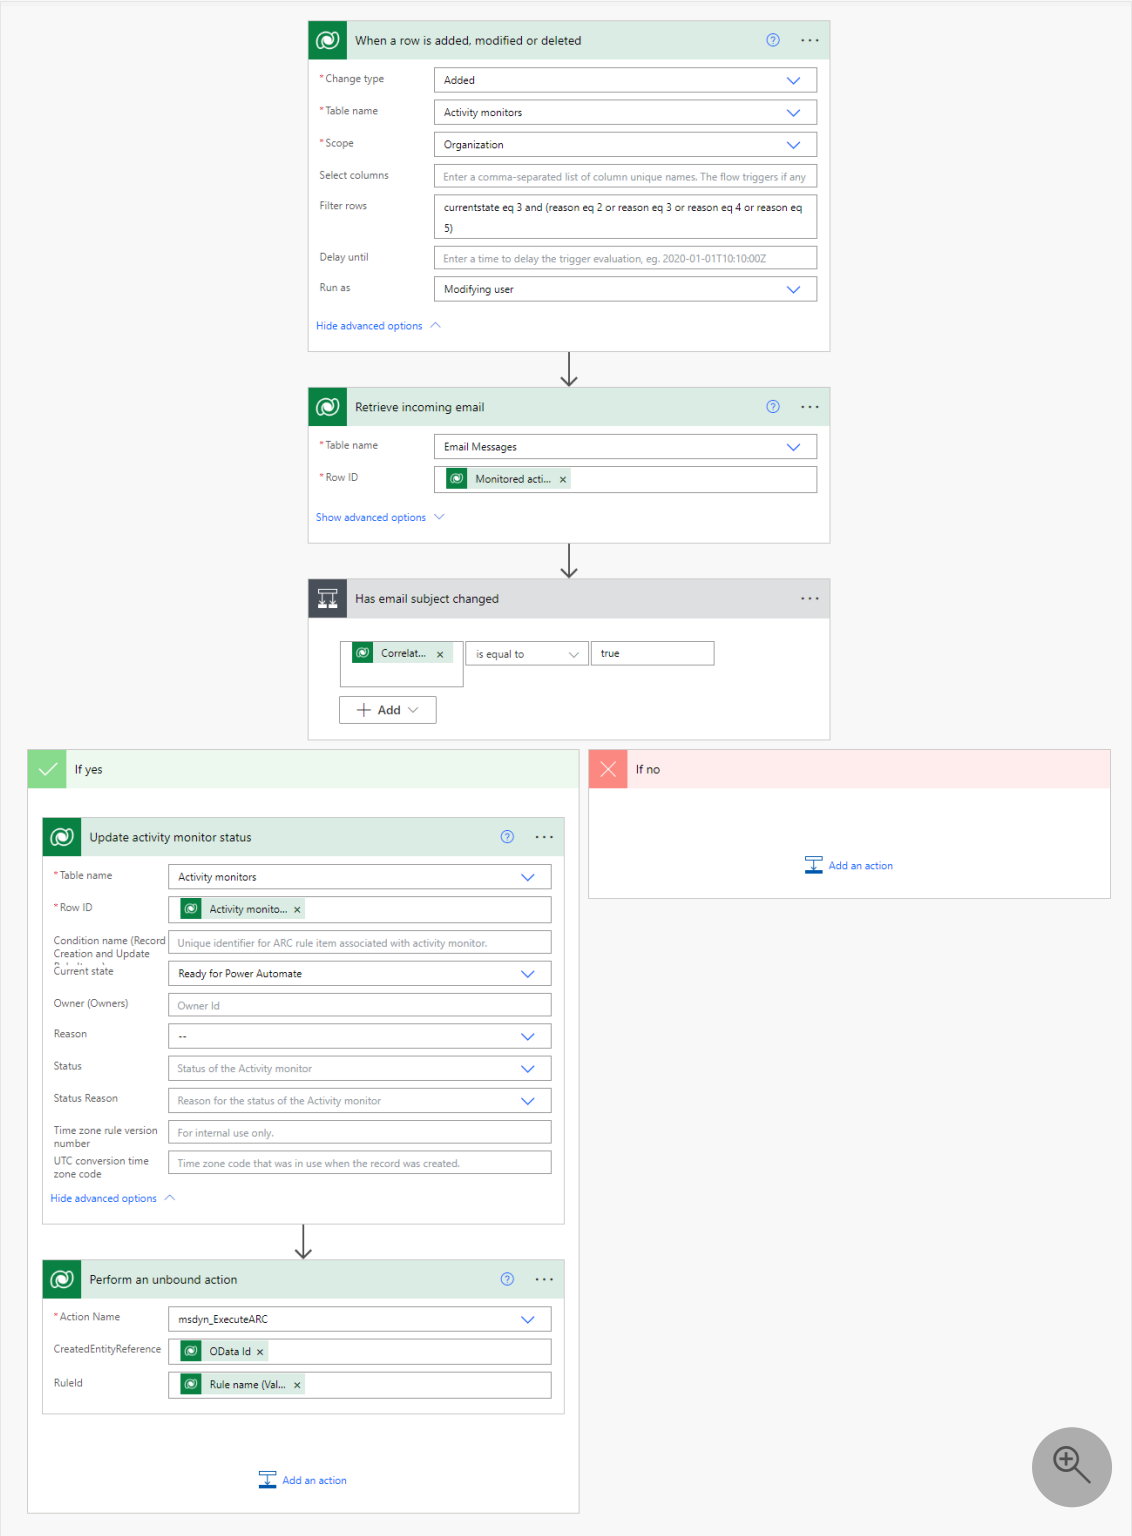
   - Change type: **Added**
   - Table name: **Activity monitors**
   - Scope: **Organizations**
   - Run as: **Modifying user**
   - Filter rows: The reason can be adjusted according to your business requirements. For example, currentstate eq 3 refers to the **Skipped** activity monitor state, and the reason can be any of the following:
     - An existing entity is already connected with this record.
     - An active case is already connected with this record.
     - A resolved case is already connected with this record.
     - The rule requires a connected case to be resolved for a specific amount of time before creating a new one. This connected case has been resolved for less than the amount of time selected.

   b. Retrieve the email record. Enter **RowID** as **Monitored activity item (Value)**.

c. Add a conditional check to verify whether the correlatedsubjectchanged attribute is set to true and proceed only if yes; otherwise, terminate. If you have complex conditional logic, we recommend that you write your logic in an unbound custom action that gives certain simple structured output, such as Boolean. Check the Boolean value and define case creation based on condition.

d. Update the activity monitor status. If the correlatedsubjectchanged attribute is set to true from step 6c (subject doesn't match), update the current state of that activity monitor ID to **Ready for Power Automate**, and then set the **Reason** to **blank**.

e. Continue executing automatic record creation and update rules and create case. Perform an unbound action and add the fields as shown in the screenshot.



By performing the steps, the automatic record creation and update rule can be conditionally bypassed (based on email subject change condition) and a new case can be created.

Overview of service-level agreements

Article • 06/24/2022

Service-level agreements (SLAs) enable businesses to track support policies and ensure customers are being supported per the support policy to which they are entitled. Businesses use SLAs to govern support products that customers either receive as part of their purchase or add on to their purchase. What SLAs include are policy details such as how quickly a customer is entitled to receive support, how many support requests a customer can make, and how long after purchases a customer can be supported as part of the agreement.

You can define the level of service or support that your organization agrees to offer to a customer by using SLAs in Dynamics 365 Customer Service. Providing support based on service levels ensures that you're delivering measured and predictable service.

You can associate an SLA with an entitlement, so that when an entitlement is added to a case, the associated SLA is also applied. You can only associate SLAs that are created for the Case entity with entitlements. More information: Create entitlements to define support terms

You can also enable SLAs for entities other than case. More information: Enable entities for service level agreements

Alternatively, you can set up a default SLA for the organization. More information: Set a default SLA

Benefits of service-level agreements

Tracking

- After you've configured the SLA KPIs, SLAs, and SLA items for an entity, you can add the SLA Timer control to display the SLA KPIs that are configured for the entity. You can customize the views to filter the KPIs and display only the relevant KPIs to agents. More information: Add a timer control for SLA-enabled entities This helps agents monitor their service level performance and meet their service level goals.
- You can create SLA KPIs with target times by setting up customer holiday schedules or customer service schedules to calculate business hours to be considered during time calculation.

- You can also enable recalculation of SLAs, providing agents with sufficient time to work on their services. More information: Enable recalculation of SLAs on reaching terminal status

Prioritization

You can define the set of conditions based on which KPIs are applied to a case, or the set of actions to take as a warning or in case of an SLA breach. More information: Manage service configuration settings

Reminders

You can include detailed items to define metrics or key performance indicators (KPIs) to attain that service level. SLA KPIs help you get timely warnings about any issues your customer support team might be having. More information: Create SLA KPIs

Features of service-level agreements

Configure SLAs

Configuring SLAs includes the process of creating SLA KPIs, SLAs, and then applying the SLAs that you have created.

Create SLA KPIs

Creating KPIs for your SLAs helps define the success, failure, or warning criteria for your SLAs. KPIs also include performance metrics such as the response and resolution time, which help define whether the scope of services to be covered was met or breached. More information: Create SLA KPIs

Create SLAs

After you have created the SLA KPIs, you can create SLAs from the Customer Service admin center or Customer Service Hub app. Creating an SLA includes creating an SLA and SLA item, configuring actions for the SLA item, and then activating the SLA. More information: Create SLAs

Apply SLAs

As a final step, you can apply SLAs automatically, manually, through entitlements, or by setting up a default SLA. More information: Apply SLAs

Implement and manage SLAs

After you have configured and applied your SLAs, you can manage the various aspects of your SLA.

Export and import a solution with SLAs

- You can export and import a solution with SLAs to another environment without having to create SLAs in the new environment all over again. More information: Export and import a solution with SLAs
- Additionally, you can export or import a calendar with SLAs. SLA items will automatically be linked to the corresponding imported calendars on import. More information: Export or import a calendar with SLAs

Calculate SLA KPIs

- You can manage the calculation of SLA KPIs. You can enable the recalculation of SLA KPIs that reach the terminal status in the Customer Service admin center or Customer Service Hub app. More information: Enable recalculation of SLAs on reaching terminal status.

- Additionally, you can enable the custom time calculation and custom recalculation of SLA KPIs. More information: Enable custom time calculation of SLA KPIs and Enable custom recalculation of SLA KPIs

Create and manage customer service and holiday schedules

- You can create customer service schedules and define the work hours to determine the support team's availability to provide support to customers. More information: Create customer service schedule and define the work hours
- You can create and manage holiday schedules and any changes that occur to the schedules as well. This helps avoid any issues with your SLA in cases where your service organization has a holiday. More information: Create and manage holiday schedules

Add a timer control to an SLA-enabled entity form and customize the SLA timer control display label

- To help your service organization manage the current status and the time remaining for the configured SLA KPIs, you can add a timer control to an SLA-enabled entity form. More information: Add a timer control for SLA-enabled entities.
- Additionally, you can customize the SLA timer control display label according to the needs of your organization. More information: Customize the SLA timer control display label

Troubleshoot issues in SLAs

Enable entities for service level agreements

Article • 08/29/2023

Service level agreements are not just important in the customer service space, but also for sales and marketing to ensure efficient handling of leads from start to finish.

> **Important**
>
> Only enhanced SLAs can be created for other entities. A standard SLA can be created only for the Case entity.

Entities (record types) that support SLAs

With Customer Service, you can create enhanced SLAs for entities that are enabled for SLA. A system administrator or customizer can enable SLAs for the following entities:

- Account
- Contact
- Order
- Invoice
- Quote
- Opportunity
- Lead
- Activity entities such as Email, PhoneCall, and Appointment—but not RecurringAppointment or its instances.

  > **Note**
  >
  > SLAs can also be enabled for custom entities and custom activities.

To enable an entity for SLA

1. Make sure that you have the System Administrator or System Customizer security role or equivalent permissions.

   ### Check your security role

   - Follow the steps in View your user profile.

2. Go to **Settings** > **Customizations**.
3. Select **Customize the System**.
4. In the solution explorer, in the left navigation pane, select the entity that you want to enable for SLA.
5. Under **Communication & Collaboration**, select the **Enable for SLA** check box.
6. Select **Save**.
7. Select **Publish**.

> **Note**
>
> - You can have active SLAs for a maximum of seven entities.
> - We recommend that you have a maximum of five SLA KPIs per entity.
> - You can have a maximum of 100 SLA items per SLA entity, however we recommend that you have less than 15 SLA items per SLA entity.

Configure service level agreements

Create customer service schedule and define the work hours

Article • 05/24/2023

To define when your service or support team is available for providing support to customers, create a customer service schedule in Dynamics 365 Customer Service. A customer service schedule determines the business hours for each day in a week and also the weekly off. Customer Service uses these details for time tracking of service-level agreements (SLAs).

For SLA time tracking, make sure you add a holiday schedule to the customer service schedule, and associate this customer service schedule to the SLA record.

You can create the service schedule and define work hours in Dynamics 365 Customer Engagement (on-premises) 9.1 also. More information: New features in Dynamics 365 Customer Engagement (on-premises)

> **Note**
>
> With the latest release of Dynamics 365 Customer Service app, customer service schedule in service management is available in the Customer Service Hub. We recommend that you create and manage customer service schedule using the new experience.

Create a customer service schedule

1. Make sure that you assign the Customer Service Manager, System Administrator, System Customizer security role, or equivalent permissions at the user level only.

   ### Check your security role

   - Follow the steps in View your user profile.
   - Don't have the correct permissions? Contact your system administrator.

2. Navigate to the Customer Service admin center or Customer Service Hub app, and perform the following steps:

   Customer Service admin center

a. In the site map, select **Calendar** in **Operations**. The **Calendar** page appears.

b. In the **Customer service calendar** section, select **Manage**.

The **All Customer Service Calendars** view is displayed. You can switch between various system views using the drop-down list.

3. To create a customer service schedule, select **New**.

   To edit an existing schedule, select the schedule in the list of records, and then select **Edit** on the command bar.

4. In the **Name** field of the **Create Customer Service Schedule** dialog, enter a meaningful name for the schedule such as “APAC Customer Schedule", and then select **Create**.

5. In the **Weekly Schedule** dialog, follow these steps:

   a. For work hours, select one of these options:

   - **Are the same each day**: The schedule is the same for every day of the week. After you select this option, to select the days of the week that the customer support is available, select **Set Work Hours**.

     To set the work hours for the days, select **Set Work Hours**. For more information, see Define work hours for the customer service schedule.

   - **Vary by day**: The new schedule is different for one or more days of the week. After you select this option, select the days of the week that the customer support is available, and also specify the work hours for each day.

   - **24 x 7 support**: The customer support is available 24 hours a day and all days of the week.

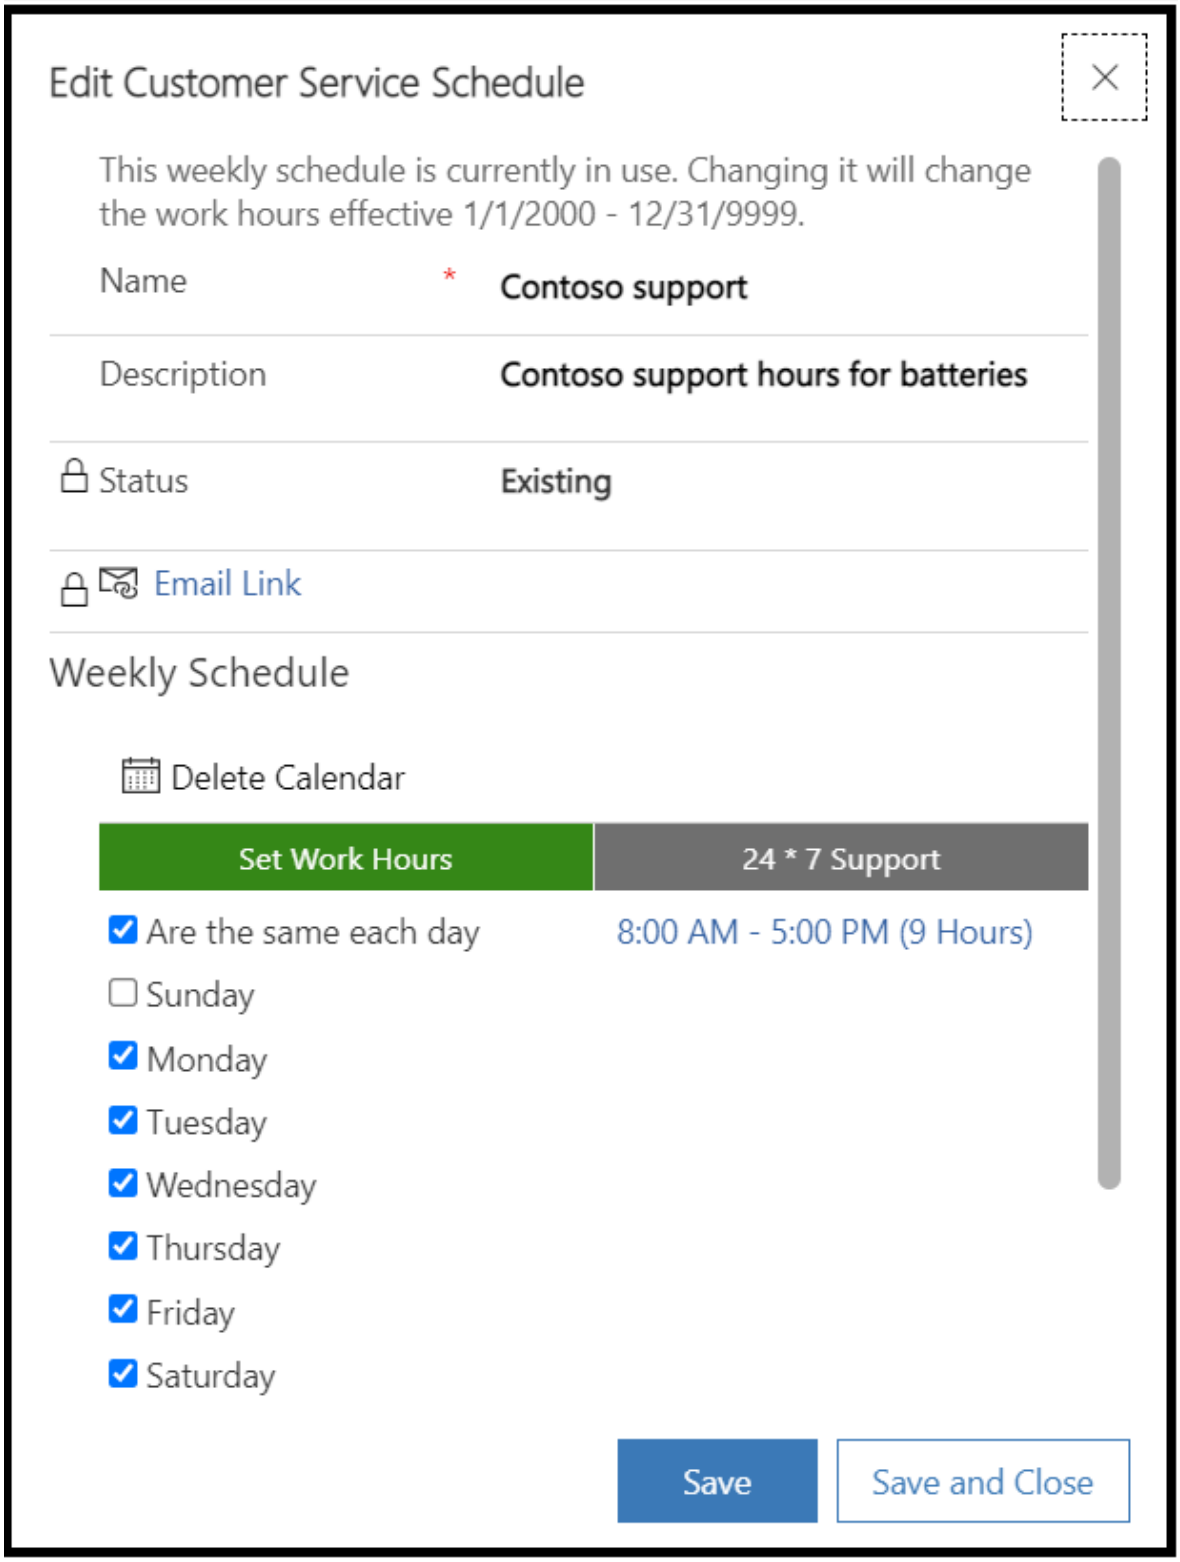
   b. For **Work Days**, select the checkbox for each day that the customer support resources will be available and working.

   c. For **Holiday Schedule**, select **Observe** to specify when your service organization will be closed.

   If you selected **Observe**, select a holiday schedule from the lookup box. More information:Set up a holiday schedule

6. In the **Time Zone** dropdown box, under **Select the time zone**, select the time zone in which your customer support resources will work. If applicable, the daylight saving time is taken into account for the selected time zone.

7. Select **Save**.



Define the work hours for the schedule

In the **Set Work Hours** dialog, complete the following fields, and then select **OK**.

- **Start**: Select the time the work day starts.
- **End**: Select the time the work day ends.

  To add a break in the work hours, like a lunch break, select **Add Break**, and then select the start and end time of the break.

Set up a holiday schedule

Create and manage holiday schedules

Article • 09/21/2022

Avoid having your service level agreements (SLAs) affected when your service organization is closed by creating a holiday schedule and adding it to your service calendar.

For example, if your service organization has an SLA to reply to email cases within two business days, you can create a holiday schedule and add it to your service calendar. Then, if a customer submits an email case on that holiday, your SLA is clear and is not affected by the holiday closure.

> **Note**
>
> With the latest release of Dynamics 365 Customer Service app, holiday schedule in service management is available in the Customer Service Hub. We recommend that you create and manage holiday schedules using the new experience.

Create a holiday schedule

You can create a holiday schedule in the Customer Service admin center or Customer Service Hub app

1. Make sure that you have the Customer Service Manager, System Administrator, or System Customizer security role or equivalent permissions.
   - Follow the steps in View your user profile. Don't have the correct permissions? Contact your system administrator.
2. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Calendar** in **Operations**. The **Calendar** page appears.

   b. In the **Holiday calendar** section, select **Manage**.

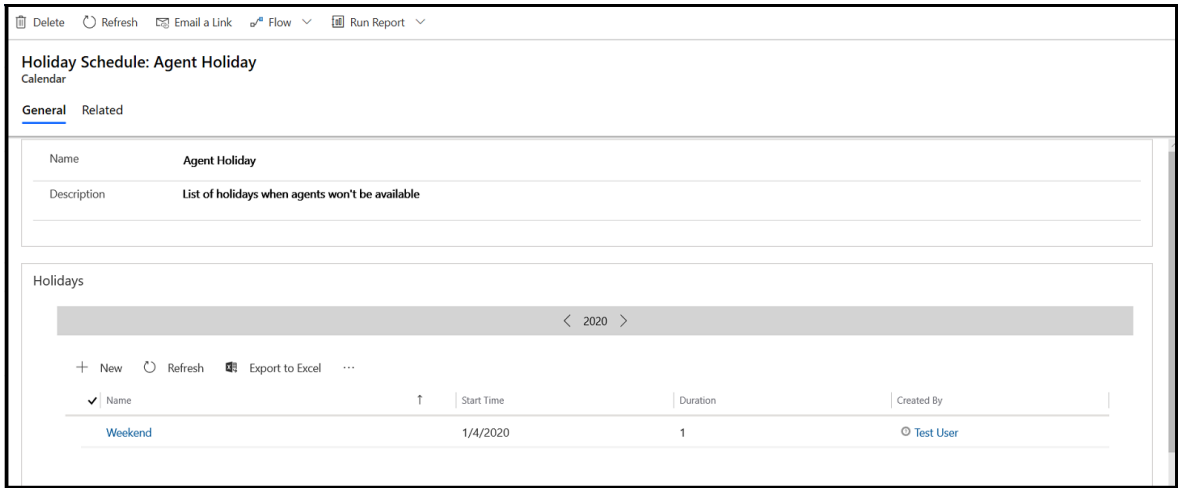
   The **All Holiday Schedules** view is displayed. You can switch between various system views using the dropdown list.

3. Select **New** and in the **Create Holiday Schedule** dialog box, enter a name and description for the holiday, and then select **Create**.

4. When the holiday opens, select **New** in the **Holidays** grid to add the holiday to your customer service calendar.

5. In the **Add Holiday** dialog box, specify the **Name**, **Start Date**, **End Date**, and **Duration** of the holiday, and then select **OK**.

   The holiday is created and associated with your customer service calendar. After the customer service schedule is associated with an SLA, then your SLA during business hours is not affected. More information: Define service level agreements



To resolve any issues with the SLA during holidays, see SLA timer does not pause when its state is changed from InProgress to OnHold on a holiday.

Create a holiday schedule (Customer Service app)

1. Make sure that you have the Customer Service Manager, System Administrator, or System Customizer security role or equivalent permissions.

   - Follow the steps in View your user profile. Don't have the correct permissions? Contact your system administrator.

2. go to **Settings** > **Service Management**

3. Select **Holiday Schedule**.

4. Select **New** and in the **Create Holiday Schedule** dialog box, enter a name and description for the holiday, and then select **Create**.

5. In the list of holidays, select the holiday you created.

6. When the holiday is open, select **New** to add the holiday to your customer service calendar.

7. In the **Add a Holiday** dialog box, specify the name and select the time of the holiday, and then select **OK**.

   The holiday is created and associated with your customer service calendar. After the customer service schedule is associated to an SLA, then your SLA during business hours is not affected. More information: Configure service-level agreements

Additional actions

- To edit an existing holiday schedule, go to **Service Management** > **Holiday Schedule**. The **All Holiday Schedules** view is displayed. Select the holiday schedule you want to edit from the list of holiday schedules and select **Edit** in the command bar.
  - You can edit the **Name** or **Description**, or add new holidays for the holiday schedule.
  - By default, all the holidays of the current year are displayed. To switch to a different year, select and type the year in the **Holidays** grid:

- To print a holiday schedule, select **Print Preview** in the **Holidays** section of the holiday schedule.

- To import or export a holiday schedule, use the Calendar import or export feature as you can't import or export a holiday schedule in the Excel format.

Create a customer service schedule and define the work hours

Manage changes to customer service and holiday schedules of existing SLA KPIs

Article • 05/11/2022

Introduction

This topic describes how you can manage changes to the customer service and holiday schedules of your existing service-level agreements (SLA) key performance indicators (KPIs).

Understand time calculation of SLA KPIs

To manage changes to the customer service and holiday schedules of your SLA KPIs, you must first understand how time calculation works for SLA KPIs. The time calculation for SLA KPIs depends on the warning and failure time, and the customer service and holiday schedules associated with the SLA KPI item.

The following is an example of a SLA KPI that describes how time calculation works. The configurations set for the SLA KPI are as follows:

- Defined working hours: 9 AM to 5 PM (8 hours daily)
- Failure duration: 12 hours
- Holiday calendar: The next day is marked as a holiday.
- The case was created today at 10 AM.

So, after time calculation, the failure duration will be the day after the next day at 14:00 (2 PM). This is calculated by considering the remaining hours for the day; that is, 5 PM – 10 AM = 7 hours, which leaves 5 hours for the next day (calculated as failure duration – hours consumed today). The next day doesn't get calculated because it's a holiday. So, the failure duration will be the day after the next day: 9 AM + 5 hours = 14:00 (2 PM).

For more information about creating customer service schedules, go to: Create customer service schedule and define the work hours. For more information about creating holiday schedules, go to: Create and manage holiday schedules.

Apart from warning and failure time calculation, SLA time calculation also involves calculating *elapsed time*, which is the period when the SLA KPIs are paused and

resumed. To ignore the working hours spent while the SLA KPIs were in a paused state, elapsed time is used in calculating the final failure duration.

Scenarios and recommendations

Whenever any SLA KPI instance is created, the warning and failure times are created, depending on the factors described in the Understand time calculation of SLA KPIs section. A change in the calendar working hours won't affect the existing KPI instances.

However, you might have the following scenarios, which will affect the existing KPI instances:

- Pausing and resuming the SLA KPI instance.
- Updating the SLA on the target entity.
- A change in the SLA item.
- Reapplying the SLA KPI instance after the terminal state (in case of Recalculation on Terminal State).

In the above scenarios, the warning time and the failure time of the SLA KPIs are recalculated by using the new customer service schedule and the holiday schedule. However, if you want to change the existing customer service and holiday schedules that are already in use in the existing SLA KPI instances, you can implement the recommendations that are provided in the following section.

> ⓘ **Note**
>
> Before applying the changes to your production environment, you must validate all the scenarios and the recommendations to ensure that all the conditions are met.

Scenario 1:

Conditions:

- Only one SLA KPI is set as the default.
- One calendar needs to be associated.
- Multiple SLA items.
- With or without a pause and resume scenario.
- No need to update existing, running KPI instances.

Recommendation:

1. Don't modify the existing SLA and calendar. The existing SLA can continue to remain in an active state in the production environment. Create a similar SLA with

a new calendar and the same kind of SLA items.

2. Activate the new SLA and set it as the default. This will ensure that all the new cases are created with the new SLA, and time calculation will be done with the new calendar information. If you aren't using a default SLA, update your SLA condition to update the SLA ID in the Case entity accordingly. More information: Apply SLAs

Scenario 2

Conditions:

- Multiple SLAs
- Multiple calendars need to be associated.
- Multiple SLA items.
- With or without a pause and resume scenario.
- No need to update existing, running KPI instances.

Recommendation:

1. Don't modify the existing SLAs and calendars. The earlier SLAs can continue to remain in an active state in the production environment. Create similar SLAs with a new calendar and the same kind of SLA items.

2. Activate the new SLAs. This will ensure that all the new cases are created with the new SLA, and time calculation will be done with the new calendar information.

3. Update your SLA conditions to update the SLA ID in the Case entity accordingly. More information: Apply SLAs

Scenario 3

Conditions:

- Multiple SLAs.
- Multiple calendars.
- Multiple SLA items.
- Doesn't include a pause and resume scenario.
- Need to update existing, running KPI instances.

Recommendation:

Modify the existing calendars. This will ensure that all the new cases are created with same SLA, and time calculation is done with the new calendar information. However, the existing running KPI instances won't calculate the warning and failure time based on the

new calendar automatically. You'll need to initiate an event for the KPI instance to pick the new calendar.

For example, introduce the pause state and trigger a quick pause, and then resume the update on the case. This will make the KPI instance pick the new calendar information. To initiate a pause and resume, either agents can do a manual update on each case individually, or you can implement a custom logic to update the case during the lowest activity hours.

For example, a flow can run during the lowest activity hours with the following logic:

- Find the associated SLA from a calendar that needs to be updated.
- Find all the incidents which have the same SLA ID field value as the above SLA. You can do this in batches to avoid running into scalability issues.
- Do an update on the case to put it to a paused state.
- Do the next update on the case, which puts it back to Resume.

More information: Apply SLAs

Scenario 4

Conditions:

- Multiple SLAs
- Multiple calendars need to be associated.
- Multiple SLA items.
- Includes a pause and resume scenario.
- Need to update existing, running KPI instances.

Recommendation:

This is a complex scenario that can't be completely implemented. It might cause unexpected results for those KPI instances that were set to a paused or resumed state before the new calendar was applied, because the elapsed time for such instances might have already been calculated during the paused or resumed state by using the old calendars. So, the final calculation might be done partly with the old calendar and partly with the new calendar.

Create and manage holiday schedules

SLA time calculation scenarios

Article • 10/13/2023

This article describes SLA time calculations, given that:

- Warning Time: 1 day (1*24= 24 hours)
- Failure Time: 2 days (2*24= 48 hours)

SLA without any calendar

When you apply an SLA to a case but don't attach a calendar to the SLA, the time is calculated from the creation of the case.

In this example, time is calculated as follows:

- Case created on 06/14/2023 3:00 PM.
- Warning and failure times are set as 1 and 2 days, respectively.
- So, the warning time is 06/15/2023 3:00 PM and the failure time is 06/16/2023 3:00 PM.

SLA with calendar

When you create an SLA with a calendar with working hours and working days of the week set, then the time calculation doesn't consider the non-working hours and days.

In this example, time is calculated as follows:

- Case created on 06/14/2023 3:00 PM.
- Warning and failure times are set as 1 and 2 days, respectively.
- Working hours are set as 8:00 AM to 5:00 PM.
- Working hours are calculated as 9 hours.
- Working days are set as Monday to Friday.
- Skips Saturday and Sunday.
- Warning time is 06/19/2023 12:00 noon and failure time is 06/22/2023 9:00 AM.

Warning Time: 1 day (1*24= 24 hours)

Here's how the warning time is calculated:

- Case was created on 06/14/2023 at 3:00 PM.
- 06/14/2023- 3:00 PM to 5:00 PM (2 hours) = 24-2 = 22 hours

- 06/15/2023- 8:00 AM to 5:00 PM (9 hours) = 22-9 = 13 hours
- 06/16/2023- 8:00 AM to 5:00 PM (9 hours) = 13-9 = 4 hours
- 06/17/2023- weekend (non-working day)
- 06/18/2023- weekend (non-working day)
- 06/19/2023- 8:00 AM to 12:00 noon (4 hours) = 4-4= 0 hours

Failure Time: 2 days (2*24= 48 hours)

Here's how the failure time is calculated:

- Case was created on 06/14/2023 at 3:00 PM.
- 06/14/2023- 3:00 PM to 5:00 PM (2 hours) = 48-2= 46 hours
- 06/15/2023- 8:00 AM to 5:00 PM (9 hours) = 46-9= 37 hours
- 06/16/2023- 8:00 AM to 5:00 PM (9 hours) = 37-9= 28 hours
- 06/17/2023- weekend (non-working day)
- 06/18/2023- weekend (non-working day)
- 06/19/2023- 8:00 AM to 5:00 PM (9 hours) = 28-9= 19 hours
- 06/20/2023- 8:00 AM to 5:00 PM (9 hours) = 19-9= 10 hours
- 06/21/2023- 8:00 AM to 5:00 PM (9 hours) = 10-9= 1 hour
- 06/22/2023- 8:00 AM to 9:00 AM (1 hour) = 1-1= 0 hour

So, if you create a case on 06/14/2023 3:00 PM with warning and failure times set as 1 and 2 days respectively, then the warning time is 06/19/2023 12:00 noon, and the failure time is 06/22/2023 9:00 AM.

SLA with calendar and break hours

When you create an SLA with a calendar and on that calendar you set working hours, break hours, and working days of the week, then the time calculation doesn't consider the non-working and break hours.

Time is calculated as follows:

- Case created on 06/14/2023 3:00 PM.
- Warning and failure times are set as 1 and 2 days, respectively.
- Working hours are set as 8:00 AM to 5:00 PM.
- Break is 1 hour between 1:00 PM to 2:00 PM.
- Working hours are calculated as 8 hours.
- Working days are set as Monday to Friday.
- Skips Saturday and Sunday.
- Warning time is 06/19/2023 3:00 PM and failure time is 06/22/2023 3:00 PM.

Warning Time: 1 day (1*24= 24 hours)

Here's how the warning time is calculated:

- Case got created on 06/14/2023 at 3:00 PM
- 06/14/2023- 3:00 PM to 5:00 PM (2 hours) = 24-2= 22 hours
- 06/15/2023- 8:00 AM to 1:00 PM (5 hours) = 22-5= 17 hours
- 06/15/2023- 1:00 AM to 2:00 PM (1 hour) = break hours
- 06/15/2023- 2:00 AM to 5:00 PM (3 hours) = 17-3=14 hours
- 06/16/2023- 8:00 AM to 1:00 PM (5 hours) = 14-5= 9 hours
- 06/16/2023- 1:00 AM to 2:00 PM (1 hour) = break hours
- 06/16/2023- 2:00 AM to 5:00 PM (3 hours) = 9-3= 6 hours
- 06/17/2023- weekend (non-working day)
- 06/18/2023- weekend (non-working day)
- 06/19/2023- 8:00 AM to 1:00PM (5 hours) = 6-5= 1 hour
- 06/19/2023- 1:00 AM to 2:00 PM (1 hour) = break hours
- 06/19/2023- 2:00 AM to 3:00 PM (1 hour) = 1-1= 0

Failure Time: 2 days (2*24= 48 hours)

Here's how the failure time is calculated:

- Case got created on 06/14/2023 at 3:00 PM
- 06/14/2023- 3:00 PM to 5:00 PM (2 hours) = 48-2= 46 hours
- 06/15/2023- 8:00 AM to 1:00 PM (5 hours) = 46-5= 41 hours
- 06/15/2023- 1:00 AM to 2:00 PM (1 hour) = break hours
- 06/15/2023- 2:00 AM to 5:00 PM (3 hours) = 41-3=38 hours
- 06/16/2023- 8:00 AM to 1:00 PM (5 hours) = 38-5= 33 hours
- 06/16/2023- 1:00 AM to 2:00 PM (1 hour) = break hours
- 06/16/2023- 2:00 AM to 5:00 PM (3 hours) = 33-3= 30 hours
- 06/17/2023- weekend (non-working day)
- 06/18/2023- weekend (non-working day)
- 06/19/2023- 8:00 AM to 1:00 PM (5 hours) = 30-5= 25 hours
- 06/19/2023- 1:00 AM to 2:00 PM (1 hour) = break hours
- 06/19/2023- 2:00 AM to 5:00 PM (3 hours) = 25-3= 22 hours
- 06/20/2023- 8:00 AM to 1:00 PM (5 hours) = 22-5= 17 hours
- 06/20/2023- 1:00 AM to 2:00 PM (1 hour) = break hours
- 06/20/2023- 2:00 AM to 5:00 PM (3 hours) = 17-3= 14 hours
- 06/21/2023- 8:00 AM to 1:00 PM (5 hours) = 14-5= 9 hours
- 06/21/2023- 1:00 AM to 2:00 PM (1 hour) = break hours
- 06/21/2023- 2:00 AM to 5:00 PM (3 hours) = 9-3= 6 hours

- 06/22/2023- 8:00 AM to 1:00 PM (5 hours) = 6-5= 1 hour
- 06/22/2023- 1:00 AM to 2:00 PM (1 hour) = break hours
- 06/22/2023- 2:00 AM to 3:00 PM (1 hour) = 1-1= 0 hours

So, if you create a case on 06/14/2023 3:00 PM with warning and failure times set as 1 and 2 days respectively, then the warning time is 06/19/2023 3:00 PM, and the failure time is 06/22/2023 3:00 PM.

SLA with calendar and holiday calendar

When you create an SLA with a calendar and set working hours, working days of the week, and some days as holidays, then the non-working hours, working days of the week, and holidays aren't considered.

TIme is calculated as:

- Case created on 06/14/2023 3:00 PM.
- Warning and failure times are set as 1 and 2 days, respectively.
- Working hours are set as 8:00 AM to 5:00 PM.
- Working hours are calculated as 9 hours daily.
- Working days are set as Monday to Friday.
- Skips Saturday and Sunday.
- Skips holidays as per holiday calendar.
- Warning time will be 06/21/2023 12:00 noon and failure time will be 06/26/2023 9:00 AM.

Warning Time: 1 day (1*24= 24 hours)

Here's how the warning time is calculated:

- Case was created on 06/14/2023 at 3:00 PM
- 06/14/2023- 3:00 PM to 5:00 PM (2 hours) = 24-2= 22 hours
- 06/15/2023- 8:00 AM to 5:00 PM (9 hours) = 22-9= 13 hours
- 06/16/2023- holiday (non-working day)
- 06/17/2023- weekend (non-working day)
- 06/18/2023- weekend (non-working day)
- 06/19/2023- holiday (non-working day)
- 06/20/2023- 8:00 AM to 5:00 PM (9 hours) = 13-9= 4 hours
- 06/21/2023- 8:00 AM to 12:00 noon (4 hours) = 4-4= 0 hours

Failure Time: 2 days (2*24= 48 hours)

Here's how the failure time gets calculated:

- Case got created on 06/14/2023 at 3:00 PM
- 06/14/2023- 3:00 PM to 5:00 PM (2 hours) = 48-2= 46 hours
- 06/15/2023- 8:00 AM to 5:00 PM (9 hours) = 46-9= 37 hours
- 06/16/2023- holiday (non-working day)
- 06/17/2023- weekend (non-working day)
- 06/18/2023- weekend (non-working day)
- 06/19/2023- holiday (non-working day)
- 06/20/2023- 8:00 AM to 5:00 PM (9 hours) = 37-9= 28 hours
- 06/21/2023- 8:00 AM to 5:00 PM (9 hours) = 28-9= 19 hours
- 06/22/2023- 8:00 AM to 5:00 PM (9 hours) = 19-9= 10 hours
- 06/23/2023- 8:00 AM to 5:00 PM (9 hours) = 10-9= 1 hour
- 06/24/2023- weekend (non-working day)
- 06/25/2023- weekend (non-working day)
- 06/26/2023- 8:00 AM to 9:00 AM (1 hour) = 1-1= 0 hour

So, if you create a case on 06/14/2023 3:00 PM and warning and failure times are set as 1 and 2 days respectively, then the warning time is 06/21/2023 12:00 noon and the failure time is 06/26/2023 9:00 AM.

Pause and hold scenario

When you create an SLA and then pause it for hours or days, the paused hours or days aren't considered in the SLA failure and warning times.

Time is calculated as follows:

- Case created on 06/14/2023 3:00 PM.
- warning and failure times are set as 1 and 2 days, respectively.
- Working hours are set as 8:00 AM to 5:00 PM.
- It will calculate 9 hours daily as working hours.
- Working days are set as Monday to Friday.
- Skips Saturday and Sunday.
- Skips holidays as per the Holiday calendar.
- Skips paused hours or days.
- Warning time is 06/21/2023 10:00 AM and failure time is 06/26/2023 4:00 PM.

Warning Time- 1 day (1*24= 24 hours)

Here's how the warning time iss calculated:

- Case got created on 06/13/2023 at 1:00 PM.
- 06/13/2023- 1:00 PM to 5:00 PM (4 hours) = 24-4= 20 hours
- 06/14/2023- 8:00 AM to 5:00 PM (9 hours)- Paused
- 06/15/2023- 8:00 AM to 5:00 PM (9 hours) = 20-9= 11 hours
- 06/16/2023- holiday (non-working day)
- 06/17/2023- weekend (non-working day)
- 06/18/2023- weekend (non-working day)
- 06/19/2023- holiday (non-working day)
- 06/20/2023- 8:00 AM to 5:00 PM (9 hours) = 11-9= 2 hours
- 06/21/2023- 8:00 AM to 10:00 AM (2 hours) = 2-2= 0 hour

Failure Time- 2 days (2*24= 48 hours)

Here's how the failure time is calculated:

- Case was created on 06/13/2023 at 1:00 PM
- 06/13/2023- 1:00 PM to 5:00 PM (4 hours) = 48-4= 44 hours
- 06/14/2023- 8:00 AM to 5:00 PM (9 hours) - Paused
- 06/15/2023- 8:00 AM to 5:00 PM (9 hours) = 44-9= 35 hours
- 06/16/2023- holiday (non-working day)
- 06/17/2023- weekend (non-working day)
- 06/18/2023- weekend (non-working day)
- 06/19/2023- holiday (non-working day)
- 06/20/2023- 8:00 AM to 5:00 PM (9 hours) = 35-9= 26 hours
- 06/21/2023- 8:00 AM to 5:00 PM (9 hours) = 26-9= 17 hours
- 06/22/2023- 8:00 AM to 5:00 PM (9 hours) = 17-9= 8 hours
- 06/23/2023- 8:00 AM to 5:00 PM (9 hours) = Paused
- 06/24/2023- weekend (non-working day)
- 06/25/2023- weekend (non-working day)
- 06/26/2023- 8:00 AM to 4:00 PM (8 hours) = 8-8= 0 hour

So, if you create a case is on 06/14/2023 3:00 PM with warning and failure times set as 1 and 2 days respectively, then the warning time is 06/21/2023 10:00 AM and the failure time is 06/26/2023 4:00 PM.

Configure service-level agreements

Article • 10/14/2023

> **Tip**
>
> If you'd like to try Dynamics 365 Customer Service for free, you can sign up for a **30-day trial**.

With service-level agreements (SLAs) configured in Customer Service Hub, you can:

- Use out-of-the-box actions in Microsoft Power Automate.
- Define work hours, and pause and resume SLAs at the SLA KPI level and SLA item level, which help track SLA items for different work hours based on priority and criteria. The pause settings at SLA KPI level or SLA item level give you added flexibility to define pause conditions at a more granular level.
- In a case lifecycle, multiple SLA KPIs can be triggered at different start points. The following illustration depicts how you can define an overall resolution time, and also specify SLA KPIs at different start points.

To configure SLAs in Customer Service Hub:

1. Review prerequisites.
2. Create SLA KPIs.
3. Create SLAs.
4. Apply SLAs

> **Note**

You can create SLAs only in environments that have customer engagement apps such as Customer Service, as SLAs are available by default in these apps.

Prerequisites

Review the following requirements before configuring SLAs for your organization:

- The System Administrator, System Customizer, or Customer Service Manager role is assigned to you. Additionally, make sure that the following permissions have been granted in **Security** > **Security Roles** > **Custom Entities**:
  - **CSR Manager**
    - **Connector**: All permissions at the business unit level.
    - **SLAKPI**: Create permission at the business unit level, delete permission at the parent-child level, and other permissions at the organization level.
    - **ProcessStageParameter**: All permissions at the business unit level.
  - **Customer Service Representative**: Read permission at the organization level for the SLA KPI entity.

- Power Automate License is available for the user creating actions on SLA KPI instance statuses.

- Identify target entities and add customizations. To add customizations in target entities to track SLAs, follow these steps:

  1. Create a lookup field on the entity for which an SLA has to be configured, and relate it to an SLA KPI instance. Lookup fields are created so that you can view the SLA in the timer on the entity form and track your SLAs. To learn more, see Create and edit fields. For example, to track an SLA on a case for "escalated by KPI", you need to create a field as **EscalatedByKPI** on the Case entity, and provide the **Data Type** as **Lookup** and **Target Record Type** as **SLA KPI Instance**.

  2. Use the lookup field to configure a timer to help users estimate the amount of time they have to complete a task—typically as specified in an SLA.
     To configure a timer, add the timer control to an entity form. The timer control initially displays a countdown timer to show the time remaining to complete the task. To learn more, see Add a timer control to the Case form to track time against an SLA.

Note

- In Unified Interface, the **Elapsed Time** and **Paused On** attributes of an SLA KPI Instance contain values equivalent to the **Onhold Time** and **Last Onhold Time** attributes respectively, of the target record, such as, case and account in the web client.
- Once the SLA KPI Instance reaches the terminal state (**Succeeded** or **Noncompliant**), the **Paused on** and **Elapsed Time** are no longer be calculated.

Create SLA KPIs

SLA KPIs are performance indicators, such as First Response or Resolve by, that you'd like to track.

You can create SLA KPIs from the Customer Service admin center or Customer Service Hub app.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Service Terms** in **Operations**. The **Service Terms** page appears.
   b. In the **SLA KPIs** section, select **Manage**.

   The **Active SLAKPIs** view is displayed. Select the SLA for which you want to add an SLA item.

2. Select **New**. The **New SLA KPI** page appears.

3. Enter the following details on the **General** tab:

   - **Name**: The name of the SLA KPI.
   - **Owner**: The user creating the SLA is populated by default. You can specify a different owner.
   - **Entity Name**: Select the entity for which the KPI must be measured.
   - **KPI Field**: Select the respective KPI field. For example, if you're creating an SLA KPI to define the time within which a first response should be sent to the customer, select **FirstResponseByKPI** in the list.

- **Applicable From**: Select a value based on which the warning and failure time are measured. For example, if you select **Created On**, the warning and failure start time for an SLA are calculated from the date and time when the entity was created.

4. Select **Save**.

5. To define the pause criteria at the KPI level, in the **Pause Conditions** section that appears, do the following:
   a. Set the toggle to **Yes** for **Override Criteria**. If any pause settings are applied at the entity level for your org, they're overridden by the criteria define at the KPI level. For the other KPIs, the entity level pause settings continues to function if no pause criteria is defined at the KPI level.
   b. Select **Add** to define the conditions in which the SLA KPI can be paused.

   > **Note**
   >
   > At runtime, when you pause an SLA KPI instance and resume it, the SLA KPI instance is canceled and a new SLA KPI instance is created.

6. Select **Activate**. The SLA KPI is saved and activated.

When agents create an SLA KPI instance for an entity other than the case entity, the **Regarding** column appears as blank on Unified Interface, and as **(No name)** on the web client. This is a by-design behavior, and is also applicable to custom entities.

If you choose to show the entity name for your agents, perform the steps provided.

Configure SLA KPI instance entity name through Advanced Find

Perform the following steps to add a new column called **Name (Regarding)** that displays the name of the target entity of the SLA KPI Instance.

1. Go to Power Apps, and then go to **Settings** > **Advanced Find**.
2. In the **Look For** list, select **SLA KPI Instances**.
3. Select the **Field** as **Regarding ID**, and then select **Contains Data**.
4. Go to **Edit Columns** > **Add columns**, and then select **Record Type** as **Regarding (Entity)**.
5. Select **Name**, and then select **OK**.
6. Select **Results**. You'll see the **Name (regarding)** column displaying the name of the entity.

You can also use the following query to add a new column called **Name (Regarding)**.

1. From **Advanced Find**, select **Download Fetch XML**.
2. Paste the following query on the URL to see the full name of the target entity for the SLA KPI instance record. For more information on the format of the API call, see: Request. Here's an example: https:// your org link/api/data/v9.2/slakpiinstances?fetchXml=enter the following query. [URL encode the fetchxml]

```
<fetch version="1.0" output-format="xml-platform" mapping="logical"
distinct="false">

  <entity name="slakpiinstance">
    <attribute name="name" />
    <attribute name="status" />
    <attribute name="regarding" />
    <attribute name="failuretime" />
    <attribute name="warningtime" />
    <attribute name="succeededon" />
    <attribute name="slakpiinstanceid" />
    <order attribute="name" descending="false" />
    <link-entity name="lead" from="leadid" to="regarding" link-type="inner"
alias="ai">
      <attribute name="fullname" />
    </link-entity>
  </entity>
</fetch>
```

Create SLAs

Create SLAs to define conditions and actions that are applicable when an SLA is applied to an entity. The following steps are involved in creating the SLA:

1. Create an SLA.
2. Create an SLA item.
3. Configure actions for the SLA item.
4. Activate the SLA.

> ⓘ **Note**
>
> SLAs that are created in either the web client or Unified Interface can be viewed in both the web client and Unified Interface, but can be edited only where they were created.

Create an SLA

You can create an SLA from the Customer Service admin center or Customer Service Hub apps.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Service Terms** in **Operations**. The **Service Terms** page appears.
   b. In the **Service Level Agreements (SLAs)** section, select **Manage**.

   The **All Service Level Agreements** view is displayed. You can switch between various system views using the drop-down list.

2. Select **New**. The **New SLA** page appears.

3. Enter the following details on the **General** tab::

   - **Name**: Enter a name for the SLA.
   - **Primary Entity**: Select a value in the box.
   - **Description**: Enter a description for the SLA.

4. Select **Save**. The **SLA Items** section appears on the page, and the SLA is saved. You can perform the steps to create SLA items as described in the following section.

Create an SLA item

You can create an SLA item from the Customer Service admin center or Customer Service Hub app.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Service Terms** in **Operations**. The **Service Terms** page appears

   b. In the **Service Level Agreements (SLAs)** section, select **Manage**.

The **All Service Level Agreements** view is displayed. Select the SLA for which you want to add an SLA item.

2. On the page that appears, select **New SLA Item**. The **New SLA Item** dialog box appears.

3. Enter the following details on the **General** tab::

   - **Name**: Enter a name.
   - **KPI**: Select an SLA KPI.
   - **Allow Pause and Resume**: (Optional.) Enable this option if you want the SLA to be paused during the time the record is on hold. For each entity that's enabled for the SLA, you can set each status that are considered "on hold" in the **Service Management** > **Service Configuration Settings** page.
   - **Business Hours**: (Optional.) Select a value to assign business hours. The SLA is calculated based on the business hours and business closure that you define. More information: Create customer service schedule and define the work hours.

4. In the **Applicable When** section, define the conditions for when the SLA can be applied for the entity.

   The SLA is triggered when the applicable when condition is met throughout. If the applicable when condition isn't met after an SLA is triggered, the SLA KPI instance gets canceled. We recommend that you don't use case fields that are updated frequently because any change to the field value might lead to cancelation of the SLA item.

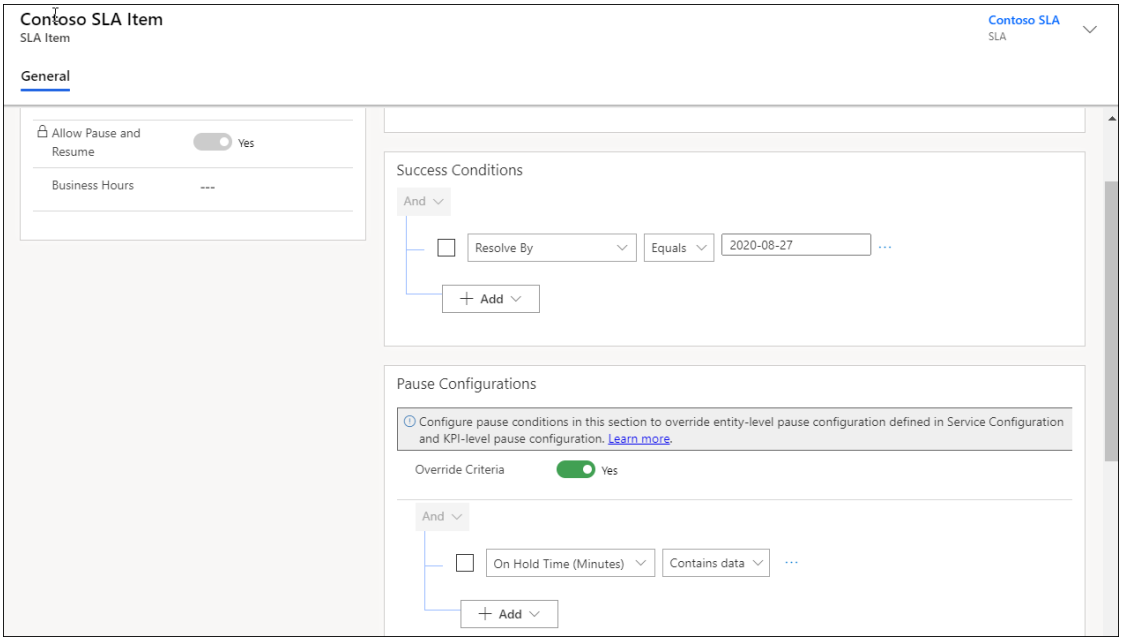
5. In the **Success Conditions** section, define the conditions that specify the success criteria of the SLA.

> **ⓘ Important**
>
> If you specify the success condition on the same entity on which applicable when is defined, a recommendation message are displayed with the suggestion that you don't use the same entity. You can choose to select **OK** if your organization needs the conditions to be configured on the same entity.

6. In the **Pause Configurations** section that appears only when **Allow Pause and Resume** is enabled, do the following:
   a. Set the toggle to **Yes** for **Override Criteria** to pause the SLA item. This setting overrides the pause settings defined at the entity level, if any, in Service

Configuration or at the SLA KPI level.

b. Select **Add** to define the conditions for pausing the SLA item.



7. In the **Warn and Fail Duration** section, specify the values to trigger notifications when an SLA is missed. If you don't need **Warning Duration**, you can set it to null so that SLAs don't reach the **Nearing noncompliance** status.

> **Note**
>
> The failure and warning time is calculated after considering the business hours selected in the SLA record. If you don't set the business hours record (customer service schedule), the work hours are considered to be all day, every day.

8. Select **Save**.

Configure actions for the SLA item

1. On the SLA page, select the SLA item, and then select **Edit SLA Item**. The SLA item page appears.

2. In the **Actions** area, select **Configure Actions**. The Power Automate application opens on a new tab where you can configure the actions and reminders for agents to keep track of their SLAs.

3. Perform the following steps in Power Automate:

   a. Accept the default settings or select the ellipsis to configure a connection.

   b. Select **Continue**. The predefined flow that's specific to the SLA appears.

> ⓘ **Note**
>
> We recommend that you don't edit the predefined flow, which can cause breaks in the flow, and the SLA might not work as defined.

c. Select **Switch**. The following condition steps are displayed for each of which you can configure a required action:

- **Is Nearing Non-Compliance**: Runs when the warning time is reached for the SLA.
- **Is Succeeded**: Runs when the SLA succeeds.
- **Is Non-compliant**: Runs when the SLA fails.

d. Select **[Do not delete or update] Is Nearing Non-Compliance** > **Add an action**. The **Choose an action** area appears, in which you can configure the action that must be performed when the warning time has been reached for the SLA.

e. In **Choose an operation**, search for an action, such as **Perform an unbound action**, and select it.

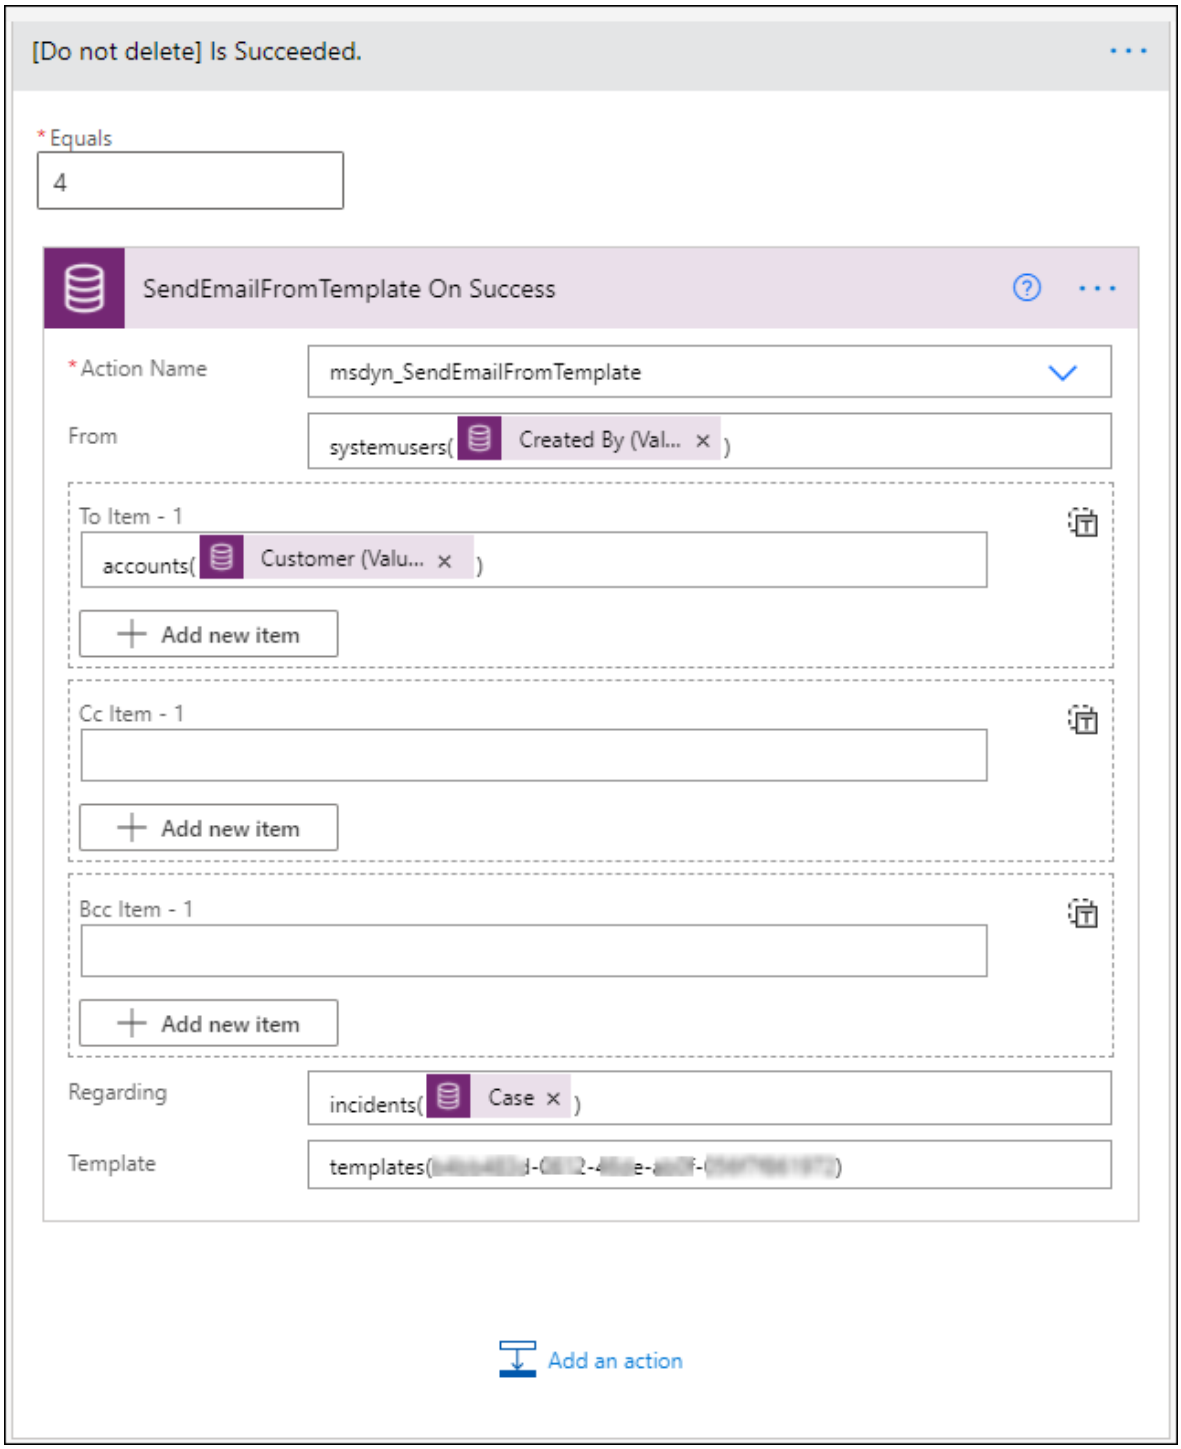
f. In **Action Name**, select **msdyn_SendEmailFromTemplate**, and configure the following options that are displayed for the action:

- **From**
- **To Item**
- **Cc Item**
- **Regarding**
- **Template**

> ⓘ **Note**
>
> To obtain the value for the **Template** field, see Open Data Protocol.

g. Repeat the steps to configure the actions for **Is Succeeded** and **Is Non-compliant**.

A sample screenshot of the configured action is as follows.



h. Save and exit Power Automate.

> **Note**
>
> More information: **Configure connectors in Power Automate**

4. Select **Save & Close** on the SLA item dialog box.

5. Define as many SLA items as you need.

6. Select **Activate**. The SLA is activated.

Apply SLAs

To understand how you can apply SLAs, see Apply service-level agreements

Troubleshoot issues in SLAs
Add a timer control for SLA-enabled entities

Apply SLAs

Article • 07/18/2023

You can apply service-level agreements (SLAs) to a case or an SLA-enabled entity record in one of the following ways:

- By updating the SLA information automatically through a workflow, Power Automate flow, or custom plug-in written for the entity.
- Through the entitlement associated with the case entity record. (This isn't applicable for other SLA-enabled entities.)
- Manually applying SLAs to records.
- By setting a particular SLA as the default SLA.

The SLA is reapplied whenever there's an update on an entity record and the updated fields are part of the **Applicable When** conditions of the SLA items.

When the SLA is reapplied, all the items of that SLA are evaluated based on the updated record fields. The failure or warning actions of the matching SLA Item are initiated if the time has exceeded. This happens even if the failure or warning actions were already initiated before the record was updated.

In Unified Interface, by default, when the SLA moves to a terminal status (non-compliant or succeeded), the **Applicable When** and **Success Criteria** won't be evaluated again on the SLA. If you want the SLA to be reevaluated, you can enable the reevaluation setting in the service configuration settings. More information: Enable SLA recalculation

When an Unified Interface SLA is reevaluated, a new SLAKPIInstance gets created and the previous instance gets cancelled. This isn't applicable to legacy SLAs.

During maintenance activities or when you're importing records and you don't want the SLAs to be applied, you can disable SLAs for your organization. A system administrator can disable SLAs from the **System Settings** dialog box. More information: System Settings dialog box - Service tab

> **Note**
>
> Only one SLA can be applied to a record. When an entity record is updated by using a different SLA, the previously applied SLA is canceled.

Apply SLAs automatically

You can automatically apply SLAs to records based on your business logic by using workflows, Power Automate flows, or custom plug-ins. For example, if your customers are spread across different countries or regions, you can have multiple SLAs with different business hours and holiday schedules. You can set up business logic to apply SLAs on case records based on the customer's country or region, to make sure that the SLA time calculation is done correctly.

To create workflows so that SLAs will be automatically applied, talk to your customer service managers, administrator, or customizer. More information: Overview of using workflow processes

You can also use the Power Automate flow portal to update the SLA. Currently the flow expects a GUID of the SLA record. More information: Create your first flow

If you choose to write a custom plug-in for the SLA-enabled entity, you can update the SLA ID in the pre-update plugin of the entity. For example, for case, the code in plug-in would look like:

`incident["slaid"] = new EntityReference("sla", new Guid("baa25488-6d99-es11-99da-225056836fb7"))` .

Apply SLAs through entitlements

You can create entitlements to define support terms. More information: Associate entitlements to cases

Apply SLAs manually

To apply SLAs to records manually, select the SLA in the SLA field. This field isn't available by default on entity forms, so you will need to ask your system administrator to add it.

While applying the SLA, the application first looks for automatically applied SLAs, followed by SLAs applied through entitlement. If there aren't any, the application looks for the SLA that's set as the default.

Set a default SLA

You can apply a default SLA in the Customer Service admin center or Customer Service Hub app by performing the following steps:

1. Go to **Service Level Agreements**.

Customer Service admin center

a. In the site map, select **Service terms** in **Operations**. The **Service terms** page appears.
b. In the **Service-level agreements (SLAs)** section, select **Manage**.

2. Select the required SLA and then select the **Set As Default** option from the ribbon.

Set an SLA as the default for a Case entity

For a Case entity, set an SLA as the default if you want it to apply to all cases that don't have an SLA applied through an entitlement. This is useful when a customer wants an SLA but doesn't have an entitlement. For all other entities that are enabled for SLA, you can set one default SLA.

To set an SLA as the default, see Set a default SLA.

> **Note**
>
> If you deactivate a default SLA, you must activate it again before resetting it as the default.

Apply and track SLA status and details on the case record

The service representative who is working on a case can see the SLA details right on the case form. The following table explains what happens when a standard or enhanced SLA is applied to a case form.

Case form with a standard SLA applied	Case form with an enhanced SLA applied
Only the failure time is tracked and saved on the case record. You can ask your system administrator or customizer to add a timer to the case form. The timer shows the time remaining to meet the SLA or the time elapsed since the SLA failed. More information: Add a timer control to the case form to track time against an SLA	When an enhanced SLA is applied to a case, a related SLA KPI Instance record is created for each SLA KPI that is tracked for that case. In the **Enhanced SLA Details** section of the case record, you'll see a timer and the SLA KPI Instances for the case with their status, failure times, and warning times. When a service rep puts a case on hold, the status of the SLA KPI Instance is set to Paused. You can see the time during which a case was on hold and the last time the case was put on hold. These details aren't available on the case

Case form with a standard SLA applied	Case form with an enhanced SLA applied
	form by default, but your system customizer can add these fields for you. The on-hold time is the time during which the case was set to a status that you defined as an On-Hold status in the **System Settings** dialog box. More information: System Settings dialog box - Service tab When the service representative resumes a case, the status of the SLA KPI Instance record is updated. The following details are updated in the record if the SLA isn't violated: - Failure time - Warning time - Total time the case has been on hold If the service representative puts the case on hold after the warning time, the warning time isn't updated when the case is resumed.

> **Note**
>
> - To track SLAs for entities other than Case, ask your system administrator or customizer to add an enhanced SLA timer on the entity forms. More information: **Add a timer to forms to track time against enhanced SLAs**
> - If you delete a custom field from an entity associated to an SLA, then you must also delete the custom field from the related entities of the SLA, such as SLA items and action flows.

Troubleshoot issues in SLAs

Add a timer control for SLA-enabled entities

Article • 08/29/2023

Add a timer control to a service-level agreement (SLA) enabled entity form to help users gauge the amount of time they have to complete a task as specified in the SLA. The timer control displays countdown timers that show the current status and time remaining for the configured SLA KPIs.

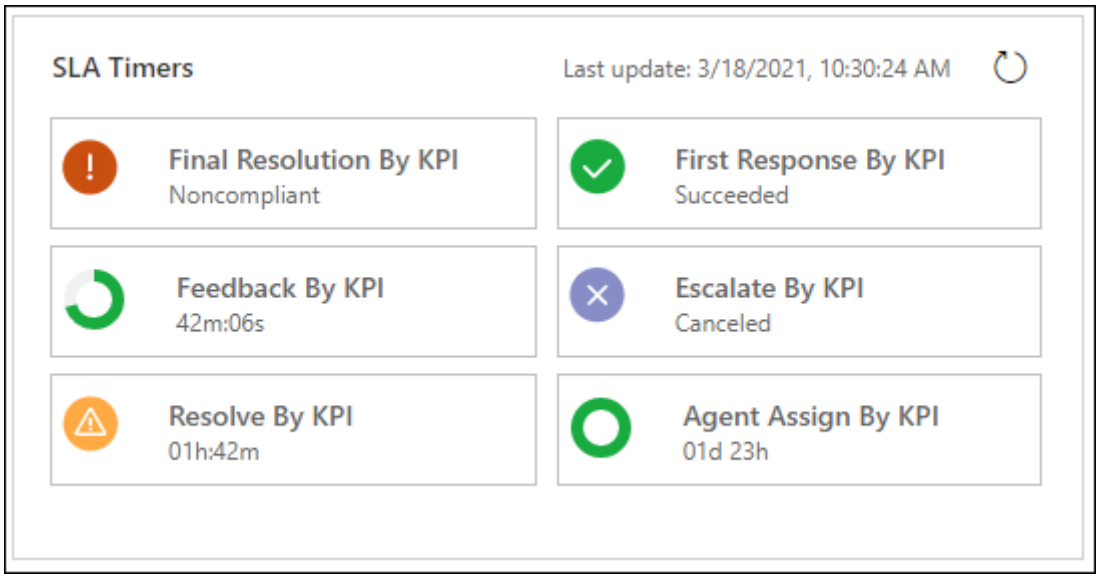
Add a SLA timer to a SLA-enabled entity

After you've configured the SLA KPIs, SLAs, and SLA items for an entity, you can add the SLA Timer control to display the SLA KPIs that are configured for the entity. You can customize the views to filter the KPIs and display only the relevant KPIs to agents. Some of the KPIs that agents can see include the different stages that KPIs go through.

For information on how the SLA KPIs are displayed at runtime when agents view the case to work on in Customer Service Hub, go to Timer for SLA-enabled entities.

> **Note**
>
> - The SLA Timer control displays SLA KPIs that are created in Unified Interface only.
> - The SLA Timer control displays **No Applicable SLA** when there aren't any applicable SLAs.

A sample runtime view of the SLA Timer is as follows.



However, SLA KPI Instances won't reach a **Nearing non-compliance** or **Non-complaint** state, if the **SLAWarningAndExpiryMonitoringFlow** isn't enabled and the SLA KPI Instance timer continues to run. The following warning message is displayed on the SLA Timers: "The SLA instances may be incorrect because workflow *<workflow ID>* is turned off. Please contact your admin to turn the workflow on." The workflow ID will vary from system to system as it corresponds to **SLAWarningAndExpiryMonitoringFlow**. For more information on how to enable **SLAWarningAndExpiryMonitoringFlow**, see Warning message appears on slakpiinstances.

For more information on why an SLA KPI Instance doesn't reach **Nearing Non-compliance** or **Non-compliant** state and how you can resolve it, see SLA KPI Instance doesn't reach Nearing Non-compliance or Non-compliant state, and the SLA KPI Instance timer continues to run.

Do the following steps to add the SLA timer control for the case entity.

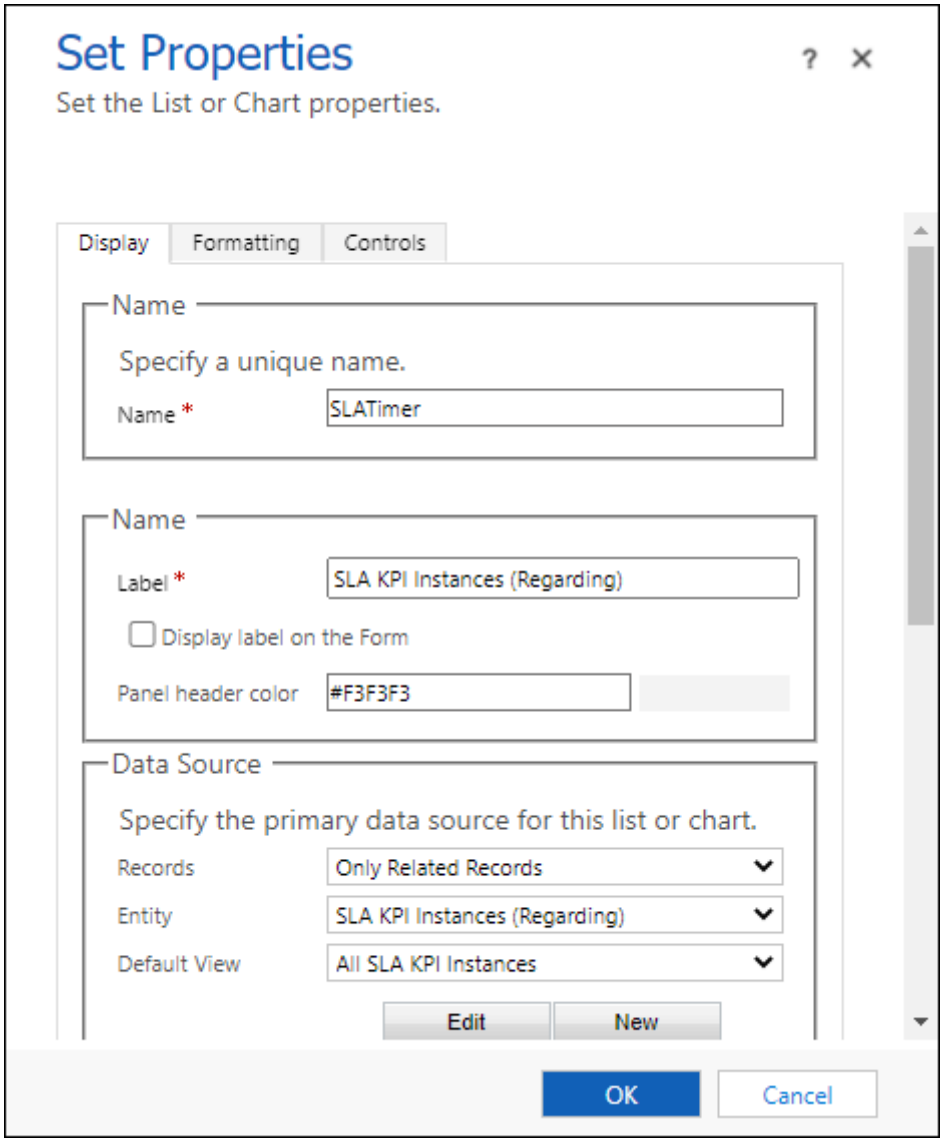
> **ⓘ Important**
>
> You can add the SLA timer control only in the classic Power Apps experience.

1. In your Power Platform environment, select **Advanced Settings** to go to **Customizations**.
2. Select **Customize the System**, and in the **Solutions** page, expand **Entities** under **Components**.
3. Select the entity for which you want to add the SLA Timer control, and in the **Forms** view, select the corresponding form. In this example, let us select the Case entity, and the **Case for interactive experience** form.

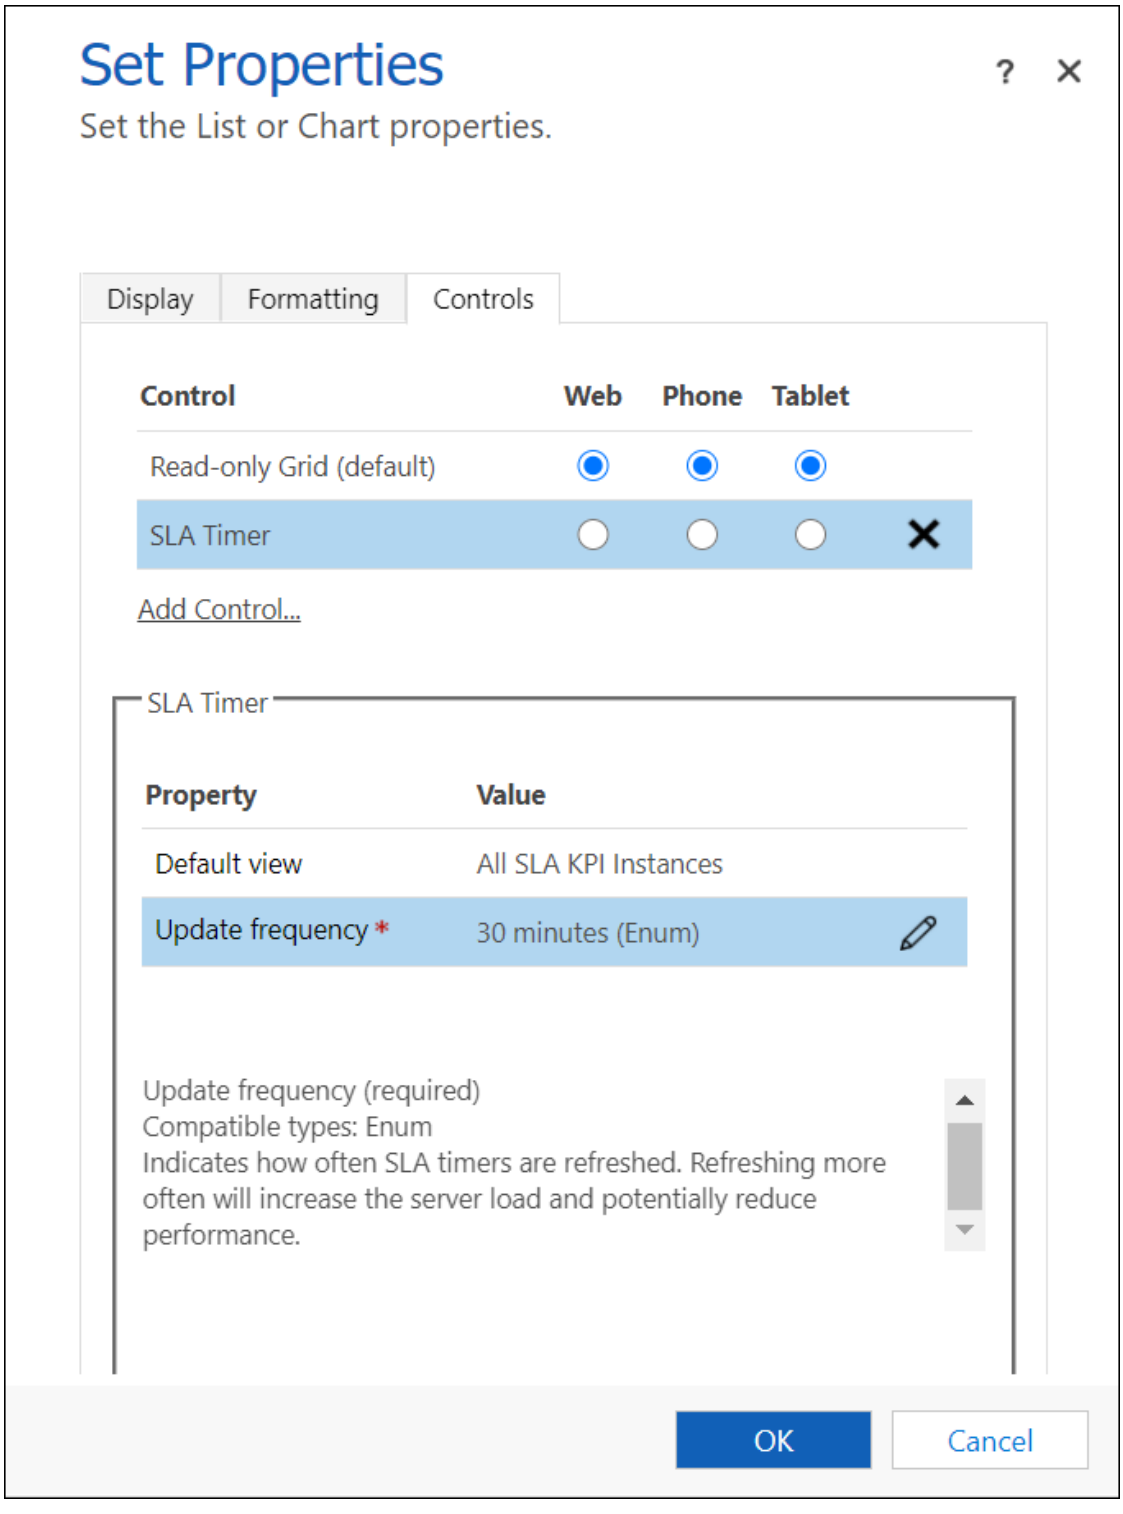
4. On the page that appears, on the **Insert** tab, insert a section, and then insert a subgrid.

5. Double-click the subgrid, and in the **Set Properties** dialog, enter the necessary details.

    - In the **Data Source** area, in **Default View**, you can add a view or edit an existing view to determine the SLA KPIs that should be displayed for agents at runtime. For information on views, go to Create and edit views.



6. On the **Controls** tab, enter the following information:
    a. Select **Add Control**, and choose SLA Timer.
    b. In the **SLA Timer** area, enter a value for **Update_Frequency_key** to set the timer refresh interval. For optimal performance, choose an interval that is not too short. The default interval is 30 minutes.

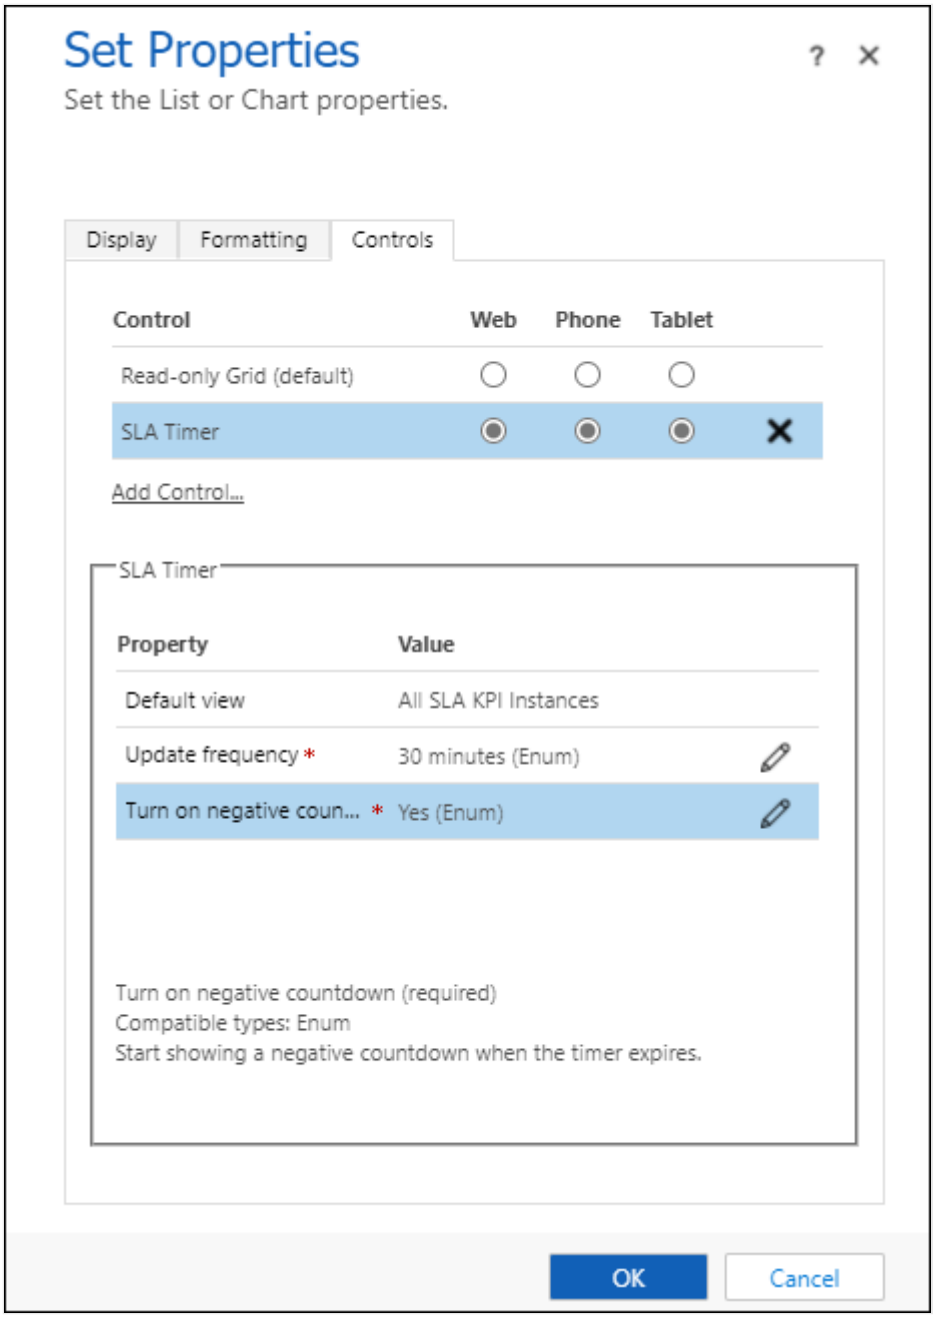


7. Save and publish the solution.

Enable elapsed time for SLA Timers in expired status

You can configure the negative countdown property for the SLA timer so that the timer continues to display the elapsed time after the SLA expires instead of showing the status. The setting needs to be configured for each SLA Timer instance.

1. After you add the SLA Timer control, set the **Turn on negative countdown** property as **Yes**.

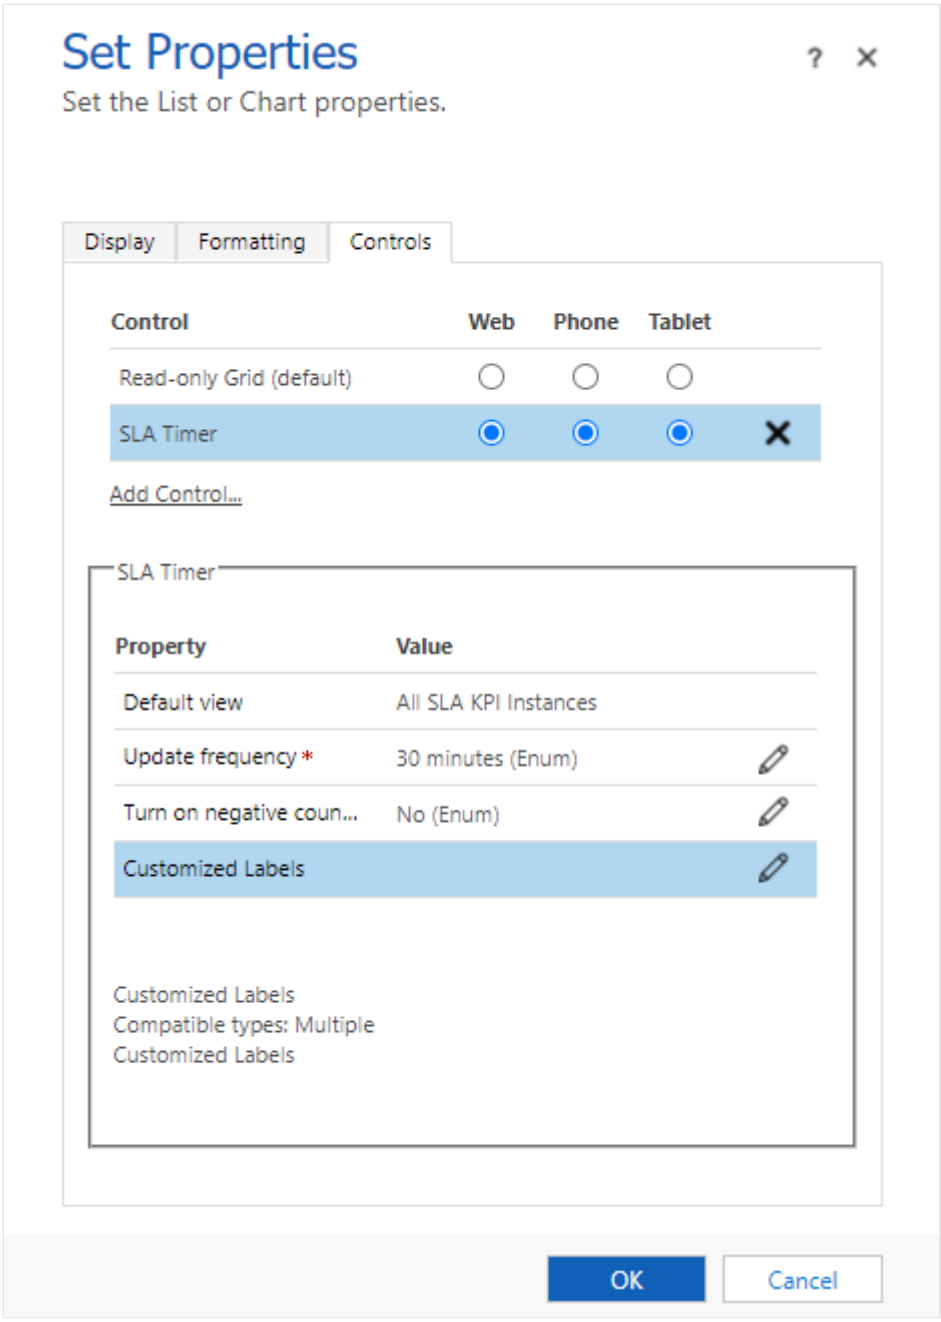


2. Save and publish the solution.

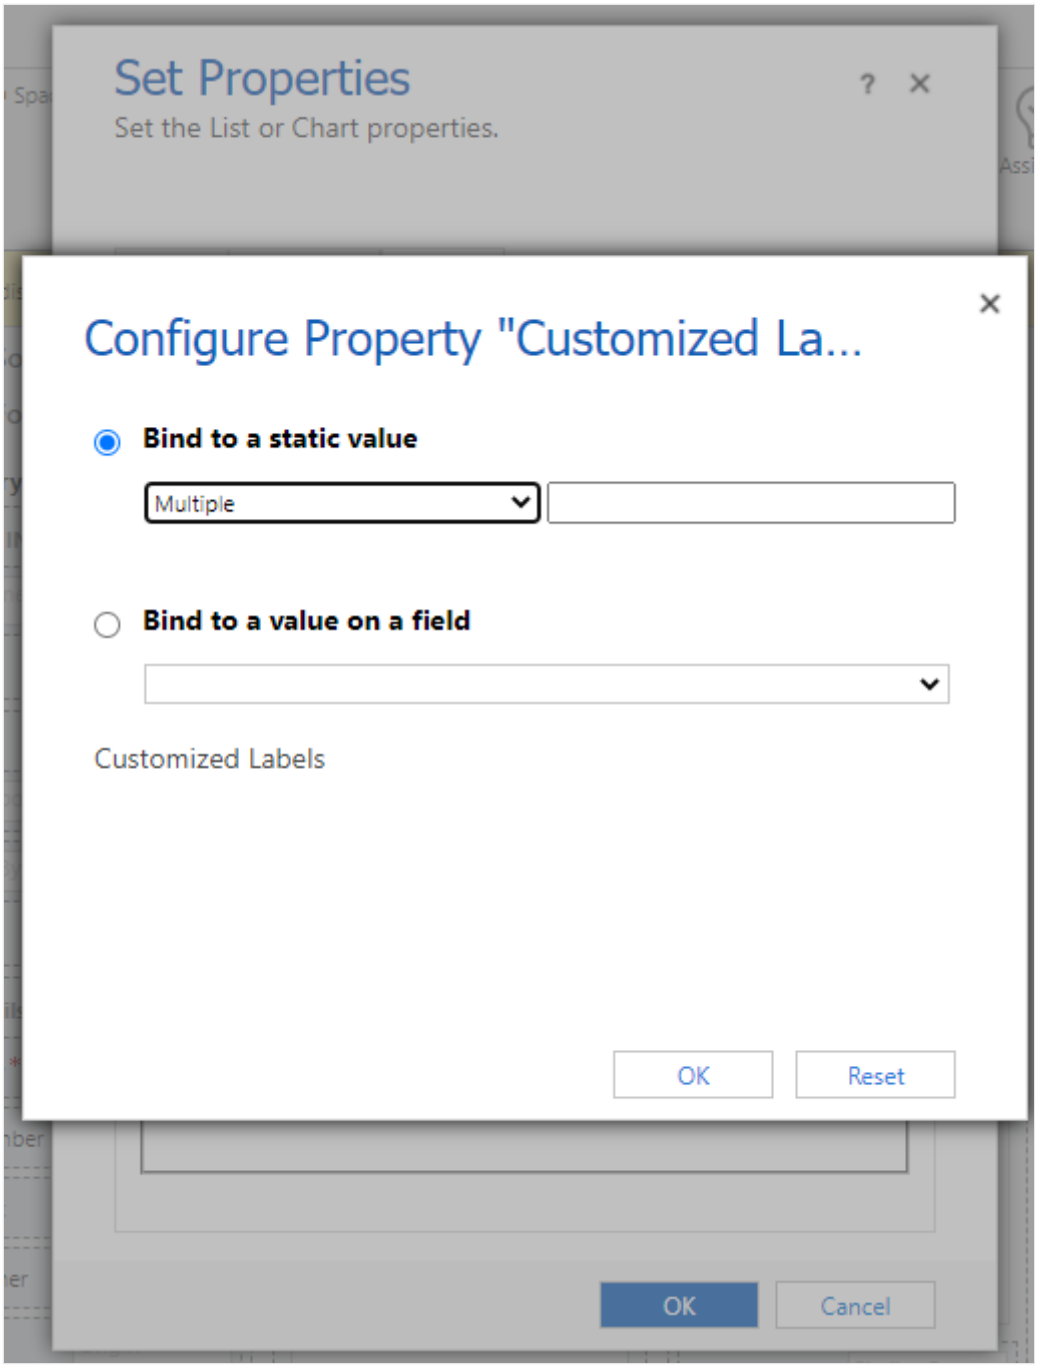
Customize the SLA timer control display label

After you've added the SLA timer control for a SLA-enabled entity, you can customize the labels of the status to be displayed for the timer control.

1. In the SLA Timer area, select **Edit** for **Customized Labels**.



2. In the **Configure Property "Customized Label"** dialog, select the **Bind to a static value** option and enter the values for multiple language codes.



- The language code value must be of the following format:

  `(language code1)=(KPI instance status value):(KPI instance custom label)`

  For example, 1033=1:Custom Noncompliant

- You can also enter multiple language codes by separating them with a semicolon:

  `(language code1)=(KPI instance status value):(KPI instance custom label); (language code2)=(KPI instance status value):(KPI instance custom label)`

  For example, 1033=1:Custom Noncompliant; 3:Paused

- If you need to create multiple language code sets, you must separate each set by selecting **Enter**. For example:

a. Enter `(language code1)=(KPI instance status value):(KPI instance custom label); (language code2)=(KPI instance status value):(KPI instance custom label)`

b. Select **Enter**.

c. Enter `(language code1)=(KPI instance status value):(KPI instance custom label); (language code2)=(KPI instance status value):(KPI instance custom label)`

- The customizable status codes are:
  - 1: Noncompliant
  - 3: Paused
  - 4: Succeeded
  - 5: Canceled
- To look up the language code, or to enable or disable a language, go to **Advanced Settings**>**Administration**>**Languages**.

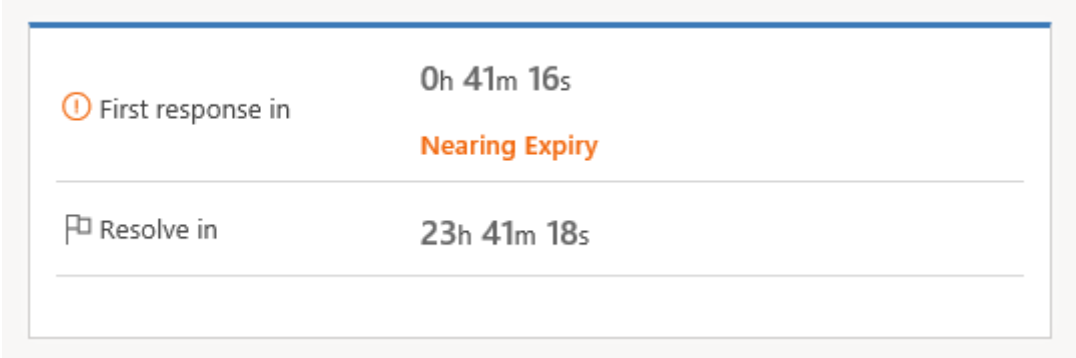
3. Select **OK**.
4. Save and publish the solution.

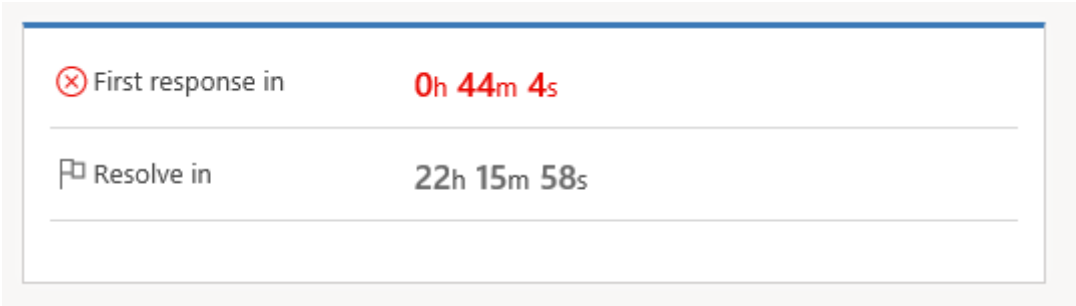
Add an out-of-the-box timer control to the Case form

On a case form, the timer control can show any of the following, depending on the actions of the customer service representative and what you specify when you set up the timer control:

- If the customer service representative completes the task within the remaining time, the control shows the word **Succeeded**.
- If the customer service representative doesn't complete the task within the remaining time, the control shows the word **Expired**.
- As the timer counts down, the color changes to yellow as the time remaining nears non-compliance. If the time remaining expires, the timer shows the word **Expired**. Then the timer color changes to red and the timer starts counting up to show the elapsed time since the task should have been completed. This behavior is optional.
- If a condition causes the milestone to be canceled, the control shows the word **Canceled**. This behavior is optional.

- If either of the required fields in the **Timer Control** dialog doesn't have a value in the record, the control shows the words **Not Set**.



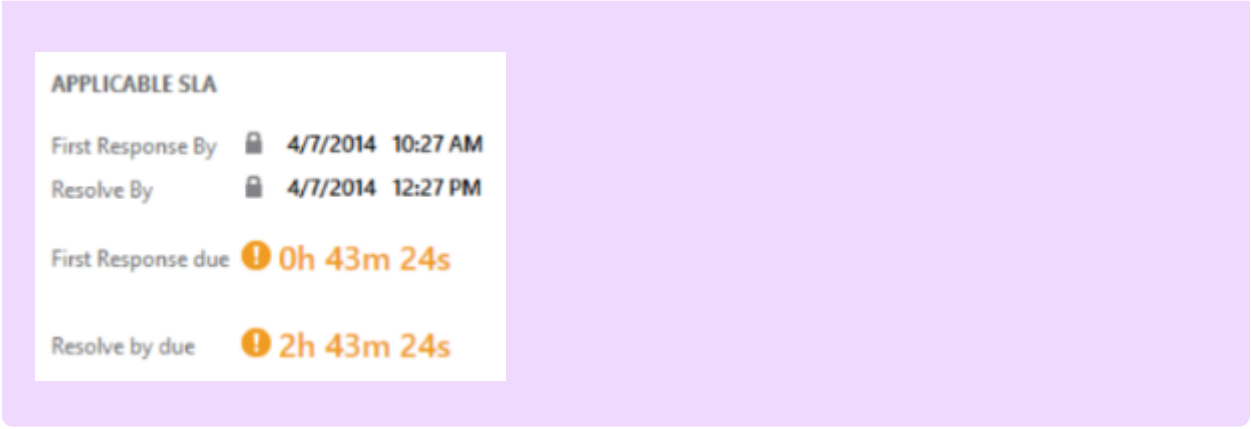


Important

- The instructions in this article apply if you're adding a timer to track time for the date/time field of any entity, or for tracking time against standard SLAs on case records. If you are using enhanced SLAs and want to add a timer to your forms, go to **Add a timer to forms to track time against enhanced SLAs**.
- The timer control is designed to visually show the current state or show the remaining or elapsed time relative to the date and time as specified in the **Failure Time** field of the SLA KPI Instance. It doesn't calculate or keep track of the time for which the Pause condition is true.

Note

The screens showcase the timer control on a Unified Interface app. On a legacy web client app, the timer control is displayed as follows:



More information: Understand SLA details with Timer control

Add an out-of-the-box timer control

1. Make sure that you have the System Administrator or System Customizer security role or equivalent permissions.

   ### Check your security role

   - Follow the steps in View your user profile.

2. Go to **Settings** > **Customizations**.

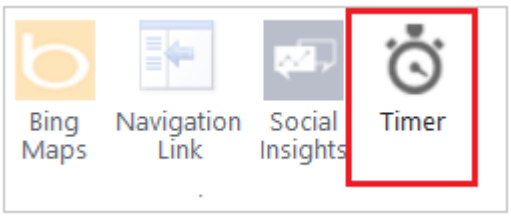
3. Select **Customize the System**.

4. In the solution explorer on the left pane, expand **Entities**, expand the **Case** entity, and select **Forms**.

   To add the timer to the form so the customer service representatives can use it in Customer Service Hub, open the case form of type **Main**.

5. Select on the form where you want to place the control. You can add it anywhere except the form header or footer.

6. On the **Insert** tab, in the **Control** group, select **Timer**.

7. In the **Timer Control** dialog, do the following:

   a. In the **General** section, type a name and label for the control.

b. Under **Data Source**, next to **Failure Time Field**, select the date-time field that represents the time when a milestone should be completed. For example, select the **First Response By** field.

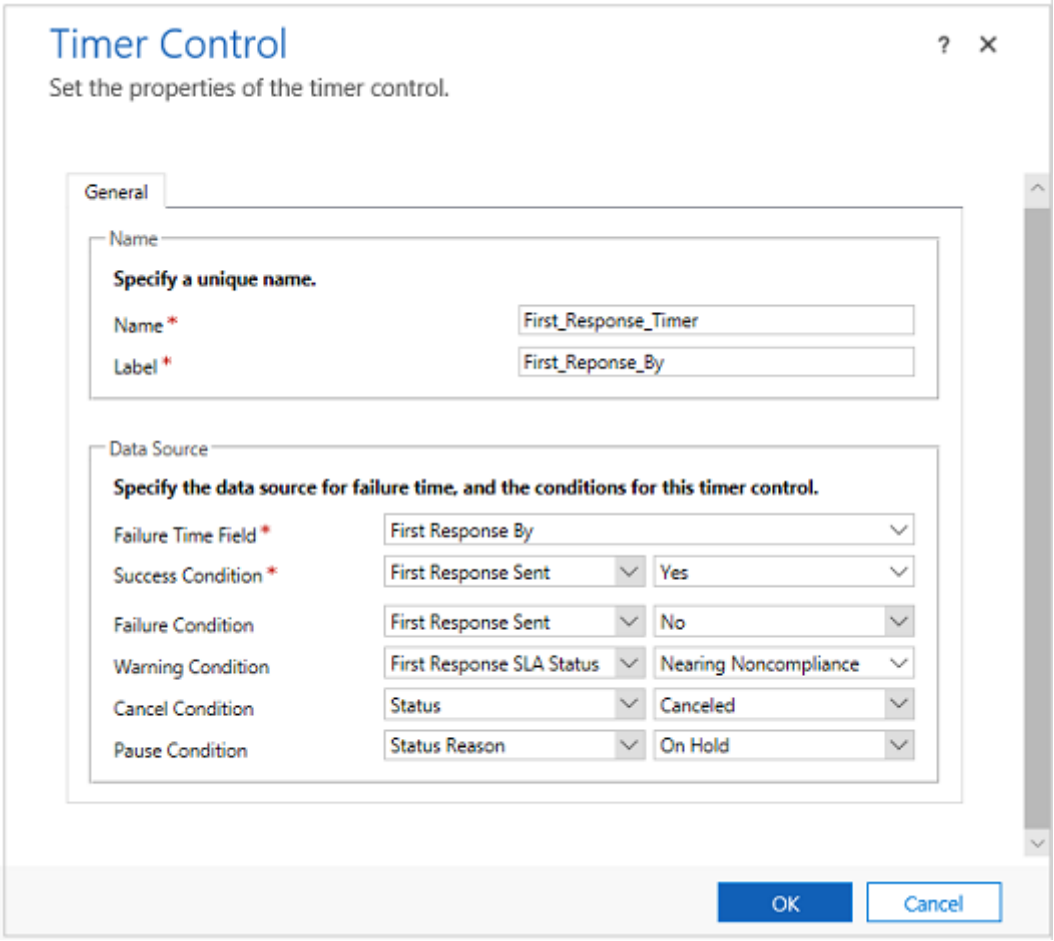
c. Next to **Success Condition**, select a field to use to evaluate the success of the milestone, and then select the condition that indicates success. For example, select the **First Response Sent** field, and then select **Yes** to indicate the success criteria of the First Response metric. This setting is required.

d. Next to **Failure Condition**, select a field to use to evaluate the failure of the milestone, and then select the condition that indicates the failure. For example, in the first drop-down list, select **IsEscalated**. In the second drop-down list, select **Yes**.

e. Next to **Warning Condition**, enter the condition that will cause the timer control to display a warning when the time is about to expire. For example, in the first list next to **Warning Condition**, select **First Response SLA Status**. In the list to the right, select **Nearing Noncompliance**. This setting is optional.

f. Next to **Cancel Condition**, select a field to evaluate whether the achievement of the milestone should be canceled. Then choose the option that indicates the milestone is canceled. This setting is optional.

g. Next to **Pause Condition**, enter the condition that will cause the timer to pause the count down. For example, you want the timer to pause the count down every time the case status is set to “On-hold”. For this, in the first drop-down list, select **Status**. In the second drop-down list, select **On-hold**.



8. Select **OK** to add the control to the form.

Notes

- The timer control refreshes on the **OnChange** form event, and also when the form is loaded.
- You can add a timer control to a form based on any record type (entity), including custom record types.
- You can add multiple timer controls for different key performance indicators (KPIs).
- You can add a timer control to any Main or Main - Interactive experience form of other entities, but timer controls are not displayed in Dynamics 365 for tablets.

Understand SLA details with Timer control

Export and import a solution with SLAs

Article • 06/16/2022

You can replicate the SLA settings in another environment by exporting the solution containing the SLAs. During the export, all the related components and their dependencies will also be exported.

You can also export or import a calendar with its corresponding SLAs by enabling the calendar import and export option.

Export or import a calendar with SLAs

You can enable the export or import of a calendar either from the Customer Service admin center or Customer Service Hub app.

1. Go to one of the apps and perform the following steps:

   Customer Service admin center

   a. In the site map, select **Service terms** in **Operations**. The **Service Terms** page appears.
   b. In the **Other SLA Settings** section, select **Manage**. The **Service Configuration Settings** page appears.

2. On the **Service Configuration Settings** page, go to the **Calendar Export and Import** section and set the **Enable calendar export and import** toggle to **Yes**. By default, the option is set to **No**.

3. Select **Save**.

> **Important**
>
> - When you delete a solution that contains SLAs, the SLAs are also deleted. However, their corresponding calendars aren't deleted.
> - Calendars, when imported to the target organization, are editable. However, we recommend that you make any changes to the calendar through the solution import or export process.
> - Calendars are overwritten when a solution is imported. So, the calendar in the latest solution that's being imported will overwrite existing customizations or

settings on the current calendar in the target environment.

- Exported calendars will be present in XML format in the Calendars folder within the exported solution.
- SLA Items will automatically be linked to the corresponding imported calendars on import.

Recommended procedure for upgrading a solution

We recommend that you perform the following steps to upgrade a solution:

1. Deactivate the SLAs that have been brought through the previous version of the solution. The status of these SLAs will change to Draft.
2. Upgrade your solution.
3. After the solution has been successfully upgraded, activate the SLAs as required.

Troubleshoot issues in SLAs

System Settings Service tab

Article • 02/15/2022

Use this tab to set preferences for the customer service area, such as service level agreements and entitlements in model-driven apps in customer engagement apps (Dynamics 365 Sales, Dynamics 365 Customer Service, Dynamics 365 Field Service, Dynamics 365 Marketing, and Dynamics 365 Project Service Automation).

1. Make sure that you have the System Administrator or System Customizer security role or equivalent permissions.

   Check your security role.

   - Follow the steps in View your user profile.
   - Don't have the correct permissions? Contact your system administrator.

2. In the web app, go to **Settings** ( ) > **Advanced Settings**.
3. Select **Settings** > **Administration**.
4. Select the **System Settings** > **Service** tab.

> **Note**
>
> With the version 9.1 release, service configuration settings in service management are available in the Customer Service Hub based on the Unified Interface experience. You are recommended to manage service configuration settings using the new experience.
> In the Customer Service Hub app, go to **Service Management** and select **Service Terms** > **Service Configuration Settings** in the sitemap to access the Service configuration settings.

Settings	Description
Disable SLAs	
Disable Service Level Agreements(SLAs) on SLA-enabled entity records	SLAs are enabled by default. You can enable or disable them for SLA-enabled entity records in your organization. For example, you might want to disable SLAs during maintenance activities or when you're importing records and you don't want the SLAs to apply to the records. To disable, select **Yes**. To enable, select **No**. **Note:** When SLAs are disabled, SLA records can still be created or modified. SLAs won't be applied to records, however.

Settings	Description
Apply SLA after manual override	
Automatically apply SLA on entity record update after SLA was manually applied **Important:** For organizations, this feature is available only if your organization has installed Dynamics CRM Online 2016 Update. Interested in getting this feature? Find your administrator or support person.	This setting determines if an SLA should automatically be applied to a record when an SLA is manually selected in the record's SLA field. The automatic SLA application can either be through the entitlement applied to the case(for theCase entity) or with the default SLA. Either way, the manual SLA takes precedence over any other way of SLA application. When set to **No**, SLAs won't be applied automatically to records after an SLA is manually applied. **Note:** For Case entity records, when both entitlement and customer, and manual SLA are changing, the manual SLA is used regardless of this setting.
Select SLA Pause Status	
Select the SLA enabled entity to choose status values for	Select the SLA-enabled entity you want to choose the pause status for. **Important:** This feature of enabling other entities for SLA was introduced in CRM Online 2016 Update 1 and CRM 2016 SP1. Interested in getting this feature? Find your administrator or support person
For the selected entity, choose the status values that SLA calculation should pause for	Select the statuses for which the SLA calculation should be paused. Double-click the statuses in the **Available Values** column. When the user sets a record to one of the pause status values you set here, customer engagement apps pauses the SLA calculation. When the user changes the status of the case back to a status other than a pause status, customer engagement apps updates the failure and warning time in the enhanced SLA KPIs. It also tracks the total time for which a record is in the pause status. **Important:** This feature of enabling other entities for SLA was introduced in CRM Online 2016 Update 1 and CRM 2016 SP1. Interested in getting this feature? Find your administrator or support person
Automatically apply entitlement	- Select whether to automatically apply the default customer entitlement when a case is created. - Select whether to automatically apply the default customer entitlement when a case is updated and the customer, contact, or product field has changed.

Recalculate SLAs in terminal status

Article • 10/13/2023

SLAs in terminal status are recalculated in the following scenarios:

- If the SLA KPI instance is in an expired state and the applicable when or success condition changes, the SLAs are recalculated if the recalculate flag is on.
- SLA KPI instances that are in succeeded or canceled terminal states remain in the same state irrespective of changes to the applicable from or when conditions if the recalculate SLA option is set to no. Changes occur only if the recalculate SLA option is set to yes.
- When a SLA KPI instance is in an expired state and changes are made to its applicable SLA item, the SLAs are recalculated. A new slakpiinstance is created, and its status depends on the failure time. Failure time is calculated from the applicable from field. If the SLA KPI Instance has passed the specified failure time, it creates a new slakpiinstance in an expired state.
- By default, SLAs in the succeeded and noncompliant terminal statuses aren't reevaluated when the success condition changes or can't be paused or resumed. However, you can recalculate such SLAs when the applicable when and success criteria of the target entity changes by enabling the recalculate SLA setting in the **Service Configuration Settings** view.

Enable recalculation of SLAs on reaching terminal status

You can enable the recalculation of SLAs that reach the terminal status in the Customer Service admin center or Customer Service Hub app.

1. Go to one of the apps and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Service Terms** in **Operations**.
   b. In the **Other SLA Settings** section, select **Manage**. The **Service Configuration Settings** view is displayed.

2. In **Recalculate SLA on terminal status**, switch the toggle to **Yes**, and select **Save**.

Enable custom time calculation of SLA KPIs

Article • 01/18/2023

This article describes how you can override the default time calculation.

Time calculation in service-level agreements (SLAs) calculates the `WarningTime` and `FailureTime` of SLA key performance indicators (KPIs), taking into consideration input parameters, such as `ApplicableFrom` (StartTime of type DateTime field), `CalendarId` (GUID), and `Duration` (warning duration or failure duration in minutes). The final `WarningTime` or `FailureTime` is calculated based on the customer service schedule and the holiday schedule associated with the SLA item.

In addition to warning and failure time, the elapsed time is also calculated if there's a pause and resume scenario configured for the SLA. To ignore the working hours spent during the paused state of the SLA KPI, the elapsed time gets added to the final failure time.

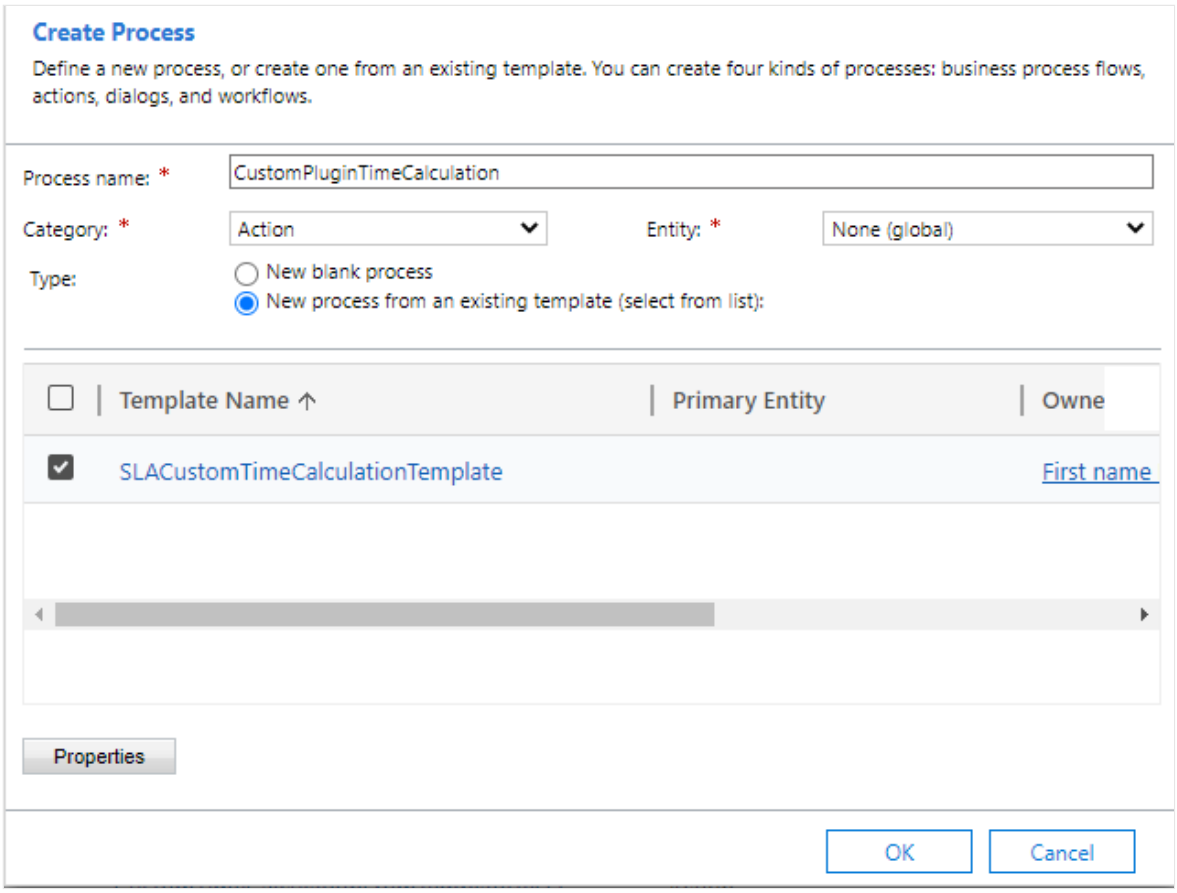
To enable your own custom time calculation, define an API interface that has a fixed set of input and output parameters, and add a custom logic to calculate the time.

> **Note**
>
> Custom time calculation is only supported as part of plug-in and not any other entity, for example, custom workflow.

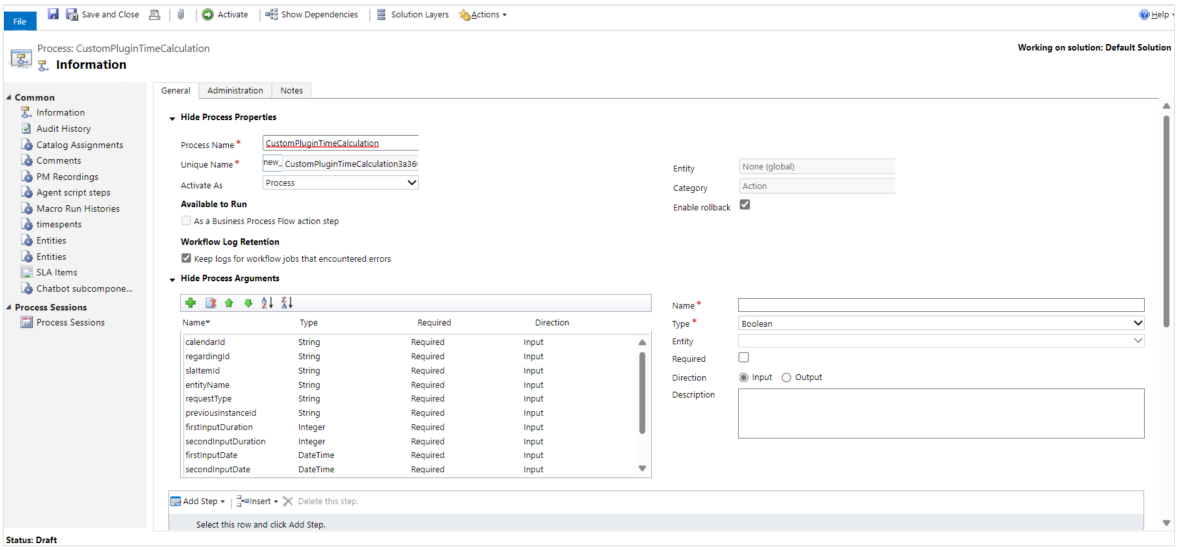
Enable custom time calculation of SLA KPIs

1. Go to make.powerapps.com.
2. Go to **Advanced Settings** > **Customizations** > **Customize the system** > **Processes** > **New**.
3. In the **Create Process** dialog, enter the following details:
   a. Enter a process name, for example, CustomPluginTime Calculation.
   b. From the **Category** dropdown list, select **Action** .
   c. From the **Entity** dropdown list, select **None (global)**.
   d. Select the **New process from an existing template (select from the list)** option.
   e. Select the **SLACustomTimeCalculationTemplate** template from the list.

f. Select **OK**.



4. On the template, add the required parameters (if any) and select **Activate**.



5. Write the plug-in.

   For information on selecting the plug-in that you need, go to Scenarios and plug-ins.

6. Go to the Plug-in registration tool and register the plug-in that you created with your organization, to link it to the custom action created in step 3.

   For information on registering a plug-in, go to Register a plug-in.

7. In Customer Service admin center, add or edit the previously created custom action with the SLA Item:
   a. Set the **Allow Custom Time Calculation** toggle to **Yes**.
   b. In the **Custom Time Calculation Process** field, select the custom action created in step 3.
   c. Select **Save and Close**.

8. On the SLA form, select **Activate**, and apply it to the required entity. The warning and failure time of the SLA KPI appears in accordance with the time calculation logic provided in the custom action.

   For information on how to apply SLAs, go to Apply SLAs

9. To export the solution to another environment, first add the SLA (whose item has the custom action reference) to the custom solution. Adding the SLA will also export the custom action workflow process. Next, include the SDK message in the solution, which will export the plug-in you created earlier.

Scenarios and plug-ins

Refer to the following scenarios and their plug-ins to implement a plug-in code associated with your custom action.

Scenario 1:

If you don't have a pause or resume scenario, only the `WarningTime` and `FailureTime` are to be calculated. Whenever any new KPI instances get created, SLA initiates the custom time calculation API to calculate only `WarningTime` and `FailureTime` in a single call.

In such a case, `requestType` will be `getEndTime`, and other attributes can be fetched as defined in the following example:

```
```

```
public void Execute(IServiceProvider serviceProvider)
{

    IPluginExecutionContext context =
(IPluginExecutionContext)serviceProvider.GetService(typeof(IPluginExecutionC
ontext));
    IOrganizationServiceFactory factory =
(IOrganizationServiceFactory)serviceProvider.GetService(typeof(IOrganization
ServiceFactory));
    _service = factory.CreateOrganizationService(context.UserId);

    // Step 1: Retrieving Input Parameters.
    string regardingId = context.InputParameters["regardingId"] as string;
    string calendarId = context.InputParameters["calendarId"] as string;
    string requestType = context.InputParameters["requestType"] as string;
    string slaItemId = context.InputParameters["slaItemId"] as string;
    string entityName = context.InputParameters["entityName"] as string;

    try
    {
        // implement this requestType for any new SLA KPi instance creation.
        if (requestType.Equals("getEndTime",
StringComparison.CurrentCultureIgnoreCase))
        {
            int warningDuration =
(int)context.InputParameters["firstInputDuration"];
            int failureDuration =
(int)context.InputParameters["secondInputDuration"];
            DateTime warningStartTime =
(DateTime)context.InputParameters["firstInputDate"];
            DateTime failureStartTime =
(DateTime)context.InputParameters["secondInputDate"];

            // Step 2 : Add the custom Logic to calculate the WarningTime
and FailureTime
            string returnCalendarId =
CalculateWarningAndFailureTime(regardingId, calendarId, slaItemId,
entityName, warningStartTime, failureStartTime, warningDuration,
failureDuration, out DateTime warningTime, out DateTime failureTime);

            // Step 3 : return the output values.
            context.OutputParameters["firstOutputValue"] =
DateTime.SpecifyKind(warningTime, DateTimeKind.Utc).ToString();
            context.OutputParameters["secondOutputValue"] =
DateTime.SpecifyKind(failureTime, DateTimeKind.Utc).ToString();
            context.OutputParameters["returnCalendarId"] = returnCalendarId;
            return;
        }

        // implement this requestType for finding Paused time for any new
SLA KPi instance after it resumed.
        if (requestType.Equals("getElapsedTime",
StringComparison.CurrentCultureIgnoreCase))
```

```
        {
            DateTime casePausedTime =
(DateTime)context.InputParameters["firstInputDate"];
            DateTime caseResumedTime =
(DateTime)context.InputParameters["secondInputDate"];
            int existingElapsedTime =
(int)context.InputParameters["firstInputDuration"];
            // Step 2 : Add the custom Logic to calculate the elapsedTime
between startTime(paused) and endTime(resumed)
            double elapsedTimeInMinutes = CalculateElapsedTime(regardingId,
calendarId, slaItemId, entityName, casePausedTime, caseResumedTime,
existingElapsedTime);

            // Step 3 : return the output values.
            context.OutputParameters["firstOutputValue"] =
elapsedTimeInMinutes.ToString();
            context.OutputParameters["secondOutputValue"] =
elapsedTimeInMinutes.ToString();
            return;
        }
    } catch (Exception ex) {
        return;
    }

    throw new Exception("Invalid requestType:" + requestType+ " for
entityName:" + entityName + " of id:" + regardingId);
}

// in this example, we're using Custom Field(new_country) on the Case entity
to apply the required calendar.

private string CalculateWarningAndFailureTime(string regardingId, string
calendarId, string slaItemId, string entityName, DateTime warningStartTime,
DateTime failureStartTime, int warningDuration, int failureDuration, out
DateTime warningTime, out DateTime failureTime)
{
    OrganizationResponse customizedTimeCalculationResponse;
    warningTime = DateTime.UtcNow;
    failureTime = DateTime.UtcNow;
    int newWarningTime = warningDuration;
    int newFailureTime = failureDuration;
    int customCode = 0;

    // Step 1: fetch the Case Entity record
    Entity caseRecord = FetchCaseRecord(entityName, regardingId);

    if (caseRecord.Attributes.Contains("new_country"))
    {
        customCode = (int)(((OptionSetValue)
(caseRecord.Attributes["new_country"])).Value);

        // Example 1: Override calendar at runtime: Choose Calendar based on
any custom logic
        if (customCode == 0)
        {
```

```
            // fetch IST calendar & override CalendarId
            IST_CALENDAR = FetchCalendar("IST_CALENDAR", _service);
            calendarId = IST_CALENDAR;
        }
        else if (customCode == 1)
        {
            // fetch PST calendar & override CalendarId
            PST_CALENDAR = FetchCalendar("PST_CALENDAR", _service);
            calendarId = PST_CALENDAR;
        }
    }
    // use OOB SLATimeCalculation Custom Action to do actual calculation_
    OrganizationRequest requestTimeCalculation = new
OrganizationRequest("msdyn_SLATimeCalculation");

    requestTimeCalculation["requestType"] = "getEndTime";
    requestTimeCalculation["calendarId"] = calendarId;

    // calculate warning time
    if (warningDuration != -1)
    {
        requestTimeCalculation["startTime"] = warningStartTime;
        requestTimeCalculation["minutes"] = newWarningTime;
        customizedTimeCalculationResponse =
_service.Execute(requestTimeCalculation);
        customizedTimeCalculationResponse.Results.TryGetValue("returnValue",
out object outputValue1);
        warningTime =
DateTime.SpecifyKind(DateTime.Parse((string)outputValue1),
DateTimeKind.Utc);
    }

    // calculate Failure time
    if (failureDuration != -1)
    {
        requestTimeCalculation["startTime"] = failureStartTime;
        requestTimeCalculation["minutes"] = newFailureTime;
        customizedTimeCalculationResponse =
_service.Execute(requestTimeCalculation);
        customizedTimeCalculationResponse.Results.TryGetValue("returnValue",
out object outputValue2);
        failureTime =
DateTime.SpecifyKind(DateTime.Parse((string)outputValue2),
DateTimeKind.Utc);
    }

    return calendarId;
}
```

Scenario 2:

If there's a pause or resume scenario, the following calculations are to be made:

- Calculation of `elapsedTime` between paused and resumed states. For this scenario, the SLA invokes the custom time calculation API to calculate the elapsed time between the pause and resume. In such a case, the requestType will be `getElapsedTime` and other attributes can be fetched as defined in the plug-in code example.
- Calculation of new `WarningTime` and `FailureTime` computation for resumed instances. In this case, `requestType` will be `getEndTime` and other attributes can be fetched as defined in the following example:

```
private double CalculateElapsedTime(string regardingId, string calendarId,
string slaItemId, string entityName, DateTime casePausedTime, DateTime
caseResumedTime, int existingElapsedTime)
{
    if (caseRecord.Attributes.Contains("new_country"))
    {
        if ((int)(((OptionSetValue)
(caseRecord.Attributes["new_country"])).Value) == 0)
        {
        // fetch IST id
        IST_CALENDAR = FetchCalendar("IST_CALENDAR", _service);
        calendarId = IST_CALENDAR;
        }
        else if ((int)(((OptionSetValue)
(caseRecord.Attributes["new_country"])).Value) == 1)
        {
        // fetch PST  id
        PST_CALENDAR = FetchCalendar("PST_CALENDAR", _service);
        calendarId = PST_CALENDAR;
        }
    }

    // use OOB SLATimeCalculation Custom Action to do actual calculation_
    OrganizationRequest requestTimeCalculation = new
OrganizationRequest("msdyn_SLATimeCalculation");
    requestTimeCalculation["startTime"] = casePausedTime;
    requestTimeCalculation["endTime"] = caseResumedTime;
    requestTimeCalculation["requestType"] = "getElapsedTime";
    requestTimeCalculation["calendarId"] = calendarId;

    // calculate elapsed time
    customizedTimeCalculationResponse =
_service.Execute(requestTimeCalculation);
    customizedTimeCalculationResponse.Results.TryGetValue("returnValue", out
object outputValue1);
    double totalElapsedTime = existingElapsedTime +
Double.Parse(outputValue1.ToString());
    return totalElapsedTime;
}
```

Error codes for custom time calculation

The following are the error codes for the various error scenarios that might occur during custom time calculation.

Error code: 10000004

Error message: "Workflow for the Custom Time Calculation API for SLA Item {0} must be active."

Reason

The error occurs if the Custom Time Calculation Workflow is disabled.

Resolution

When opening the SLA, you'll see a form notification along with an **Activate** button if the SLA is active but the Custom Time Calculation Workflow is disabled. To avoid this issue, make sure that the Custom Time Calculation Workflow process is always in **Active** state. Perform the SLA deployment, and then verify only after it has completed. Make sure that you don't delete or deactivate the workflow process manually or through customization.

Error code: 10000005

Error message: "Select the Custom Time Calculation Process."

Reason

The error occurs if the Custom Time Calculation Workflow is enabled but no workflow process action is associated with the SLA Item.

Resolution

Add the workflow process and save the SLA item. To avoid this issue, make sure that the Custom Time Calculation Workflow process is filled in the lookup value if the toggle is set to **On**.

Error code: 10000006

Error message: "Workflow for the Custom Time Calculation Process for SLA Item {0} is missing. {Placeholder="{0}"} refers to the SLA Item ID."

Reason

The error occurs if the Custom Time Calculation Workflow is enabled during SLA activation and the workflow process action is associated with the SLA Item with valid GUID but the workflow is deleted.

Resolution

You must correct the invalid workflow. Remove the existing workflow from the SLA Item, create a new workflow, and then add the new workflow to the same SLA item. To avoid this issue, make sure you don't delete any workflow manually or as part of the deployment process. Also, make sure to verify your changes before importing directly to a production environment.

Error code: 10000007

Error message: "Plugin implementation is missing for the Custom Time Calculation Process in SLA Item {0} {Placeholder="{0}"} refers to sla item id."

Reason

The error occurs if the Custom Time Calculation Workflow is enabled but the associated plugin SDK messaging process step is missing or the plugin isn't registered.

Resolution

Make sure to add the SDK step while exporting the SLA from the source or development environment. To avoid this issue, make sure that you add the SDK message step and plugin assembly in the SLA solution.

Error code: 10000008

Error message: "Warning or the failure time returned by Custom Time Calculation Process for the SLA Item {0} is invalid. {Placeholder="{0}"} refers to sla item id."

Reason

The error occurs if the Custom Time Calculation Workflow action returns an invalid **Failure Time** for **requestType getEndTime**.

Resolution

You'll need to debug to find out why the custom workflow process isn't returning proper values. To avoid this issue, make sure that you add and test all the scenarios before deploying the scenarios to production. For example, this includes various SLA item applications and Pause or Resume scenarios.

Error code: 10000009

Error message: "Elapsed Time returned by Custom Time Calculation Process for the SLA Item {0} is invalid. {Placeholder="{0}"} refers to sla item id."

Reason

The error occurs if the Custom Time Calculation Workflow action returns an invalid **Elapsed Time** for **requestType getElapsedTime**.

Resolution

You'll need to debug to find out why the custom workflow process isn't returning proper values when the case was paused and resumed. To avoid this issue, make sure you add and test all the scenarios before deploying the scenarios to production. For example, this includes Pause or Resume scenarios.

Error code: 10000010

Error message: "Workflow for the Custom Time Calculation Process {0} for SLA Item {1} is not found."

Reason

The error occurs if the custom action for custom time calculation isn't found in the system.

Resolution

You'll need to debug and find out if the custom action is present in the system with the same name as shown in the error. To avoid this issue, make sure that you create the same custom action name prefix as shown in the error message. You need to change the prefix of your solution or avoid exporting it as an unmanaged solution. You can also avoid creating the workflow interface directly in the managed solution, and instead create the managed solution in default customization and then add it to the solution.

Define service-level agreements

Apply SLAs

Enable records for SLA

Enable custom recalculation of SLA KPIs

Article • 03/17/2023

Introduction

Time calculation in service-level agreements (SLAs) is dependent on SLA key performance indicators (KPIs) and input parameters. More information: Time calculation of SLA KPIs

Changes in the associated customer service schedule and holiday schedule don't affect the existing SLA KPIs unless one of the following events occurs:

- The SLA KPI is paused and resumed.
- The SLA on an entity instance is updated.
- The SLA item is updated.
- The SLA KPI instance is reapplied after terminal state in recalculation.

Enable the custom recalculation on a target entity

You can trigger the recalculation of active SLA KPI instances that have a status of either **In Progress** or **Nearing Noncompliance** and create new SLA KPIs by explicitly calling the custom action `msdyn_ManageSLAInstances` independent of the events mentioned previously.

> **Note**
>
> This doesn't affect the SLA KPI instances that have a status of **Paused**, **Cancelled**, **Succeeded**, or **Non-compliant**.

To enable custom recalculation and create new SLA KPIs, you must set the integer value of the **Recalculate** parameter to **1** through custom plug-in code. By default, the integer value of the **Recalculate** parameter is **0**. You can set the integer value by creating custom plug-in code on the SLA's target entity and implementing the custom logic based on which the custom action will be initiated. More information: Write a plug-in

For example, if you want to recalculate the SLA KPIs that have a status of **In progress** or **Nearing Noncompliance**, on updating the **Case Type** field on the Case entity, you'll need to create a custom plug-in and register it on the Case update for the **Case**

Type field. On updating the **Case Type** field, you'll need to call the custom action in your custom plug-in code. The previous SLA KPI instances will be canceled, and new instances will be created.

Following is an example of the plug-in code:

OrganizationRequest

```
customEvaluation["SLAId"] = "<sla id>";
customEvaluation["RegardingId"] = <case id>;
customEvaluation["EntityLogicalName"] = "incident";//logical name of case
entity
customEvaluation["Recalculate"] = 1;

OrganizationResponse customEvaluationResponse =
service.Execute(customEvaluation);
```

Create entitlements to define support terms

Article • 10/12/2023

Define what kind of support your customers are eligible for by creating entitlements in Dynamics 365 Customer Service. With entitlements, you specify the support term based on number of hours or number of cases. The customer's support level can vary based on the product or service that the customer has purchased. Customers who've purchased different products can be entitled to different support levels. This information helps the customer support agents verify what the customers are eligible for and create cases for them accordingly.

> **Note**
>
> With the latest release of Dynamics 365 Customer Service app, entitlements in service management are available in the Customer Service Hub. We recommend that you create and manage entitlements using the new experience.

Create an entitlement

You can create an entitlement in the Customer Service admin center or Customer Service Hub app.

1. Make sure that you have the Customer Service Manager, System Administrator, or System Customizer security role or equivalent permissions. You can check your security permissions by following the steps in View your user profile.

2. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Service terms** in **Operations**. The **Service Terms** page appears.

   b. In the **Entitlements** section, select **Manage**.

      The **All Entitlements** view is displayed. You can switch between various system views using the drop-down list.

3. To create an entitlement from a template, select **New** > **From Template**. In the **Select Template** dialog box, select the entitlement template, and select **Select**.

   To create an entitlement from scratch, select **New** > **Blank Entitlement**.

4. Fill in your information. Use the handy tooltips as a guide.

   - In the **Information** section, specify the basic details:
     - **Name**: Give the entitlement a meaningful name.
     - **Primary Customer**: Choose the customer you're creating this entitlement for.
     - **Start Date**: Choose the date from which the customer will be entitled for support.
     - **End Date**: Choose the date after which the customer will no longer be entitled for support.
     - **Restrict based on entitlement terms**: Select **Yes** to make sure that cases aren't created when the entitlement term is over. Agents won't be able to create cases when **Remaining Terms** is less than zero or when the term remaining for a channel is less than zero.

       If you select **No**, agents will be able to create cases, but **Remaining Terms** is updated to a negative value.
     - **SLA**: Choose a service level agreement (SLA) record to associate the service levels or key performance indicators for the support you're providing with this entitlement.
     - **Owner**: Specify the owner of the entitlement.
     - **Description**: Write a brief description of the entitlement.
   - In the **Entitlement Terms** section, specify the term details for the entitlement:
     - **Allocation Type**: Choose whether the entitlement is for number of hours or number of cases.
     - **Decrease Remaining On**: Choose whether to decrease the remaining term on case creation or resolution.

       If you decrease the remaining term based on case creation:

- Creating or updating a case with the associated entitlement decreases entitlement terms
- Canceling a case with the associated entitlement increases entitlement terms
- Reactivating a canceled case with the associated entitlement decreases the entitlement terms

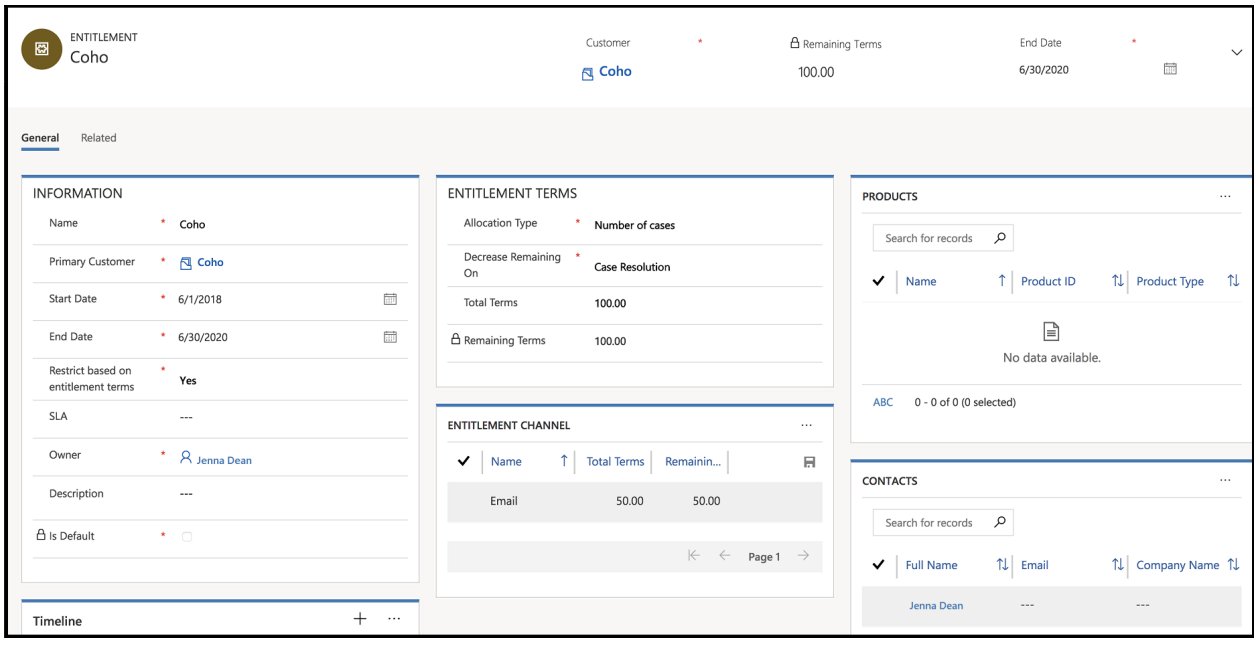
  If you decrease the remaining term based on case resolution:

- Resolving a case with the associated entitlement decreases the entitlement terms
- Reactivating a resolved case with the associated entitlement increases the entitlement terms.

- **Total Term**: Specify the total amount of support the customer is entitled to with respect to the allocation type. For example, if the allocation type is number of cases and you specify 100 in **Total Term**, the customer is entitled to support up to 100 cases.
- The **Remaining Term** shows the total number of hours or cases remaining for the customer's entitlement. The value decreases every time a case is created or resolved (depending on what you select in **Decrease Remaining On**) against the entitlement.

5. Select **Save**.

When you save the entitlement, additional sections are added for a new entitlement, such as Entitlement channel, Products, and Contacts.



Add an entitlement channel

The **Entitlement Channel** section specifies the support channel through which the customer can reach the organization and seek support.

Use this section to define the channels your customers are entitled to and track the customer support term for each channel. For example, you can add phone and email as the channels through which you'll offer support. If you want to restrict support through the phone channel to 80 hours and email to 20 hours, create individual entitlement channel records and add their total terms.

> ⓘ **Note**
>
> You must save the entitlement record before you can add entitlement channels to an entitlement.

1. In the **Entitlement Channel** section, select **...** and select **Add New Entitlement Channel** to add a new entitlement channel.
2. Specify the **Name** of the channel and **Total Terms** that you want to allot to the channel.

   The remaining term is auto-calculated and shows the total number of hours or cases remaining for the customer's entitlement.

Associate a product with the entitlement

If you want the entitlement to apply to a specific product for a customer, associate the product to the entitlement.

> ⓘ **Note**
>
> If you don't add a product, the customer will be entitled to support for all the products.

1. While in the entitlement record, in the **Products** section, select **...** and select **Add New Product** to add associate an existing product.
2. In the **Search** box, enter the first few letters of the name of the product that you want to associate with the entitlement.

   If a product isn't available, select **New** to create one.

Associate a customer contact with the entitlement

To let only certain contacts of a customer claim the entitlement for a specific product, associate the contacts with the entitlement.

> ⓘ Note
>
> If you don't add a contact, all the contacts for the specified primary customer will be entitled to support.

1. While in the entitlement record, in the **Contacts** section, select **...** and select **Add Existing Contact** to associate an existing contact.
2. In the **Search** box, enter the first few letters of the contact that you want to associate with the entitlement. This contact record must belong to the account or contact specified in the **Customer** field.

   If a contact isn't available, select **New** to create a contact record.

   All active entitlements for a customer appear in the **Active Entitlements** section of the customer record.

Activate or deactivate an entitlement

Before you can start applying an entitlement to a case, you must activate it.

1. While in the entitlement record, on the command bar, select **Activate**.
2. In the **Confirm Activation** dialog box, select **Activate**.

   > ⓘ Note
   >
   > If the start and end date of the entitlement fall in the future, the status of the entitlement is set to **Waiting**. On the start date, the status automatically changes to **Active**. If the end date is in the past, the entitlement is set to **Expired**.

   When an entitlement is active, you can't edit it. To deactivate an entitlement so you can edit it, on the command bar, select **Deactivate**.

Set an entitlement as default entitlement

You can activate the entitlement and then set it as the default entitlement for a customer. The entitlement terms from the associated entitlement are automatically reduced. However, if you don't want the entitlement terms to be reduced for a case, select **Do not decrement entitlement terms** on the command bar.

1. On the command bar, select **Set As Default**.
2. In the **Confirm set default** dialog box, select **OK**.

   Now the default entitlement will automatically be applied when a case is created or when a case is updated depending on what you selected for default entitlements in the system settings area. For more information, see the **Automatically apply entitlement** section in step 4 here, System Settings dialog box - Service tab.

Associate entitlements to cases

In a case record, in the **Entitlement** field, select the **Lookup** button,and select an entitlement. The inline lookup shows only the active entitlement for the customer of the case.

The Entitlements section in the case record lists all the active entitlements for the customer. More information:: See recent cases and entitlements

Cancel an entitlement

If the entitlement is no longer valid, you can cancel it. To cancel an active or waiting entitlement, open the entitlement, and on the command bar, select **Cancel**.

Renew an entitlement

To renew a canceled or expired entitlement, open the entitlement, and then on the command bar, select **Renew**. A new entitlement will be created, and its status is set to "Draft", while the canceled or expired entitlement will remain as is. The start date of the new entitlement will be set to the current date and the end date will be set to the current date plus the number of days between the end date and start date. The data in other fields is copied as is from the old entitlement.

Set up entitlements quickly with templates

Use entitlement templates to set up entitlements

Article • 04/04/2022

Quickly create other entitlements prefilled with the basic information like the start and end date, service level agreement (SLA), allocation type, and total term by using an entitlement template in Dynamics 365 Customer Service. For example, create a template for a standard entitlement, and then apply this template for every standard customer in your organization.

> **Note**
>
> With the latest release of Dynamics 365 Customer Service app, entitlement templates in service management are available in the Customer Service Hub. We recommend that you create and manage entitlement templates using the new experience.

Create an entitlement template

You can create an entitlement template in the Customer Service admin center or Customer Service Hub app.

1. Make sure that you have the Customer Service Manager, System Administrator, or System Customizer security role or equivalent permissions.

   ### Check your security role

   - Follow the steps in View your user profile.
   - Don't have the correct permissions? Contact your system administrator.

2. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Service terms** in **Operations**. The **Service Terms** page appears.

   b. In the **Entitlement Templates** section, select **Manage**.

The **All Entitlement Templates** view is displayed. You can switch between various system views using the drop-down list.

3. To create a new entitlement template, select **New** in the entitlement template search box.
4. Add or edit information in the text boxes.
    - **Entitlement Template Name**: Enter a name for the entitlement template.
    - **Start Date**: Select the date from when the entitlement will be valid.
    - **End Date**: Select the date until when the entitlement will be valid.
    - **Restrict based on entitlement terms**: To restrict creating case when the entitlement term is over, select Yes. Otherwise, select **No**.
    - **SLA**: Select an SLA record to associate the service levels or key performance indicators for the support you are providing with this entitlement.

      Under **Entitlement Terms**, specify the term details for the entitlement:

        - **Allocation Type**: Select whether the entitlement is for number of hours or number of cases.
        - **Decrease Remaining On**: Select whether to decrease the remaining term on case creation or resolution.
        - **Total Term**: Specify the total amount of support the customer is entitled to with respect to the allocation type. For example, if the allocation type is number of cases and you specify 100 in Total term, then the customer is entitled to support up to 100 cases.
5. Select **Save**.

Add entitlement channels

Use the **Entitlement Channels** section to define the channels your customers are entitled to, and track the customer support term for each channel separately. For example, to use phone and email as support channels, and restrict them to 80 and 20 hours respectively, create an entitlement channel for each of them.

> **Note**

You must save the template record before you can add entitlement channels to the template.

1. In the **Entitlement Channel** section, select **...** and select **Add New Entitlement Template Channel**.
2. Specify the total terms that you want to allot to the particular channel.

   The remaining term is auto-calculated and shows the total number of hours or cases remaining for the customer's entitlement.

Associate a product with the entitlement template

If you want the entitlement template to be applicable to specific products for an individual customer, associate a product to the template.

1. In the **Search for records** box, type the first few letters of the name of the product that you want to associate with the template.
2. While in the template record, in the **Products** section, select **...** and select **Add Existing Product**.

> ⓘ **Note**
>
> In the Customer Service app, you can also select to open the template form in the **Form Editor** in case you want to add additional sections to the form.

Create an entitlement to define the support terms for a customer

SLA limitations

Article • 10/12/2023

The following limitations apply to SLAs created in Unified Interface apps:

- The **Applicable When** and **Success Conditions** don't work as expected if they're configured for related entities.
  - The **Applicable When** conditions, if defined on the related entity, work only the first time the conditions are met, and the KPI instance is set to **In Progress**. After that, any update to the related entity won't cancel the existing KPI instance if the conditions of the same SLA item are false. The update doesn't create a new KPI instance if there's a change in the SLA item.
  - The **Success Conditions** defined on the related entity will never be true and the KPI instance once set to **In Progress** will never succeed, even if conditions are met. It continues to be in **In Progress**, **Nearing NonCompliance**, or **Noncompliant** status.

  To use related entities, you can add the related attribute values to the parent entity.

- You can't define multiple SLA items with the same **Applicable When** criteria and KPI.

- You can’t use nested related entities with the **Under** or **Not Under** operator as part of the conditions for SLAs. So, you need to change the **Applicable When**, **Success**, and **Pause** conditions to add one level of related entities only with the **Under** or **Not Under** operator.

- You can’t directly use the **Under** or **Not-Under** operator as conditions when configuring **Applicable When** or **Success** conditions for SLA items, so use related entities when using the **Under** or **Not Under** operator.

- We recommend that you don't use the **Modified On** field in the target entity while configuring **Applicable When** or **Success** conditions of SLA items or as the **Applicable From** field of SLA KPI instances. Changes to the **Modified On** field in the target entity might not initiate SLAs and might result in incorrect updates to SLA KPI instances.

- For expired SLAs, even if the success criteria is met, the SLA success date isn't available because the SLA KPI Instance doesn't have a field that can display the date of the action.

- Out of the box, you can’t retrieve data for SLA related case fields, such as **Active Duration** and **Elapsed Time**.
- You can't edit or remove an SLA that's already assigned to a case. However, you can customize how SLAs can be assigned to other cases and pause the SLA timer.
- You can’t manually update SLA time.
- If you're migrating more than 1000 SLAs, they might not pass the premigration checkup that processes all legacy SLAs. You can use the **&flags=FCB.SkipPreMigrationCheckUp=true** flag in the URL to skip the premigration checkup. To access the URL, go to **Miscellaneous** > **ARC and SLA migration** in the Customer Service admin center site map.

Troubleshoot issues in SLAs

Migrate SLAs

Article • 06/16/2022

Service-level agreements (SLAs) are deprecated in the web client. We recommend migrating standard and enhanced SLAs created in web client to Unified Interface. For more information on the deprecation, see SLAs in web client are deprecated. The migration tool for automatic record creation rules and service-level agreements (SLAs) helps migrate the rules in the web client to Unified Interface.

Before you begin the migration, learn how migrating to Unified Interface helps:

Standard or Enhanced SLA	**Unified Interface**
Condition Control in SLA item isn't accessible compliant	Condition Control in SLA item is accessible compliant
Uses Workflows for Actions	Uses **Workflows** and **Power Automate** flows for Actions
Pause configurations can be set only at **Table Level**	**Pause configurations** can be set at **Table**, **KPI**, and **SLA Item Level**
Calendar is on SLA level	Calendar is on SLA item level
Can't configure parallel KPIs	Can configure parallel KPIs
Can't configure SLA items with different **Applicable From**	Can configure SLA items with different **Applicable From**
Limited number of actions	Multiple actions (as Power Automate allows)
No support for Custom Time Calculation and Recalculation	Support for Custom Time Calculation and Recalculation of Warning Time and Failure Time of SLA

How migration works

To understand how you can migrate service-level agreements, see Migrate automatic record creation rules and service-level agreements.

For queries about migration, see Migration tool FAQ.

Troubleshoot issues in SLAs

Create standard SLAs

Article • 09/22/2023

> **Note**
>
> Standard SLAs created in the web client have been deprecated and replaced with Unified Interface SLAs. For more information on deprecation, see **SLAs in web client are deprecated**. We recommend migrating the standard SLAs created in the web client to Unified Interface. For more information on migrating SLAs, see **Migrate SLAs**.

1. Make sure that you have the Customer Service Manager, System Administrator, or System Customizer security role or equivalent permissions.

   When you activate an SLA, a corresponding workflow is also created. For every action you perform on the SLA, you must have permissions to perform the same action on workflows. The SLA is applied in the context of the permissions that the owner of the SLA has.

   Check your security role

   - Follow the steps in View your user profile.
   - Don’t have the correct permissions? Contact your system administrator.

2. Go to **Settings** > **Service Management**.

3. Go to **Service Level Agreements**.

4. To create a new SLA, select **New** on the command bar.

   > **Note**
   >
   > If your organization has the Customer Service admin center app and you try to create a new SLA from the web client, you'll see a deprecation message and an option to create the SLA in Unified Interface. There's no message displayed if you don't have the Customer Service admin center app in your organization.

5. Optionally, to edit an SLA, select the SLA in the list of records, and then select **Edit** on the command bar.

6. If you're creating a new SLA in Unified Interface, you'll see the **Create SLA** dialog box. Type a name for the SLA, and then in the **Entity** dropdown list, select **Case**.

   You do this because you can create a standard SLA only for the Case entity.

7. Enter your information as follows:

   - **Applicable From**: Select the case field that specifies the date and time from which the SLA items will be calculated. For example, if you select the **Created On** field, calculations will start from the time the case was created.

     > ⓘ **Note**
     >
     > You can have multiple SLA KPIs within one SLA. The start time for different SLA KPIs within an SLA is set at the SLA level and can't be different across SLA KPIs. The start time is determined by the **Applicable From** field value.

   - **Business Hours**: Select a customer service schedule record that defines your support organization's business hours. This is useful in the SLA time-tracking calculations. If a business hours record (customer service schedule) isn't selected, work hours are considered to be all day, every day.

   - **SLA Type**: Select **Standard**.

     You can select **Standard** only when the **Entity** field is set to **Case**.

   - **Allow Pause and Resume**: Select **Do Not Allow**. Because standard SLAs don't support pausing and resuming of SLAs, you can set this field to **Allow** only when you're creating an enhanced SLA.

8. Select **Save**.

9. To add SLA details, in the **SLA Details** section, select the **Add** button ➕.

   You add SLA details to define the KPIs or metrics for the SLA. You can define any KPI your organization needs. For example, a KPI might be that all cases for standard customers must be resolved within five days from when the case was created.

   Define success criteria and the failure and warning actions that need to be taken when an SLA metric isn't met for a customer case.

SLA KPIs are performance indicators that you'd like to track. For example, First Response or Resolve By. SLA items refer to SLA KPIs based on specific conditions. You can add multiple SLA items and arrange them in the order that works for you. For any given KPI, only the first SLA item that matches the conditions in the **Applicable When** section is applied.

> **Note**
>
> In Customer Service, SLA and SLA KPIs (SLA details) use the process (workflow) functionality. Although SLA KPIs use workflows, not all of the actions available in workflows are available for defining failure and warning actions. The available actions are currently limited to **Send Email**, **Create Record**, **Update Record**, **Assign Record**, and **Change Status**. More information: **Create and edit workflow processes**

10. Enter the following information in the **New SLA Item** form:

    - **Name**: Type a meaningful name.
    - **Related Case Field**: Select a field of DateTime type of the case record that this SLA item refers to. For example, if you're creating a KPI for sending the first response within a specified time, select the **First Response By** option from the dropdown list. If necessary, ask your system customizer to create new fields of type DateTime.

      When a case record is created or updated, this field is set to the date and time when the failure time will be reached for the respective SLA item. For example, select **First Response By** in **Related Case Field**, and set **Failure After** to two hours from the time the case was created. If the case was created at 09:00, the **First Response By** field in the case record will be set to 11:00, assuming the business hours are all day, every day.

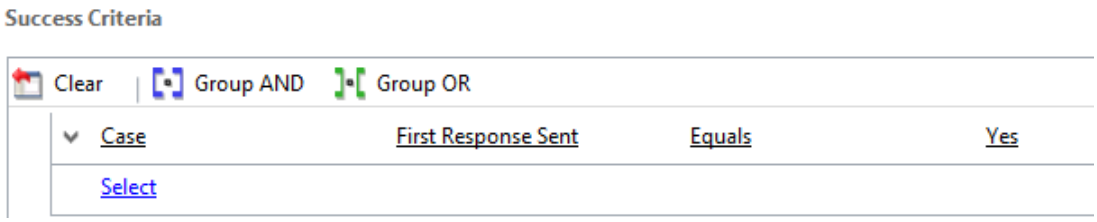
      > **Tip**
      >
      > By default, there are four options available in the dropdown list. If you want to track other KPIs, ask your system customizer to create case fields of type DateTime.

    - In the **Applicable When** section, define the conditions under which the KPI will be applied. The condition can be based on case or related entity fields.

      For example, the conditions might be as shown in the following image.

> **Note**
>
> If there are multiple clauses, and you don't use AND or OR grouping, by default the clauses will use the AND grouping.

- In the **Success Criteria** section, specify the conditions to define when the KPI will be considered as met. For example, the condition might be as shown in the following image.



> **Note**
>
> Before you specify the failure and warning actions for the SLA, save the SLA item record.
>
> If the conditions configured in the SLA fields conflict with each other, the SLA is canceled before it meets the success or failure criteria. For example, if the **Case Status** field is set as **Active** in the **Applicable When** section and is set as **not equal to Active** in the **Success Criteria** section, the SLA will be canceled when implemented.

- Under **SLA Item Failure**, in the **Failure After** dropdown list, select when the SLA items will be considered as failed. For example, if you select **1 hour**, the KPI will be considered as failed if the first response isn't completed within one hour of the time the case was created. One hour is calculated based on the value in the date-time field that you select in the **Applicable From** field of the SLA record.

- In the **Failure Actions** section, select **Add Step**, and then specify the actions to be taken if the success criteria aren't met and the case exceeds the specified failure time. For example, to mark a case for escalation when the KPI has failed, select **Add Step** > **Update Record** > **Case** > **Set Properties**. In the

case record, change the value of the **Is Escalated** field, and then close the case form.

- Under **SLA Item Warning**, in the **Warn After** dropdown list, select the time when a warning is to be raised that the KPI is nearing violation.
- In the **Warning Actions** section, select **Add Step**, and then specify the actions to be taken when the KPI reaches the time when a warning is to be raised. For example, to warn the case owner that the KPI is nearing violation, select **Add Step** > **Send Email** > **Create New Message** > **Set Properties**. In the email record, type the email details, and then close the email form.

> ⓘ **Note**
>
> The time for failure and warning is calculated after considering the business hours selected in the SLA record. If a business hours record (customer service schedule) isn't selected, the work hours are considered to be all day, every day.

> ⓘ **Important**
>
> Make sure that you don't have too many SLA items in an SLA because it might negatively affect the create and update operations on the record on which the SLA is applied or reevaluated. For performance reasons, we recommend that you don't have more than 15 SLA items in an SLA record.

11. Select **Save and Close**.

> ⓘ **Important**
>
> - Failure and warning actions run asynchronously and might not be triggered exactly at the failure or warning time.
> - If failure or warning times are set to less than one hour, the processing of failure or warning actions might be delayed.
> - Make sure you author SLAs in a way that best suits your company's needs. For example, in the SLA **Applicable When** conditions, we recommend that you don't use case fields that are updated too

frequently because any change to the field value might lead to the SLA item being canceled.

Troubleshoot issues in SLAs

Create enhanced SLAs

Article • 09/22/2023

> **Note**
>
> Enhanced SLAs created in the web client have been deprecated and replaced with Unified Interface SLAs. For more information on deprecation, see **SLAs in web client are deprecated**. We recommend migrating the enhanced SLAs created in the web client to Unified Interface. For more information on migrating SLAs, see **Migrate SLAs**.

1. Make sure that you have the Customer Service Manager, System Administrator, or System Customizer security role or equivalent permissions.

   When you activate an SLA, a corresponding workflow is also created. For every action you perform on the SLA, you must have permissions to perform the same action on workflows. The SLA is applied in the context of the permissions that the owner of the SLA has.

   Check your security role

   - Follow the steps in View your user profile.
   - Don’t have the correct permissions? Contact your system administrator.

2. Go to **Settings** > **Service Management**.

3. Go to **Service Level Agreements**.

4. To create a new SLA, select **New**.

   > **Note**
   >
   > If your organization has the Customer Service admin center app and you try to create a new SLA from the web client, you'll see a deprecation message and an option to create the SLA in Unified Interface. There's no message displayed if you don't have the Customer Service admin center app in your organization.

5. Optionally, to edit an SLA, select the SLA from the list of records, and then select **Edit** on the command bar.

6. If you're creating a new SLA in Unified Interface, you'll see the **Create SLA** dialog box. Type a name for the SLA, and then select the entity for which you want to create the SLA.

7. Enter your information as follows:

    - **Applicable From**: Select the field that specifies the date and time from which the SLA items will be calculated. For example, if you select the **Created On** field, calculations will start from the time the record was created.

        > ⓘ **Note**
        >
        > You can have multiple SLA KPIs within one SLA. The start time for different SLA KPIs within an SLA is set at the SLA level and can't be different across SLA KPIs. The start time is determined by the **Applicable From** field value.

    - **Business Hours**: Select a customer service schedule record that defines your support organization's business hours. This is useful for SLA time-tracking calculations. If a business hours record (customer service schedule) isn't selected, work hours are considered to be all day, every day.

    - **SLA Type**: Select **Enhanced**.

      If you're creating an SLA for an entity other than the Case entity, this field is automatically set to **Enhanced** and can't be changed.

    - **Allow Pause and Resume**: Select **Allow** if you want the SLA to pause during the time the record is on hold. For each entity that's enabled for SLA, you can select each status that will be considered "on hold" by using the **Service** tab of the **System Settings** dialog box. More information: System Settings dialog box - Service tab

8. Select **Save**.

9. In the **SLA Details** section, select **Add** (➕).

10. Enter the following information in the SLA Item form:

    - **Name**: Type a meaningful name.

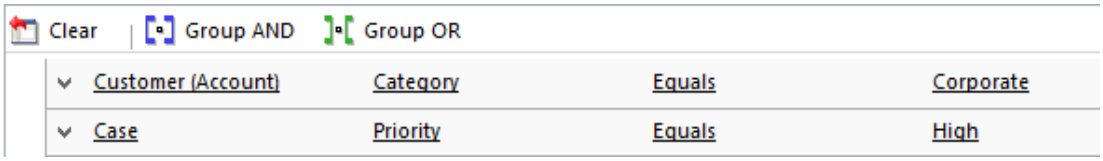
    - **SLA KPI**: Select the KPI the SLA item is about. For example, if you're creating a KPI for sending the first response within a specified time, select the **First Response By KPI** option from the dropdown list.

For example, select **First Response By KPI** in the **SLA KPI** field, and set **Failure After** to two hours from the time the record was created. If the record was created at 09:00, the **Failure Time** field of the SLA KPI Instance record is set to 11:00, assuming business hours are all day, every day.

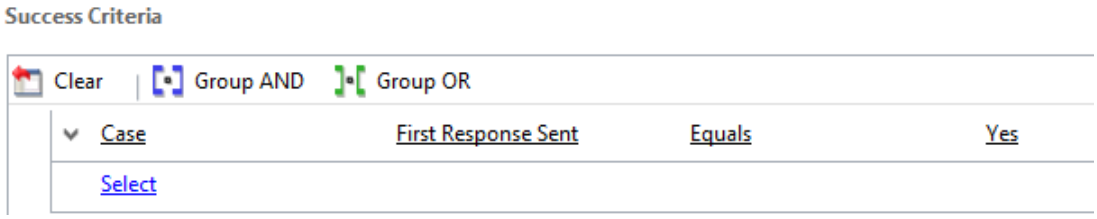
> **Tip**
>
> If you're creating an SLA for a Case entity, by default you have two options to choose from in the dropdown list. If you want to track other KPIs for a case or if you're creating the SLA for entities other than the Case entity, ask your system customizer to create new fields (of type Lookup) that refer to the SLA KPI Instance entity.

- In the **Applicable When** section, define the conditions under which the KPI will be applied. Conditions can be based on primary entity or related entity fields.

  For example, the conditions might be as shown in the following image.



- In the **Success Criteria** section, specify the conditions to define when the KPI will be considered as met. For example, the condition might be as shown in the following image.



> **Note**
>
> - Before you specify the failure and warning actions for an SLA, save the SLA item record.
> - If the conditions configured in the SLA fields conflict with each other, the SLA is canceled before it meets the success or failure criteria. For example, if the **Case Status** field is set as **Active** in the **Applicable**

When section and is set as not equal to **Active** in the **Success Criteria** section, the SLA will be canceled when implemented.

- In the **Success Action** section, select **Add Step**, and then specify the actions that you want the application to take when the success criteria is met before the violation time. For example, select **Add Step** > **Change Status**, and then in the first dropdown list, select **Case**, and in the next dropdown list, select **Information Provided**.
- Under **SLA Item Failure**, in the **Failure After** dropdown list, select when the SLA items will be considered as failed. For example, if you select **1 hour**, the KPI will be considered as failed if the first response isn't completed within one hour of the time the case was created. One hour is calculated based on the value in the DateTime field that you select in the **Applicable From** field of the SLA record.
- In the **Failure Actions** section, select **Add Step**, and then specify the actions to be taken if the success criteria aren't met and the record exceeds the specified failure time. For example, to mark a case for escalation when the KPI has failed, select **Add Step** > **Update Record** > **Case** > **Set Properties**. Now in the case record, change the value of the **Is Escalated** field, and then close the case form.
- Under **SLA Item Warning**, in the **Warn After** dropdown list, select the time when a warning is to be raised that the KPI is nearing violation.
- In the **Warning Actions** section, select **Add Step**, and then specify the actions to be taken when the KPI reaches the warning time. For example, to warn the case owner that the KPI is nearing violation, select **Add Step** > **Send Email** > **Create New Message** > **Set Properties**. In the email record, specify the email details, and then close the email form.

> ⓘ **Note**
>
> The time for failure and warning is calculated after considering the business hours selected in the SLA record. If a business hours record (customer service schedule) isn't selected, work hours are considered to be all day, every day.

Samples for creating enhanced SLA KPIs

The following sample SLA KPIs for the Lead entity can help you get familiar with creating SLAs for other entities.

Sample 1: Contact the customer

This sample SLA KPI tracks whether the salesperson has contacted the customer within a specific timeline.

Applicable when	Success condition	Failure time	Failure action	Warning time	Warning action
Rating = Hot	Status = Contacted	1 day	Send an escalation email to the sales manager	16 hours	Send a warning email to the salesperson
Rating = Warm	Status = Contacted	2 days	Send an escalation email to the sales manager	1.5 days	Send a warning email to the salesperson
Default	Status = Contacted	7 days	Send an escalation email to the sales manager	5 days	Send a warning email to the salesperson

Sample 2: Take action on a lead

This sample SLA KPI tracks whether the salesperson has taken necessary action on the lead within a specific timeline.

Applicable when	Success condition	Failure time	Failure action	Warning time	Warning action
Rating = Hot	Status = Qualified or Disqualified	2 days	Send an escalation email to the sales manager	1.5 hours	Send a warning email to the salesperson
Rating = Warm	Status = Qualified or Disqualified	5 days	Send an escalation email to the sales manager	4 days	Send a warning email to the salesperson
Default	Status = Qualified or Disqualified	15 days	Send an escalation email to the sales manager	12 days	Send a warning email to the salesperson

Important

- We recommend that you don't create or update SLAs by using Dynamics 365 for Outlook. Use the Customer Service app for this purpose.
- Make sure you don't have too many SLA items in an SLA because that might negatively affect the create and update operations on the record on which the SLA is applied or reevaluated. We recommend that you have no more than 15 SLA items in an SLA for performance reasons.
- The SLA business logic relies on **SLA KPI Instance** record values, so to avoid any conflict, we recommend that you don't create plug-ins or processes to directly update the **SLA KPI Instance** record values.

Troubleshoot issues in SLAs

Add a timer in forms to track time against enhanced SLAs

Article • 06/16/2022

> **Note**
>
> - Enhanced SLAs have been deprecated and replaced with Unified Interface SLAs. More information: **SLAs in web client are deprecated**.
> - For more information about adding a timer control to Unified Interface SLA-enabled entities, see **Add a timer control for SLA-enabled entities**.

A timer helps users gauge the amount of time they have to complete a key performance indicator (KPI) that is typically associated with a service level agreement (SLA). If your organization uses enhanced SLAs, you must use quick view forms to add a timer to track time against such SLAs.

The timer control initially displays a count-down timer to show the time remaining to complete the KPI.

> **Note**
>
> - A timer control can be used independent of SLAs, too.
> - The timer control is designed to visually show the current state or show the remaining or elapsed time relative to the date and time specified in the **Failure Time** field of the SLA KPI instance. It doesn't calculate or keep track of the time for which the Pause condition is true.

The timer control can show any of the following, depending on the actions of the user and what you as a system administrator or customizer specify when you set up the timer control:

- If the user completes the task within the remaining time, the control shows the word **Succeeded**.
- If the user doesn't complete the task within the remaining time, the control shows the word **Expired**.

- As the timer counts down, the color changes to yellow as the time remaining nears non-compliance. If the time remaining expires, the timer shows the word **Expired**. Then the timer color changes to red and the timer starts counting up to show the elapsed time since the task should have been completed.
- If a condition causes the SLA KPI to pause, the control shows the word **Paused**.
- If a condition causes the SLA KPI to be canceled, the control shows the word **Canceled**. This behavior is optional.
- If either of the required fields in the **Timer Control** dialog box does not have a value in the record, the control shows the words **Not Set**.

To add a timer to track time against enhanced SLAs:

1. Ensure the entity is enabled for SLA.
2. Create SLA KPI fields for the entity for which you want to create the SLA.
3. Create quick view forms for each SLA KPI instance field that you've created.
4. Create an SLA.
5. Add the quick view forms that you created to the primary entity form

Enable an entity for SLA

To add a timer for an enhanced SLA to an entity form, that entity must be enabled for SLA. To learn more, see Enable entities for service level agreements.

Create SLA KPI fields

1. Make sure you have the System Administrator security role or equivalent permissions in Microsoft Dynamics 365.

   ### Check your security role

   - Follow the steps in View your user profile.
   - Don’t have the correct permissions? Contact your system administrator.

2. Go to **Settings** > **Customizations**.
3. Choose **Customize the System**.

4. Under **Components**, expand **Entities**, and then expand the entity you want.
5. Click **Fields**.
6. On the Actions toolbar, click **New**, and then enter a **Display Name** to generate the **Name**.
7. In the **Data Type** drop-down list, select **Lookup**.
8. In the **Target Record Type** drop-down list, select a SLA KPI Instance.

   If you create a lookup field in an entity form, the relationship is automatically generated. A lookup field is created as a relationship field.
9. Click **Save and Close** to close the form editor.
10. Publish your customization.

    - To publish customizations for just one entity, under **Components**, click **Entities**. Then, on the Actions toolbar, click **Publish**.
    - To publish all customizations you have made to any entities or components, on the Actions toolbar, click **Publish All Customizations** .

Create quick view forms for the SLA KPI Instance entity

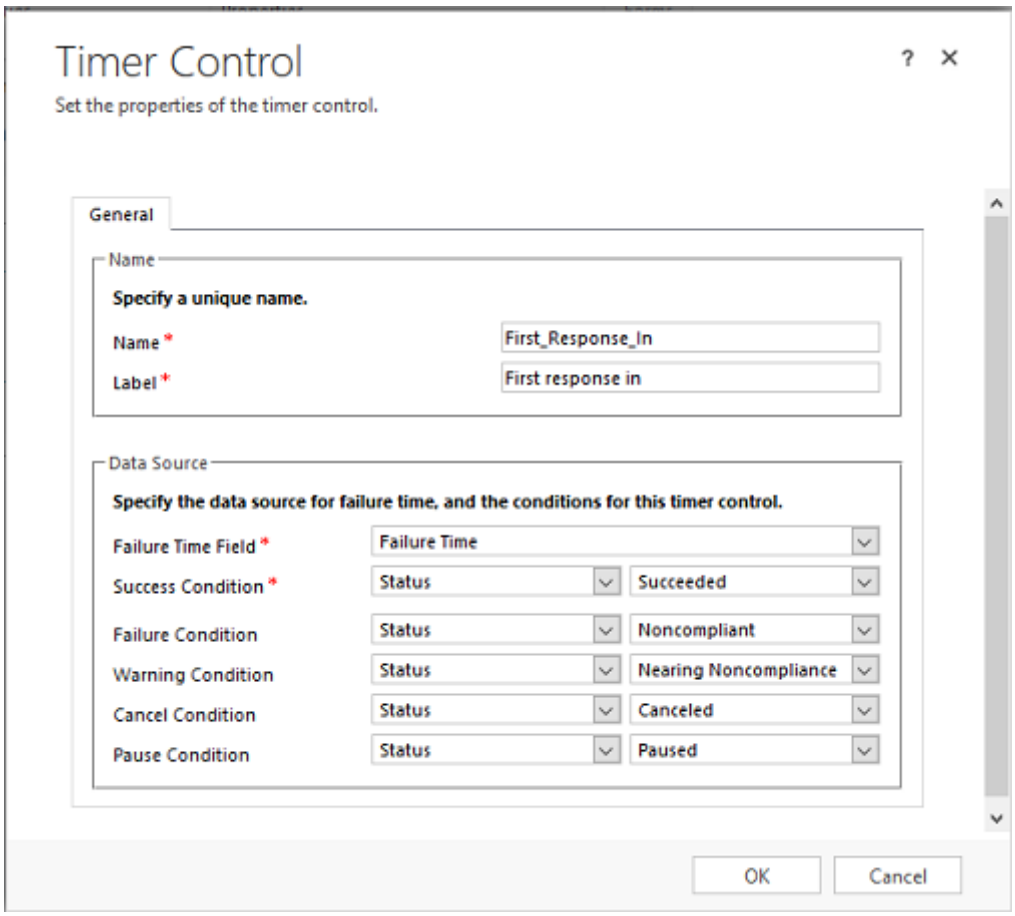
Quick view forms help you show data of a related entity in the primary entity form. For enhanced SLAs, all the SLA-related states and times are stored in the SLA KPI instance entity. To show this data in the primary entity like a lead or an opportunity form, you must create a quick view form for each SLA KPI field that you've created for the primary entity. Add a timer to the quick view form so it shows the count down for the SLA.

Create a quick view form

1. Go to **Settings** > **Customizations**.
2. Choose **Customizations**, then choose **Customize the System**.
3. In the solutions explorer, expand the SLA KPI Instance entity, and then select **Forms**.
4. Select **New** > **Quick View Form** from the tool bar.

5. In the **Form** group, click **Form Properties**, and then specify a form name.
6. Double-click the section, type a meaningful name for the section, and then click **OK**.
7. Select the section, and on the **Insert** tab, click **Timer**.
8. Specify a name and label for the timer, and the data source for the failure time.

   Following is an example of the properties you'd set for a timer for a Case entity.



> ⓘ **Note**
>
> Typically, for enhanced SLAs, the timer control is set up using the SLA KPI Instance status field values only.

9. When you are finished, click **OK**.
10. Publish the customizations .

Create an SLA

Create an SLA for the entity you want to track. For example, you may want to create track the time taken by sales person to take action on a lead, like qualifying or disqualifying a lead. For this, create an SLA for the lead entity. For more information on creating an SLA, see Define service level agreements

Add the quick view form to the primary entity form to show the timer

You can add the quick view forms you created earlier as quick view controls in the primary entity forms.

1. Make sure that you have the System Administrator or System Customizer security role or equivalent permissions.

   ### Check your security role

   - Follow the steps in View your user profile.

2. Go to **Settings** > **Customizations**.

3. Click **Customize the System**. In the solution explorer, in the left nav pane, expand **Entities**, expand the entity you want to add the quick view form to, and then click **Forms**.

4. To add the timer to use in the Dynamics 365 Customer Service app, open the form of type **Main**.

   -OR-

   To add the timer to the interactive experience form so users can use it in the interactive service hub, open the form of type **Main – Interactive experience**

5. Add a section to insert the quick view control. On the **Insert** tab, in the **Section** group, click **Section**, and then click **One Column**. Double-click the section to specify the section properties. More information: Section properties.

   > **Note**
   >
   > You can't add an SLA timer to the reference panel section of the Main - Interactive experience form.

6. Select the section that you just added, and on the **Insert** tab, in the **Control** group, click **Quick View Form** .
7. Specify a name and label for the quick view control. In the **Lookup Field** drop-down list, select the lookup field that you created to point to the SLA KPI Instance entity.
8. The Related Entity drop-down list will be automatically set to "SLA KPI Instance".
9. In the **Quick View Form** drop-down list, select the quick view form you created in the SLA KPI Instance entity.
10. Click **OK** to close the **Quick View Control Properties** dialog box.

    You must save and publish the Main form before the quick view control changes will be visible.

Add a timer control to the Case form to track time against an SLA

Understand SLAs

Article • 10/14/2023

Understand the various service-level agreements (SLA) KPIs and SLA KPI Instance record details.

Understand SLA details with Timer control

You can see the SLA details on the SLA-enabled entity record.

Timer control for SLA-enabled entities

If your administrator has enabled the configurations to display the statuses of the configured SLA KPIs by using the SLA Timer control subgrid, you see the following details:

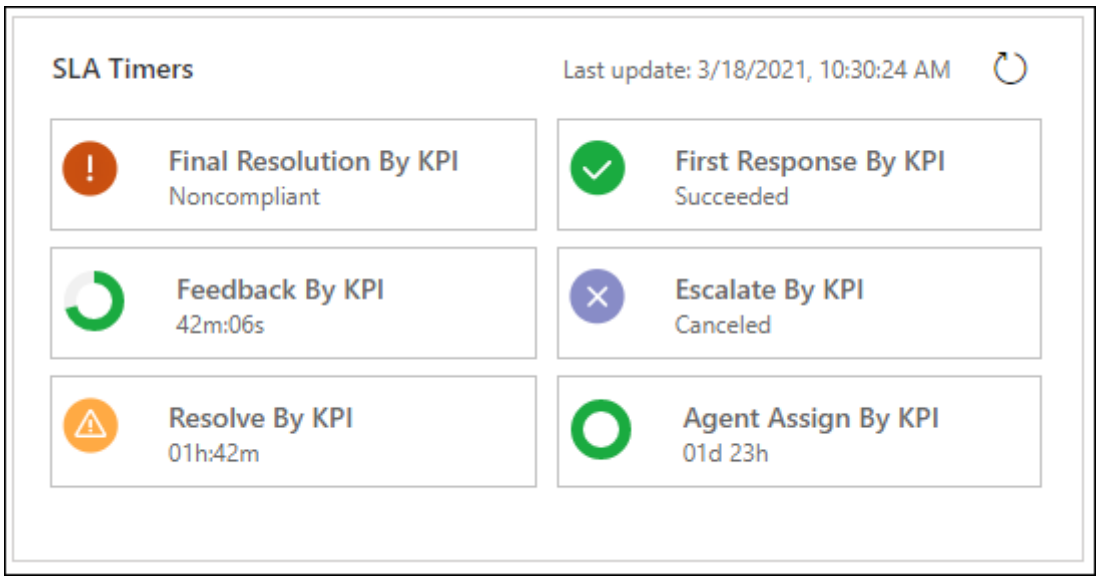
- The different status changes that the KPIs go through.
- When a KPI nears compliance or noncompliance, the time ticker changes to show the time in hours, minutes, and seconds, as applicable.
- The icons are updated for the different stages that the KPIs go through.
- The KPIs are refreshed at the interval that you specify at the time of configuration.

The statuses and their corresponding symbols are as follows.

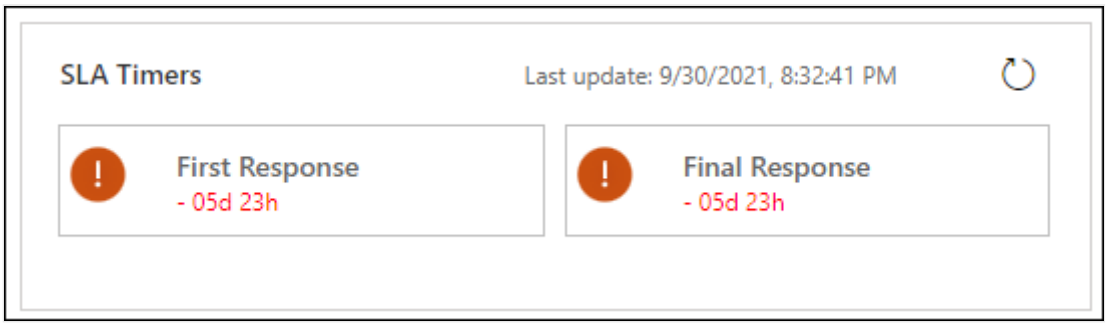
Symbol	Status
	In progress
	Noncompliant
	Nearing noncompliance
	Paused
	Succeeded

Symbol	Status
	Canceled

A sample runtime view of the SLA Timer is as follows. The SLA KPIs displayed aren't in any particular order.



For SLAs that are in the expired status, your administrator can configure the SLA Timer to display the elapsed time. The timer displays the countdown using a negative value in the red color. Only those SLA Timers that have been configured to show the negative time displays the negative countdown time. More information: Enable elapsed time for SLA Timers in expired status



Know the status of an SLA KPI Instance record

Based on the business hours, the timer displays the time remaining to meet the SLA or the elapsed time since the SLA failed. For example, if failure time is set to 5 days and business hours are 9:00 AM to 5:00 PM, then you see 5 days on the timer. If failure time is set to 10 hours, then you see 1 day and 2 hours on the timer. Your system administrator or customizer can add a timer to the SLA-enabled entity form.

When an SLA is applied to an entity, a related SLA KPI Instance record is created for each SLA KPI that is tracked for that entity. The on-hold time is the time for which the case was set to a status that you defined as On-Hold in the System settings dialog box. More information: System Settings Service tab

For example, when you put a case on hold, the status of the SLA KPI Instance is set to Paused. You can see the time for which a case was on hold and the last time the case was put on hold. These details aren't available on the case form by default but your system customizer can add these fields on the case form for you.

When you resume a case, the status of the SLA KPI Instance record is updated. The following details are updated in the record if the SLA isn't violated:

- Failure time
- Warning time
- Total time the case is on hold

If you put the case on hold after the warning time, then the warning time isn't updated when the case is resumed. Similarly, the status of the SLA KPI Instance is updated when the first response time on a case is:

- Nearing expiry
- Has expired
- Has succeeded

> **Note**
>
> - The SLA Timer continues to run after it's triggered or resumed. It includes the holiday hours, non-business hours, and pause time (only business hours) while projecting the SLA warning or failure time.
> - The timer control auto-refreshes for **Pause** and **Resume** states to show the updated SLA. For all other states, you must refresh the page to view the refreshed SLA. Select **...** and select **Refresh** on the command bar to refresh the SLA Timer control.

You can now also apply SLAs on demand. More information: Apply SLAs

To learn more about adding a timer control to an SLA-enabled entity, go to Add a timer control for SLA-enabled entities.

Know active duration and elapsed time for SLA KPI Instances

Track the time taken by SLA KPI Instances to reach their terminal status during business hours to evaluate whether the SLAs are realistic and take decisions about resourcing and efficiency.

The **Active Duration (min)** and **Elapsed Time (min)** fields for an SLA KPI Instance help you derive the exact number of business hours that were spent. The **Active Duration (min)** field shows data only when the KPI is in a **Paused** or terminal state. **Elapsed Time (min)** shows data only when the KPI is in an **In progress** or terminal state. The final value appears in the last KPI instance after the terminal state. The active duration and elapsed time data is shown in minutes.

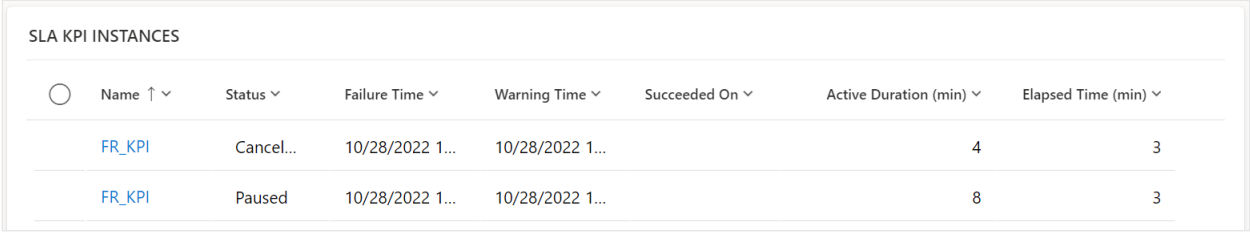
Active duration calculation is asynchronous by default.

You might need to refresh the views that have an **Active Duration (min)** field after any create or update operation. You may also need to review any customizations associated with the **Active Duration** attribute of the SLA KPI instance.

You can view the active duration and elapsed time on the **SLA** tab of the custom entity as well.

- **Active Duration (min)**: Displays the time for which the SLA KPI Instance was active.
- **Elapsed Time (min)**: Displays the time for which the SLA KPI Instance timer was paused.

Both **Active Duration (min)** and **Elapsed Time (min)** are calculated based on the current value of the business hours and calendars, similar to warning and failure time calculation. So, changing the calendar working hours might affect the calculation.



SLA KPI INSTANCES

Name	Status	Failure Time	Warning Time	Succeeded On	Active Duration (min)	Elapsed Time (min)
FR_KPI	Cancel...	10/28/2022 1...	10/28/2022 1...		4	3
FR_KPI	Paused	10/28/2022 1...	10/28/2022 1...		8	3

> **Note**
>
> The **Active Duration (min)** and **Elapsed Time (min)** data aren't applicable for legacy SLAs.

Know the SLA KPI instance entity name

For SLA KPI instances, you see the **Regarding** column as blank on Unified Interface, and on the web client you see it as **(No name)**. This happens for all existing and custom entities other than the case entity.

Your administrator must configure the SLA KPI instance name through **Advanced Find**.

Configure email

Article • 05/23/2023

Email is typically used as a communication channel between customers and agents throughout the lifecycle of support delivery. Regardless of the channel where a customer begins a conversation, agents often use email to send their customers confirmations, case IDs, attachments, or other communications of record throughout the support lifecycle.

In customer engagement apps, system administrators have the ability to configure email templates and enable quick access to email to help users create emails directly from the timeline so they can deliver a more personalized service.

The following email configuration options are available:

- Configure the email form order: Allow users to access email capabilities and create an option on the command bar.
- Enable the enhanced email experience: Allow users to use broader email functionality, such as expanding the email editor pop-up window, applying predefined templates, and inserting attachments to email.
- Configure email attachments size limitations: Allows you to manage file size limits for email attachments.
- Configure the attachment tiles thumbnail layout: Allows you to configure the visual layout of attachments and the number of attachments to show per page.
- Change the number of attachments to show per page: Configure how many attachments you want to show.
- Manage blocked attachment file types: Allows you to configure the types of file types you want to block users from being able to upload as email attachments.

Configure the email form order

Email must be enabled for users so they can view and access it. When email is enabled, it shows as an option on the command bar.

To enable email:

1. In Power Apps, go to **Settings** > **Advanced Settings**.
2. From the top menu, select **Settings** > **Customizations**.
3. Select **Customize the System**.

4. Expand **Entities**, select and expand **Email**, and then select **Forms**.
5. On the command bar, select **Form Order**, and then select **Main Form Set** from the drop-down list.
6. The **Form Order** window appears, which displays the enabled email forms that are available. If **Enhanced email** doesn't display at the top of the list, use the arrows to move it up so it displays first on the list, and then select **OK**.

   > ⓘ **Note**
   >
   > Both the Navigate-to and Contextual (pop-up) email experience use the same **Form Order**.

7. When you've completed your updates, select **Publish All Customizations** in the top-left corner in order for changes to be displayed.

Enable the enhanced email experience

Enhanced email is the default setting, but you must enable email for users to access and use the features.

Sign in to https://`<YourOrgURL>`.dynamics.com/apps and open a customer engagement app. In the app:

1. Go to **Settings** > **Advanced Settings**.
2. Select **Settings** > **Administration**.
3. Select **System Settings**. The **System Settings** window is displayed.
4. Select the **Email** tab, scroll down to the **Enhanced email for Timeline** section, and then select the check box.
5. Select **OK** to save your global organizational setting and close the window.

Configure email attachment size limitations

You can manage file size limits for email file attachments by doing the following:

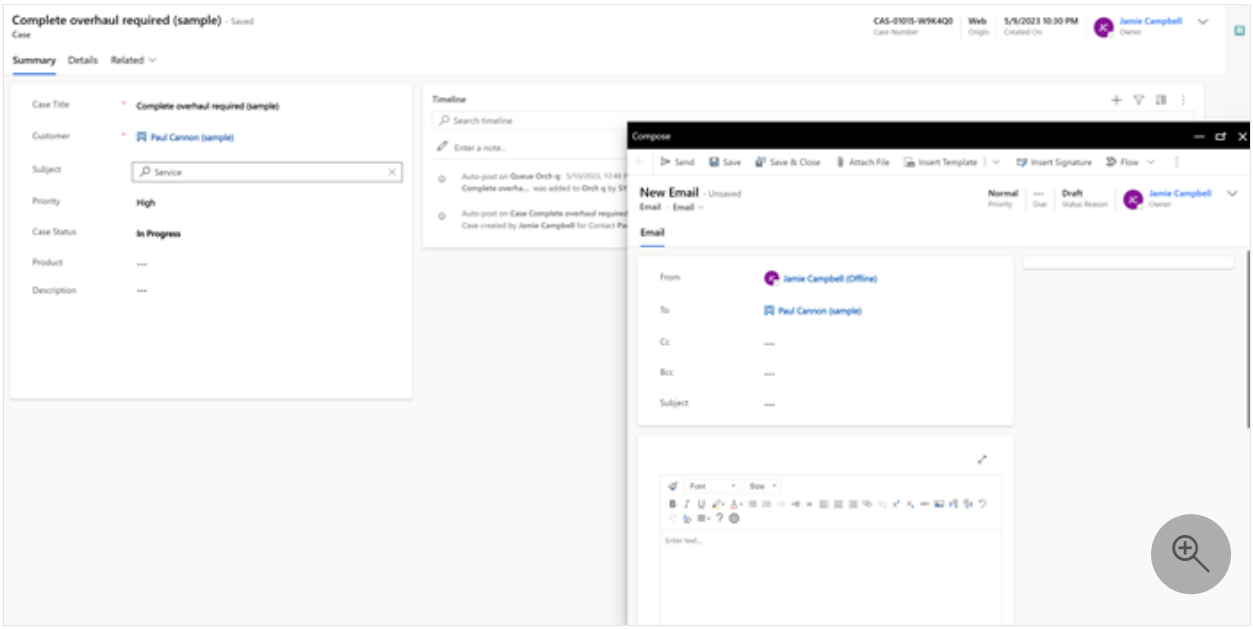
1. In Power Apps, select **System Settings**.
2. In the **System Settings** display window that appears, go to the **Email** tab.

3. Scroll down to the **Set file size limit for attachments** section, set the file size you want to use for attachment, and then select **OK**.

> ⓘ **Note**
>
> The default file size limit for attachments is 5 MB. The size limit for attachments can be increased to a maximum of 132 MB per file.

Configure email pop-up window

When an agent selects **New Email** from the Timeline, you can to choose to display the email editor either as a pop-up window or in a new tab. If you enable the email pop-up editor setting, agents see the following experience:



Perform the following steps to display the email editor as a pop-up window:

1. Select **Settings** > **Advanced Settings**.
2. Select **System** > **Administration**.
3. Select **System Settings**.
4. In the **System Settings** display window that appears, go to the **Email** tab.
5. Select **Multitask, compose, and save drafts using email pop-up windows when creating email from timeline** in the **Enhanced email for Timeline** section, and then select **Ok**.

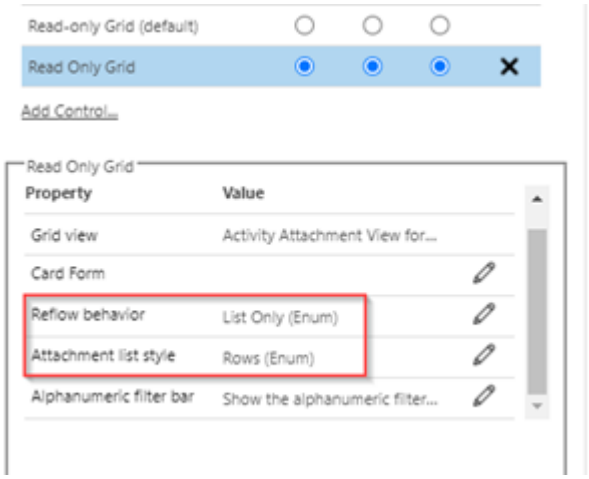
Configure attachment tiles thumbnail layout

You can configure the attachment tiles thumbnail layout in email by selecting the Email entity form for enhanced email from the Advanced settings menu.

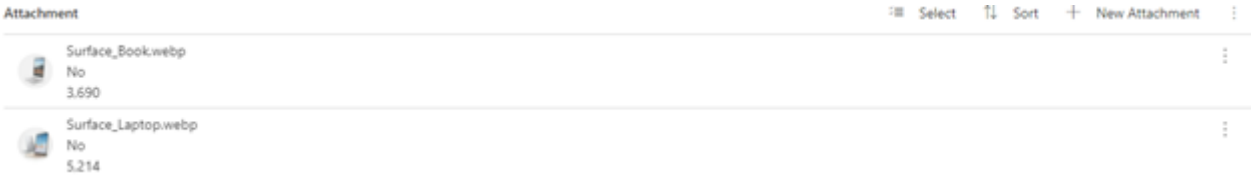
1. In Power Apps, go to **Advanced settings**.
2. Select **Customizations** > **Customize the System**.
3. Select **Entities** > **Email** > **Forms** > **Enhanced Email**.
4. Double-click the **Attachment** area of the form to show the **Properties** dialog.
5. If the **Read Only Grid** control isn't already present, add it by selecting the **Controls** tab and then selecting **Add Control**.
6. After you've added the **Read Only Grid**, you can select it to set the properties you want. Choose from the following:

- **Reflow Behavior**: Determines whether the layout of a grid changes to a list layout when not enough space is available.
  - **Reflow**: Shown in list mode or grid mode, depending on the available size.
  - **List Only**: Shown in list mode only.
  - **Grid Only**: Shown in grid mode only.
- **Attachment List Style**: The way individual attachments are displayed in list mode (for the Attachment entity only)
  - **Grid**: Shown in block with multiple attachments per row.
  - **Rows**: Default experience with a single attachments per row.

For example, we'll set **Reflow behavior** to **List Only** and **Attachment list style** to **Rows**.



These settings display attachments as follows:



Changing to **List** and **Grid** shows the following attachment layout:

Change the number of attachments to show per page

You can configure the maximum number of attachments to show per page. Adjust the settings on the **Formatting** tab of the **List or Chart properties** dialog. For example, if you set the **Number of Rows** property to 4, and then have more than four attachments per email, the rest of the attachments will paginate and you can then use the arrow buttons to view them.

Manage blocked attachment file types

You can configure the attachment file types you want to block to prevent users from uploading certain files.

1. In Power Apps, go to **Advanced settings**.
2. Select **System** > **Administration** > **System Settings**.
3. On the **General** tab, scroll down to **Set blocked file extensions for attachments**.
4. Type the file extension(s) you want to block. Users who try to upload a blocked file type will see an error message that tells them the attachment is blocked.

Customize the email experience

Article • 04/05/2023

The email configuration experience enables users to be more effective and efficient when using email to communicate with customers. This article discusses how to configure the email editor, email template builder, and email signature builder, which accepts the full configuration capability of the Rich Text Editor control.

> **Note**
>
> If you're using the Activity Editor control, we recommend that you use the rich text editor control instead because the Activity Editor control has been deprecated. For details, see **Use the rich text editor control in Power Apps**.

Each instance of the email editor or builder can be configured independently, enabling you to:

- Choose the fonts you want.
- Set a default font.
- Add your own font.
- Adjust the toolbar location and buttons.
- Automatically increase the editor height to fit the content.
- Access HTML.
- Configure the rich text editor control in email experiences (including email editor, email template builder, and signature builder).

Configure the email form by using a web resource file

You can configure email by using a web resource file that can be modified as needed and then linked to the email form.

Enabling the user configured settings to an email form consists of the following steps:

1. Configure the web resource file
2. Enable the RTE control in the email form

Configure the web resource file

1. Access the web resource file by navigating to **Advanced settings** > **Customize the system** > **Web Resources**.

2. Use the filter to search for the web resource files, as shown below:

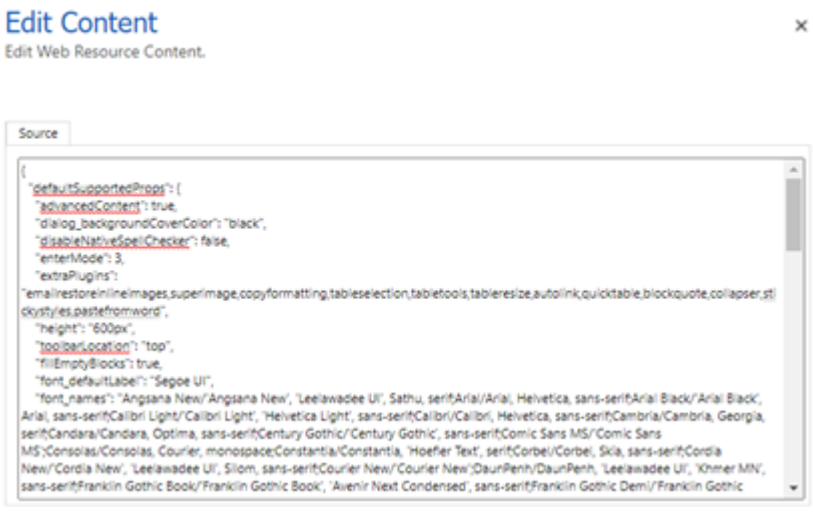
   There may be more than one file named msdyn_EmailRTEconfig_reference.js. One is the default, out-of-the-box configuration file that isn't modifiable. The other can be opened and used as a reference to create a new web resource file that will host your configuration changes.

3. Select the editable file. A new window is displayed.

4. In the **Content** section, select **Text Editor**.

   An **Edit Content** window is displayed.

5. Copy the text in the **Source** field, and then close the window.



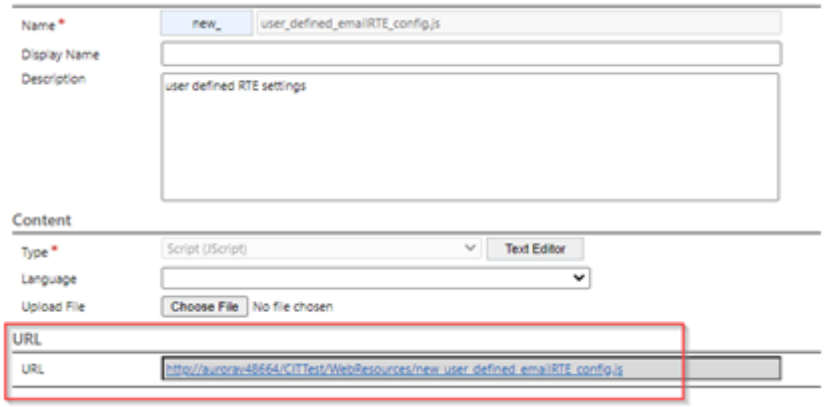
6. Create a new web resource and paste the code you copied from the existing file into it.

7. Make any changes you want, and then select **Save and publish**.

> ⓘ **Note**

- A code editor such as Visual Studio Code can provide a better editing experience.
- There are a variety of properties that can be modified and will apply to the email form when you configure it. For more information, see **Rich Text Editor Properties**.
- Ensure that the **disableDefaultImageProcessing** property is set to **True** for inline images added to the editor to load properly in the recipient's email.

8. Save the URL to the new web resource because you'll need it to map the new web resource file to the **Enhanced Email** form.



9. Navigate to **Customization** > **Customize the system** > **Entity** > **Email** > **Forms**.

10. Open the **Enhanced Email** form, double-click **Description**, and then navigate to the **Control** tab.

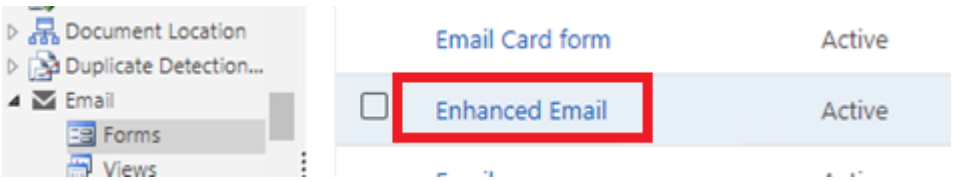
11. Add the RTE control, select **Custom Configuration URL**, and then in the URL field, enter the URL from the new web resource file you created.

12. Select **Save** and then **Publish All Customizations**.

Enable the RTE control in the email form

1. Navigate to the email form properties: Select **Advanced settings** > **Customize the system** > **Entities** > **Email** > **Forms**.

   In this example, we'll add the web resource file to the **Enhanced Email** form.



2. Select the form, and then double-click the **Description** field to enter the field properties.
3. If the RTE control isn't already added, select the **Controls** tab to add it.
4. Select the **Custom configuration control** and replace **singleLine.URL** with the web resource URL for the web resource file you created in the steps above.

5. Select **Save** > **Publish**.

   The settings will now apply to the form when you create an email.

> ⓘ Note
>
> If you're using a workflow to populate email content in RTE fields that aren't in Timeline and you experience issues with inline images not rendering properly, you must use the msdyn_EmailRTEconfig_reference.js plugin.

Add the language filter in the email template selection view

Perform the following steps to enable the language filter for the enhanced email template selection window:

1. Navigate to **Settings** > **Advanced Settings**.
2. Select **Customizations** > **Customize the System**.
3. In **Solution: Default Solution**, expand **Entities**.
4. Expand **Email Template** and then select **Forms**.
5. On the **Active Forms**, select **Template gallery filter form**.
6. Drag and drop **Language** from the available fields to the form.

   > ⓘ Note
   >
   > **Language** is added to the form by default.

7. Select **Language** and then select **Change Properties**.

8. In **Label**, select **Display label on the form**.
9. In **Visible**, select **Visible by default**.
10. Save and publish the changes.

Customize the enhanced email template selection view

The enhanced email template selection window displays the **Select Record dialog** and allows agents to toggle between email template views. Perform the following steps to enable these features:

1. Navigate to **Advanced Settings** > **Email Configuration**.
2. Select **Email Configuration** > **Email Configuration Settings**.
3. In **Enhanced E-mail Template selection experience**, set **Enable Email Template views** and **Skip Select Record dialog** to **Yes**.

Configure the default email template selection view

Perform the following steps to configure the default view for the enhanced email template selection window:

1. Navigate to **Settings** > **Advanced Settings**.
2. Select **Settings** > **Email Configuration** > **Email Configuration Settings**.
3. Set the **Default view** option for **Enhanced E-mail Template selection experience**.

Configure the enhanced insert email template selection dialog

Article • 04/10/2023

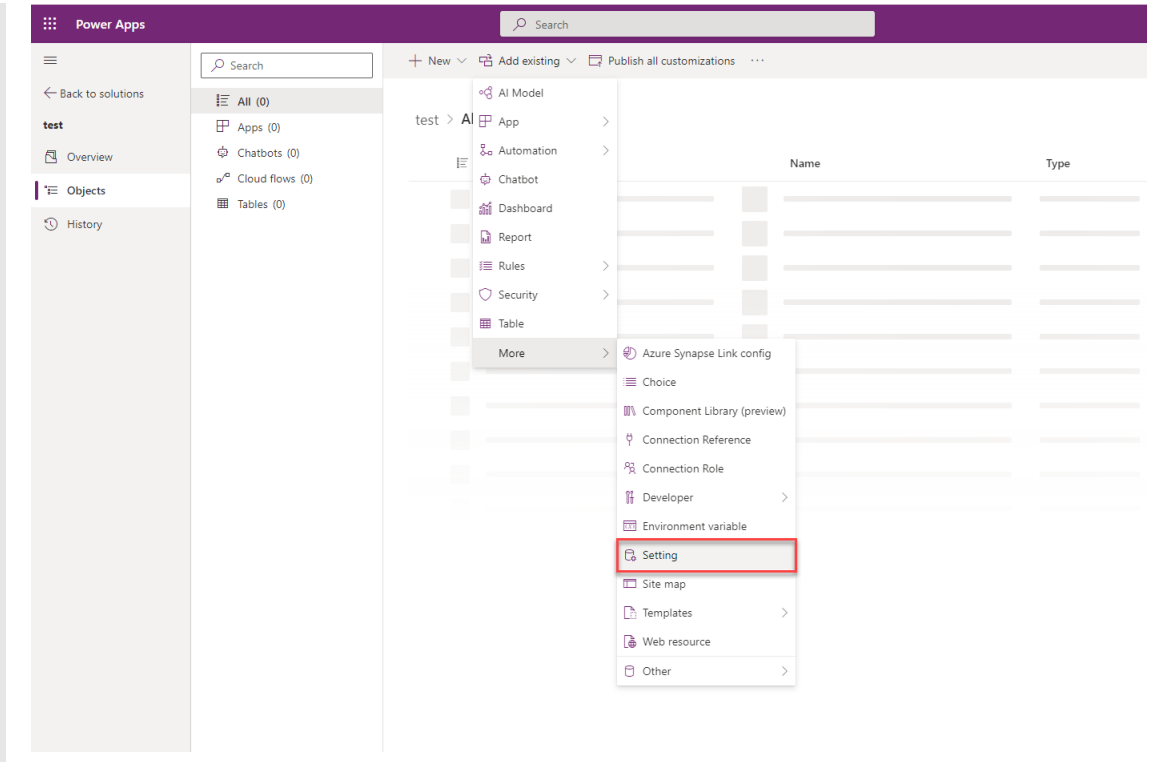
Turn on the enhanced email template selection experience for apps across your organization. If you need to, you can turn off the enhanced email template selection dialog for a specific app. And then, the users of the app see the default email template editor page.

Enable the enhanced email selection dialog

1. In Power Apps, select the environment the environment that contains your solution.
2. Select **Solutions**, and then select the solution in which you want to turn on the enhanced template editing experience.

   > **Note**
   >
   > Don't select the default solution to configure the template.

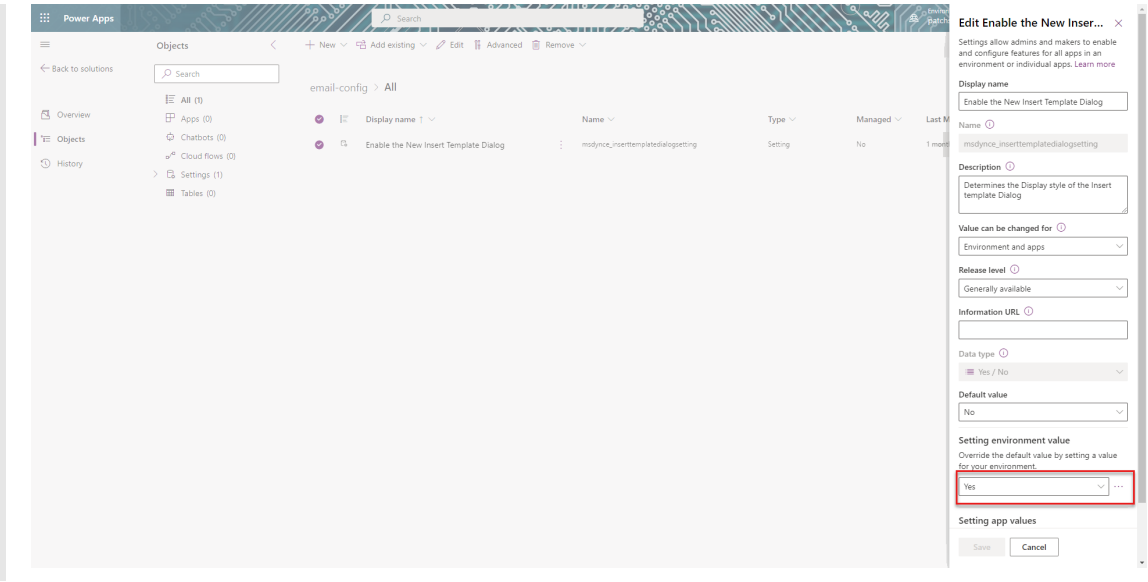
3. Select **Add Existing** > **More** > **Setting**.



4. On the **Add existing Setting Definition** pane, select the **Enable the New Insert Template Dialog** option and then select **Next**.

5. Select **Add** on the **Selected Setting Definition**. The **Enable the New Insert Template Dialog** option is added to your solution. Select **Edit**.

6. Set the **Setting environment value** option to **Yes** on the **Edit Enable the New Insert Template Dialog** pane.



7. Select **Publish All Customizations**.

Disable the enhanced email selection dialog for an app

For an app to display the default email template selection dialog, you must disable the enhanced email template selection option. To disable the option for a specific app, you must add the app to the Solution in which you've added the email template selection option. Perform the following steps:

1. Go to **Power Apps** instance.
2. Select **Solutions**.
3. On the **Solutions** page, select the Solution in which you've added the email template selection option.
4. Go to **Add Existing** > **App** > **Model-driven app**> **Add existing model-driven apps** pane. Select the app for which you want to disable the enhanced insert email template selection dialog. The app is added to the solution.
5. Select the **Enable the New Insert Template Dialog** option in the solution.
6. On the **Edit Enable the New Insert Template Dialog**, in the **Setting app value** section, the selected app is displayed.

7. Select **New app value** for the app, and select **No** for the specified app.
8. Select **Save** and **Publish All Customizations**.

How to create an email template in model-driven apps
Customize an email template using the template editor

Configure the enhanced email template editor page

Article • 04/04/2023

You can configure the enhanced email template editing experience for apps across your organization. If you need to, you can turn off the enhanced email template page for a specific app. And then, the users of the app see the default email template editor page.

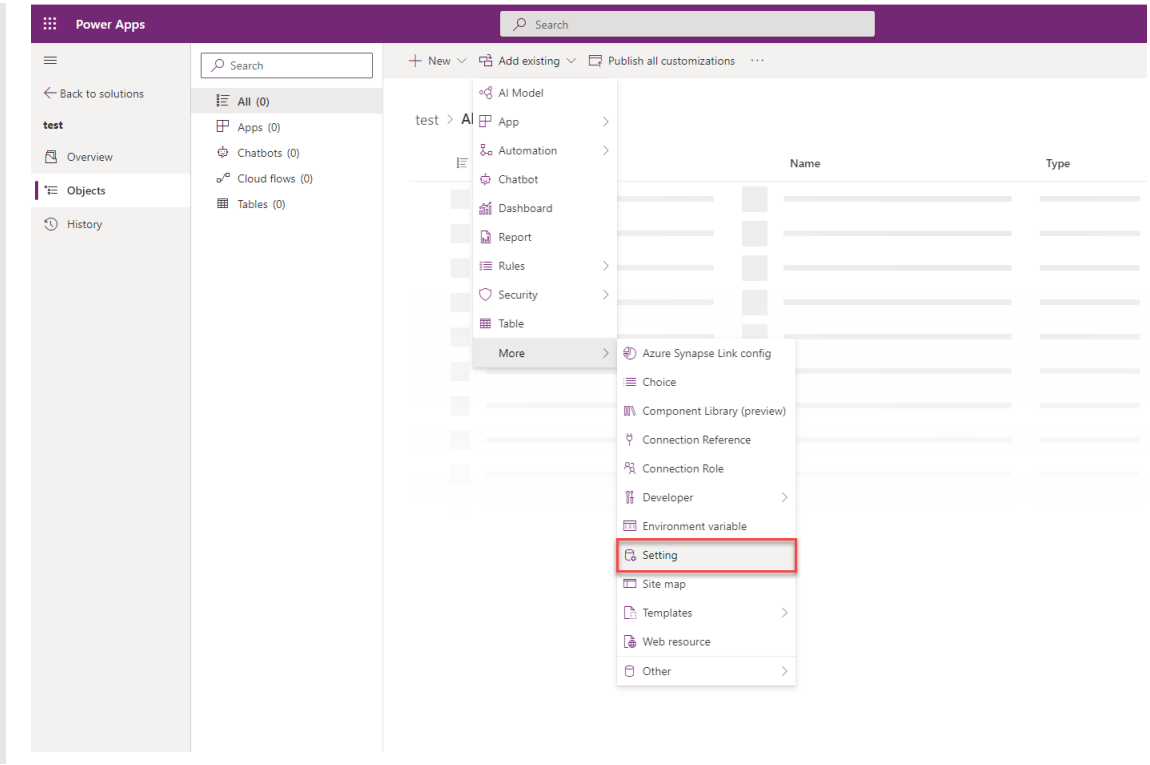
> **Note**
>
> - You must have an active subscription to **Dynamics 365 Customer Service Enterprise** to use the enhanced email template editor.
> - In Customer Service workspace and Customer Service Hub, the enhanced email template dialog is enabled by default as an early access feature.

Enable the enhanced email template editor

1. In Power Apps, select the environment that contains your solution.
2. Select **Solutions** on the left navigation pane, and then select the solution where you want to turn on the enhanced template editing experience. If the item isn't in the left navigation pane, select ...More and then select the item you want.

   > **Note**
   >
   > Don't select the default solution to configure the template.

3. Select **Add Existing** > **More** > **Setting**.



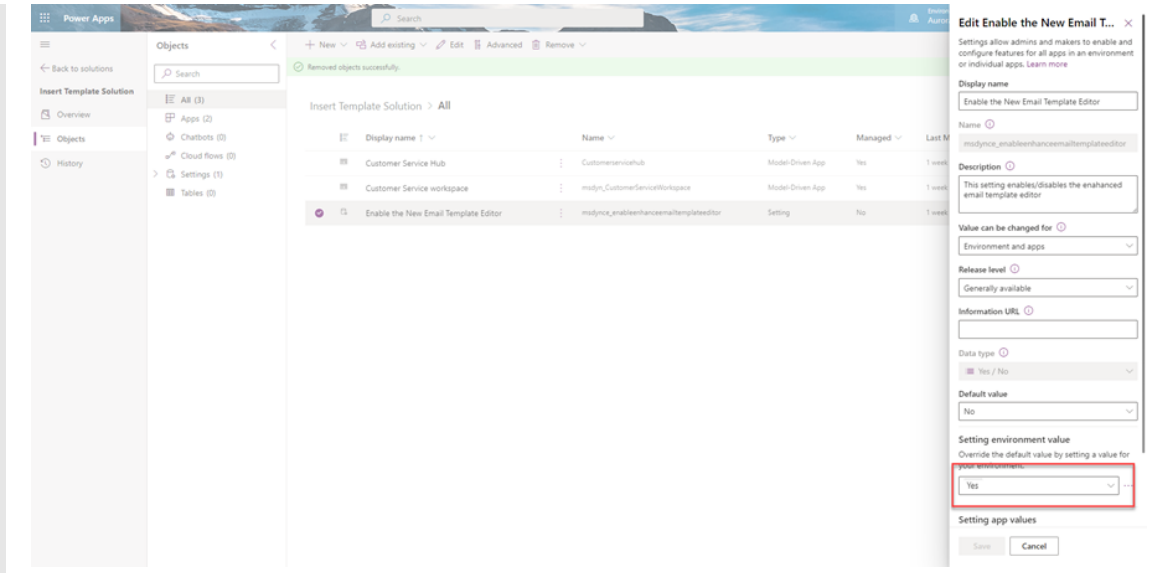
4. On the **Add existing Setting Definition** pane, select the **Enable the New Email Template Editor** option and then select **Next**.

5. Select **Add** on the **Selected Setting Definition** to add the **Enable the New Email Template Editor** option to your solution.

6. Go to **Add Existing** > **App** > **Model-driven app**> **Add existing model-driven apps** pane.

7. Select the **Enable the New Email Template Editor** option. The **Edit Enable the New Email Template Editor** pane appears.

8. Set the **Setting environment value** option to **Yes** on the **Edit Enable the New Email Template Editor** pane.



9. Select **Publish All Customizations**.

Disable the enhanced email template editor for an app

For an app to display the default email template selection dialog, you must disable the enhanced email template selection option. To disable the option for a specific app, you must add the app to the Solution in which you've added the email template selection option. Perform the following steps:

1. Open the **Power Apps** environment.
2. Select **Solutions** on the left navigation pane. If the item isn't in the left navigation pane, select ...More and then select the item you want.
3. Open the Solution in where you've added the email template selection option.
4. Go to **Add Existing** > **App** > **Model-driven app**> **Add existing model-driven apps** pane. Select the app for which you want to disable the enhanced insert email template selection dialog. The app is added to the solution.
5. Select the **Enable the New Email Template Editor** option in the solution.
6. On the **Edit Enable the New Email Template Editor**, in the **Setting app value** section, the selected app is displayed.
7. Select **New app value** for the app, and select **No** for the specified app.
8. Select **Save** and **Publish All Customizations**.

Add a default signature template to a queue

Article • 10/03/2022

You can add a default signature template for a queue to ensure that emails sent with the queue as the sender have consistent email signatures. When you send an email with the queue as the sender or reply to messages received by the queue, the default signature is added to the body of the email. If you don't specify a default signature template for a queue, the application adds the signature queue's owner.

Prerequisites

Email signature templates must be available before adding them to a queue.

Set up default email signature for queues

1. Go to one of the admin apps, and perform the following steps:

   Customer Service admin center

   a. In the site map, select **Queues** in **Customer support**.

   b. On the **Queues** page, select **Manage** for **Basic queues**.

2. To create a queue, select **New**. To edit a queue, select the queue in the list of queues, and then select **Edit** on the command bar.

3. In the **EMAIL SETTINGS** section, specify the signature template in **Email Signature**.

Understand the email experience

Article • 02/15/2022

Having the ability to communicate effectively with customers can lead to increased sales and customer satisfaction. The email capability in customer engagement apps empowers users with the ability to respond and provide timely customer interaction effortlessly through quick email access with enhanced features and functionality. You can compose, reply, and review email, as well as quickly attach and send images that add value and support to customer communication using streamlined functionality. You can also ensure interactions between you and your customers are consistent and professional by using email templates with rich text and images.

You can work in either the **navigate-to** email or the **contextual** email experience. The difference between the navigate-to vs. contextual email experience is where the email displays on your screen. Both experiences use the same **Enhanced Email** form, which is enabled by default out-of-the-box (OOTB).

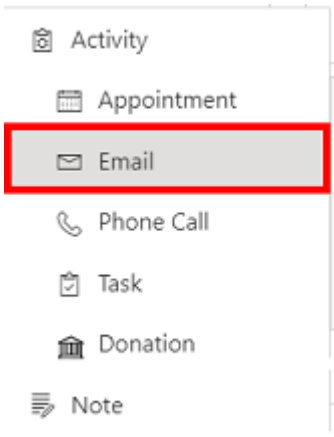
> **ⓘ Important**
>
> - **Contextual** email is also referred to as enhanced email. Please be aware that there isn't any special functionality associated with the contextual email experience, other than it is a pop-up experience.

- **Navigate-to email experience**: Always displays in a new screen.
- **Contextual email experience**: Can only be initiated from the timeline, displays email in a pop-up screen, and allows you to:
  - Move to different pages without losing email content.
  - Minimize the email window to return to the records you were working on.
  - Simultaneously view, compose, and reply to five emails in pop-up windows when enabled.

The following highlights the difference between the "navigate-to" and contextual email experience in the timeline based on how your system administrator has configured your email:

1. Select **Create a timeline record**.

2. Select **Email**.



Depending on the experience you are using, your email will display as follows:

Navigate-to email experience	-	**Contextual email experience**
		The "navigate-to" email will display in a new screen.		The contextual email will display in a pop-up window on your current screen.

> **ⓘ Important**
>
> - The pop-up window only opens when the height and width of your screen size is at least 400 x 650 pixels or greater. If lower, "navigate-to" email will be the default experience.
> - The contextual email experience is available only for timeline.

> **ⓘ Note**
>
> - If you use customized forms in email, you will still be able to see and use them. The **Enhanced Email** form showcases various email capabilities and functionality.

For more information, see View, compose and respond to email.

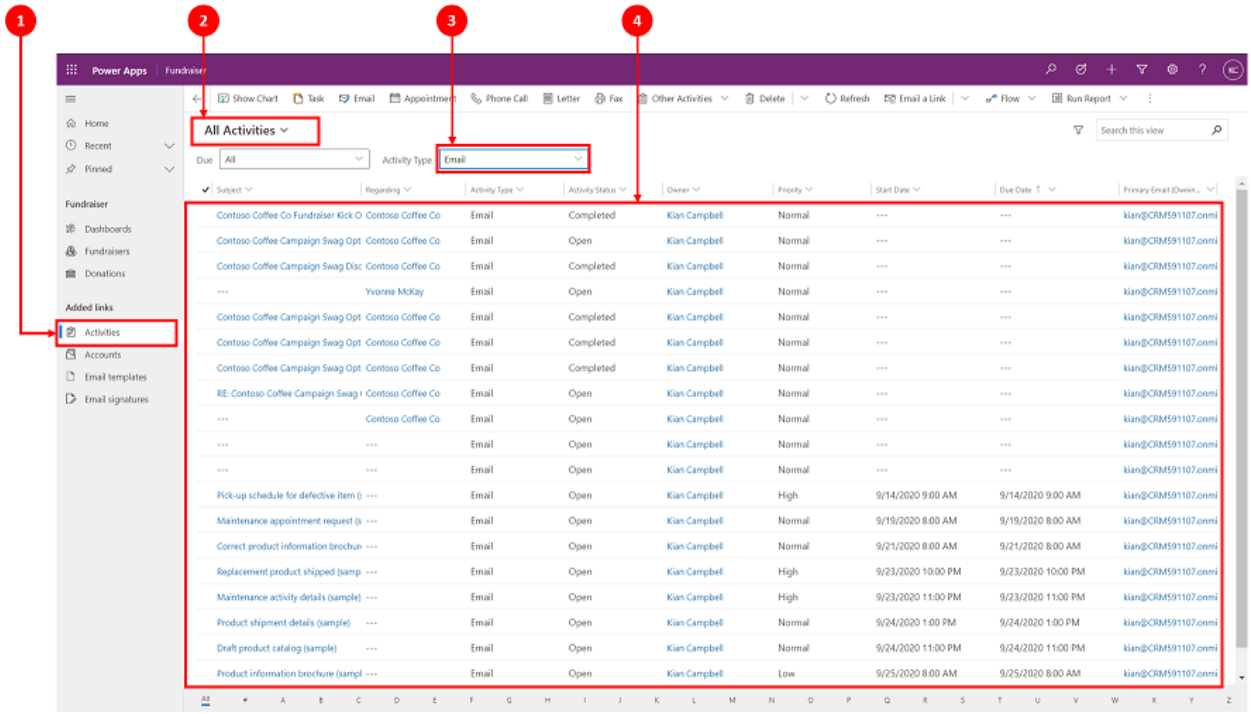
View, compose and respond to email

Article • 06/09/2023

Users can view, create, and send email faster with streamlined access that helps users compose, reply, and send emails using rich text editing and drag-and-drop attachment features and functionalities to embed images in emails.

Access and view emails



Legend

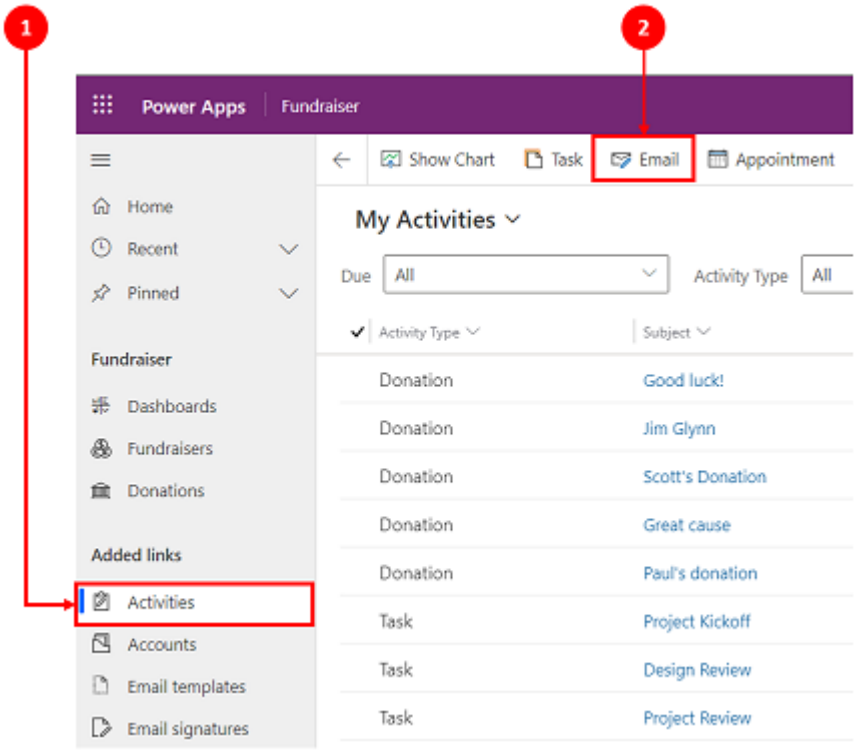
1. Select **Activities**
2. Select **All Activities**
3. Under **Activity Type** select **Email**
4. Email list appears in the screen below

Compose an email

Email capabilities, like rich-text editing and drag-and-drop or copy-and-paste images enriches customer interactions when composing email.

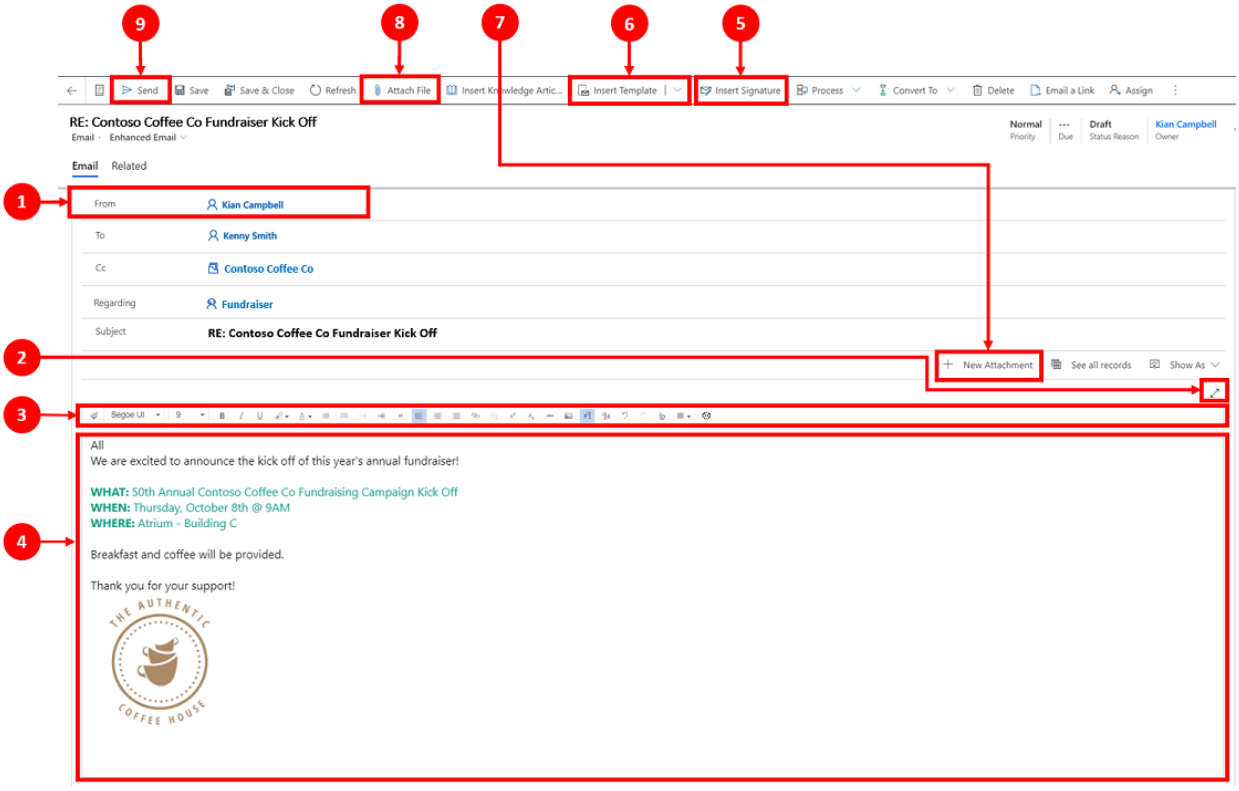
When enabled by your system administrator, you can access email from the top navigation bar.

Compose an email



1. Select **Activities**
2. On the command bar, select **Email**. An email then opens in a new window where you can begin composing.

Anatomy of an email form



Legend

1. **From**. The name displayed in the **From** field is automatically populated based on the user who is currently signed in.
2. **Expand**. The **Expand** icon allows you to compose your email in a full-screen view and minimize when done.
3. **Rich text editor**. This tool bar helps you format emails. The editor is displayed as a single line that can be expanded to view the full list of editing features by default. For more information, see Use the rich text editor toolbar in email and Accessibility shortcuts for email. **User Personalization**. The icon allows you to set the default font and font size for your emails. Once set, the **Font** and **Font Size** display these values by default.
4. **Body**. The body is where you compose and/or reply to an email.
5. **Insert Signature**. Use this command to personalize your message.
6. **Insert Template**. This is used to apply an email template.
   For more information, see Insert an email template.

   > **Note**
   >
   > The **To** box must contain a recipient to select a template.

7. **New Attachment**. This command is used to add a file to your email.
8. **Attach File**. This command uses the 'plus' icon functionality to add attachments.

   > **Note**
   >
   > After you save your email, you can use Attach file and New Attachments interchangeably.

9. **Send**. Select this icon to **Send** your email when you are done.

   > **Important**
   >
   > - The **From** and **To** fields are automatically populated based on the user and the account and contact of the original record.

Reply to an email

The way you can reply to an email depends on where you are in your app.

When enabled by your system administrator, the email option displays in the top navigation bar and in the activities command bar.

> **Note**
>
> The best performance is achieved when the HTML content size is 1 MB or less. When your HTML content size exceeds 1 MB, you might notice slower response times for loading and editing content. By default, image content is referenced from the content HTML but isn't stored as part of the HTML content, so in the default configuration, images don't negatively impact performance.

Access email

When accessing email, there are a couple of options you can use.

- **Option 1:**

  
  - Select **Email** on the command bar.

  > **Note**
  >
  > Email option will only appear in the drop-down list and the command bar when enabled by your system administrator.

- **Option 2:**

  
  1. From the navigation bar, select the plus icon.
  2. Select **Email** from the drop-down menu.

Set the default font and font size

You can set the default font and font size for your email text. Perform the following steps:

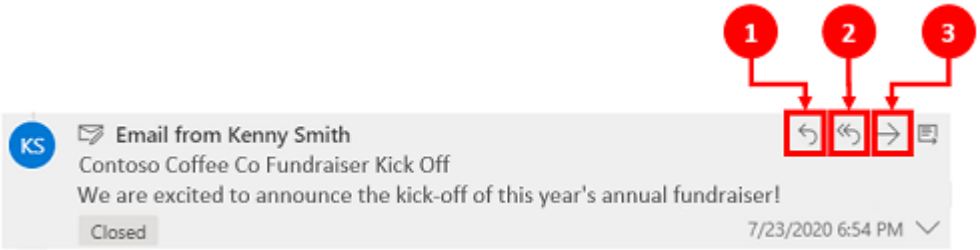
- In the email editor, in the Rich text editor tool bar, select .
- In **User Personalization** specify the **Font** and **Font Size**.
- Select **Ok**. The application defaults the values specified in the Font and Font Size fields of the rich text editor toolbar.

If your administrator has set default font and font size, the application displays the set values in the Font and Font Size fields of the rich text editor toolbar.

Reply to email in timeline

When replying to emails in Timeline, the command bar in the top-right corner provides you with reply options. When you select an option, your email automatically is set and opens in that state ready for you to begin your message.

You can use the following command options when working with emails in the timeline.



1. **Reply**. Use this command to reply directly the sender of the email you received.
2. **Reply All**. Use this command to reply to everyone on an email you received.
3. **Forward**. Use this command to forward the email to someone else.

Attach a file to email

Article • 06/09/2023

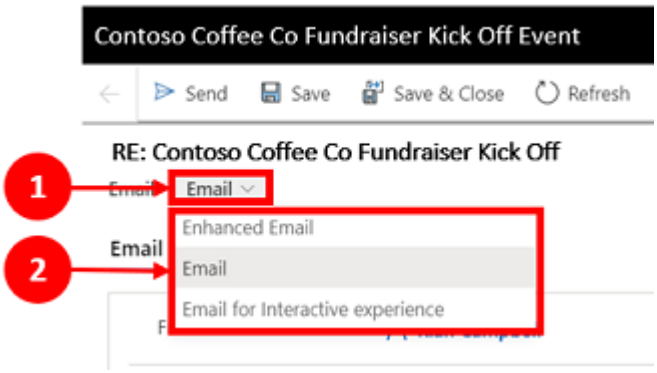
The option to attach files to an email is a useful feature when you need to share additional information. Use the **Attach file** button on the command menu or the **New Attachments** button in the email body to attach files to the email.

> **ⓘ Important**
>
> The default file size limit for an email file attachment is 5 MB. The size limitations on email file attachments can be increased by your system administrators.

Work with attachments

You can attach an unlimited number of files to an email; however, there are file size limitations that are managed by your system administrator.

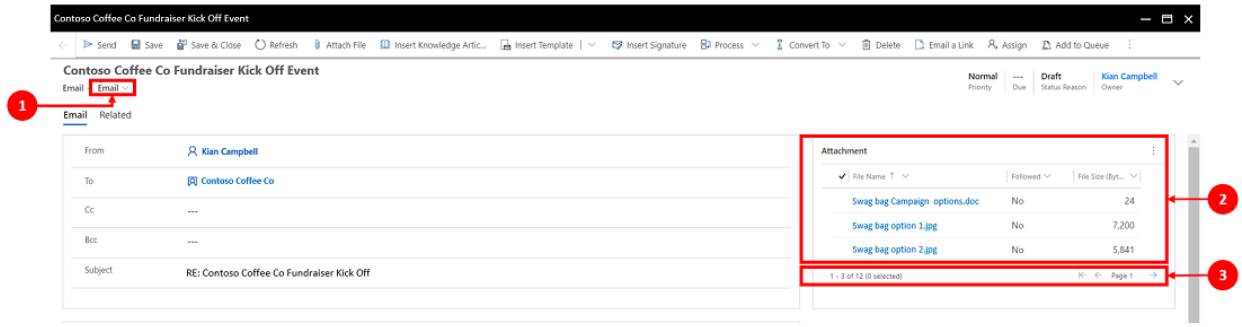
Enhanced email is the default email form, however you can switch forms by doing the following:



1. Under the email subject name, select on the caret (v) next to **Email**
2. A drop-down appears with a list of email form options you can choose from.

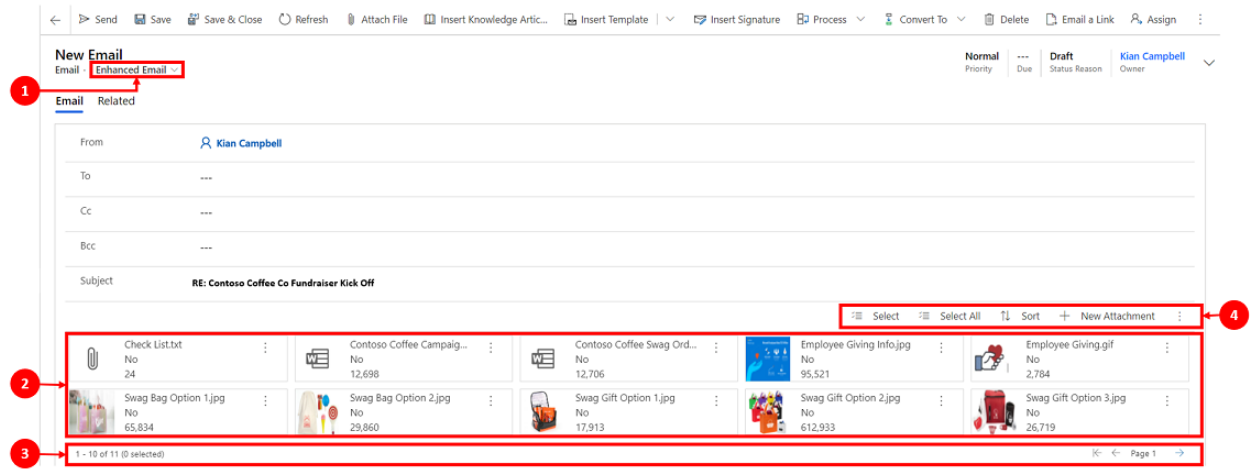
File attachments display differently, depending on the email form you're working in. You can switch email forms without losing information.

Email form file attachment



1. **Email**. This display confirms which email form you're working in.
2. **Attachment**. This section displays a list of file attachments in a vertical view and only displays the first three attachments.
3. **File count**. This displays when you have more files than what can be viewed and allows you to see the total number of attached files on the left side under the last attachment with the option to page over to see more files.

Enhanced email form file attachment



1. **Enhanced Email**. This display confirms you're working in the **Enhanced email** form.
2. **Attached files**. This section displays all your email attachments in a tile view above your message horizontally. The defaulted setting for the maximum number of files that can display is five attachments before displaying the page forward functionality.
3. **File count**. This displays when you have files that occupy more than two rows and allows you to see the total number of attached files on the left side under the last attachment with the option to page over to see more files.
4. **Attachment Commands**. This allows you to use the select, select all, sort, delete, and download functionality when working with your file attachments.

Work with the attachment command bar

When you've attached one or more files to a message, you can manage them using the file attachment commands.

Select commands

Select commands allow you to select individual files or multiple files at once.

Legend

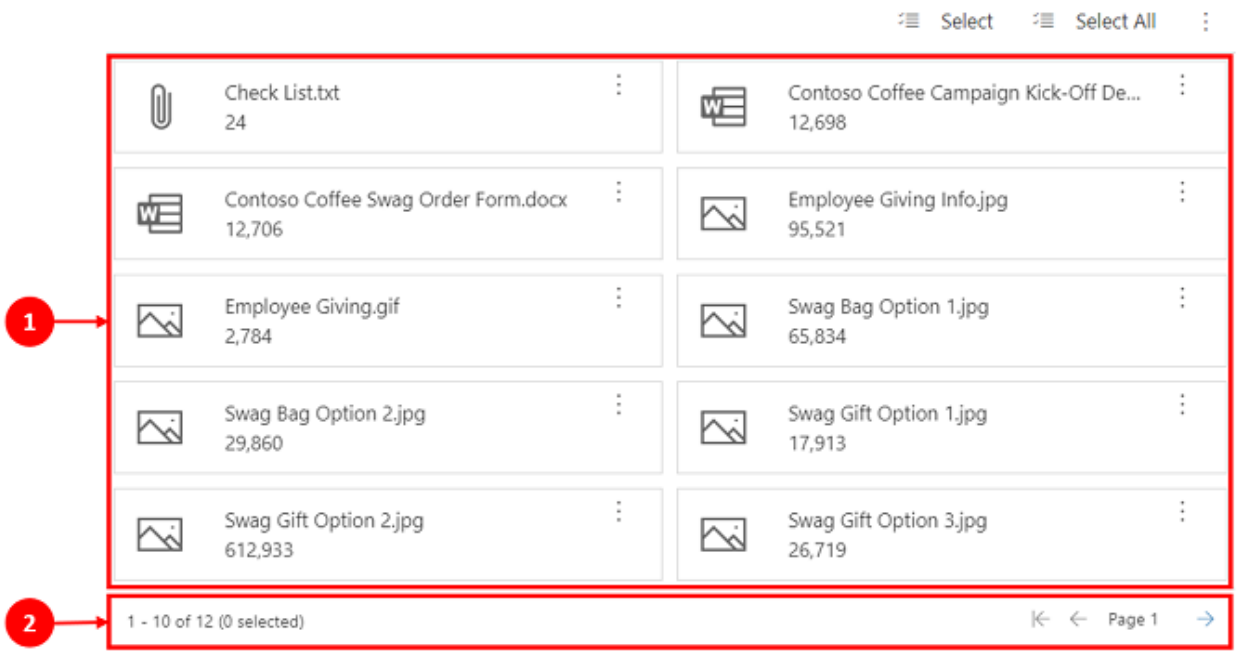
1. **Select All**. This command is located on the right, above your attached files and allows you to select all file attachments at once.

   > **Note**
   >
   > **Select All** only selects files that are visible. If you have multiple pages of file attachments, you will need to go to that page and select those files independently.

2. **Tile Color Transparency**. The background color of selected file attachments changes to light grey to identify which files have been selected.

3. **Check box** You can also verify which files have been selected by viewing whether the checkbox in the top-right corner of the file attachment is selected.

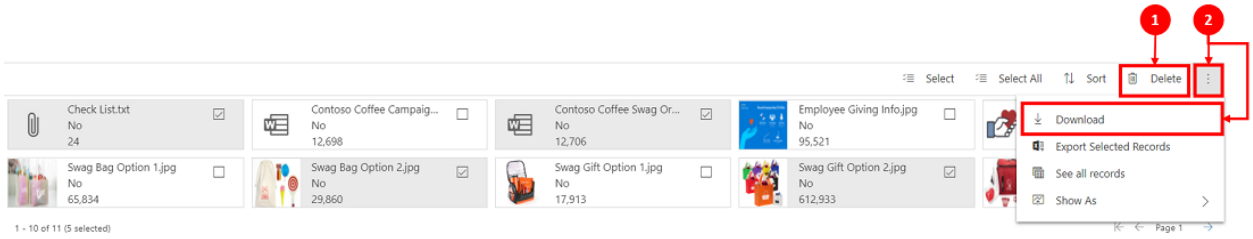
Formatting of file attachments in email can be realigned based on the device being used and format it's being worked in.



1. **Format Display** Regardless of format display, file attachments will only display the number of files that are enabled by your system administrator.
2. **Page view**. The page view displays the total number of email attachments and always is displayed under the file attachments.

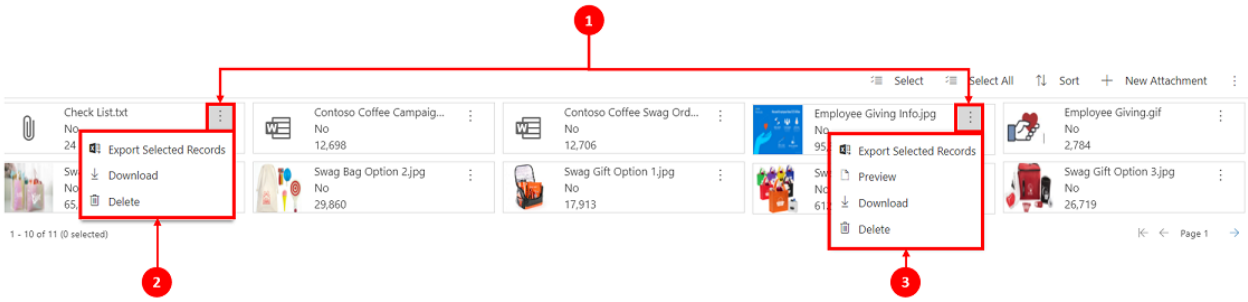
Delete and download commands

These are two of the most important commands when working with images.



1. **Delete**. This command works with the **Select** commands. You must first select a file before you can delete it. A confirmation request appears, requiring you to confirm you want to delete the file(s) you've selected.
2. **Download**. This command also works with the **Select** commands and your browser download settings, allowing you to download an individual file or multiple files at once.

Preview image attachments



1. **More options**. This command provides a list of actions for that file type.
2. **Non-preview image**. Only non-preview image types allow you to either **export selected records**, **download**, or **delete** the attached file.
3. **Preview image types**. Allow you to **export selected record**, **preview**, **download**, or **delete** the attached file. When you select the **preview** option, a pop-up window appears, displaying the image with the image name listed below.

Supported email file attachments

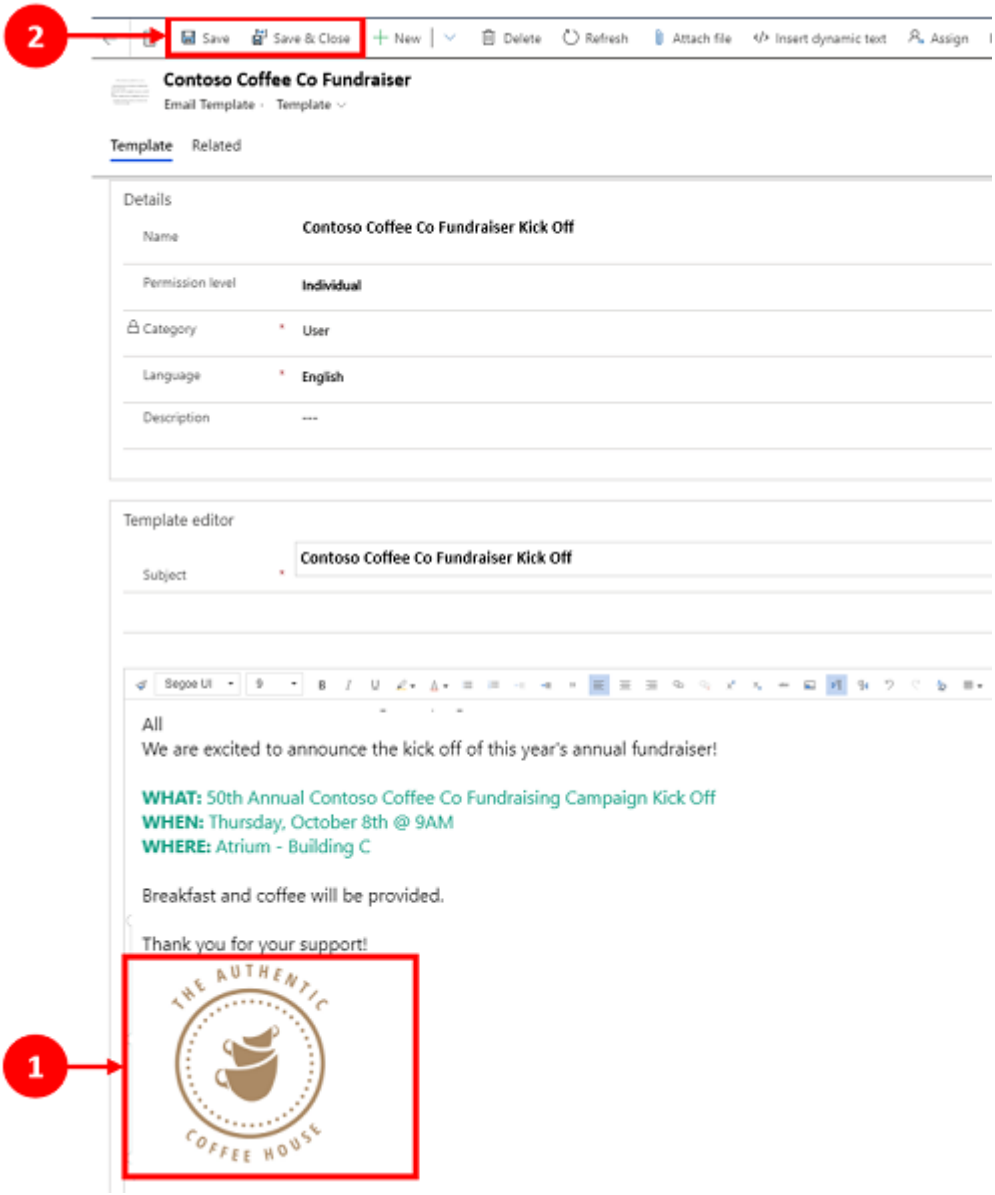
The following is a list of file image types that are supported:

image type	supports preview	supported inline (in editor)
BMP.bmp	Yes	Yes
GIF.gif	Yes	Yes
ICO.ico	Yes	Yes
JPG.jpg	Yes	Yes
PNG.png	Yes	Yes
SVG.svg	Yes	Yes
PDF.pdf	Yes (preview not supported on IE)	No

View and insert images in email

The use of visual aids helps users convey a tremendous amount of information with just a glance. Having the ability to view and insert inline images in email using the drag-and-drop or copy-and-paste functionality is a powerful tool for users. Additionally, you can browse to a file or reference an online URL using the image toolbar button.

You can drag-and-drop or copy-and-paste images into the email.



1. **Email images** You can adjust the image size.

2. **Save**. When you complete your edits, select **Save** or **Save & Close**.

> **Note**
>
> There's a 1 MB file size limitation when adding an inline image to an email for email templates. (For new or replied emails, there isn't a limit to the email size (it becomes part of the total email size).

Use the rich text editor toolbar in email

Article • 10/03/2022

The rich text editor toolbar provides features and functionality that allows you to work with rich text formats in emails to better communicate with your customers.

Formatting options

The following table describes the different formatting features and functionality options available in the rich text editor that you can use in the email form.

> **Note**
>
> You can access your browser's context menu by pressing **Ctrl** + right-click. This is useful if you need to use your browser's built-in spell checker. Otherwise, you can use the right-click to provide contextual formatting for any element you might be using.

Icon	Name	Shortcut key	Description
	Format Painter	Ctrl+Shift+C, Ctrl+Shift+V	Apply the look of a particular section to another section.
	Font	Ctrl+Shift+F	Select your desired font. The default font is Segoe UI. **Note**: When you select any formatted content, the font name for that content displays. If your selection contains multiple fonts, the topmost font name of your selection is displayed.
	Font size	Ctrl+Shift+P	Change the size of your text. The default size is 9. **Note**: When you select any formatted content, the font size for that content displays. If your selection contains multiple font sizes, the topmost font name of your selection is displayed.
	Bold	Ctrl+B	Make your text bold.
	Italic	Ctrl+I	Italicize your text.
	Underline	Ctrl+U	Underline your text.

Icon	Name	Shortcut key	Description
	Text Highlight Color		Make your text stand out by highlighting it in a bright color.
	Font Color		Change the color of your text.
	Bullets		Create a bulleted list.
	Numbering		Create a numbered list.
	Decrease Indent		Move your paragraph closer to the margin.
	Increase Indent		Move your paragraph farther away from the margin.
	Block Quote		Apply a block-level quotation format in your content.
	Align Left	Ctrl+L	Align your content with the left margin. (Commonly used for body text to make it easier to read.)
	Align Center	Ctrl+E	Center your content on the page. (Commonly used for a formal appearance.)
	Align Right	Ctrl+R	Center your content on the page. (Commonly used for a formal appearance.)
	Link		Create a link in your document for quick access to web pages and files. Pasted or typed URL text is converted into a link. For example, "http://myexample.com" will become "http://myexample.com ". In the **Link** dialog box, choose the type of link you'd like to insert. The **Link Info** tab allows you to choose the link type as well as set the link protocol and URL. The **Target** tab is only available for the URL link type. It specifies the location where the link will open after you select it.
	Unlink		Delete a link in your email or document. When you place the cursor on a link, the **Unlink** button on the toolbar becomes active. Select the button to remove the link and make it plain text.

Icon	Name	Shortcut key	Description
	Superscript		Type very small letters just above the line of text.
	Subscript		Type very small letters just below the line of text.
	Strikethrough		Cross out text by drawing a line through it.
	Insert Image		You can insert an image by directly copying and pasting it inline in the editor, dragging and dropping it from your desktop or local folder directly into the editor, or by typing a URL. The following formats are supported: .PNG, .JPG., or .GIF. To insert an image inline in your article: 1. Drag and drop the image or copy and paste it directly into the article. 2. Drag any corner of the image to resize it. To insert an image using a URL or navigating to the local image: 1. Choose Insert Image. 2. In the **Image** property dialog, choose from the following options: • Select **Browse** to navigate to the image on your computer. • Or specify the web address of the image, and properties to define how the image will appear in the email or article. **Note:** ◦ If the image is located on the external server, use the full absolute path. ◦ If the image is located on a local server, you can use a relative path. ◦ If you want the image to be linked to a target, add a URL for the image. ◦ You can also specify if you want the targeted page to open in a new window, topmost window, same window, or parent window.
	Left to Right		Change the text to left-to-right for content such as a paragraph, header, table, or list. Commonly used for bi-directional language content. This is the default setting.

Icon	Name	Shortcut key	Description
	Right to Left		Change the text to right-to-left for content such as a paragraph, header, table, or list. Commonly used for bi-directional language content. The default setting is left-to-right.
	Undo Typing		Undo changes you made to the content.
	Redo Typing		Redo changes you made to the content.
	Clear All Formatting		Remove all formatting from a selection of text, leaving only the normal, unformatted text.
	Add a Table		Add a table to your content. After adding a table, you can do any of the following: • Resize table columns by clicking and dragging your mouse to resize to the columns to the desired width. • Select one or several cells within a table and apply specific formatting, add links to the selection, or cut, copy, or paste entire rows or columns. • Right-click to access the properties. This supports features such as cell type, width and height, word wrapping, alignment, merging and splitting cells horizontally and vertically, inserting or deleting rows and columns, row and column span, and cell and border color.
	User personalization		Select the default Font Name and Font Size. After they're added, the **Font** and **Font Size** reflect these values as default font and font size.
	Expand Toolbar		Displays when the toolbar is collapsed and not all options appear. Click to expand the toolbar and make all options visible.

> **Note**
>
> You can access your browser's context menu by pressing **Ctrl** + right-click. This is useful if you need to use your browser's built-in spell checker. Otherwise, you can use the right-click to provide contextual formatting for any element you might be using.

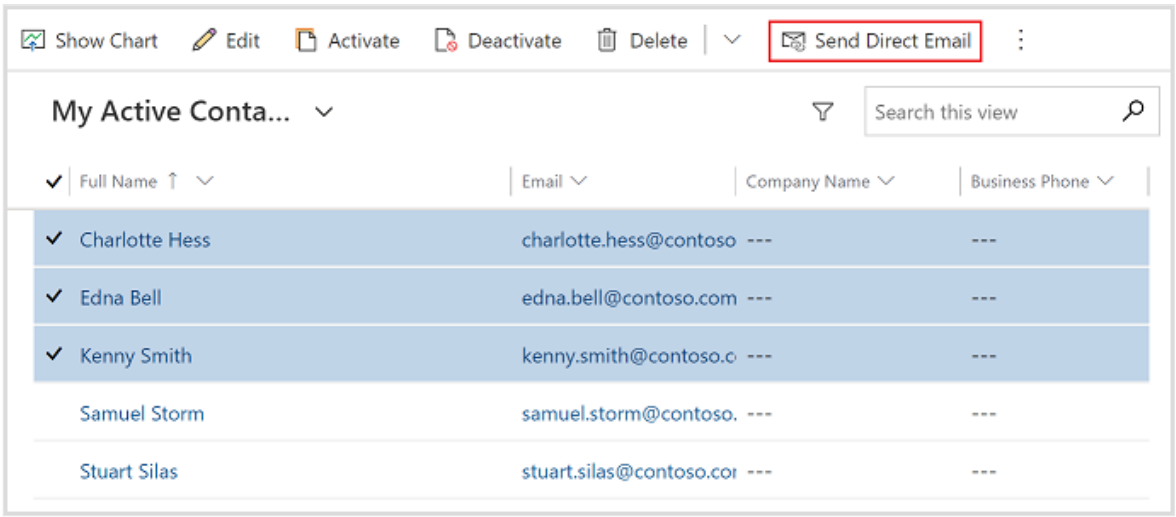
Send email to multiple recipients

Article • 02/15/2022

You can send an email to multiple recipients by using email templates. This is known as *direct* or *bulk* emailing. By default, the direct email feature is disabled. An administrator must enable the direct email feature by selecting **Yes** for **Enable Send Direct Email Action in Unified Interface for Send Email enabled tables** on the **Email** tab in the **System Settings** dialog box. More information: System Settings Email tab

To send email to multiple recipients

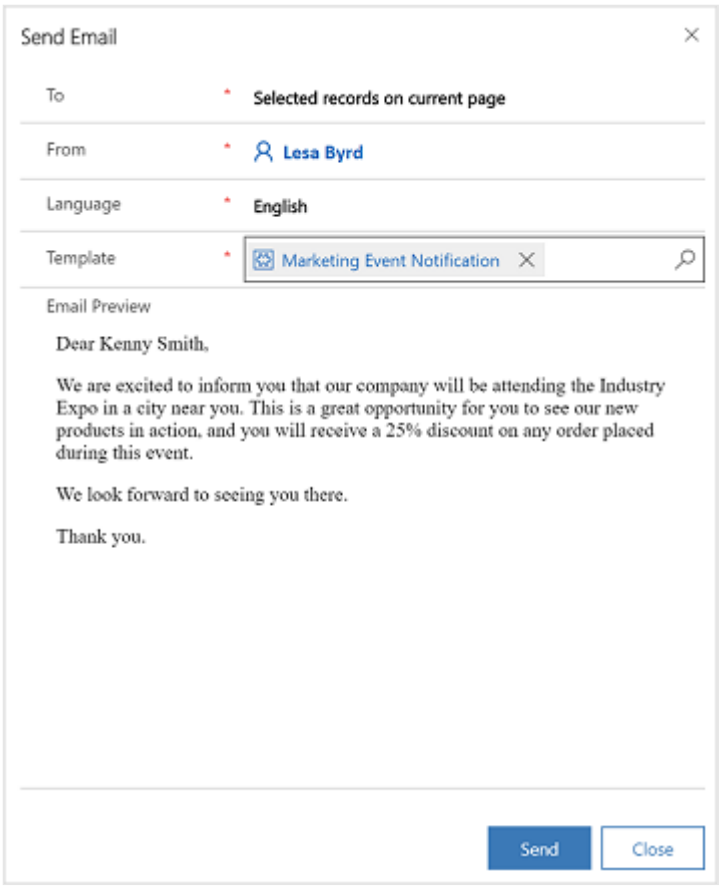
1. In the site map for the model-driven app, select a table to which you want to send email. For example, **Contacts**.
2. In the list of rows, select the contacts you want to send an email to.
3. On the command bar, select **Send Direct Email**.



4. In the **Send Email** pane, select an email template from the **Template** list.

> **Note**
>
> - If you have multiple rows that span multiple pages, you can select one of following options from the **To** list:
>   - **All rows on current page**: Sends the email to all rows displayed on the current page.
>   - **All rows on all pages**: Sends the email to all the stored rows.
> - If a few rows don't have an email address or they have an invalid email address, those rows will be skipped from sending the email.

5. Select **Send**.

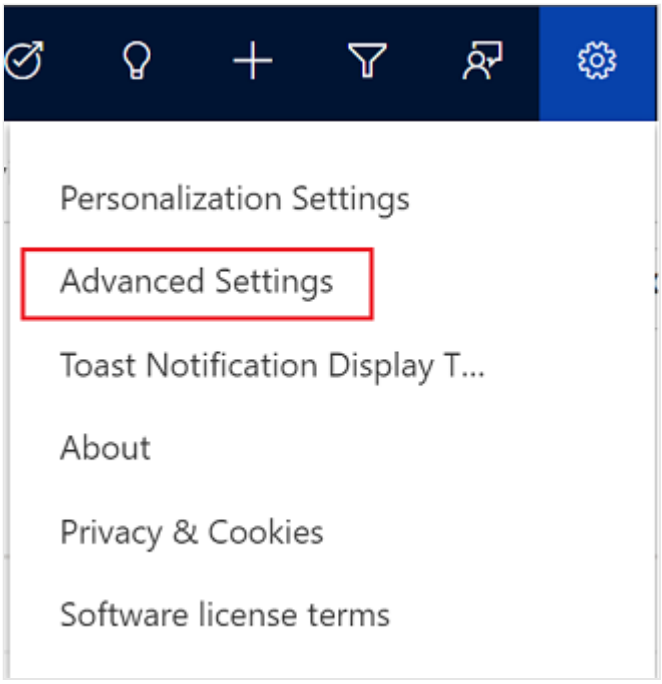


Check the status of bulk email action

You can check the status of bulk email action on the **System Jobs** page. You can see whether the bulk email job has failed or succeeded. If a job has failed, you can open the failed job to see its details.

To check the bulk email status

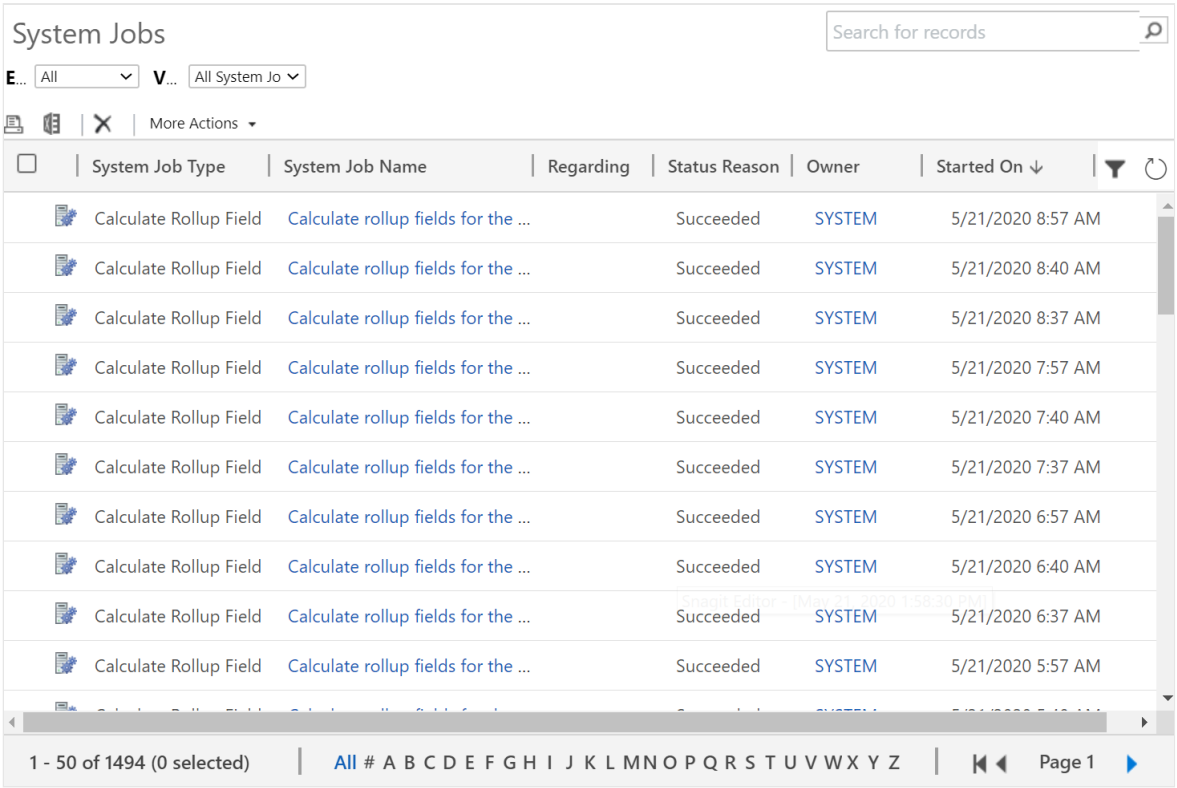
1. In your app, select the **Settings** icon, and then select **Advanced Settings**.



The **Business Management** page opens in a new browser tab.

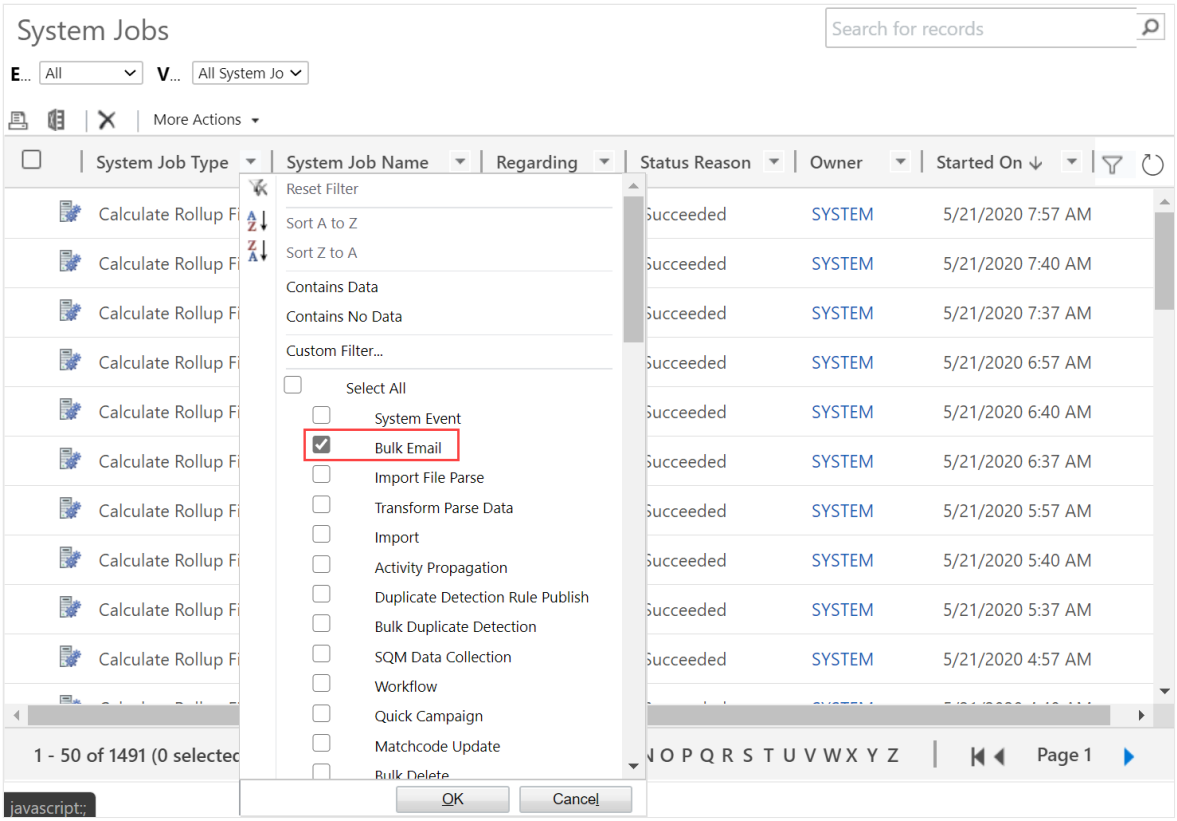
2. On the navigation bar, select **Settings**, and then under **System**, select **System Jobs**.

   A list of system jobs is displayed.

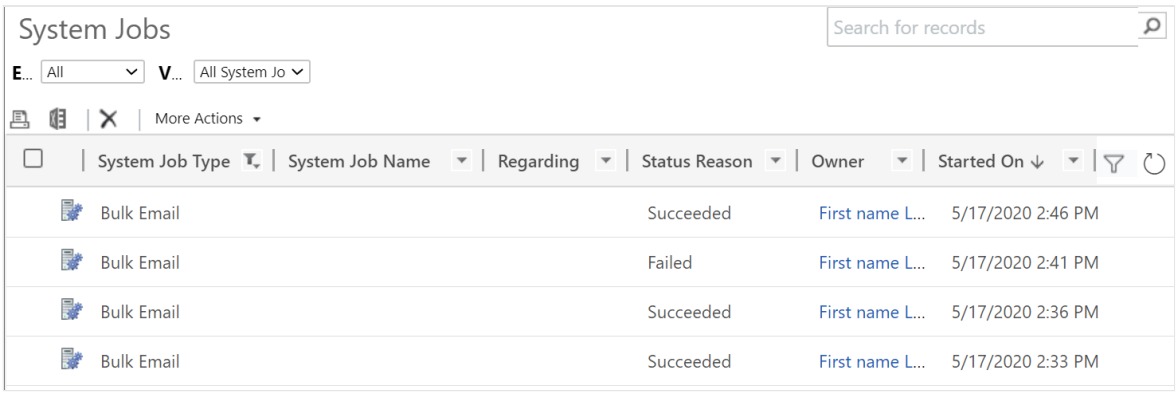


3. In the grid header, select **Filter** .

4. In the **System Job Type** column header, select the down arrow, select **Bulk Email**, and then select **OK**.



Bulk email jobs are displayed with their corresponding status.



5. Double-click the failed job to see its details.

System Settings Email tab

Resolve an unresolved email recipient

Article • 02/15/2022

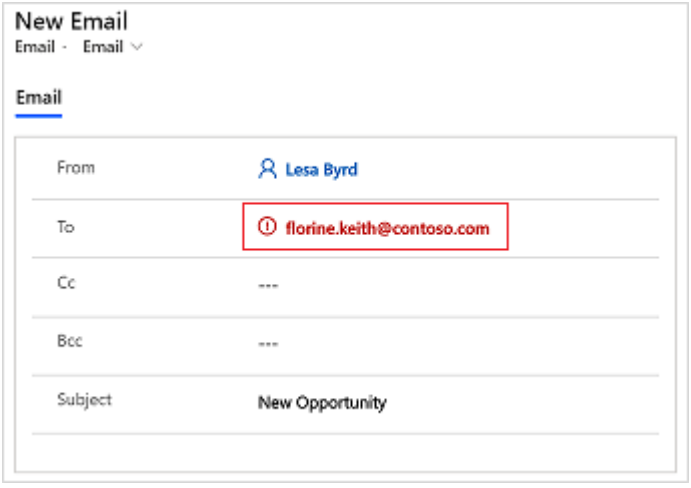
An *unresolved email recipient* is one whose email address isn't associated with any table rows in Microsoft Dataverse. By default, you can't send an email to an unresolved email recipient. If you enter an unresolved email recipient address, the email address is deleted as soon as you move the focus out of the **To**, **Cc**, or **Bcc** column. An administrator must enable the unresolved email recipient feature by selecting **Yes** for **Allow messages with unresolved email recipients to be sent** on the **Email** tab in the **System Settings** dialog box. More information: System Settings Email tab

After the feature is enabled, you can add an unresolved email recipient in the **To**, **Cc**, or **Bcc** column. The entered email address is shown in red. You can then select the email address and associate it with a table row in Dataverse without navigating away from the email form.

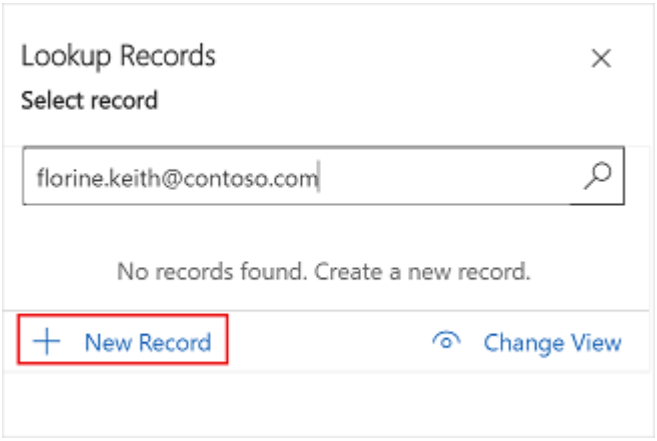
If you receive an email that has email addresses that aren't associated with a table row, the email addresses are shown in red. You can then individually select the email addresses and associate them with a table row. You can then send emails to the newly added email addresses.

To resolve an unresolved email recipient

1. Open the email editor and select the unresolved email recipient.

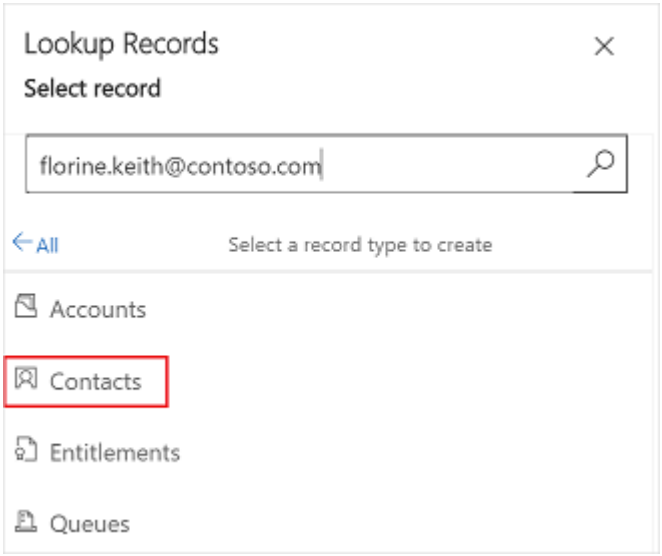


2. In the **Lookup Rows** pane, select **New Row**.

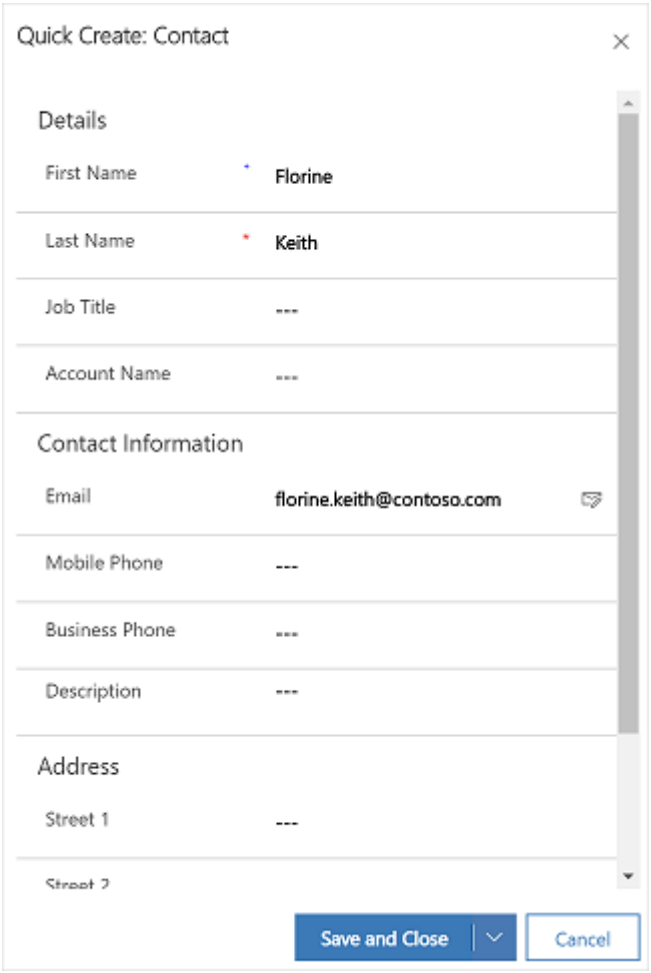


> **Note**
>
> If rows are displayed in search results, you can resolve the email to one of the existing rows.

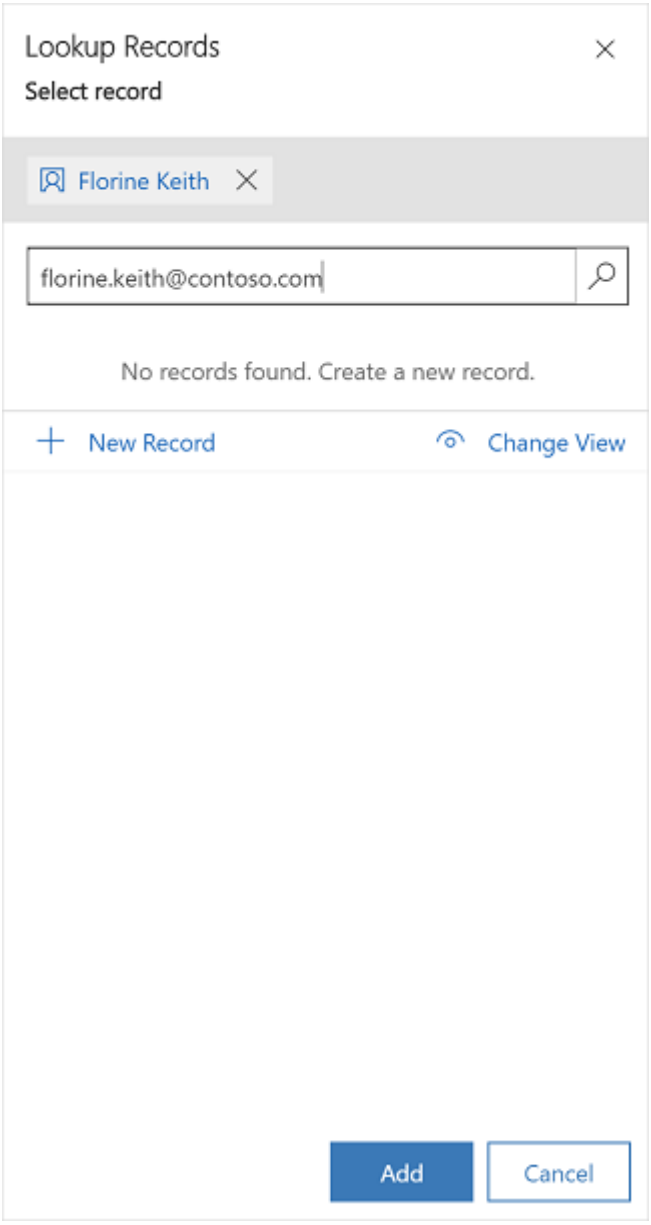
3. Select the row type to create. For example, **Contacts**.



4. In the **Quick Create: Contact** pane, enter the required details, and select **Save and Close**.



5. The contact is created and selected in the **Lookup Rows** pane. Select **Add**.



6. The unresolved email recipient is resolved and shown in the **To** column in the email editor.

Allow unresolved email recipients

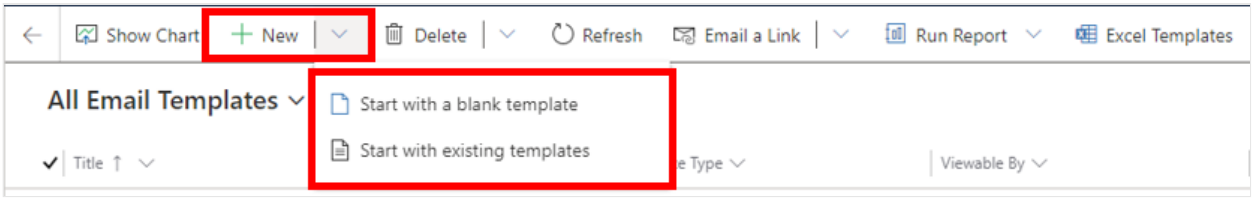
Create email templates

Article • 04/01/2023

Email templates are a fast and easy way to send consistent, professional, preformatted email messages to your customers. To create email templates, the legacy email template editor is available by default. However, the enhanced email template editor is displayed as a choice if it is enabled by your administrator.

You can create email templates by using one of the following options:

- **Start with a blank template**: Create a template from scratch. The editor that's displayed depends on wether the enhanced email template editor option is enabled.
- **Start with an existing template** : Create a template by choosing an existing template. The editor that's displayed depends on the editor in which the existing template was created.



Start with a blank template

When you start with a blank template, nothing is provided for you. You must add everything you want customers to see.

1. On the **Email Templates** command bar, select **New**, and then select **Start with a blank template**.

2. Enter the following details:

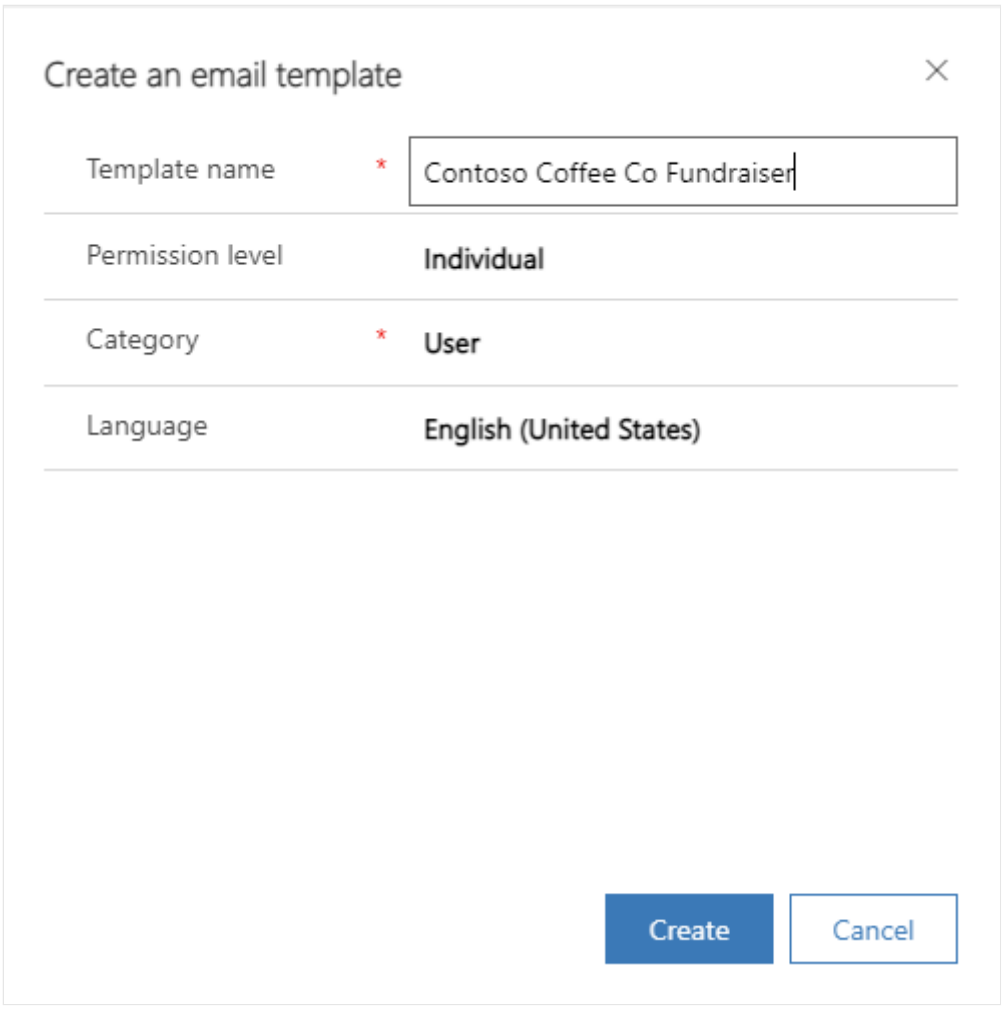
    - **Template name**: Give your email template a detailed name to help you identify it later.

    - **Permission level**: Select **Organization** to share your template with others or **Individual** for personal use.

    - **Category**: The default value is **User**. Categories determine which dynamic text fields are available for use in your template.

    - **Language**: Display installed language packs. **Language** also helps to categorize your templates.

- **Create**: Opens one of two editors where you can build your template.



3. Select **Create**. The template editor is displayed.

The editor page you see depends on whether your administrator has turned on the enhanced email template editor option:

- If yes, you'll use the enhanced email template editor page.
- If not, you'll use the email template editor page.

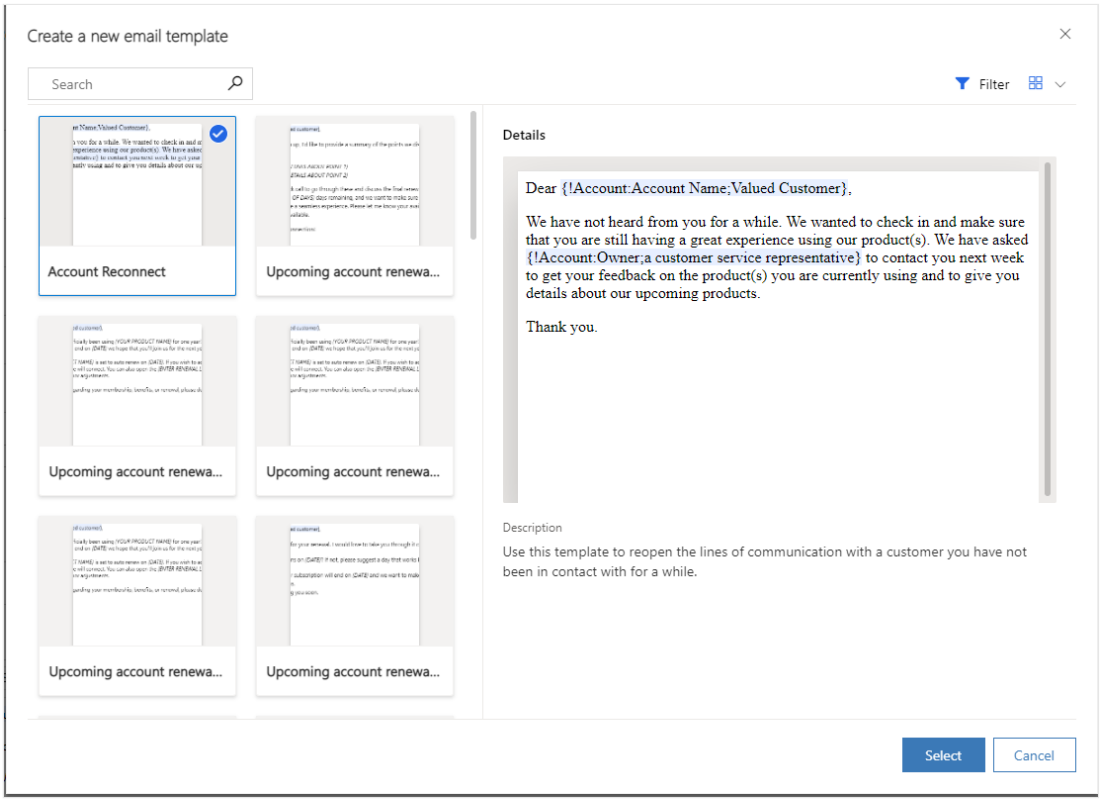
Start with existing templates

Start with an existing template to create an email template faster and with less effort. The template is pre-populated with data. All you need to do is customize it for your needs.

1. On the **Email Templates** command bar, select **New**, and then select **Start with existing templates**.

2. Enter the following details:

- **Search**: Search for the name of a template to start from. Search doesn't support regular expressions.
- **Browse** out-of-the-box templates, global and entity-specific, listed in alphabetical order. Global templates are shown as the type User. If you've created custom email templates, they're also listed.
- **Details**. Preview the templates so that you can pick the one that best meets your needs. You can modify it as needed later.



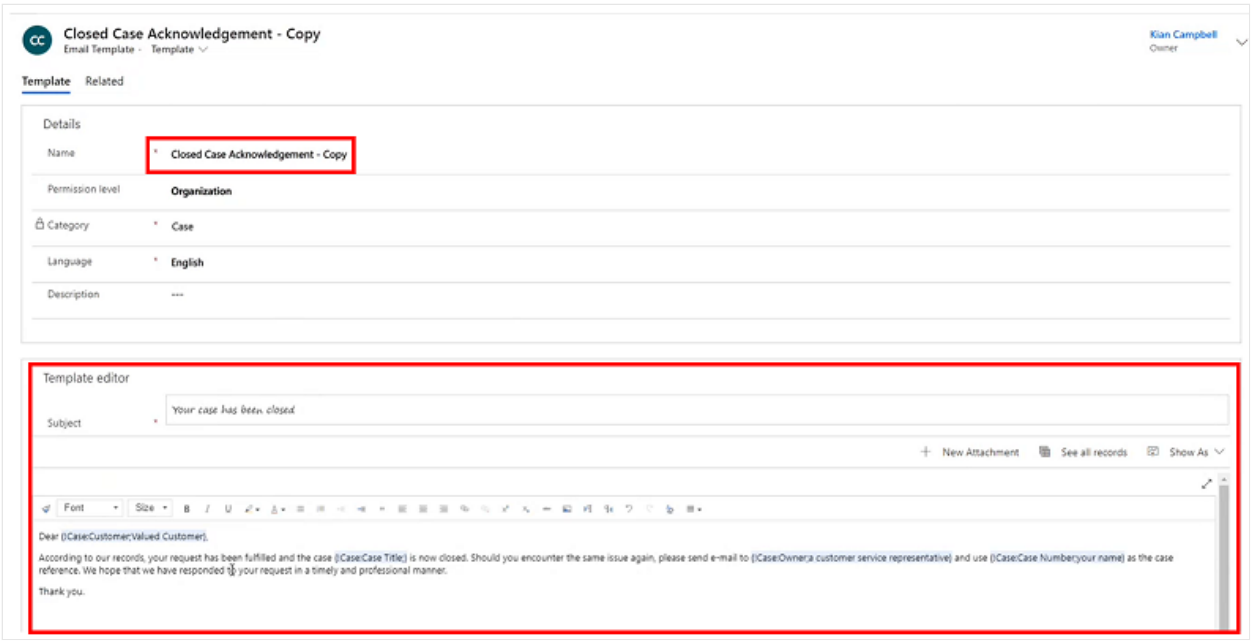
3. The template editor page is displayed.

When you create a template from an existing template, irrespective of the enhanced email template editor option setting, the app displays the newly-created email template in one of the following template editors:

- Enhanced email template: If the selected email template was created with the enhanced email template.
- Email template: If the selected template was created with the legacy email template.

> **ⓘ Important**
>
> If you create templates in the enhanced editing environment, don't edit them in the legacy web client. You'll lose any inline images and strip out some of the advanced formatting and functionality.

Work with existing templates



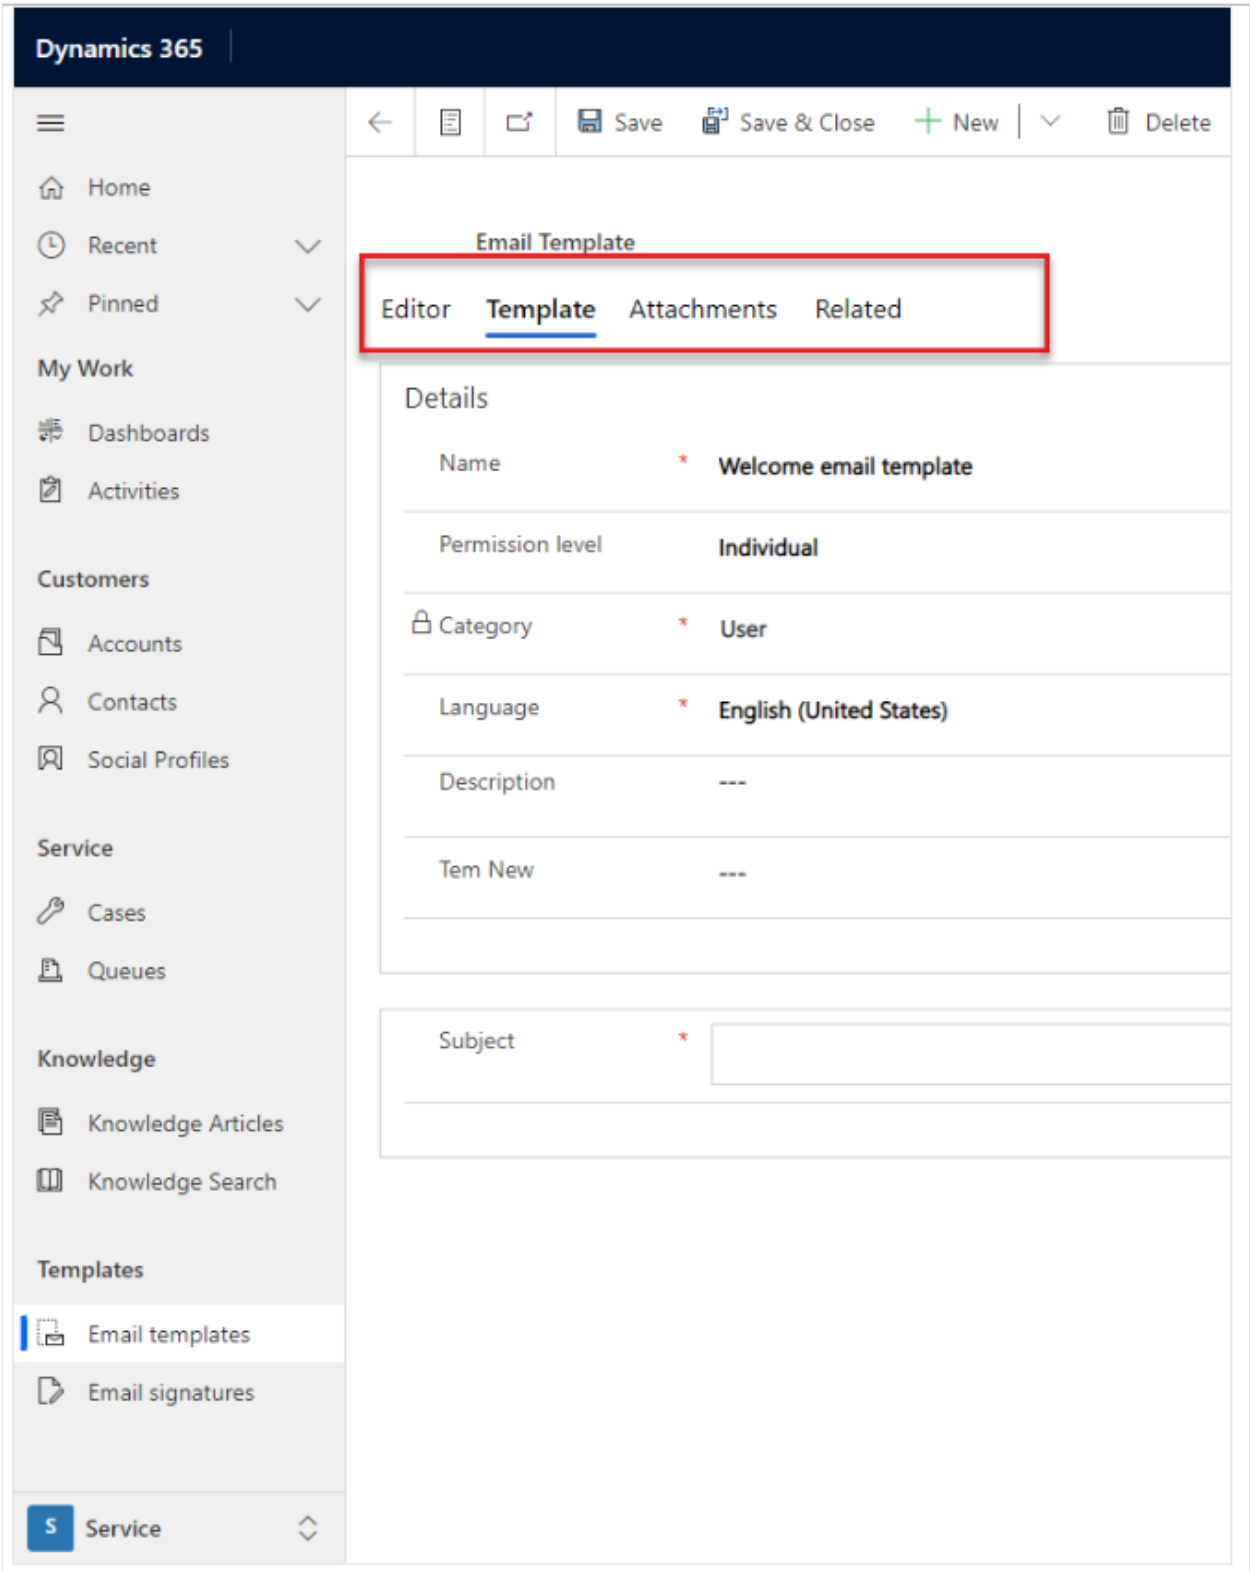
- **Template** tab: Specify or change the template details and the email subject. The name includes **– Copy** at the end to identify this template is a copy of another one.
- **Template editor** section: Design and customize the email template.
- Select **New Attachment** to add attachments to your template if needed.

Email template editor

You can use either the enhanced email template editor or the legacy email template editor to create email templates.

Enhanced email template editor

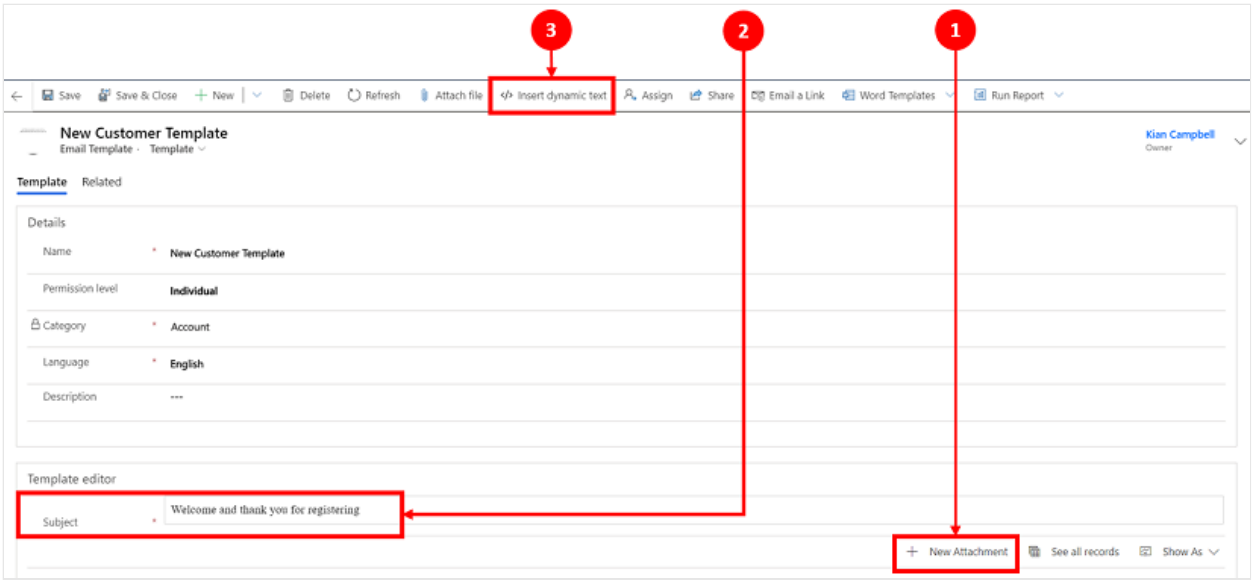
The enhanced email template editor is displayed if the enhanced email template editor option is enabled. However, for Customer Service workspace and Customer Service Hub apps, the enhanced email template editor is displayed by default. More information: Enhanced email template editor option



- **Editor** tab: Use this tab to design and customize your email template. See: Design and customize the email template.
- **Template** tab: Specify or change the template details and the email subject.
- **Attachments** tab: Add attachments to your template if needed.

Email template editor

The email template editor is displayed if the enhanced email template editor option is disabled.



1. **Insert dynamic text**: Use dynamic text in the subject and body of the email.
2. **Subject**: Enter or change the email subject.
3. **New Attachment**: Add one or more attachments to your template, if needed.

Insert an email template

Article • 04/05/2023

If you previously created an email template, you can easily use it as the basis for your email by inserting it into the email.

You can access the email template you created from the command bar by selecting **Insert Template**.

Insert an email template overview

After you select **Insert Template**, a window appears displaying a list of existing **Email templates** that are available to use.

> **Note**
>
> There is an intermediary window that might appear if:
>
> - You don't have either a Recipient or Regarding field for your email.
>
> >
>
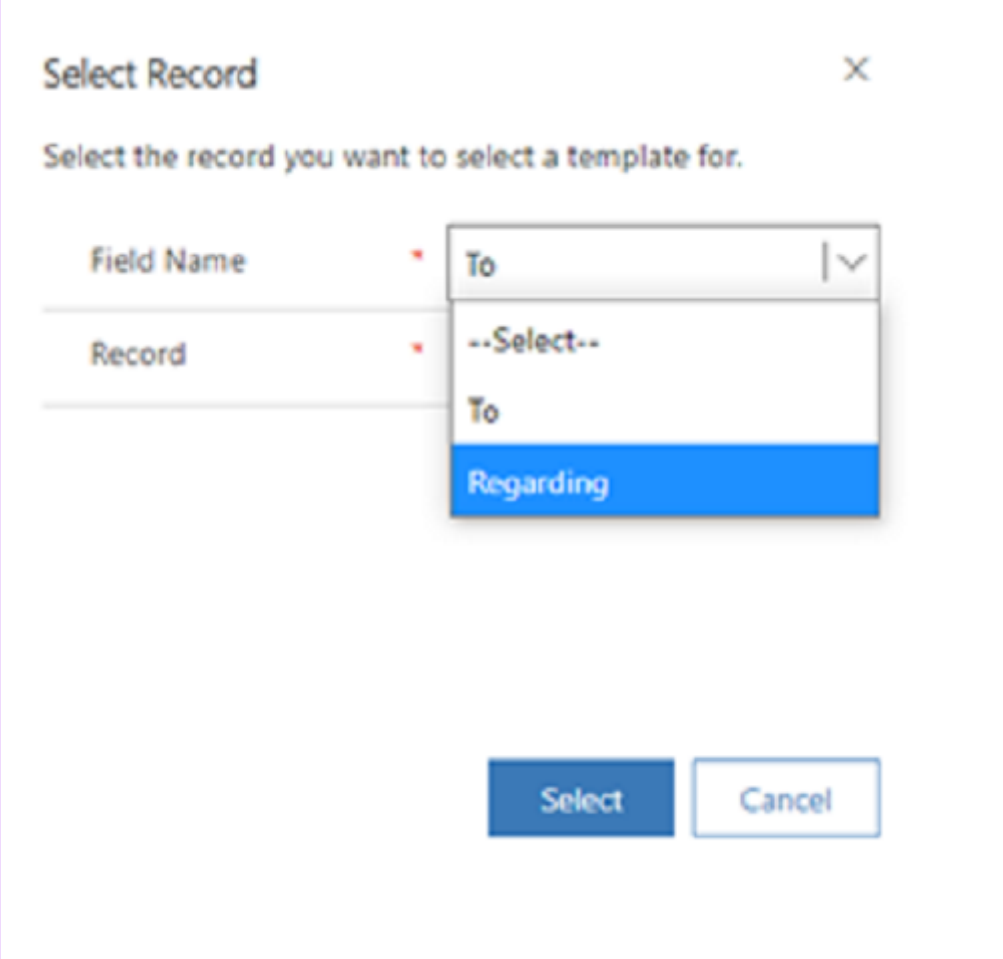
> - You have both a Recipient and Regarding field. You must select one.



This window doesn't appear if your administrator has set **Skip Select Record dialog** in **Advanced Settings** to **Yes**. The selection of one of these fields determines which template types are shown to a user in the template selection window:

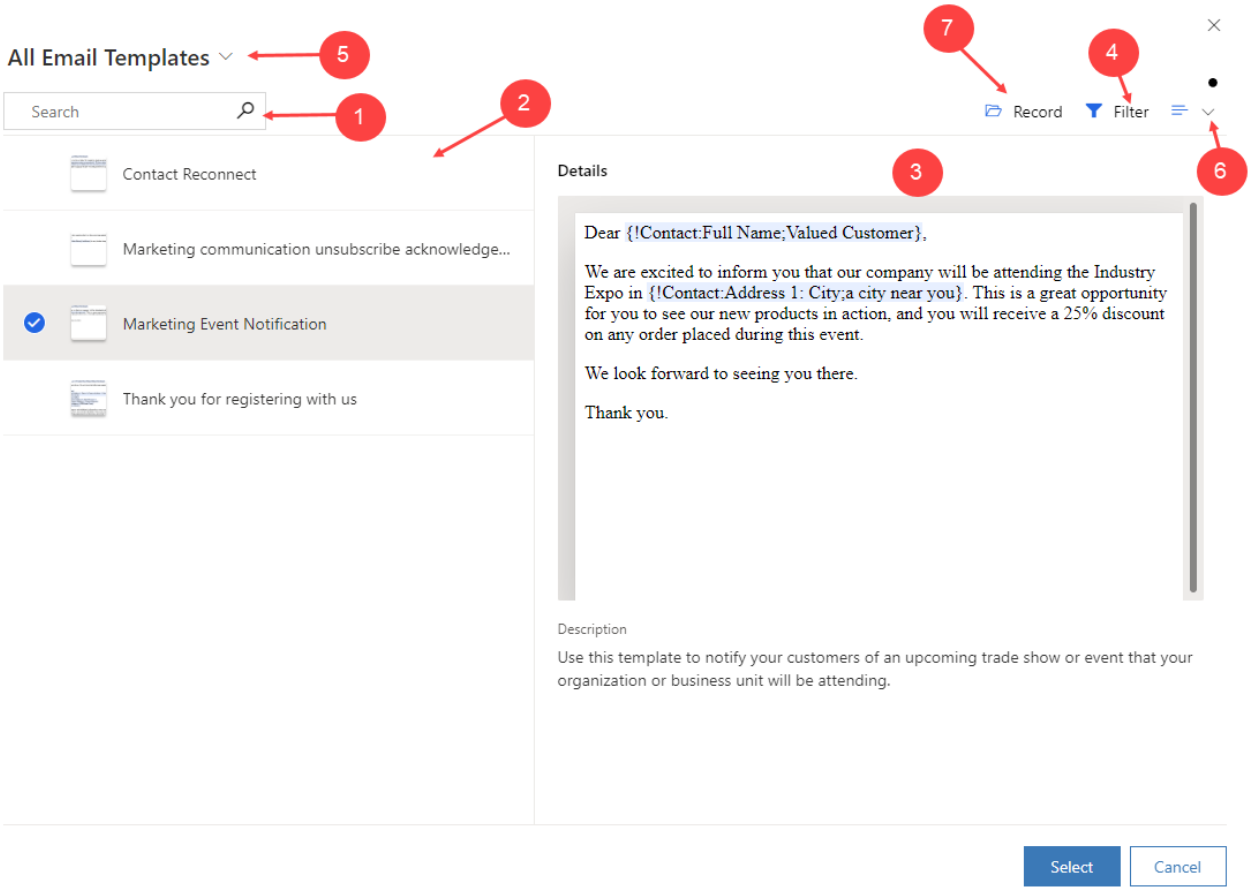
- Recipient (TO): user (global) and contact templates are displayed.
- Regarding: user (global) and templates for the regarding entity are shown.

Enhanced email template selection dialog

The application displays the enhanced email template selection window only if your admin has configured the enhanced insert template dialog option. You can perform the following actions in the enhanced email template selection window:

- Switch between email template views.
- Switch among list, tile, and grid views.
- Search for templates based on their title, subject, description, or content of the template.
- By default, you can filter templates based on standard and custom attributes, and language, if your Administrator has enabled **Language** in the **Template Gallery Filter Form**. See: Add the language filter in the email template selection view

- Additionally, if your administrator has set **Enable Email Template views** in **Advanced Settings** to **Yes**, you can filter templates based on the email template view filters.
- Zoom in to view templates on a full screen. The application provides an option to navigate between templates.



Legend

1. **Search**. Use search to find a template. You can search for templates based on name, subject, description, or content. Search doesn't support regular expressions.
2. **All templates**. Choose and browse from the templates displayed based on TO or Regarding, the filters applied, or a combination of both. You can change the view to display the templates in a grid, list, or tile view. Hover over the template tile to see the zoom option. Select the tile to open the template on a full screen.
3. **Preview**. When you select an email template, a preview of the template is displayed here. The preview shows you the content so you can pick the template that best meets your needs. After inserting an email template, you can modify the content as needed in the email editor.
4. **Filter**. You can filter templates based on standard or custom attributes.
5. **View**. Use the view to switch between email template views.
6. Use the dropdown list to switch between grid, tile, or list views. Based on your admin's settings, the application displays a specific view. More information: Customize the email.

7. **Record**. Specify the **Field Name** and **Record**. The template types shown to a user is based on what you've selected for these fields.

    - Recipient (TO): user (global) and contact templates are displayed.
    - Regarding: User (global) and templates for the regarding entity are shown. By default, **Field Name** is set to **Regarding**.

> ⓘ Note
>
> - You can see the **Record** tab and switch between email template views only if your administrator has enabled the **Enable Email Template views** and **Skip Select Record dialog**. More information: **Customize the enhanced email template selection view**
> - The enhanced email template selection view might vary based on the customizations your administrator has configured on the **Template Gallery Filter Form**, **Email Template Sorted View**, and **Template Gallery Properties Form**.
> - If you try to insert an email template on a device with a smaller screen size, you'll only see an option to search and select a template only.

Customize your email template selector filters

With the enhanced email template selector dialog, you can switch between multiple email template views. The filters set for the email template views are available on the template selector, and lets you to view only the relevant email templates. You can modify the filters set for the view, but you can't save the modified filter conditions.

For example, you have a custom view, Agent email template view, with filters set to display only the templates that have "case" in the title.

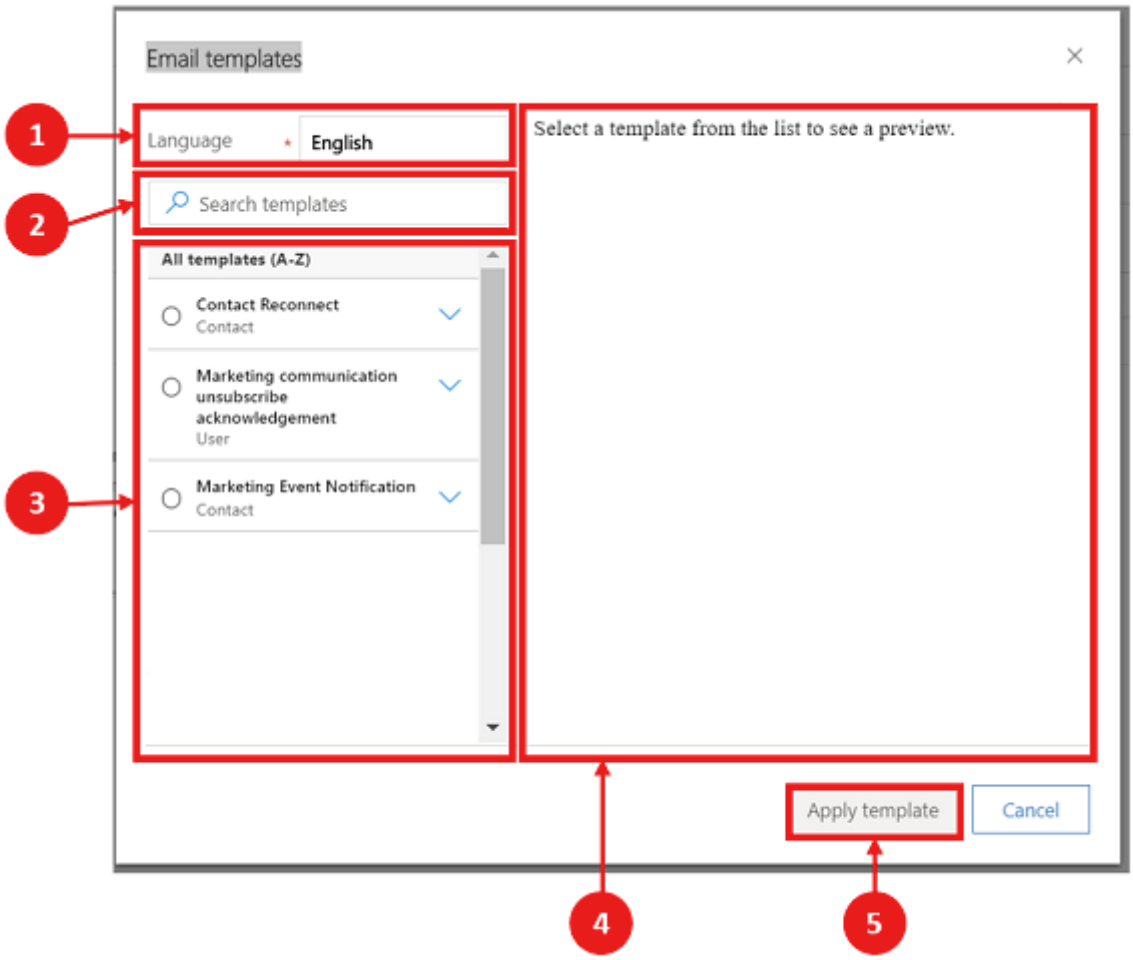
When you access the enhanced email template selector and choose Agent email template view, the application displays only the templates with "case" in the title.

> ⓘ Note
>
> The email templates that are displayed are filtered based on the specified email template view filters and record.

Email template selection dialog

You can perform the following actions on the email template selection window:

- Select a language.
- Search for templates by title.
- Modify the content for a selected template.



Legend

1. **Language**. Templates are loaded according to the selected language.
2. **Search**. Use search to find a template. Search doesn't support regular expressions and only works when using the name of that specific template.
3. **All templates**. All existing templates that have been created are displayed in this window, which you can browse and choose from.
4. **Preview**. When you select an email template, a preview of the template is displayed here. The preview shows you the content so you can pick the template that best meets your needs. After inserting an email template, you can modify the content as needed.
5. **Apply template** to insert the content to your email.

> ⓘ **Note**

If you try to insert an email template on a device with a smaller screen size, you'll only see an option to search and select a template.

Personalize emails with dynamic text

Article • 10/02/2022

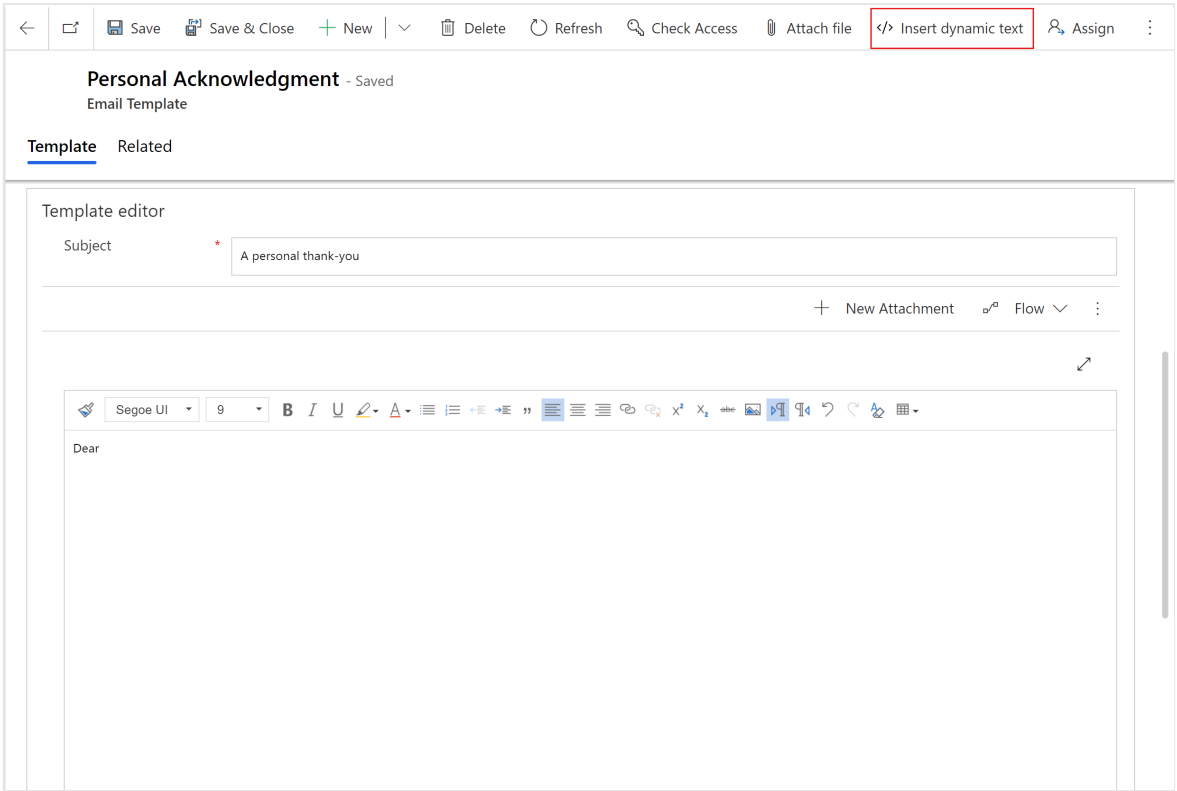
Generic greetings like "Dear customer" make customers less likely to engage with your emails. Personalize your outreach instead with dynamic text in your email templates.

Dynamic text replaces a placeholder entity with the value of the entity when you send the email. For example, your email template might contain "Dear {!User:First Name;}" but your customer sees “Dear Sal.”

Insert dynamic text

You can insert dynamic text in existing email templates or templates that you create.

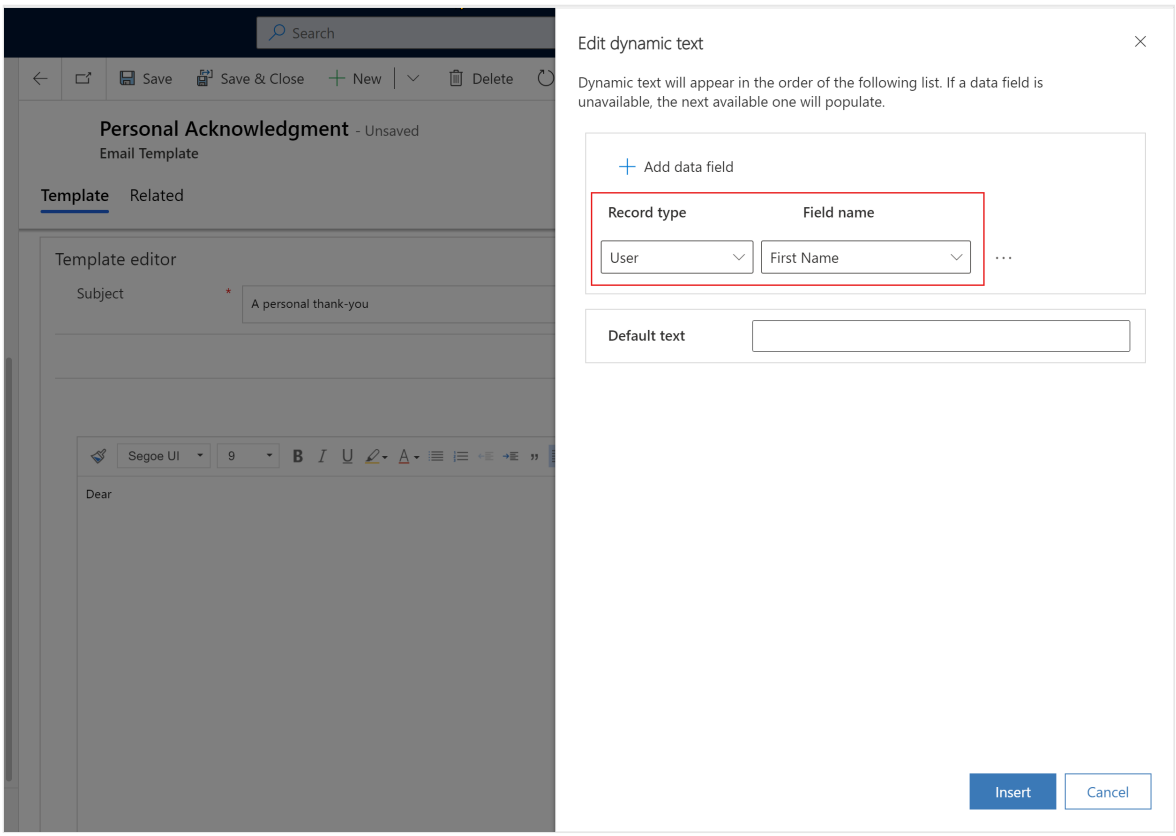
1. Select **Email Template** to edit an existing template or create a new email template.
2. On the template editor, place your cursor where you want the personalized content to appear.
3. Select **Insert dynamic text**.



4. Select the **Record type** and **Field name**.

   The category that you specified when you created the email template determines the record types you can choose. The record type you choose determines the fields

you can select.



Insert custom fields

You can insert fields from custom entities by typing them directly in your email template.

Use the following syntax:

Field Type	Syntax
• Single line of text • Currency • Multiple lines of text • Decimal number • Floating number	{!EntityLogicalName:FieldLogicalName;}
• Lookup • Multi-select option set • Option set	{!EntityLogicalName:FieldLogicalName/@name;}
Date	{!EntityLogicalName:FieldLogicalName/@date;}
Time	{!EntityLogicalName:FieldLogicalName/@time;}

For example, let's say you want to insert a custom field, *CustomerId*, that's linked to the record type *User*. Type the following placeholder in your template: `{{!User:CustomerId;}}`.

If you want to insert a custom field, *ModifiedOn*, that's linked to the record type *User*. Type the following placeholder in your template: `{{!User:ModifiedOn/@date;}}`.

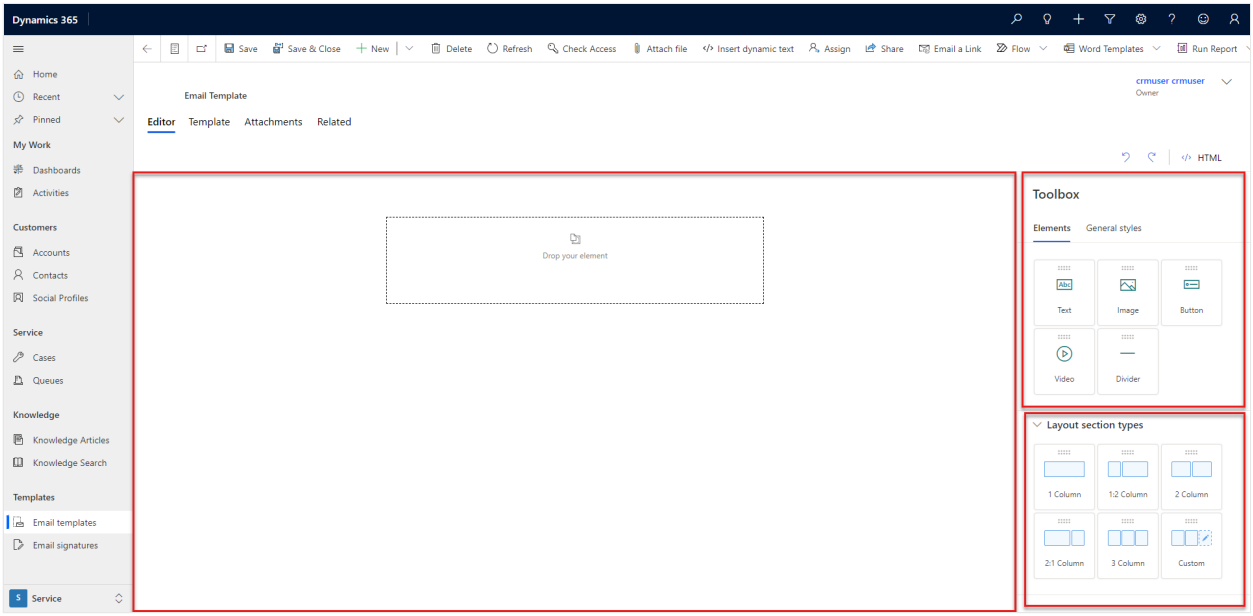
Customize an email template using the template editor

Article • 05/05/2023

Use the **Editor** tab in the **Email Template** form to create customized email templates. The **Editor** tab has three sections:

- Design canvas
- Toolbox
- Layout section types



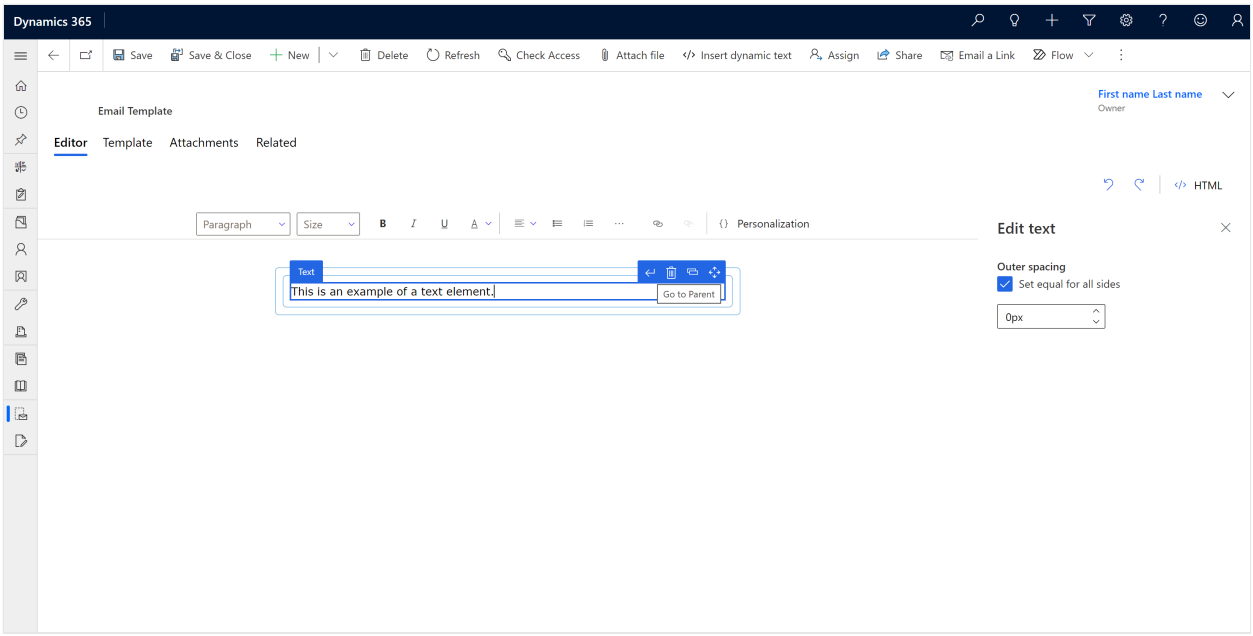
Manage an email template

On the design canvas, you can drag, arrange, enter, and delete content. By default, the canvas contains an empty one-column layout section.

You have a few different ways to add items to your template.

- Drag an element from the Toolbox to the canvas. The blue shade indicates that the element is in a suitable location and may be dropped.
- Select an element in the **Toolbox** or the **Layout section types**. An **add** icon appears on the canvas. Select the icon to add the element.

You can select **Go to the parent** to identify the section or column in which the element is embedded.



Select **HTML** to personalize your email template. We recommend the following guidelines:

- Ensure that you don't delete the existing meta tags.
- You can add CSS inside the style tags and HTML content inside the body tags.

Add a layout section to the template

Drag a layout section from the **Layout section types** box to the canvas.

To modify a layout, select it, and then select **Edit layout**. You can change a layout's spacing, style, background color, and image. You can also change the number of columns in the layout and the width of each column.

To change the appearance of a column, select it, and then select **Edit column**. You can change a column's spacing, style, background color, and image.

Add an element to the template

You can use the design elements in the **Elements** tab in the Toolbox to customize your email template:

- **Text**: Add text content to your template. Replace the placeholder text with your content. Use the floating toolbar to insert dynamic text or format the content.

  > **Note**
  >
  > When you select the text element, the following capabilities of the rich text editor toolbar aren't supported:

- Personalization. Use the Insert dynamic text editor to personalize content.
- Insert image. Use the image element to add an image to column.
- Tracking for links
- Inserting tables
- Font style and size of the text isn't detected, if you paste formatted content from other sources.

- **Image**: Add an image to your template. Select the image placeholder, and then select **Edit Image** and upload an image or specify an image URL. You can also modify the image's size and alignment.
- **Button**: Add a button to your template. Select the button, and then select **Edit Button** and enter the URL to open when the user selects the button. You can also change the label, label font, color, and appearance of the button.
- **Divider**: Divide the template into bordered sections. Select a divider, and then select **Edit Divider** and change the divider's appearance, color, width, alignment, and spacing.

Use the **General Styles** tab to change the layout's width, font, font size, background, and text color.

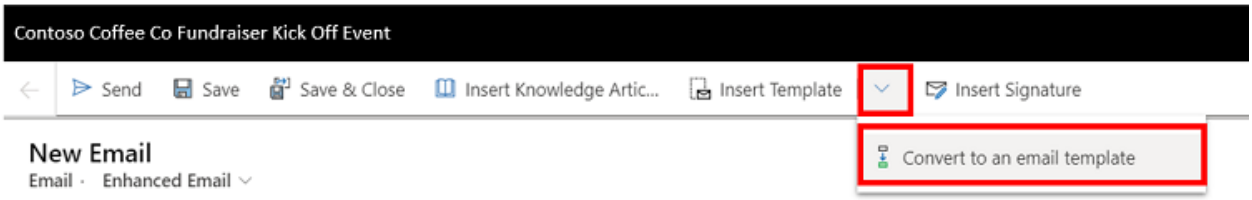
Convert an email to a template

Article • 04/29/2022

When you've composed an email that you'd like to reuse with other customers, you can convert it to an email template and save it for future use.

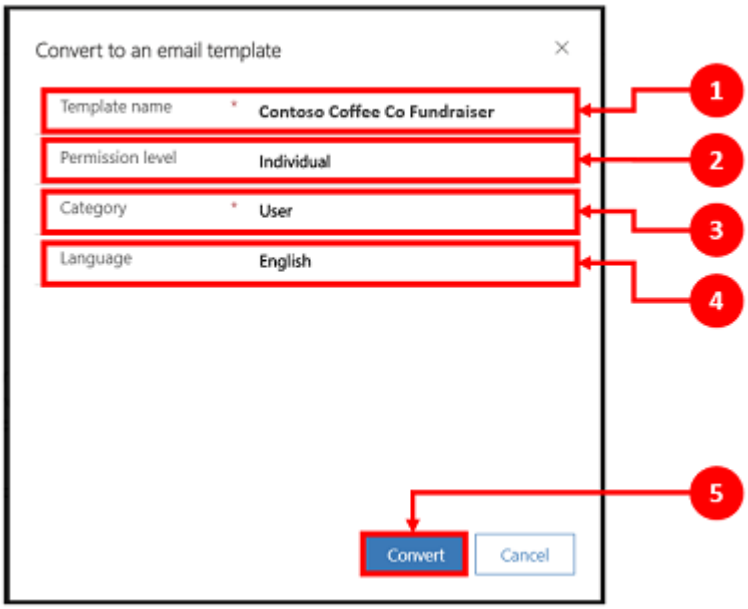
Convert an email into a template



To save an email you've composed and formatted an email message as a template, select the downward-facing caret (v) next to **Insert Template**, and then select **Convert to an email template** from the drop-down list.

Convert an email to a template overview

The following window will display with a list you can customize.



Legend

1. **Template name**. Assign your email template a detailed name you want to save for future use.
2. **Permission level**. You can share the template you create with your **Organization** or as **Individual** for personal use.

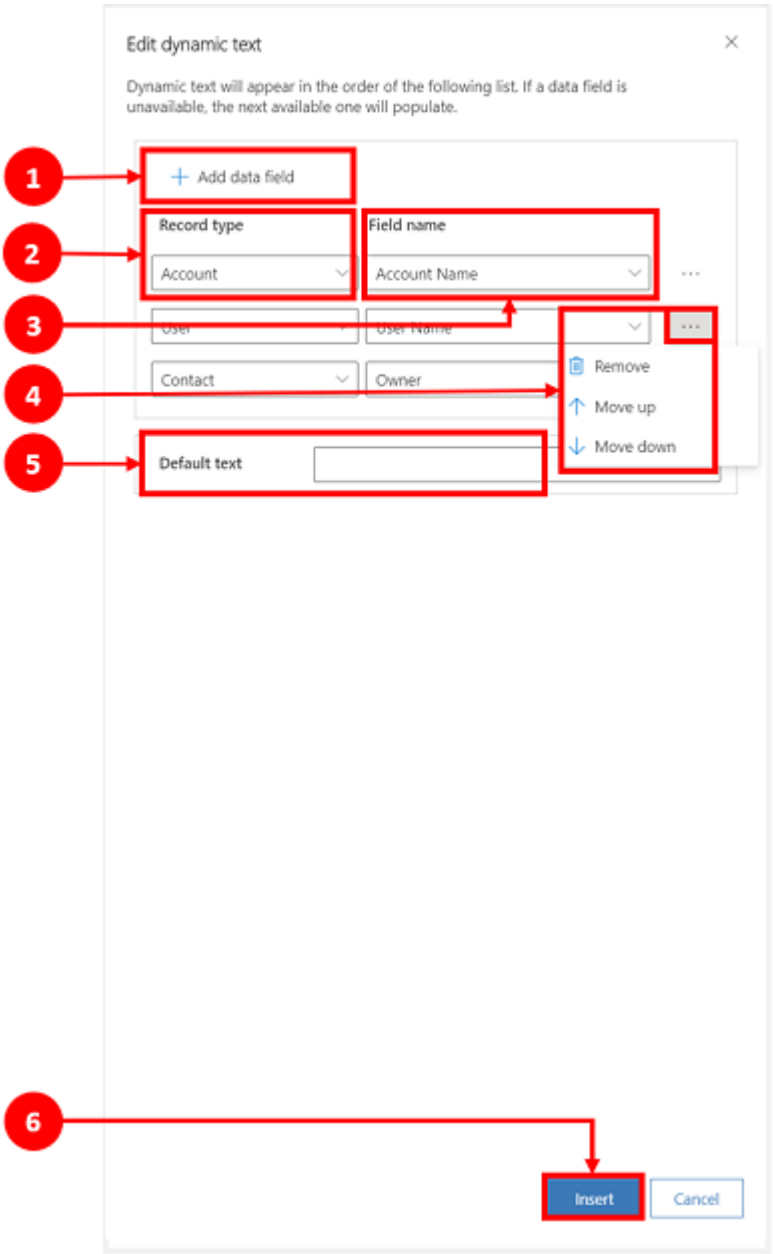
3. **Category**. The default for this field is set to **User**.
4. **Language**. You can display your installed language packs in this field. **Language** also helps to categorize your templates.
5. **Convert**. Once an email is formatted, you can convert it to an email template.

View an email template

To view a complete list of all the email templates you've created:

1. Go to the **Templates** section on the left-hand pane.
2. Select **Email templates** A list of **All Email Templates** is displayed, which you can edit and update.

Insert dynamic text in an email template form



Legend

1. **Add data fields**. When you add data fields, the template adds **Record type** and **Field name** fields below. You can add as many data fields you want.
2. **Record type**. You can then customize the record types. Default is set to account.
3. **Field name**. You can customize the field names. Default is set to account name.
4. **More Commands**. The **More commands** icon allows you to edit the order of the record types using the **Move Up** or **Move down** functionality to align records in a customized order.
5. **Default text**. Allows you to select the style of text for the subject and body of your email template. If no text is selected, it will display using the default text.
6. **Insert**. When done this command inserts and saves your form.

> ⓘ **Note**
>
> If you click in an area on the form that does not support dynamic text, it displays **Unable to insert**.

For more information on creating email templates and configurations, see Create templates for email.

Create a signature for emails

Article • 04/10/2023

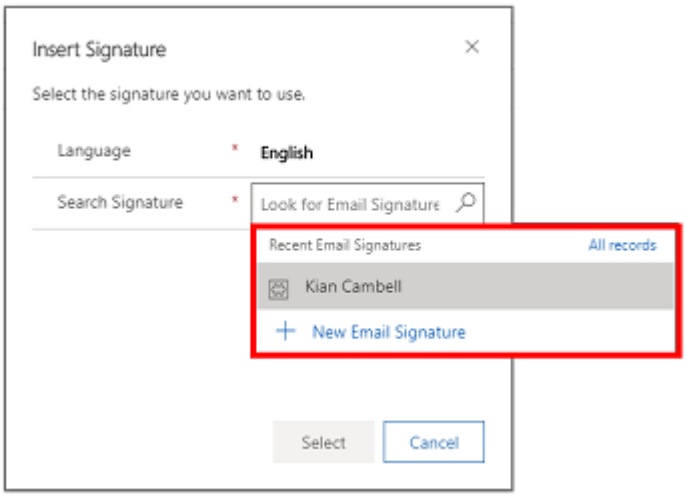
Email signatures are an important and valuable tool for users. Email signatures are like electronic business cards you include when you send an email, and can promote professional branding for your company.

Add text to an email signature

Adding an email signature is easy and can be done at any point while you are composing an email. You can either add an email signature with static or dynamic text. Dynamic placeholders are used to define dynamic text. The placeholders are replaced with the corresponding values of the email's sender, specified in the **From** field.

Add an email signature

- On the command bar, select **Insert Signature**.
- From the drop-down list, select an existing signature or select **New Email Signature**.



Based on the email's sender specified in the **From** field, one of the following actions occur:

- If the sender is a user, the dynamic placeholders defined in the email signature template are replaced with the values corresponding to the user.
- If the sender is set to a queue and the queue's owner is a user, the dynamic placeholders defined in the email signature template are replaced with the values corresponding to the queue's owner.
- If the sender is set to a queue and the queue's owner is a team, the dynamic placeholders are replaced with the values corresponding to the team's

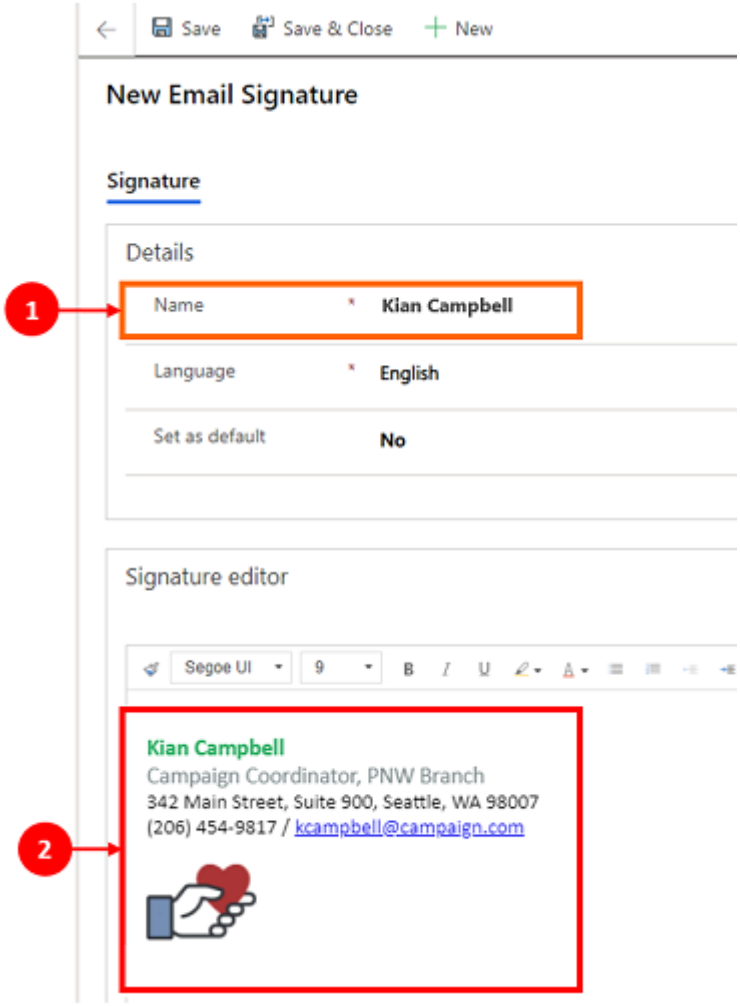
administrator.

Create an email signature

You can quickly create an email signature at any point while you are composing an email.

Create a new email signature

You can add a new email signature by:



1. **Details** in this section, enter the name of the email signature.
2. **Signature editor**. This allows you to create your email signature and **Save** when finished.

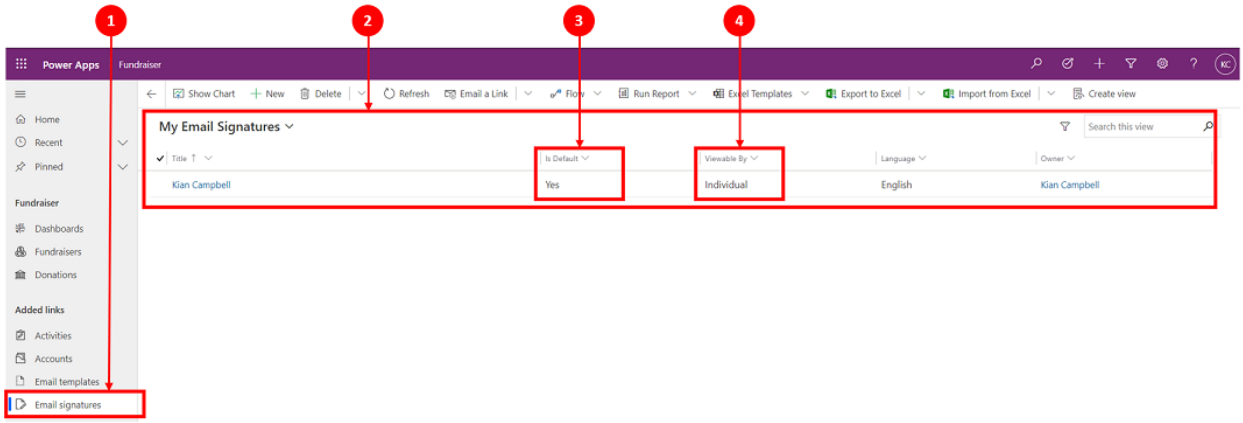
> ⓘ Note
>
> - You can include inline images, such as a business logo, in email signatures, as long as they are under 1 MB in size. However, the inline

image might not render properly if you open the email in the Outlook Desktop app.

- You can add only those fields as dynamic placeholders that are linked to the **Record type** user.
- Signatures can also be created and used for queues.

Manage email signature lists

You can view and manage email signatures you have created to make edits, change default, and who can view your signatures.

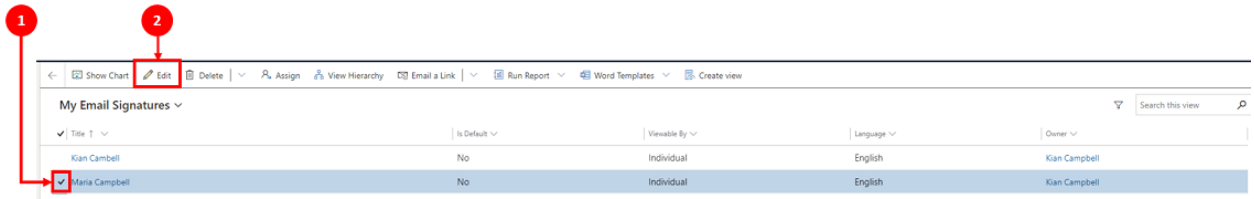


Legend

1. Under **Templates** select **Email signatures**.
2. **My Email Signatures** list displays, showing all your email signatures you can edit and update.
3. You can select a default signature for email. Only one signature per user can be set as **Is Default**.
4. Email signatures can only be **Viewable By** the individual user.

Change the default email signature setting

While you can create multiple email signatures depending on your needs, only one can be set as your default email.



To change your default email signature setting:

1. Select the email signature you want to set as default. This will change the command bar to display **Edit**.
2. Select **Edit**. A new page opens, where you can update the email default setting. While you are on this page, you can also delete one or multiple email signatures just by selecting them.

Email FAQs and known issues

Article • 02/15/2022

Find answers to common questions regarding the email experience features and functionality, configurations, and other key concepts.

Email content is lost after entering text in the body of the message

Issue: Recent content added to the email may get lost if you enter text in the body of an email and immediately select **Save**, **Save and Close**, or **Send**.

Resolution: To avoid this issue, wait a few seconds before you select **Save**, **Save and Close**, or **Send** after you enter text in the body of the email.

The From column is read only or lookup isn't working

Issue: The **From** column in an email form is read-only or you can't look up rows and filter results by **User** or **Queue**.

Resolution: This happens when customization specifically have been applied on this column by your system administrator. To fix the issue, open a browser window and run the following two commands replacing the **environment URL** with the URL of your environment.

- (replace with your environment URL)/api/data/v9.1/RemoveActiveCustomizations(SolutionComponentName='AttributeLookupValue',ComponentId=(25E9AF0C-2341-DB11-898A-0007E9E17EBD))
- (replace with your environment URL)/api/data/v9.1/RemoveActiveCustomizations(SolutionComponentName='AttributeLookupValue',ComponentId=(26E9AF0C-2341-DB11-898A-0007E9E17EBD))

To find the URL, in the address bar the first part of the URL that starts with **https://** and ends with **.com** is your environment URL. For more information on how to find the environment URL, see Get the environment UR.

I've enabled an email form but it doesn't display.

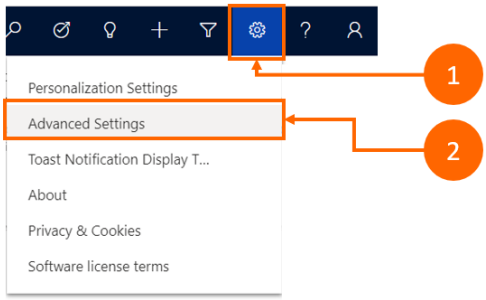
If you've enabled an email form but it is doesn't display, you'll need to enable it in the **App Designer** by doing the following:

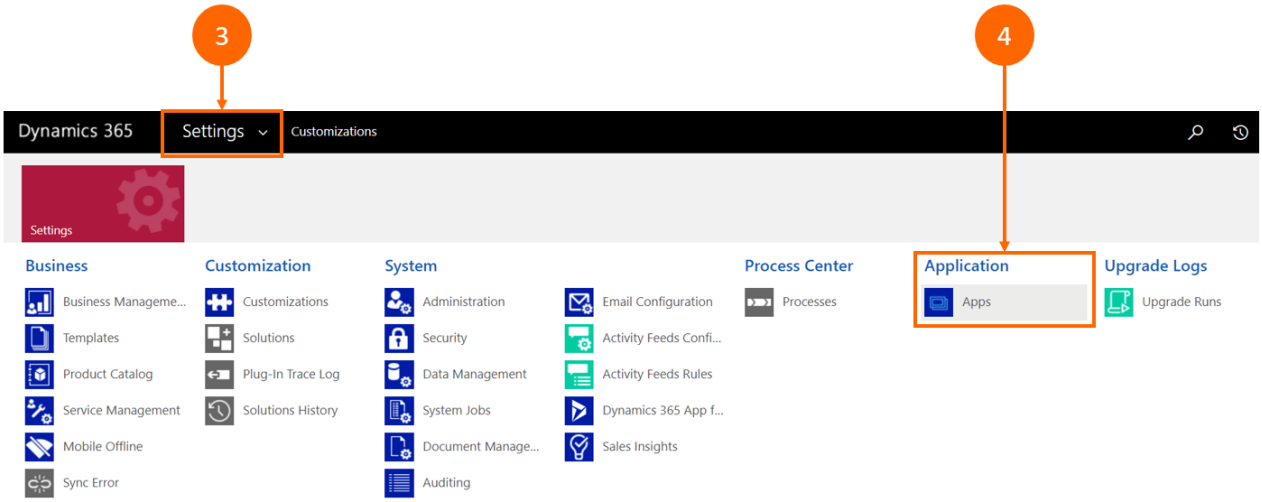
1. Go to **Settings** > **Advanced Settings**.
2. Select **Settings**.
3. In **Application** settings, select **Apps*.
4. Select ⋮ **More Options** on **Customer Service Hub**.
5. On the **App Designer** drop-down menu, select **Open**.
6. On the site map, select the edit feature.
7. Under the **Email** form selector, select the drop-down menu to display the **Email** forms you have enabled.

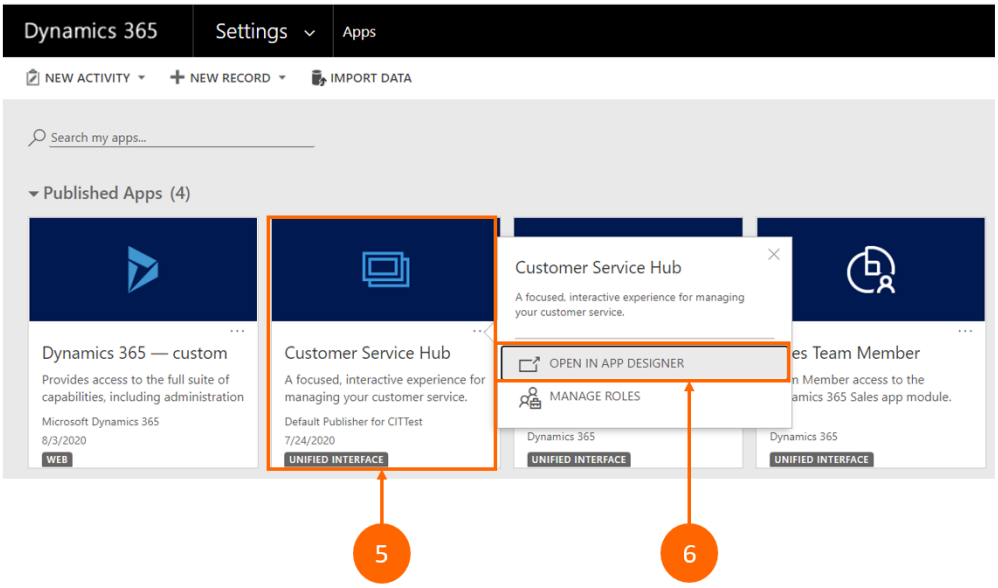
If the form isn't displayed in the list, it hasn't been enabled.

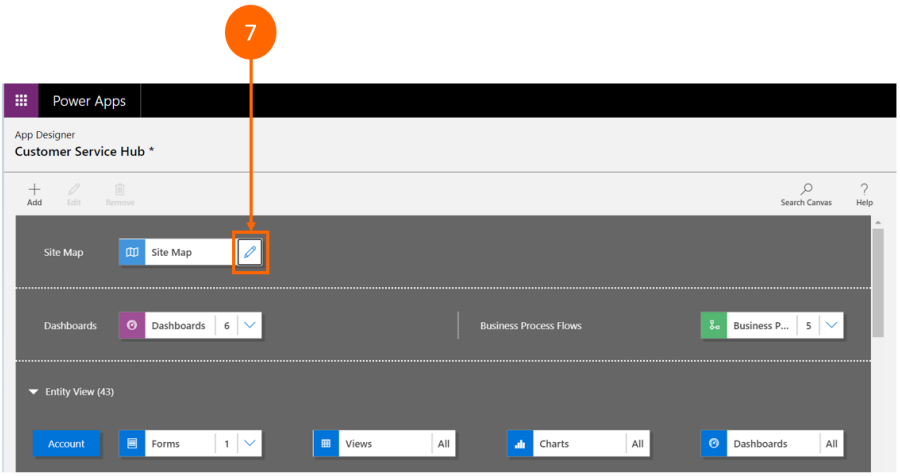
8. To enable a form, go to **Main Forms** and select the form.

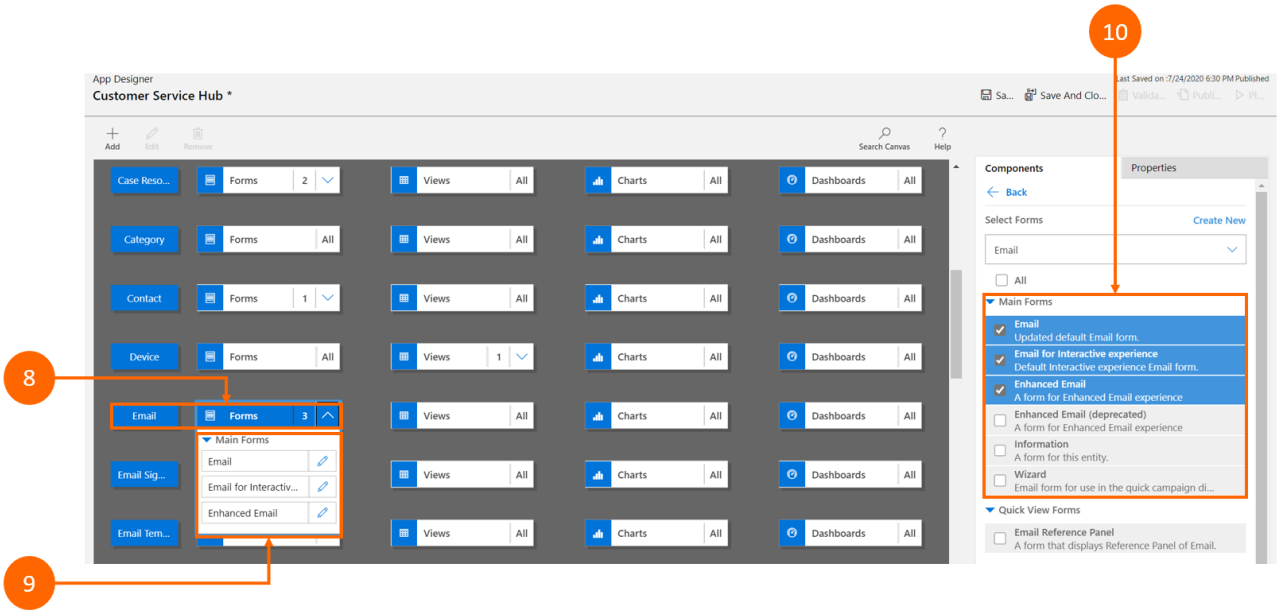
> **Note**
>
> You can't change the display order under **Main Form**. You must go back to the **Form Order** to change the display order.











9. Add the email template and signature link to the site navigation by going to the site map and doing the following:

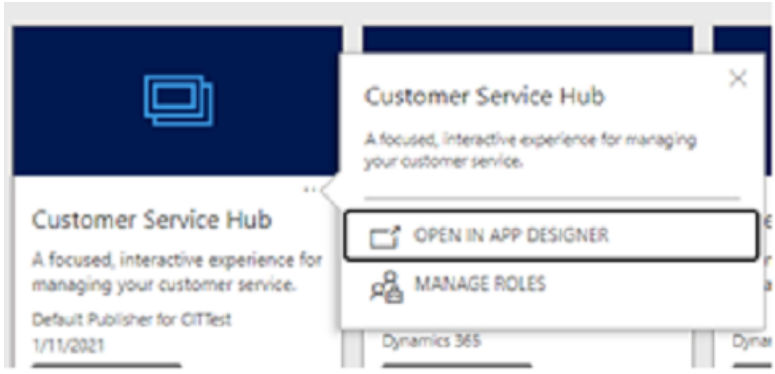
   a. Go to **Settings** > **Advanced Settings**.

   b. Select **Settings**.

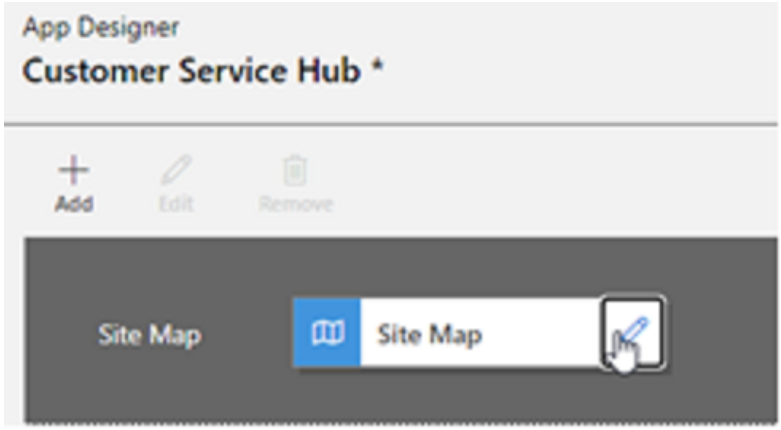
   c. In **Application settings**, select **App*.

   d. Select **More Options** on the **Customer Service Hub** tile.

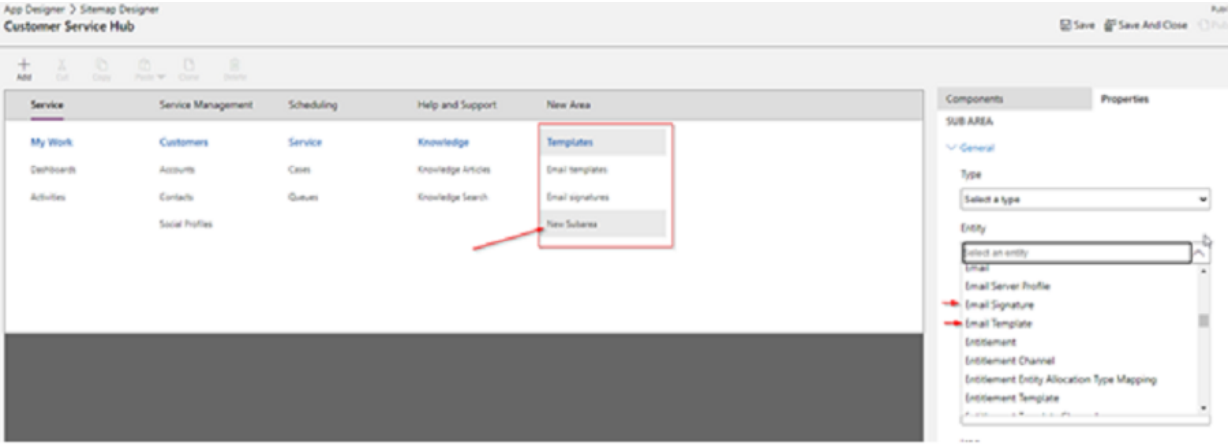
   e. Select **OPEN IN APP DESIGNER**.



f. Select the pencil icon to edit.



g. When the site map opens, create a new group for templates by selecting **New subarea**.



h. Select **email templates** or **email signature**.

i. Add a title. (This is the name that will show instead of **New subarea** when saved.)

j. Save and publish. A link is added to the site map.

Configure the inbox

Article • 10/03/2023

As an administrator, you can configure the inbox setting so that when your agents open Customer Service workspace or Omnichannel for Customer Service, they can select the inbox icon to show all the cases and conversations that are assigned to them. The inbox is designed to help agents efficiently work on high velocity tasks, and promote inbox sessions to regular sessions when they need more time to resolve cases and complete their conversations.

You can configure the inbox settings for custom experiences only.

You can also configure and enable the inbox in app profile manager.

The following channels are supported in the inbox:

- Live chat
- Asynchronous chat
- Case
- Email
- Voice

The following asynchronized channels are available in the conversation inbox.

- SMS
- Persistent chat
- Facebook
- WeChat
- LINE
- WhatsApp
- Teams

Live chat and voice channel in inbox

The following are things to note about live conversation settings in the inbox:

- When an agent accepts a live work item, that item is then added to the relevant view in the inbox, whether or not the agent is using the inbox at the time of the live work item.
- Voice calls always open as a new session with the card added to the inbox for awareness.
- Live work item cards have a "live" visual indicator.

- Live work item unread counts accrue to the unread count on the view.

Configure the inbox setting for agents

You can configure the inbox in the Customer Service admin center by editing the agent experience profile to meet your preferred inbox settings.

1. Open the Customer Service admin center app.
2. In **Agent experience**, select **Workspaces**.
3. In **Agent experience profiles**, select **Manage**.
4. Select the profile for which you want to configure the inbox.

   > ⓘ **Note**
   >
   > Channel providers must have **All active channels** set to **On** to use and configure the chat setting in the inbox.

5. In **Inbox**, select the **Settings** icon, and then toggle **Inbox** to on.
6. You can either modify an existing view or create a new one by selecting **Edit**. The following fields can be configured:

   - **Name:** Specify a name that shows in the inbox. Alphanumeric values are valid names.
   - **Record Type:** Select the record types for which the settings need to be applied. You can select more than one record type.
   - **Chat Status**: Is available if you select the record type as chat. Select one or more of the following settings:
     - **Assigned**
     - **Unassigned**
     - **Resolved**
   - **Email**: Is available if you select the record type as Email. Select all the options that you want to enable.
     - Assigned to me:
       - Emails sent to me
       - Emails assigned to me
     - Unassigned:
       - Emails in my team
       - Emails in my queue(s)

    - Emails in a shared mailbox
- **Agent Visibility**: Select one of the following options to show or hide the view to agents:
    - **Show**
    - **Hide**

Preconfigured inbox views

The following views are supported out of the box in the inbox:

- **Cases**: Shows all cases that the user owns, including active and resolved cases.
- **Assigned Conversations**: Shows all conversations that have been assigned to the user, including active and closed conversations.
- **Resolved Conversations**: Shows all conversations that have been marked as closed, and where the user was the primary agent in the conversation.
- **Unassigned Conversations**: Shows all active conversations and emails in a team or queue in which the user is a member. The user is able to assign conversations to themselves and reply to emails directly from this view.

Inbox views are refreshed every five minutes. Agents can manually refresh the view by using the **Refresh** icon.

Configure custom views for the inbox

You can configure a customized view for the inbox so that agents can see their cases, conversations, emails, and voicemails all in a single view.

To configure multiple views for the inbox, complete the following steps.

1. Go to the agent experience profile for which you want to configure a custom view.

2. On the **Inbox** card, select **Edit**. The **Inbox** page is displayed.

3. Toggle **Enable Inbox** to **On** if it isn't already on, and then select **+ Add**. The **Add a new view** page is displayed.

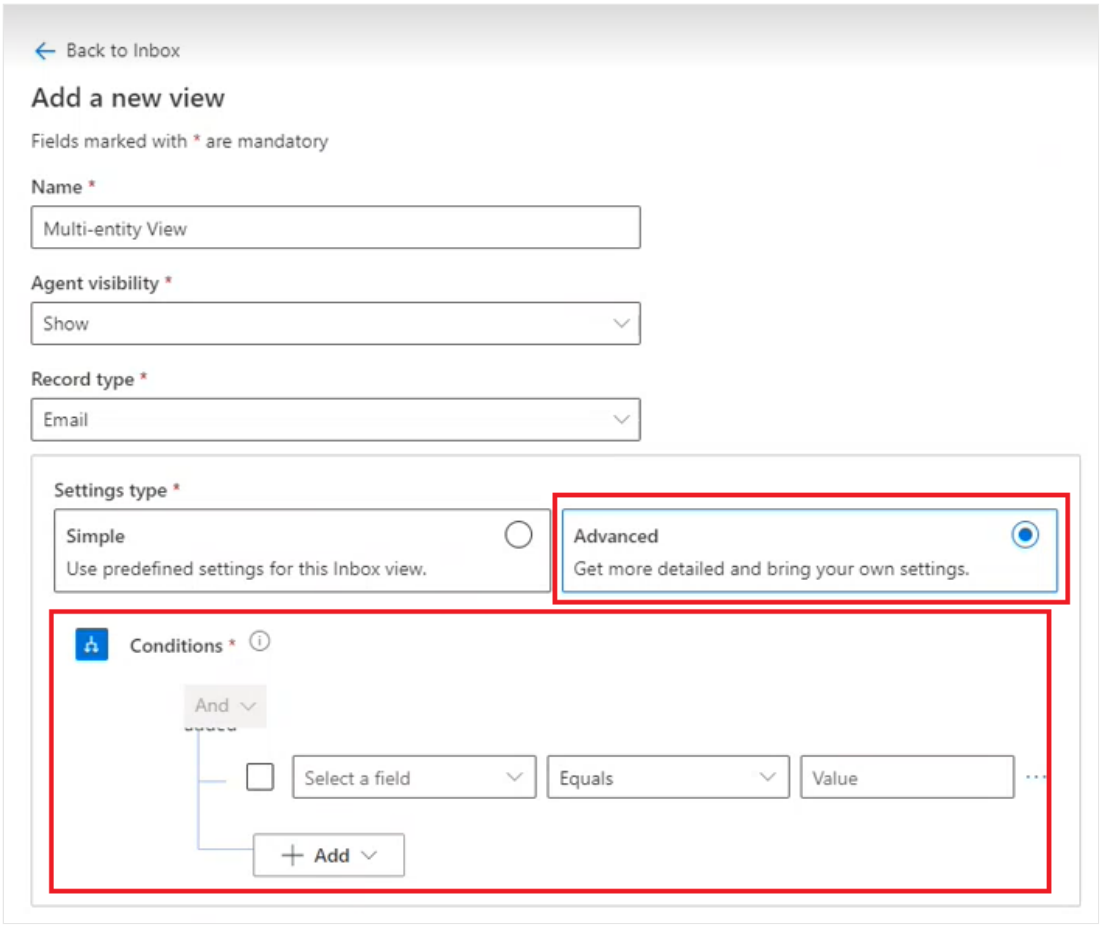
4. On the **Add a new view** page, enter the following details:

    - **Name**: Type a name for the view.
    - **Agent visibility**: Select whether to **Show** or **Hide** the view from agents.
    - **Record type**: Select the records that you want to include in the multi-entity view.

5. For each record type, choose one of the following settings. The settings are different for each record type.

   - **Simple** opens a dropdown menu where you can choose the type of records that appears in your multi-entity view. More information: Simple settings

   - **Advanced** opens a **Conditions** option where you can set the desired conditions for your multi-entity view. More information: Advanced condition builder



6. Select **Save**.

Simple settings

The following simple settings are available out of the box for the record types.

Record type	Simple settings
Email	- Emails sent to me - Emails assigned to me - Emails in my team(s) - Emails in my queue(s) - Emails in a shared mailbox
Chat	- Assigned - Unassigned - Resolved
Case	- Cases assigned to me - Cases in my team(s) - Case(s) in my queue(s)
Voicemail	- Assigned - Unassigned - Resolved

Real-time translation

Use the inbox

Article • 10/03/2023

The inbox in Customer Service workspace gives you quick view of your assigned cases and conversations. It's designed to be your central place to locate, manage, and complete your day-to-day work. It can help you efficiently work on high velocity tasks, and promote inbox sessions to regular sessions when you need more time to resolve cases and finish your conversations.

The view you see in your inbox depends on how your administrator has configured it. More information: Configure the inbox.

Depending on how your inbox configured, you may see any of the following channels:

- Live chat
- Asynchronous chat
- Case
- Email
- Voice

View the inbox

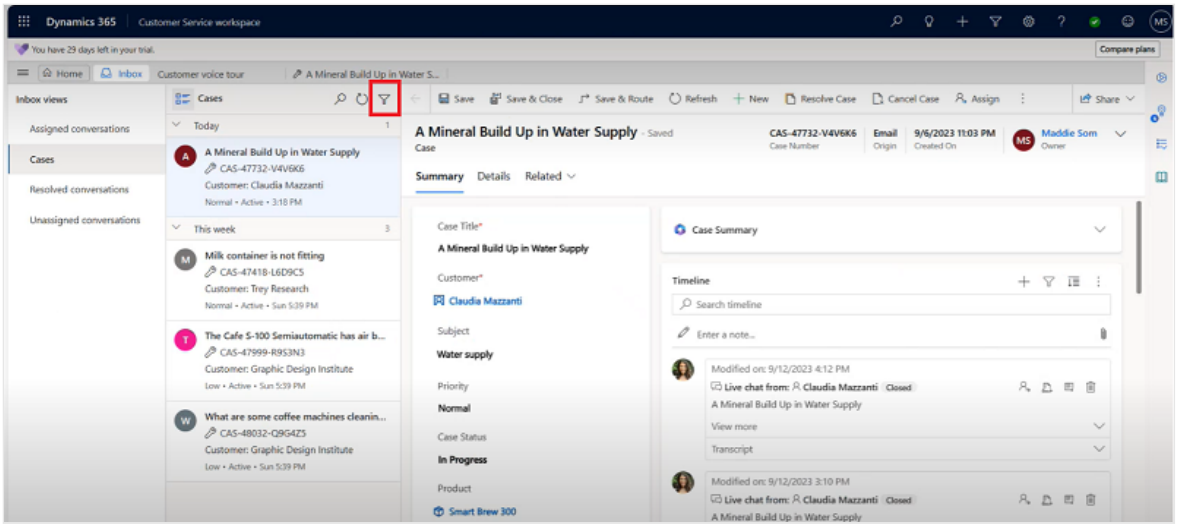
1. In Customer Service workspace, select **Inbox** on the sitemap.
2. Select either **Cases** or **Conversations** to view a respective list of assigned items.
3. Select the item to work on. It opens in a new tab. Alternatively, you can open an item in a new tab by selecting the **new session** icon.

Filter your inbox views

You can use filters to show only the items you want in your inbox.

To filter your inbox view:

1. In the inbox, select the **Filter** icon.



2. Select the desired filter views. The following options are available:

   - **Filter**
     - **All** - Displays both read and unread items.
     - **Unread** - Displays only unopened items.
     - **Read** - Displays only opened items.
   - **Sort by**
     - **Customer** - Displays items based on the customer record.
     - **Date** - Displays items based on the date they were created.
   - **Sort order**
     - **Oldest on top** - Displays oldest items first in the inbox.
     - **Latest on top** - Displays most recent items first in the inbox.

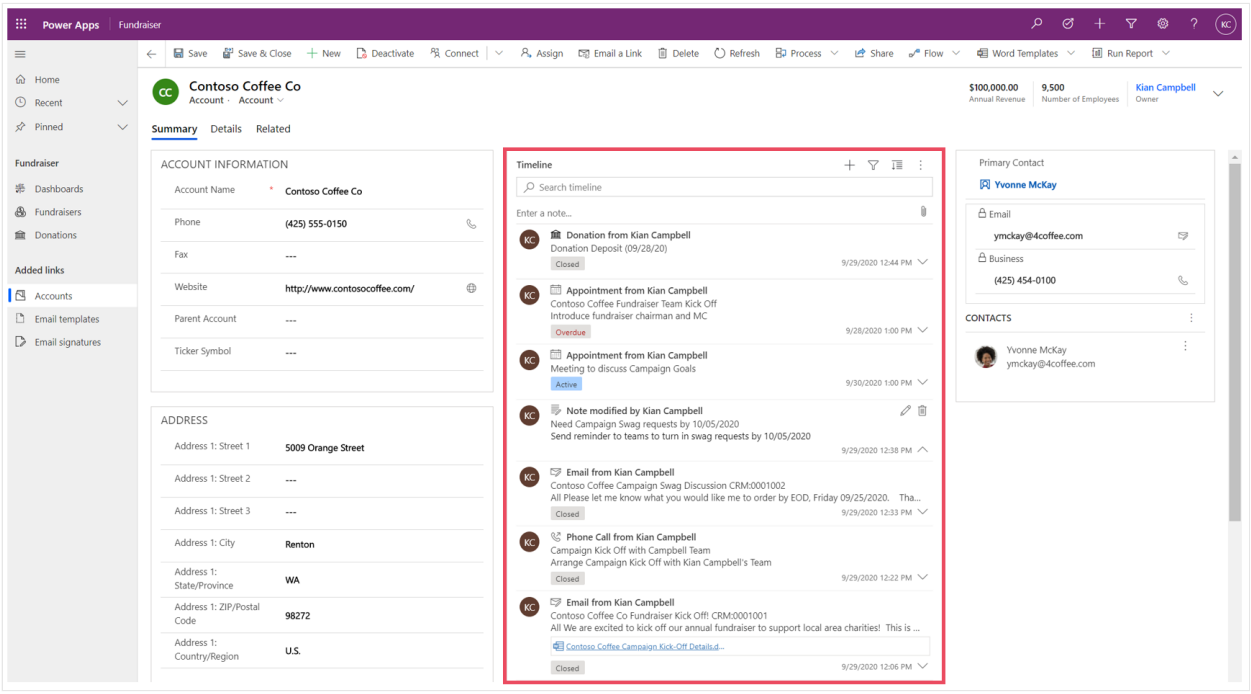
Get started with Customer Service workspace

Set up the timeline control

Article • 10/05/2023

The timeline helps app users see all activity history. The timeline control is used to capture activities like notes, appointments, emails, phone calls, and tasks to ensure that all interactions with the related table are tracked and visible over time. Use the timeline to quickly catch up on all of the latest activity details.



The timeline control provides an easy way to view information related to a table, such as accounts or contacts. This immersive experience helps give users a better understanding of their customer interactions, and helps them deliver more personalized service in an efficient and effective manner.

App makers can configure the information that's displayed on the timeline to help users access information and create new activity records, such as email and tasks, directly from the timeline quickly so they can deliver more personalized service.

Add a timeline

A timeline control is located on a form within a table. Any timeline control that's on a form can be configured. For example, an account table has three standard forms, and each of those forms can have a timeline that can be configured.

Display a custom table in a timeline

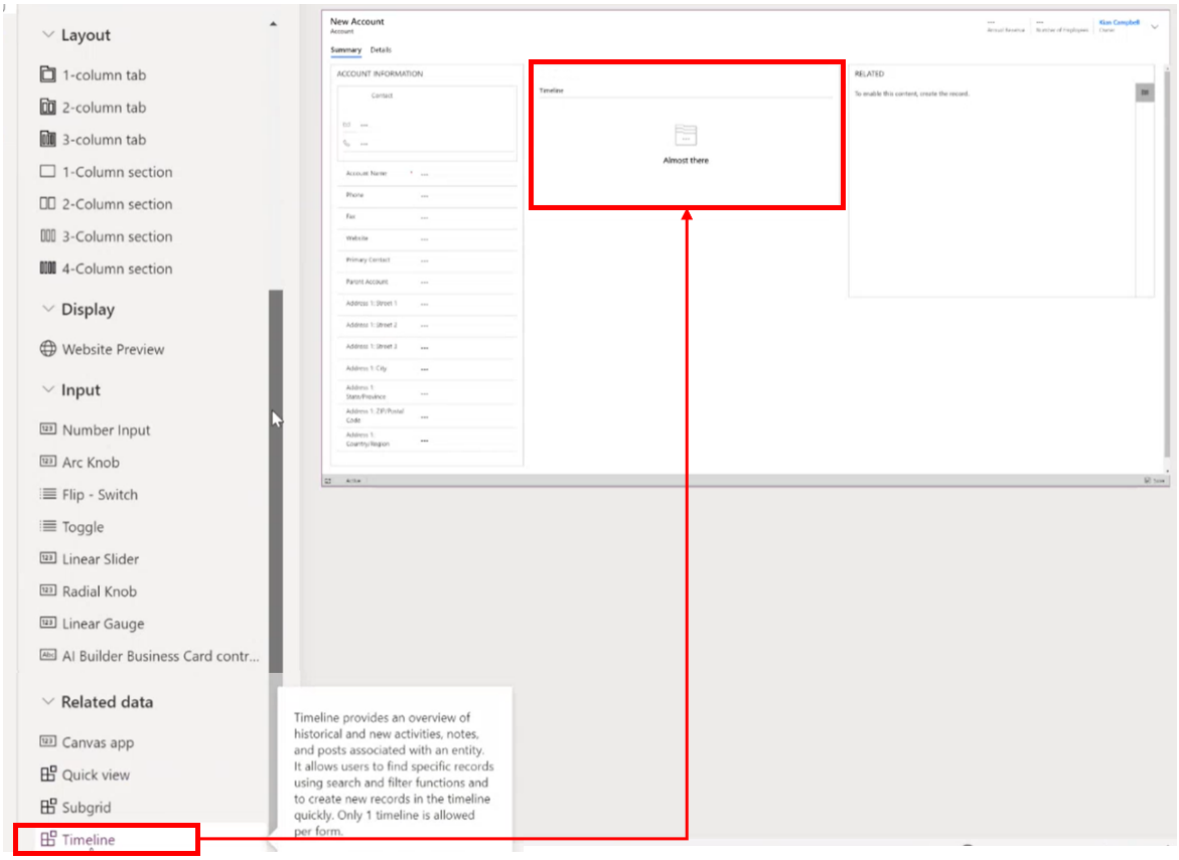
For custom tables to appear in the list of activities that can be added to a timeline control, make sure that when you create the table you configure the following settings:

- Set the table **Type** as **Activity**.
- Check the **Enable attachments** setting if you want app users to be able to add attachments and notes to the custom activity record.

More information: Create a custom table

Add the timeline component to a form

1. Sign in to Power Apps.
2. Select **Tables** on the left navigation pane, and then open the table you want. If the item isn't in the left navigation pane, select ...More and then select the item you want.
3. Select the **Forms** area, and then open the form where you want to add or configure a timeline.
4. In the form designer, select **Components** from the left navigation, and then scroll down to the **Timeline** component on the left side. Drag and drop it into a section on the form.



5. Make the changes you want to the timeline settings. More information: Configure the timeline component
6. Before you can view any configuration changes on the table form, you must save and publish your updates on the timeline component. Select **Save**, and then select

Publish to make your form changes available on the table form for the environment.

Note the following when you work with the timeline control in the form designer.

- You can add multiple timelines to a form.
- To remove the timeline component from a form, select the **Timeline** component area, and then press the Delete key.
- Since the timeline component relies exclusively on underlying related data, **Almost there** is displayed in the timeline section.
- Because you are in a create and/or edit state on the form, there's no underlying data, so the timeline section is blank in the form designer.

Configure the timeline component

The timeline component is rich in features and functionality that can be configured and tailored to support specific business needs. The timeline is composed of features and functionality that you configure in the timeline component, which is then displayed in the table form.

Display options

This section describes the settings available in the Display options area of the timeline control settings.

Timeline component name

The **Name** column under the **Properties** tab in **Display options** is the unique name of the timeline control and is only used by the app maker to reference.

> ⓘ Note
>
> - The **Name** column has limitations. For example, you can't use spaces between words. Instead, you must use an underscore (_)
> - You can't change the default heading label that is displayed as **Timeline** on the form during app runtime.

Records shown on page

This section allows you to control the number of records that appear before displaying **Load more** at the bottom of the section.

Form designer configuration View	Form designer display View
	The default setting on the **Records shown on page** column is set to 10 records, but you can change it to display up to 50 records.	1. Per the default setting shown in this example, the form displays a maximum of 10 records. 2. Once records exceed 10, the **Load more** option appears at the bottom of the form.

Record types to show

There are three primary record types: Activities, notes, and posts. All record types are enabled by default.

- Activities. Activities can have a large number of customizable subactivity record types to support business needs. Depending on what you've installed, the administrator can create, add, and display many different customized subactivity record types under the **Activity** section of the dropdown menu on the timeline.
- Notes. Notes allow you to capture details related to the table record. For example, you can use notes to capture thoughts, summarize information, and provide feedback on a case, and then update the case details later.
- Posts There are two types of posts: auto and user:
  - **Auto Posts** are system-generated posts that notify you of account activity that has occurred.
  - **User Posts** allow you to leave a message for another user on a record.

> **Note**
>
> Posts require a Dynamics 365 app, such as an app for Dynamics 365 Customer Service.

Enable these record types to be displayed in the timeline

Form designer configuration view	Form designer display view
	To enable **Record types shown** for **Activities**, **Notes**, and **Posts** on a form, check the box next to the record type.	1. To confirm that the record type is displaying on the form, select **Create a timeline record** + in the top-right nav in the timeline, and a dropdown menu that displays the list of enabled record types appears. 2. When **Activities** are enabled, you see **Activity** record types for appointments, email, phone calls, and tasks. 3. When **Notes** are enabled, you see the note record types on the form. 4. When **Posts** are enabled, you also see the post record types on the form.

> **Note**

Activities and notes are standard entities. If additional solutions have been imported into the environment, other tables may also be displayed.

Activity, notes, post icons, and date / timestamp display on timelines

The timeline shows a simple icon before the activity, note, post, and custom table, making it easy for you to identify the record type.

Dates and timestamps always appear on each record on the bottom-right side of the preview, and are always viewable.

> **Note**
>
> When a custom table has a custom icon, activities related to the custom table are displayed using the default custom table icon not the custom icon.

Advanced

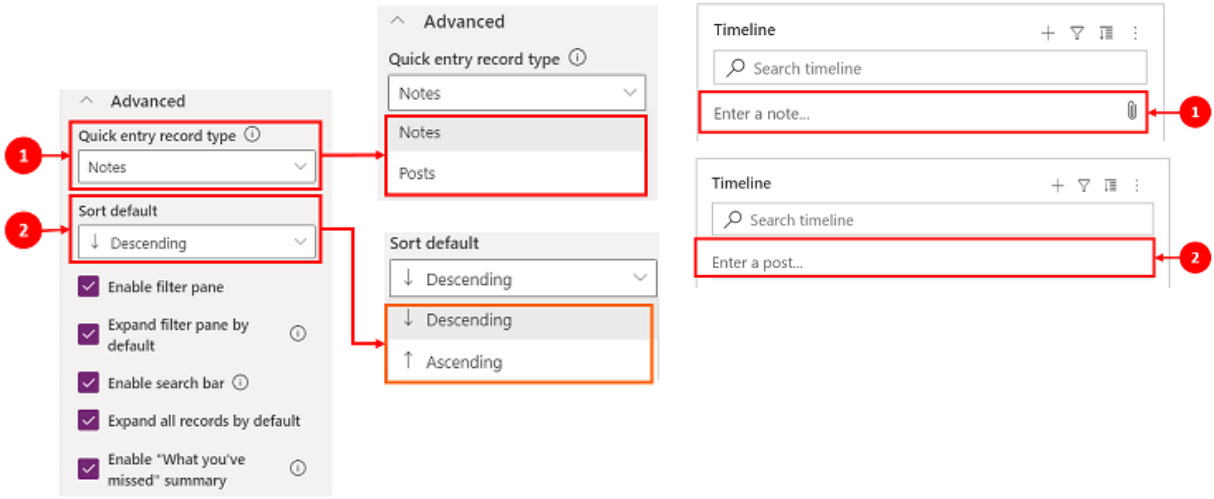
This section describes the settings available in the Advanced area of the timeline control settings. The **Advanced** settings apply to all record types.

When enabling and disabling **Advanced** features, you aren't able to view updates (even though it may appear that there's activity occurring on the timeline component) until you save and publish your configuration updates and refresh the table form.

Advanced covers common settings that span across an activity, note, or post, which are the three primary record types that appear in the timeline section.

Quick entry record type and sort order default

The following is a detailed overview of the **Advanced** configuration options, starting with selecting your **Quick entry record type**:

Form designer configuration View	Form designer display View
	


1.Select **Advanced** to expand this area in the configuration view. The **Quick entry record** type provides you with quick access to create either a **Note** or a **Post**. The default setting for this setting is set to **Notes**. 2.The **Sort order default** setting controls the order of how all data is sorted on the timeline. The default setting for this setting is set to Descending.	1. When you select **Notes**, it displays under the **Search** bar in the timeline. Also, you see a paperclip icon that allows you to attach files. You can only attach files to Notes. 2. If you select **Posts**, it also displays under the **Search** bar in timeline.

Enable filter pane

Filters provide a quick option to sort and look for specific data quickly.

Form designer configuration View	Form designer display View
	The **filter pane** setting allows you to enable or disable filter functionality on timeline. It's enabled by default.	Enable the **filter pane** by checking the box next to the setting. This enables the filter icon to display on the timeline.

Form designer configuration View	Form designer display View
	To disable the **filter pane**, clear the box next to the setting and the filter icon no longer appears on the timeline.

Filter records on timeline

Filters are valuable for sorting data. You can quickly filter activities, notes, and posts with multiple options to see what matters to you. The filter is available for the activities, notes, posts, and custom tables that are present in the timeline. The timeline filters and displays the records and the count that are present in the timeline.

When you select filters based on an activity status then those activities, notes, and posts are displayed in your timeline. You can customize data using data filters and either choose to keep filters in place or clear them when you're done.

- When the **Filter** icon is transparent on the table form, it means no items have been selected, therefore the filter pane is empty.
- When the **Filter** icon is dark, it means filters have been set. To view which filters have been designated, select the **Filter** icon and the filter pane displays the filters that have been set.
- Choose how you want to filter data by selecting the box next to the filter.
- Clear filters by selecting the **Clear all filters** icon on the filter pane.

The following category and subcategory options are available on the filer menu:

Category	Subcategory
Record type	• Notes • Activities • Posts
Activity type	• Appointment • Campaign Activity[1] • Campaign Response[1] • Email • Fax • Case Resolution[1] • Letter • Opportunity Case[1] • Order Case[1] • Phone Call • Quote Close[1]

Category	Subcategory
	• Recurring Appointment • Social Activity • Task • Project Service Approval[1] • Booking Alert[1] • Conversation • Session • Customer Voice survey invite[1] • Customer Voice survey response[1] • Custom activities (made available by imported solutions)
Activity status	• Active • Overdue • Closed
Activity status reason	Allows you to filter using specific status reasons. The values are a unique list of all of the status reasons from the activities in the timeline. The status reasons change depending on the activity. If there are multiple activities on the timeline that have the same status reason, it reflects once, but then the number next to it indicates how many occurrences of that status reason appear in the timeline.
Activity due date (active)	• Next 30 days • Next seven days • Next 24 hours • Last 24 hours • Last seven days • Last 30 days
Posts by	• Auto post • Users
Modified date	• Last 24 hours • Last seven days • Last 30 days

> **Note**
>
> By default, the fax and letter records are disabled on the timeline.

[1] Requires a Dynamics 365 app

Expand filter pane

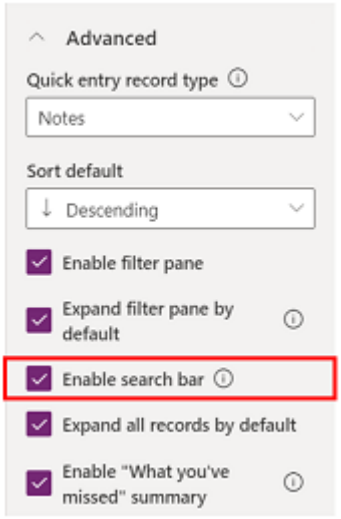
The **Expand filter pane** setting provides quick access to sorting options within the timeline. It's enabled by default.

Form designer configure view	Form designer display view
	The **Expand filter pane by default** setting displays an expanded filter pane at the top of the form anytime it's opened and refreshed. It's disabled by default.	Enable the **Expand filter pane** by checking the box next to the setting. This enables the filter pane to appear at the top of the form anytime the form is opened and refreshed. To disable the **Expand filter pane**, clear the box next to the setting and the filter pane doesn't appear on the timeline.

Enable search bar

You can search for records in the timeline. When you search for a phrase in the timeline, it searches in the title of the record or body and description column of the record then displays the record for you.

Form designer configure view	Form designer display view
	



Form designer configure view	Form designer display view
Select **Enable search bar** to enable the **Search timeline** bar functionality. It's enabled by default.	Enable the search bar setting to display a **search bar** at the top of the timeline. Disable the search bar by clearing the box next to the setting and the search bar doesn't appear on the timeline.

Expand all records in timeline

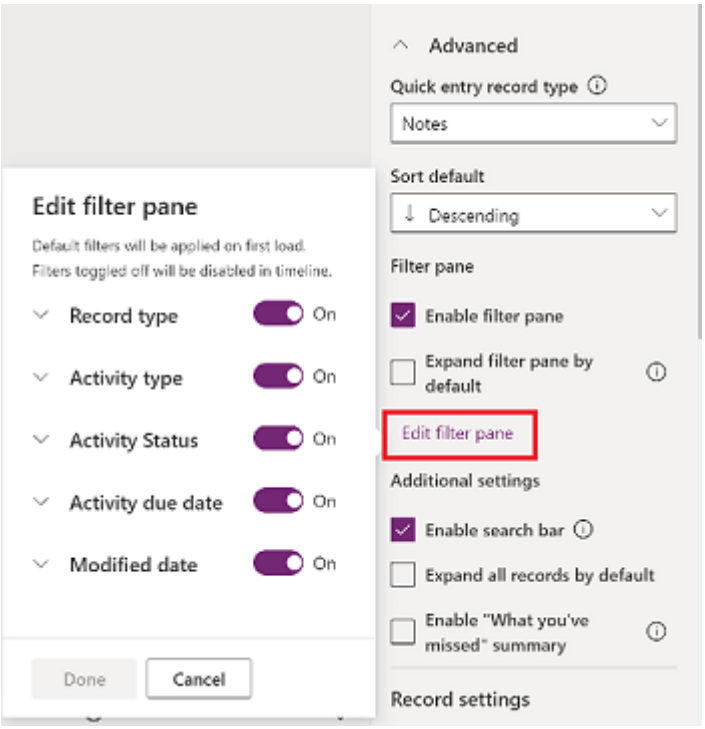
Expand all records by default displays all activities in an expanded view in timeline.

Form designer configure view	Form designer display view
	Select **Expand all records** to set the default view to display all records in the expanded view format in the form each time the timeline is opened. **Expand all records** is disabled by default.	1. When enabled, the **Expand all records** icon is displayed in the top-right corner of the timeline nav. 2. Records can be expanded or collapsed by using the **Expand all records** icon. When expanded, all records are displayed in the expanded view in the form each time it's opened. When you clear **Expand all records**, it no longer displays activities in an expanded view. When disabled, the **Expand all records** icon doesn't display in the top-right nav of the timeline. Records are always be displayed in a collapsed view.

Edit filter pane

You can configure the default filters that are applied when a form loads or is refreshed using **Edit filter pane**. Remove filter groups by turning the setting **Off**. Users can remove

the default filters to see all the records unless **Enable filter pane** is disabled.

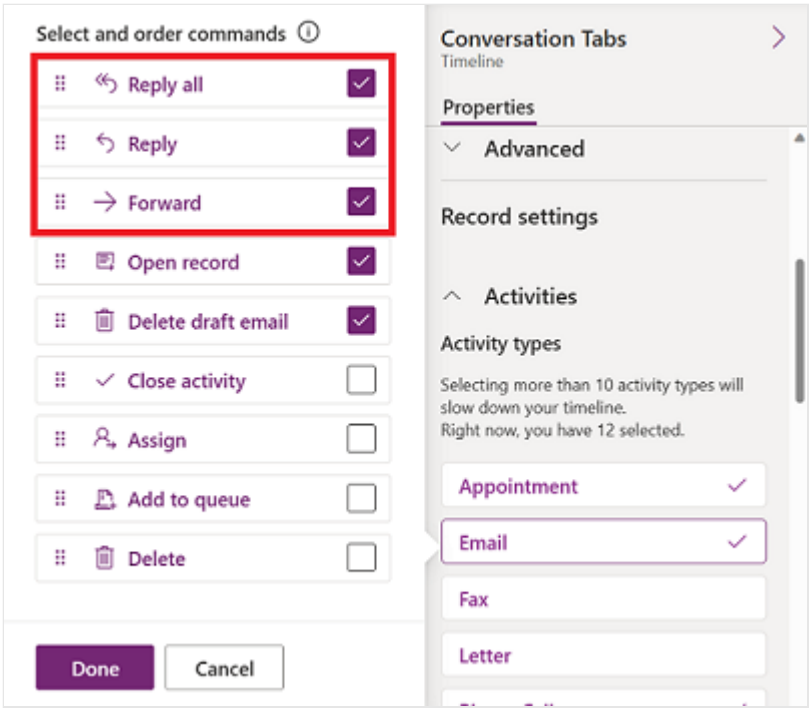


Configure email commands for timeline

You can configure email options for the timeline so that users can reply, reply-all, and forward messages. You can select the order in which the options are displayed for users, and exclude them if they're not needed. Reply-all is the default order setting.

1. Select the form for which you want to apply the email settings, and then in **Properties** in **Conversation Tabs**, select the **Email** activity type. The **Email** properties pane is displayed.

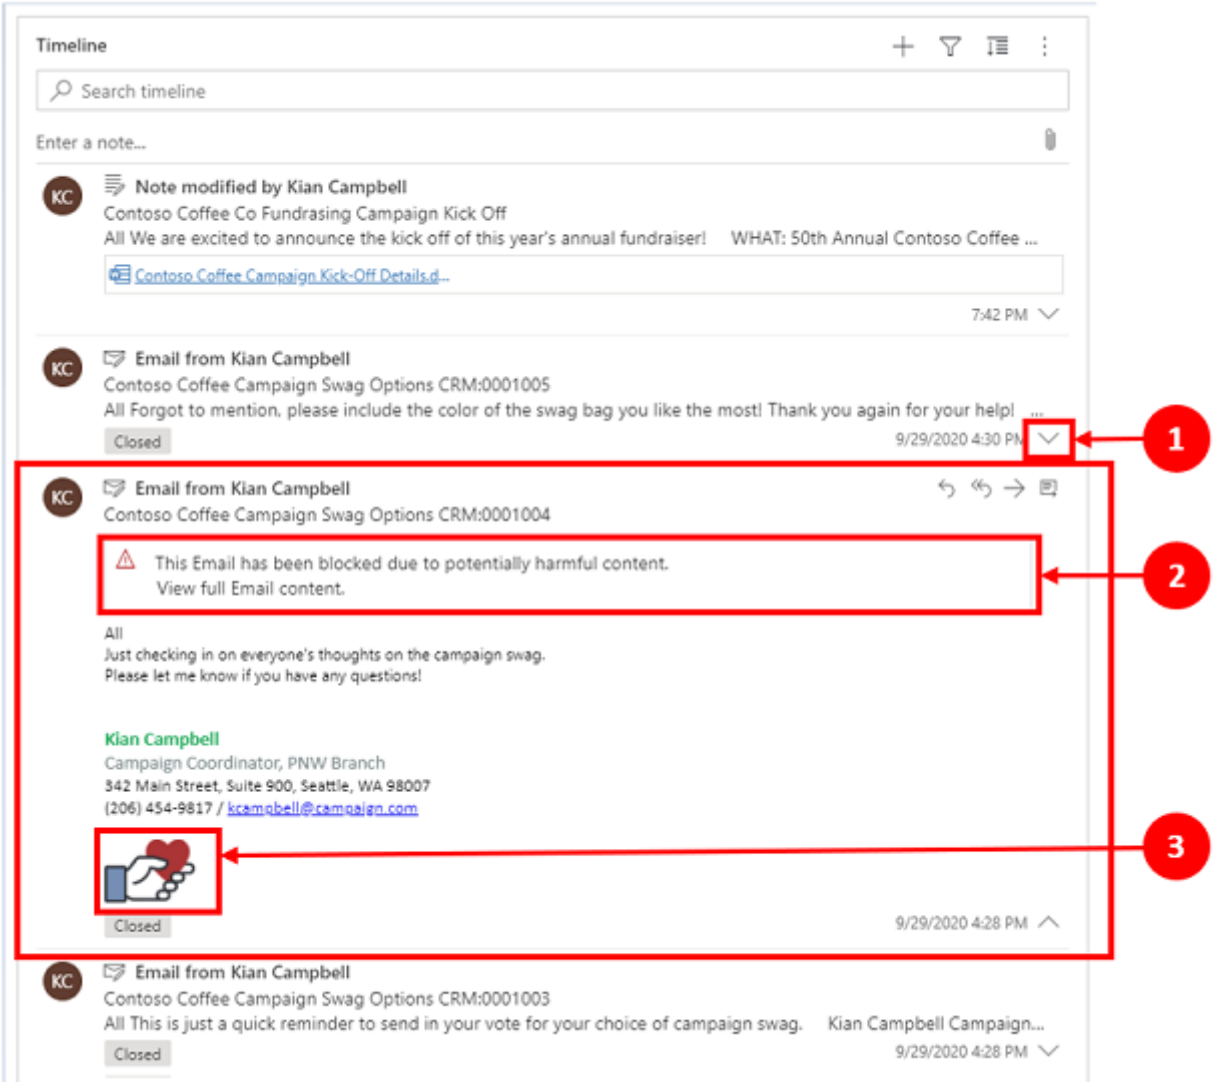
2. In **Select and order commands**, check the boxes for the email commands you want to configure for users. You can drag and drop the options to choose the order in which you want each option to display.



3. Select **Done**, and then save and publish your changes.

Expand records with images in timeline

You can send and receive records with images, but they don't display when the record is collapsed. Records with images must be expanded to be viewed.



1. Records when collapsed provide a visual summary. To expand an individual record, select anywhere on the timeline record to expand and collapse a record view. In the bottom-right corner of the record, there's a caret:

    - When the caret is facing downward (v), the record is collapsed.
    - When the caret is facing upward (^), the record is expanded.

2. Records with images might display the following notice:
   This email has been blocked due to potentially harmful content. View full email content.

3. When you select the message, the warning goes away, and the image appears.

Enable "What you've missed" summary

What you've missed helps you stay on top of updates and changes made to records by displaying updates at the top of the timeline when you access a record.

Form designer configure view	Form designer display view
	The **What you've missed** setting displays new records you haven't seen. It's enabled by default. To disable it, clear the box next to the setting.	When enabled, when you view an account record, the newest activities appear at the top of the list.

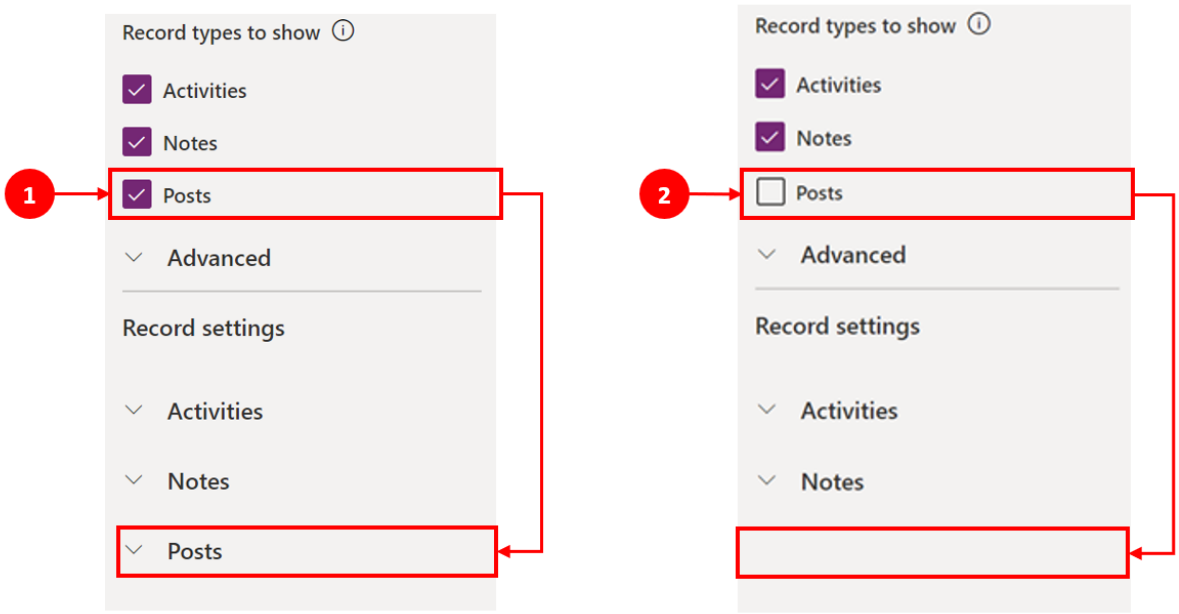
Record settings

This section describes the settings available in the Record settings area of the timeline control settings. The **Record types to show** setting determines the record types that are affected by the **Record settings** described here.

Record settings let you manage the settings within the record types.

- The **Activities** record type is tied to **Activities** in record settings.
- **Notes** record type is tied to **Notes** in record settings.
- **Posts** record type is tied to **Posts** in record settings.

To enable or disable a record type, select or clear the checkbox. Then, that record type either displays or no longer appears in the **Record settings** section.



1. When **Posts** is checked in the **Record types to show** section, it's enabled in the **Record settings** section.
2. When **Posts** is cleared in the **Record types to show** section, it's disabled in the **Record settings** section.

Configure activity record types

When you expand the **Activities record settings** on the timeline component section, a list is displayed that shows all the activity types that can be either enabled or disabled on the table form.

Form designer configuration view	Form designer display view
	1. Expand and view **Activities** under the **Record settings** section using the caret (^). 2. A list of **Activity types** is displayed in the expanded view. 3. You can enable or disable an activity by selecting an activity type. For example, enable **Email**. To enable an **Activity type**, check the box next to **Enable** and select **Done**. To disable an **Activity type**, clear the box next to **Enable**, and then select **Done**. This action disables all other items in the box and disables the activity type from displaying on the timeline. This action also disables the activity type from being created or viewed in the timeline.	1. When enabled, an **Activity type** appears under the **Create a timeline record** +. 2. The activity type is displayed as an option the user can choose from the dropdown menu. 3. Also, the **Activity type** record is displayed in the body of the timeline.

> **Note**
>
> A check mark appears to the right, next to enabled **Activity types**. Additional record type settings are disabled until they're enabled under that specific record type.

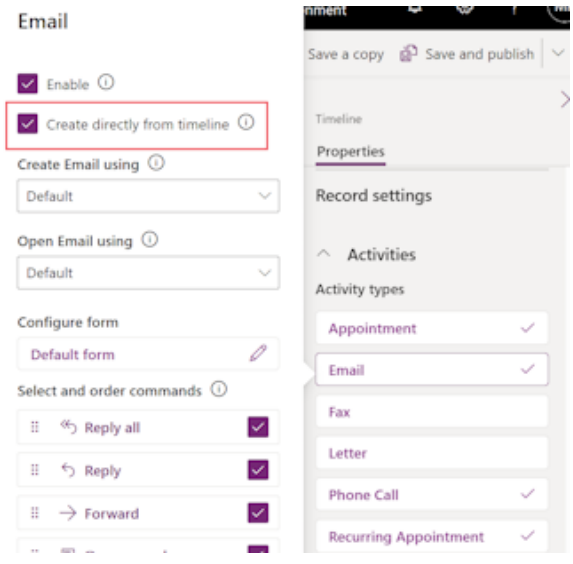
Show status tags on activity record types

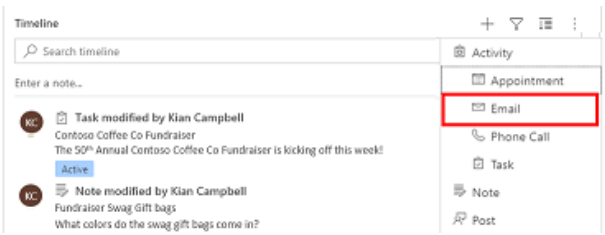
Status tags match the status filter that display in the timeline to help you to see at a glance if the state of an activity record is **Active**, **Overdue**, or **Closed** on an activity, such as a task, appointment, or email. Makers enable or disable status tags for any **Activity type** in the default form configuration. Status tags are enabled by default.

Form designer configuration view	Form designer display view
	To display email status tags, select **Default form** (pencil icon) > **Show** in the **Display option** dropdown list under **STATUS TAG**.	When enabled, status tags such as **Active**, **Overdue**, or **Closed** appear in the timeline next to that activity record.

Enable the ability to create directly from timeline

App makers have the ability to enable activity types so they can be created directly on the timeline. Having the ability to quickly select and create an activity, such as email, tasks, and appointments, helps to streamline productivity.

Form designer configuration view	Form designer display view
	


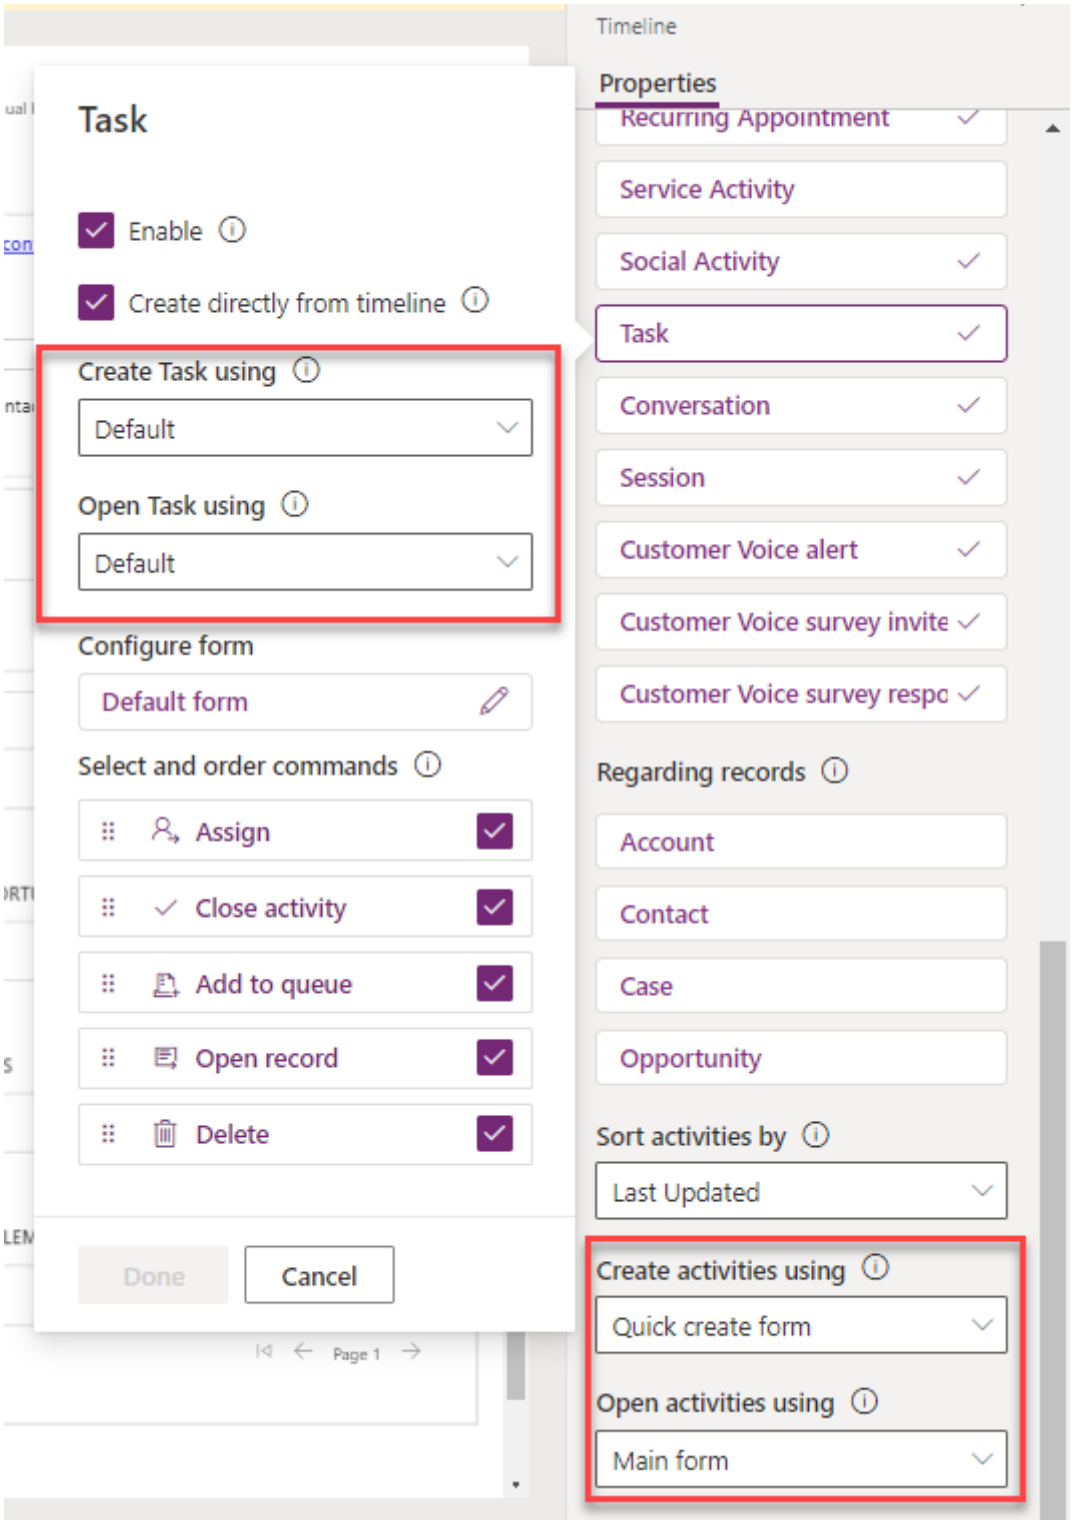


Form designer configuration view	Form designer display view
To allow users to create activity types directly from the timeline, check the box next to **Create directly from timeline**.	When enabled, the activity type appears in a dropdown box on the **Create a timeline record** + icon in the top-right of the timeline.

Set form types to create and open activities

Set the **Create activities using** and **Open activities using** individually for an activity type or for all activity types to set the form type users use based on your business needs. You can set these fields as follows:

- Select an activity type in **Activities** and specify the values.
- Specify the value for these fields in the **Activities** pane.



If you set the following form type for a specific activity, the application considers the following settings:

- **Default**: The form type in the **Create activities using** or **Open activities using** in **Activities**.
- **Quick create form**, **Main form**, or **Main form dialog**: The activity specific setting irrespective of the form type set in **Create activities using** or **Open activities using** in **Activities**.

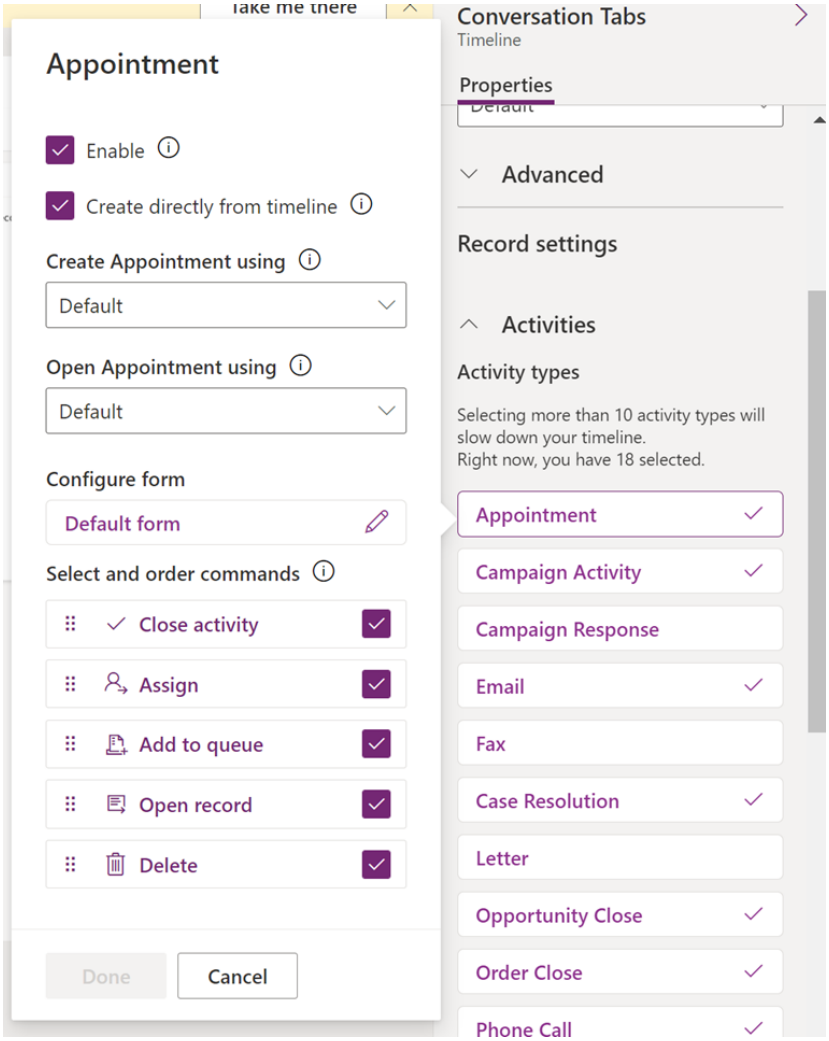
When the user selects the activity from the create a timeline record or opens an activity from the timeline, the activity is either created or opens in the selected form type.

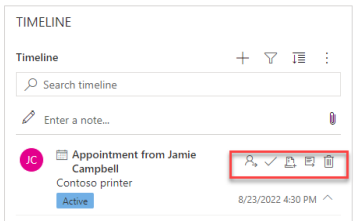
Enable command actions on activity record types (Preview)

> **Note**
>
> These features are part of an early access release. You can opt in early to enable the features in your environment, which allows you to test them and then adopt them across your environments. For information about how to enable these features, see **Opt in to early access updates**.

Command actions allow users to assign, close, delete, open a record, or add a record to a queue for activities from the timeline. You can enable or disable the command actions for a specific activity type.

Based on the activity type, you can also enable other command actions. For example, for an email you can also enable actions such as Reply, Reply All, and Forward.

Form designer configuration view	Form designer display view
	




To allow users to enable command actions for an activity directly from the timeline, check the box next to command action in **Select**

Form designer configuration view	Form designer display view
and order commands. You can only enable five command actions for an activity.	
You can also move the position of the command actions to change the order in which they're displayed on the timeline.	When enabled, the command action appears on the activity record in the timeline.

Display related records on the timeline

Accounts, contacts, cases, and opportunities linked to an activity are displayed on the timeline record. The administrator can enable or disable the records in **Regarding records**.

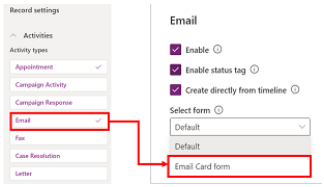
Form designer configuration view	Form designer display view
	1. Expand and view activities under the **Record settings** section using the caret (^). 2. A list of records are displayed in **Regarding records**. 3. To enable records, select the box next to **Enable** and select **Done**.	When the checkbox is enabled, users can view the linked records to an activity. The record linked to the activity is then displayed on the timeline. The linking of the record is not manual and it occurs due to the rollup of the record. More information: Set the activity rollup type in timeline

> **Note**

A check mark appears next to the enabled record. Disabling the table type only disables the linked record for the Timeline records rolled up for that table.

Create and use card forms in timeline

Records are displayed using the default setting for each activity type. However, if you want to display record information for an appointment or email, for example, you can either edit the existing card form, use a different card form from record settings, or customize your own.

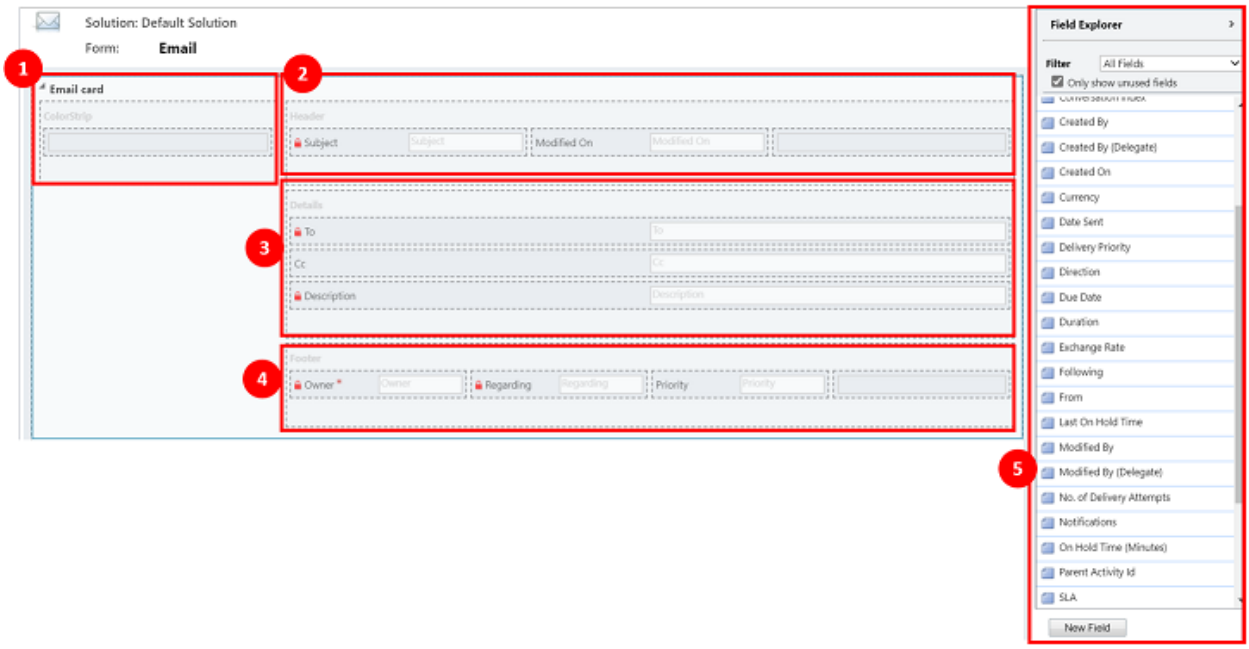
Form designer configure view	**Form designer display view**
	


You can change the default card settings to a different card form if one has been created.	If you create a new card form, you must go to the parent table and add the new form of card type there before it appears in the timeline list for configuration. If **Default** is displayed, you aren't using the card form. You can't use the **Email card form** in a timeline unless you select and publish it first.

> **Note**
>
> Not all activity types allow you to create card types, so the default selection is your only option for those records.

Customize a card from within timeline

All card forms are separated into the following four sections:



Legend

1. **ColorStrip**: This section doesn't appear on the timeline record. The **ColorStrip** is located on the left of the card form.
2. **Header**: This section is displayed on the timeline record; however, only the first two columns are displayed on the timeline record. For this example, only the **Subject** and **Modified On** columns are visible.
3. **Details**: This section is displayed on timeline record; however, only the first three columns are displayed on the timeline record. For this example, only the **To**, **CC**, and **Description** columns are visible on the timeline record.
4. **Footer**: This section isn't displayed on the timeline record.
5. **Table columns**: You can select which columns you want to add to your card form from the column options listed. You can customize your card form by dragging and dropping the columns you want to use into the sections you want that column to appear in on the timeline record.

Each individual card form must be customized for each activity record, such as email, tasks, posts, and so forth.

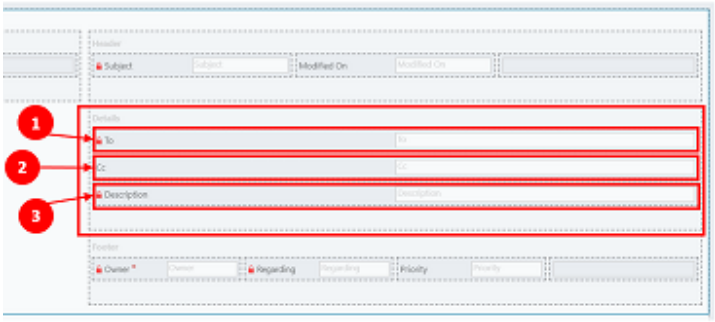
Header section

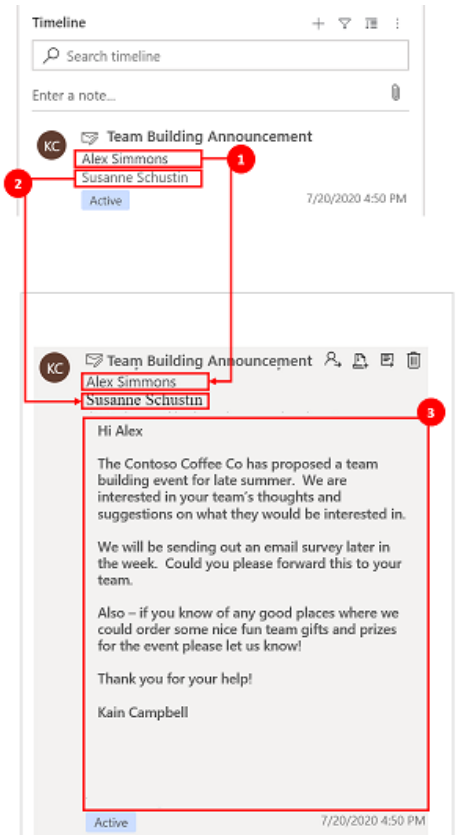
The card **Header** displays the title/subject in your timeline email form. You can have up to six columns in the **Header** section, but only the first two columns are seen on the timeline record. The form ignores empty columns in all sections.

Form designer configuration view	Form designer display view
	Column 1 1. Regardless of the column you choose for this section, it appears as a bold header at the top of your timeline record. For this example, we selected **Subject** for this column. **Column 2** 2. Again, regardless of the column you choose for this section, this column always appears in the bottom-right corner of the timeline record. For this example, **Modified On** is selected for this column.	**Column 1** 1. Column 1 from the card header is always displayed in this section of the timeline record. **Column 2** 2. Column 2 from the card header is always displayed in this section of the timeline record.

Details section

The card **Details** section displays in the body of your timeline email record. You can have up to four columns in the **Details** section, but only the first three columns are viewable on the timeline record.

Form designer configuration view	Form designer display view
	




The card details always appears below the header regardless of the column you choose.

Column 1

1. In the card details Column 1 acts as a subheader on the timeline record. For this example, **To** is selected for this column.

Column 2

2. This column only displays one line of text in a summary view on the timeline record. When you expand your timeline record, content in this column is fully displayed and formatted. For this example, **CC** is selected for this column.

Column 3

3. This column follows the content of Column 2 and is part of the main body of your timeline record that is only viewable when you expand the record. For this example, **Description** is selected for this column.

Column 1

1. This column always displays in this section and acts as a subheader on the timeline record.

Column 2

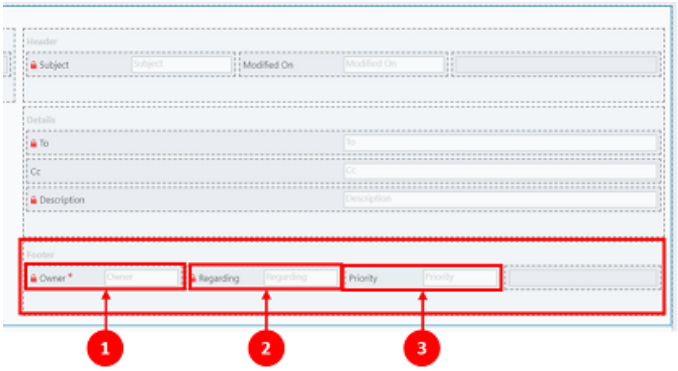
2. This column always displays in this section and only displays one line of text in the summary view but when expanded, content is fully displayed.

Column 3

3. This column always displays in this section and is only viewable when the record is expanded.

Footer section

This section isn't visible on the timeline record.

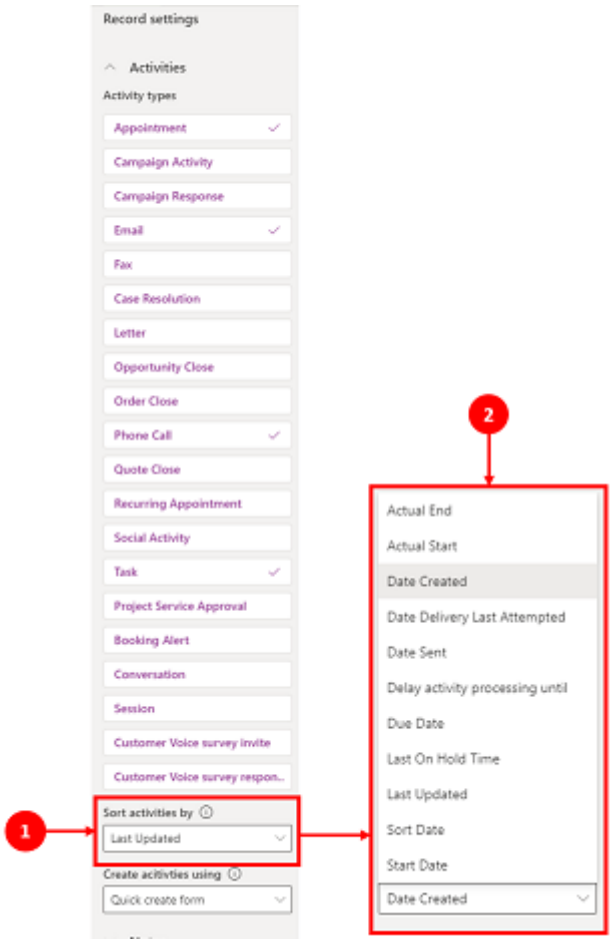
Form designer configuration view	Form designer display view
	


Column 1 1. For this example, we selected **Owner** for this column. **Column 2** 2. For this example, we selected **Regarding** for this column. **Column 3** 3. For this example, we selected **Priority** for this column.	These columns aren't visible on the timeline record

> **Note**
>
> Records *Modified On* are all updated to the same time by which the modification occurred and & *Modified By* is assigned to one user when the table is assigned to a new user. This occurs due to the cascading behaviour. More information: **Configure table relationships cascading behavior**

Set the date to use when sorting activities in timeline

How users view data is important, and setting a default display view of the data varies based on the needs of your business. App makers can choose how data is sorted and create a default setting for **Activity types** in **Record settings**. **Last Updated** is on all activities, which is why it's set as the default in ascending order.



Legend

1. The **Sort activity by** setting in the **Activities record settings** allows you to control how data is sorted in timeline.
2. The **Sort activities by** column displays a list when selected. You can select from this list how you want your data to be sorted and displayed on timeline in the form.

Sort date

Some dates can only exist on specific types of activities. For example, **Date sent** or **Date delivery last attempted** only apply to email. If you sort by such dates, then non-email activities end up grouped together without any ordering. You can't create a custom date column, but if you need more flexibility, you can use **Sort date**, which is empty by default and requires that you populate it for each activity record with the date you want to use for sorting. Some of the ways you can populate the date are by using Microsoft Power Automate, business rules, or JavaScript.

When using Sort date, keep in mind the following:

- If you set a value in **Sort date**, you can use it for more customized sorting, but you have to populate it for every activity record or it doesn't work. The sort date has to

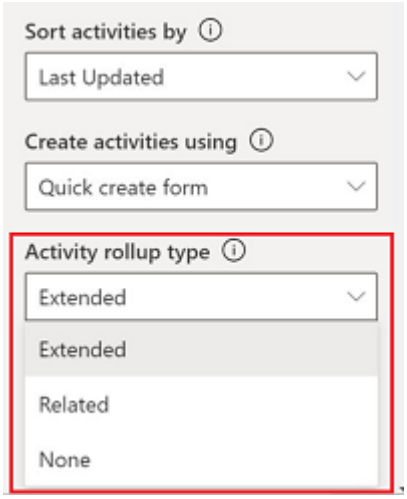
be configured for each timeline instance, and must be set up for all three main forms in the account table.

- If the **DateTime** column is on the same calendar day, the date doesn't display if **DateTime** was earlier in the day compared to the current time.
- The sort date isn't based on a 24-hour period, but rather, compares the **DateTime** column value with the current date and time (based on the user's preferred time zone). If the value entered occurred earlier in the day, the date isn't displayed.

Set the activity rollup type in timeline

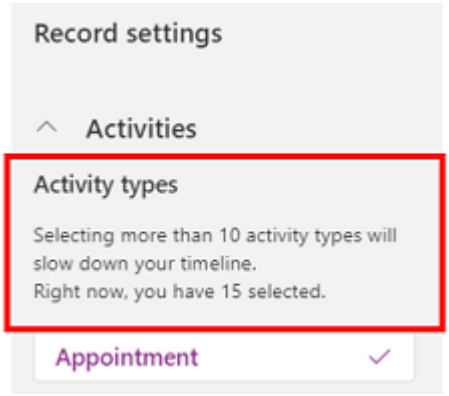
The activity rollup type can be configured for timelines on forms for the account and contact tables. The available types of rollups are **Extended**, **Related**, and **None**. Activity rollup only affects accounts and contacts in Dynamics 365 apps, such as Dynamics 365 Customer Service applications. To only show activities that are directly related to the table in timeline, select **None**.

More information on rollup types is available from RollupType EnumType.



Timeline performance

Only enable the activities that you need on the form. If you select more than 10 **Activity types**, a warning notice displays to let you know that the number of activity types you have selected impacts the performance of your timeline. To improve timeline performance, consider limiting activity types to 10 or less.



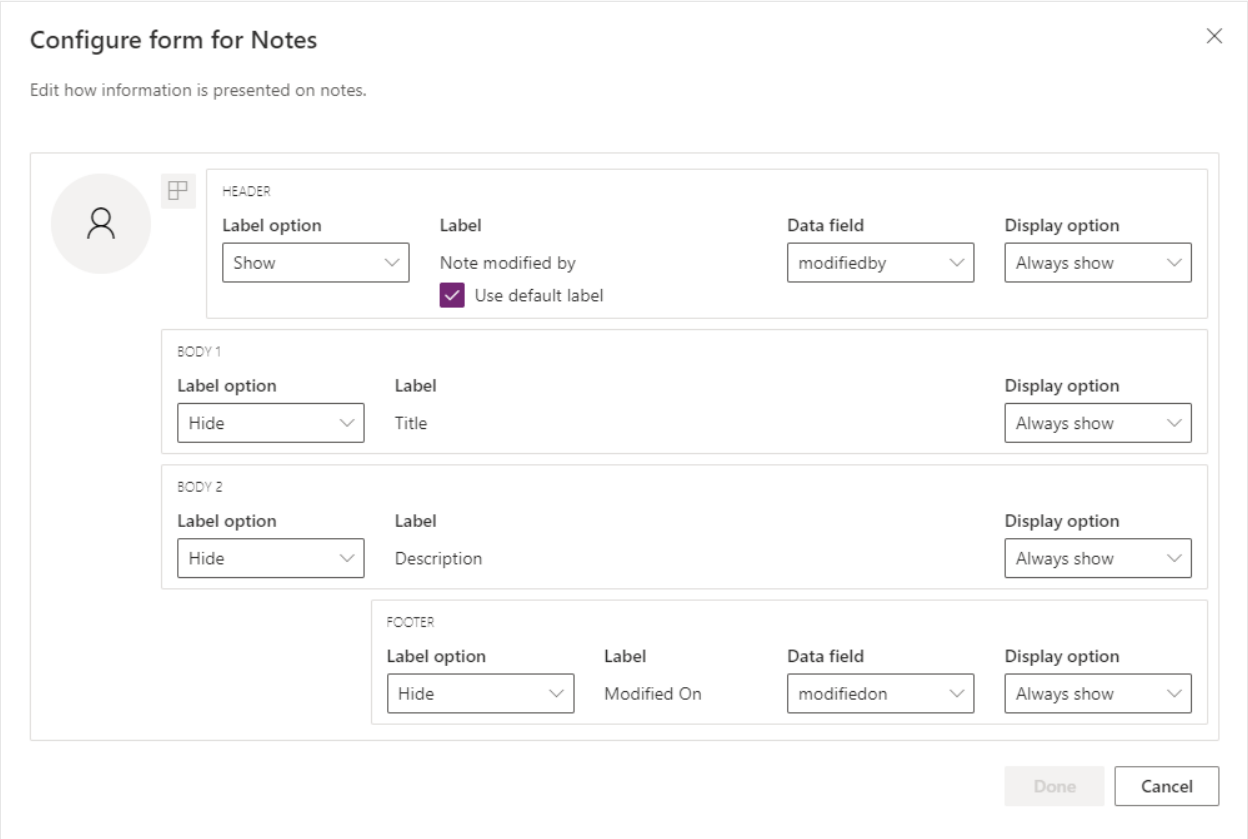
Notes on timeline

Form designer configuration view	Form designer display view
	The **Notes** section expands when enabled and allows you to: 1. **Sort notes by** date created or date modified. The **Modified On** date is the default setting. 2. Add a relative web resource path in the **Rich text editor configuration URL** column for customized note capability. More information: Add the rich text editor control to a model-driven app	1. When enabled, Notes can be access via the **Create a timeline record** + icon. 2. A dropdown list appears where you can access **Notes**. 3. Use **Notes** to create a note to add to a record using rich text editing. You can set the font and size for the notes from the timeline, without having to set it multiple times.

Configure the form for notes

In the **Notes** area, under **Configure form**, select **Default form** to configure how information is displayed in notes, such as relevant users and dates, and whether or not

to include labels. This setting lets you increase or reduce the number of timeline records that display.



- Header
  - Label option: Hide, show, or show on hover the label, "Created by" or "Modified by".
  - Label: Select the **Use default label** checkbox label to display the label "Note modified by". Clear the checkbox to display the label "Modified by".
  - Data column: Select to show either the user who created the note or the user who modified the note. The label changes to match the data column you selected.
  - Display option: Always show, show on expand, or hide this header containing the user who created or modified the note.
- Body1
  - Label option: Show or hide the label of the note.
  - Display option: Always show, show on expand, or hide the body text.
- Body2
  - Label option: Show or hide the label of the note.
  - Display option: Always show, show on expand, or hide the body text.
- Footer
  - Label option: Show or hide the label, "Created on", "Modified on", or "Overridden on".
  - Data column: Select to show the createdon, modifiedon, or overridenon date.

- Display option: Always show, show on expand, this footer containing the createdon, modifiedon, or overridenon date.

Set the notes rollup type in timeline

> **Note**
>
> This is an early access feature. You can opt in early to enable these features in your environment, which allows you to test these features and then adopt them across your environments.

The rollup type can be configured for timelines on forms for notes. The available types of rollups are **Extended**, **Related**, and **None**. To show those records only that are directly related to the notes in timeline, select **None**.

More information on rollup types is available at RollupType EnumType.

Posts on timeline

To enable rich text posts on the timeline, contact Microsoft Support.

> **Note**
>
> Posts are only available with certain Dynamics 365 apps, such as apps for Dynamics 365 Customer Service.

Form designer configuration view	Form designer display view
	The **Posts** section expands when enabled and allows you to: - Select **Enable user posts** enabling users to leave a message on the record - **Sort posts by** date created or date modified. The **Created On** date is the default setting. - The **Select and order commands (Preview)** section allows users to display the command actions that can be performed on posts displayed on the timeline. You can also move the position of the commands to change the order in which they're displayed on the timeline.	1. When enabled, posts can be accessed by selecting **Create a timeline record** +. 2. A dropdown menu displays, and you can access **Posts**. 3. Use **Posts** to create a post to add to a record. When date **Created On** is used to sort posts on the timeline, the location in the timeline remains constant even when there are responses to that post. When date **Modified On** is used to sort posts on the timeline, the location in the timeline adjusts to the top when there are responses to that post. **NOTE**: The timeline doesn't automatically refresh when post replies are added.

Form designer configuration view	Form designer display view
The **Enable simple auto posts (Preview)** allows auto posts to be displayed either in the existing card format or as a simple post. Clear the checkbox to display the posts in the existing card format. The checkbox is selected by default.		When the **Enable simple auto posts (Preview)** checkbox is enabled, the posts aren't displayed in card form. Command actions can't be performed on auto posts from the timeline.

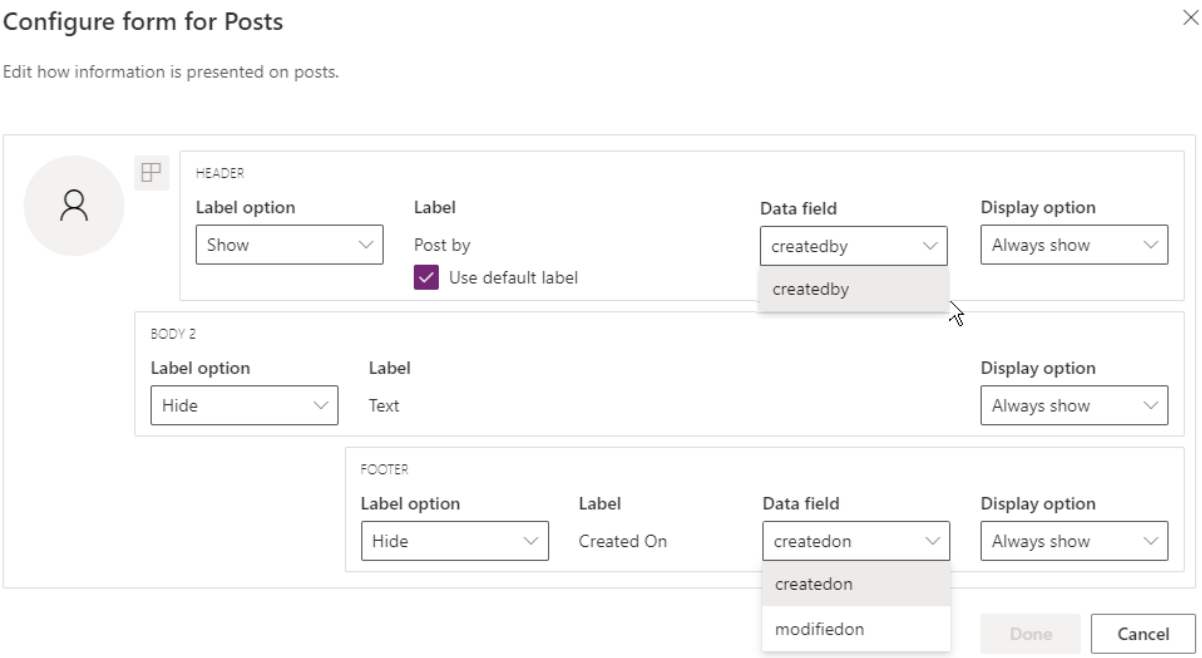
Configure the form for posts

You can configure how information is displayed in posts, such as relevant users and dates, and whether or not to include labels. This enables you to increase or reduce the number of timeline records that appear onscreen.



Go to your timeline configuration in make.powerapps.com, scroll down to the **Posts** section containing the **Configure form** column, and edit the following column in the default form:

- Header
  - Label option: Hide, show, or show on hover the label, "Created by" or "Modified by".
  - Label: Select the **Use default label** checkbox label to display the label.
  - Data column: Select to show the user who created the post. The label changes to match the data column you selected.
  - Display option: Always show, show on expand, or hide this header containing the user who created the post.
- Body2
  - Label option: Show or hide the label of the post.
  - Display option: Always show, show on expand, or hide the body text.
- Footer
  - Label option: Show or hide the label, "Created on", "Modified on", or "Overridden on".
  - Data column: Select to show the createdon or modifiedon date.
  - Display option: Always show, show on expand, this footer containing the createdon or modifiedon date.

Configure mentions in notes and posts on timeline

To enable mentions in notes and posts, contact Microsoft Help + support. You can also temporarily try out this feature before asking Microsoft to enable it by appending the following text string to your current browser session URL:

```
&flags=FCB.TimelineWallRichTextPosts=true,FCB.TimelineNotesRichTextMentions=true
```

When the rich text editor is enabled, users can mention other users and entities in notes and posts using the @ and # symbols. Configuration for the rich text editor is available in the maker experience in **Power Apps**: make.powerapps.com. The users and entities that are displayed are pulled from the configuration file provided in the **Rich text editor configuration URL** column. More information: Use the rich text editor control in Power Apps

By default, the @ symbol returns matches with the first name, family name, or email address of system users starting with the search string.

By default, the # symbol returns matches with the account and contact name table records starting with the search string.

As an administrator, you can configure other entities to appear when a user types these symbols. Adding more entities to the default configured entities may result in slower load times, so only add the entities your organization requires. You can add the following entities:

- "systemuser"
- "contact"
- "competitor"
- "lead"
- "account"
- "incident"
- "opportunity"
- "knowledge article"

To configure more entities, add and modify the following code to the configuration file you're using for rich text notes and posts:

```
"defaultSupportedProps": {
   "pcfmentions" : {
       "markerMap" : {
           "@" : ["systemuser"],
           "#" : ["account", "contact"]
       },
       "calloutWidthInpx" : "300px",
       "debounceInms" : 250
   }
 }
```

The "systemser" table persists for @ and the "account" and "contact" entities for # regardless of how the file is edited.

> **ⓘ Important**
>
> The mentions feature doesn't work with Power Platform environments that were created with the **Enable Dynamics 365 apps** option set to **Yes**. For more information about this option, go to **Create an environment with a database**.

Configure autopost messages to display on the timeline

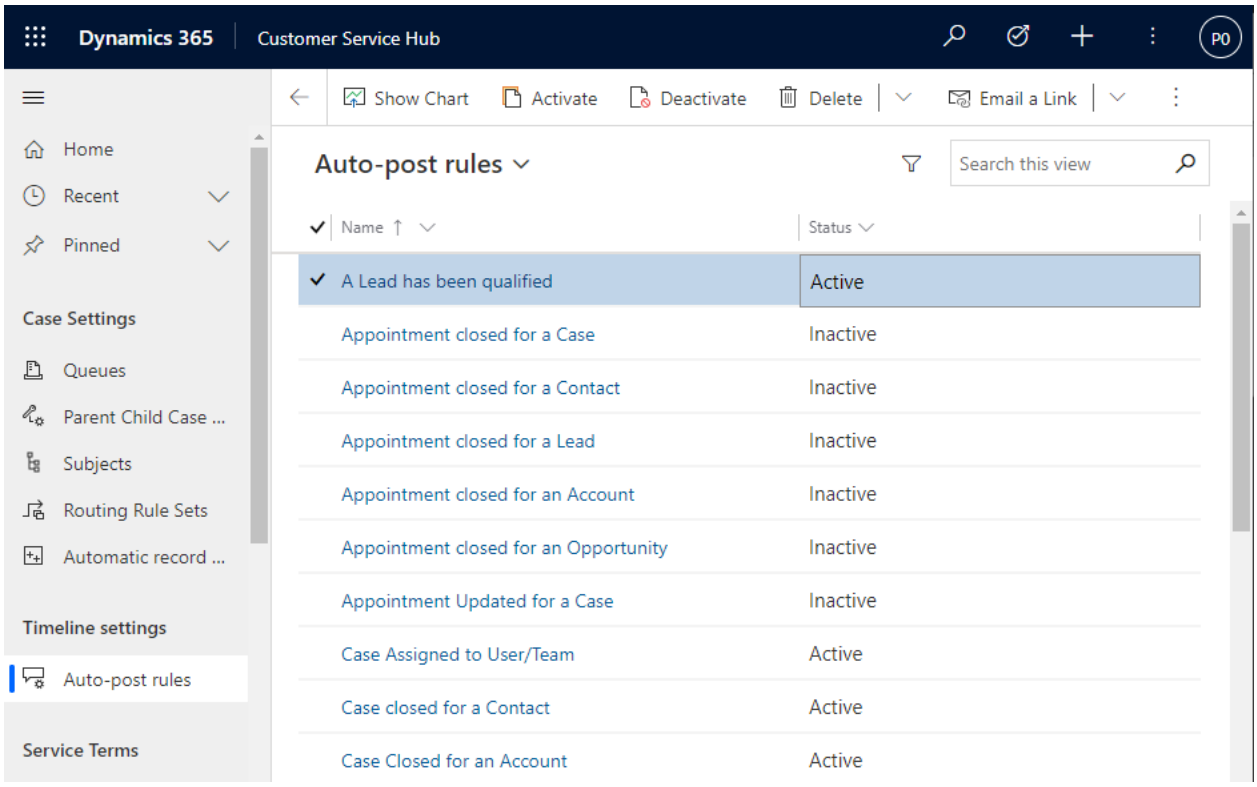
> **Note**
>
> - The autopost functionality is only available with environments that are configured for **Enable Dynamics 365 apps**.
> - Dynamics 365 incudes autopost rules for some standard tables such as account, contact, lead, and case. It is not possible to create new autopost rules. However, you can use other options such as Power Automate or a custom plug-in to create a post record based on the desired conditions.

You can configure which autopost messages appear on the timeline when a system event occurs. The autopost configuration replaces the legacy Activity Feed Configuration and Activity Feed Configuration Rules.

To configure the autopost messages that should be displayed:

1. In Customer Service Hub, go to **Service Management**, and under **Timeline settings**, select **Auto-post rules**.
2. Select which autopost rules to make active using the grid and **Activate** and **Deactivate** buttons at the top.

When a system event corresponding to an active rule occurs, an autopost message displays on the timeline.



If you're using a Dynamics 365 app other than Customer Service Hub or Customer Service workspace, you need to add your own sitemap. To add your own sitemap in your app:

1. Open your app in the app designer in **Power Apps**: make.powerapps.com
2. On the app designer command bar, select **Add page**, select **Table based view and form**, and then select **Next**.
3. In the **Table** list, select **Post Rule Configuration**, and then select **Add**.

   > **Note**
   >
   > If you don't have the Post Rule Configuration table, you're environment doesn't have the required Dynamics 365 app installed.

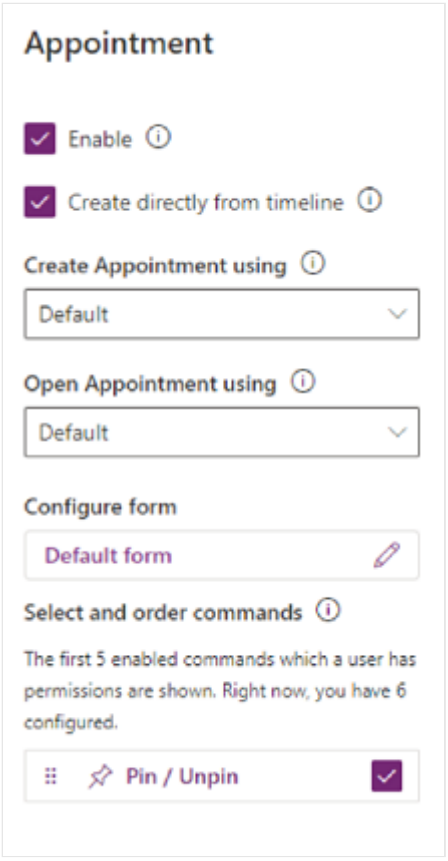
4. Select **Save**, and then select **Publish**.

Let users pin and unpin activities to the top of timeline

You can configure the ability for users to pin or unpin activities, such as notes, to the top of the timeline so that they're easily accessible. Pinning activities helps users save time by not requiring them to scroll an entire timeline to find the information they need.

By default, notes are enabled for pinning. When you click on the activity type such as a task, appointment, and so forth, the pin and unpin option appears in the list of

commands. Select the **Pin / Unpin** checkbox for each activity you want users to be able to pin or unpin.



Create and add custom activities to timeline

You can create custom tables that display on a timeline. More information: Display a custom table in a timeline

Configure blocked attachment file types

Power platform administrators can configure the file types that are blocked from being added as file attachments to records, including records in a timeline.

1. Find the **Set blocked file extensions for attachments** systems setting. More information: Open the System Settings dialog box General tab
2. In the text box of blocked file attachments, type the file extension type you want to block for attachments (for example, ".pdf"). Separate file types with a semi-colon.
3. Select **OK**.

Set file size limits for attachments

Power platform administrators can restrict the file size of attachments users can upload in the rich text editor.

> ⓘ **Note**
>
> File sizes for attachments generally can be any size under 90 MB, but for optimal system performance, smaller file sizes are recommended.

1. Go to **Advanced Settings**, and then on the Settings menu, select System > Administration.
2. On the **Administration page**, select **System Settings**.
3. On the **System Settings** dialog, select the **Email** tab, and then scroll down to find the **Set file size limit for attachments** value.
4. Enter the desired size limit for attachments, and then select **Save**. 131,072 KB is the maximum allowed value.

Known issues

Duplicate posts are shown when sorting records by older to newer

The API the timeline uses to fetch posts doesn't support sorting by older to newer posts. When you sort this way, the timeline receives the wrong posts to display. When sorting the timeline by older to newer, use notes instead.

Notes can only have one attachment added from the attachment button

This is by design, with plans to allow more attachments in the near future. Multiple attachments can be added inline by dragging and dropping them into the note.

Timeline fails to load with error `code:"0x8004430d","message":"Number of link entity: <number> exceed limit 15`

There's a limit of 15 different tables that can be associated with a timeline. Either disable some of the activities associated with the timeline, or follow one of the workarounds

described in this article: Timeline doesn't render and shows "Records couldn't be loaded"

When you create a note in a timeline, the character string "$&" is converted to "{3}amp;"

This is a configuration issue for the rich text editor control. To resolve this, add `"removePlugins": "stickystyles"` to your RTE config file. More information: Rich text editor properties

FAQs for timeline control

Use the timeline control

Turn on linking of timeline notes with other table records

Article • 08/01/2023

You can use **Relate note to a table record** to perform the following actions without leaving the page that you're on:

- Move a note on the timeline of an existing table record to another table record. For example, you can move a note on the timeline of a contact to an existing case. After you move the note, it'll appear only on the timeline to which you've moved and not on both.
- Create a new table record from the note. For example, you can create a case from an existing note on a contact's timeline.

You can enable this feature for any table that allows you to add a timeline component. However, the tables that a note can be linked to are only account, contact, and case.

Configure linking of timeline notes

1. In Power Apps, select the environment that contains your solution.
2. Select **Tables**, and then select the table for which agents can link notes taken on the timeline.
3. Select **Form**.
4. Create a new form or use an existing form. More information: Create, edit, or configure forms using the model-driven form designer.
5. Select the timeline component on the form.
6. In the **Properties** > **Notes** section, perform the following steps:

    - Select **Link to Table**.
    - Select the table you want to link the note to. You can select account, case, and contact. The required table's pane appears.
    - Select **Enable** on the table's pane. If you've selected **Case**, you must specify the following:
        - **Create Case using**: the form type that opens when the agent creates a new case from the note.
        - **Configure form**: the form that is displayed when the agent creates a new case from the note.
        - **Map notes title to**: the field to which the notes title should get copied. For example, if you select **Case Title**, when you create a new case, the Case title is auto- populated with the value of the notes title.

- **Map notes description to**: The field to which the notes description should get copied to. For example, if you select **Description**, when you create a new case, the case description is auto populated with the value of the notes description.

7. Save and publish the customizations.

Learn about linking timeline notes with tables

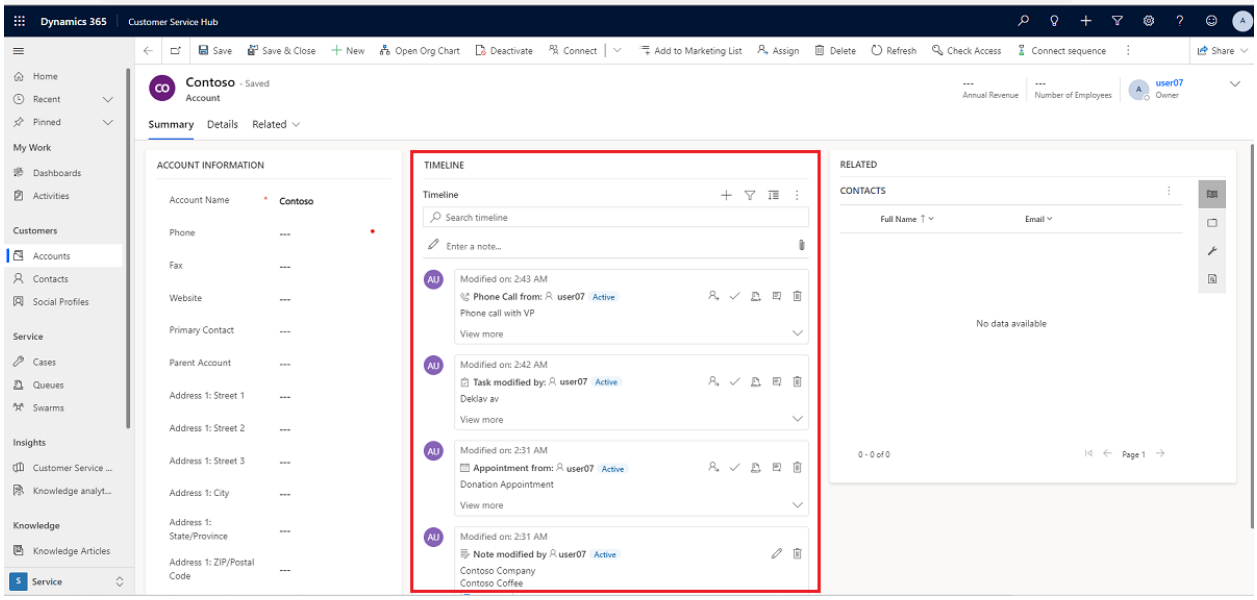
Use timeline

Article • 10/04/2023

Timeline is a modernized and optimized control that helps provide you with at-a-glance understandability when working with your customers. You can use the timeline to view information that is connected to a row in a table and occurs over time in a single stream. Some information that can be logged into the timeline includes notes and posts, in addition to displaying activities such as emails, appointments, phone calls, and tasks.

Timeline allows you to:

- Access the command bar to perform common actions quickly
- Filter and view important notes, posts, and activities using multiple filter options, and keep the filtered settings across activities
- Quickly view and manage email conversation threads with ease
- Keep detailed customer records by attaching important files and images to posts



Timeline functionality

The timeline section on the table form is intended to centralize access to information and streamline effort to accomplish actions. The following section is an overview of how the timeline functionality works in each section on the table form.

When enabled by your system administrator, you can use the icons that are displayed on the top-right navigation in the timeline for quick access to do the following actions:

- Create a timeline row
- Work with Filters

- Work with row
- Explore more commands
- Search row
- Add attachments

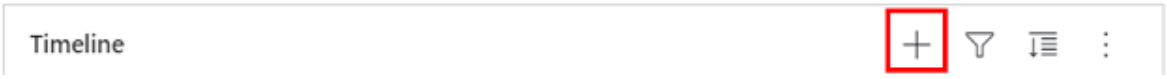
The timeline dashboard displays only the entities that are configured for the signed-in user. So, what you see on the timeline may differ from what another user sees. The signed-in user sees any rows they've followed if those rows are configured to display on the dashboard. For example, if only email and appointments are configured to display, then the signed-in user only sees email that relates to them, which can be email they've sent, email sent to them, and email they follow. The same would be true for appointments in this scenario. For more information on setting up timeline, see Set up the timeline control.

> **Note**
>
> The Notes feature isn't available from the timeline.

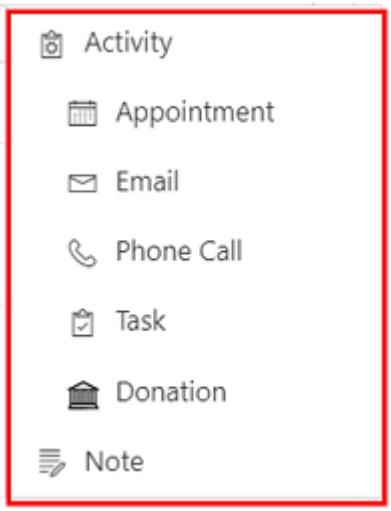
Create a timeline row

When enabled by your system administrator, you can use the **Create a timeline record** feature to quickly create appointments, tasks, send emails, and make notes and posts and associate them with other rows.

1. Select **Create a timeline record** icon.



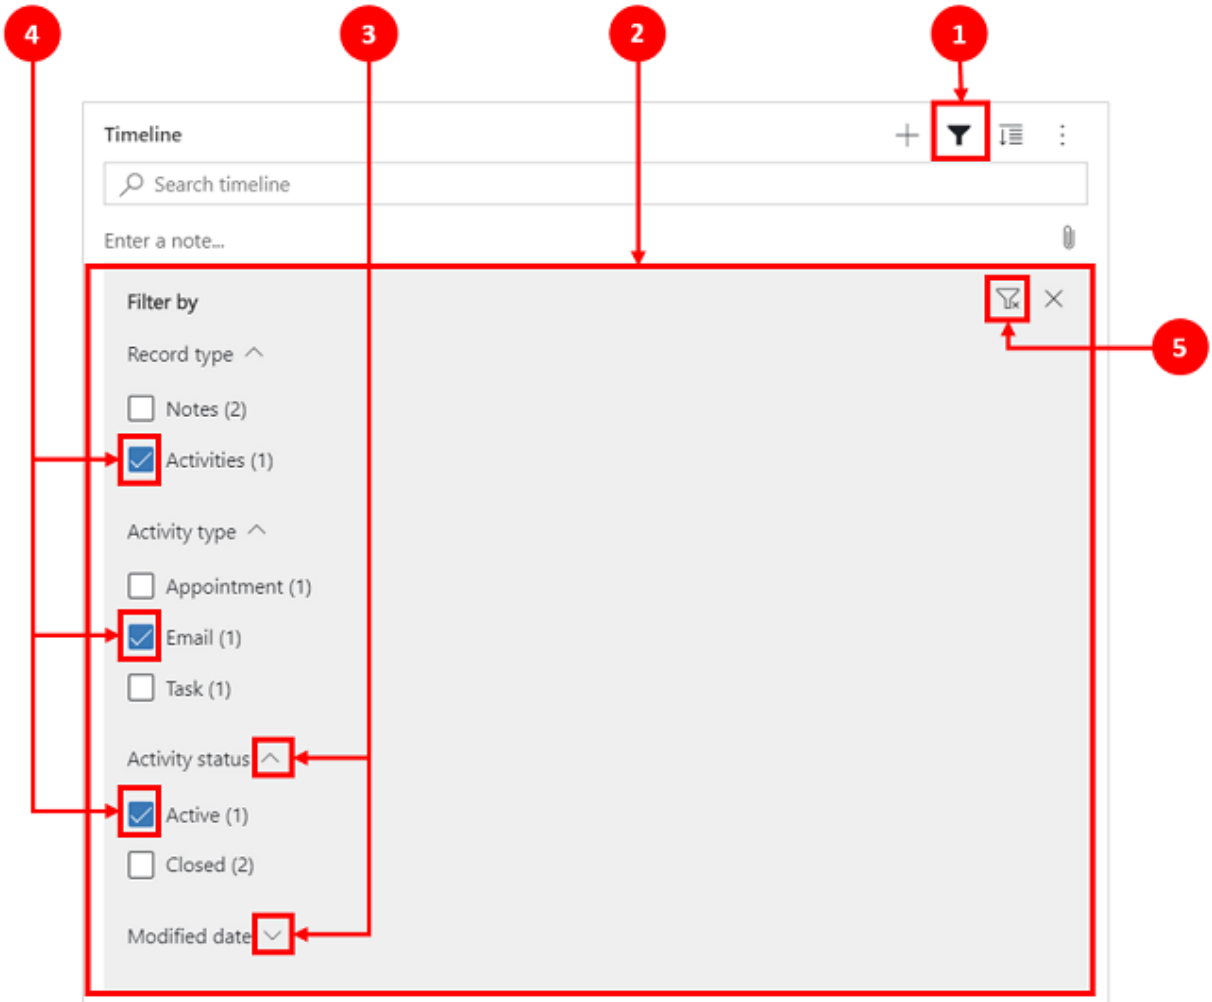
2. Select the type of row you want to create from the display options available.



For information on timeline row configuration, Set up the timeline control.

Work with filters

When enabled by your system administrator, the timeline **Filter** further streamlines your productivity by allowing you to customize your experience and view data that's relevant to you.



Legend:

1. The timeline **Filter** icon is located in the top-right navigation on the timeline.
2. The filter pane displays when the filter icon is selected.
3. Use the carats to expand or minimize selections.
4. When enabled by your system administrator, row and activity types are displayed in the filter pane. Row and activity types can be filtered by selecting the corresponding box next to the item.
5. The icon removes and clears all filter selections from the filter pane.

Filter rows on timeline

Filters are valuable for sorting data. You can easily filter through rows and activity types using multiple options to quickly see what matters to you. The filter is available for the activities, notes, posts, and custom entities that are present in timeline.

Filter icon display

- When the **Filter** icon displays as a transparent , it means the filter pane is empty and nothing has been applied.
- When the **Filter** icon displays as dark , it means filters are applied.

Filter options

The following category and subcategory options are available on the filer menu:

Category	Subcategory
Row type	• Notes • Posts • Activities
Activity type	• Appointment • Campaign Activity • Campaign Response • Email • Fax • Case Resolution • Letter • Opportunity Close • Order Close • Phone Call • Quote Close • Recurring Appointment • Social Activity • Task • Project Service Approval • Booking Alert • Conversation • Session • Customer Voice survey invite • Customer Voice survey response • Custom activities (as configured by your system administrator)
Activity status	• Active • Overdue • Closed
Activity due date (active)	• Next 30 days

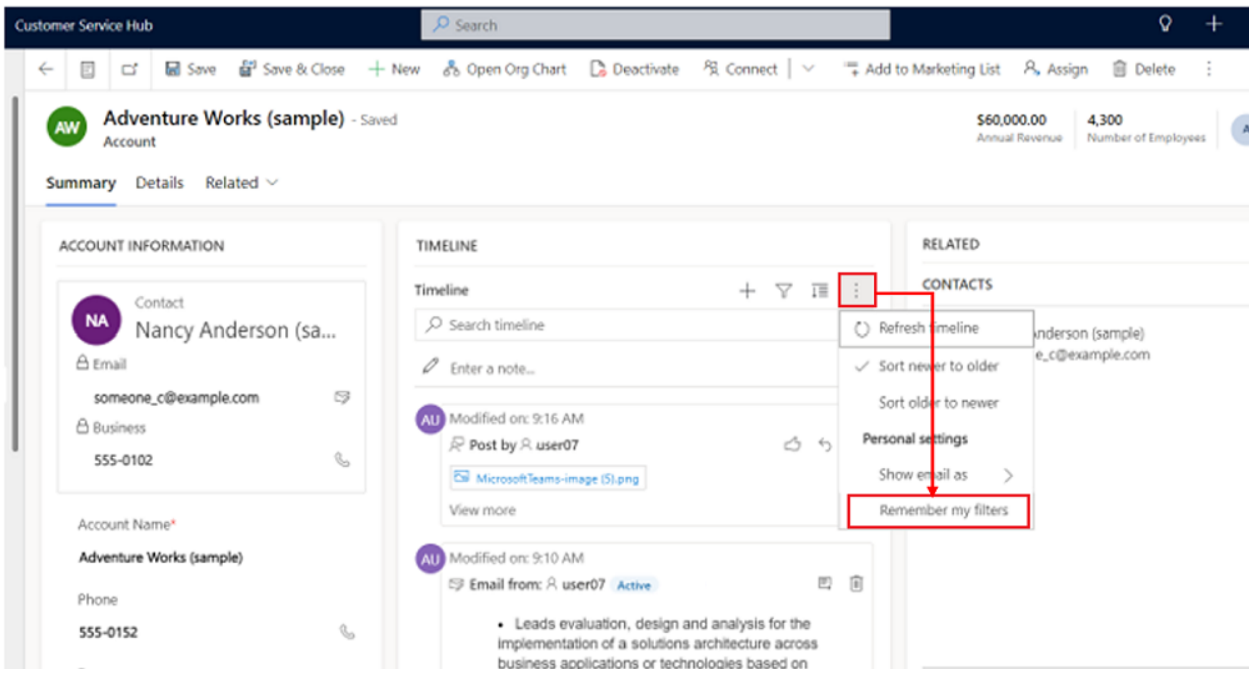
Category	Subcategory
	• Next seven days • Next 24 hours • Last 24 hours • Last seven days • Last 30 days
Posts by	• Auto post • Users
Modified date	• Last 24 hours • Last seven days • Last 30 days

Save filter settings

You can choose to save your filter settings so that you don't have to set them again each time you work with activities in the timeline.

To save your filter settings, after configuring the filters you want, select the ellipses, and then select **Remember my filters**.

> **Note**
>
> If you have a system administrator or basic user role, Remember my filters works by default. If you don't have either of these roles, you must have Create/Read/Write privileges to be added to the msdyn_customcontrolextendedsettings table for the setting to work.

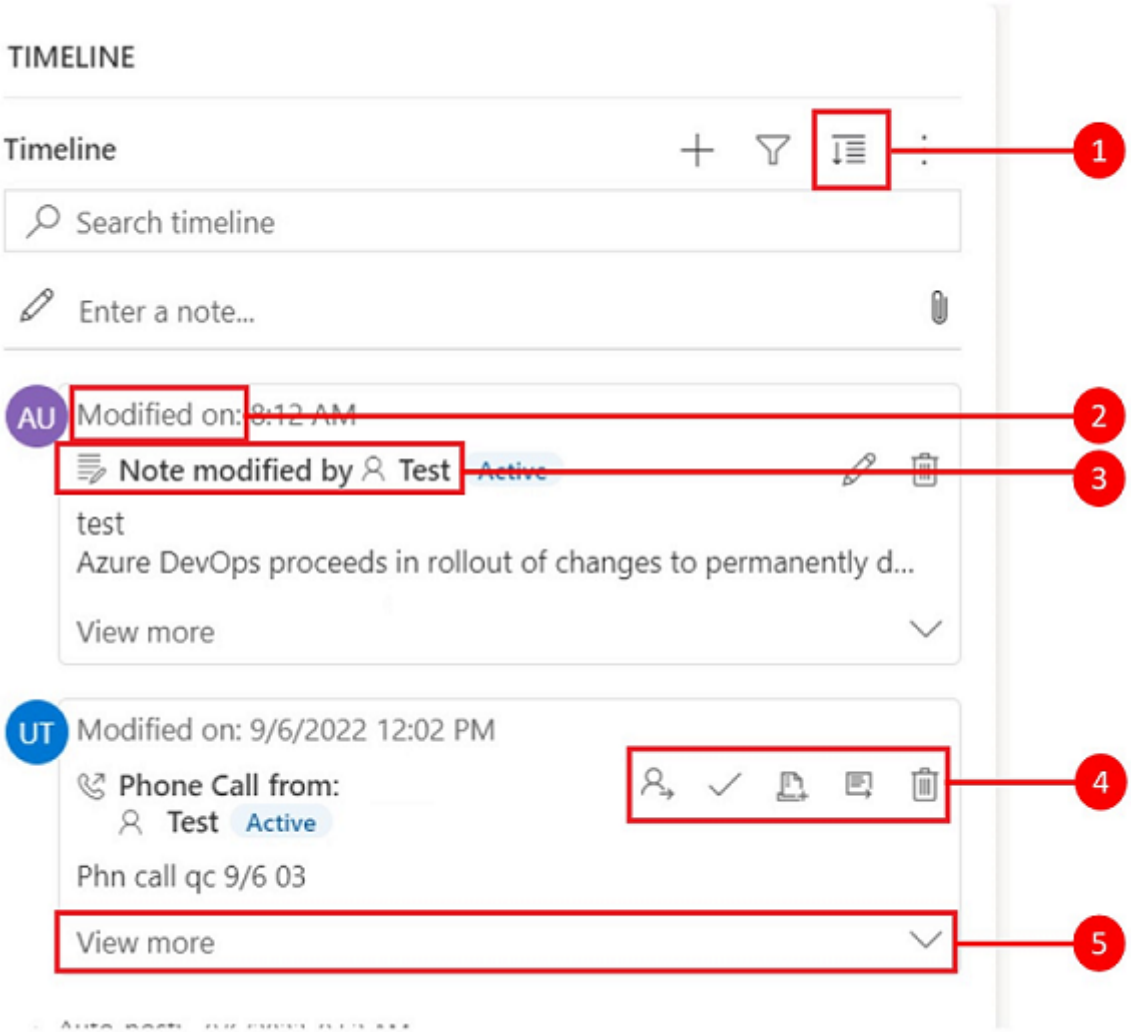


Work with rows

When working with rows, you can view key information at a glance or expand rows to view more details. When you hover over a row, actions display that you can use.

Expand all rows

When enabled by your system administrator, you can view timeline rows quickly in a collapsed format or expand a row to see more details for ease of use.



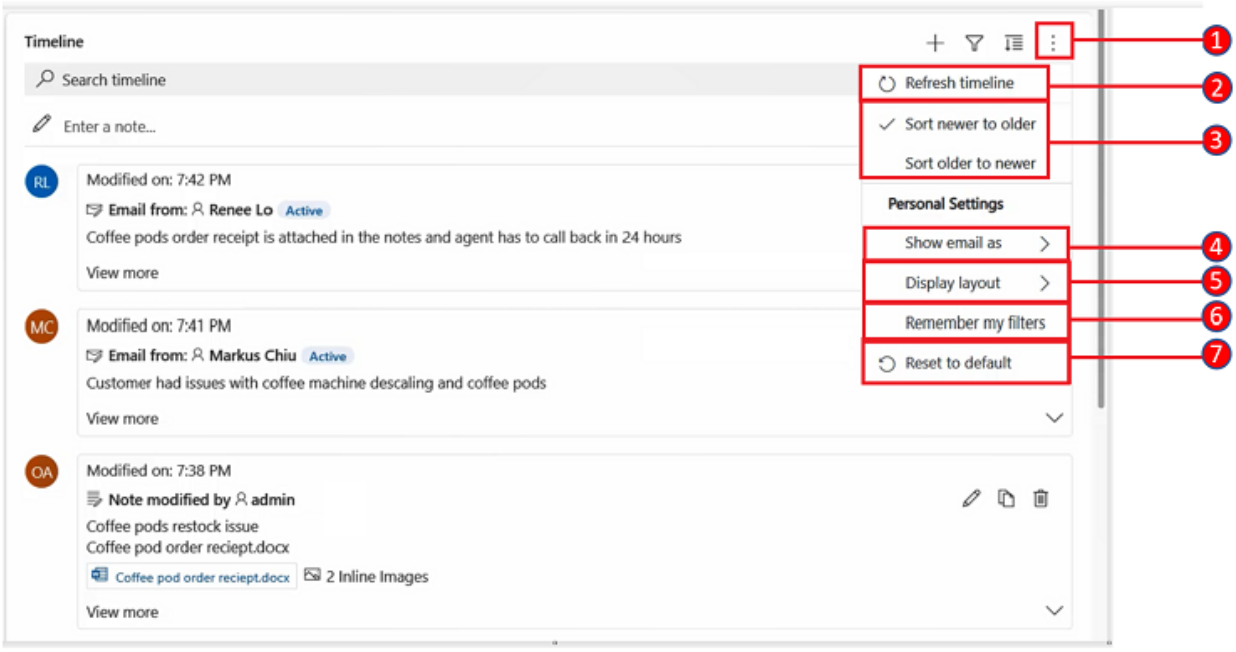
Legend

1. The **Expand all records** icon is used to expand all rows listed on the timeline.
2. The **Modified on** timestamp displays the time the record was last updated.
3. Each row has a list of commands relevant to their row type that displays in the top right corner for ease of use.
4. Row backgrounds change to grey when you hover over it, and it becomes transparent again when you move the mouse away.

5. The carats in the bottom-right corner of each row allow you to expand (^) or minimize (v) the display views.

More commands

The **More commands** option contains refresh, sort, and email functionalities.



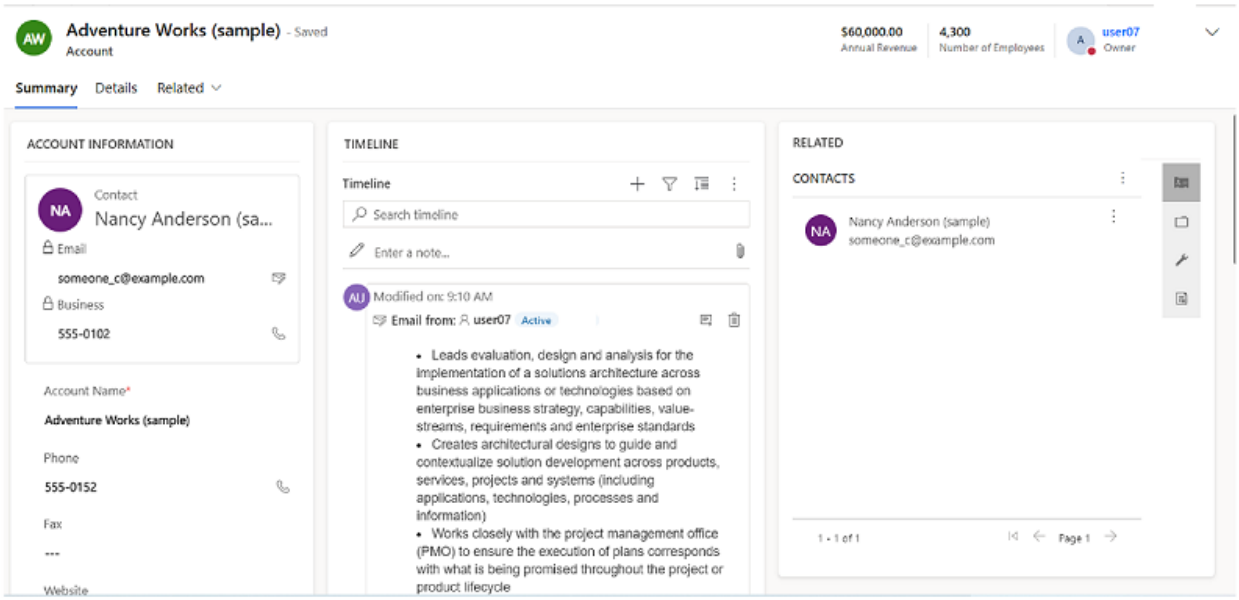
Legend

1. The **More commands** icon, when expanded, provides more functionality options.
2. The **Refresh timeline** command updates row details in the timeline.
3. The **Sort newer to older** or **Sort older to newer** command is used to sort rows.
4. The **Show email as** command is used to enable or disable threaded email views.
5. The **Display layout** command allows you to choose from two different views: **Roomy** or **Cozy**. **Roomy** (set by default) shows you more information, such as profile details, and adds space between the rows. **Cozy** hides some of the details, such as icons, and compacts the space between rows.
6. The **Remember my filters** command allows your filters to persist when you close the record so that they continue to be applied across sessions.
7. The **Reset to default** command reverts all of the command settings you've changed back to the default settings.

View email inline in timeline

If preferred, you can view email messages inline on the timeline rather than open them as separate pages.

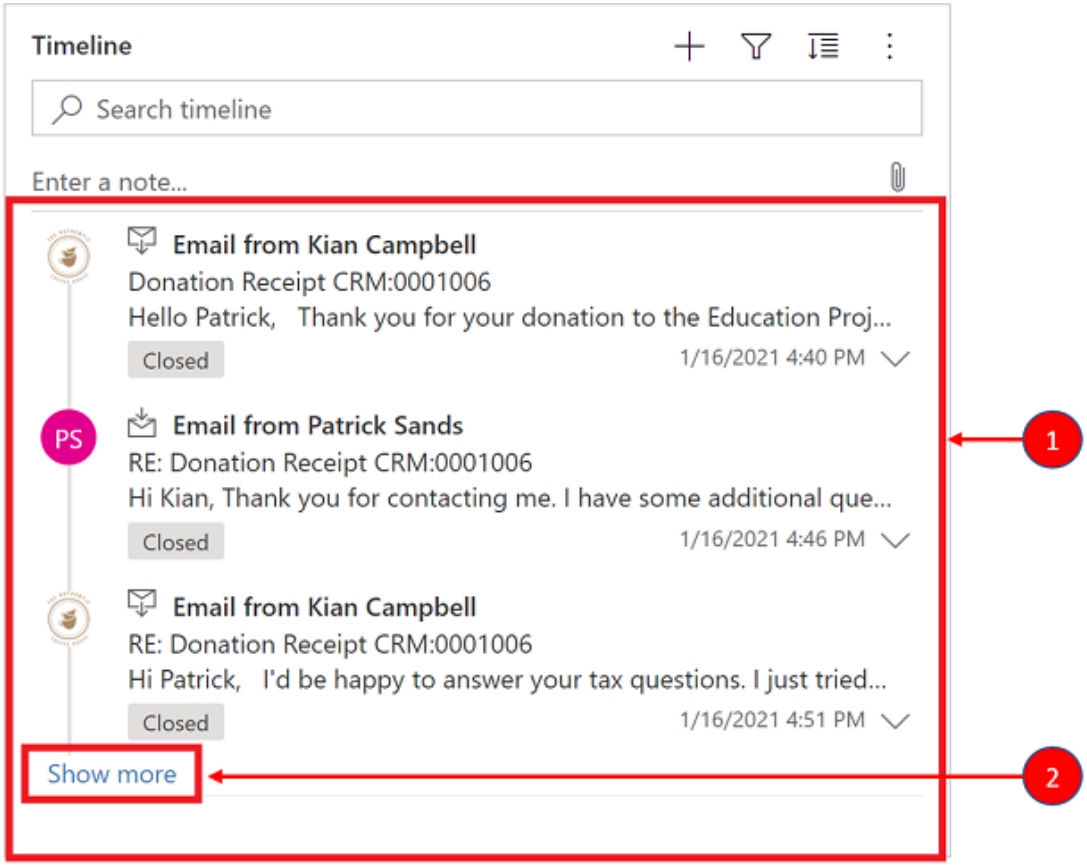
To view an email directly in the timeline, on the row, select **View more**. The email is displayed on the same form. When you're finished viewing the email, you can collapse the screen and return to the previous view of the form.



Threaded email views in timeline

Use the threaded email view option to save valuable space when you have emails with multiple replies. This view consolidates email threads when collapsed.

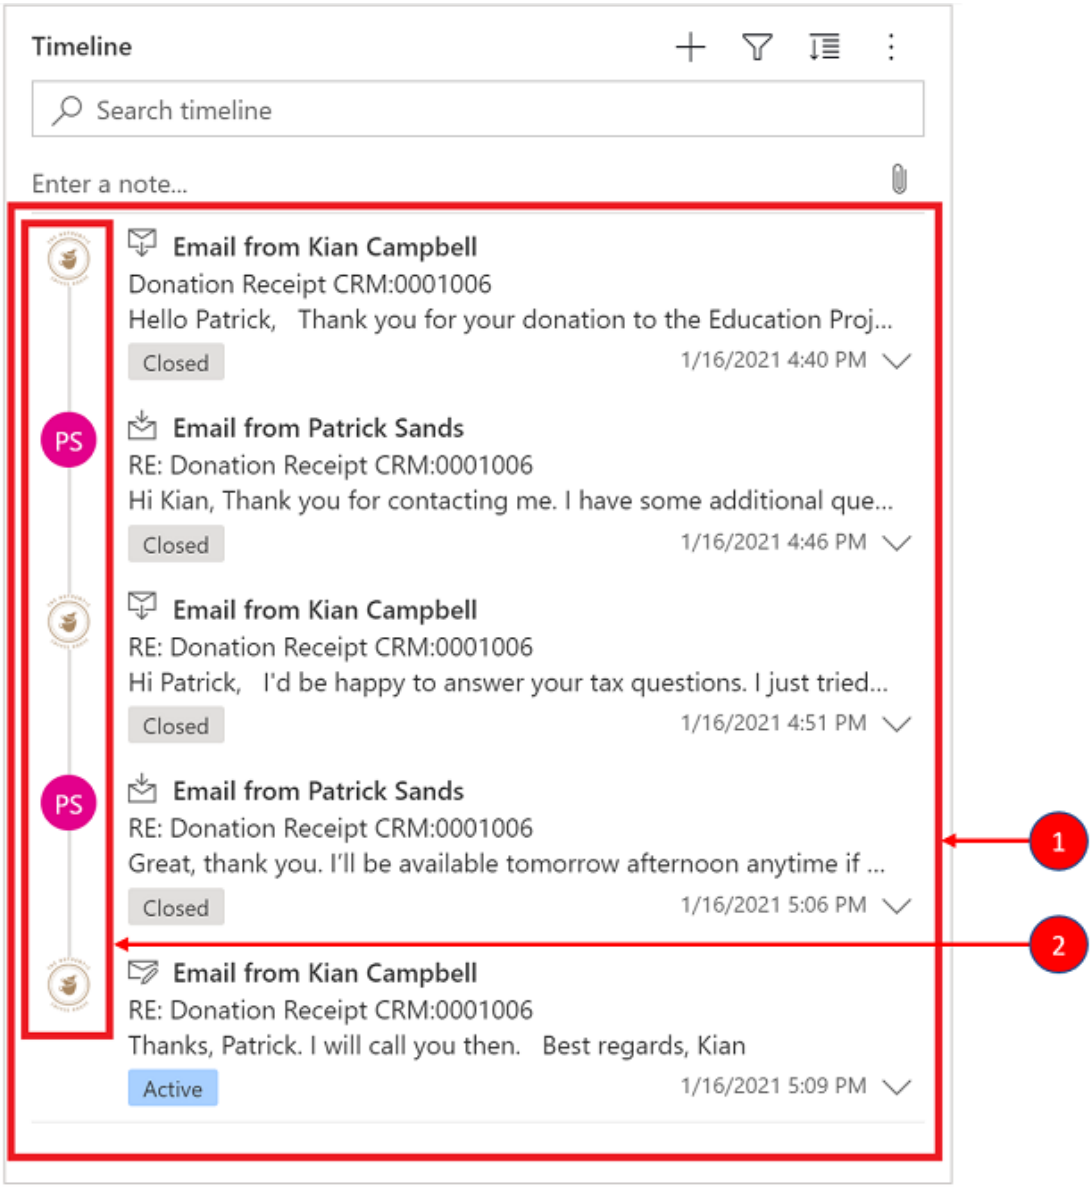
Collapsed threaded email view



Legend

1. When enabled using the **Always show email as conversations** option under **More commands** ⋮, emails with multiple responses are grouped together into threaded emails.
2. The **Show more** link appears in the bottom-left corner of the last visible email in the thread to view the complete string of email responses.

Expanded threaded email view



Legend

1. When expanded, the most recent 10 email responses in the thread display. To display more, select **Show more** to expand the view again.
2. Emails in the same thread are displayed as being linked together.

Enable threaded email views in timeline

Enabling the threaded email view is done via the timeline configuration in Power Apps. Threaded email views must be done in this setting for the specific table, in the specific form, for each specific timeline.

Threaded email views can be enabled in timeline via two options:

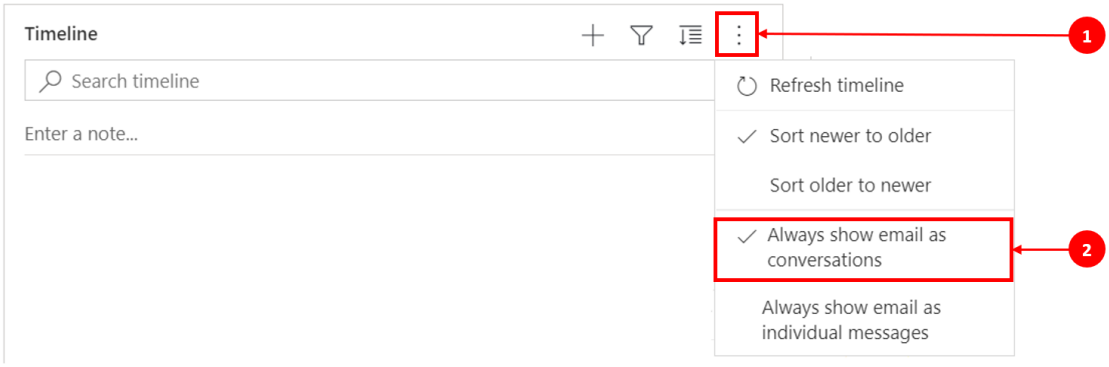
Option 1:

You can enable the threaded email view using the **More Commands** feature, located on the right-hand side of the timeline.

Enable threaded email through the More Commands option

Steps:

1. Use the **More commands** icon on timeline that displays a flyout menu.
2. Select **Always show email as conversations** to thread and group all emails in that specific timeline.



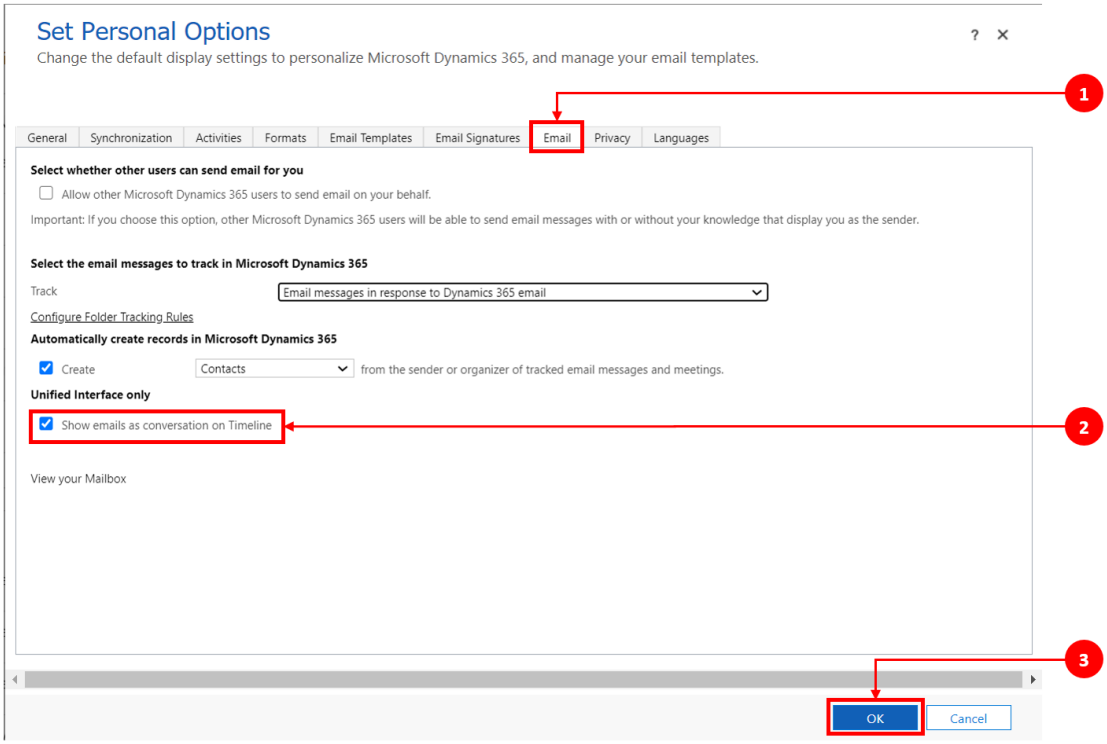
Option 2:

Enable threaded email through Personal Options setting

To enable threaded email via this option, go to the command bar and select **Settings**, then **Personalization Settings**. The **Set Personal Options** dialog box is displayed so you can use the following steps to enable the threaded email view on timeline.

Steps:

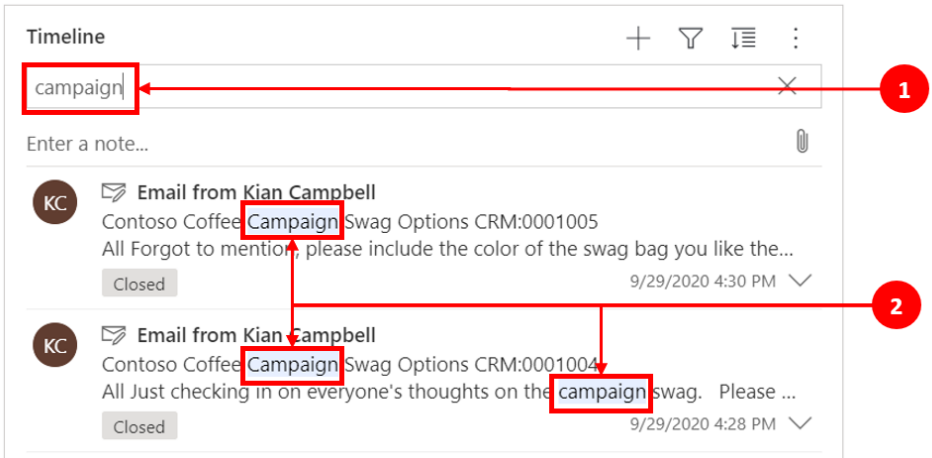
1. Select the **Email** tab.
2. Select the **Show emails as conversation on Timeline** check box.
3. Select **OK**.



> **Note**
>
> The **emails as conversation** view is based on the user's preference. Personal settings are tied to the user, not the form, which means when you enable the threaded email view, the setting is applied to all of your timeline views.

Search rows on timeline

When enabled by your system administrator, you can easily search for rows in the timeline. When you search for a phrase in the timeline, it searches in the title, subject of the row, body, or description fields of the row and displays the row for you.



Legend

1. The **Search** bar allows you to quickly find rows using keywords or phrases that the search feature retrieves and displays below the search bar.
2. Keywords that are used are highlighted.

Work with notes and posts

Notes allow you to record richly formatted information and images for reference, summary, or investigation. You can easily add a mention to another user or a reference to a timeline row. The mention capability is available in timeline only when rich text notes and rich text posts are enabled.

When you type the @ symbol, the results you see are matches with the first name, last name, or email address of system users starting with your search string. When you mouse over the profile image, you can view the user's detailed profile card and online presence status. More information: View the profile card for a contact or user.

When you type the # symbol, the results you see are matches with the account and contact name table rows starting with your search string.

Add a note or post to a row on timeline

When enabled by your system administrator, you can either add a note or a post to a row on timeline. Each note and post has a maximum size limit of 100,000 characters.

You can also enter a note and add it to a row, but you can only add one attachment per note. If your administrator hasn't enabled note, you can't add an attachment.

Note display view

When enabled by your system administrator, the **Note** field is displayed under the **Search** feature on timeline.

Post display view

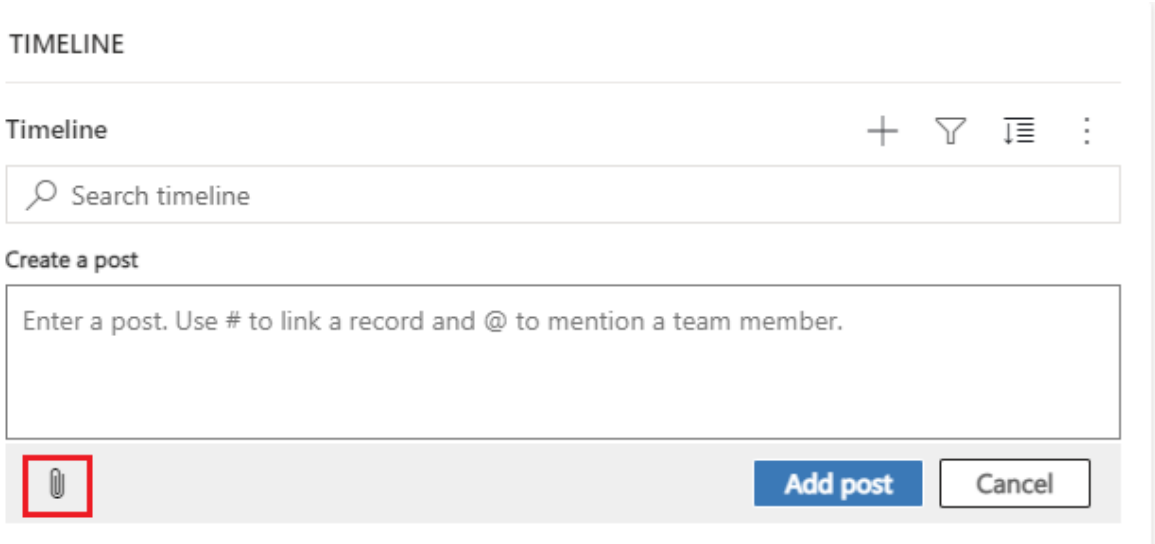
When enabled by your system administrator, the **Post** field is also displayed under the **Search** feature on timeline.

Add an attachment to a post

You can add an attachment to a post, such an image or a document. The supported file formats are as follows: .JPG, .PNG, and .PDF.

To add an attachment to a post:

1. In the **Create a post** section in the timeline, select the **Attach** icon in the lower-left corner.

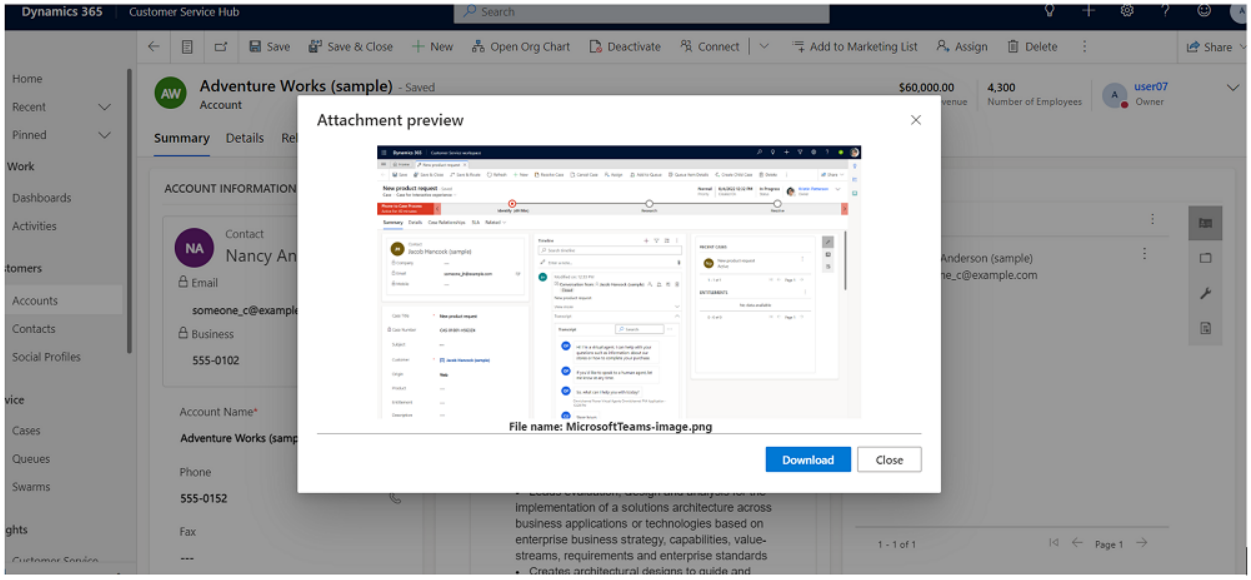


2. Browse to the file you want to attach to the post, and then select it.

3. Finish the edits you want to make to your post, and then in the timeline, select **Add post**.

Preview an attachment in the timeline

You can view previews of attachments in the timeline if they are in the supported file format (.JPG, .PNG., or .PDF). Any attachment that is viewable inline on the timeline can be downloaded, whether or not a preview is available.



To preview an attachment in the timeline, do either of the following steps:

In edit mode:

1. Right-click the attachment, and then select **Preview**. The **Attachment preview** dialog opens with the attachment displayed. You can view and download the attachment from the dialog.
2. When you're finished viewing the attachment, select **Close** to return to the note or post.

OR

In read mode:

1. Select the attachment. The **Attachment preview** dialog opens with the attachment displayed. You can view and download the attachment from the dialog.
2. When you're finished viewing or downloading the attachment, select **Close** to return to the note or post.

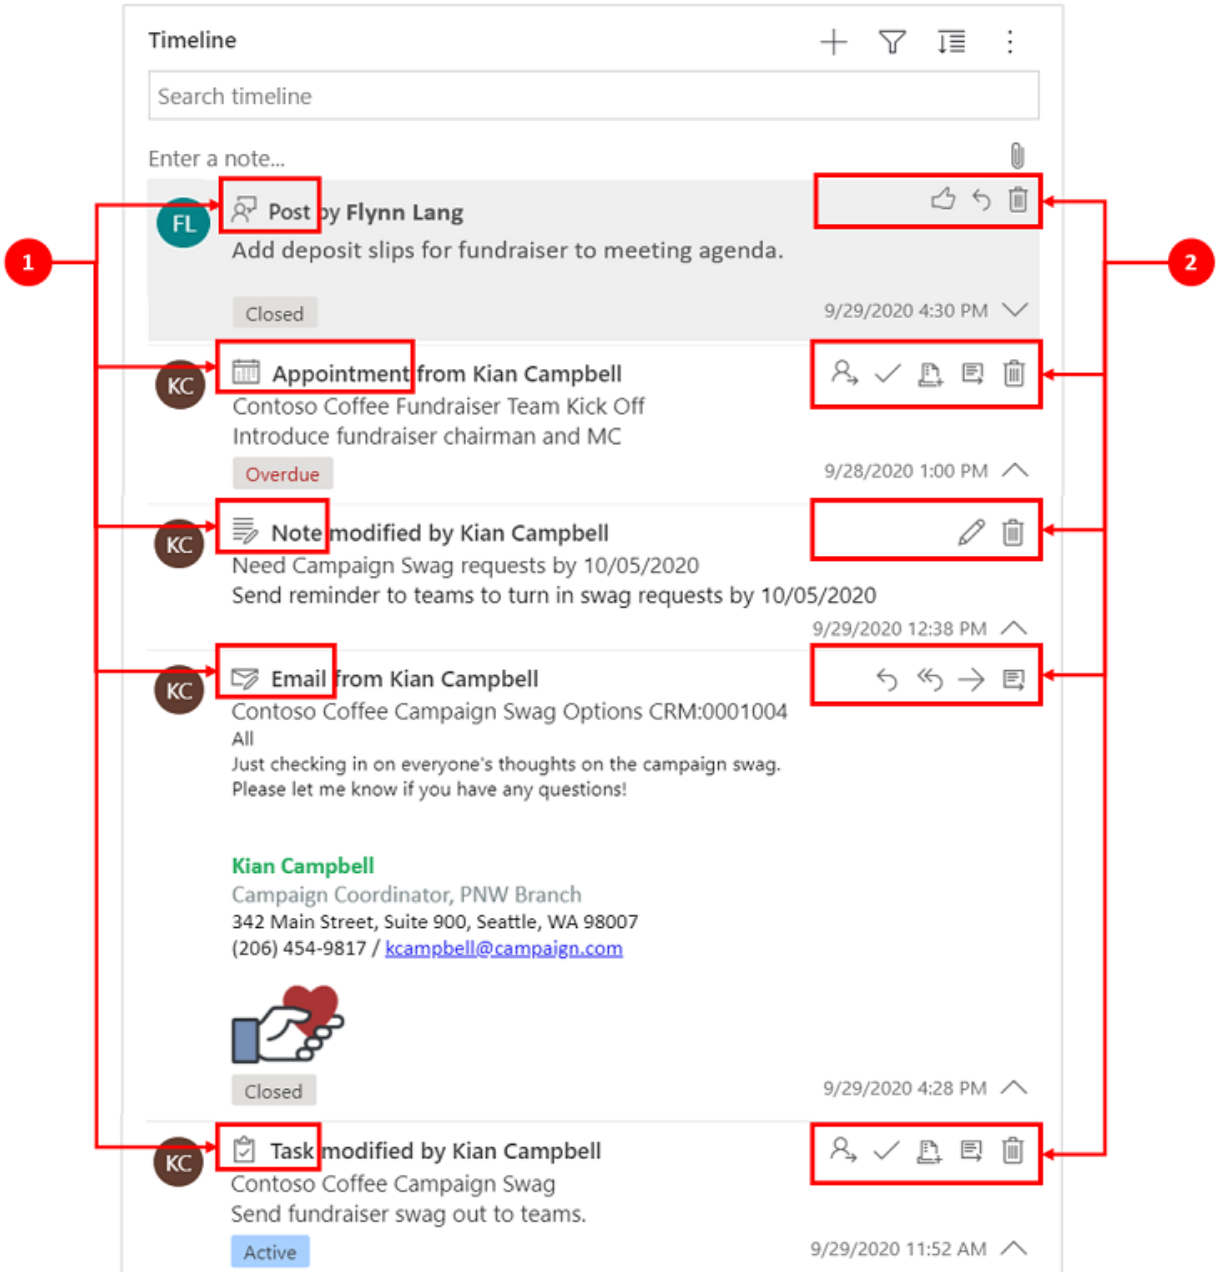
> ⓘ **Note**
>
> The use of the **Attachment preview** dialog to view the file can be skipped in the browser by using **Ctrl + Left click (of mouse)**. By doing so, the attachment is directly downloaded without previewing it.

Access the command bar to perform actions

When you hover your cursor on or expand an activity, post, or note, the command bar appears in the top-right corner of the row with the specific options that support that activity, such as assigning it to others, adding it to a queue, converting it to a case, liking

or replying to a post, editing a note, or deleting an activity. However, not all rows can perform the same actions.

Command actions by row



Legend

1. Only the actions associated with that row are displayed in the top-right command bar displayed in the row.
2. Each row displays a different set of associated actions. Not all actions work on all rows.

The following table is an overview of the command bar icons and the actions they support:

Icon	Name	Description
	Assign	Lets you assign a task.
	Close Activity	Lets you close the activity row.
	Add to Queue	Lets you add a task to a queue.
	Open Row	Lets you open a row.
	Delete	Lets you delete the row.
	Reply	Lets you reply to an email. **Note**: This command is only available for Email.
	Reply All	Lets you reply to all for an email. **Note**: This command is only available on Email.
	Forward	Lets you forward an email. **Note**: This command is only available on Email.
	Like this post	Lets you like a post. **Note**: This command is only available on Posts.
	Edit this note	Lets you edit a note. **Note**: This command is only available on Notes.

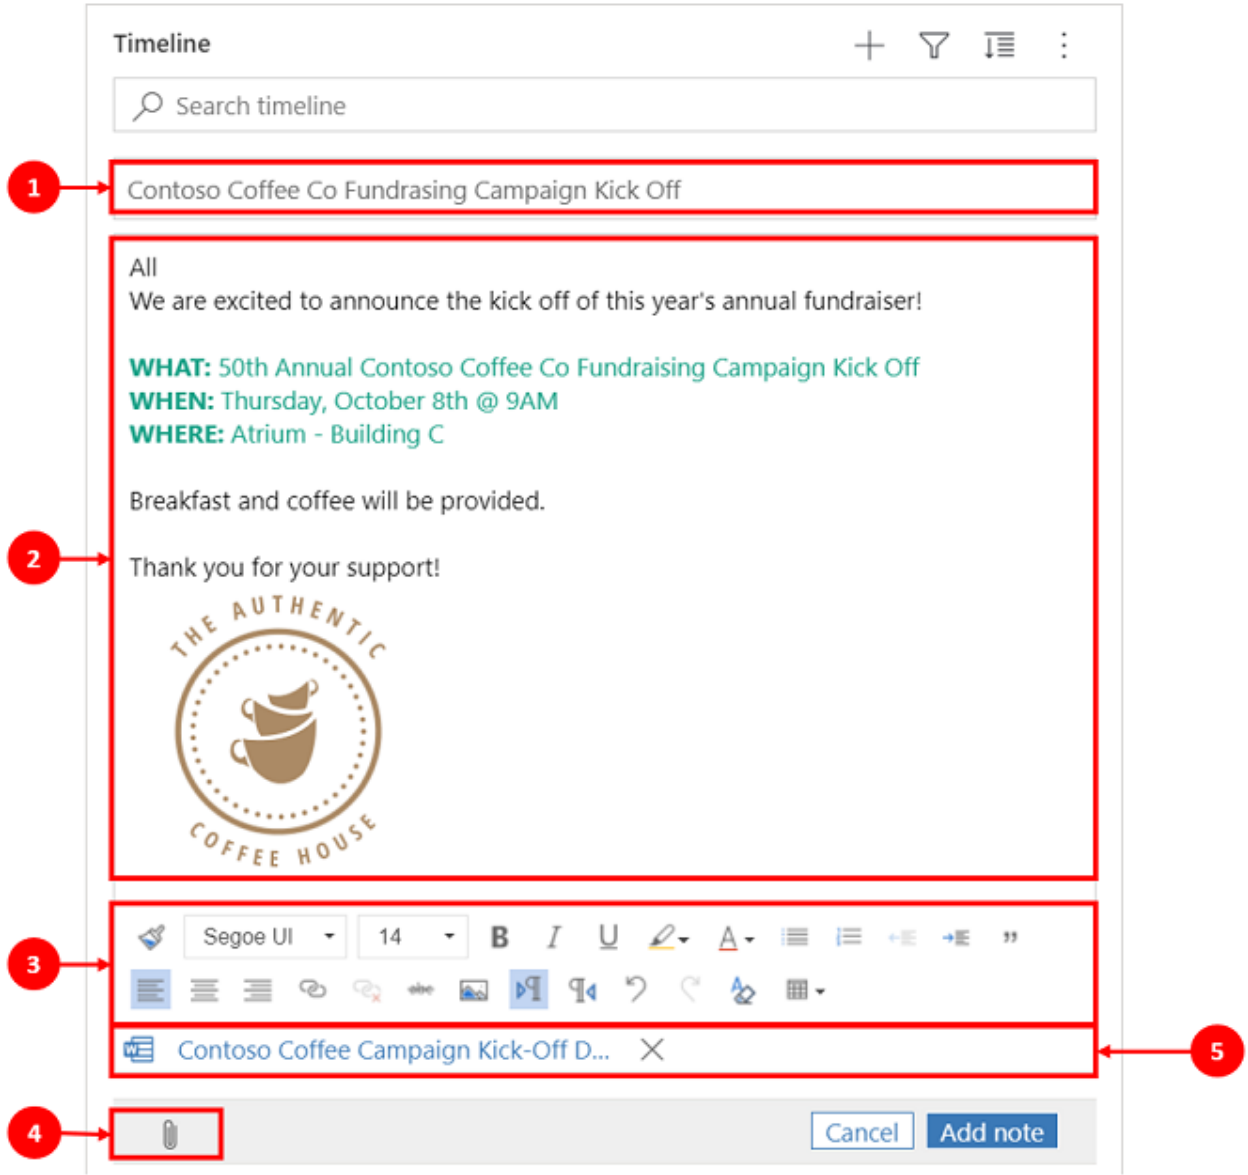
The following table is an overview of the default command bars for frequently used activities, notes, and posts:

Activity	Command bar icons	Notes
Email (draft)	Open Row, Delete	
Email	Reply, Reply All, Forward, Open Row	
Appointment	Assign, Close Activity, Add to Queue, Open Row, Delete	
Appointment (closed)	Assign, Add to Queue, Open Row, Delete	

Activity	Command bar icons	Notes
Task	Assign, Close Activity, Add to Queue, Open Row, Delete	
Task (closed)	Assign, Add to Queue, Open Row, Delete	
Phone Call	Assign, Add to Queue, Open Row, Delete	
Note	Edit, Delete	
Post (user)	Like, Reply, Delete	Only the author of the post has the ability to delete it. The author always has the ability to delete regardless of user privilege.
Autopost	Like, Reply, Delete	

Work with notes

The **Note** message box has a rich text editor that enables you to use rich text and create well-formatted content.



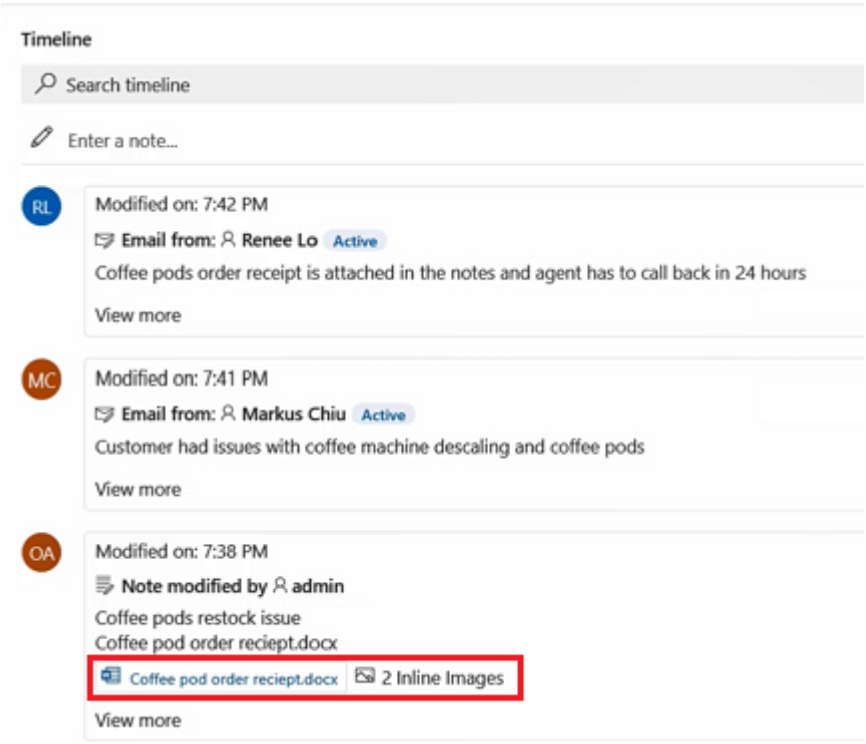
Legend

1. Note title field for adding headings and subjects.
2. Notes have a rich text editor so you can format and structure your messages.
3. The rich text editing tool expands to a full menu for quick access to formatting features.
4. The paperclip is used to attach files to your note.
5. Attached files are displayed at the bottom of the note.

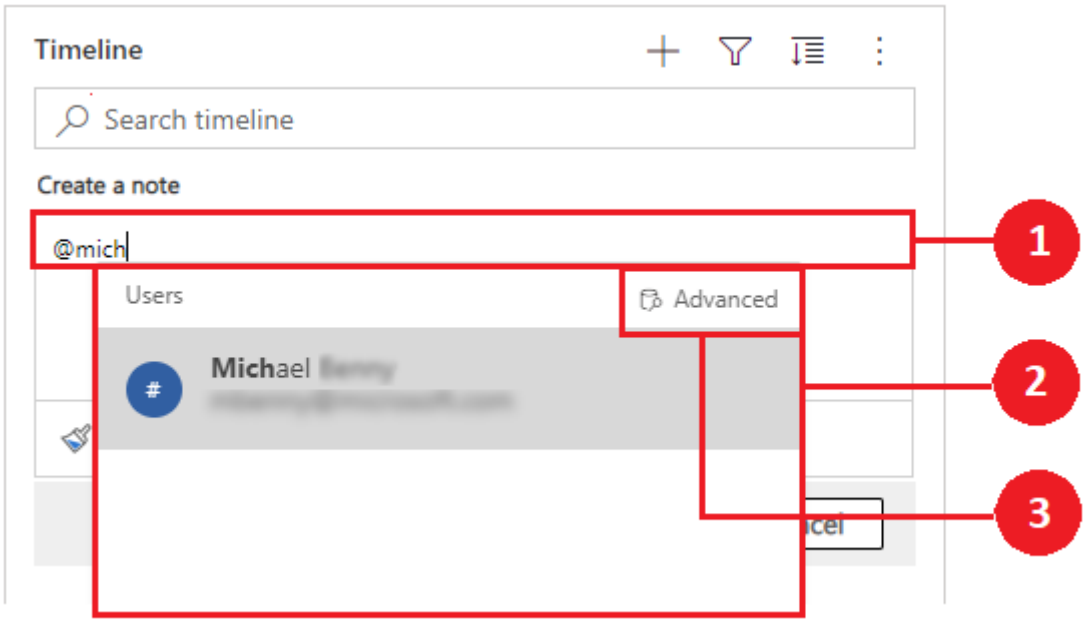
> **Note**
>
> - Only **Notes** have rich text capability, and they're only available in the timeline.
> - You can only format the message body of a note; not the title.
> - The rich text editor is available only for Unified Interface.
> - If you create a rich text editor note in Unified Interface and then view the note in the web client, it displays in HTML syntax.

View whether a note has attachments and inline files in the timeline

If you attach a file to a note or include an inline image in the note, the timeline shows that the note has an attachment or inline files. If you attach a file or include multiple files inline, the note shows the number of files using the first two file names and a number to represent the remaining count of and the file type.



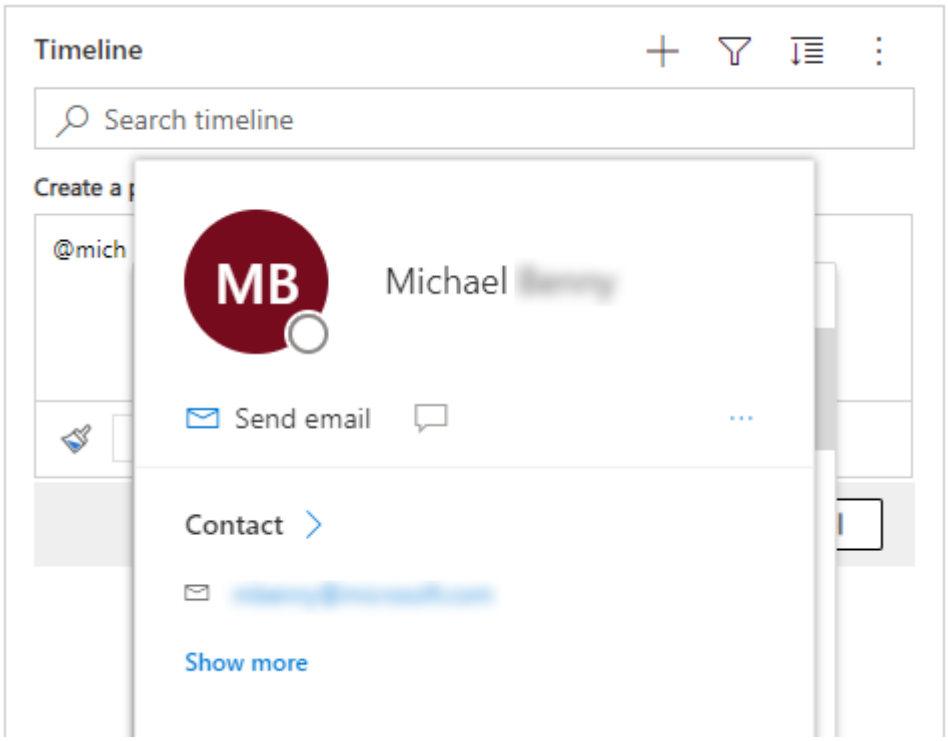
Add a mention or reference a team member in a note



Legend

1. Typing the @ sign in the **Note** field displays a flyout menu with a list of users that have been recently used.
2. If the user row isn't displayed, typing the name after the @ sign refreshes the rows in the flyout menu using the **Quick Find** search engine that's operating in the background.
3. Switch views using **Advanced** to display the **Lookup Records** pane. In the **Lookup Records** pane, you can switch between the **Recent records** and **All records** view to search rows.

When you mouse over the profile image, you can view the user's detailed profile card and online presence status.



> **Note**
>
> You can mention only a system user in a note. For example, a team member within your organization.

Add an attachment to a note in timeline

When enabled by your system administrator, you can add an attachment, such as a file, to a note in timeline to share with users. Any attachment that is viewable inline on the timeline can be downloaded, whether or not a preview is available.

> **Note**

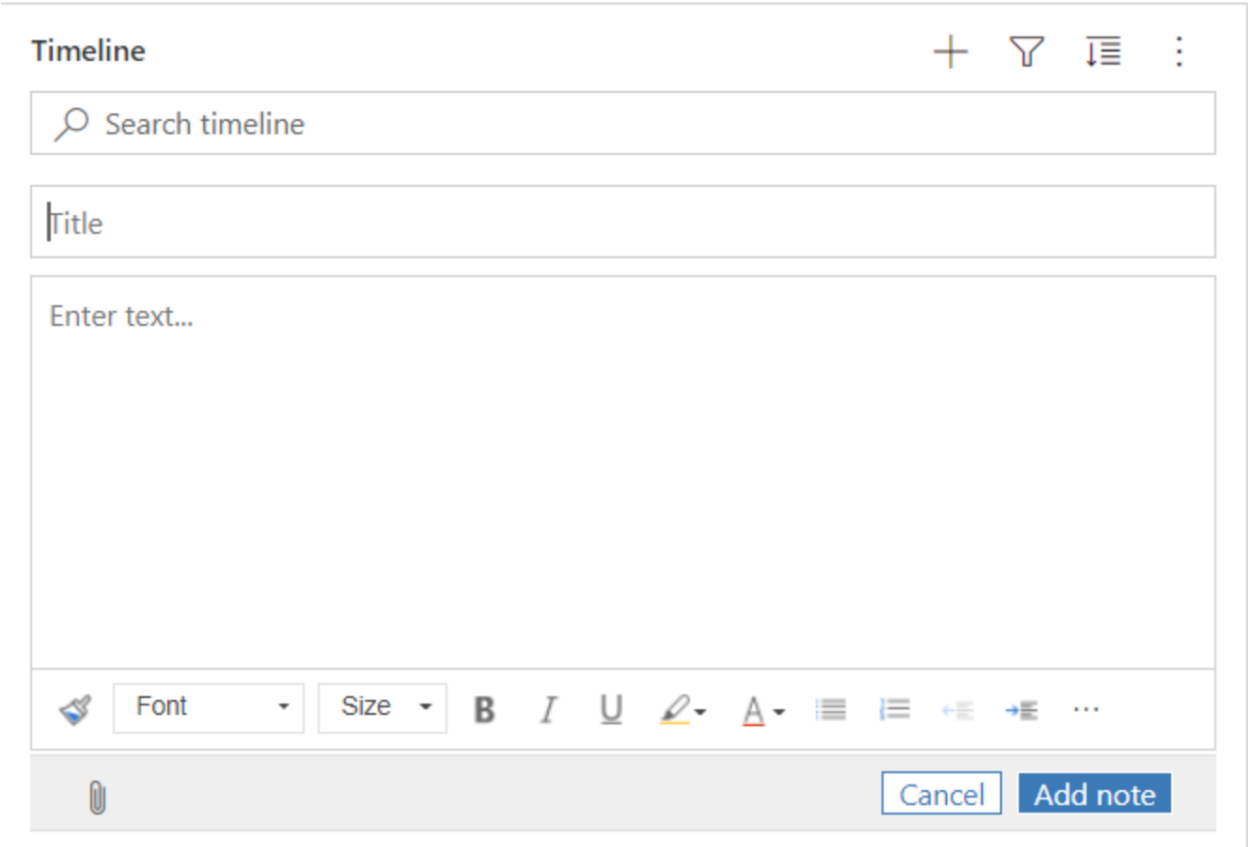
- The list of allowed attachments is configured by your system administrator.
- On iOS and Android you can only select and attach a picture or video.

Select the paperclip icon to attach a file to a note.

Edit Note

When you attach a file to your note, the **Edit note** screen displays, and attachments show at the bottom of the **Edit note** screen.

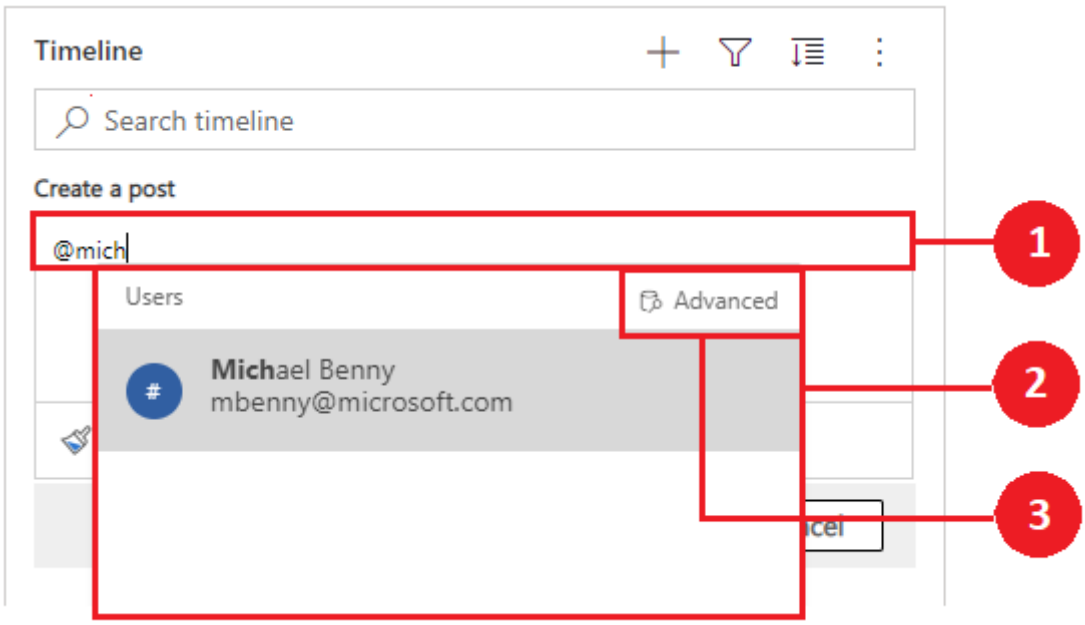
> **Important**
>
> You can only add one file attachment per note.



Work with posts

When enabled by your system administrator, you can either add a post to a row or mention to another user or timeline.

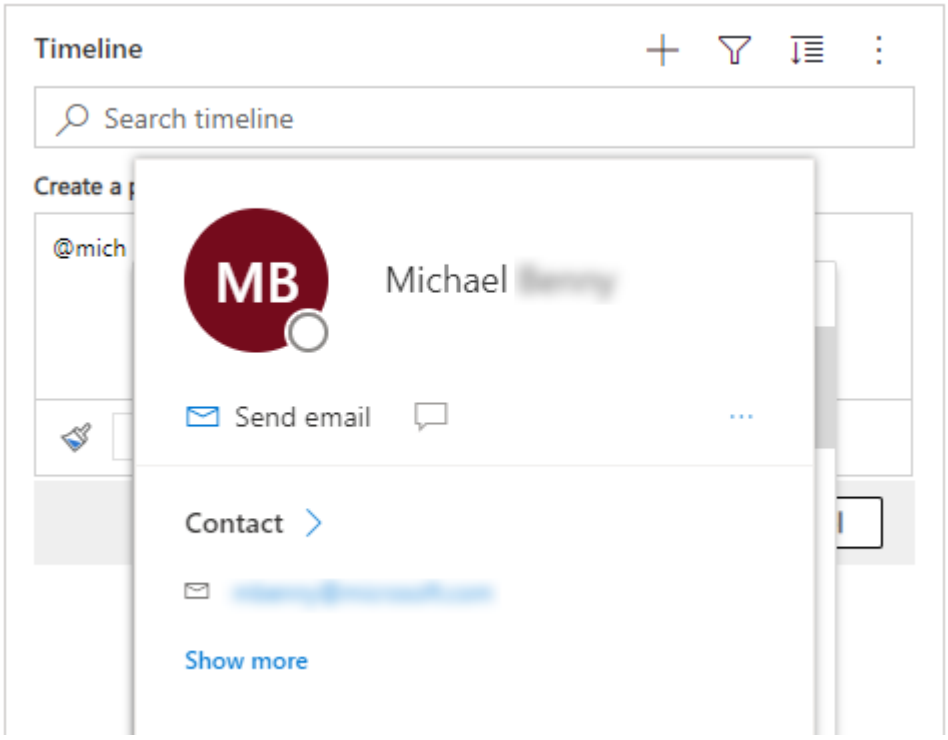
Add a mention or reference a team member in a post



Legend

1. Typing the @ sign in the **Post** field displays a flyout menu with a list of users that have been recently used.
2. If the user row isn't displayed, typing the name after the @ sign refreshes the rows in the flyout menu using the **Quick Find** search engine that's operating in the background.
3. Switch views using **Advanced** to display the **Lookup Records** pane. In the **Lookup Records** pane, you can switch between the **Recent records** and **All records** view to search rows.

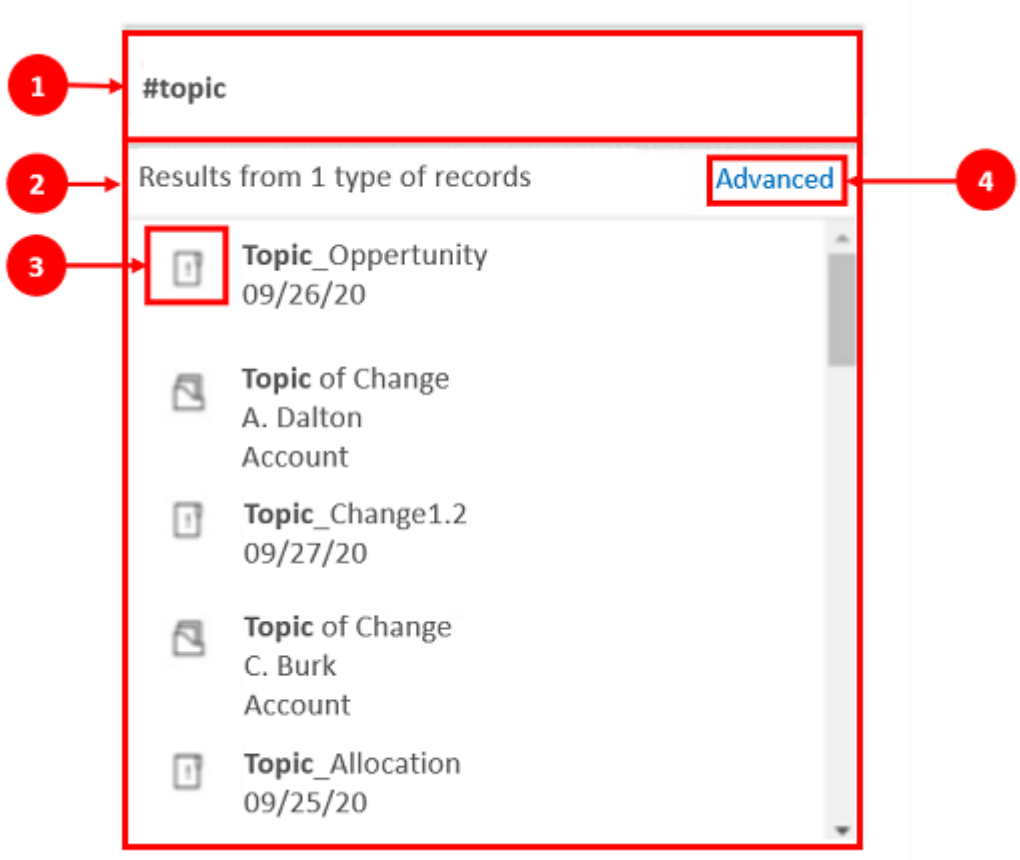
When you mouse over the profile image, you can view the user's detailed profile card and online presence status.



> **Note**
>
> You can mention only a system user, i.e. a team member within your organization, in a post.

Add references in a post in timeline rows

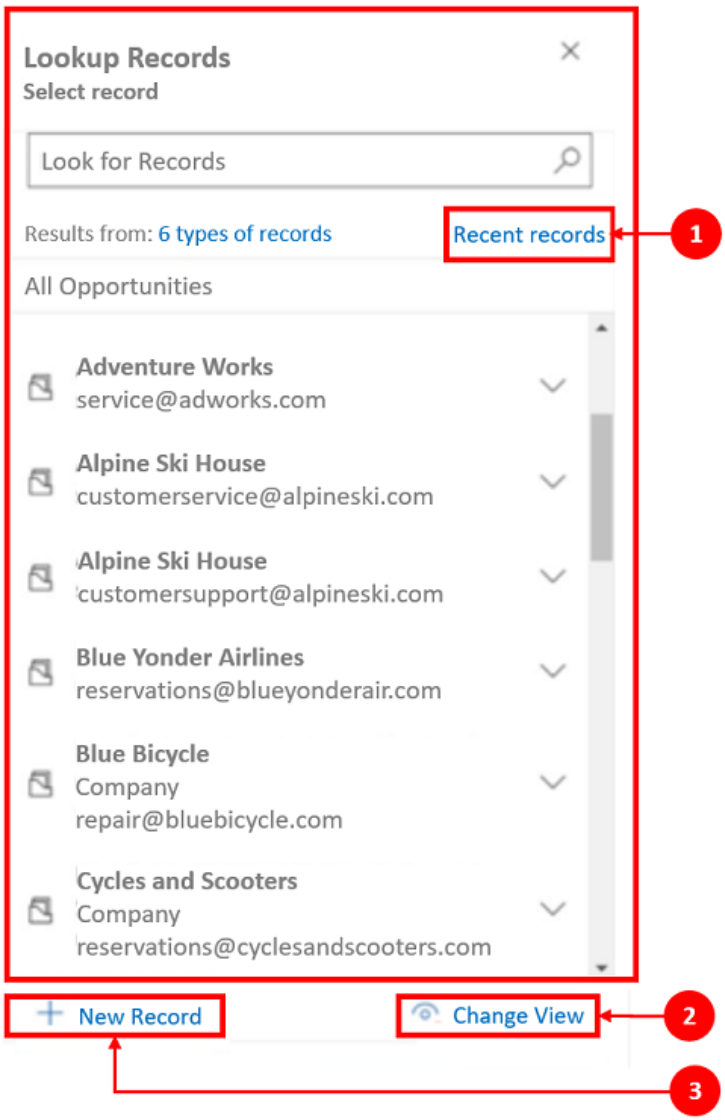
To add a reference such as links in a post to a timeline row, select the + icon, select **Post**, and then complete these steps:



Legend

1. Links can be added to a row by typing # which displays a flyout menu with a list of rows recently accessed. Type a keyword after the # tag and the display refreshes in the flyout menu via the **Quick Find** search engine that's operating in the background.
2. Rows displayed can be of any row type, such as accounts, contacts, or leads.
3. The icons beside the row names in the flyout menu indicate the row types, which help you determine which row to select.
4. **Advanced** provides more options when a row can't be located by allowing the user to switch to a different view or create a new row.

Look up rows in posts in timeline



Legend

1. The **Lookup Records** pane provides users with options to switch between the **Recent records** and **All records** view to find a row.
2. **Change View** to see rows from a different view.
3. **New Record** allows you to create a new row if you can't find the row you need.

For more information on notes and post functionality and configuration, see: Set up the timeline control

Use the rich text editor toolbar

The rich text editor toolbar provides features and functionality that allows you to work with rich text format in notes.

Formatting options

The following table describes the different formatting features and functionality options that are available in the rich text editor that you can use in notes.

> **Note**
>
> You can access your browser's context menu by selecting **Ctrl + right-click**. This setting is useful if you need to use your browser's built-in spellchecker. Otherwise, you can right-click to provide contextual formatting for any element you are using.

Icon	Name	Shortcut key	Description
	Format Painter	Ctrl+Shift+C, Ctrl+Shift+V	Apply the look of a particular section to another section.
	Font	Ctrl+Shift+F	Select a font of your choice. The default font is Segoe UI. **Note**: When you select any formatted content, the font name for that content displays. If your selection contains multiple fonts, the topmost font name of your selection is displayed.
	Font size	Ctrl+Shift+P	Change the size of your text. The default size is 9 pt. **Note**: When you select any formatted content, the font size for that content displays. If your selection contains multiple font sizes, the topmost font name of your selection is displayed.
	Bold	Ctrl+B	Make your text bold.
	Italic	Ctrl+I	Italicize your text.
	Underline	Ctrl+U	Underline your text.
	Text Highlight Color		Make your text stand out by highlighting it in a bright color.
	Font Color		Change the color of your text.
	Bullets		Create a bulleted list.
	Numbering		Create a numbered list.
	Decrease Indent		Move your paragraph closer to the margin.

Icon	Name	Shortcut key	Description
	Increase Indent		Move your paragraph farther away from the margin.
	Block Quote		Apply a block-level quotation format in your content.
	Align Left	Ctrl+L	Align your content with the left margin. (Commonly used for body text to make it easier to read.)
	Align Center	Ctrl+E	Center your content on the page. (Commonly used for a formal appearance.)
	Align Right	Ctrl+R	Align content to the right on the page. (Commonly used for a formal appearance.)
	Link		Create a link in your document for quick access to web pages and files. Pasted or typed URL text is converted into a link. For example, "http://myexample.com" becomes "http://myexample.com ". In the **Link** dialog box, choose the type of link you'd like to insert. The **Link Info** tab allows you to choose the link type and set the link protocol and URL. The **Target** tab is only available for the URL link type. It specifies the location where the link opens after you select it.
	Unlink		Delete a link in your email or document. When you place the cursor on a link, the **Unlink** button on the toolbar becomes active. Select the button to remove the link and make it plain text.
	Superscript		Type small letters just above the line of text.
	Subscript		Type small letters just below the line of text.
	Strikethrough		Cross out text by drawing a line through it.
	Insert Image		You can insert an image by directly copying and pasting it inline in the editor, dragging and dropping it from your desktop or local folder directly into the editor, or by typing a URL. The following formats are supported: .PNG, .JPG., or .GIF.

Icon	Name	Shortcut key	Description
			To insert an image inline in your article: 1. Drag and drop the image or copy and paste it directly into the article. 2. Drag any corner of the image to resize it. To insert an image using a URL or navigating to the local image: 1. Choose Insert Image. 2. In the **Image** property dialog, choose from the following options: • Select **Browse** to navigate to the image on your computer. • Or specify the web address of the image, and properties to define how the image appears in the email or article. **Note:** ◦ If the image is located on the external server, use the full absolute path. ◦ If the image is located on a local server, you can use a relative path. ◦ If you want the image to be linked to a target, add a URL for the image. ◦ You can also specify if you want the targeted page to open in a new window, topmost window, same window, or parent window.
	Left to Right		Change the text to left-to-right for content such as a paragraph, header, table, or list. Commonly used for bi-directional language content. This setting is the default setting.
	Right to Left		Change the text to right-to-left for content such as a paragraph, header, table, or list. Commonly used for bi-directional language content. The default setting is left-to-right.
	Undo Typing		Undo changes you made to the content.
	Redo Typing		Redo changes you made to the content.
	Clear All Formatting		Remove all formatting from a selection of text, leaving only the normal, unformatted text.
	Add a Table		Add a table to your content.

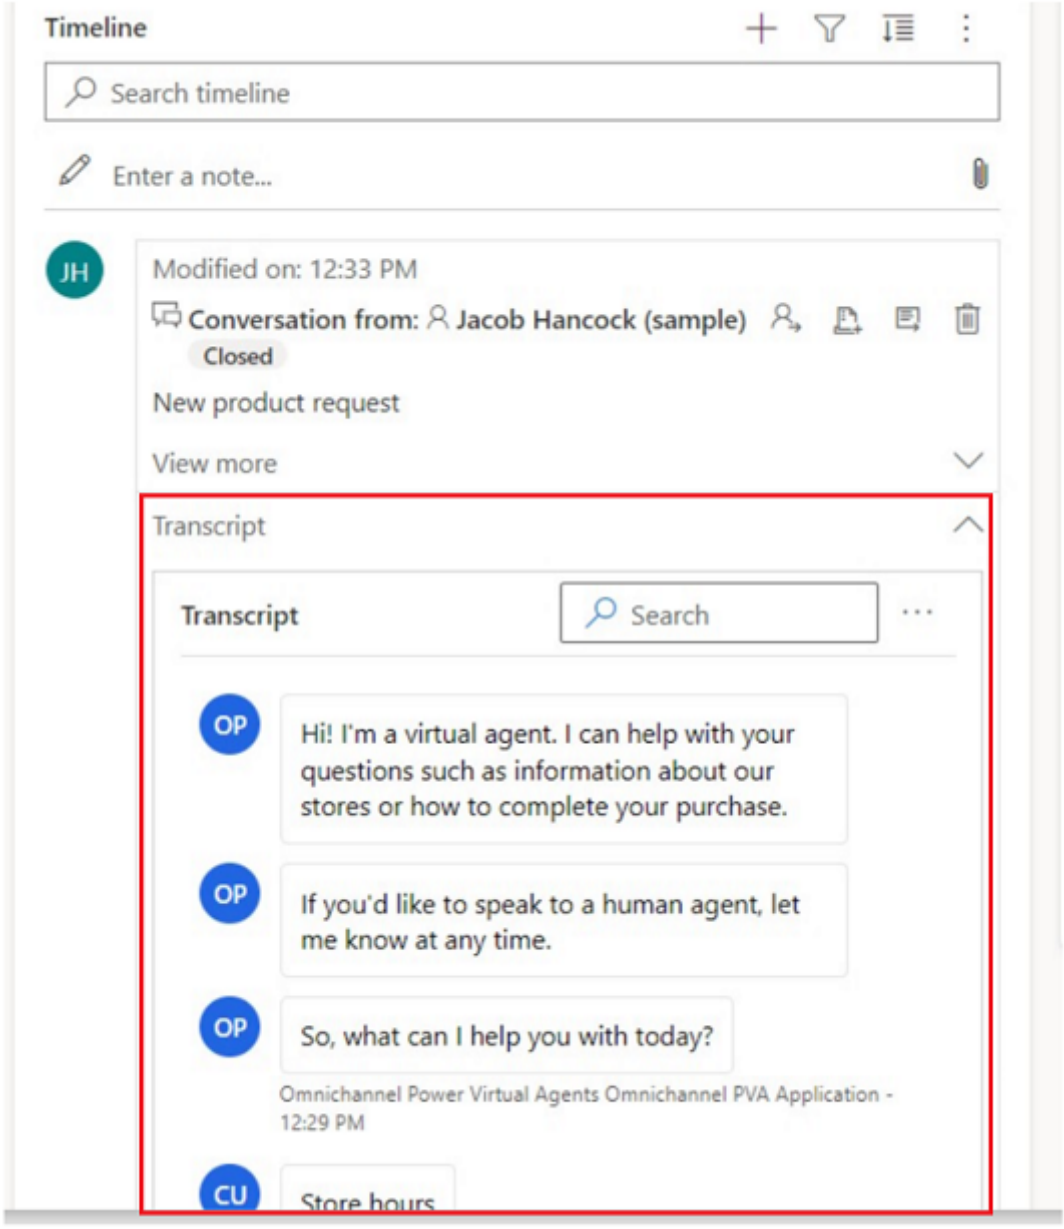
Icon	Name	Shortcut key	Description
			After adding a table, you can do any of the following: • Resize table columns by clicking and dragging your mouse to resize to the columns to the desired width. • Select one or several cells within a table and apply specific formatting, add links to the selection, or cut, copy, or paste entire rows or columns. • Right-click to access the properties. This setting supports features such as cell type, width and height, word wrapping, alignment, merging, and splitting cells horizontally and vertically, inserting or deleting rows and columns, row and column span, and cell and border color.
•••	Expand Toolbar		Appears when the toolbar is collapsed. Select to expand the toolbar and make all options visible.
	Copy to Clipboard		Copies entire text in a note to the clipboard so that you can paste the contents in another location.

The rich text editor is enabled by default. Your system administrator can enable or disable the editor for you.

View a conversation transcript

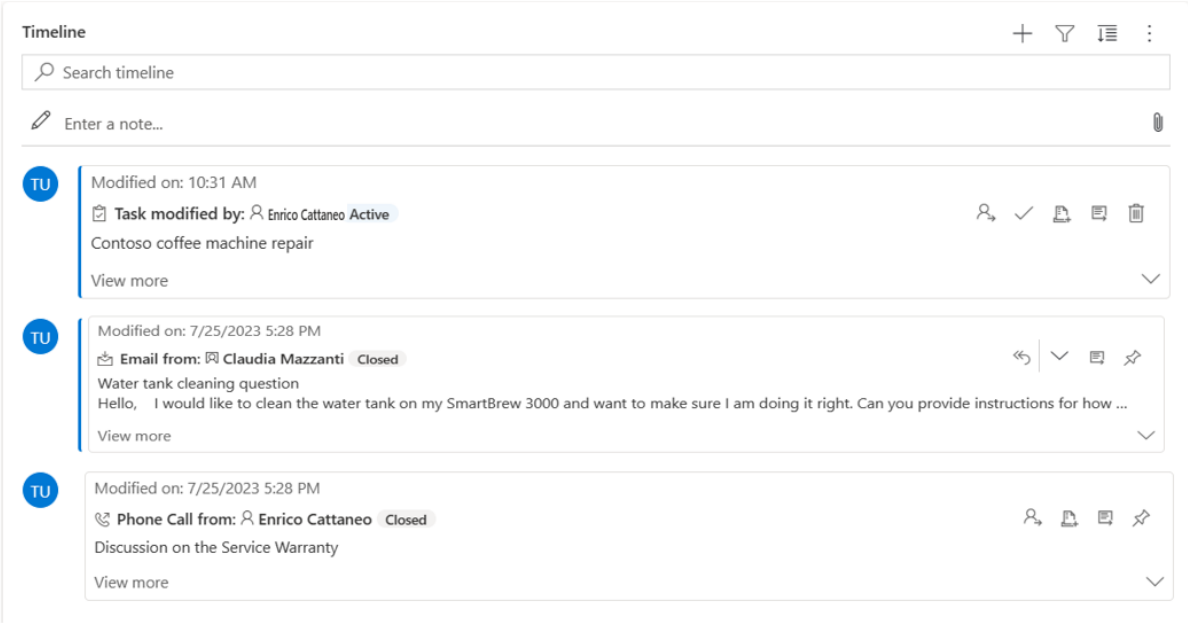
In the timeline, you can view the transcripts of completed chats you've had in conversation channels. To view these transcripts, you must have prvReadmsdyn_transcript permission. More information: Roles and permissions

To view a conversation transcript, select the **View more** link in the row for which you want to view the transcript. The row expands and the entire transcript is displayed inline.



View what you've missed in timeline

When you access the timeline after being away, activities that you've missed display at the top of the timeline, denoted with a blue vertical line next to them. You can quickly open the activities or scroll past them.



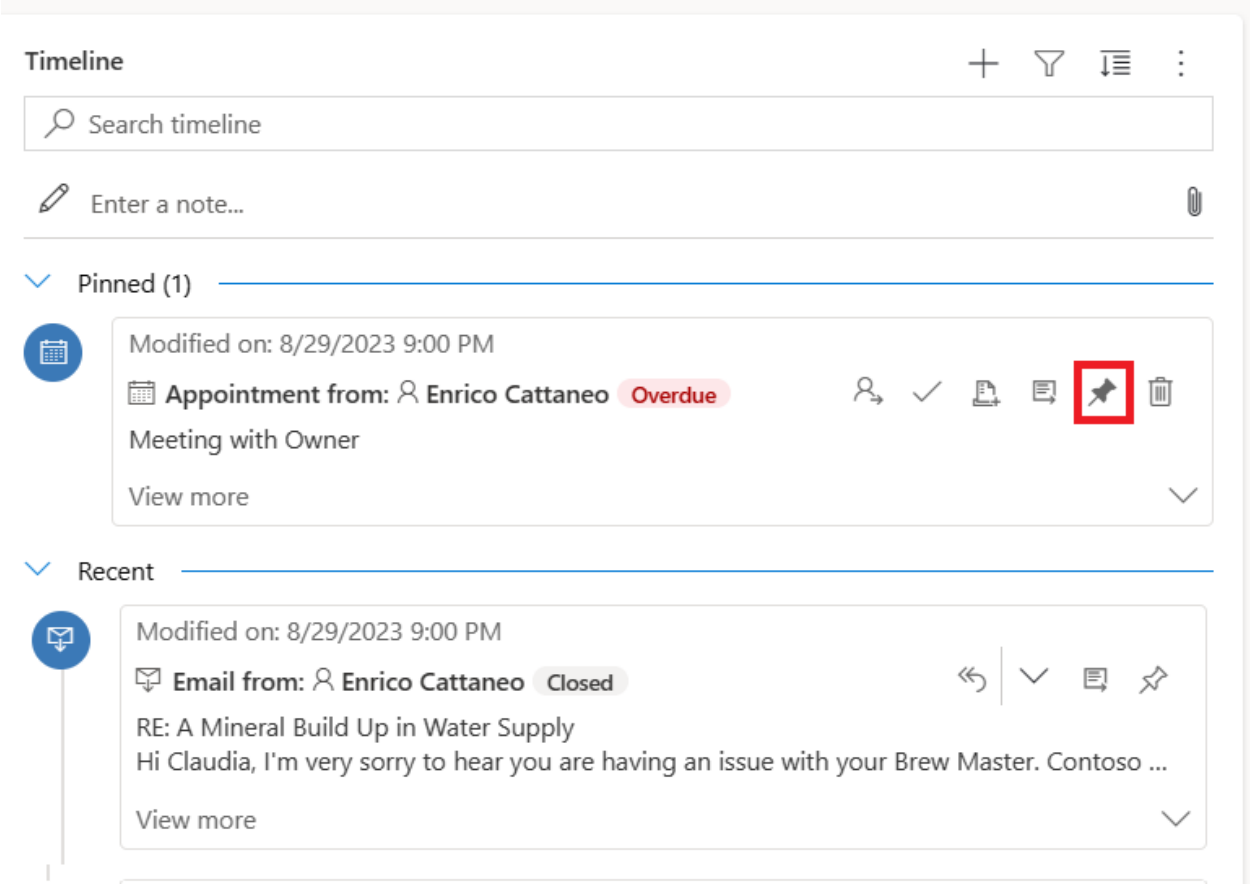
Pin or unpin records in timeline

If your administrator has enabled the pin setting and you have write/delete access, you can quickly access records, such as activities, by keeping them at the top of the timeline. Pinning a record eliminates the need to scroll through every record to find the one you need.

> **Note**
>
> If you have a system administrator or basic user role, the pin and unpin settings work by default. If you don't have either of these roles, you must have Create/Read/Write privileges to be added to the msdyn_customcontrolextendedsettings table for these settings to work.

By default, you can pin notes. The activities that you can pin depend on how your administrator has set up the feature. More information: Let users pin and unpin activities to the top of timeline.

Pin a record by selecting the pin icon next to it. This setting moves it to the top of the timeline in the **Pinned** section, where it can be quickly accessed. The Pinned section also lists the number of records that are pinned. You can pin a maximum of 15 records. Records that are pinned will stay at the top of the timeline for a year unless you unpin them.



To unpin a record, select the pin icon next to it. Unpinning it moves it out of the **Pinned** section and back to where it originally appeared in the list of records in the timeline.

Bookmarks

Bookmarks are a quick way for the user to set, and switch between, different sets of filters. Bookmarks are enabled by default. If necessary, you can disable them from the Advanced section.

> **Note**
>
> Bookmarks feature replaces **Remember my filters** button. Use the steps in the following section to set up your user filters.

Create a bookmark

1. Open the filter pane, and select the filters that will be associated with the new bookmark. You may have no filters selected.
2. Select the bookmark icon in timeline's action bar.
3. Select **Add bookmark**.

4. Enter a bookmark name. Optionally, set it as a default bookmark.

5. Select **Save**.

Selecting the bookmark icon again will now display a flyout of your created bookmarks. You can apply a bookmark by selecting it from this list, or edit it using the **More options** button on the right side of the bookmark.

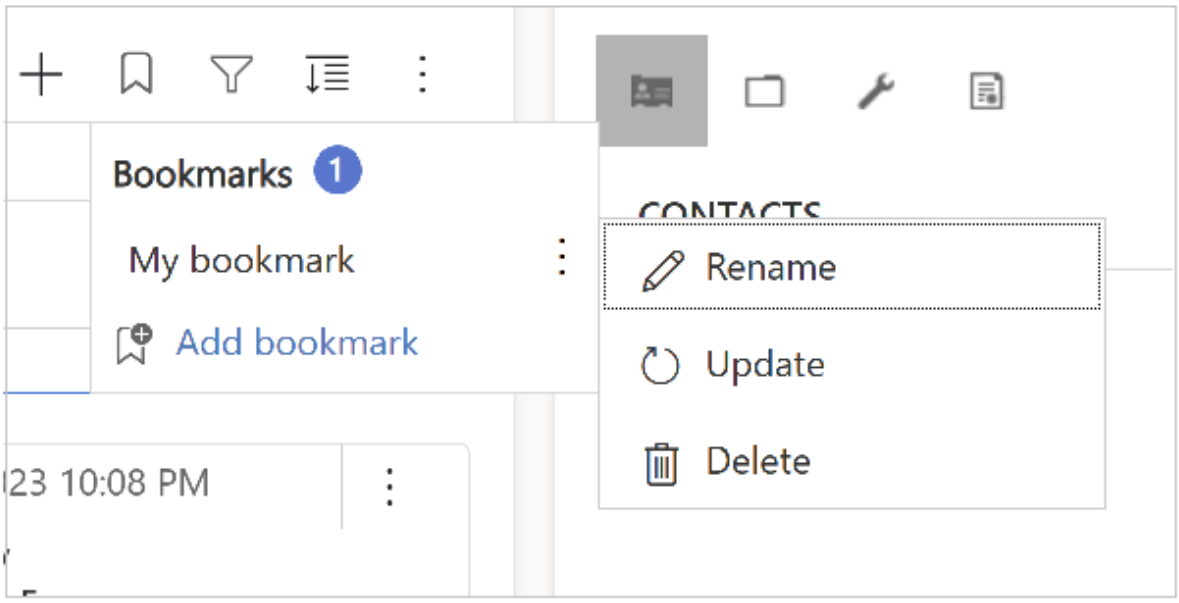
If a bookmark is selected, its filters are applied to the timeline, and is indicated by a filled bookmark icon in the action bar. Hover over the icon to see the name of the bookmark, or select the icon. The selected bookmark has a grey background color.

> **Note**
>
> You can have a maximum of 15 bookmarks.

Edit a bookmark

Any bookmark can be renamed, updated, or deleted from the **More options** menu.

> **Note**
>
> Selecting **Delete** directly deletes the bookmark.



Updating a bookmark will change its filters to the currently selected filters.

You may also set this bookmark as a default for the current form or all forms.

Set a default bookmark

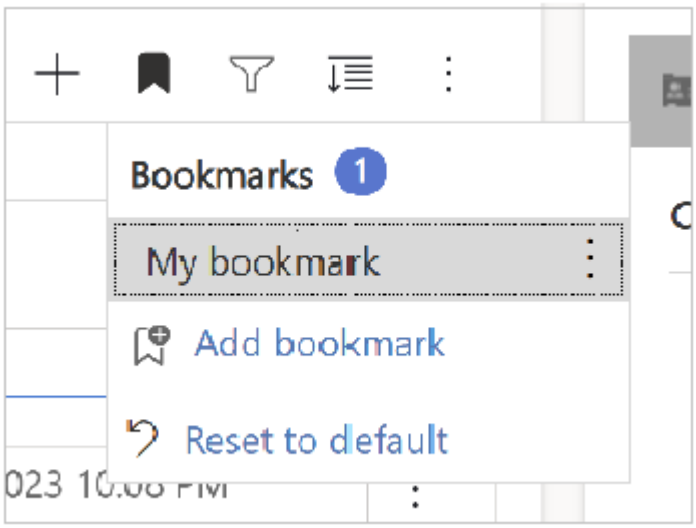
When creating or updating a bookmark, you may select the **Set as default bookmark** checkbox, with the option to apply this change for the current form or globally.

A default bookmark has a star icon ☆ next to its name, and is selected automatically when the timeline loads, overriding any admin filters set for timeline.

> ⓘ **Note**
>
> You may set a bookmark as a form default for multiple forms; however, it can't be both a form default and a global default. A form-default bookmark will override a global one.

Reset to the default view

If a nondefault bookmark is selected, or if other filters are applied, a reset to default button appears in the bookmark flyout. This applies the **default bookmark** to timeline, if one exists, otherwise **clearing all filters**.



Bookmark filters can't be applied

If a bookmark's filters can't be applied (for example, a bookmark that filters for notes while timeline has notes disabled), then an exclamation mark icon is displayed next to its name.

FAQs about Activities and the Timeline Wall

Learn about linking timeline notes with table records

Article • 08/01/2023

You can use notes on the timeline to record case summary, investigations, or add images and files for reference. You can use **Relate note to a table record** on the timeline to perform the following actions on case, account, and contact tables without leaving the page that you're on:

- Move a note on the timeline of an existing table record to another table record. For example, you can move a note on the timeline of a contact to an existing case. After you move the note, it'll appear only on the timeline to which you've moved and not on both.
- Create a new table record from the note. For example, you can create a case from an existing note on a contact's timeline.

Understand linking timeline notes

The following sections contain scenarios to describe how linking timeline notes to tables works.

Move note from one table record to another table record

Consider the following scenario, you have taken a note on the timeline of the account Contoso Coffee during an interaction with the customer about an issue with CX300 coffee machine. After the interaction, you want to link the note to an existing case or create.

To link the note on the Contoso Coffee account to the Issue with coffee machine case:

1. On the Contoso Coffee account timeline, select the note to link.
2. Select **Link to record** button.
3. On the window that appears, search for the case to move the note to. The case is Issue with coffee machine.
4. The application displays a message to confirm if the note must be unlinked from the account table. Select **OK**. The note now appears only on the timeline of the Issue with coffee machine case.

Create a new table record from a note

Consider a scenario where you're talking to an customer over a voice call. The customer's account, Contoso Coffee, appears on the Customer Details section of the Active Conversation form. The timeline on the Active Conversation form is either the account or the contact timeline, based on the record you've selected. More information: Take notes specific to conversation.

On the communication panel, you select **Notes**. After you've saved the note, it's displayed on the timeline.

To create a new case from the note, perform the following steps:

1. Select the note that you took on the timeline for the Contoso Coffee account.
2. Select **Link to record** button.
3. On the window that appears, select **Add a new record**. Based on your administrator's configurations, you see **Case**, **Account**, and **Contact**.
4. Select **Case**. The case form opens and some of the fields on the case form are populated with the content from note based on your administrator configuration. For example, if your administrator has configured to notes title to be copied as the case title and the notes description to be copied to the case description, **Case Title** and **Description** is automatically populated from the note.
5. Add the information on the quick create case form and save the details. The case is created.
6. The application then displays a message to confirm if the note must be unlinked from the table. If you select **OK**, the note appears on the timeline of the new case that you've created.

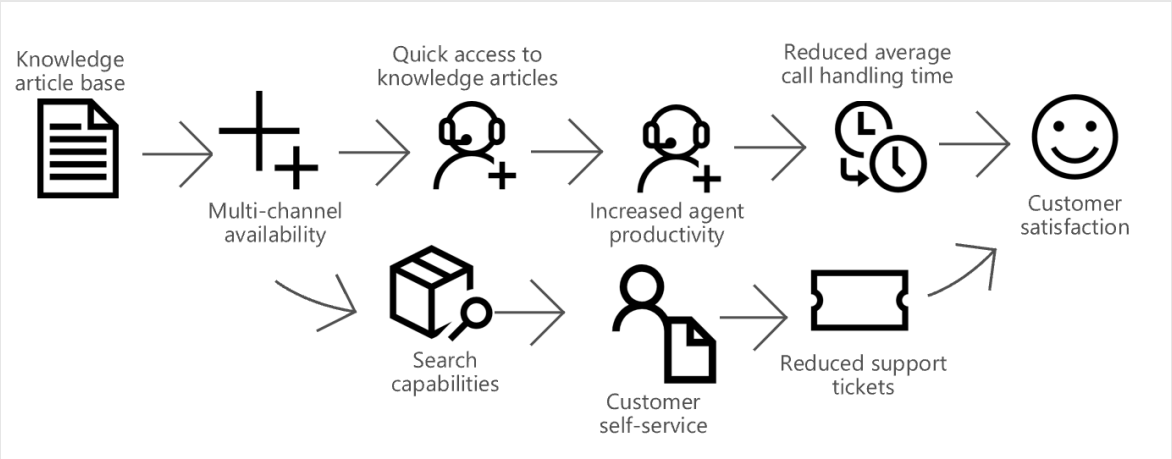
Overview of knowledge management

Article • 12/14/2022

Knowledge management plays a vital role in delivering world-class customer care. It provides team members in an organization the ability to author, categorize, deliver, analyze, and share information through a knowledge base.

Benefits of knowledge management

- Primary service providers, such as agents, can look up information in a knowledge base to resolve customer queries right away, thereby increasing their productivity.
- With access to rich, high-quality knowledge resources across consistent and contextual Omnichannel experiences, agents can resolve issues faster, reducing their average call handling time.
- Customers can use knowledge management search capabilities across channels to solve issues themselves, reducing support tickets and driving customer satisfaction.



Features of knowledge management

Depending on your role in your organization, here's how you can leverage the features of knowledge management to help your organization grow.

Create knowledge articles

Create and design knowledge articles

As a knowledge author, you can:

- Create rich and well-formatted content for emails or knowledge articles using the new rich text editor. More information: Use the rich text editor to create knowledge articles and emails
- Review knowledge articles for accuracy before they're published or made available to others. More information: Review knowledge articles
- Use templates to create knowledge articles quickly, with prepopulated fields in the selected template. Templates also help knowledge managers and authors maintain consistency in branding, language, and structure. More information: Create a knowledge article template
- Set up a default knowledge article authoring language. More information: Configure a default knowledge article authoring language for your organization

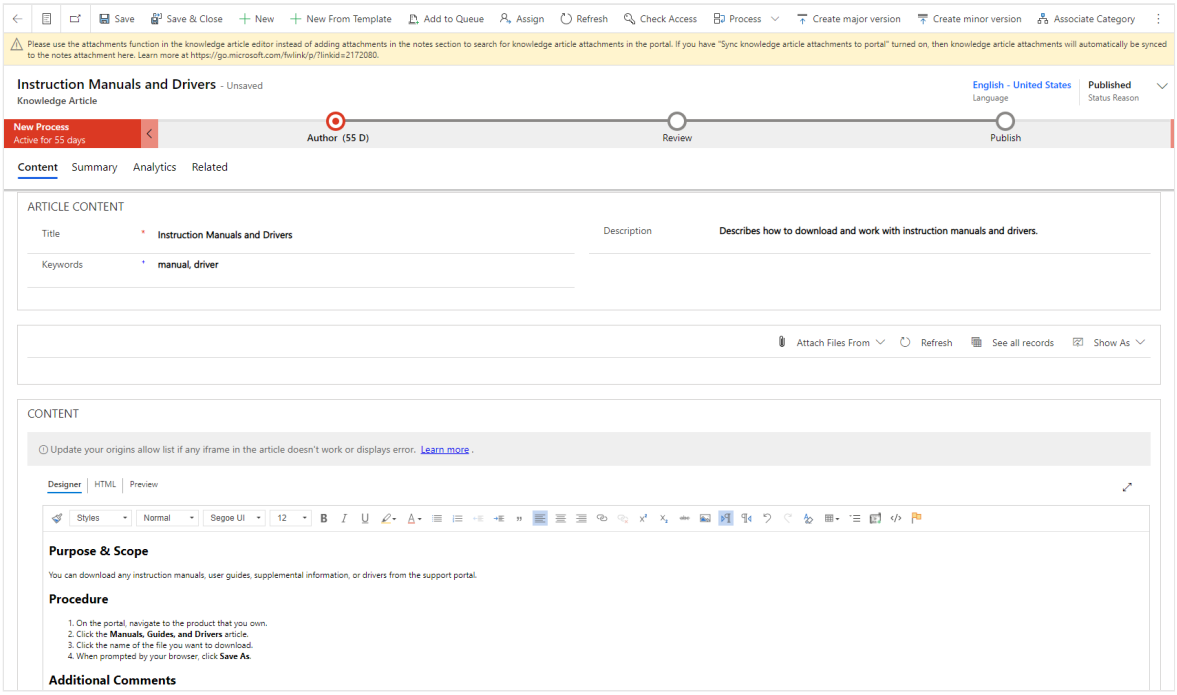
Manage the lifecycle of knowledge articles

As a knowledge author, you can:

- Create major and minor versions of a knowledge article, and keep your articles up to date with the latest information while keeping track of changes throughout the lifecycle of your products and services. More information: Create and manage article versions

- Create a translation for a knowledge article record in multiple languages. More information: Create a knowledge article translation

- Publish articles as soon as they're approved, or schedule them for later publication. You can also set expiration dates on articles. More information: Publish knowledge articles



Create and manage categories for your knowledge articles

As an administrator, you can create hierarchical, categorical data to help group records. Categories are useful for reporting, sorting, segmenting, and categorization of records. More information: Create and manage categories.

Integrate knowledge management with a Power Virtual Agents bot

As an administrator, you can integrate a Power Virtual Agents bot with knowledge management to make it easier to use customized conversations in your bot. This helps free up your agents' time so they can focus on complex issues that need human intervention, as the bot helps answer questions, perform actions, and solve issues that are simple in nature. More information: Integrate knowledge management in Dynamics 365 with Power Virtual Agents bots

Search knowledge articles

Search knowledge articles through different channels

- As an agent, you can use either the **Smart assist** or the **Knowledge search pane** to search articles in Customer Service workspace. **Smart assist** provides you with knowledge article suggestions about your case that helps you resolve customer issues quickly. For more information on **Knowledge search pane**, see: Use the knowledge search pane to search articles
- As a customizer, you can set up knowledge base search control on a standard or custom form to help make it easy for users in your organization to find knowledge articles. More information: Add the Knowledge Base Search control to forms
- As an administrator, you can configure how you want the knowledge base search control to appear for your entities on the app side pane of Customer Service workspace and Omnichannel for Customer Service. Configuring a record type will specify the information that your agents will see while they interact with customers. More information: Configure knowledge search control on app side pane for an entity record

Search multiple knowledge providers

As an administrator, you can use search providers to federate the search of files, documents, or articles from data sources outside of your organization. More information: Set up external search providers

Set up search logic and search filters

As an administrator, you can:

- Set up a knowledge search logic for your knowledge articles to help agents find only the articles they need. More information: Set up knowledge search logic.
- Create filters to help your agents more quickly find what they're looking for. More information: Customize search filters for knowledge articles

Perform knowledge self-service

Search the knowledge base on portals

Having a knowledge base on the portal makes it a customer self-service portal, where you can access and search for knowledge articles through simple queries. This helps resolve issues and makes information easily accessible. You can search for your knowledge articles by selecting **Knowledge Base** from your portal. More information: Search the knowledge base on portals

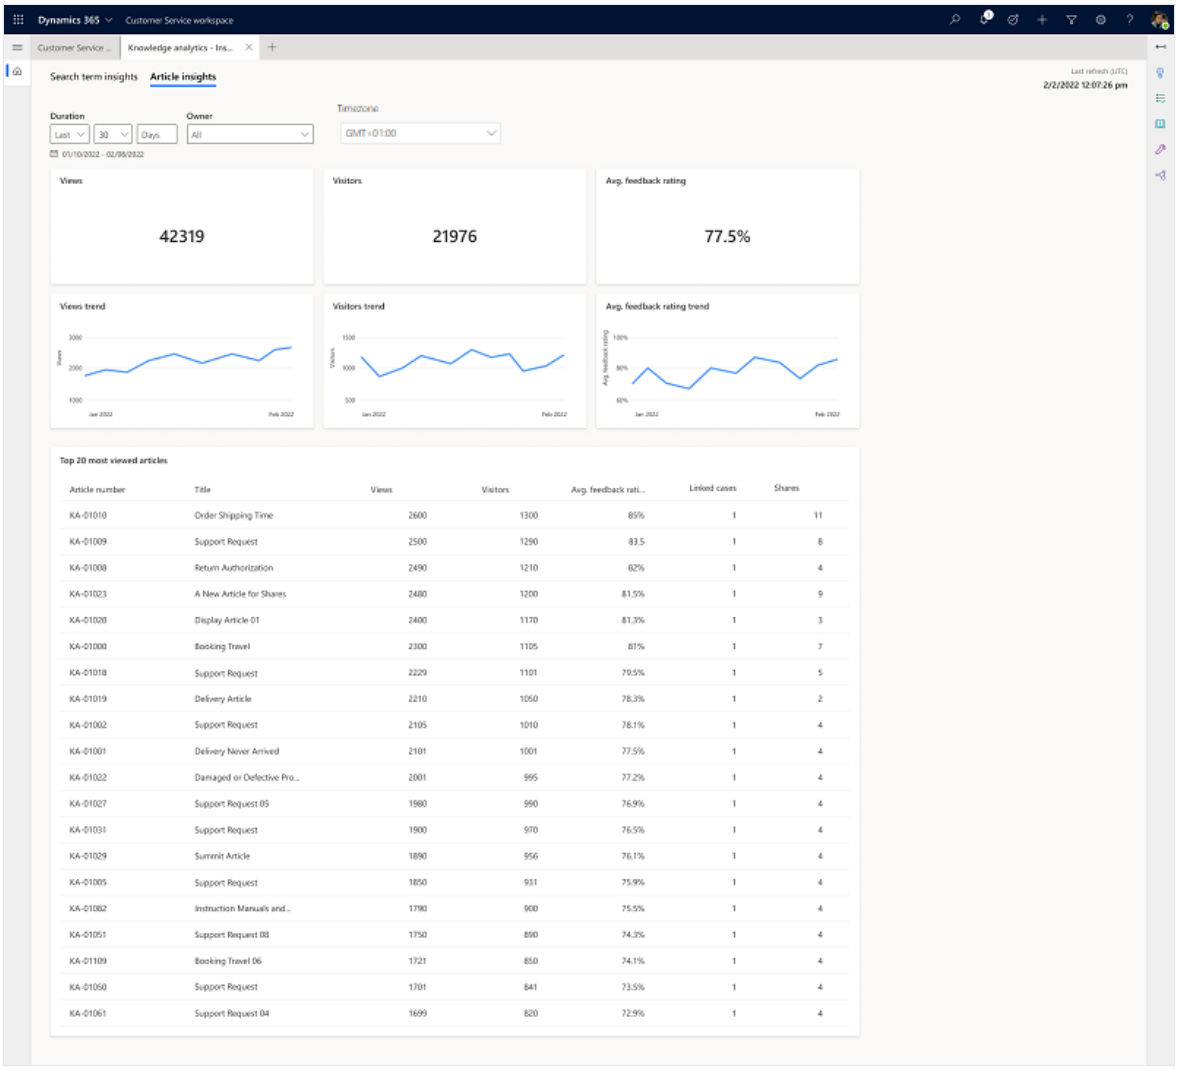
Analyze and report

Track and analyze knowledge article statistics

As an administrator, you can:

- Track how many times an article is used, viewed, and sent to customers. Use this information to proactively create knowledge based on search insights across customers and agents.

- Use the knowledge search analytics dashboard to provide supervisors and knowledge workers with valuable insights into how your support agents are finding and using knowledge articles. More information: Manage Knowledge analytics



As a supervisor, you can identify searches that have low success or return no results through the Knowledge search analytics dashboard to help identify knowledge gaps, improve search results, and surface the most relevant articles. More information: Introduction to knowledge analytics

Create a knowledge article using a template

Configure knowledge management

Article • 07/03/2023

Introduction

A comprehensive knowledge base is a key to increased customer satisfaction and improved productivity of users. Give users quick access to the knowledge base by setting up knowledge management in Dynamics 365 Customer Service.

> **ⓘ Important**
>
> Usage of Parature knowledgebase as a knowledge management solution has been deprecated. For more information, see **Important changes coming**.

After knowledge management is set up, users will be able to:

- Search for relevant knowledge base articles from Customer Service while they're working on a record.
- Set up the search logic, suggest-as-you-type option, and search filters to get only the required knowledge articles, thereby providing timely and consistent information to customers while working on their cases.
- Use smart assist to receive AI suggestions on related knowledge articles and similar cases.
- See the content of the knowledge base article inline, including images and videos.

Setup overview

You can set up knowledge management on the Customer Service admin center, Customer Service Hub, or manually for a model-driven app.

- Set up knowledge management
- Set up knowledge management settings page manually for a model-driven app

After you have configured knowledge management on your app, you must also set up the various other aspects of knowledge management, based on your organizational requirements, such as:

- Configure knowledge base article URLs

- Create and manage categories
- Create templates for knowledge articles
- Set up AI suggestions for article keywords and description
- Set up external search providers

Set up knowledge management

Make sure that you have the System Administrator or System Customizer security role or equivalent permissions. You must also be the tenant administrator of Microsoft 365.

You can set up knowledge management in the Customer Service admin center or Customer Service Hub app. The settings you configure for knowledge management in the Customer Service Hub app are carried over to the Customer Service admin center app, and vice versa.

Customer Service admin center

1. In the site map, select **Knowledge** in **Agent experience**. The **Knowledge** page appears.

2. In the **Record types** section, select **Manage**.
   a. On the **Record Types** page, add and configure the record types for which you want to turn on knowledge management. More information: Configure knowledge search control on app side pane for an entity record. By default, knowledge management is enabled for **Case** and **Conversation** record types. The ability to set up knowledge search control for app side pane is available only in the Customer Service admin center app.

3. In the **General Settings** section, select **Manage**. The **General Settings** page appears.
   a. In the **Search results display count** section, select the display count from the dropdown. This option is only available for the app side pane knowledge base search control, and standalone knowledge base search control in single session and multisession apps.
   b. In the **Feedback** section, set the **Enable feedback** toggle to **Yes**. To learn more about how users use this option, see Submit ratings and feedback for knowledge articles.
   c. In the **Authoring language** section, set the **Enable default authoring language** for your users to **Yes**.

- If you want to select a default knowledge authoring language for your organization, then select the **Organization's UI language** radio button.
- If you want to use the organizations' s UI language as the default knowledge authoring language, select the **Other language** radio button, and then select a language from the **Language** dropdown.
- If you also want to allow users to set their default knowledge authoring language, set the **Allow users to set default knowledge authoring language** toggle to **Yes**. More information: Configure a default knowledge article authoring language for your organization
- In the **Origins allow list** section, add your origins links to the **Add origin links** field. More information: Configure origins allowlist for knowledge articles.
- In the **Knowledge search logic** section, set the **Set search mode as all** toggle to **Yes**. More information: Set up knowledge search logic
- Select **Save**.

4. Optionally, in the **Categories** section, select **Manage**. The **Categories System Views** page appears. You can create and manage a logical structure of categories for your records. More information: Create and manage categories.

5. In the **Filters** section, set the **Enable search filters** toggle to **Yes**. If you want to allow agents to save the the search filters according to their areas, set the **Allow agent to personalize** toggle to **Yes**.

6. In the **Portals** section, select **Manage**. The **Portals** page appears.
   a. In the **Support portal connection** section, do the following to share knowledge articles as URLs:

      - Set the **Use an external portal** toggle to **Yes** to integrate an external portal to publish knowledge articles.
      - **URL Format**: Type the portal URL that will be used to create external (public-facing) portal links for knowledge articles, which the service agents can share with the customers. The external URL is created in the following format: https://support portal URL/kb/{kbnum}. The placeholder, "{kbnum}", is replaced by an actual knowledge article number.

   b. In the **Sync knowledge article attachments to portal** section, set the **Sync attachments to the portal** toggle to **Yes**. More information: Update knowledge article attachments for portal

7. Optionally, in the **Article templates** section, select **Manage**. The **Article Templates System Views** page appears. You can create templates to help

knowledge authors use consistent language and messaging. More information: Create templates for articles.

8. Optionally, in the **Search providers** section, select **Manage**. The **Search providers System Views** page appears. You can use search providers to federate the search of files, documents, or articles from data sources outside of your current Dynamics 365 organization. More information: Set up external search providers

> **Note**
>
> During the creation of knowledge articles, duplicate detection rules aren't supported on the Knowledge Article entity.

Set up knowledge management settings page manually for a model-driven app

> **Note**
>
> The embedded knowledge search control is deprecated in the web client. You must use the Knowledge Settings page in Unified Interface.

If you are using the custom model-driven app, you need to manually update your sitemap with the Knowledge Settings page. To update the sitemap:

1. Select your custom app.
2. Select **Open in app designer**.
3. Select **Site Map**.
4. Select **Add** > **Subarea** to create a new sub area for your area.
5. In the **Properties** > **SUB AREA** section, provide the following information:
   - Type: Select **URL**.
   - URL: Enter `/main.aspx?pagetype=inlinedialog&name=KnowledgeSettings`

Configure knowledge base article URLs

Knowledge articles can be configured with their portal URLs, and then agents can copy and share the URL links.

> **Note**
>
> Before you can configure knowledge articles with their own URLs, you must create a portal using your domain name. For information on how to create a portal, see **Create a portal in an environment containing customer engagement apps**.

You can configure a knowledge base article URL in the Customer Service admin center or Customer Service Hub app by performing the following steps:

1. Go to the **Support portal connection** section.

Customer Service admin center

1. In the site map, select **Knowledge** in **Agent experience**. The **Knowledge** page appears.
2. On the **Knowledge** page, go to the **Portal** section and select **Manage**. The **Portal** page appears.
3. On the **Portal** page, go to the **Support portal connection** section.

2. Set the **Use an external portal** toggle to **Yes**.
3. In the **URL format** field, enter the URL name.
4. Select **Save**.

The knowledge base article link is now active and can be copied and shared.

Update knowledge article attachments for portal

With the knowledge article attachments option, you can stop using notes attachments for the portal. To use knowledge article attachments for the portal, you must enable the feature in the Customer Service admin center or Customer Service Hub app by performing the following steps:

1. Go to the **Sync knowledge article attachments to portal** section.

Customer Service admin center

1. In the site map, select **Knowledge** in **Agent experience**. The **Knowledge** page appears.
2. In the **Portals** section, select **Manage**. The **Portal** page appears.
3. On the **Portals** page, go to the **Sync knowledge article attachments to portal** section.

2. Set the **Sync attachments to portal** toggle to **Yes**.
3. Select **Save**.

Set up AI suggestions for article keywords and description

You can enable knowledge authors to get suggested keywords and description based on the article content stored in the built-in knowledge article entity. More information: Configure AI suggestions for article keywords and description.

Set up knowledge search logic

If you have Dataverse search enabled, you can apply knowledge search logic for your knowledge articles to help agents find only the articles they need. By default, knowledge search works by the `searchMode=any` logic, which brings up articles that match any of the keywords used in your search. If you search for Contoso Coffee, the search results will show articles that have either "Contoso" or "Coffee", as seen in the following example:

- Article 1: Contoso machine repair
- Article 2: Coffee powder quality
- Article 3: Contoso coffee order price
- Article 4: Coffee machine order for Contoso
- Article 5: Espresso coffee machine troubleshooting

You can enable the knowledge search to work by the `searchmode=all` logic, which matches all the keywords that you used in the search. If you search for Contoso Coffee, the search results will show articles that match both "Contoso" and "Coffee", as seen in the following example:

- Article 1: Contoso coffee order price
- Article 2: Coffee machine order for Contoso

You can set up the knowledge search logic in the Customer Service admin center or Customer Service Hub app by performing the following steps:

1. Go to the **Settings** page.

Customer Service admin center

1. In the site map, select **Knowledge** in **Agent experience**.
2. On the **Knowledge** page, in the **General settings** section, select **Manage**. The **General settings** page appears.

2. In the **Knowledge search experience** section, set the **Set search mode as all** toggle to **Yes**.
3. Select **Save**.

More information: Search across table data using Dataverse search

Enable the suggest-as-you-type option

You can help agents improve their productivity by setting the **Enable suggest as you type** toggle to **Yes**. This feature provides suggestions on the most relevant records as agents type keywords in the search box. The search phrase is matched against the title of the article, and the matching results appear in a flyout menu. The matched text is highlighted to show the presence of the keyword.

When an agent selects the record, the system displays the article inline on the knowledge search control embedded on a form, on an application tab in Customer Service workspace, and as an inline view in the independent knowledge search control. More information: Use suggest-as-you-type

1. In the Customer Service admin center site map, select **Knowledge** in **Agent experience**.
2. On the **Knowledge** page, in the **General settings** section, select **Manage**. The **General settings** page appears.
3. In the **Knowledge search experience** section, set the **Enable suggest as you type** toggle to **Yes**.
4. Select **Save**.

Add the Knowledge Base Search control to a form

Work with knowledge articles

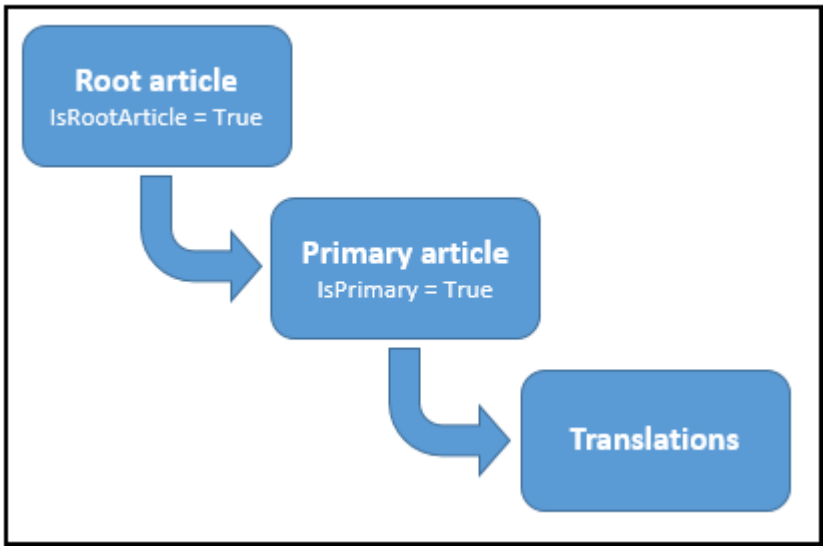
Article • 02/17/2022

The new knowledge experience in Dynamics 365 Customer Service enable you to create rich knowledge articles along with versioning and translation support. The new knowledge experience uses the `KnowledgeArticle` entity to store and manage knowledge natively in Dynamics 365 Customer Service.

> ⓘ **Note**
>
> The entities `KBArticle`, `KBArticleTemplate` and `KBArticleComment` are now deprecated. This means that we do not expect you to use these entities anymore. You must use the newer `KnowledgeArticle` entity for knowledge management in Dynamics 365 Customer Service. For more information, see the section **Deprecated knowledge entities** at the end of this topic.

Create a knowledge article

When you create a knowledge article record, Dynamics 365 Customer Service internally creates a root article for the record. The root article acts as a container for the primary knowledge article created by you along with all the article versions and translations that you might create in future. The following diagram depicts the entity model for the `KnowledgeArticle` entity.



When you create a knowledge article record, it is created in the `Draft` state. Using the new `KnowledgeArticle` entity, you can create an article by specifying its contents and formatting in HTML format. You can specify your own value for the

`KnowledgeArticle.ArticlePublicNumber` attribute while creating a knowledge article record programmatically; otherwise, the value is automatically generated based on the format you specified in the Dynamics 365 Customer Service settings area in the web client. The `KnowledgeArticle.ArticlePublicNumber` attribute stores the ID exposed to customers, partners, and other external users to reference and look up knowledge articles, and remains the same across knowledge article versions and translations.

The following sample code shows how you can create a knowledge article record.

C#

```
KnowledgeArticle newKnowledgeArticle = new KnowledgeArticle
{
   Title = "Sample Knowledge Article",
   Content = "<p>This is the article content.</p>"
};
knowledgeArticleId = _serviceProxy.Create(newKnowledgeArticle);
Console.WriteLine("Created {0}", newKnowledgeArticle.Title);
```

Create major and minor versions of a knowledge article

When you create a knowledge article record, the major version is automatically set to 1 and minor version to 0. Use the `CreateKnowledgeArticleVersion` message (CreateKnowledgeArticleVersion Action or CreateKnowledgeArticleVersionRequest) to create a major or minor version of a knowledge article. In the request message, set `IsMajor` to `true` to create a major version; set it to `false` to create a minor version. The new version record that is created uses the:

- `KnowledgeArticle.RootArticleId` attribute to maintain the association with the root knowledge article record.
- `KnowledgeArticle.PreviousArticleContentId` attribute to point to the previous version of the record.

The following sample code shows how you can create a major version of a knowledge article record using CreateKnowledgeArticleVersionRequest.

C#

```
CreateKnowledgeArticleVersionRequest versionRequest = new
CreateKnowledgeArticleVersionRequest
{
   Source = new EntityReference(KnowledgeArticle.EntityLogicalName,
```

```
knowledgeArticleId),
   IsMajor = true
};
CreateKnowledgeArticleVersionResponse versionResponse =
(CreateKnowledgeArticleVersionResponse)_serviceProxy.Execute(versionRequest)
;
```

Create a knowledge article translation

Use CreateKnowledgeArticleTranslation Action (Web API) or CreateKnowledgeArticleTranslationRequest (organization service) to create a translation for a knowledge article record. You can translate your knowledge article in more than 150 languages, and information about these supported languages is available in the new `LanguageLocale` entity.

More information: LanguageLocale Entity.

Using CreateKnowledgeArticleTranslation Action (Web API) or CreateKnowledgeArticleTranslationRequest (organization service) creates a new knowledge article record with the title, content, description and keywords copied from the source record to the new record, and the language of the new record set to the one you specified in the request. You also need to specify whether the new record will be a major or minor version. The new record uses the `KnowledgeArticle.ParentArticleContentId` attribute to maintain the association with the primary knowledge article record.

After you execute this message and get a response, retrieve the knowledge article record from the response object, and then update the title, content, description, and keywords to add the translated content.

The following sample code shows how to create a knowledge article translation using CreateKnowledgeArticleTranslationRequest:

C#

```
CreateKnowledgeArticleTranslationRequest translationRequest = new
CreateKnowledgeArticleTranslationRequest
{
   Source = new EntityReference(KnowledgeArticle.EntityLogicalName,
knowledgeArticleId),
   Language = new EntityReference(LanguageLocale.EntityLogicalName,
languageLocaleId), //languageLocaleId = GUID of the Primary Key of
LanguageLocale record
   IsMajor = true    // Creating a major version
};
CreateKnowledgeArticleTranslationResponse translationResponse =
```

```
(CreateKnowledgeArticleTranslationResponse)_serviceProxy.Execute(translation
Request);

// Retrieve the new knowledge article record
KnowledgeArticle respObject =
(KnowledgeArticle)_serviceProxy.Retrieve(KnowledgeArticle.EntityLogicalName,
      translationResponse.CreateKnowledgeArticleTranslation.Id, new
ColumnSet(true));
```

> **Note**
>
> The GUID value of the primary key (`LanguageLocaleId`) for each language record in the `LanguageLocale` entity is the same across all Dynamics 365 Customer Service organizations.

Knowledge article lifecycle: Change the state of a knowledge article

During its lifecycle, a knowledge article can be in the following states:

- 0: Draft (after a knowledge article is created)
- 1: Approved (after a knowledge article is approved)
- 2: Scheduled (after a knowledge article is scheduled to be published)
- 3: Published (after a knowledge article is published)
- 4: Expired (after a knowledge article is expired as per the expiration date specified while publishing)
- 5: Archived (after a knowledge article is archived)
- 6: Discarded (after a knowledge article is discarded)

To change the state of the article, use the `Update` message on the knowledge article record to update the `KnowledgeArticle.StateCode` attribute. For early bound types, use the `KnowledgeArticleState` enumeration to set the possible states. More information: Perform specialized operations using Update.

The following sample code shows how to publish a knowledge article record.

```
C#
```

```
// Retrieve the knowledge article record
KnowledgeArticle myKnowledgeArticle =
(KnowledgeArticle)_serviceProxy.Retrieve(
        KnowledgeArticle.EntityLogicalName, knowledgeArticleId, new
ColumnSet("statecode"));

// Update the knowledge article record
myKnowledgeArticle.StateCode = KnowledgeArticleState.Published;
UpdateRequest updateKnowledgeArticle = new UpdateRequest
{
    Target = myKnowledgeArticle
};
_serviceProxy.Execute(updateKnowledgeArticle);
```

Associate a knowledge article record with a Dynamics 365 Customer Service entity instance

When you enable embedded knowledge search for an entity in Dynamics 365 Customer Service using the web client, a many-to-many relationship, `msdyn_<Entity_Name>_knowledgearticle`, is automatically created. You can use this relationship to programmatically associate or link a `KnowledgeArticle` instance with a Dynamics 365 Customer Service entity instance. When you associate a `KnowledgeArticle` instance with an entity instance, a record for the relationship is created in an intersect entity called `msdyn_<Entity_Name>_knowledgearticle`. For example, when you associate a `KnowledgeArticle` instance with an `Account` instance for the first time, an intersect entity called `msdyn_account_knowledgearticle` is created, and a record with the association mapping is created in this intersect entity. By default, the `Incident` (Case) entity is enabled for the embedded knowledge search, and when you link a `KnowledgeArticle` record to an `Incident` record, an association record is created in the `KnowledgeArticleIncident` intersect entity.

The following sample code demonstrates how to associate a `KnowledgeArticle` instance with an `Account` instance:

C#

```
// Associate the knowledge article record with an account record

// Step 1: Create a collection of knowledge article records that will be
// associated to the account. In this case, we have only a single
// knowledge article record to be associated.
EntityReferenceCollection relatedEntities = new EntityReferenceCollection();
relatedEntities.Add(new EntityReference(KnowledgeArticle.EntityLogicalName,
```

```
knowledgeArticleId));

// Step 2: Create an object that defines the relationship between knowledge
article record and account record.
// Use the many-to-many relationship name (msdyn_account_knowledgearticle)
between knowledge article
// record and account record.
Relationship newRelationship = new
Relationship("msdyn_account_knowledgearticle");

// Step 3: Associate the knowledge article record with the account record.
_serviceProxy.Associate(Account.EntityLogicalName, accountId,
newRelationship, relatedEntities);
```

Increment knowledge article view count

Use the IncrementKnowledgeArticleViewCountRequest message to increment the view count of a knowledge article record for a given day in the `KnowledgeArticleViews` entity. If a record doesn't exist for a knowledge article for a specified day, it will create a record and then set the specified view count value in the `KnowledgeArticleViews`.`KnowledgeArticleView` attribute. If a record already exists for a knowledge article for the specified day, it will just increment the view count in the `KnowledgeArticleViews`.`KnowledgeArticleView` attribute of the existing record.

Search knowledge articles using full-text search

Knowledge articles in Dynamics 365 Customer Service, including their versions and translations, are full-text indexed and support SQL Server full-text search. For more information about full-text search, see SQL Server: Full-text Search.

Use the FullTextSearchKnowledgeArticleRequest message to search knowledge article from your applications to find the information you are looking for. The FullTextSearchKnowledgeArticleRequest message lets you use inflectional stem matching (allows for a different tense or inflection to be substituted for the search text) and specify query criteria (using FetchXML or QueryExpression to specify filtering, ordering, sorting, and paging) to find knowledge articles with specified text. You can also choose to remove multiple versions of the same articles in the search results and filter on the knowledge article state while searching for a text.

Deprecated knowledge entities

The following legacy entities have been deprecated. More information: Deprecated knowledge entities

- KbArticle
- KbArticleComment
- KbArticleTemplate

Legacy knowledge entities are not accessible as of December 1, 2020. We strongly recommend that you move to the KnowledgeArticle entity. For more information about creating a knowledge article in Unified Interface, see Create and manage knowledge articles.

Use the following for help with migration:

- Use SDK, WebAPI, or Microsoft Power Automate depending on your scenarios.
- Use the open source migration tool with MIT license.

> **Important**
>
> - The open source migration tool is not support by Microsoft and may need to be modified to suit your scenarios.
> - Always run a test environment before using in production.
> - Check the license and readme before you use the tool.

Set up external search providers

Article • 06/30/2023

Use external search providers to federate the search of files, documents, and articles from data sources, such as SharePoint or another organization outside your current organization.

You can set up one of the following as a search provider:

- **Cross-Organizational Search**: Lets you specify an organization within the Microsoft organization to search articles. The organization URL is automatically identified. If the selected organization is in another geographical region, data transfer occurs across these locations.
- **Sharepoint**: Lets you specify the SharePoint URL that's in the same Microsoft organization as the current organization in which you're configuring the search provider.
- **Microsoft Graph connector**: Lets you specify the unique connection ID of the connector. Use this option if your organization uses Microsoft Search to index all external data. You need to specify the unique connection ID only when you create the connector.

In Microsoft Cloud for Sovereignty, the external search providers feature is available for use in Government Community Cloud (GCC) only.

To view search results, your agents must have access to external content.

Use the integrated search provider option to set up third-party knowledge sources, such as enterprise websites that are based on the site map protocol. For more information, see Manage integrated search providers.

Set up a search provider

> **Note**
>
> Before you set up a search provider, ensure that your firewall doesn't block the **https://www.d365ccafpi.com/** domain. Otherwise, users will encounter errors.

You can set up a search provider in the Customer Service admin center or Customer Service Hub app by performing the following steps:

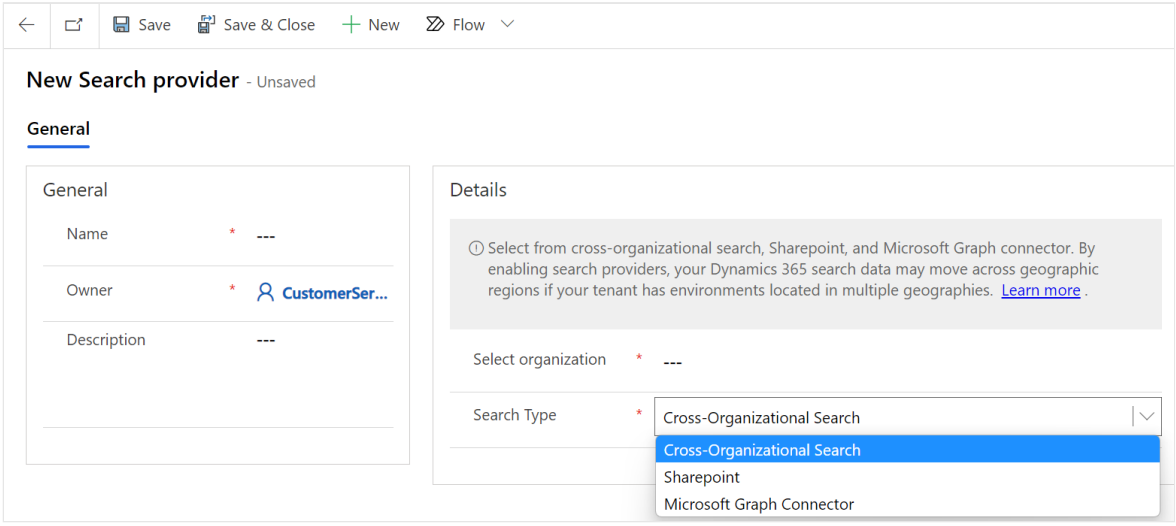
1. Go to **External search providers**.

Customer Service admin center

> **Note**
>
> **Search Providers** on the **Knowledge** page has been renamed as **External search providers**.

1. In the site map, select **Knowledge** in **Agent experience**. The **Knowledge** page appears.
2. In the **External search providers** section, select **Manage**.

2. Select **New**.
3. On the **New Search provider** page, **General** section, enter the name and owner of the search provider. Optionally, you can enter a description.
4. In the **Details** section, select the organization and the type of search provider you want to use from the **Select organization** and the **Search Type** dropdown, respectively.



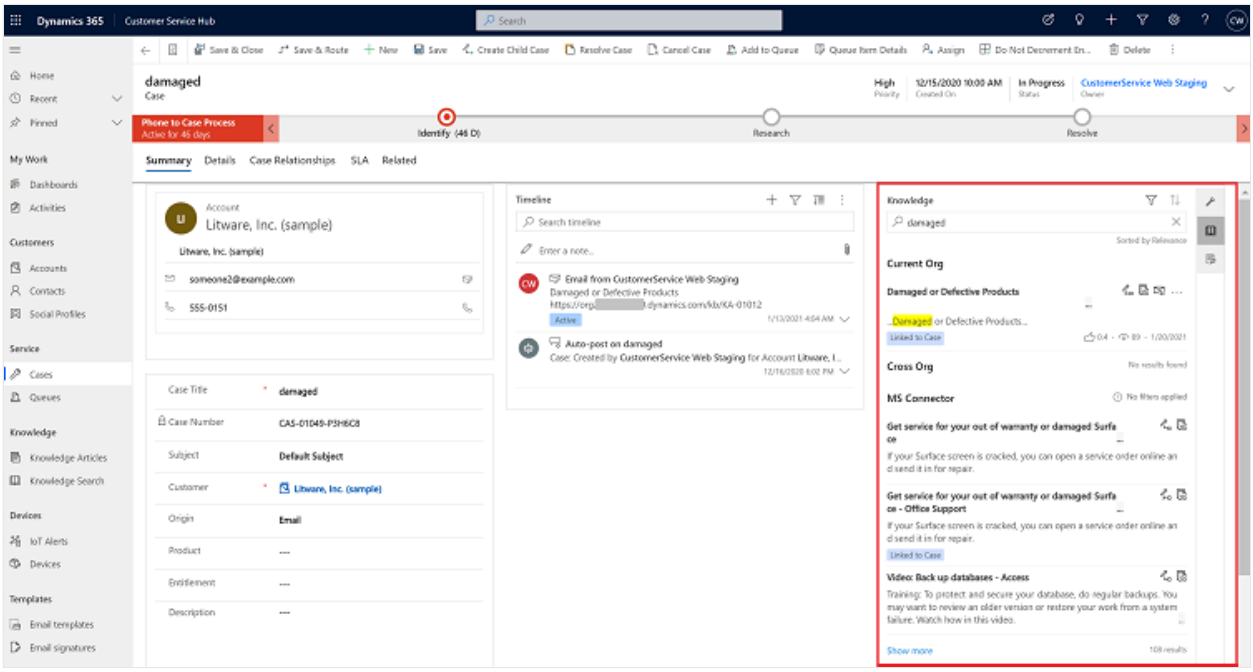
5. Select **Save**.

Post-configuration agent experience

After you've configured the search providers, agents can view links in their search results for each search provider included in their current organization.

> **Note**

The **configured value for the number of article search results** won't be applicable, if you configure even a single external search provider. For each configured search provider, the search results will display three articles. Agents can select **Show more** to view additional results.



For more information about agent search experience, go to Use external search providers.

> **Note**
>
> Custom roles must have **Read**, **Create**, **Append**, and **AppendTo** access to the following entities to see search results from other search providers:
>
> - Knowledge Federated Article
> - Knowledge Federated Article Incident

Manage integrated search providers

Article • 07/21/2023

With integrated search providers in Dynamics 365 Customer Service, you can configure third-party sources, such as enterprise websites that are based on the site map protocol. Articles are ingested into Dataverse and refreshed on the schedule you specify.

Prerequisites

If you're a first-time user, you must provision integrated search providers. Make sure that you have the following privileges:

- Basic level: **prvReadconnector**
- Global level:
  - **prvReadWorkflow**
  - **prvWriteWorkflow**
  - **prvCreatemsdyn_knowledgeconfiguration**
  - **prvReadmsdyn_knowledgeconfiguration**
  - **prvWritemsdyn_knowledgeconfiguration**
  - **prvDeletemsdyn_knowledgeconfiguration**

Learn more about security roles and privileges.

Provision integrated search providers

1. Sign in to the Dynamics 365 Customer Service admin center.
2. Go to **Knowledge** > **Integrated Search providers (Preview)** > **Manage**.
3. On the **Integrated search providers** page, select **Set up integrated search**.

If you aren't able to provision the integrated search provider, you'll need to enable the Integrated Search API trigger flow.

If integrated search isn't enabled in your geographical region, contact Microsoft Support to provision the feature.

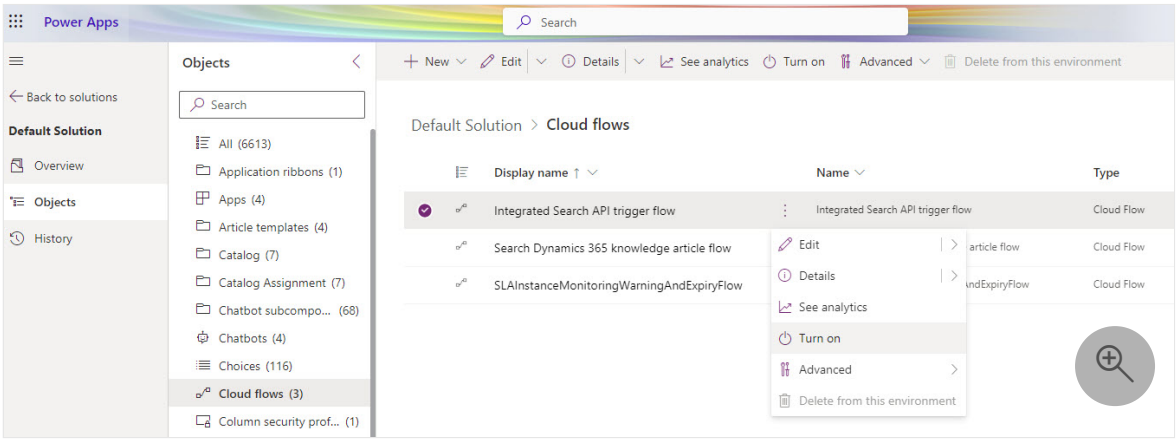
Enable the Integrated Search API trigger flow

> **Note**

To turn on the **Integrated Search API trigger** flow, you must have the **prvReadWorkflow** (Global-level) privileges.

> **Tip**
>
> Images that include an icon that looks like this: may be expanded to show more detail. Select the image to expand it. To close it, press the Esc key.

1. Sign in to make.powerapps.com.
2. Go to **Solutions** > **Default Solution** > **Cloud flows** and turn on **Integrated Search API trigger flow**.



Add integrated search providers

1. In the Customer Service admin center, under **Experiences**, select **Knowledge**.
2. On the **Knowledge** page, in the **Integrated search providers** section, select **Manage**.
3. Select **New**.
4. In the **Provider info** section:
   - **Search provider name**: Enter the name of the search provider.
   - **Description**: Enter the description of the search provider.
   - Select the authorization check box.
5. Select **Next**.
6. In the **Authentication and testing** section:

- **Root URL**: Enter the root URL of the search provider website, including the protocol.
- **Site map URL**: Enter the site map URL of the website. To get the site map URL, enter the root URL followed by `/robots.txt` in the address bar, and then search the file for "sitemapindex." For example, type https://www.contoso.com/robots.txt in the address bar.

  > **Note**
  > - The site map that you provide must have the **lastmod** tag within the article **url** tag.
  > - The site map and the site index files must have content-type as either application/xml or text/xml.
  > - You must provide static websites only for data ingestion. Websites that return scripts to load content aren't supported for data ingestion.
  > - A unique combination of root URL, site map URL, and language filters only are allowed.

- **Language filter for ingestion**: Select the languages you want to map for the ingestion. Select **Reset** to clear your selection. By default, all languages are considered for ingestion. If you apply language filters, you must maintain the mapping for language code.

7. Select **Next**.
8. In the **Knowledge article schema** section, select either **Field Mapping** or **JSON Schema**.

   You can't change the configuration method after you save it. Learn more about knowledge article schema mapping.
9. In the **Refresh Schedule** section, specify the refresh intervals:

   - **Refresh frequency**: Select a value from the list to specify the frequency at which new or updated articles are ingested from the search provider. To pause ingestion, select **No refresh**.
   - **Lookback period**: Select a value from the list to specify an additional period over which articles should be ingested that might have been missed during the initial ingestion.

For example, if you set the refresh frequency at 15 minutes and lookback period at 2 hours, your data is refreshed for the last 2 hours and 15 minutes, every 15 minutes.

10. Select **Next**.
11. In the **Summary** section, review the information you entered and make any changes you need to.
12. Select **Save and close**.

    The new search provider appears on the **Knowledge** > **All integrated search providers** page. Its status is **Inactive** with status reason **Validated**.

    If you need to add further information, select **Save as draft**. The status is **Inactive** with status reason **Draft**.

Run ingestion for search providers

Depending on the search provider's status, run either a time-range based or a trial ingestion. When you start a trial ingestion, you can spot and correct any errors. View the status of your ingestion on the **Insights** tab in the **Crawl failures** column.

You can't run ingestion for search providers that are **Inactive** with status reason **Draft**.

Trial ingestion

If your search provider is **Inactive** with status reason **Validated**, you can run a trial ingestion.

1. On the **Knowledge** > **All integrated search providers** page, select the search provider.
2. Select **Run Ingestion**.
3. Select **Trial Ingestion**.
4. Specify the number of articles to ingest from the **No of records** list. The maximum number of articles you can select is 1,000.

Check the **Insights** tab for errors. If you don't see any and you want to run a time-range based ingestion, activate the search provider first.

Time-range based ingestion

If your search provider is **Active** with status reason **Ingestion Ready**, initiate a time-range based ingestion.

1. On the **Knowledge** > **All integrated search providers** page, select the search provider.
2. Select **Run Ingestion**.
3. Select **Time-range based ingestion**.
4. Specify the date range from which to pick up updated articles for the ingestion. The date range has to be 60 days from the **From** date.

Activate search providers

When you activate a search provider, new and updated articles start ingesting from the provider, and articles start appearing in the search results.

1. In the Customer Service admin center, under **Experiences**, select **Knowledge**.
2. On the **Knowledge** page, in the **Integrated search providers** section, select **Manage**.
3. From the **Inactive search providers** list, select a search provider, and then select **Activate**.
4. Select **Activate** again to confirm you want to activate the search provider.

Edit search providers

When you edit a search provider, your changes take effect with the next ingestion.

1. In the Customer Service admin center, under **Experiences**, select **Knowledge**.
2. On the **Knowledge** page, in the **Integrated search providers** section, select **Manage**.
3. Select **Active integrated search providers** or **Inactive integrated search providers** from the **All integrated search providers** list, and then select the search provider that you want to make changes to.
4. Select **Edit**.
5. On the **Search provider details** page, select the tab where you want to make changes.
6. Edit the information as needed.
7. Select **Save and Close**.

Deactivate search providers

When you deactivate a search provider, ingestion of new and updated articles from the search provider stops. Articles that have already been ingested no longer appear in search results.

1. In the Customer Service admin center, under **Experiences**, select **Knowledge**.
2. On the **Knowledge** page, in the **Integrated search providers** section, select **Manage**.
3. From the **Active search providers** list, select a search provider.
4. Select **Deactivate**.
5. Select **Deactivate** again to confirm you want to deactivate the search provider.

Configure search providers as search filters

Configure search providers as filters to search knowledge articles only from selected data providers. The filter works only if you have Dataverse Search enabled.

> **Note**
>
> If you have a custom layer on the Knowledge Articles Quick Find view, add `msdyn_integratedsearchproviderid` in **View columns** and **Find columns** to stop articles from appearing in search results.

1. In the Customer Service admin center, under **Experiences**, select **Knowledge**.
2. In the **Filters** section, make sure that **Enable search filters** is set to **Yes**.
3. From the **Select filter type** list, select **Integrated Search Dataprovider Id**, and then select **Add**.
4. Select the **Search** icon.
5. Select the search provider, and then select **Add**.
6. Optionally, to set predetermined search providers to appear for agents by default, switch **Set as preselected filter** to **Yes**.

If you select a deactivated data search provider, it might appear on the **Filter by** list, but no search results from the selected provider are returned.

Search knowledge articles

Configure knowledge article schema mapping

Article • 09/15/2023

As part of adding an integrated search provider in Customer Service, you need to tell the service how to ingest the knowledge articles it receives from the provider. You do that by selecting and configuring a knowledge article schema. You can't change the schema after you save the configuration.

If you applied a language filter in the **Authentication and Testing** section, you must maintain the mapping for language locale either in the **JSON Schema** or in the **Knowledge article schema mapping** section. For more information on language locale values, go to: Language (LanguageLocale) table/entity reference.

To start, select an option in the **Knowledge article schema** section:

- **Field Mapping**
- **JSON Schema**

Field mapping

With field mapping, you map a knowledge article received from the search provider (the source property) to an attribute of the knowledge article entity (the target), based on an operation type. You need to use an operation type and then select the source property for the mapping.

- **Article attributes**: The knowledge article target field values.
- **Operation types**: The mapping patterns that map the source article to the article attributes of the knowledge article entity. Learn more about operation type mapping options.
- **Source property**: The value that you define for each operation type. For example, if you select the **Direct** operation type, you must select among the previously selected meta tags or the `HTML-Title` tag.

1. Save the article locally as a **Web Page, HTML Only** file. Make sure the file name is fewer than 99 characters.

2. In the Customer Service admin center site map, **Knowledge article schema** > **Field Mapping** section, upload the file by selecting **Choose file**.

All the meta tags found in your HTML file are listed in the **Meta tags settings** section.

3. Either select **Select all below meta tags** or select only the meta tags you need to map.

   The meta tags you select here become attributes you can select as source properties in the **Mapping** section. If you don't select any, only the default source properties **HTML-Title** and **HTML-Body** are available to map.

4. To go to the **Mapping** section, select **Next**. If you want to stop and come back to this point later, select **Save as draft**.

5. In the **Mapping** section, the mandatory knowledge article attributes are **External Reference Id**, **Title**, and **Content**. For each, select an **Operation Type** and a **Source Property**.

   Make sure the **External Reference Id** value is unique.

6. To add more article attributes, select **Add Row**, and then select an **Article Attribute**, **Operation Type**, and **Source Property**.

   You can also select **Delete** to delete an article attribute if needed.

7. Select **Validate mapping**.

   The service uses the values you entered to determine the values of the attributes against the HTML file you uploaded. It validates entries in the mapping table and Regex patterns. There are no validations for RegexUrl.

   If validation succeeds, you see a confirmation message. If validation fails, you see an error message. Depending on the error message, check either the entries in the mapping table or the regex patterns you entered.

8. Select **Next** to go the next section. If you want to stop and come back to this point later, select **Save as draft**.

JSON schema

Learn more about schema details to build a metadata mapping template.

1. Copy and paste your article properties and schema JSON in the field provided to you

2. Select **Validate JSON**.

If validation succeeds, you see a confirmation message. If validation fails, you see an error message that identifies the parameter that has an incorrect value.

3. Select **Next** to go the next section. If you want to stop and come back to this point later, select **Save as draft**.

Operation type mapping options

- **Regex**: Uses regex patterns to extract values from the source website. The source property is a text field where you can enter the regex pattern. The string from your website's HTML that matches this pattern is mapped to the corresponding knowledge article field.

  The regex patterns must have a capture group enclosed in parentheses that allows you to extract a specific portion of the matched text. The text is extracted from the first nonempty group of the first match.

  Here are some examples of regex patterns to extract content from a specific div tag:
  - Based on the div tag ID: `<div\b[^>]*id=\"your-id-name-here\"[^>]*>([\s\S]*?)<\/div>`
  - Based on the div tag class: `<div\b[^>]*class=\"your-class-name-here\"[^>]*>([\s\S]*?)<\/div>`
  - For content inside the body tag: `<body[^>]*>([\s\S]*)<\/body>`
  - For content inside the head tag: `<head[^>]*>([\s\S]*)<\/head>`

- **Direct**: Maps the value of any meta tag from its source website directly to any knowledge article field. The **Source Property** list shows all the meta tags extracted from the sample website along with source properties **HTML-Title** and **HTML-Body**, which are available by default.

  If you select **Direct** as the operation type and **og: url** as the source property, then the value of the **og: url** meta tag from the source property is mapped to the corresponding knowledge article attribute.

- **Constant**: Enter a constant value in any knowledge article field. The source property is a text field where you can enter the constant value.

- **RegexUrl**: Like Regex, but looks for matches in the URL of the source website only. To map the entire source website URL to a knowledge attribute field, select **Regexurl** in the operation type, and use the (. *) pattern in the source property.

Manage integrated search providers

View and use insights for search providers

Article • 07/21/2023

After you add search providers to Customer Service, you can use the **Insights** tab in the Customer Service admin center to monitor ingestion. The tab displays the following details for the search provider: **Ingestion ID**, **Status**, **Crawl failures**, **Recognized**, **Created**, **Updated**, and **Failed**.

View insights

1. In the Customer Service admin center, go to **Knowledge** > **Integrated search providers (Preview)** > **Manage**.
2. Select **Active integrated search providers** or **Inactive integrated search providers** in the list, and then select a search provider.
3. Select the **Insights** tab.

The tab shows up to 100 ingestion IDs. The data is refreshed every 30 minutes.

Use insights

The **Failed** column shows articles that weren't ingested. To view the failed articles, select the ingestion ID.

The **Error type** column indicates whether the failure was a crawl error before ingestion or an ingestion run error.

Schema details to build a metadata mapping template

Article • 05/02/2023

This article describes the schema details required to map information from external data providers to the knowledge article entities, and how you can prepare your own schema mapping JSON file using various fields and attributes.

Fields

The following table lists the fields and field details that you must use in your JSON schema.

Field name	Definition	Required	Value
Name	Name of the field definition	No	A string indicating the name of the field.
UniqueTargetFieldName	Is the unique identifier or alternate key of the knowledge article entity. Typically, this field is the ID on the content provider side.	Yes	A string indicating the name of the field. You can set the value to "msydn_externalreferenceid"
ContentTargetFieldName	Field value shouldn't be changed.	Yes	Set the value to "content".
ApiPathLeafName	Field value should not be changed.	Yes	Set the value to "knowledgearticles".
List<FieldDefinitions>	Is a list of field definitions.	Yes	A set of definitions for the fields. See the following table for the list of supported fields for setting field definitions.

Field definitions

The following table lists the required and optional attributes that you can use in your metadata mapping schema.

Field name	Definition	Required	Value

Field name	Definition	Required	Value
TargetFieldName	Is the logical field name of the target attribute in the knowledge article entity.	Yes	Any string indicating the name of the target field
TargetFieldType	Indicates the type of the target field.	Yes	A string indicating the type of the field.
DocFieldSource	Indicates how the source field value will be identified and resolved at run time	Yes	Set the value to one of the following source types: • Regex • Meta • Constant • Url • Document To know about these data types, refer to the following Field source types section.
DocFieldPattern	Indicates the nature of the target field to be fetched.	No	Set this value based on the DocFieldSource value. See the examples below on how to set DocFieldPatterns.
MaxLength	Is the maximum length of the string that can be stored in the target field.	No. Can be used when **TargetFieldType** attribute is of type String	Int
UseRegexCapture	Stores the regex pattern that can be applied to the URL.	No. Can be used when the **TargetFieldType** attribute is of type String and **DocFieldSource** attribute is of type Url.	Url or String.

Field source types

The data in the external search providers can be set to any of the following field source types:

- **Regex**: Use to indicate a regular expression type of data.

- **Meta**: Use to indicate that the target field value is obtained from a <meta> tag in the source article
- **Constant**: Use to set a static value for the target field.
- **Url**: Use to indicate the URL of the external source document.
- **Document**: Use to indicate the HTML content of the article.

Considerations to build your own metadata mapping template

When you develop your own mapping schema, you must be sure to configure a few mandatory fields and set default values for some field definitions.

Your mapping template must include:

- The **UniqueTargetFieldName**, **ContentTargetFieldName**, and **ApiPathLeafName** fields. These fields must be set to their required values as follows:
  - Set the **UniqueTargetFieldName** to the out-of-the-box **msdyn_externalreferenceid** field or to a custom field. If you're using a custom field, then ensure that you add the field as an alternate Key. More information: Define alternate keys to reference Dynamics 365 records.
  - Include the **ContentTargetFieldName** field and set its value to "content".
  - Include the **ApiPathLeafName** field and set its value to "knowledgearticles".
  - Ensure that you provide mappings for both the **UniqueTargetField** and **ContentTargetField** fields in the **FieldDefinitions** list.

  Your mapping schema would look like:

  JSON

  ```
  {
    "Name": "{To be filled by you}",
    "UniqueTargetFieldName": "msdyn_externalreferenceid",
    "ContentTargetFieldName": "content",
    "ApiPathLeafName": "knowledgearticles"
    "FieldDefinitions": []
  }
  ```

- You must include the below **FieldDefinitions** list and populate its attributes such as **FieldUse**, **DocFieldSource**, **TargetFieldName**, and **TargetFieldType** with default values. Be sure to include the following fields and attributes with their values, "as-is", in your template. However, the Docfieldsource and Docfieldpattern for the title

and content value fields can be set by you to either **Regex**, **Meta**, **Document**, **Constant**, or **Url**.

JSON

```
  {
    "FieldUse": "Create",
    "DocFieldSource": "ArticlePublicNumber",
    "TargetFieldName": "articlepublicnumber",
    "TargetFieldType": "String"
  },
  {
     "DocFieldSource": "Constant",
     "DocFieldPattern": "true",
     "TargetFieldName": "msdyn_isingestedarticle",
     "TargetFieldType": "Boolean"
  },
  {
     "DocFieldSource": "Url",
     "TargetFieldName": "msdyn_ingestedarticleurl",
     "TargetFieldType": "String"
  },
  {
     "DocFieldSource": "DataProvider",
     "TargetFieldName": "msdyn_integratedsearchproviderid@odata.bind",
     "TargetFieldType": "String"
  },
  {
     "DocFieldSource": "Regex",
     "DocFieldPattern": "<title>(.*?)</title>",
     "TargetFieldName": "title",
     "TargetFieldType": "String"
  },
  {
     "DocFieldSource": "Url",
     "TargetFieldName": "msdyn_externalreferenceid",
     "TargetFieldType": "String",
     "UseRegexCapture": "^https://.*?/(.*?)/.*/.*?([0-9A-F]{8}[-](?:[0-
9A-F]{4}[-]){3}[0-9A-F]{12})$"
  },
  {
     "DocFieldSource": "Document",
     "TargetFieldName": "content",
     "TargetFieldType": "String"
  }
```

- After you've listed the mandatory fields and attribute information, you can include any additional metadata mappings and set your own custom values for them. For

example, you can include a Meta type of **DocFieldSource** and set any custom values for the attribute, as follows.

JSON

```
{
  "DocFieldSource": "Meta",
  "DocFieldPattern": "description",
  "TargetFieldName": "description",
  "TargetFieldType": "String",
  "MaxLength": 155
 }
```

Sample metadata mapping template

You can use the following metadata mapping JSON sample as template to build your own custom mapping template.

JSON

```
{
  "Name": "Integrated Search Data Provider Name",
  "UniqueTargetFieldName": "msdyn_externalreferenceid",
  "ContentTargetFieldName": "content",
  "ApiPathLeafName": "knowledgearticles",
  "FieldDefinitions": [
  {
    "FieldUse": "Create",
    "DocFieldSource": "ArticlePublicNumber",
    "TargetFieldName": "articlepublicnumber",
    "TargetFieldType": "String"
  },
  {
    "DocFieldSource": "Constant",
    "DocFieldPattern": "true",
    "TargetFieldName": "msdyn_isingestedarticle",
    "TargetFieldType": "Boolean"
  },
  {
    "DocFieldSource": "Url",
    "TargetFieldName": "msdyn_ingestedarticleurl",
    "TargetFieldType": "String"
  },
  {
    "DocFieldSource": "DataProvider",
    "TargetFieldName": "msdyn_integratedsearchproviderid@odata.bind",
    "TargetFieldType": "String"
```

```
      },
      {
        "DocFieldSource": "Regex",
        "DocFieldPattern": "<title>(.*?)</title>",
        "TargetFieldName": "title",
        "TargetFieldType": "String"
       },
       {
          "DocFieldSource": "Meta",
          "DocFieldPattern": "description",
          "TargetFieldName": "description",
          "TargetFieldType": "String",
          "MaxLength": 155
       },
       {
          "DocFieldSource": "Document",
          "TargetFieldName": "content",
          "TargetFieldType": "String"
        },
        {
          "DocFieldSource": "Url",
          "TargetFieldName": "msdyn_externalreferenceid",
          "TargetFieldType": "String",
          "UseRegexCapture": "^https://.*?/(.*?)/.*/.*?([0-9A-F]{8}[-](?:[0-
9A-F]{4}[-]){3}[0-9A-F]{12})$"
        }
    ]
 }
```

Transform, map external source data to knowledge fields

When you're mapping information from external data providers to knowledge article entities, if the source value is of a different data type, you'll have to transform the value before you can map it to the target knowledge field. More information: Transform and map external source data to corresponding target knowledge attribute

Customize knowledge article search filters

Article • 06/16/2023

You can configure standard and custom fields as filters to help your agents find the right content through knowledge search and thus improve their productivity.

The fields that are present on the knowledge article entity are the fields that are available as filters. Additionally, filters can be defined on fields that have the following data types:

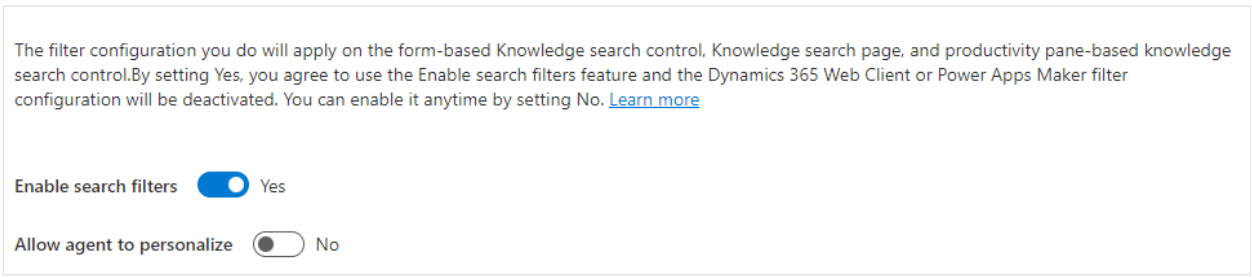
- Options set
- Multiselect options set
- Lookup
- Two choices
- Date and time

Any filter configurations that you set will be available wherever the knowledge search experience is configured, such as the form-based knowledge control, knowledge search page, productivity pane-based knowledge search control, embedded search control in Unified Service Desk, and the application tab search experience in Customer Service workspace.

The **Enable search filters** option is set to **Yes** by default. To disable search filters, you can set it to **No** on the **Filters** page.

If you choose to retain the **Enable search filters** option as **Yes**, then the filter configurations made in Power Apps will be deactivated. Additionally, the archived and discarded status filters will no longer be supported.

The settings that you've previously configured for your organization, including the default language configured for your organization in the Power Apps filter configurations, will no longer be applicable. You'll need to configure the language as default using the filter configurations.



Customize search filters

You can customize the search filters for knowledge articles in the Customer Service admin center or Customer Service Hub app by performing the following steps:

1. Go to **Filters**.

   Customer Service admin center

   a. In the site map, select **Knowledge** in **Agent experience**. The **Knowledge** page appears.
   b. On the **Knowledge** page, go to the **Filters** section and select **Manage**. The **Filters** page appears.

---

2. To enable agents to personalize knowledge article search filters:

   Customer Service admin center

   - Set the **Allow agent to personalize** toggle to **Yes**.

---

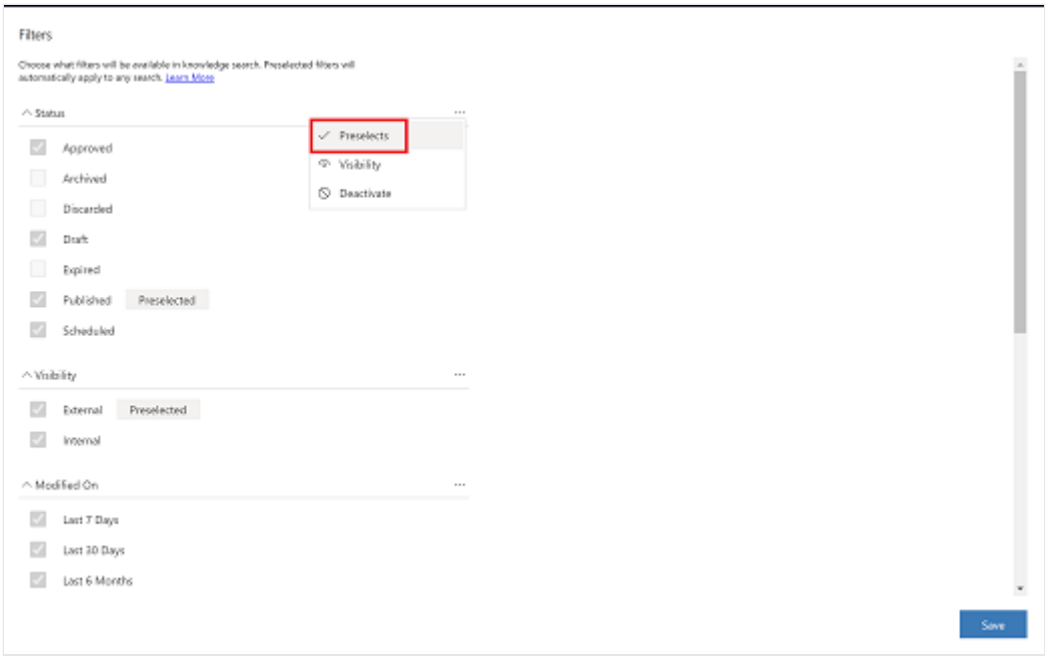
3. Select the filters you want to make available for knowledge search.

   Customer Service admin center

   - Move through the **Filters** page to view the filters.

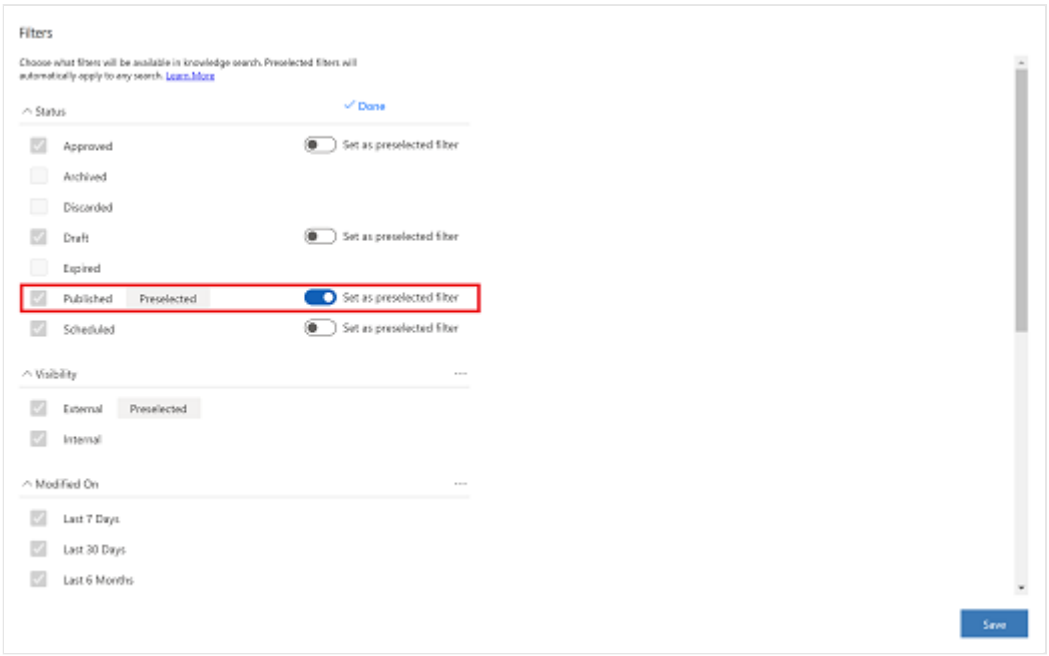
---

4. To set predetermined values that will appear for agents by default, select the ellipsis in the upper-right corner of a filter area, and then select **Preselects**.



5. To make a filter value available by default, turn on the **Set as preselected filter** toggle, so that **Preselected** appears next to the filter name, and then select **Done**.

   Values that are set as preselected automatically participate in the filtering without requiring the agent to manually select them. Only values made visible can be preselected.



6. If you want to set the filters that must be shown to the agent, select the ellipsis in the upper-right corner of a filter area, and then select **Visibility**.

7. Select the values that you want to show the agent, and then select **Done**.

8. When you're finished with configuring the values you want, select **Save**.

Enable custom fields as search filters

To configure custom fields as search filters for knowledge articles:

1. Enable the standard search filters.
2. Add the custom fields to the Quick Find view columns. To add a field to the Quick Find view column, see Configure searchable fields for Relevance Search.

Additional configuration settings

- If Dataverse Search is enabled and if you have selected the **Archived**, **Discarded**, or **Expired** values for the **Status** filter, articles that contain these values will not be displayed.
- To view these articles in your Dataverse Search results, you must delete the **Archived**, **Discarded**, **Expired**, and **Is Latest Version** filters in the **Quick Find Knowledge Article** > **Edit Filter Criteria** dialog.

> **Note**
>
> These filters will only work if you have Dataverse Search enabled.

Add a default filter configuration

The following steps apply to these data types:

- Options set
- Multiselect options set
- Two choices
- Date and time

You can add a default filter in the Customer Service admin center or Customer Service Hub app by performing the following steps:

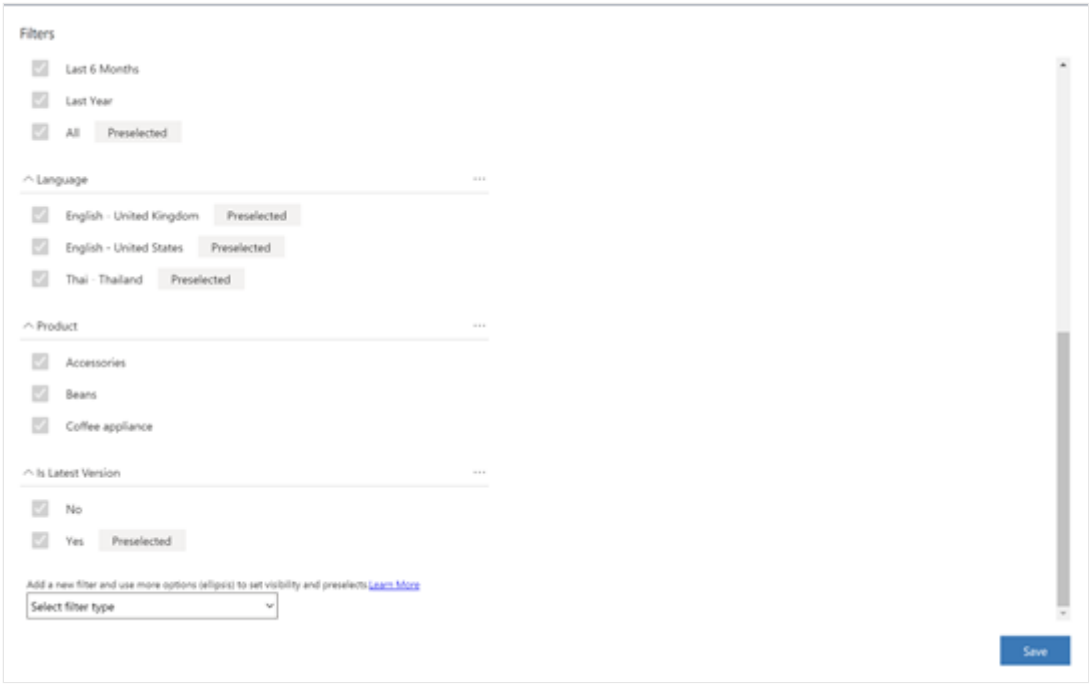
1. Go to the **Filters** page.

   Customer Service admin center

   a. In the site map, select **Knowledge** in **Agent experience**. The **Knowledge** page appears.

b. On the **Knowledge** page, go to the **Filters** section and select **Manage**. The **Filters** page appears.

2. Scroll to the bottom of the page, select the filter type you want from the dropdown list, and then select **Add**. The filter is added to the page.



3. Customize the filter according to your requirements by selecting or deselecting the values displayed, and then turn on the **Set as a preselected filter** option if you want the filter to be shown to the agent by default.

4. Select **Save**.

Configure fields with data type as lookup as filters

Some configurable filter values may include lookup types, where there are numerous value options that can be set. Some examples of these filters are Created by, Modified by, and Owner. For these types of values, when you add the filter, you can manually search for and select the records that you want to use.

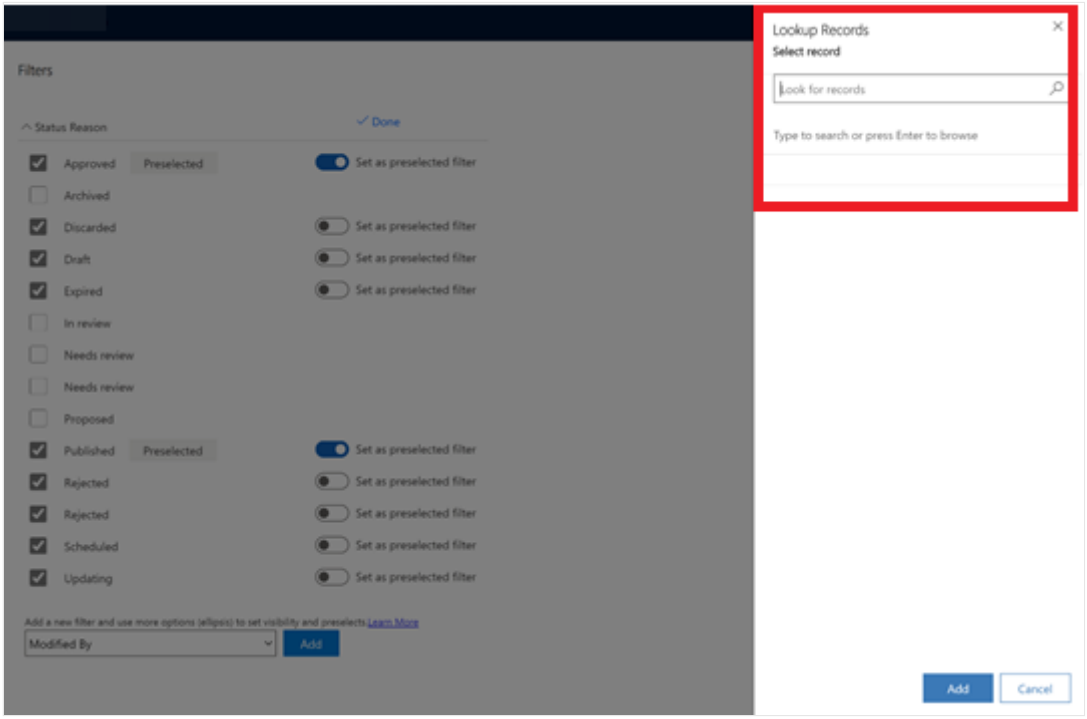
You can configure a lookup type filter in the Customer Service admin center or Customer Service Hub app by performing the following steps:

1. Go to the **Filters** page.

Customer Service admin center

a. In the site map, select **Knowledge** in **Agent experience**. The **Knowledge** page appears.
b. On the **Knowledge** page, go to the **Filters** section and select **Manage**. The **Filters** page appears.

2. Scroll to the bottom of the page, select the filter type you want from the dropdown list, and then select **Add**. The **Lookup Records** flyout menu is displayed.



3. To find the values you want, either enter the value details in the field or select the search icon to list the available records.

4. Select the records that you want in the results, and then select **Add**.

5. If you want to set the values as defaults, turn on the preset next to the filter to the right so that **Preselected** appears next to the filter name.

6. Select **Save**.

Deactivate or reactivate a filter configuration

There may be times when you want to temporarily suspend a filter configuration but don't want to lose the configuration settings. You can deactivate a filter configuration and then reactivate it later on.

> ⓘ **Note**

If you deactivate or delete all of the filters, then agents will see the following message on the personalization page: "No filters have been configured. Contact your administrator."

Keep in mind the following:

- If you delete a knowledge article field for which a filter has been created, your agents won't see the filter, and they won't be notified about the change in the UI. You, as the administrator, will see the filter with a message indicating that it has been deleted.
- If you deactivate the filter, it will show as deactivated to you as the administrator, but your agents won't see the filter on the knowledge control. When the filter is activated again, the filter configuration will remain as it was previously configured.
- If an agent doesn’t have permission to see a specific field because of field-level security, then a filter created on that field won't be visible to the agent.
- Filters that are available in the default, out-of-the-box configuration can't be deleted.
- If an agent sets default values, those values will persist and cannot be overwritten by changes made by an administrator.

You can deactivate or reactivate a filter configuration in the Customer Service admin center or Customer Service Hub app by performing the following steps:

1. Go to the **Filters** page.

   Customer Service admin center

   a. In the site map, select **Knowledge** in **Agent experience**. The **Knowledge** page appears.
   b. On the **Knowledge** page, go to the **Filters** section and select **Manage**. The **Filters** page appears.

---

2. Select the ellipsis in the upper-right corner for the filter you want to deactivate, and then select **Deactivate**.
3. Select **Done** > **Save**.
4. When you are ready to reactivate the filter, go to the **Filters** page, select the ellipsis next to the value you want to reactivate, and then select **Activate**. All of the previous configurations will be reinstated.

Allow agents to personalize their knowledge article search filters

You may have scenarios within your organization where agents are working on different areas and don't all need the same filter settings. For example, an organization may have agents working on different product areas. One agent might need to see knowledge articles for Product A, while another agent might only want knowledge articles for Product B, and so forth.

You can allow your agents to personalize the knowledge article search filters for their areas, from the Customer Service admin center or Customer Service Hub app by performing the following steps:

1. Go to the **Settings** page.

   Customer Service admin center

   a. In the site map, select **Knowledge** in **Agent experience**. The **Knowledge** page appears.
   b. In the **General settings** section, select **Manage**. The **General settings** page appears.

2. Customize the filter according to your needs by selecting or deselecting the values displayed and then turn on the **Set as a preselected filter** toggle if you want the filter to be shown to the agent by default.

   > **Note**
   >
   > This option will be available only if **Enable custom filters** is set to **Yes**.

3. Select **Save**.

After you've enabled the option, your agents will be able to view all the configurations that you previously set for them and personalize the knowledge search filters for their areas.

Create and manage categories

Article • 04/04/2022

Using the **Categories** entity, you can create hierarchical categorical data to help group records. Categorizing entity records in Dynamics 365 Customer Service helps you tag the records so that you can easily search them. Use the entity to create and manage a logical structure of categories in Dynamics 365 Customer Service, and then associate entity records to one or more categories.

Categories are useful for reporting, sorting, segmenting, and categorization of records.

Create a category

Make sure that you have the Customer Service Manager, System Administrator, or System Customizer security role or equivalent permissions.

Check your security role

- Follow the steps in View your user profile.
- Don't have the correct permissions? Contact your system administrator.

You can create a category in the Customer Service admin center or Customer Service Hub app by performing the following steps:

1. Go to the **Categories** page.

Customer Service admin center

1. In the site map, select **Knowledge** in **Agent experience**. The **Knowledge** page appears.
2. In the **Categories** section, select **Manage**. The **All Categories** view is displayed. You can switch between various system views using the dropdown list.

Create templates for articles

Article • 02/15/2022

Article templates help you create new articles for your organization's knowledge base library. You can also create templates with boilerplate text to help article writers use consistent language and messaging.

> **Note**
>
> This experience is applicable only to legacy Articles entity and not the new Knowledge Article entity.

1. Make sure you have the System Administrator security role or equivalent permissions in Microsoft Dynamics 365.

   Check your security role

   - Follow the steps in View your user profile.
   - Don't have the correct permissions? Contact your system administrator.

2. In the web app, go to **Settings** ( ) > **Advanced Settings**.
3. Select **Settings** > **Service Management**.
4. Select **Article Templates**.
5. To create a new article template, select **New**.
6. In the **Article Template Properties** dialog box, type the new article title, select the language, and then select **OK**.
7. To add a section, in the **Common Tasks** area, select **Add a Section**, and specify the following:

   a. In the **Title** box, type a title.

   b. In the **Instructions** box, type a description of the information that users should provide in this section when they use this template.

   When a user creates a new article with this template, these instructions appear in the body text for this section, and disappear when the user starts typing.

8. To reposition a section from the template, select the section you want to reposition, and in the **Common Tasks** area, select the green arrows to move the section to the position you want.

   When you select a section, its border turns green and the border lines become solid.

9. To remove the section, select the section you want to remove, and in the **Common Tasks** area, select **Remove a Section**.

10. To edit a section, select the section you want to edit, and in the **Common Tasks** area, select **Section Properties**. Edit the title and description.

11. To format the text, font, and color of the article title, headings, and body text of each section, use the tools on the **Modify** toolbar.

12. When you're done, select **Save** or **Save and close**.

    After you save the template, it is immediately available for use. If the template is not complete and you want to finish it later, you can save the template, deactivate it (make it ready-only), and then complete it later. When the template is complete, you can reactivate it.

> **Note**
>
> If you need to back up your templates, or export them for use in a different implementation, you can export them as part of exporting customizations. More information: **Export your customizations as a solution**.

Integrate knowledge management in Dynamics 365 with Power Virtual Agents bots

Article • 11/17/2022

Integrate knowledge management with a Power Virtual Agents bot to use customized conversations. Bots help answer questions, perform actions, and solve simple problems. This frees up your agent's time to deal with complex issues that need human intervention.

Power Virtual Agents lets you configure bots with various topics and trigger phrases to automatically resolve questions posed by your customers on your portal page. More information: Power Virtual Agents overview

You can integrate knowledge management with a Power Virtual Agents bot by using either of the following ways:

- Search Dynamics 365 knowledge articles
- Power Automate flow template

Prerequisites

- Dataverse search must be enabled for the integration. You must have a system administrator role to be able to enable Dataverse search. More information: Configure Dataverse search for your environment
- You must perform the following two steps before you begin the integration.

    1. Create and publish knowledge articles to a portal created in Power Apps.

        Set up your portal with the Power Apps portals feature before integrating knowledge management with the Power Virtual Agents bot. More information: Use settings to set up knowledge management. For more information on setting up your Power Apps portal, see: Power Apps portal documentation.

        You can create and manage knowledge articles by setting the **Internal** field to **No** in the Microsoft Datverse Web API. More information: knowledgearticle EntityType

    2. Create a Power Virtual Agents bot and a topic in it.

- For more information on creating a bot, go to Create and delete Power Virtual Agents bots.
- For more information on creating a topic, go to Create and edit topics in your Power Virtual Agents bot.

Use the Search Dynamics 365 knowledge article flow action

Perform the following steps if you want to integrate a Power Virtual Agents bot with knowledge management using the **Search Dynamics 365 knowledge articles** action:

1. Set connection references.
2. Add the action to the Power Virtual Agents topic.

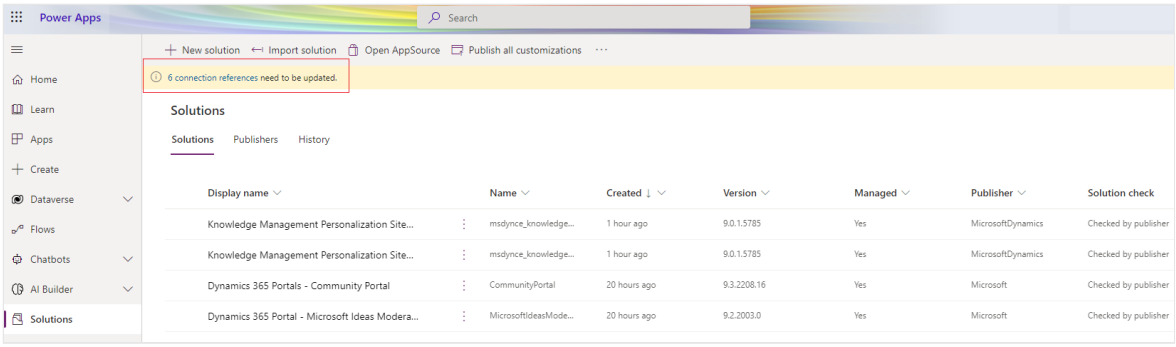
Set connection references

Knowledge management integrated with Power Virtual Agents solution uses the flow with connections, such as **Content Conversion** and **Microsoft Dataverse**. You must configure these connection references before turning the **Search Dynamics 365 knowledge article flow** action on.

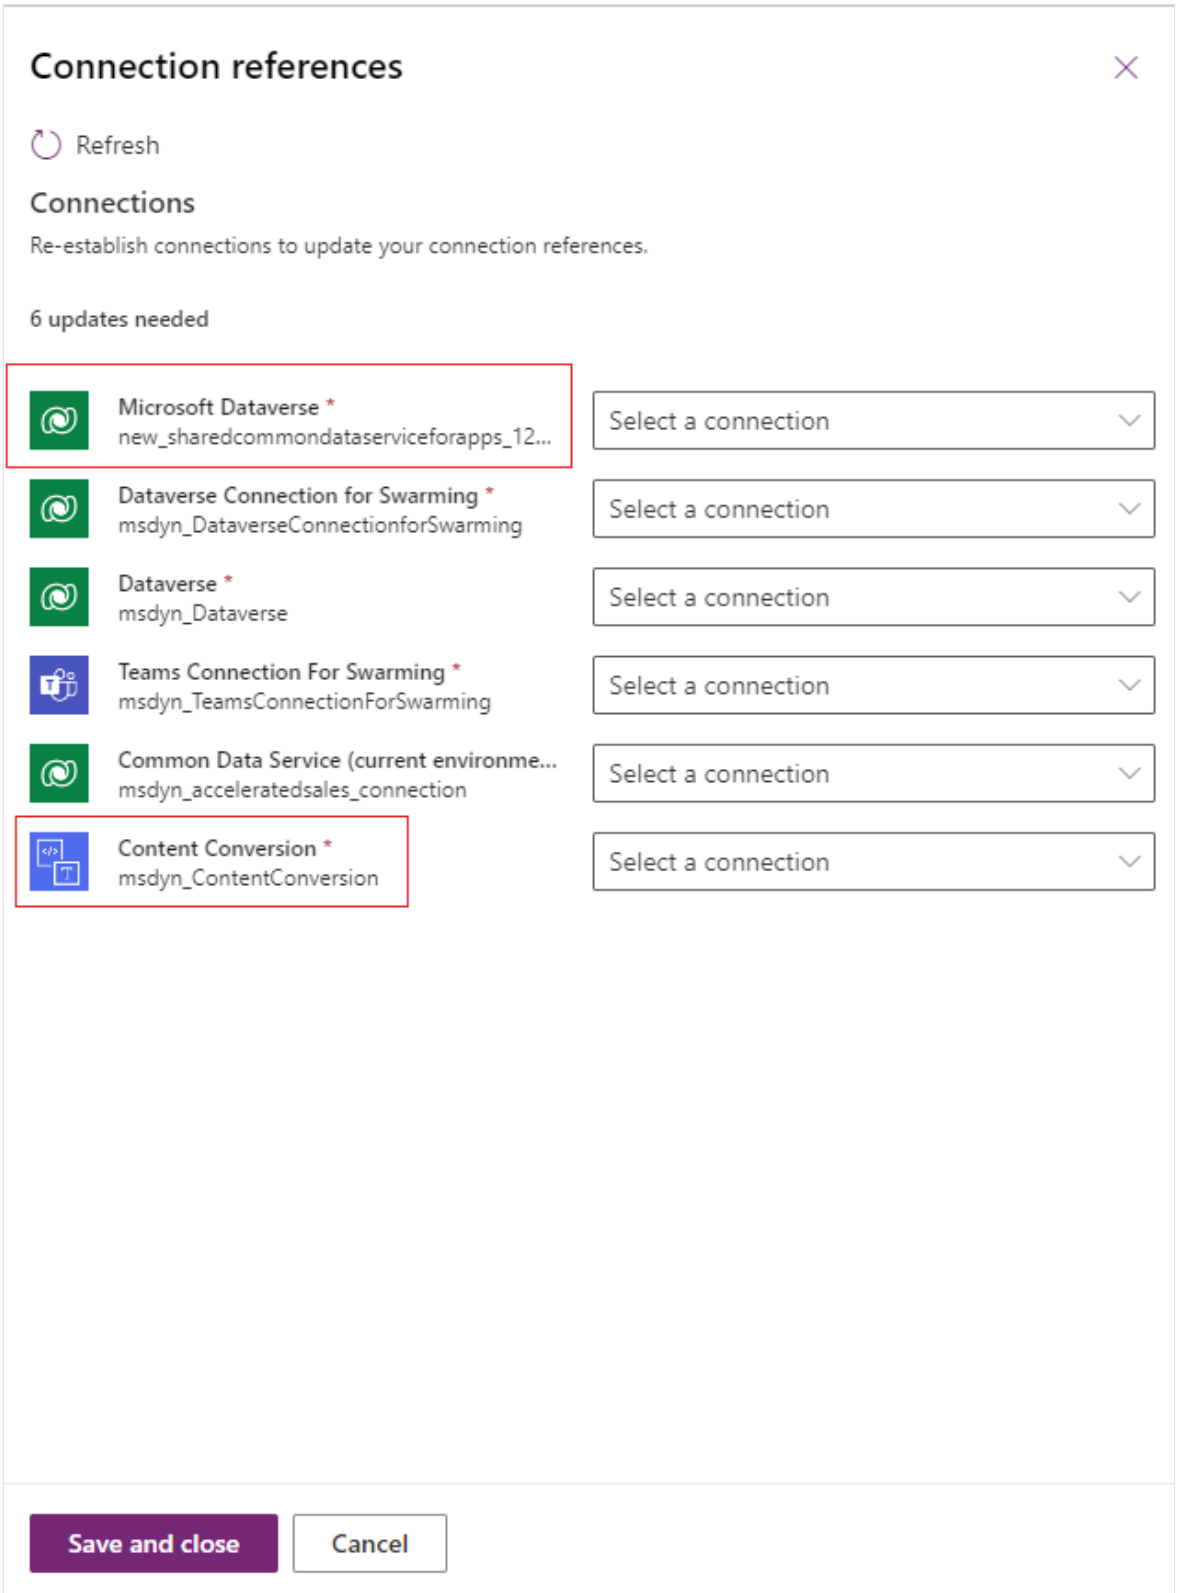
> **Note**
>
> - If you have the Environment Maker role and can't see either the notification for connection references or the cloud flow, then you don't have the permission to update them. You must contact your system administrator or system customizer to set the connection references and enable the flow.
> - When the solution is imported from a test environment to the production environment, you must again set up the connection references as a system administrator. For more information on importing, go to **Export and import bots using solutions**.

To set connection references:

1. Go to make.powerapps.com.
2. Go to **Solutions**. The **Solutions** page displays a notification with a link to configure connection references.



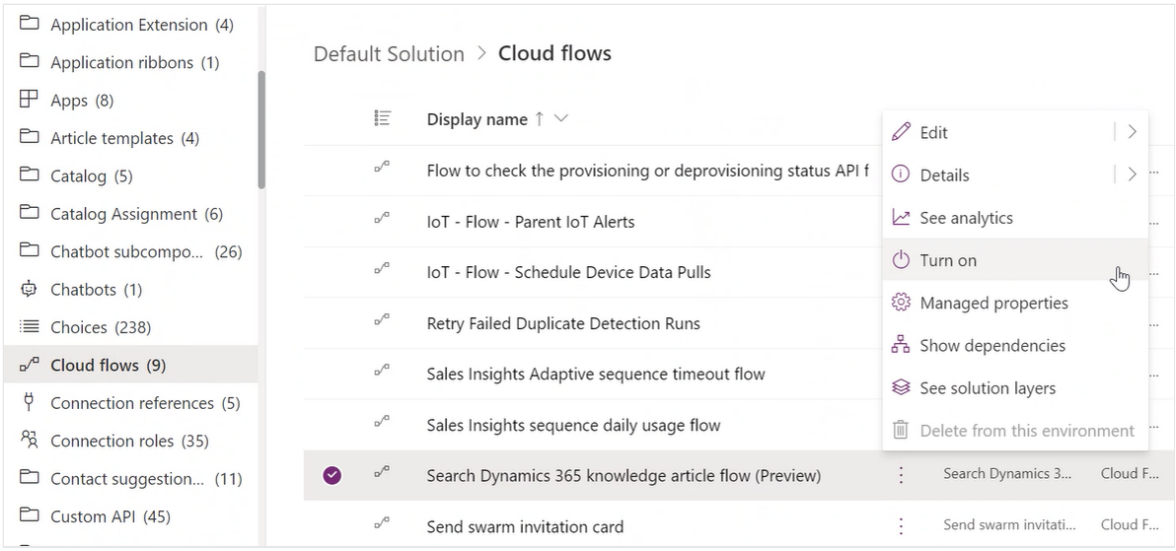
3. Select the link. If you don't see the notification on the **Solutions** page, go to **Default Solutions** > **Connection references**.



4. Select the connections for **Microsoft Dataverse** and **Content Conversion** on the **Connection references** page.

5. Select **Save and Close**.

6. Go to **Default Solution** > **Cloud flows** and turn on **Search Dynamics 365 knowledge article flow** flow.



Add the action to the Power Virtual Agents topic

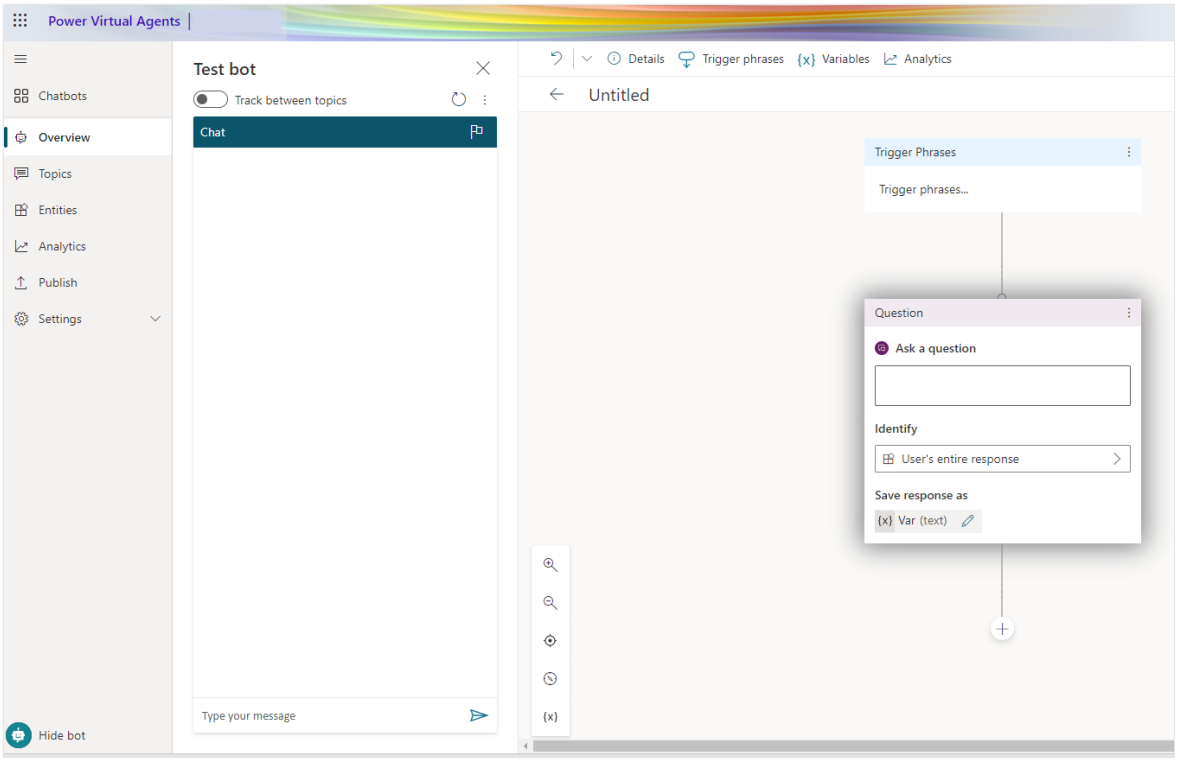
After you configure the connection references in make.powerapps.com, go to **Chatbots** > **List** and select the required chatbot. This will take you to the Power Virtual Agents portal where you can create a topic. If you need to create a chatbot, see Create chatbots from Power Apps.

You can create a topic with two question nodes for search text and filter, or you can configure the search integration to set up a fallback topic in case of an unrecognized search phrase. More information: Configure the system fallback topic in Power Virtual Agents

If you're creating a topic with two question nodes, for the filter question node, the Power Virtual Agents author can provide a sample filter value; for example, **statecode eq 3**.

Perform the following steps to ensure that flow is properly configured and can now be replaced with **Search Dynamics 365 knowledge articles** action.

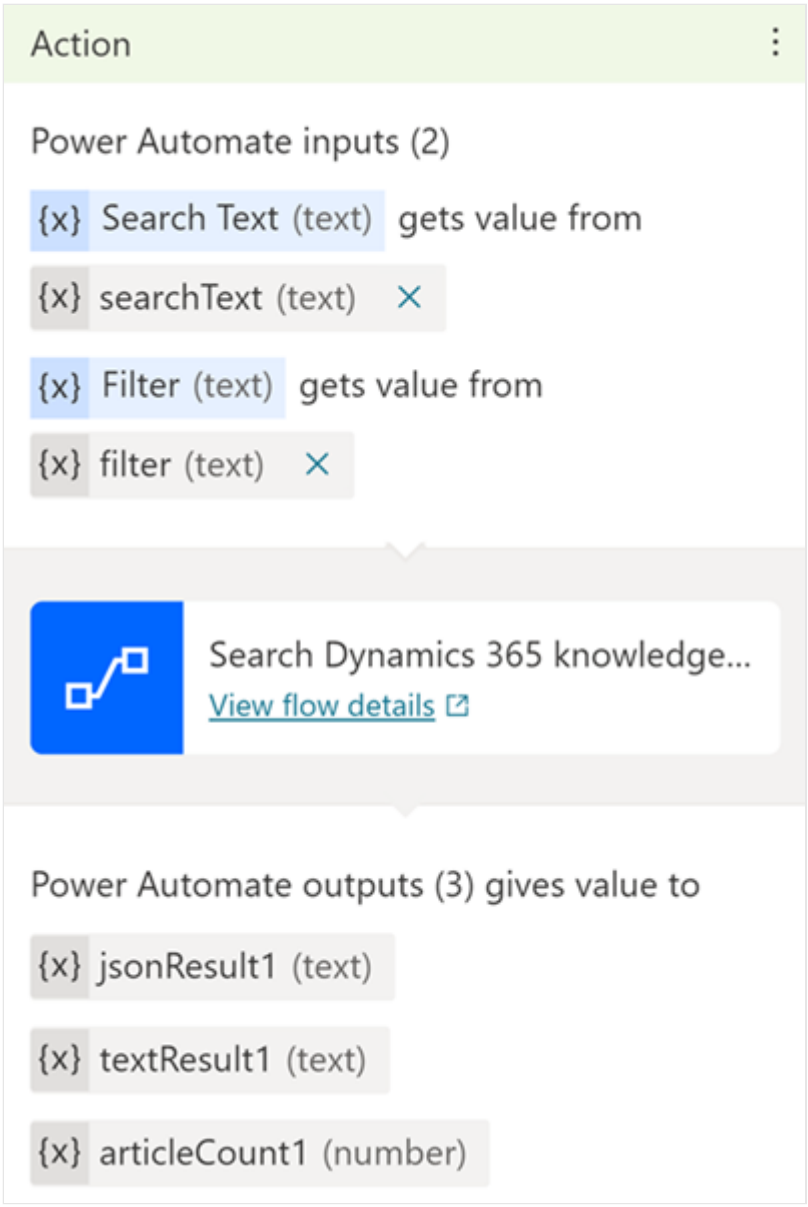
1. On the Power Virtual Agents portal, select **Topics** > **New Topic**.
2. Within the topic, create a question node to ask the user to search for the input text.



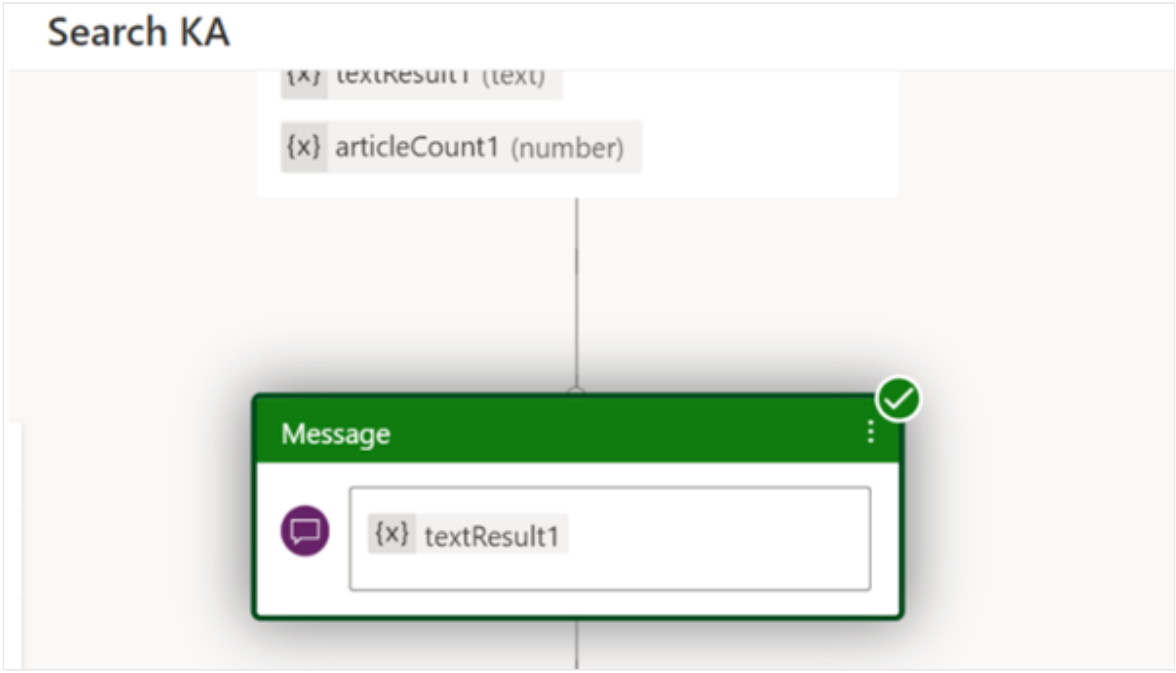
3. Create a question node for the filter and provide the sample filter value after you trigger the topic.

4. Select **Add node** (+) and select **Call an action**. Select **Search Dynamics 365 knowledge article flow** action.

5. Provide the input to the flow. An error might appear if the filter isn't provided to the flow.



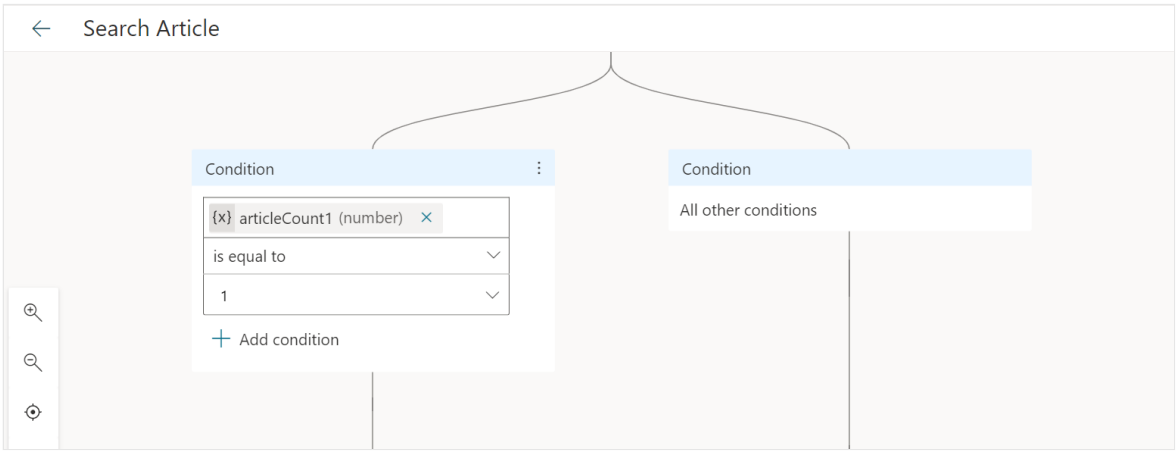
6. Add a message node to show the results returned by the flow. More information: Render results



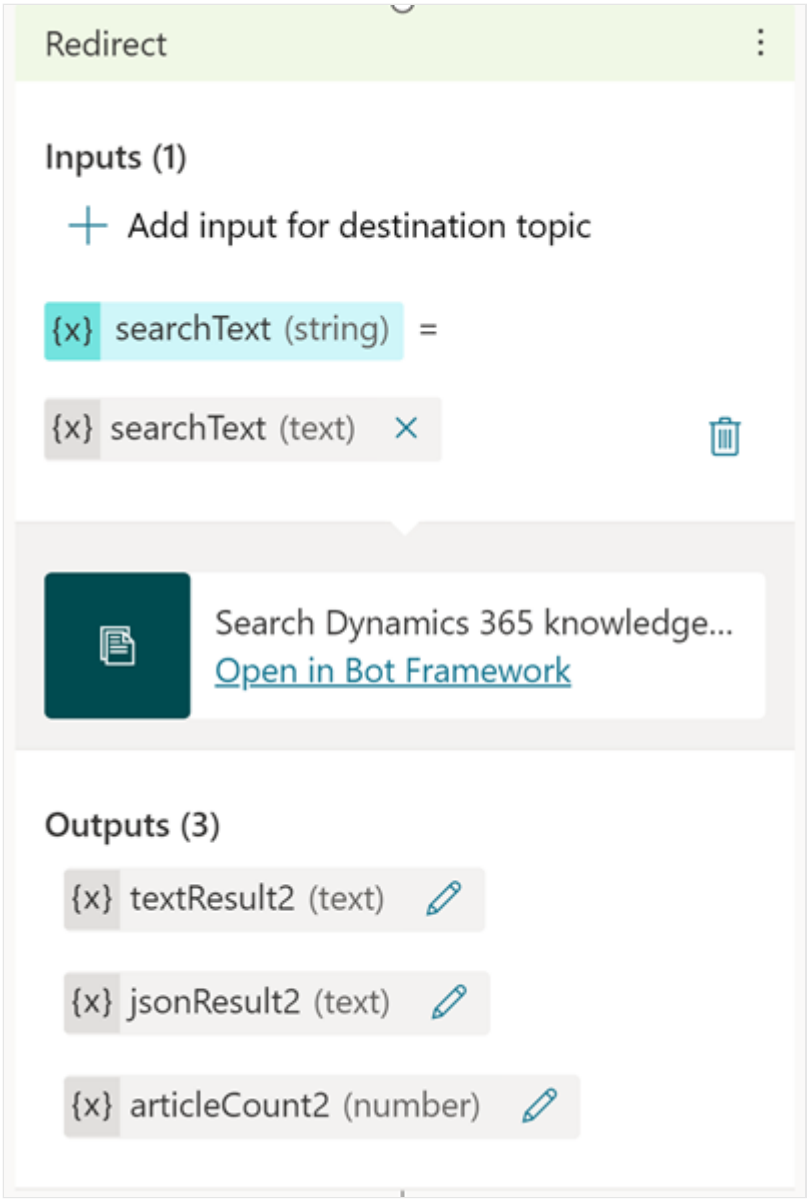
7. Select **Save**.

8. Use the trigger phase and run the topic to verify the flow.

> **Tip**
>
> If your search doesn't return any results, modify the search terms or filter conditions. You can also add a filter condition if required.



9. After the topic is configured, replace the **Search Dynamics 365 knowledge article flow** with the **Search Dynamics 365 knowledge articles** action. You can now configure any bot in the organization to access knowledge articles using the **Search Dynamics 365 knowledge articles** action.



10. Remove the filter question node. More information: Work with filters.

11. Update the message node with the output from the action and select **Save**.

Work with filters

- By default, the search is performed on the external published articles (**statecode eq 3** and **isinternal eq false**). If you need to perform additional filtering, you can set the required filter query as the Filter (text) input variable.
- To check which filters you can use and the attributes of the knowledge article entity, go to knowledgearticle EntityType.
- To write a Dataverse search query using filters, go to Working with operators.
- To see filter conditions that aren't supported by Dataverse search, see Configure Dataverse search to improve search results and performance .
- To filter on a string attribute like keywords, append the string value to the search text.

Publish the changes

For details on publishing the bot, see Publish the latest bot content. If you get errors during publishing, see Troubleshoot.

Use the Power Automate flow template

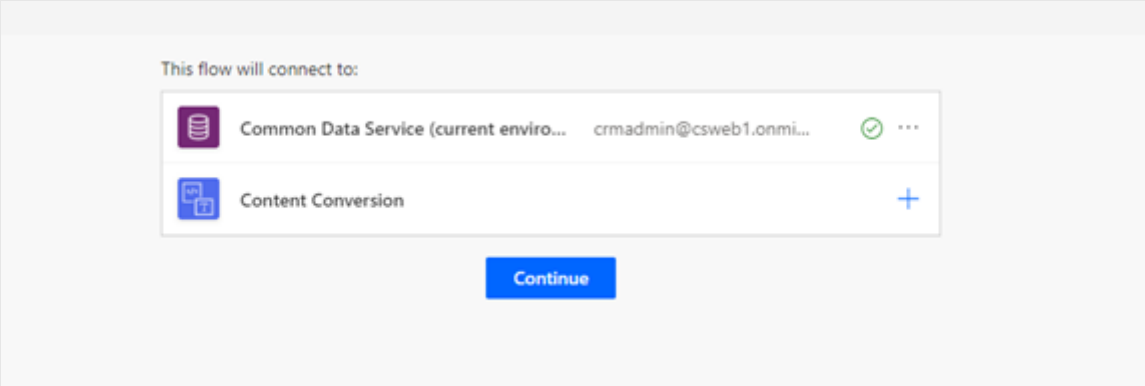
Perform the following steps if you want to integrate a Power Virtual Agents bot with knowledge management by using the Power Automate flow template:

1. Create a flow using the template.
2. Add the solution's flow to the Power Virtual Agents topic.

Create a flow using the template

1. Go to powerautomate.microsoft.com.

2. On the templates page, search for the **Generate answers from Dataverse knowledge articles to Power Virtual Agent** template.



3. Select **Continue**. You'll be redirected to the Power Automate flow template.

4. Save the template, and then select **Solutions**. You might be prompted with a message on which you can select **OK**.

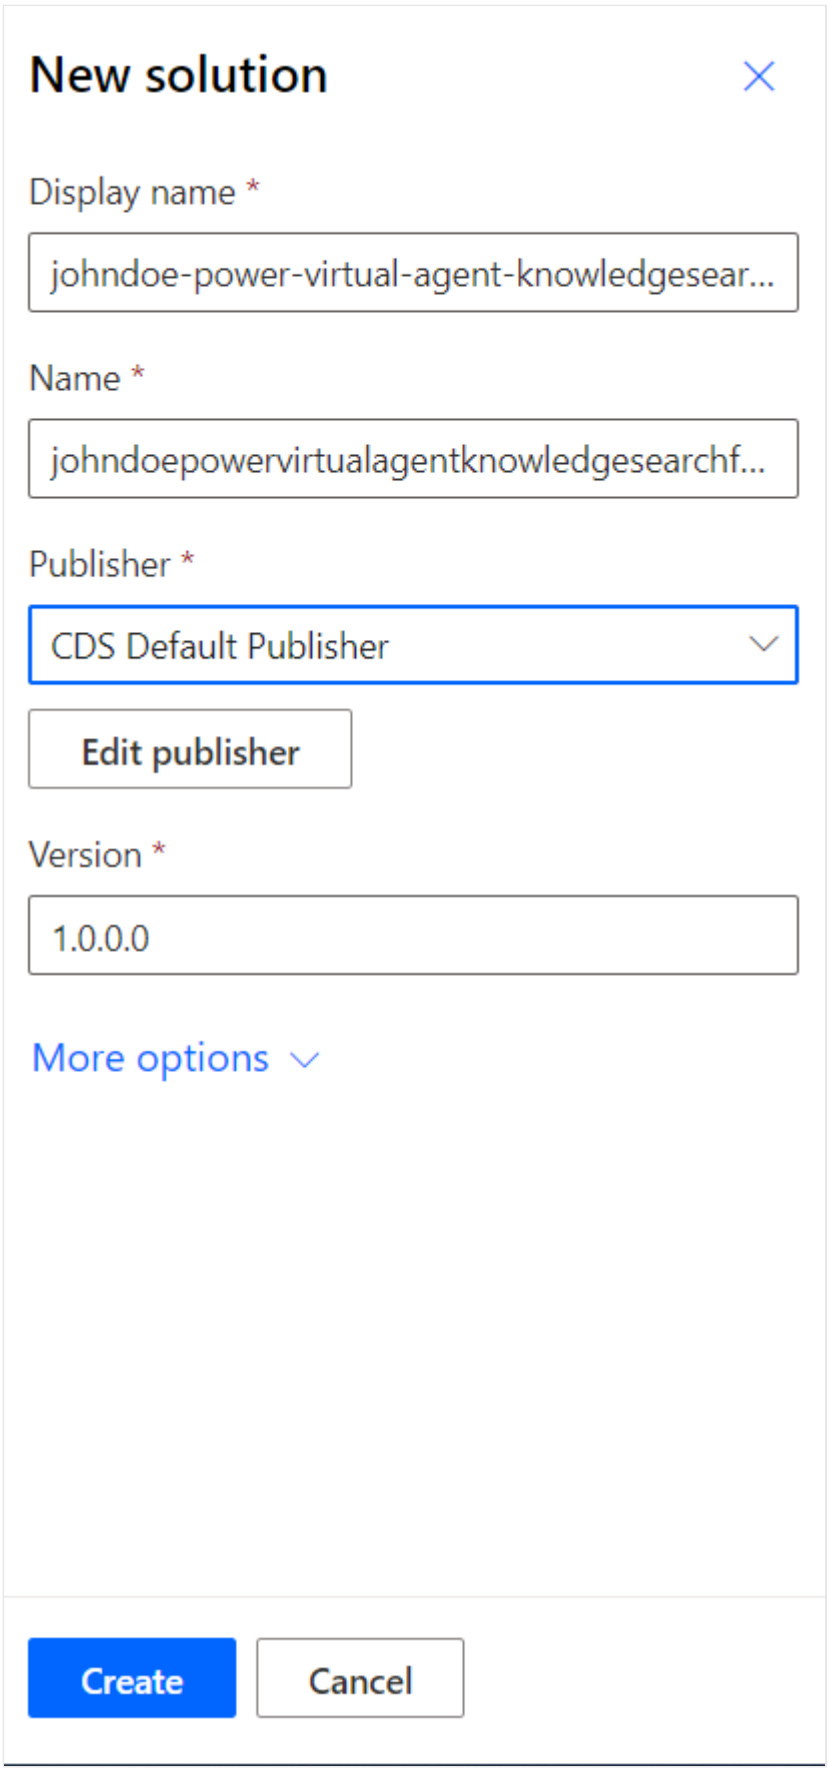
5. Select **New solution**.

6. Enter a display name. The list of solutions includes every solution in your organization. Choose a naming convention that helps you filter to just your solution. For example, you might prefix your email to your solution name: *johndoe-power-virtual-agent-knowledgesearch-fallback*.

7. Select your publisher from the list of choices.

8. Accept the default values for name and version.

9. Select **Create** to complete the process.



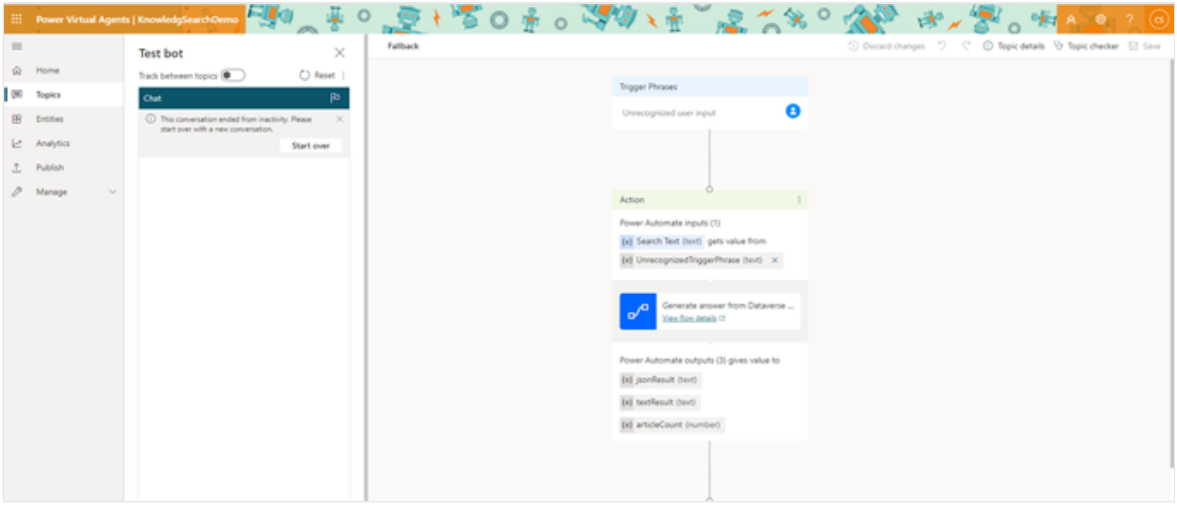
10. In the list of solutions, select the solution you just created. It should appear at the top of the list. If it doesn't, search by the convention you used in step 6 to name the solution.

11. In the solution, select **Add existing**, and then select **Cloud Flow** from the list.
12. In the **Outside solutions** list, select your flow, and then select **Add** to complete the process. If there are several flows, look at the **Modified** column to find the most recent version.

For more information on managing Power Virtual Agents solutions, go to Export and import bots using solutions.

Add the solution's flow to the Power Virtual Agents topic

1. Open the browser with the authoring canvas.
2. Above the **Message** action box, select the connector, and select **Call an action**.
3. From the pop-up flow window, select the new flow named **Generate answer from Dataverse knowledge articles for Power Virtual Agent**. The new action appears in the flow.
4. To correctly set the input variable to the action, select **Select a variable**, and then select **bot.UnrecognizedTriggerPhrase**.



5. To return the knowledge article search results to the bot, go to Render results.

Render results

To return the knowledge article search results to the bot, follow either of these steps:

- Use thumbnail cards to show the article. More information: Respond with cards
- Use the following sample code to render search results in adaptive cards.

#kbcardjson()

```
-
{

  "type": "AdaptiveCard",

    "body": [

        {

            "type": "ColumnSet",

            "columns": [

                {

                    "type": "Column",

                    "items": [

                        {

                            "type": "Image",

                            "height": "35px",

                            "url":

                            "text":
"${json(virtualagent.jsonResult).articles[0].title}",
                            "wrap": true,
                            "size": "Large"
                        },
                        {
                            "type": "TextBlock",
                            "spacing": "None",
                            "text": "Last modified on
${json(virtualagent.jsonResult).articles[0].modifiedon}",
                            "isSubtle": true,
                            "wrap": true
                        }
                    ],
                    "width": "stretch"
                }
            ]
        },
        {
            "type": "TextBlock",
            "text":
"${json(virtualagent.jsonResult).articles[0].description}",
            "wrap": true,
            "size": "medium"
        }
    ],
    "actions": [
        {
```

```
            "type": "Action.OpenUrl",
            "title": "View article in Dynamics App",
            "url": "${json(virtualagent.jsonResult).articles[0].crmAppUrl}"
        }
    ],
    "$schema": "http://adaptivecards.io/schemas/adaptive-card.json",
    "version": "1.0"
}
```

Troubleshoot

- If a dialog is cross-linked and is modified, you'll see a validation error on publish and Power Virtual Agents will block the publish. More information: Publish the latest bot content
- If errors exist while saving a topic, the **Topic checker** shows the impacted topics. Errors will prevent the bot from working and must be fixed before you can publish your bot. More information: Topic errors
- For more information on flow error codes, go to Error codes: Power Virtual Agents

Configure origins allowlist for knowledge articles

Article • 09/29/2023

You can configure an origins allowlist to ensure that knowledge authors add only safe links to their knowledge articles.

> **Important**
>
> The supported origins are HTTP or HTTPS protocol, IP address or domain name, and TCP port number. For example, **https://www.contoso.com**, **https://www.contoso.com:443** are supported origins. Knowledge authors must use only links with origin links as specified in the supported origins list.

After you've enabled this feature while creating knowledge articles, if knowledge authors add links whose origin links don't match any of the links specified in the origins list, an error message displays for links that are hosted within an iframe. For example, if you add https://www.contoso.com in the origins list, knowledge authors can use https://www.contoso.com/about or https://www.contoso.com/overview. But if they use https://contoso.com/about or https://contoso.com/overview in the articles, the links will be broken and an error message is displayed. Also, in the **Content** field on the knowledge article form, knowledge authors see the following message: "Update your origins allowlist if any iframe in the article doesn't work or displays error."

For published articles, agents and portal users see an error message in the article for the links that are hosted within an iframe. In such cases, you must update the origins list so that all the existing iframe links continue to work.

Configure origins allowlist

You can configure the origins allowlist in the Customer Service admin center or Customer Service Hub app by performing the following steps:

1. Go to the **Settings** page.

Customer Service admin center

1. In the site map, select **Knowledge** in **Agent experience**. The **Knowledge** page appears.

2. In the **General settings** section, select **Manage**. The **General settings** page appears.

4. Go to **Origins allowlist** and add your links to the **Add origin links** field.
5. Select **Add** + or **Enter** to add the link to your list.
6. Select **Save**.

To remove a domain, select **Close** next to the domain name.

Configure knowledge search control on app side pane for an entity record

Article • 06/09/2022

Introduction

You can configure how you want the knowledge base search control to appear for your entities on the app side pane of Customer Service workspace and Omnichannel for Customer Service. To do so, you'll need to first add the record types for which you want to turn on knowledge management and then configure the record type settings.

Configuring a record type will specify the information that your agents will see while they interact with customers. **Case** and **Conversation** record types are enabled by default. The **Conversation** record type will be available by default if you have purchased add-on SKUs, such as Chat, Digital messaging, or Voice. If you're an existing user, you'll also see all the entities previously enabled by you.

Add record types for which you want to turn on knowledge management

Go to the Customer Service admin center or Customer Service Hub app, and perform the following steps:

Customer Service admin center

1. In the site map, select **Knowledge** in **Agent Experience**.
2. On the **Knowledge** page, in the **Record Types** section, select **Manage**.
3. On the **Record Types** page, select **Add**. The **Add record type** dialog appears.
4. On the **Add record type** dialog, from the **Select record type** dropdown list, select the record type.
5. Select **Save and Close**.

After you've enabled a record type, to set up knowledge base search control on a standard or custom form, see Add the Knowledge Base Search control to forms. Setting up knowledge base search control on a standard or custom form makes it easy for agents in your organization to find knowledge articles, so they can answer common

customer questions and resolve their issues right from the records, without having to switch to a different application.

To set up knowledge search control on the app side pane, see Configure knowledge search control on the app side pane.

Configure knowledge search control on the app side pane

After you've added the record types for which you want to turn on knowledge management, you can configure the knowledge search control on the app side pane by editing the record type. The app side pane is available only in Customer Service workspace and Omnichannel for Customer Service. For more information on how to set up an app side pane, go to Configure productivity pane.

> **Note**
>
> You can configure the knowledge settings for record types from the Customer Service admin center app only. You'll also be able to view and edit the record types that you've previously enabled in Customer Service Hub.

To edit an entity record:

1. In the Customer Service admin center, on the **Record Types** page, select the entity you want to edit.
2. Select **Edit**. The **Knowledge settings** dialog appears.
3. In **Automatic search**:
    - Set the **Turn on automatic search** toggle to **Yes**, if you want automatic search to be enabled for your entity record.
    - From the **Provide search results using** dropdown list, select the field by which the search results will be provided for the entity.
4. In **Actions**, select the checkboxes as required for the following:
    - **Link / unlink article**
    - **Copy URL**
    - **Link article and email URL**
    - **Link article and send article content**

5. In **Email recipient**, from the **Select default email recipient** dropdown list, select the email recipient. The **Email recipient** option is available only to the Customer or Lookup attribute type, and to the Account or Contact lookup entity.

6. Select **Save and Close**.

Add the Knowledge Base Search control to a form

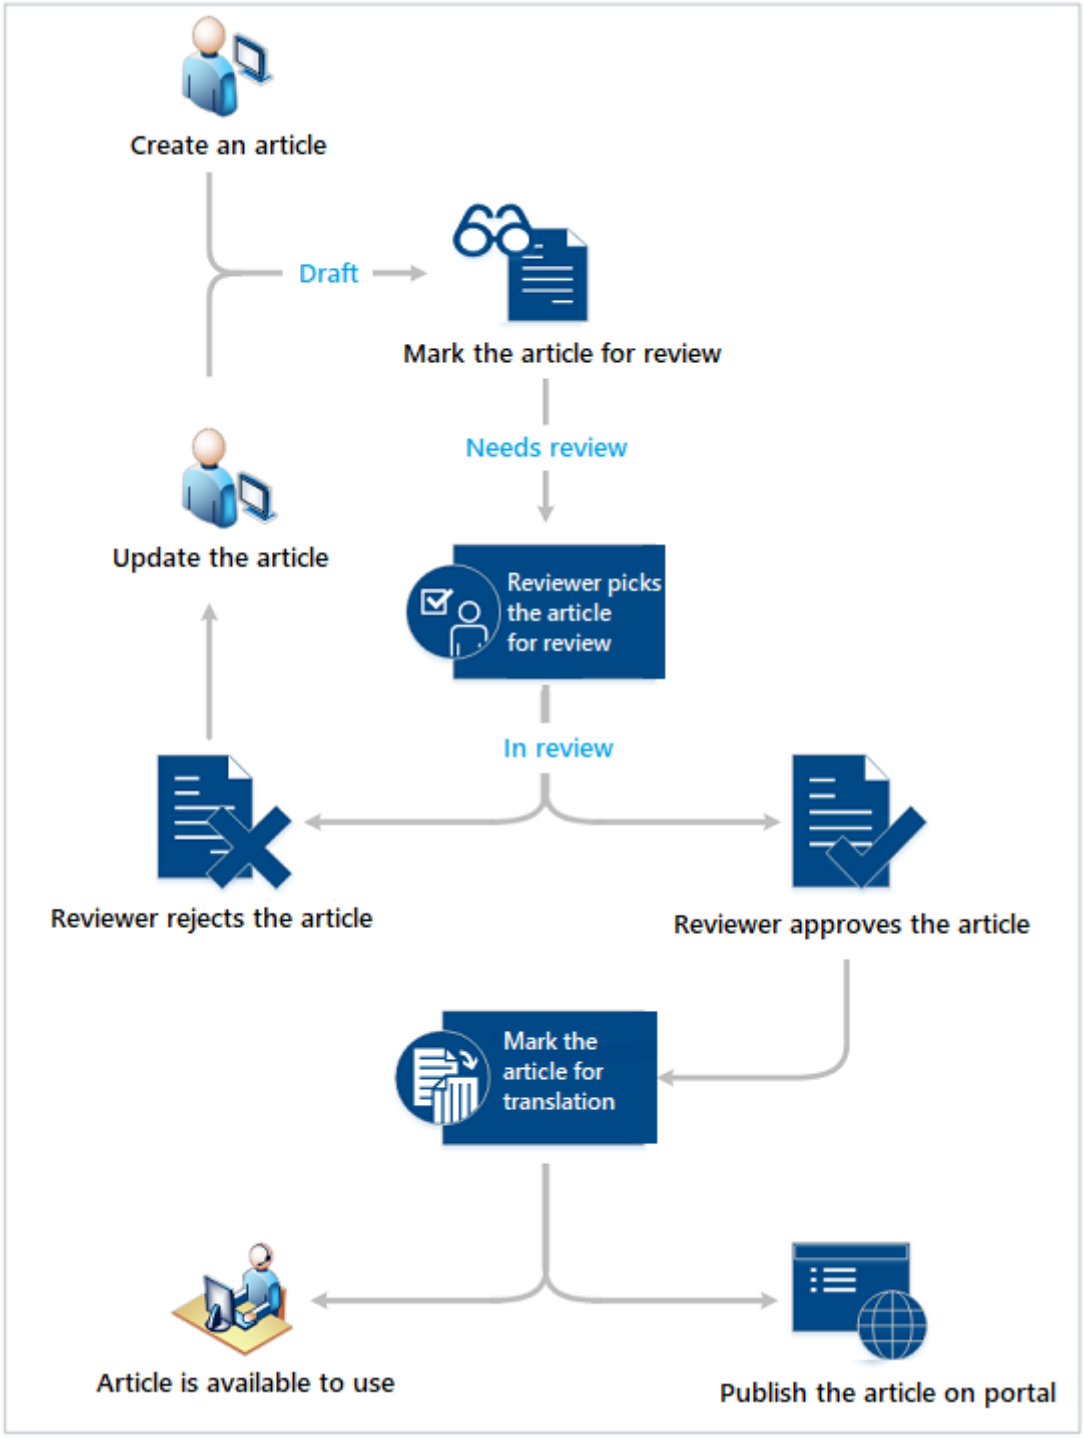
Understand the knowledge article creation process

Article • 01/23/2023

With the knowledge management module, you can create and manage knowledge articles that your users may be looking for. This will help reduce the call handling times for agents as they can look up information in a knowledge base to resolve customer queries right away, thereby increasing their productivity.

Default process

The following image describes the default process to create and use knowledge articles in your Customer Service app. Create an article and mark it for review. The reviewer can approve or reject the article. If the article is rejected, it's sent back for edits or updates. If the article is approved, it's published on the portal. It's also available in search and can be translated.



Next steps

For information on creating and managing a knowledge article, go to Create and manage knowledge articles.

For information on reviewing a knowledge article, go to Review knowledge articles.

For information on publishing a knowledge article, go to Publish knowledge articles.

Create and manage knowledge articles

Article • 12/14/2022

> **Tip**
>
> If you'd like to try Dynamics 365 Customer Service for free, you can sign up for a **30-day trial**.

Turn your customer questions, issues, and feedback into knowledge articles, so that agents can benefit from them. Add images and videos to your articles to explain things better and make the articles engaging. You can author, edit, search, publish, and translate the knowledge articles in the Customer Service Hub.

Knowledge articles can address any number of issues your customers encounter while using your organization's product or services. Types of knowledge articles can include solutions to common issues, product or feature documentation, answers to frequently asked questions (FAQ), product briefs, and more.

> **Important**
>
> Knowledge management is available out of the box through the Customer Service Hub app module, and it works with other customer service apps as well. Articles that are created in the Customer Service Hub will be available in the Dynamics 365 Customer Service app as read-only records.

> **Note**
>
> The entities `KBArticle`, `KBArticleTemplate` and `KBArticleComment` are now deprecated. This means we don't expect you to use these entities anymore. You must use the newer `KnowledgeArticle` entity for knowledge management in Dynamics 365 Customer Service. More information: **Work with knowledge articles**

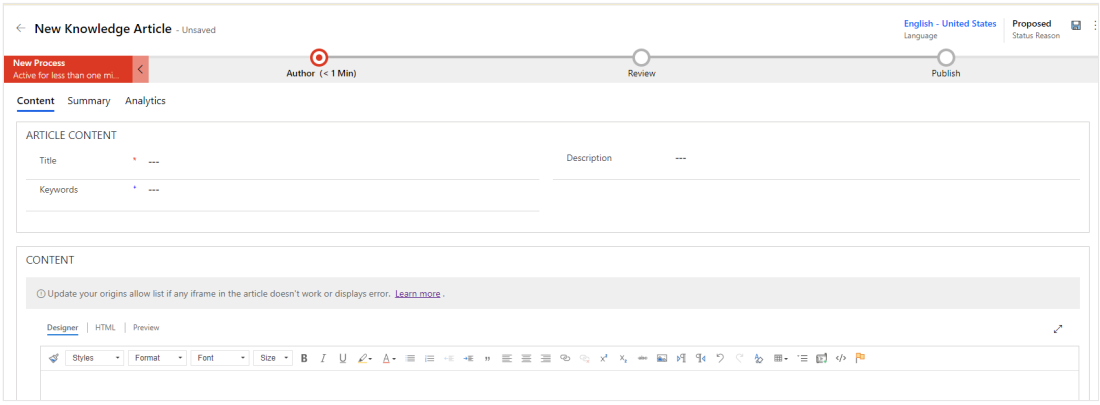
Ensure that you have Create and Read permissions on the Knowledge Article entity. By default, these permissions are added to the roles of knowledge manager, customer service manager, or customer service representative. Perform the following steps:

1. In the Customer Service Hub sitemap, go to **Service** > **Knowledge Articles**.
2. On the command bar, select **New**.

You'll be on the **Content** tab of the knowledge article.

3. In the **Article Content** section, fill in the following details:

    - **Title**: Type a descriptive title that communicates the subject and purpose of the article in a concise manner.
    - **Keywords**: Type or select keywords for the article. These keywords are used to search the knowledge base for articles. Separate keywords with commas.
    - **Description**: Type or select a short description of the article. This appears in the search results and is used for search engine optimization.



4. In the **Content** section, add the content for your knowledge article.

> **Note**
>
> As soon as you select inside the editor space, the rich text editor command bar appears. Use the rich text editor command bar options to format and style your content. If you can't use the features, your editing space is too small. If this is the case, you'll need to resize to a larger space. More information: **Use the rich text editor to create knowledge articles and emails**

5. Select **Save**.

    As the article is saved, the Business Process flow bar appears for the article. The stages are **New Process**, **Author**, **Review**, and **Publish**. The Business Process flow bar guides you to drive the article toward completeness. You can customize the stages in the Business Process flow to suit your requirements.

6. On the Business Process flow bar, select **Author**.

7. In the **Set Keywords** text box, add keywords for your article.

8. In the **Article Subject** dropdown list, choose the subject of the article to help with article searches.

9. In the **Assign Primary Author** dropdown list, choose a person who is responsible for maintaining the article content. By default, the user who creates the article is the primary author.

   Once a new article is created, the author value will be replicated to Primary author if it is a system user but not a team. The knowledge article author must be a single user (not a team) in order for it to be searchable and to load properly.

   You can mark the article complete by selecting the checkbox at this stage.

> **Tip**
>
> Select the icon to pin the stage flyout vertically.

Posts about knowledge article-related activities will begin appearing in the **Timeline** section.

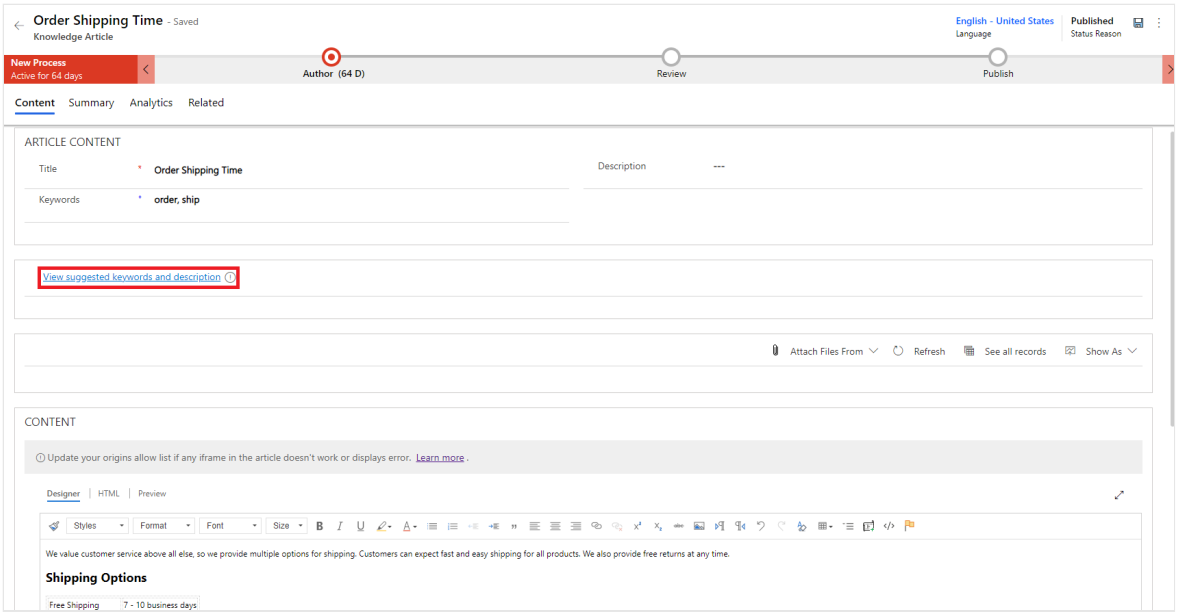
Use AI-suggested article keywords and descriptions

If your administrator has enabled keywords and description suggestions, you can select and enter your preferred keywords and descriptions when authoring or updating knowledge articles. More information: Configure AI suggestions for article keywords and description

However, either the **Title** or **Content** fields—or any other corresponding mapped fields set by the administrator—must contain some value for suggestions to be generated. If any of the fields that the model uses to generate suggestions are empty, you'll see messages such as "There was a problem finding suggested keywords" or "There was a problem finding a suggested description".

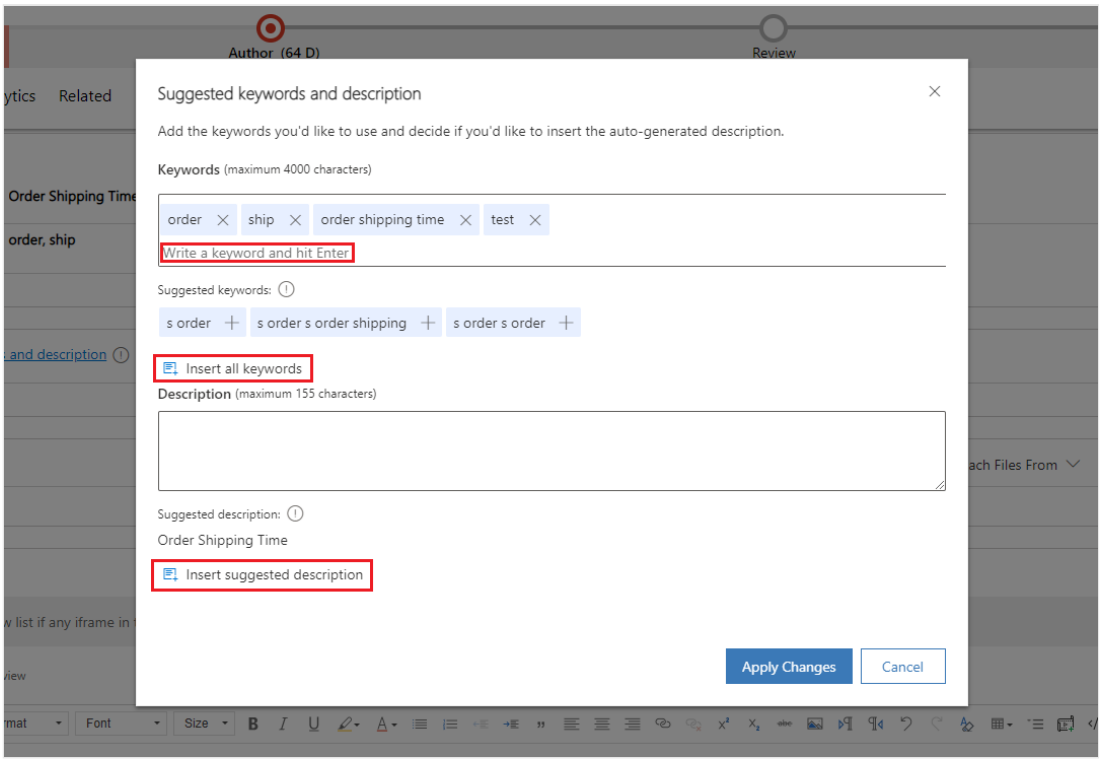
1. In the article **Content** section, add the content for your knowledge article and then select **Save**. The **View suggested keywords and description** link appears.

2. Select the **View suggested keywords and description** link.



3. In the **Suggested keywords and description** dialog, do the following:

   - Select the keywords that you want to add to your keywords list or select the **Insert all keywords** link to insert all the suggested keywords to the Keywords field. You can enter a keyword in the Keywords field to add to existing list.
   - Select **Insert suggested description** to add the description to the **Description** field.



4. Select **Apply Changes**.

The selected keywords and description appear in the **Keywords** and **Description** fields of the knowledge article form.

Create knowledge articles using templates

Authors can use the templates to create knowledge articles quickly because the fields for the knowledge article are prepopulated according to the selected template. To create knowledge articles using templates:

Ensure that you have Create and Read permissions on the Knowledge Article entity. By default, these permissions are added to the roles of knowledge manager, customer service manager, or customer service representative.

1. In the Customer Service Hub sitemap, go to **Service** > **Knowledge Articles**.

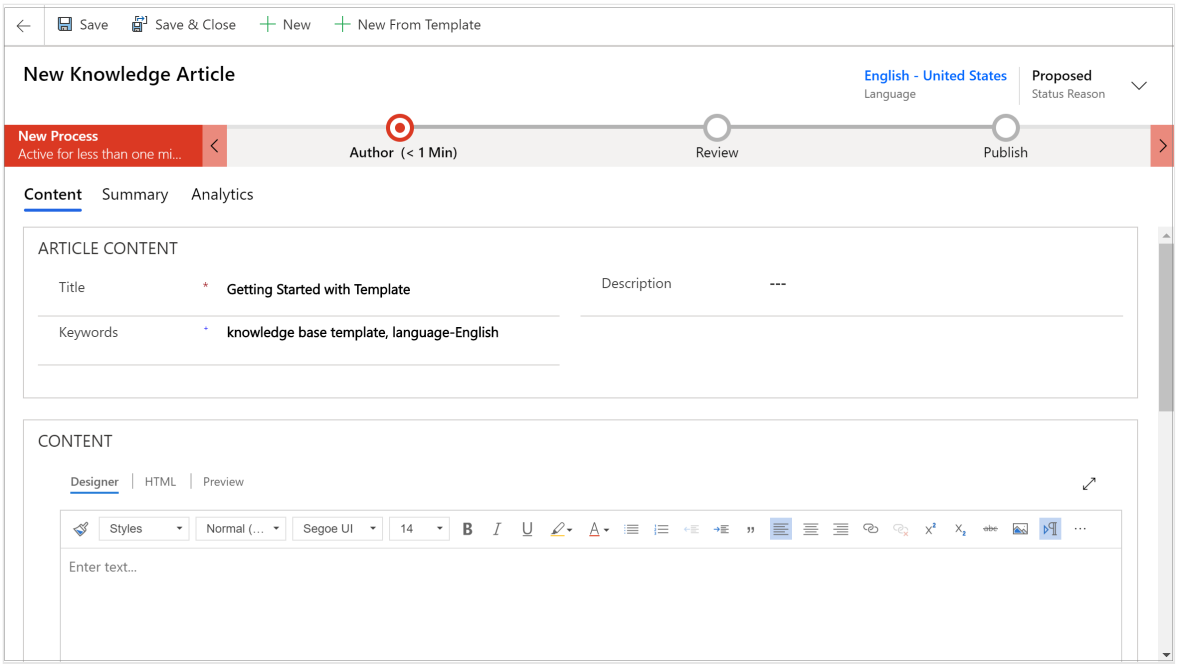
   A list of available articles is displayed.

2. To create an article from a template, select **+ New From Template**.

3. In the **Select Knowledge Article Template** dialog, select the template to use as a base on which you author the article and select **OK**. In this example, we are selecting the template as **Getting Started With Template**.

   
   You observe that some fields are prepopulated as defined in the template.

4. In the **New Knowledge Article** page, edit the fields as required.



5. Select **Save**.

   The article is saved, and you can take it to the next stage to approve and publish the article to make it available for users.

> **Note**
>
> To learn how to create knowledge article templates, see **Create a knowledge article template**.

Use the rich text editor to create knowledge articles and emails

Create rich and well-formatted content for emails or knowledge articles using the new rich text editor in the Customer Service Hub. The editor brings common word processor features like advanced styling, linking, find and replace, and insert images and tables.

The **Content** editor panel consists of three tabs:

- **Designer**: Author and edit the article here. Benefit from the enhanced and rich text editing capabilities.
- **HTML**: View the HTML preview of the content here. You can author or edit the article in the HTML tab also.
- **Preview**: See how your content would look on devices like desktop, tablet, or mobile.

Additionally, you can perform **Undo**, **Redo**, and **Full Screen** in the Content editor panel.

Designer

You can choose a specific format or style for the content you're writing. The following table outlines the different formatting options of the rich text editor.

> **Note**
>
> You can access your browser's context menu by pressing **Ctrl+right-click**. This is useful if you need to use your browser's built-in spell checker. Otherwise, you can use the right-click to provide contextual formatting for any element you might be using.

Icon	Name	Shortcut key	Description
	Format Painter	Ctrl+Shift+C, Ctrl+Shift+V	Apply the look of a particular section to another section. **Note**: Copy formatting only works with inline styles, and won't copy or apply block-level styles.
	Formatting Styles		Apply predefined sets of formatting features to make it easier to keep the presentation of the text consistent. To make the choice easier, the style names are displayed in a style that they represent, giving you a preview of what the text will look like. **Note**: This option is available in the expanded mode only.
	Paragraph Format		Apply predefined block-level combinations of formatting options. A paragraph format can only be applied to a block-level element, like a `paragraph` or a `div` element. **Note**: This option is available in the expanded mode only.
	Font	Ctrl+Shift+F	Select your desired font. The default font is Segoe UI. **Note**: When you select any formatted content, the font name for that content displays. If your selection contains multiple fonts, the topmost font name of your selection is displayed.
	Font size	Ctrl+Shift+P	Change the size of your text. The default size is 12. **Note**: When you select any formatted content, the font size for that content displays. If your selection contains multiple font sizes, the topmost font size of your selection is displayed.

Icon	Name	Shortcut key	Description
	Bold	Ctrl+B	Make your text bold.
	Italic	Ctrl+I	Italicize your text.
	Underline	Ctrl+U	Underline your text.
	Text Highlight Color		Make your text stand out by highlighting it in a bright color.
	Font Color		Change the color of your text.
	Bullets		Create a bulleted list.
	Numbering		Create a numbered list.
	Decrease Indent		Move your paragraph closer to the margin.
	Increase Indent		Move your paragraph farther from the margin.
	Block Quote		Apply a block-level quotation format in your content.
	Align Left	Ctrl+L	Align your content with the left margin. (Commonly used for body text to make it easier to read.)
	Align Center	Ctrl+E	Center your content on the page. (Commonly used for a formal appearance.)
	Align Right	Ctrl+R	Center your content on the page. (Commonly used for a formal appearance.)

Icon	Name	Shortcut key	Description
	Link		Create a link in your document for quick access to webpages and files. URL text that you paste or enter is converted into a link. For example, **http://myexample.com** will become http://myexample.com . In the **Link** dialog, choose the type of link you'd like to insert. Use the **Link Info** tab to choose the link type and set the link protocol and URL. The type of links that you can add are defined by your administrator. If you add links whose origin link doesn't match any of the links specified in the origins list, an error will be displayed when users open an article. The error message "Update your origins allow list if any iframe in the article doesn't work or displays error" will appear. More information: Configure origins allow list for knowledge articles The **Target** tab is only available for the URL link type. It specifies the location where the link will open after you select it.
	Unlink		Delete a link in your email or document. When you place the cursor on a link, the **Unlink** button on the toolbar becomes active. Select the button to remove the link and make it plain text.
	Superscript		Type very small letters just above the line of text.
	Subscript		Type very small letters just below the line of text.
	Strikethrough		Cross out text by drawing a line through it.
	Image		Insert an image. You can insert an image by directly copying and pasting it inline in the editor, dragging and dropping it from your desktop or local folder directly into the editor, or by typing a URL. The following formats are supported: PNG, JPG, or GIF. For details on using inline images, see Use inline images.

Icon	Name	Shortcut key	Description
	Left to Right		Change the text to left-to-right for content such as a paragraph, header, table, or list. Commonly used for bi-directional language content. This is the default setting.
	Right to Left		Change the text to right-to-left for content such as a paragraph, header, table, or list. Commonly used for bi-directional language content. The default setting is left-to-right.
	Undo Typing		Undo changes you made to the content.
	Redo Typing		Redo changes you made to the content.
	Clear All Formatting		Remove all formatting from a selection of text, leaving only the normal, unformatted text.
	Add a Table		Add a table to your content. After adding a table, you can do any of the following: • Resize table columns by clicking and dragging your mouse to resize the columns to the desired width. • Select one or several cells within a table and apply specific formatting, add links to the selection, or cut, copy, or paste entire rows or columns. • Right-click to access the properties. This supports features such as cell type, width and height, word wrapping, alignment, merging and splitting cells horizontally and vertically, inserting or deleting rows and columns, row and column span, and cell and border color.

Icon	Name	Shortcut key	Description
	Create Collapsible Section		Create a section that can be collapsed or expanded. This is useful in articles with a lot of information. Collapsed sections help agents find relative information more quickly by scanning the titles within an article. Collapsible sections include title and body fields to type text into, and you can nest collapsible sections to make it easier to scan longer articles to find the most relevant sections quickly. You can also select text you have already typed and then click the collapse icon to turn it into a collapsible section. If you create a collapsible section and then later want to delete it, place your cursor within the section, and then click **Delete** on your keyboard, or right-click within the collapsible section and select **Cut**.
	Embed Media		To embed videos into your content: 1. Place the cursor where you want to insert the video, and then on the toolbar, select the **Embed Media** button. The **Embed Video** dialog opens. 2. Enter the embed link of the video provided by the video hosting provider, and then select **OK**.
	Create Div Container		Create a `div` container to apply formatting to a larger document fragment that extends beyond one block. The **General** tab lets you manually add a stylesheet class that is applied to the div element. The **Advanced** tab lets you configure additional div element options such as assigning it an ID, a language code, a text direction, an advisory title, or CSS style properties. **Note**: This option is available in the expanded mode only.

Icon	Name	Shortcut key	Description
	Create Anchor		You can add anchors in document text and then link to them for easier navigation. **Note**: The anchor feature only works when an article is open. It doesn't work if you are viewing an article from the **Preview** tab. To add an anchor: 1. Place the cursor where you want to insert an anchor, and then on the toolbar, select the **Anchor** button. The **Anchor Properties** dialog opens. 2. Enter a name for the anchor, and then select **OK**. The **Anchor** button appears in the area where you created the anchor. You can now use the **Link** button to link to your anchor.

> **ⓘ Important**
>
> You can't use client-side code (script tags or JavaScript) in articles or emails. If you want to associate CSS or JavaScript, use web resources.

> **ⓘ Note**
>
> In mobile devices, where you have comparatively smaller screen sizes, a limited set of formatting options will be displayed.

Use inline images

You can insert an image by directly copying and pasting it inline in the editor, dragging and dropping it from your desktop or local folder directly into the editor, or by typing a URL.

Before using inline images, keep in mind the following:

- These are the supported formats: PNG, JPG, or GIF
- These are the supported browsers: Microsoft Edge, Chrome, Firefox, Safari

Drag and drop an image

> ⓘ **Note**
>
> You can only drag and drop an image in an editable area of the editor.

1. Drag and drop the image either above the content or in the middle of the content in the editor.
2. Drag any corner of the image to resize it to your desired size in the editor.

Copy and paste an image

> ⓘ **Note**
>
> To copy and paste images, you must open the image file and then copy and paste it into the editor.
> You can drag and drop or copy and paste an image from Microsoft Word into the editor. One or two images can be copied at a time, as long as the total size of the images together doesn't exceed 5 MB.

1. Open the image file that you want to copy to the editor.
2. Right-click the image, then select **Copy**.
3. Go to the desired location in the editor where you want to insert the image, and then either right-click and select **Paste**, or select **Ctrl+V**.

Insert a URL for an image

To insert an image by using a URL or navigating to the local image:

1. In the editor, choose **Insert Image**.
2. In the **Image** property dialog, choose from the following options:

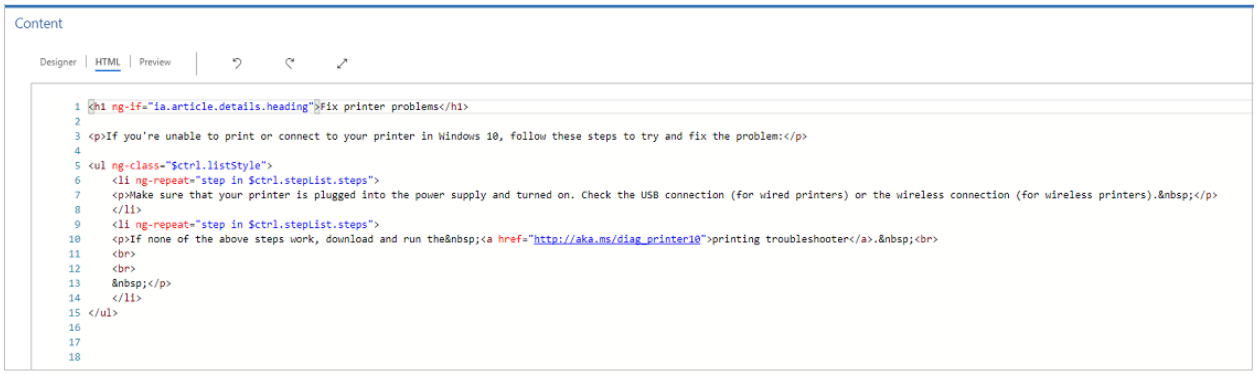
    - Specify the web address of the image, and also specify properties to define how the image will appear in the email or article.

      Note: If the image is located on the external server, use the full absolute path. If the image is located on a local server, you can use a relative path. If you want the image to be a selectable link, add a URL for the image. You can also specify if you want the targeted page to open in a new window, top-most window, same window, or parent window.

    - Select **Browse** to navigate to the image on your computer.

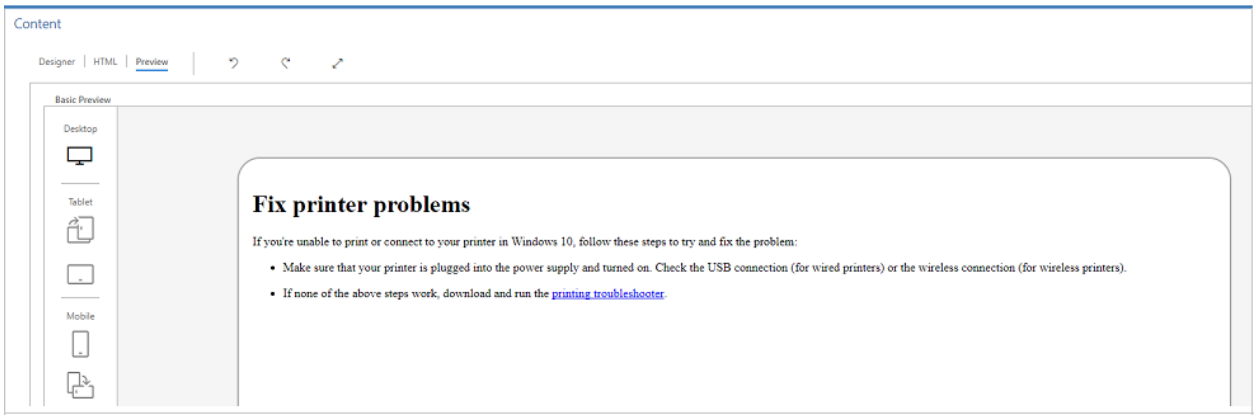
HTML

You can author and edit the article in the HTML tab of the Content editor panel, using HTML tags.



Preview

You can preview the content to view its compatibility on multiple devices, like tablets or phones.



This is an indicative preview. Content rendered can be different in the actual device or screen.

> **Note**
>
> If you add anchor links to a knowledge article in the **Content** field, you can't test them because they don't work in the **Designer** or **Preview** mode. The anchor links work only when you open the article in knowledge search and on portals.

Add a file attachment to a knowledge article

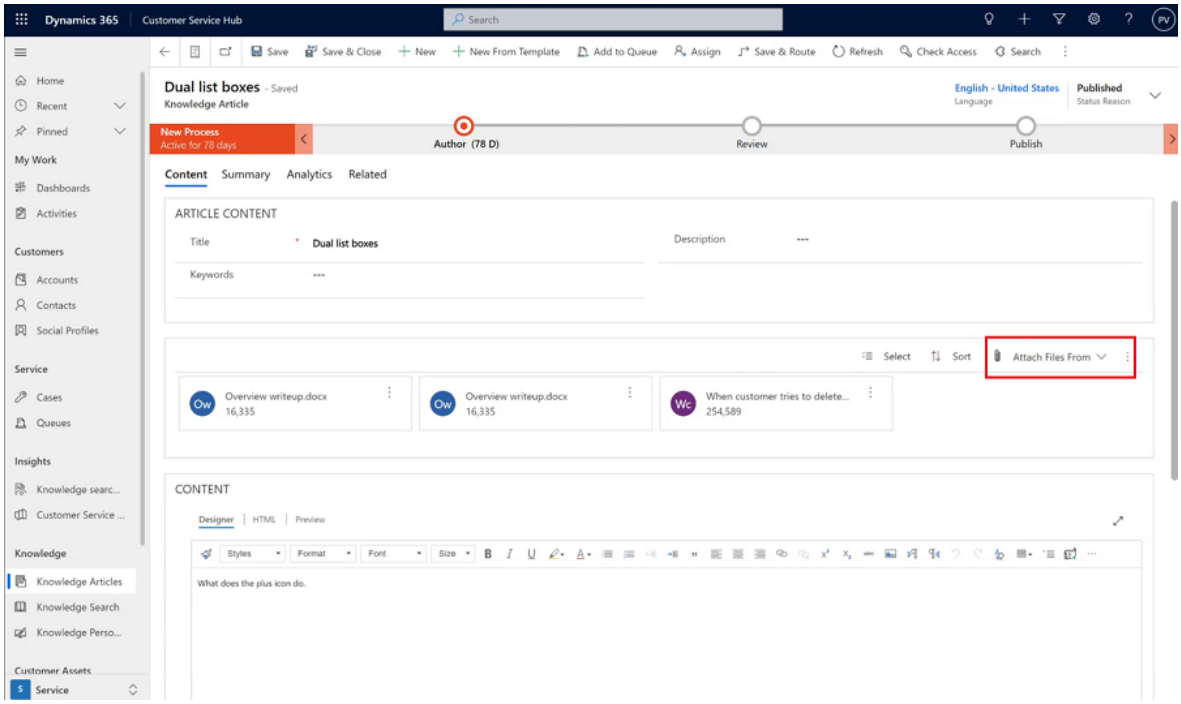
When you're creating a knowledge article, you can attach one or more files to it to help provide comprehensive information for your customers. Keep in mind the following

when attaching files:

- There is no limit to the number of articles that can be attached to a knowledge article, but the file size mustn't exceed 32 MB.
- Your administrator may limit the file size for knowledge articles.
- You must save your knowledge article before attaching files to it.

To attach a file to a knowledge article:

1. Open the knowledge article where you want to add a file attachment, and then on the **Content** tab, on the right side of the screen, select **Attach Files From**.



2. Choose from the following file locations:

    - **My Device** lets you browse and select files from your local device.
    - **Previous Uploads** opens a search pane where you can search and select from files that were previously uploaded to Customer Service Hub.

Work with file attachments

The **Attached files** section displays all your knowledge article attachments in a tile view horizontally above your message. The default setting for the maximum number of files that can be displayed is five attachments before the page forward functionality is displayed.

For your attached files, use these commands to do the following:

- **Select**: Allows you to select one or more attachments by clicking the box that appears on the attachments, and then you can either **Remove** or **Download** the

selected files.

- **Sort**: Allows you to sort records by a specific filter, such as file name or size.

> **Note**
>
> Uploads and downloads of knowledge article attachments are supported for files up to 4MB only, for:
>
> - Dynamics 365 Customer Engagement (on-premise)
> - Customer Managed Key-enabled organizations

When you publish your knowledge article, if you've attached files to it, the attachments can be accessed by knowledge consumers through Knowledge Search.

User permissions to view and download file attachments

For users to be able to view and download file attachments, you'll need to grant the following permissions to the Knowledge Article table:

Task	Access needed
Download and search attachments	Read
Add attachments	Create, append, append-to
Remove and add existing attachments	Append or append-to

Sync knowledge article attachments to the portal

To sync knowledge article attachments to the portal, your administrator must first enable the option. More information: Update knowledge article attachments for portal

On syncing knowledge article attachments to the portal:

- Dataverse search will be able to search through knowledge article attachments. More information: Microsoft Dataverse search can search through file data type Additionally, you must configure the faceted search results web template from your portal to be able to search through knowledge article attachments. More information: Configure faceted search results web template from your portal
- There will be a one-time migration from the notes attachments that have the prefix of your original KnowledgeManagement/Notesfilter setting to new attachments in

knowledge articles. Only the notes attachments used in the portal will be migrated to new attachments.

For more information, see Display file attachments with knowledge articles.

Mark a knowledge article for review

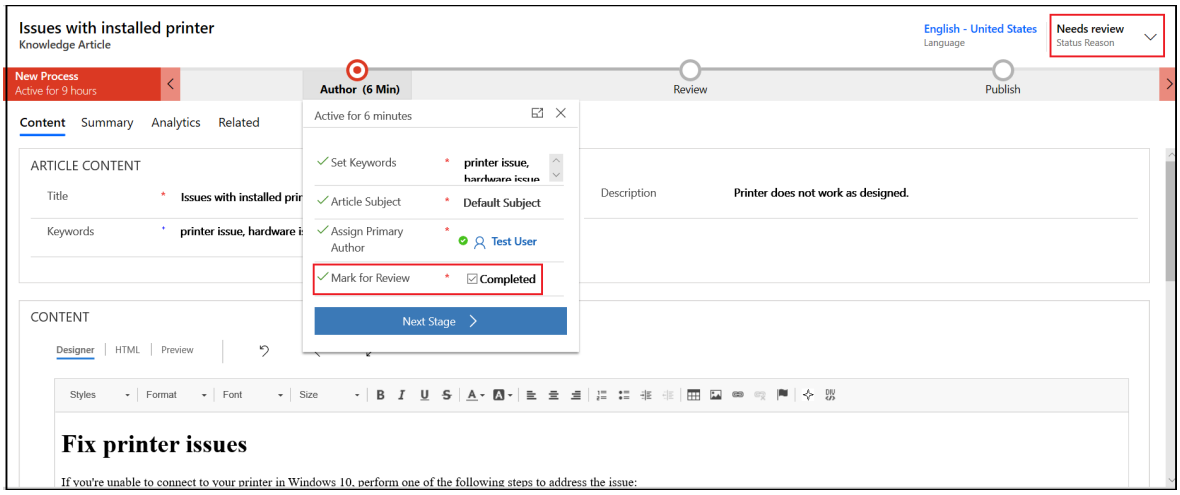
To ensure that the content you've created is accurate, have someone review it.

You can mark an article for review or directly assign it to a specific person or queue. When you mark an article for review, it starts appearing in the knowledge manager's dashboard. The knowledge manager can then assign the article to specific team members or a queue for review.

1. In the article you want to mark for review, in the **Status Reason** dropdown list, select **Needs Review**.

2. On the Business process flow, select **Author**.

3. In the **Mark for Review** field, select **Mark Complete**.



4. To assign the knowledge article to another reviewer or team, on the command bar, select **Assign** and select the user or a team.

5. To add the article to a queue so reviewers can pick it from there, on the command bar, select **Add to Queue**, and then select the queue.

Configure a default knowledge article authoring language for your organization

Article • 12/14/2022

There may be times when your agents prefer to author knowledge articles in a language other than the language that is set for your organization. You can set a language for your organization, but then also give agents the ability to personalize it to their own choice. Agents can also change the language for different articles. Review the hierarchy as described in the table below.

> **Note**
>
> The settings you configure for knowledge article authoring on the **Settings** page won't apply when you create a knowledge article by converting a case. In such cases, the knowledge articles will be created in English.

Admin settings for KA authoring language (Knowledge settings page)

Hierarchy	Personalization preference	Configurations allowed
Admin	Language preference at the organization level	• Set UI language • Choose a language-locale combination from the lookup
Knowledge managers	Language preference at the individual author level	• Set UI language • Choose a language-locale combination from the lookup
Agent	Language preference at the individual knowledge base level	Override administrative settings and choose a language-locale combination from the lookup

The ability to override follows the hierarchy order at the individual articles, agent or knowledge manager, and then administrator.

You can set a default knowledge article authoring language for your organization in the Customer Service admin center or Customer Service Hub app by performing the following steps:

1. Go to the **Authoring language** section.

Customer Service admin center

1. In the site map, select **Knowledge** in **Agent experience**. The **Knowledge** page appears.
2. In the **General settings** section, select **Manage**. The **General settings** page appears.
3. On the **General settings** page, go to the **Authoring language** section.

2. Set the default knowledge article authoring language for the users.

Customer Service admin center

- Set the **Enable default authoring language** toggle to **Yes**.

3. If you want to set a default knowledge authoring language for your organization:

Customer Service admin center

- Select **Other language** and select a language from the **Language** dropdown.

5. Set the **Allow users to set default knowledge authoring language** toggle to **Yes** if you want to allow your users to set their default authoring language.

6. Select **Save**.

Personalize your language preferences for authoring knowledge articles

If your administrator has enabled language personalization, you can select your preferred language when authoring knowledge articles.

> ⓘ **Note**
>
> Language settings apply only to knowledge articles that aren't created by converting a case. Converted knowledge articles are created in the default language setting of your organization.

1. In **Customer Service Hub**, go to **Service** > **Knowledge** > **Knowledge Personalization**.
2. Select the **Authoring** tab.
3. Do one of the following:
    - Set **Use organization's language value** to **Yes**.
    - Select your preferred language from the dropdown list.

    > ⓘ **Note**
    >
    > At any point, you can only either set the org language or select a language from the list.

4. Select **Save**.

    When you create a new knowledge article, the default language you selected is used.

5. If you need to change the language for a specific article only, select the **Summary** tab, and then select your preferred language in the **Language** field.
6. Select **Save**.

Review knowledge articles

Article • 02/03/2023

Review articles for accuracy before they're published or made available to others. After reviewing, you can either reject the article and suggest review feedback, or approve the content of the article.

Prerequisites

To approve a knowledge article, you must have **Approve** permissions for the knowledge article record type. This permission is added by default to the knowledge manager, customer service manager, customer service representative, and system administrator roles or to equivalent roles.

How to review, and reject or approve a knowledge article

To	Do the following
Pick an article assigned to you	In Customer Service app: Go to **Dashboard** > **My Knowledge Dashboard**, and then see the **My Active Articles** stream. **-OR-** Go to **Queues**, and then select the **Items available to work on** view.
To suggest review feedback	1. On the Business process bar, in the **Review** stage, in the **Review** field, select **Reject**. Give the reason for rejection in the **Reject Knowledge Article** flyout. 2. To add details about the changes you want in the knowledge article, go to **Summary** tab and in the **Timeline** section, select + to add a note. The rejected article is assigned back to the primary author of the knowledge article.
Approve the content of the article	When you approve the article, it implies that the content is ready to be consumed by agents and is ready to be published as well. On the Business process bar, **Review** stage, **Review** field, select **Approve**. The article is now ready to be published.

Publish knowledge articles

Article • 01/23/2023

After the content in the article is complete and reviewed, you can publish the article to the portal to make it available to your customers. You can publish the article immediately or schedule it for a later time.

> **Important**
>
> If your organization is using a portal to publish the knowledge articles, your customizer can write a plug-in that can pick the published articles and post on your portal, and also report the article views back.

Prerequisites

Ensure that you have the Publish and Update permissions on the Knowledge Article record type. These permissions are added by default to the roles of knowledge manager, customer service manager, customer service representative, or system administrator. You will also need the Publish permission on the Knowledge Article record type, if you want to change the state of a published article.

Publish an article

1. In the Customer Service Hub, go to **Service** > **Knowledge Articles**.
2. Open a knowledge article that's in the **Approved** state.
3. To make it easy to find knowledge articles related to specific products, associate the knowledge article with a product.
   a. On the command bar, select **More** > **Relate Product**.
   b. In the **Select Product to Associate with** field, select the **Lookup** button, select a product this article is about, and then select **Associate**.

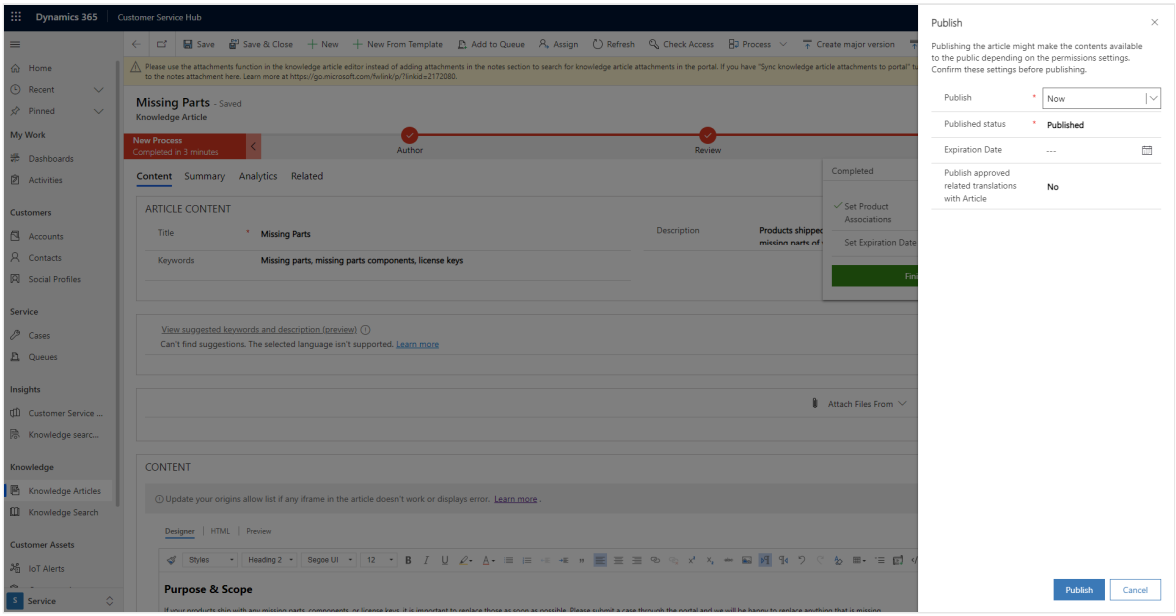
      The associated article appears in the **Related Products** list in the **Related Information** section of the **Summary** tab.
4. On the Business process bar, select the **Publish** stage.
5. In the **Set Product Associations** field, select **Mark as Complete**.

6. If you want to schedule the article to publish on a later date, on the **Summary** tab, in the **Publish On** field, select a date and time to publish the article.

7. Select **Finish**. The Publish dialog is displayed.

> **Note**
>
> The Publish dialog appears only for the default business process flows where the final stage is **Publish**. To configure the Publish dialog for other customized stages, see **Process events and event handler methods**.

- In the **Publish** field, select whether you want to publish the knowledge article now or in the future. To publish the article in the future, in the **Publish On** field, select a date and time.
- In the **Published Status** field, select what status the article should be in after it is published. By default, **Published** is selected.
- In the **Expiration Date** field, select a date and time when you want the published article to expire. Expired articles are no longer available in searches.
- If you've set an expiration date, in the **Expiration Status** field, select the status the knowledge article should be set to after it expires.
- To publish all approved related translated articles with the article, in the **Publish Approved related translations with Article** field, select **Yes**.
- Select **Publish**.



> **Note**
>
> In the knowledge article for interactive experience form, if there is an active customization layer over the **msdynce_KnowledgeManagementFeatures** layer, you won't be able to view the quick form publish dialog. You must delete the active customization layer to view the quick form publish dialog. More information: **Removed an unmanaged layer**.

Update published knowledge articles

When a knowledge article is in the Published (or Scheduled) state, only those users who have the Publish privilege can update it.

1. In the Customer Service Hub site map, go to **Service** > **Knowledge Articles**.
2. Select the published article you want to edit.
3. On the command bar, select **Update**.
4. Update the article based on the feedback.

If the article has information that complements an existing knowledge article, associate the existing article with the current knowledge article.

1. In the knowledge article, on the command bar, select **More** > **Relate Article**.
2. In the **Select Article to Associate** field, select the **Lookup** button, select an existing article, and then select **Associate**.

   The associated article appears in the **Related Articles** list in the **Related Information** section of the **Summary** tab.

Create and manage article versions

Article • 01/23/2023

Article versioning helps you manage updates to your knowledge articles without disrupting the live or published articles. By creating major and minor versions of a knowledge article, you can keep your articles up to date with the latest information while keeping track of changes throughout the lifecycle of your products and services.

This capability helps you to keep accurate records of the features your organization provides and go back to previous versions if you need to.

Create a new version

1. In the Customer Service app, select **Knowledge Articles**.
2. Select the article you want to create a new version for.
3. From the command bar, select **Create Major Version** or **Create Minor Version**.

   An example of a major version would be when your documentation changes to detail a new feature or functionality, while a minor version might be a change to the user interface with no change to functionality.

   The new version of your article will contain all of the same content, information, and permissions as the current version. The **Version Major** or **Version Minor** field will automatically update to reflect the new version number.

   > ⓘ **Note**
   >
   > You won't be able to make any changes to the **Major Version Number**, **Minor Version Number**, **Language**, or **Article Public Number** fields when creating a new major or minor version of an article.

4. After you have reviewed the article, make any changes that you want to the new version. You can update the article title, content, keywords, and description to reflect any changes to your products, features, or services.

Review and publish your new version

When you're done making changes, you can push the new version of your article through your standard article workflow. When you're finished reviewing and are ready

to publish, on the command bar, select **More** > **Publish**, and then choose how and when you want to publish your new version. You can publish your new version immediately, schedule it to publish at a future date, or leave it as a draft to manually publish later. More information: Publish knowledge articles

Manage article versions

Managing your article versions means publishing and archiving different versions of each article to provide the most accurate information to your customers and internal employees. Keep in mind that only one version of an article can be published at a time. It's important to keep track of the changes that are made to each version and publish them when it's appropriate.

1. In the knowledge article, select the **Summary** tab.
2. In the **Related Information** section, select the **Related Versions** button to display a list of all major and minor versions of the article.
3. In the **Related versions** list, open the version you want to delete.
4. Select the **More** button, and then select **Send to Trash**.
5. When prompted, select **OK**.

   Deleting an article version is permanent and can't be undone. You won't be able to go back to that version of the article, so ensure that you don't need any of the information. It's a good idea to create a local backup of any versions you delete.

Translate knowledge articles

Article • 01/23/2023

Your knowledge article must reach your customers irrespective of their market or region. The knowledge management capability in Customer Service helps you set the translation language for your articles, which enables you to provide the same self-help content in multiple languages without having to manage multiple copies of the same article.

Select a language for your knowledge article translation

1. In the Customer Service app, select **Knowledge Articles**.
2. Select the article you want to translate, and from the command bar, select **Translate**.
3. In the **Create new translation** dialog, do the following:

   - From the **Pick a language** dropdown list, search for and select the language you want.
   - In the **Create new version** field, select either the **Major** or **Minor** version for your translation.

   You can set languages that are supported by your Dynamics 365 instance.
4. Select **Create**.
5. Enter your translated text in the appropriate fields. You can enter translated text for the following fields:

   - Title
   - Keywords
   - Article Description
   - Content
6. When you are done reviewing and your article is ready for publish, select **More** > **Publish**. Select how and when you want to publish your new version. You can publish your new version immediately, schedule the publish for a future date, or leave it as a draft to publish it manually at a later point in time. More information: Publish knowledge articles

Manage article translations

After you've published a translation for an article, you can manage it and any other translations by selecting the **Summary** tab of the knowledge article.

1. In the **Related Information** section, select **Related Translations**.
2. Open the translation you want to view. Keep in mind that there may be multiple versions for each language. You can sort the translations by selecting the column headers of the **Related Translations** section.

   From here, you can:

   - Edit or update a translation.
   - Create a new major or minor version of a translation.
   - Delete a translation or version of a translation.

Manage feedback for knowledge articles

Article • 01/23/2023

Mange feedback received for your articles by adding them to your knowledge articles. Update your knowledge articles based on the feedback to make your articles useful for agents.

Add feedback to an article

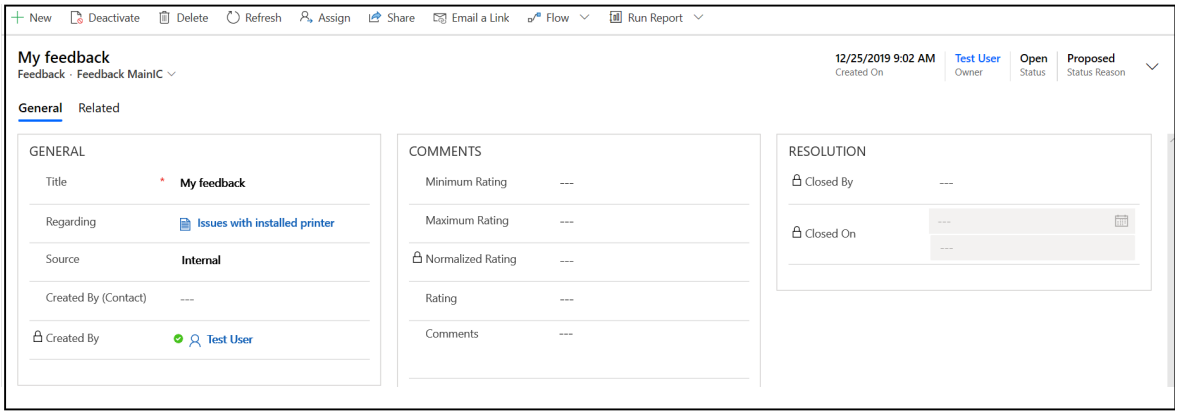
1. In the Customer Service app, select **Knowledge Articles**.
2. Select the article you want to add feedback for.
3. In the **Feedback** subgrid, select **Create Feedback**. You can also select ➕ in the navigation bar and then go to **Feedback** to create a feedback.
4. In the **Quick Create: Feedback** dialog, fill in the information:

    - **Title**. Type a descriptive title for the feedback. For example, if the feedback is about customer satisfaction, type that.
    - **Regarding**. Look for relevant records to associate the feedback.
    - **Source**. Select whether the feedback is internal or from a portal. If you received the feedback via a phone call, you can select **Internal**.
    - **Comments**. Type any feedback comments that you want.
    - **Rating**. Type a number to specify how useful the related record is. For example, if you're tracking the customer satisfaction for a case and you want to rate it a 2 on a scale of 1–10, type 2.
    - **Minimum Rating** and **Maximum Rating**. Specify a minimum and maximum rating to define a rating scale. For example, if you want to give it a rating of 2 on the scale of 1–10, type 1 as the minimum rating and 10 as the maximum.
    - **Created by (Contact)**. If you're creating the feedback on behalf of a customer contact, select the contact here.

      The **Created By** and **Closed By** fields are automatically populated with the user who creates or deactivates the feedback record.

- Dynamics 365 Customer Service automatically calculates the **Normalized Rating** based on the following formula: **(Rating - Minimum Rating)/ (Maximum Rating - Minimum Rating)**.

5. Select **Save and Close**.



> **Note**
>
> You can also update the owner of the feedback in the flyout.

Update knowledge articles based on the feedback

Ensure that your articles are up to date and accurate at all times by updating them based on feedback you receive.

1. In the Customer Service app, select **Knowledge Articles**.
2. Select the article you want to edit.

   If the reviewer has suggested any changes from their review, you can see them as notes in the **Timeline** section.

3. Update the article based on the feedback.
4. Select **Save**.
5. To assign the article back to the reviewer for approval or publishing, on the command bar, select **Assign**, and then select a user or a team.

Create templates for knowledge articles

Article • 12/14/2022

Knowledge article templates help knowledge authors simplify the process of creating knowledge articles. Templates also help knowledge managers and authors maintain consistency in branding, language, and structure.

When an author chooses a template to create an article, certain fields in the template are pre-populated with values, allowing the author to focus on the main content of the article.

> **Note**
>
> To learn how to use knowledge article templates to create knowledge articles, go to **Create knowledge articles using templates**.

Prerequisites

Before working with templates, make sure you have the required privileges to create, edit, or delete knowledge article templates. Contact your administrator if you do not have these privileges.

Create a knowledge article template

As a knowledge manager, you can create knowledge article templates by defining the necessary fields such as Language, Title, Keywords, and Subject. These fields will be pre-populated when the author creates the article using the template, reducing the efforts to fill in these fields.

You can create a knowledge article template in the Customer Service admin center or Customer Service Hub app by performing the following steps:

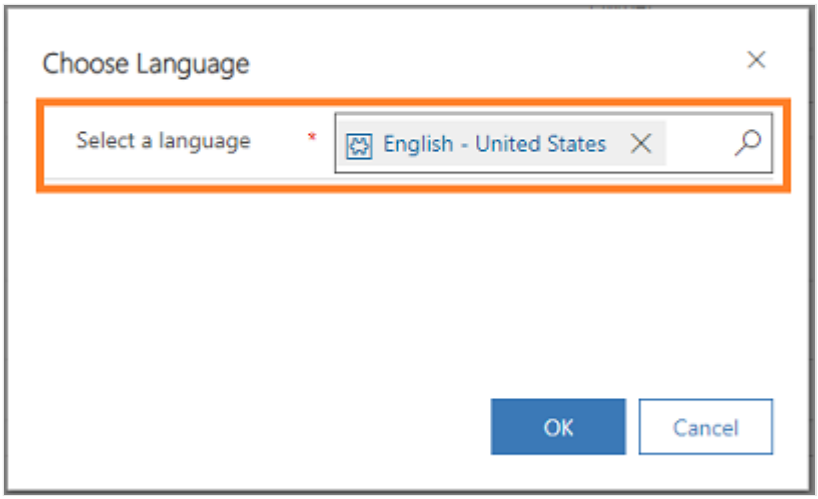
1. Go to the **Article Templates** section.

Customer Service admin center

1. In the site map, select **Knowledge** in **Agent experience**. The **Knowledge** page appears.
2. On the **Knowledge** page, go to the **Article Templates** section and select **Manage**.

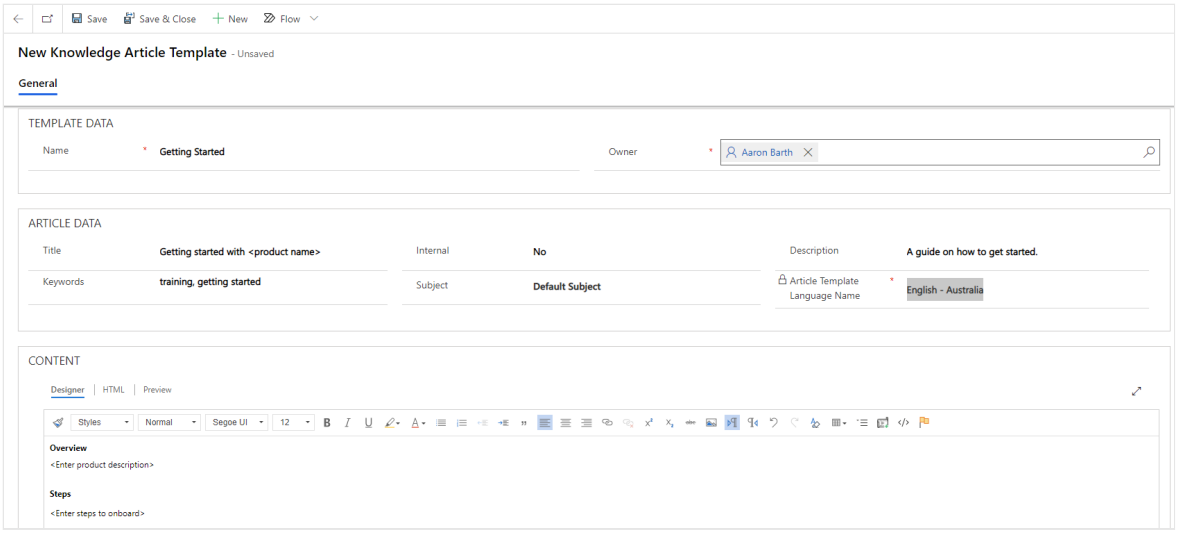
3. Select **New**.

4. In the **Choose Language** dialog box, select the language for the template, and then select **OK**. In this example, we are selecting the language as **English – United States**.



5. On the **New Knowledge Article Template** page, enter the values for the required fields that you want to pre-populate when the template is selected.

Section	Field	Description
TEMPLATE DATA	Name	Enter a name for the template.
	Owner	Enter the name of the owner who owns the template. By default, your name will be displayed in this field.
ARTICLE DATA	--	Define article fields such as Title, Keywords, and Subject that are used in any knowledge article that's created based on the template.
CONTENT	--	Define a structure that will be used in any knowledge article that's created based on this template. To learn more, see Use the rich text editor to create knowledge articles and emails.



6. After you have entered the required information, select **Save**.

   A template is created and is available for knowledge authors to use to create articles.

> **Note**
>
> Similarly, you can edit or delete knowledge article templates from the **Service Management** area.

Use a template in Portal Knowledge Article Interactive Experience forms and custom forms

To add a knowledge article template to your forms, perform the following steps:

1. In Dynamics 365, go to **Settings** > **Advanced Settings** > **Customizations**.
2. Select **Knowledge Article Entity**, and then select **Forms**.
3. Open **Portal Knowledge Article Interactive Experience form**, and then select **Form Properties**.
4. Select **Add** to add the knowledge article template library that has the following web resource:

```
msdyncrm_/KnowledgeManagementFeatureWebResource/KnowledgeArticleTemplate/KnowledgeArticleTemplateMainSystemLibrary.js
```

5. Under **Event Handlers**, make sure that the **Event** field is set to **Onload**.
6. Select **Add**. Ensure that the **Library** field is populated with the same web resource that you have added.
7. In the **Function** field, add the following function:

```
KnowledgeManagement.CommandBarActions.Instance.knowledgeArticle_onload
```

8. Ensure that the **Enabled** box is selected.
9. Select the **Pass execution context as first parameter** box, and then select **OK**.
10. Select **Save**, and then select **Publish**.

Create knowledge articles using templates

Prevent duplicate workflows with knowledge article operations

Article • 01/23/2023

If you use workflow processes to perform knowledge article operations, such as creating or updating a knowledge article, the update operation is further classified into suboperations, such as:

- Update a knowledge article version.
- Manage a knowledge article version.
- Translate a knowledge article.

For the create and update operations, be aware of the following when using the workflow process:

Whenever you create a new knowledge article manually, the system creates two articles: a root article and a base article. This means if you use a workflow process that is triggered on a create operation, the workflow is triggered twice—once each for the creation of the base article and the root article.

When you use a workflow process to perform the following update operations, the workflow is triggered twice—once each for the base article and the root article:

- Create major version
- Create minor version
- Translate

> **Note**
>
> Other update operations, such as updating a field or approve or publish, do not trigger the second workflow.

To avoid triggering the workflow twice, in the workflow itself, set the trigger condition for the knowledge article as follows:

- For a create operation, set the root article to **Yes**.
- For an update operation, set the root article to **No**.

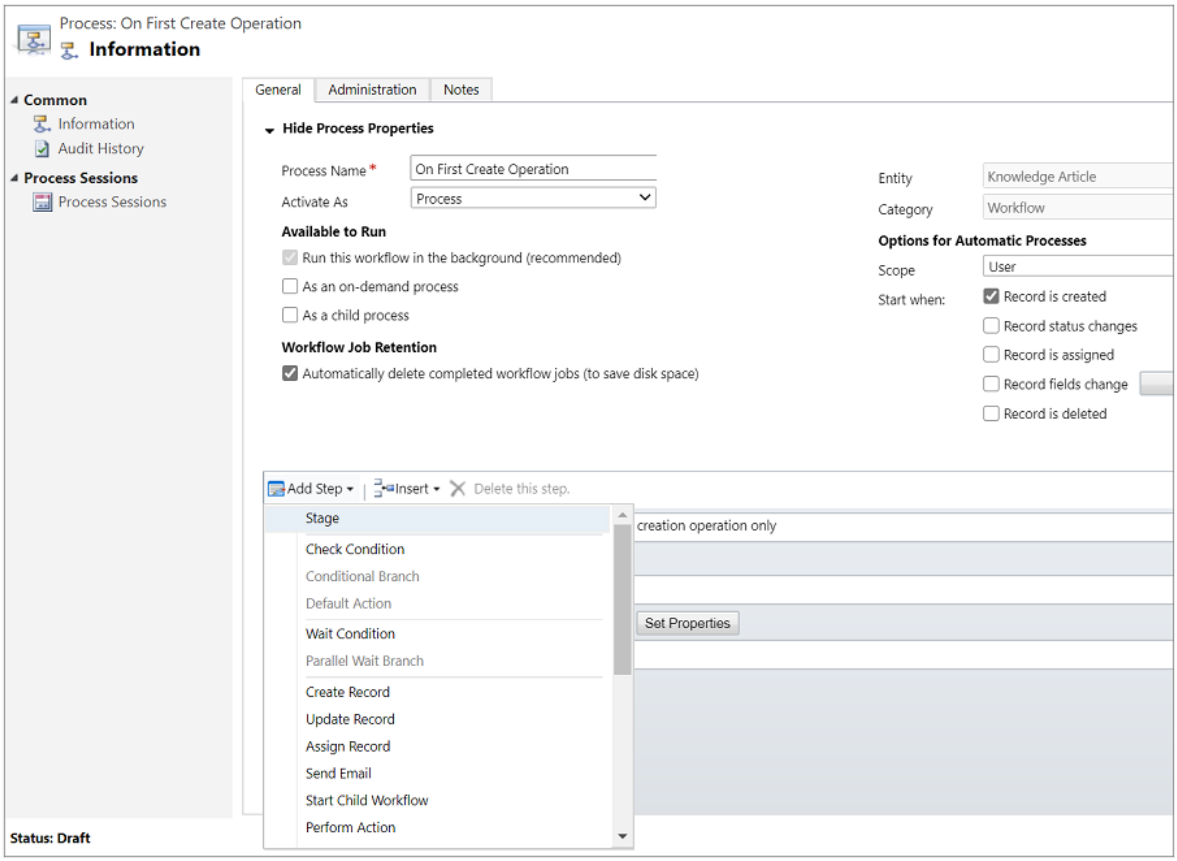
Set the trigger condition

1. In your Customer Service app, select **Settings** > **Advanced Settings**. Advanced Settings opens in a new browser tab.

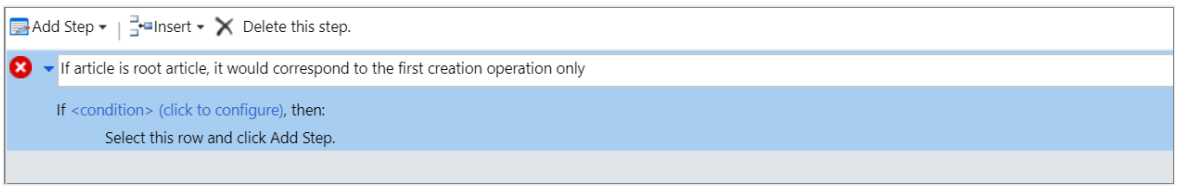
2. In the navigation bar, select **Settings** > **Processes**.

3. Select the knowledge article flow you created. The workflow process opens in a new browser window.

4. In the **General** tab, select the **Add Step** dropdown list, and then select **Check Condition**. A new step will be added.



5. In the step, select **<condition> (click to configure)**. The **Specify condition** page opens in a new browser window.



6. From the entity dropdown list, select **Knowledge Article**.

7. From the field dropdown list, select **Root Article**.

8. From the condition dropdown list, select **Equals**.

9. From the value dropdown list, select a value:

- **Yes** for the create operation.
- **No** for the update operation.

10. Select **Save and Close** to save the condition and close the window.
11. In the workflow process window, select **Save and Close** to save the condition and close the window.

Now, when you perform a create or update operation, the workflow process will trigger only once.

Knowledge article analytics

Article • 07/18/2023

Tracking knowledge article analytics helps you assess the value your articles provide to your customers. Knowing and understanding when, where, and how many times an article was viewed, tells you how much your customers rely on the information that it contains. This data is extremely useful when creating future content curation plans and can help you decide what content you will deliver in the future, as well as how you deliver it, where you deploy it, and what style or structure you use to write it.

Analytics for knowledge articles in Customer Service Hub

You can track the various details of your article in Customer Service Hub. The **Analytics** and the **Summary** tab display the statistics that help you understand how helpful your article is in resolving customer queries.

Analytics tab

To view an article's view counts and other related statistics, open the article you want to track, and then select the **Analytics** tab.

- **Views**: Shows you the total number of times the article has been viewed. The **View by day and location** section shows the article views on a particular day.

  To maintain uniformity among users who see the article views across different time zones, the views are calculated based on the Coordinated Universal Time (UTC) time zone, aggregated, and then displayed according to the user's local time zone. So, if you are in the UTC-3 time zone, you'll see the time and consequently the day as UTC-3. For example, 23rd Jun, 12:00 AM UTC time translates to 22nd Jun, 9:00 PM Brazil (UTC-3) time.

  The total number of views remains constant. You can select the **Day**, **Knowledge Article Views**, and **Location** column headers to sort the data.

- **Feedback**: Captures all the feedback and ratings on the knowledge articles and updates the articles accordingly. If your articles are published on a portal, customers and users can provide their feedback and also give ratings on an article. The Feedback sub grid shows all feedback received for the current knowledge article.

The **Rating** field calculates the average rating of the article based on the amount of feedback and number of ratings received.

> ⓘ Note
>
> Rating and view count numbers are rollup fields that are not updated instantly. For more details, see **Define rollup fields**.

- **Cases**: Shows a list of the cases that have used this article. Double-click a case to view its details.

  By reviewing cases that have used your articles, you can gain valuable insights into the questions that customers are asking, as well as what avenues they tried before asking for help. This data can help you promote your knowledge articles better and provide more useful information to your customers and team members.

Summary tab

Use the **Summary** tab to view and edit basic details of the article. In the **Summary** tab, you can:

- View or edit **Basic settings** for the article. These include details like Language, Article Public Number, and more.
- View or edit **Publish settings** for the article.
- See the **Timeline**. Add notes or view what you have missed.
- View related information about the article in the **Related Information** section. These include related versions, translations, categories, articles, and products.

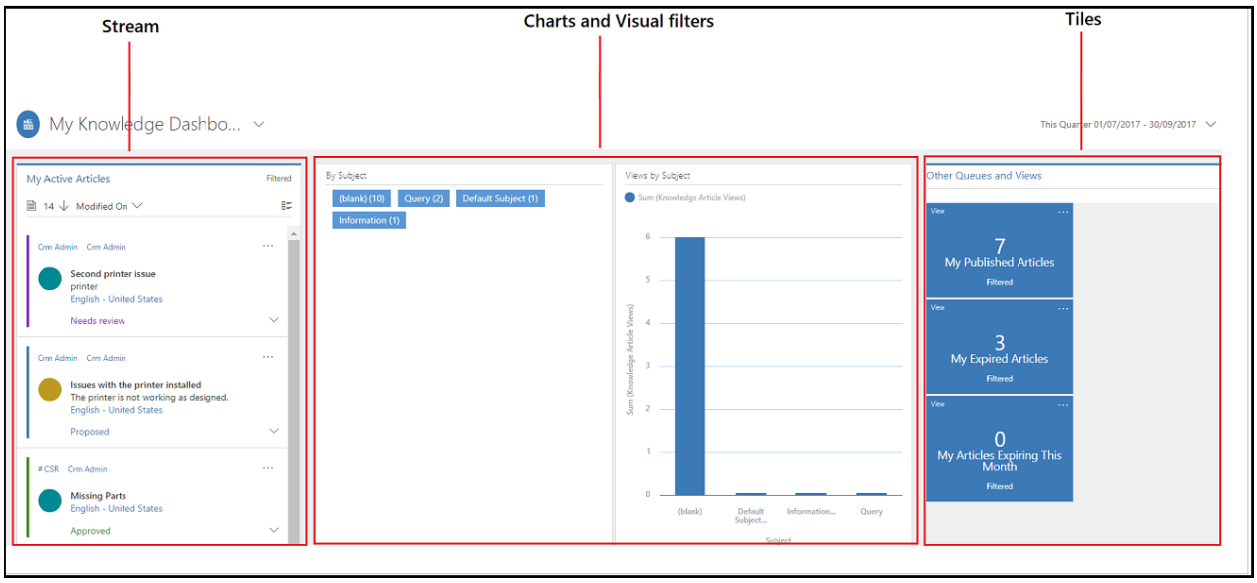
Dashboards for knowledge articles in Customer Service Hub

Knowledge managers and authors can now monitor the status of knowledge articles using the two default dashboards available in Customer Service Hub.

> ⓘ Note
>
> If these dashboards don't offer what you need, you can create new interactive dashboards. More information: **Configure interactive experience dashboards**

My Knowledge Dashboard

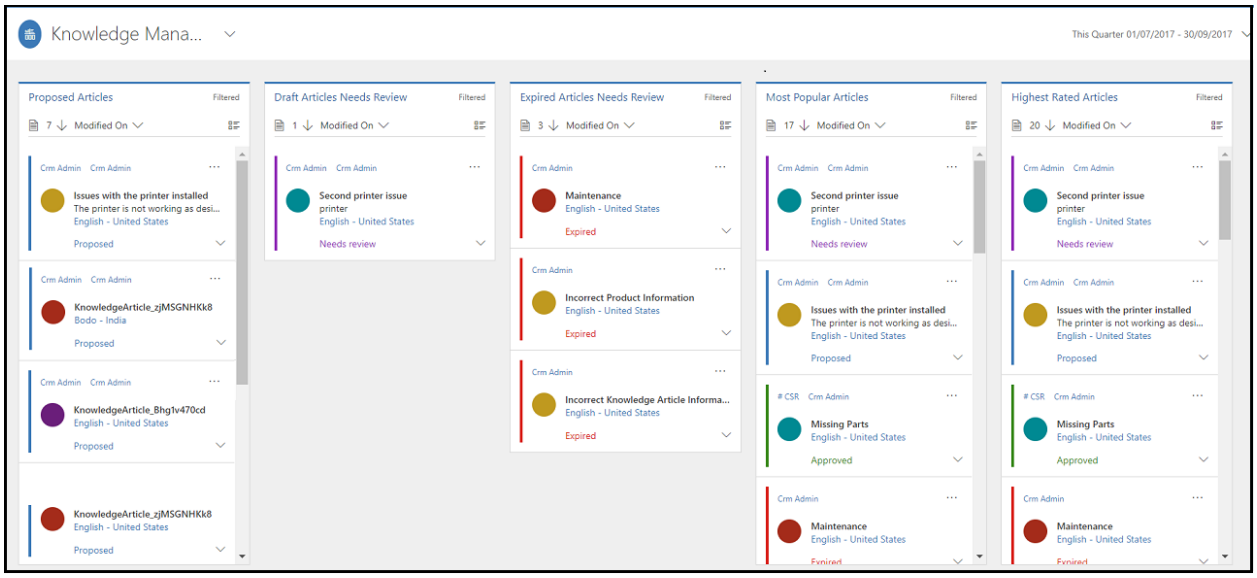
This dashboard is designed to give authors a visual snapshot of the number and status of knowledge articles they're working on. It helps them quickly know things like articles expiring in the month and articles in review.



- **Streams** show data from views or queues. In the My Knowledge Dashboard, the stream shows the active articles assigned to the author.
- **Charts** provide a count of relevant records in the streams, such as articles by status, articles by owner, or articles by subject. They also act as visual filters. You can drill down in a chart to see data that interests you the most.
- **Tiles** give authors an aggregated view of data in the streams and help them monitor the volume of their knowledge articles.

Knowledge Manager

This dashboard is designed specifically for knowledge managers. As a knowledge manager, you can quickly view the most popular articles, articles that need review, highest-rated articles, or articles that are about to expire, and take necessary actions on the articles from here.



More information: Use interactive dashboards to effectively manage service cases

Manage versions in alternate keys for knowledge article entity

If you're creating an alternate key for a Knowledge article entity, include the major or minor version in the key to maintain uniqueness. Also, if you're using translations, include the language code along with the version in the key to ensure a seamless translation experience. For more information about alternate keys, go to Define alternate keys for an entity.

Knowledge article analytics in Customer Service workspace

The **Knowledge analytics** dashboard consists of the **Article insights** and **Search term insights** dashboards and is meant for knowledge authors and supervisors. Supervisors can use these insights to improve their knowledge management base.

Next steps

For more information on knowledge management analytics in Customer Service workspace, go to Introduction to knowledge analytics.

Search knowledge articles

Article • 07/21/2023

Search and view knowledge articles to help answer a customer's question or solve an issue.

Knowledge base search is available in Customer Service Hub, Customer Service workspace, Omnichannel for Customer Service, and some versions of Dynamics 365 Customer Engagement (on-premises). Customers can search your knowledge base on their own if your organization has provided a self-service portal.

Prerequisites

- Your administrator has turned on Dataverse search.
- Your administrator has set up the following columns in the **Quick Find View** by navigating to **Tables** > **Knowledge Article** > **Views** > **Quick Find Active Knowledge Articles**:
  - Article Public Number
  - Content
    The **Content** field is hidden in the user interface to avoid unintentional deletion of content.
  - Created On
  - Keywords
  - Knowledge Article Views
  - Language
  - Major Version Number
  - Minor Version Number
  - Modified On
  - Rating
  - Status
  - Title
- You have access to knowledge article entities, such as Knowledge Article, Knowledge Article Views, Knowledge Article Attachment, Favorite Knowledge Article, and Knowledge Article Image.
- Your administrator has granted **Create**, **Read**, **Write**, **Delete**, **Append**, and **Appendto** privileges to any new custom roles you created.

- In Customer Service workspace and Omnichannel for Customer Service, your administrator has turned on the app side pane and knowledge search in agent experience profiles.
- You're dealing with a case or a conversation, or your administrator has turned on the ability to open the knowledge pane for other entities.

Tips for search results

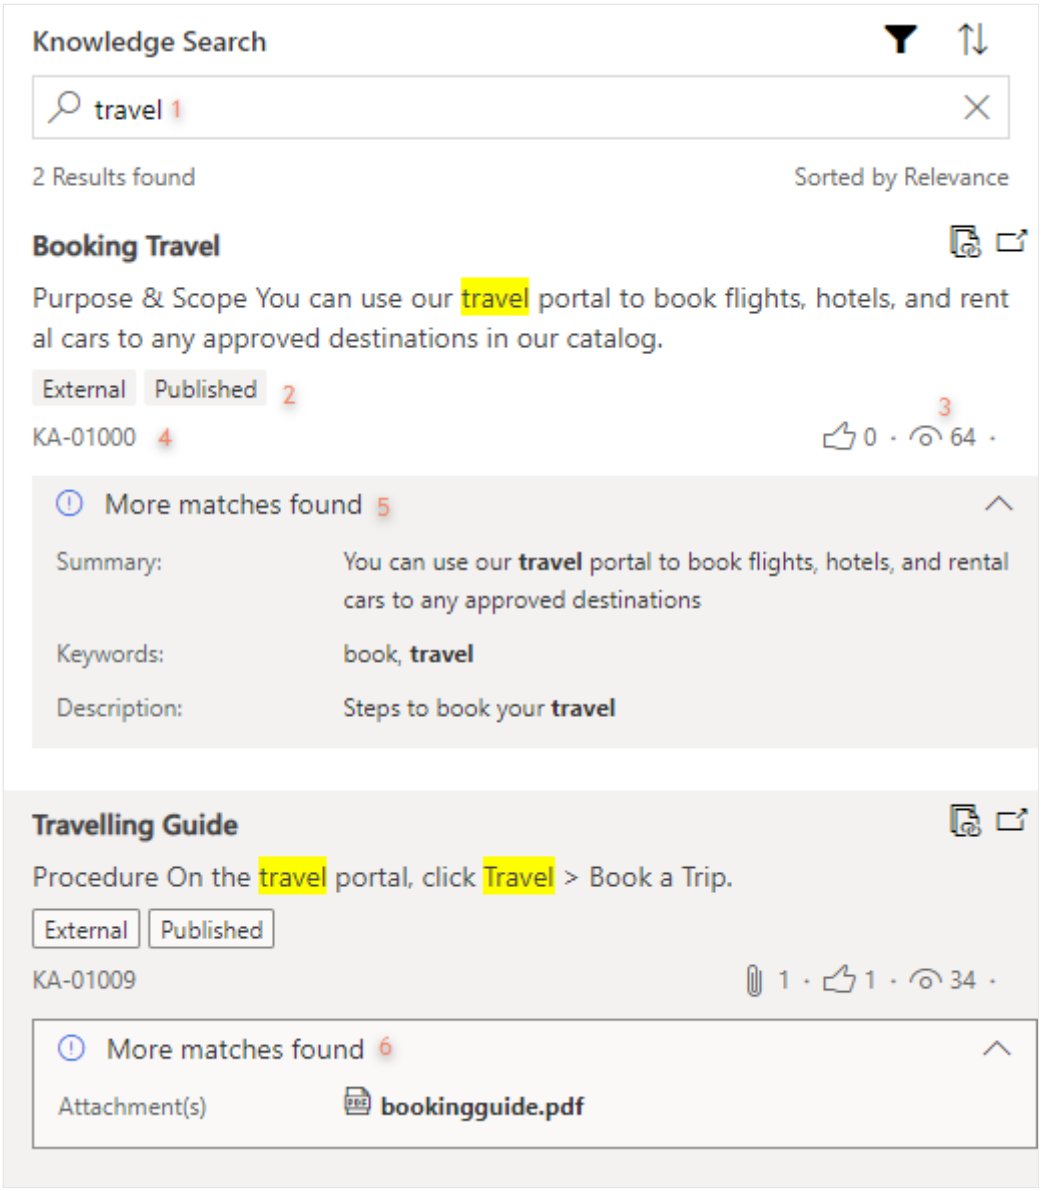
If a keyword you enter matches content in the knowledge base, the matching words are highlighted in yellow in the search results. Matches don't necessarily appear in the first three lines or words of an article, so you might not see the highlighted text in the search results.

If style tags are visible in an article's content summary, it means that style tags were used to format the article. Consider offering feedback to the article's author to use inline CSS styling instead.

Search the knowledge base directly in Customer Service Hub

You can search the knowledge base directly, without viewing a case or conversation first, in Customer Service Hub.

1. In Customer Service Hub, under **Knowledge**, select **Knowledge Search**.
2. Enter a keyword in the search box.



Legend:

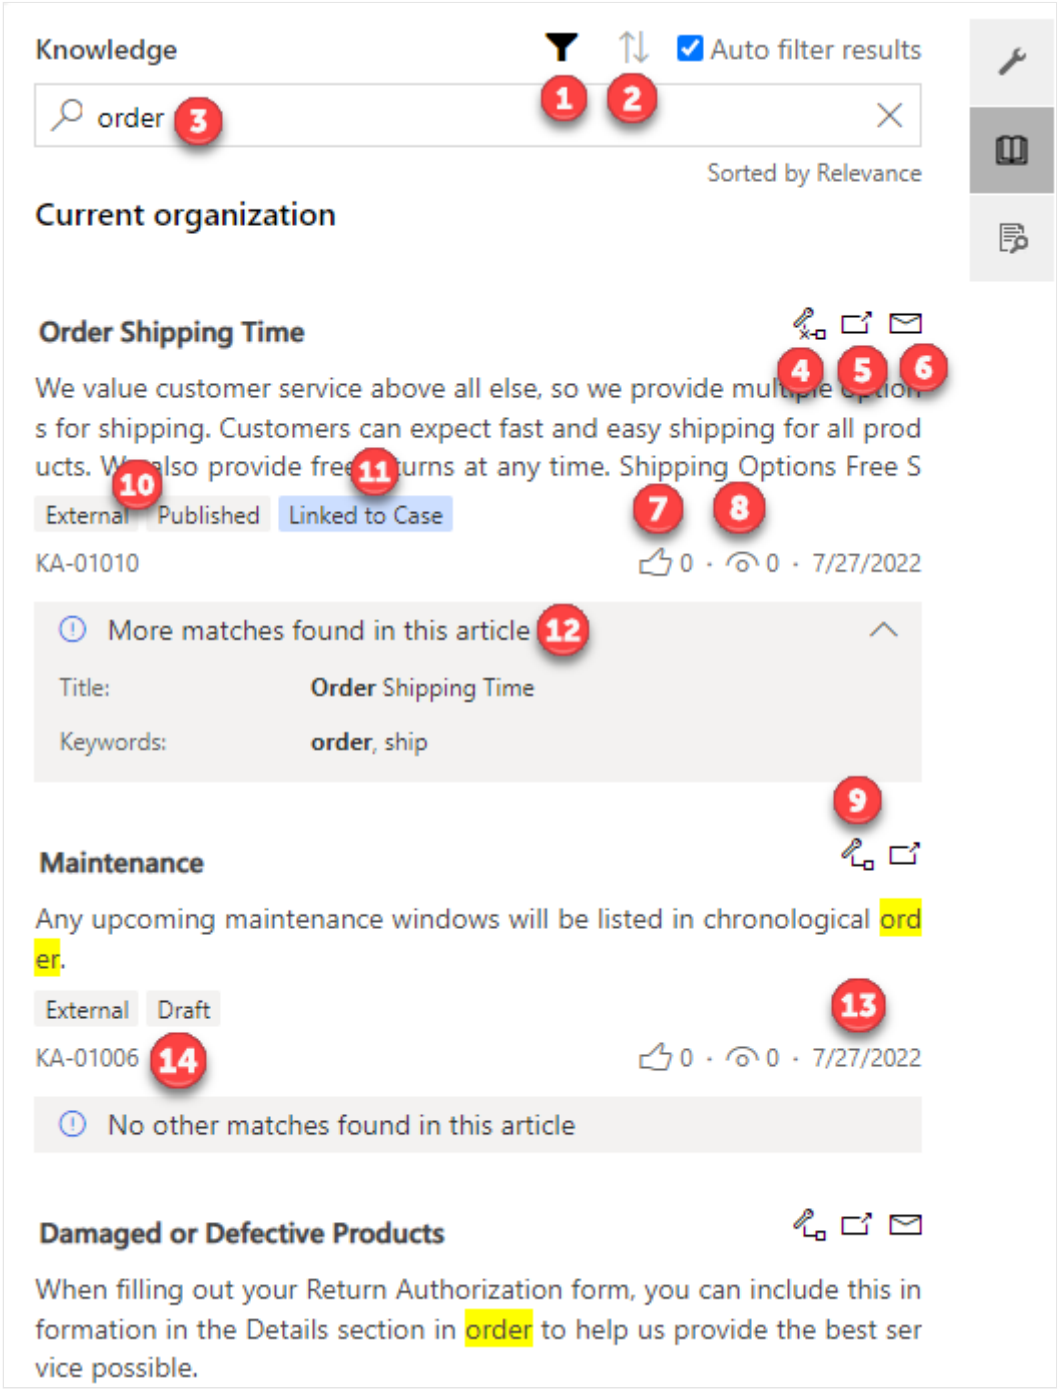
1. The search box
2. Status and visibility tags
3. The number of attachments, likes, and views, and the date the article was most recently updated
4. The article ID
5. A card that displays search term matches from keywords, description, attachments, and other custom fields
6. An attachment that includes the search term in its title or contents

If your administrator hasn't turned on Dataverse search, the system uses the keywords you enter to perform a full-text search of the following knowledge article metadata: **Title**, **Content**, **Keywords**, **Description**, and **Article Public Number**. If Dataverse search is turned on, your administrator can select the columns that are searched.

Search for related articles in Customer Service Hub

You can search the knowledge base for related articles when you view a case or conversation in Customer Service Hub.

1. In Customer Service Hub, open a case or conversation.
2. In the reference pane to the right of the timeline, select the **Knowledge search** (book) icon.
3. The case title is used as the search term by default, but you can enter your own keywords to get more relevant results.



Legend:

1. Filters the list of results
2. Sorts the list of results
3. Search box
4. Unlinks the article from the current case or conversation
5. Opens the article in a new browser window To view the article in the reference pane, select its title in the search results.
6. Opens a new email so that you can send the article to your customer
7. Rating
8. The number of times the article has been viewed
9. Links the article to the current case or conversation
10. Status and visibility tags for the article
11. Confirmation that the record is linked to a case
12. A card that displays search term matches from keywords, description, attachments, and other custom fields
13. The date the article was most recently updated
14. The article ID

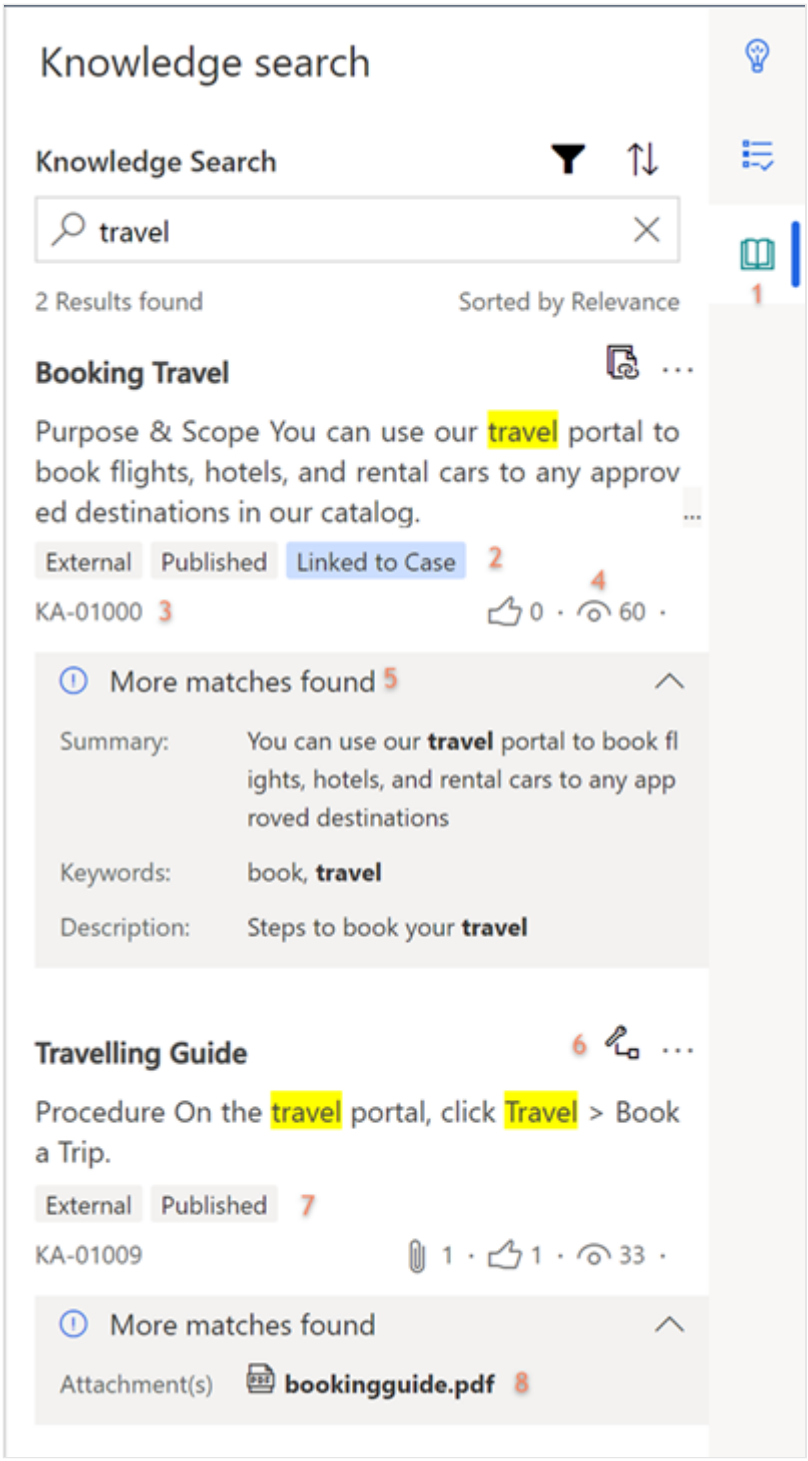
Search for related articles in Customer Service workspace and Omnichannel for Customer Service

You can search the knowledge base for related articles in the app side pane when you view a case or conversation in Customer Service workspace and Omnichannel for Customer Service. By default, a successful search displays up to 10 results.

1. In Customer Service workspace or Omnichannel for Customer Service, open a case or conversation.

2. In the app side pane, select the **Knowledge search** (book) icon.

3. The case title is used as the search term by default, but you can enter your own keywords to get more relevant results.



Legend:

1. **Knowledge Search** icon
2. The tag that indicates the article is linked to the case or conversation
3. The article ID
4. The number of times the article has been viewed
5. A card that displays search term matches from keywords, description, attachments, and other custom fields
6. Links the article to the current case or conversation, or, if the article is already linked, unlinks it
7. Status and visibility tags for the article
8. An attachment that includes the search term in its title or contents

Select **More options** (...) to:

- Select **Email Content** to open a new email so that you can send the article to your customer.
- Select **Send URL** to paste the article link in the conversation window in channels other than Voice in Omnichannel for Customer Service.

You can perform these actions only on published or expired articles.

See suggested articles during a conversation in Customer Service workspace and Omnichannel for Customer Service

In Customer Service workspace and Omnichannel for Customer Service, smart assist suggests knowledge articles in real-time based on your ongoing conversation with your customer.

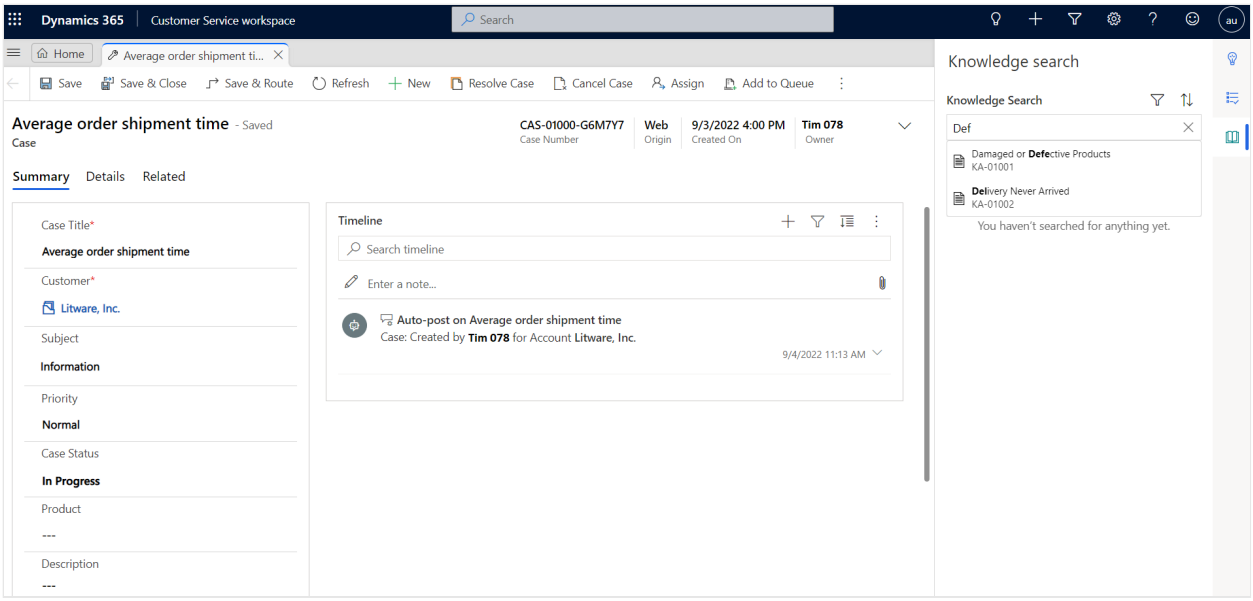
In the app side pane, select the **Smart assist** (light bulb) icon to view suggestions of knowledge articles that are related to your conversation.

Save time searching with suggest-as-you-type

If your administrator has turned on suggest-as-you-type, the system suggests related knowledge articles as you type in the search box.

Your search term is matched against article titles, and the matching results appear in a flyout menu. If your search term consists of more than one word, only titles that contain the full string, not individual words, are matched. For example, if you search for **Cheque Book Reissue**, articles with "Cheque Book Reissue" in the title are returned. Articles with the individual words "Cheque," "Book," or "Reissue" in the title aren't.

Suggest-as-you-type suggests up to six knowledge articles. Text that matches your keyword is highlighted in yellow. When you select the record, the system displays the article inline on the knowledge search control embedded on a form, on an application tab in Customer Service workspace, and as an inline view in the direct knowledge base search.



Search using favorites

If your administrator has provided privileges to custom roles, you can mark the knowledge articles you use most often as favorites to get back to them quickly while you're working on a case. You can mark up to 50 articles as favorites.

1. Select an article from the list of search results.
2. Select the **Favorite** (heart) icon to add the article to your favorites list, or, if it's already a favorite, remove it.

View your favorite articles on the **My favorites** tab. This tab is available in the app side pane, the standalone search control, the form-embedded control, and the reference pane.

The article you most recently marked as a favorite appears first in your favorites list. If an article is deleted, it no longer appears in the list.

Favorite articles are saved in the language in which you viewed them when you marked them as a favorite. The translated version of a favorite article doesn't appear as a favorite.

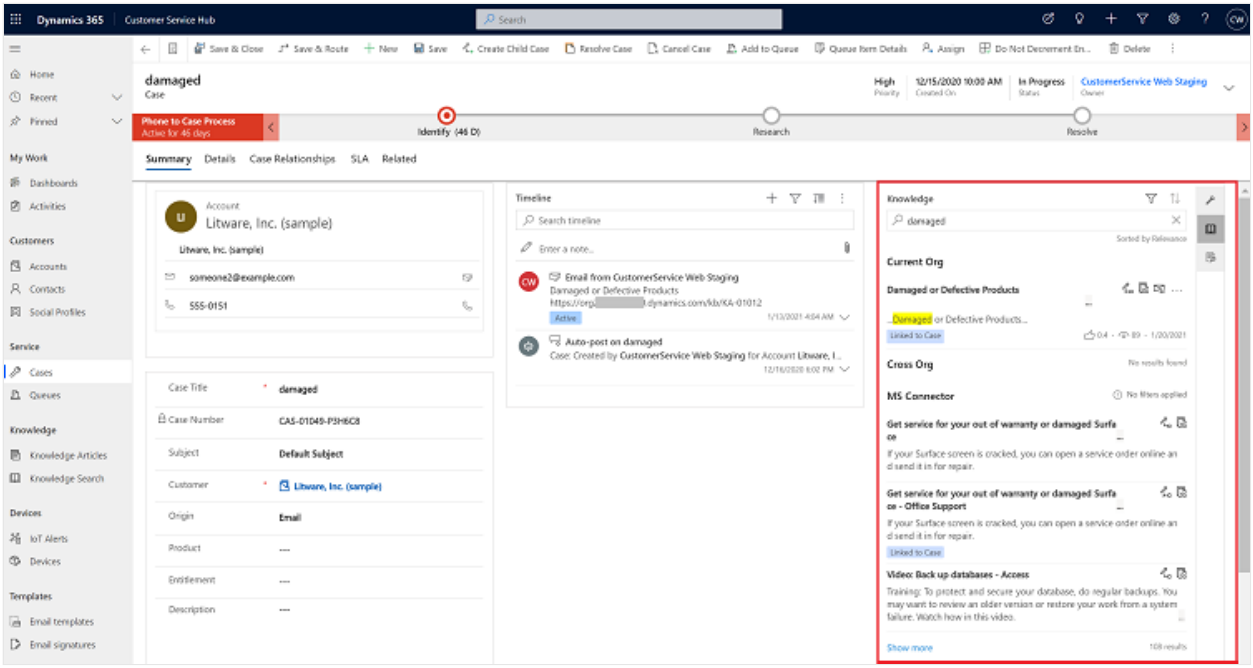
If you create a major or minor version of a favorite article, then the new version appears as a favorite and the earlier version is removed from the list.

In Customer Service workspace and Omnichannel for Customer Service, when you select a favorite article, it opens on an application tab. In Customer Service Hub, the article opens in a new browser window.

Search across external search providers

In Customer Service Hub and Customer Service workspace, you can search for files, documents, and articles from data sources outside your Dynamics 365 organization, if your administrator has configured this option. To view those results, select the source in the list under **Knowledge**.

In Customer Service Hub:



In Customer Service workspace:

For more information on setting up search providers, see Set up external search providers.

Search across integrated providers in Customer Service Hub and Customer Service workspace

In Customer Service Hub and Customer Service workspace, view and sort search results from any providers your administrator has added for you. The name of the search provider the article was pulled from appears on the knowledge article card. If it's truncated, hover over it to view the full name.

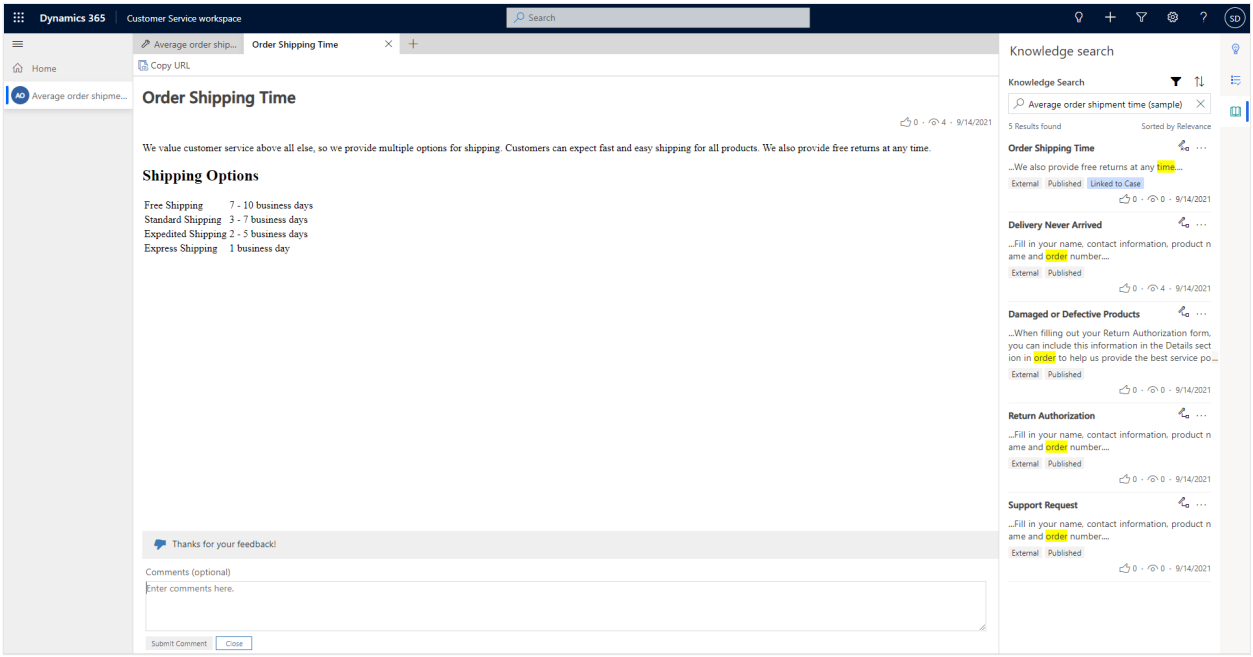
1. In the Customer Service workspace site map, select a case and then select **Knowledge search** on the app side pane.
2. Enter the search keyword. You'll see search results along with the search provider.
3. Select **Show more** to view more results.

View knowledge articles

When you select an article in the search results, where it opens depends on where you searched for it.

View the knowledge article in an application tab in Customer Service workspace and Omnichannel for Customer Service

In Customer Service workspace and Omnichannel for Customer Service, the article opens in an application tab. You can open up to 10 articles in app tabs.



You can perform the following actions on knowledge articles you view in an app tab:

- Select **Copy URL** to copy the external URL of the article to share with your customer in channels like chat or email.
- If your administrator has turned on feedback and ratings for knowledge articles, you can select the thumbs-up or thumbs-down icon to rate how helpful the article was. If you select the thumbs-down icon, a comment box appears, where you can enter the reason for your rating.

  Customer service agents and customer service managers can create or view feedback based on their role and privileges. Unless your administrator allows it, you can create, view, or edit only your own feedback. Customer service managers and knowledge managers can view your feedback.

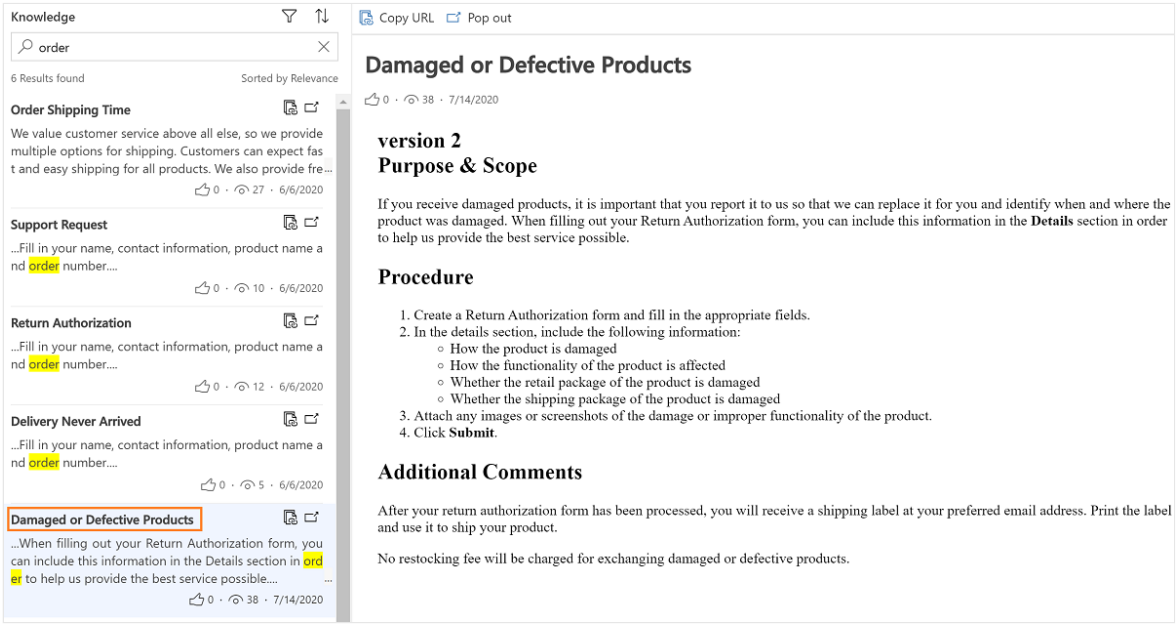
View the knowledge article in the search control in Customer Service Hub

In Customer Service Hub, select an article title. The full article opens inline, right in the search control.

If you see an error like this when you open an article: "Update your origins allow list if any iframe in the article doesn't work or displays error," ask your administrator to update your origins allow list.

You can perform the following actions on knowledge articles you view inline:

- Link it to a record, or, if it's already linked, unlink it.
- Email it to a customer.



- Select the **Copy Link** icon to copy the external URL of the article to share with your customer in channels like chat or email.

The copy and email options are available only if the knowledge article is published on an external portal.

View the knowledge article on a new window

In Customer Service Hub, in the **Knowledge Search** reference pane, select the pop-out option to view the article on a new window.

Email a knowledge article

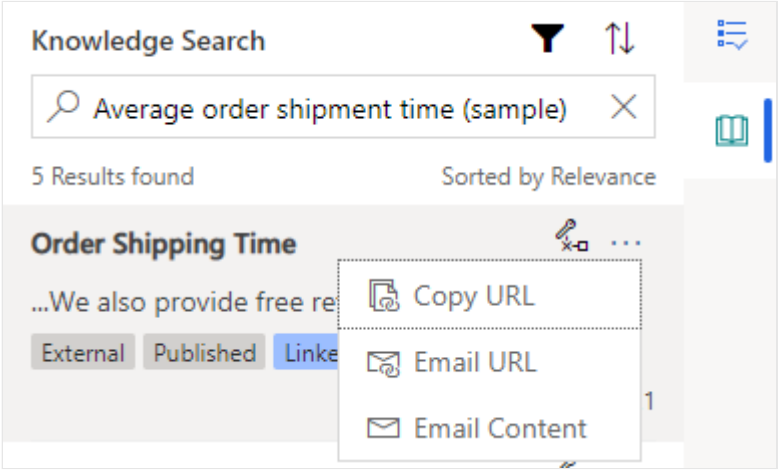
Article • 08/25/2022

Email options

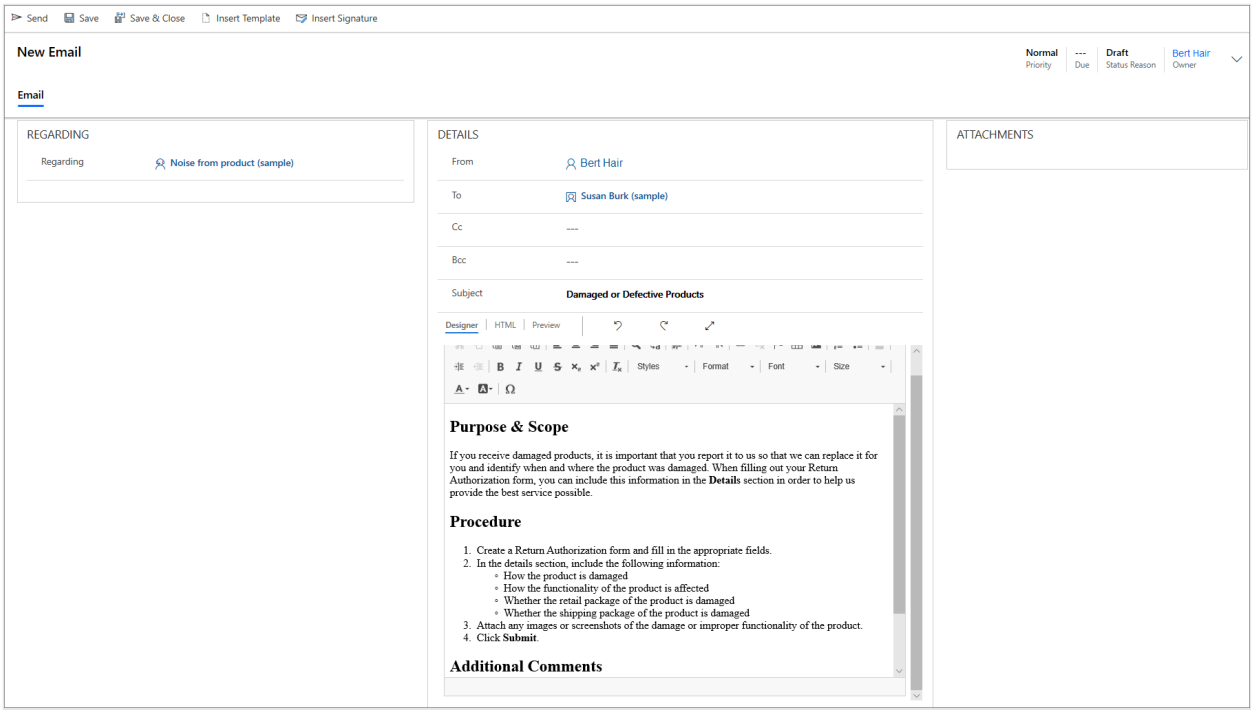
You can share the knowledge article link or knowledge article content through mail by selecting the ellipsis next to an article.



- **Copy URL**: You can copy the URL to share the knowledge article link.
- **Email URL:** The new email form opens with the link to the article in the mailbox.
- **Email Content:** The article content is populated in the mail body. The fields are automatically populated based on the case and customer details.

Email the knowledge article

Use the **Email** button to send the knowledge article via mail. When you select the **Email** button, first, the knowledge article is linked to the current case record. Simultaneously, an email form opens with the link to the article. The article content is populated in the email body. The fields are automatically populated based on the case and customer details. Add other information as needed, and then on the command bar, select **Send**.



You can perform these actions for only published or expired articles.

Link and unlink knowledge articles

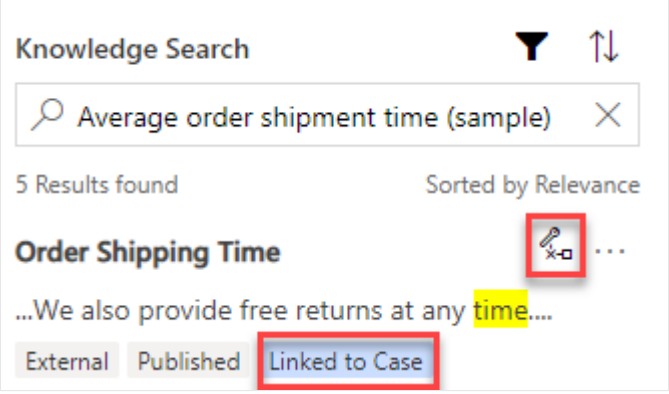
Article • 08/25/2022

Link and unlink the knowledge article to a record

You can associate and dissociate a knowledge article with a record. By default, the articles aren't linked to the case. When you select to link the article to the case, the link icon changes, and **Linked to Case** is displayed for the article.



Linked knowledge articles subgrid

The linked knowledge article subgrid is available for an entity, such as a case or account, only if your system administrator has added the subgrid to the entity form. The knowledge article subgrid displays the knowledge articles that have been linked with the entity. Some of the options available are as follows:

- Add a knowledge article
- Select and edit an article's content
- Sort
- Bulk operations

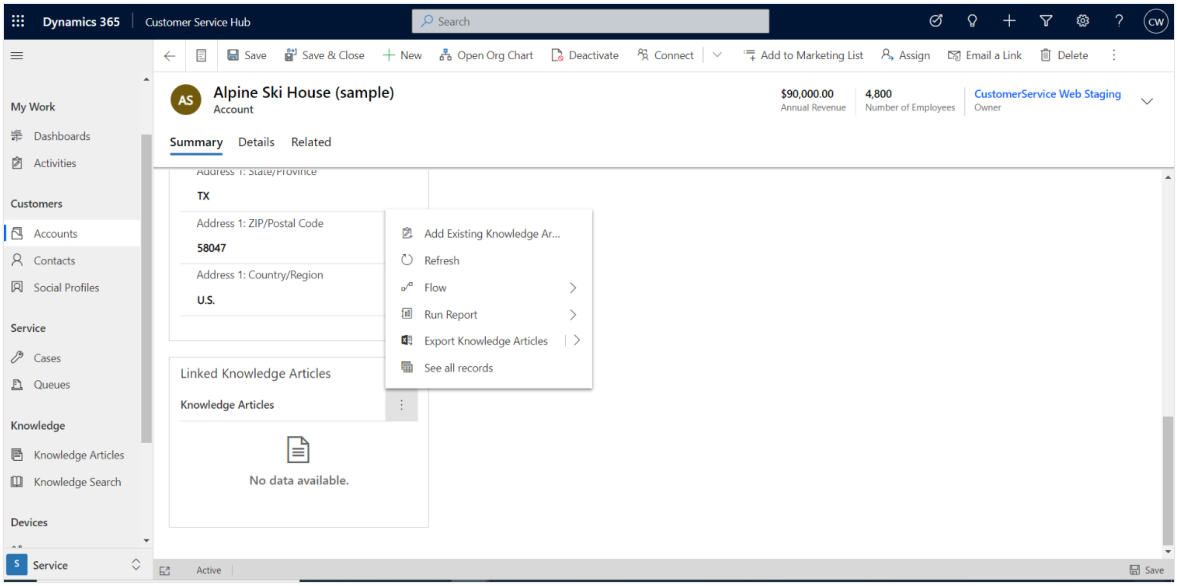
You can also edit a knowledge article by double-clicking it in the linked articles list.

To link the knowledge article to an entity, you need to do the following steps. For the sake of this example, let us consider the entity as Accounts.

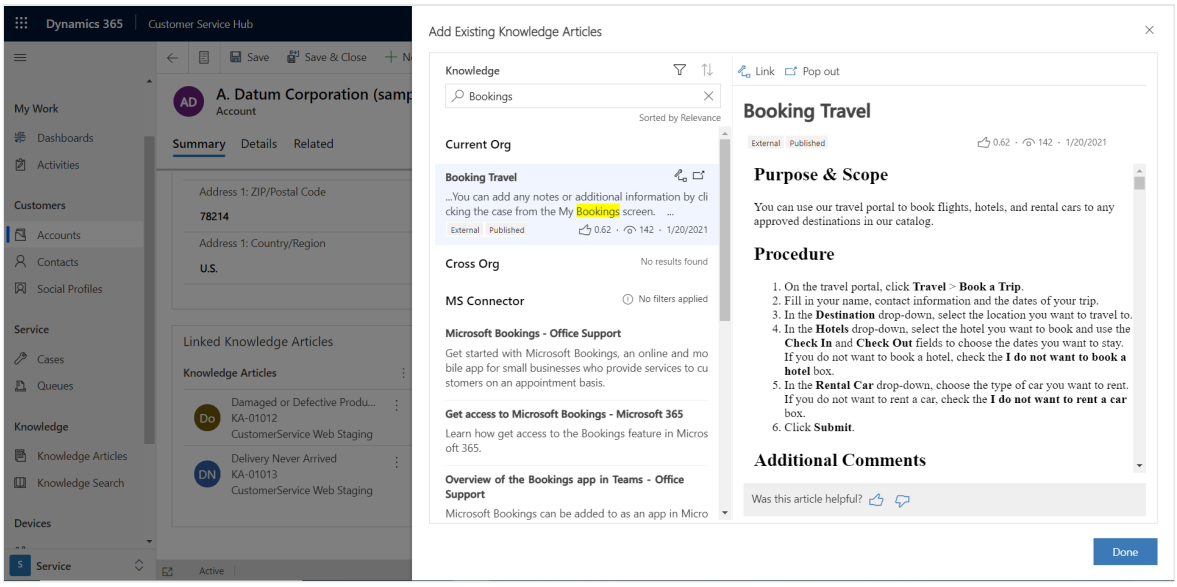
1. In the Customer Service Hub site map, go to **Customers** > **Accounts**.
2. Select any active account from the list of accounts.
3. On the **Summary** tab, scroll down to the **Linked Knowledge Articles** subgrid.

> **Note**
>
> The name of the subgrid can vary depending on the customizations your organization has made.

4. Select **More commands** (⋮), and then select **Add Existing Knowledge Article**.



5. Search for the knowledge article that you want to link, and select **Link.**



6. Select **Done**. The article will appear in the **Linked Knowledge Articles** subgrid.

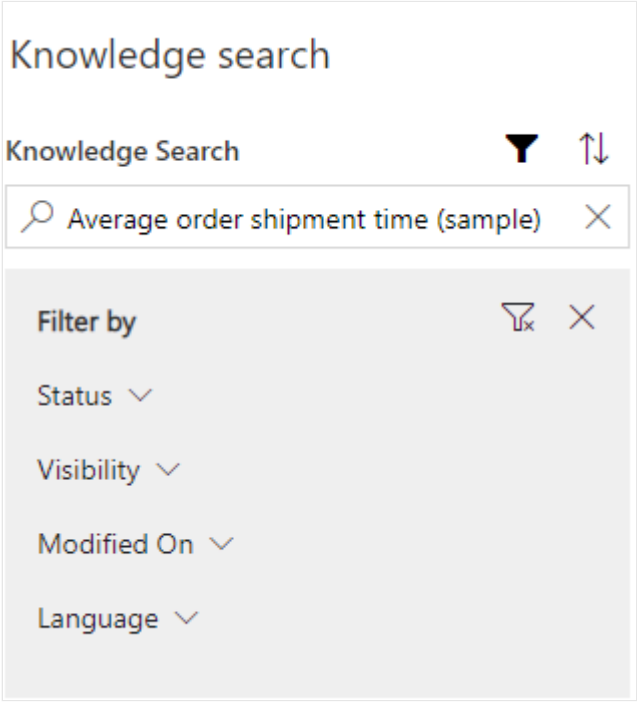
Filter knowledge articles

Article • 08/25/2022

Filter knowledge articles

With the help of text and visual filters, you can filter knowledge articles.



When you select the filter icon, you can see the **Filter by** menu where you can filter the items based on the following categories.

Category	Sub-category
Status	• Draft • Approved • Published • Scheduled
Visibility	• Internal • External • All
Modified On	• Last 7 days • Last 30 days • Last 6 months • Last year • All

Category	Sub-category
Language	• List of languages **Note:** The language list is based on the articles that are present in those languages. For example, there are a total of 50 articles in five different languages such as French, English, Japanese, Spanish, and Danish. The language filter will show only these five languages.

Personalize your knowledge search article filters

If your administrator has configured knowledge filter personalization settings, as an agent, you can select the filters you want to use.

You can do the following:

- Set preselects
- Activate or deactivate a filter

Only the filters that your administrator has configured are viewable. If your administrator deactivates a filter, that filter becomes invisible without notifying you. If you notice that a filter has suddenly disappeared, contact your administrator for assistance. If your administrator disables all filters, you won't see any filters, and a message will be displayed that says, "No filters have been configured. Contact your administrator."

Any personalization you make to your filter selections will also be applicable to the form-based knowledge control and standalone knowledge base search page.

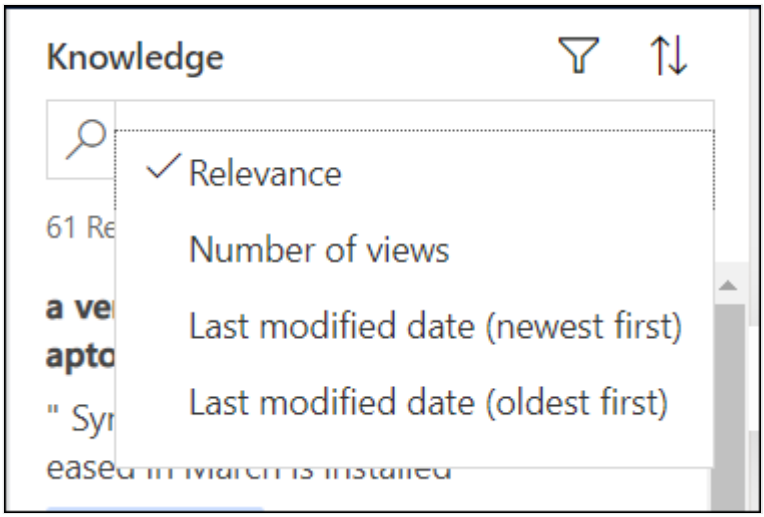
If you deactivate a filter, it will appear as deactivated. If you reactivate the same filter later, the filter will keep its previous configuration.

1. In **Customer Service Hub**, go to **Service** > **Knowledge** > **Knowledge Personalization**.
2. For each filter value you want to change, select the ellipsis in the top-right corner, and then select **Preselects**.
3. To make a filter value available by default, toggle the preset next to the filter to the right so that **Preselected** appears next to the filter name.
4. When you are finished making your selections, select **Done** > **Save**.
5. If you want to deactivate a filter, select the ellipsis in the top-right corner for the filter you want to stop using, and then select **Deactivate**.
6. Select **Done** > **Save**.

7. When you are ready to reactivate the filter, select the ellipsis again, and then select **Activate**. All of the previous configurations will be reinstated.

Sort knowledge articles

The knowledge base search control also enables you to sort the knowledge articles.



Select the up-arrow icon to view the sorting options and select an option from the following:

- Relevance
- Number of views
- Last modified date (newest first)
- Last modified date (oldest first)

View auto-filtered results

As a customer service agent, to view the most relevant results, you can have knowledge articles automatically filtered based on the case data. This helps with identifying the most relevant articles so that you can resolve customer queries quickly and accurately. You can also disable the auto-filter results and search the entire knowledge base. Auto-filtered results option is only available on single session.

An administrator or system customizer must configure this option for you. More information: Configure automatic filtering

To view the auto-filtered results:

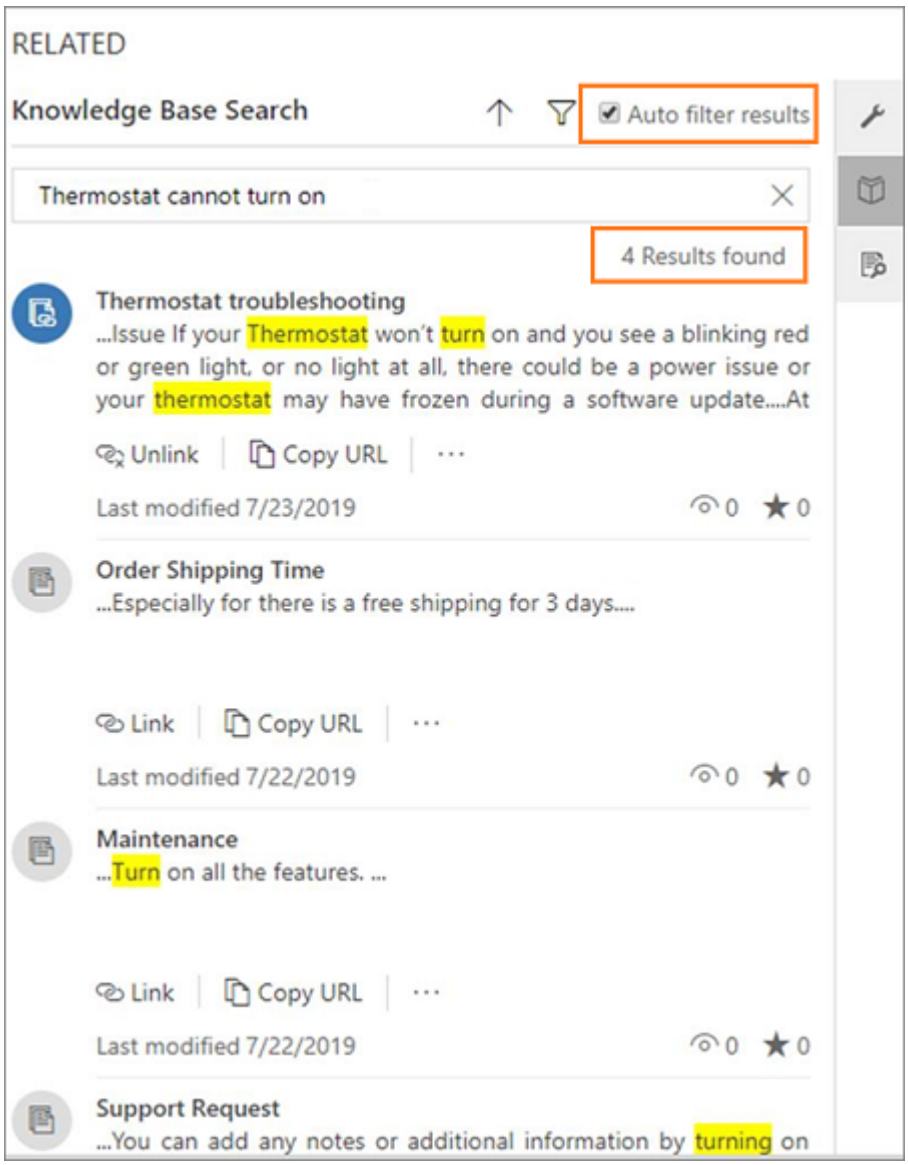
1. Search knowledge articles from the related section of the case. More information: Search knowledge articles. The articles are automatically filtered and displayed based on case data.

2. If you want to disable the automatic filtering option and search the entire knowledge base for articles, deselect **Auto-filter results**.

> **Note**
>
> Your administrator or system customizer must enable **Users can turn off automatic filtering** option for you to see the **Auto-filter results** option. If the **Users can turn off automatic filtering** option isn't enabled, you'll always see the auto-filtered results. More information: **Configure automatic filtering**

Here's an example.

In the following illustration, the case subject is **Xbox**. If automatic filtering is configured on the case subject, with the **Auto filter results** checkbox selected, only those knowledge articles whose subject is **Xbox** are displayed. Other articles are automatically filtered out, as shown in the following image.



However, if the **Auto-filter results** checkbox isn't selected, you can see more articles that aren't related to the subject. These are the results from the entire knowledge base.

Submit ratings and feedback for knowledge articles

Article • 08/03/2023

You can easily provide feedback on knowledge articles with the help of knowledge article rating. Knowledge managers can capture and review the feedback on the articles to improve and maintain a relevant knowledge base.

In the Customer Service workspace, when you open an article from the **Knowledge Search** tab, you can select either the **Thumbs up** or the **Thumbs down** option to state whether the article was helpful. If you select the **Thumbs down** option, you see a **Comments** box, where you can also enter your feedback for the article.

To rate or provide your feedback for an article listed on the productivity pane, select and open the article on the preview pane.

The value beside the **Thumbs up** icon doesn't represent an article's total number of likes. The number that you see might range from 0 to 1 and can include decimals such as 0.75. This is because the value beside the **Thumbs up** icon indicates the average rating of the article based on the feedback and the number of ratings received. The **knowledgearticle.rating** field is a rollup field defined as Aggregate(Average(feedback.normalizedrating)).

> ⓘ **Note**
>
> - Rating and view count numbers are rollup fields that aren't updated instantly. For more information, see **Define rollup fields**.
> - Customer service agents and customer service managers can create or view feedback based on their role and privileges in the feedback entity. Out of the box, customer service agents can create, view, or edit their own feedback only. Customer service managers or knowledge managers can view feedback submitted by all agents.

Submit ratings and feedback

1. On the Customer Service workspace site map, select **Knowledge Search**.
2. On the **Search** tab, select and open an article from the search results.

3. Select **Thumbs up** if the article was helpful to you, or select **Thumbs down** if it wasn't. Optionally, you can submit your feedback in the **Comments** box.

Convert a case to a Knowledge article

Article • 12/14/2022

There are times when existing knowledge articles don't contain relevant information for resolving a case. You, as an agent, can now contribute to the knowledge base by turning all information that's been researched for a case into a knowledge article. You can convert one case into multiple knowledge articles.

1. Make sure you have Create permissions on the Knowledge Article entity.
2. In the list of active cases, open the one that has the information that you want to convert to a knowledge article.
3. On the command bar, select the ellipsis **(...)** and go to **Convert To** > **To Knowledge Article**.

   The **Convert to Knowledge Article** dialog box opens. The title, owner, and subject of the article are populated based on the title, owner, and subject of the case. The content of the article is automatically populated with the description of the case. If the case is resolved, the content field shows the case description, case resolution, and case resolution description.
4. If you want to open the newly-created article, select the **Open the new knowledge article** field to set it to **Yes**, and then select **Convert**. Otherwise, set it to **No**.
5. If you set **Open the new knowledge article** to **Yes**, a knowledge article form opens. Fill in the necessary information for the knowledge article, and then select the **Save** button. More information: Create and manage knowledge articles

The knowledge article is created regardless of whether you set **Open the new knowledge article** to **Yes** or **No**.

Understand how search works in knowledge management

Article • 08/25/2022

Introduction

Setting up a comprehensive knowledge base is the key to increased customer satisfaction and improved productivity. A knowledge base is created to help you with solutions to the most common customer issues so that you can assist customers quickly. This topic describes how various search methods work in a knowledge base and how you can view accurate search results based on the keywords or operators that you use to search the knowledge base.

Dataverse search is enabled by default in all production environments, except those using their own encryption key. For more information, go to Enable Dataverse search. When Dataverse search is enabled, knowledge management search control uses Dataverse search to search for knowledge articles. For more information, go to What is Dataverse search?. If Dataverse search isn't enabled, the search mechanism switches to full-text search, which lets you run full-text queries against character-based data in SQL Server tables. For more information, go to Full-text search.

Depending on the configurations made in Dataverse search through the Quick Find view columns list, you can view the information provided in search results, such as keywords, description, attachments, or article number. More information: Prerequisites

How search works

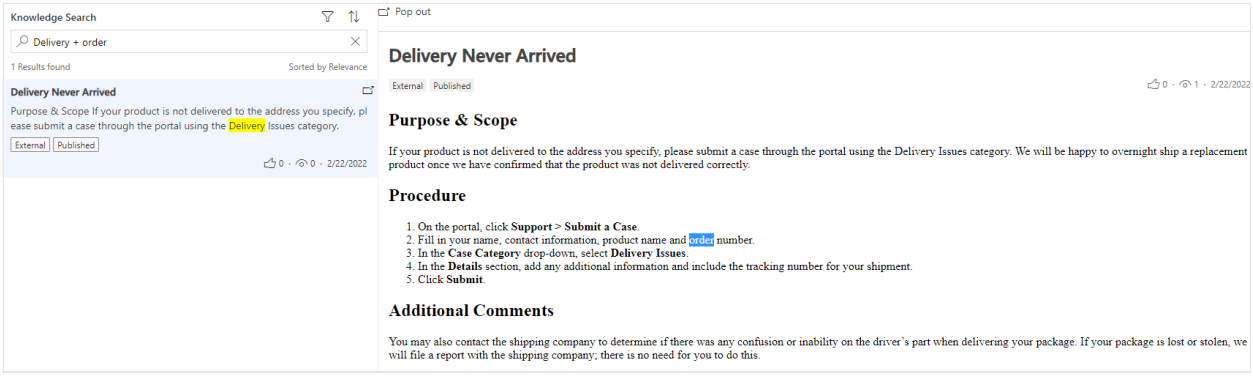
By default, the search mode is "any", which means that the search results will include articles that contain any of the search keywords you entered. However, if you have Dataverse search enabled along with the **Knowledge search logic** option in **Settings**, the search mode will be set to "all". This means that the search results will return records that contain all the search keywords you entered. More information: Set up knowledge search logic.

However, irrespective of your search settings, you can use the following search methods to search for your knowledge articles.

Boolean operators

AND operator

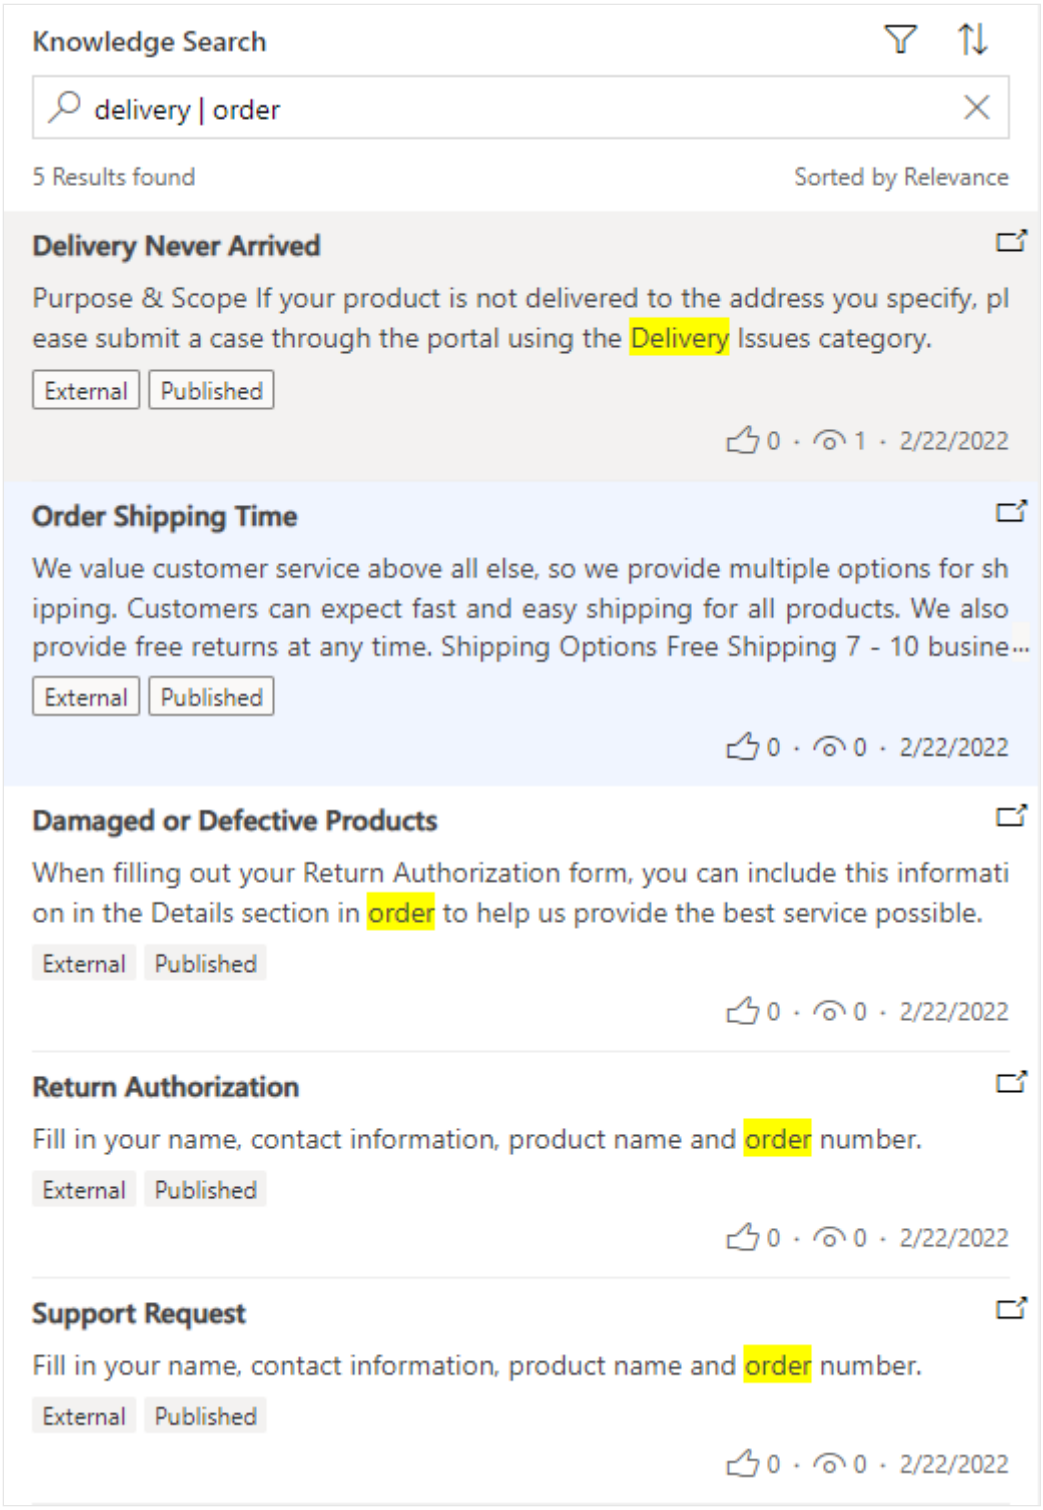
Use the AND operator when you need to search with a combination of words. The search results will only include articles that contain all the individual terms separated by (+). For example, **Delivery + order** returns the article **Delivery Never Arrived** which has **Delivery** and **order** in the article content.



- Query: AND operator; denoted by +

OR operator

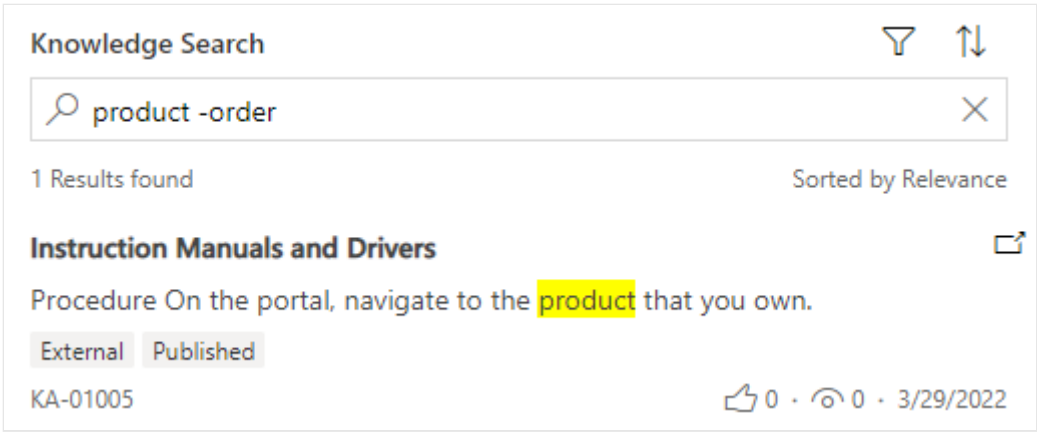
Use the OR operator to search for either of terms. Search terms separated by a vertical bar (|). For example, searching for **delivery | order** returns records with reference to either term.



Query syntax: OR operator; denoted by |

NOT operator

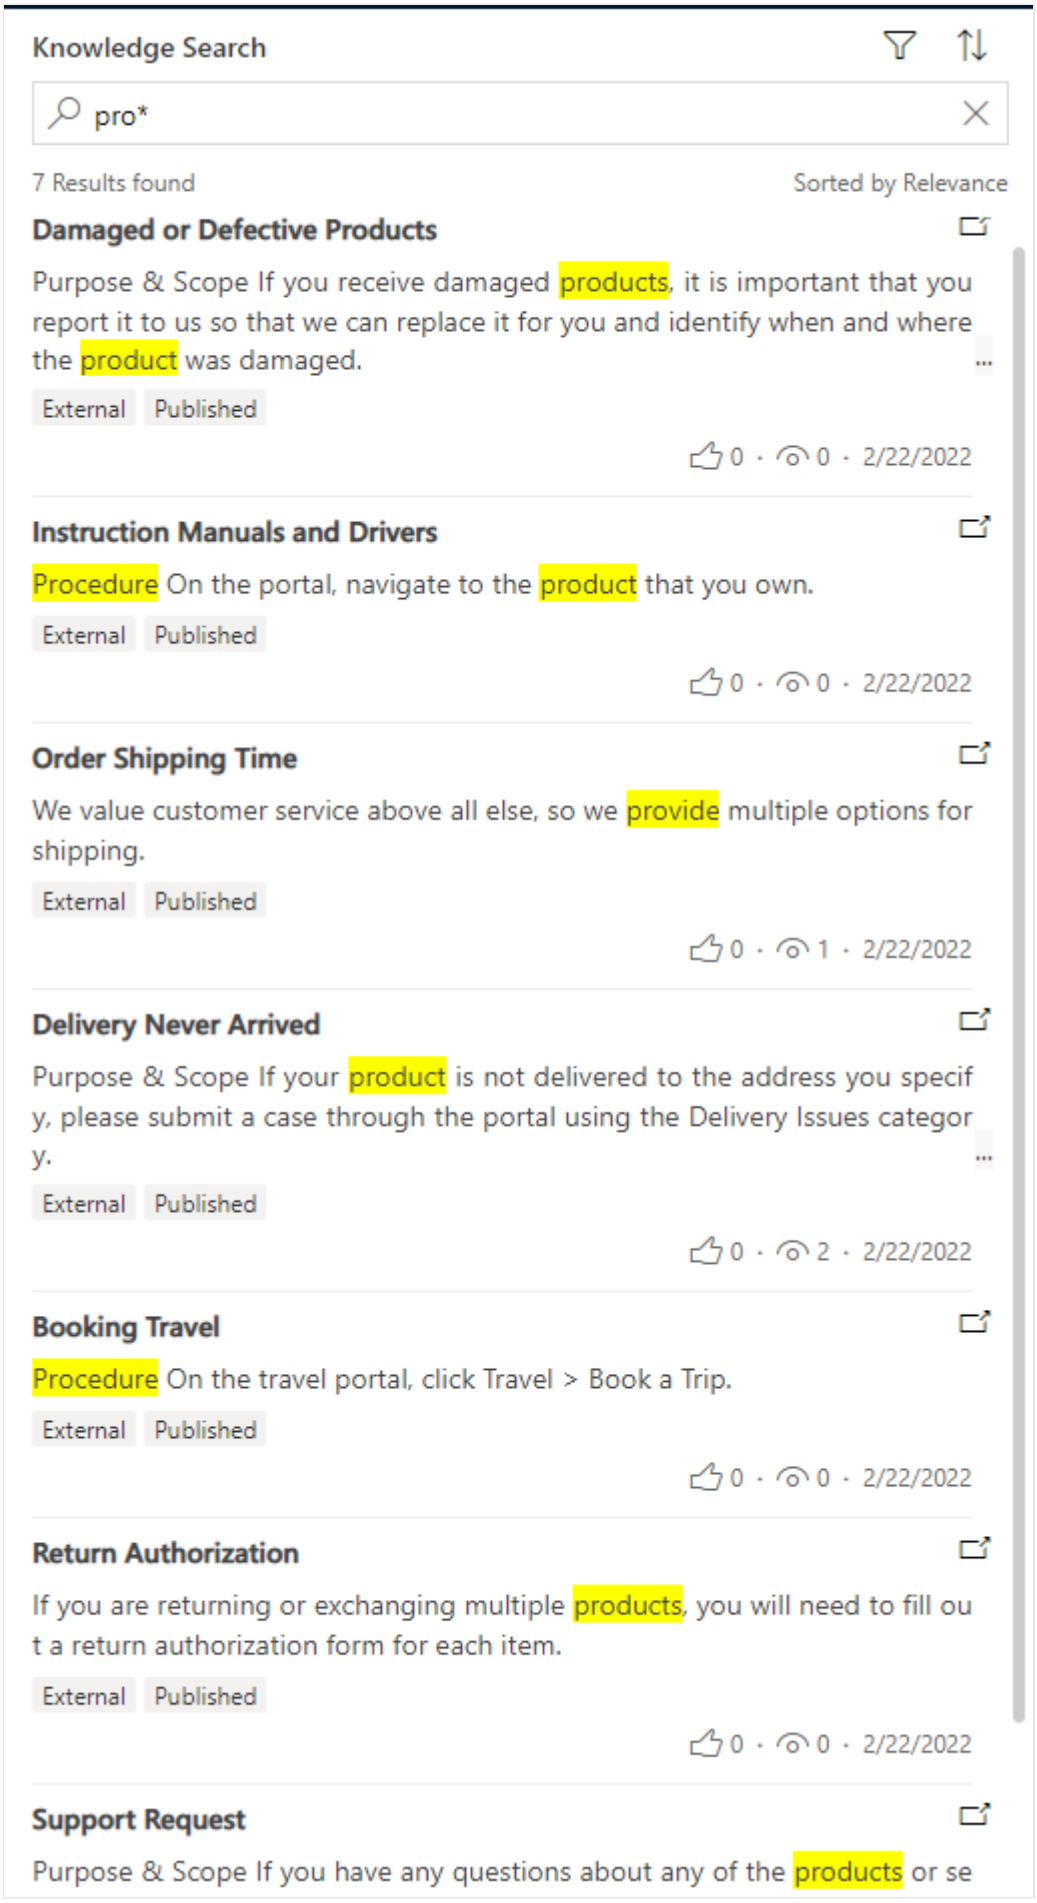
Use the NOT operator with a hyphen (-) before a keyword to indicate that it should be excluded from the search results. For example, when you search for **product**, all rows matching the term product will appear in the search results. However, searching for **product -order** will match all rows that contain the term **product** but not the term **order**.



- Query syntax: NOT operator; denoted by -

Wildcards

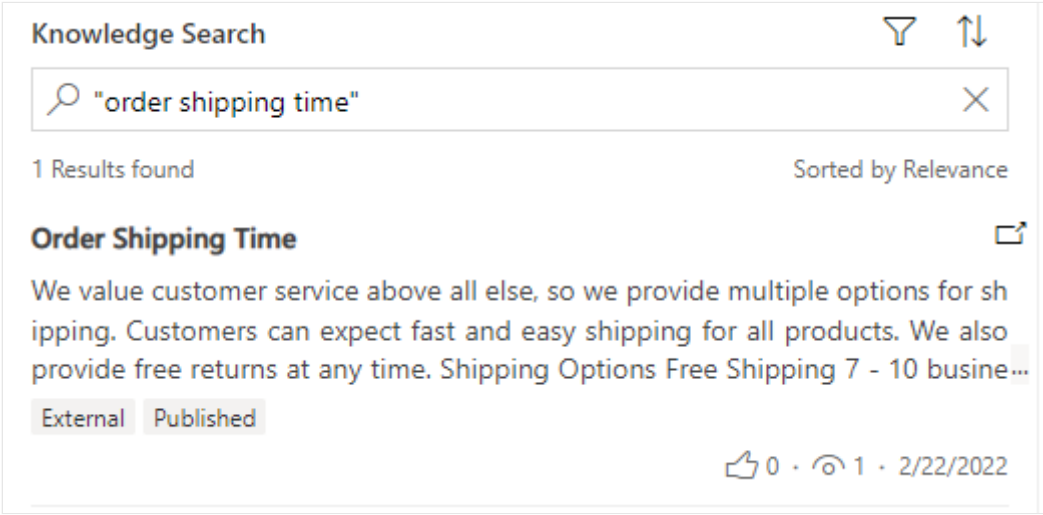
Use wildcards as placeholders for one or more text characters. Use an asterisk at the beginning or end of a keyword. For example, searching on **pro*** will show results for all records associated with a keyword that starts with **pro**. **Pro*** searches for **product**, **products**, and **procedure**.



- Query syntax: Search term with asterisk at the beginning or end of a keyword.

Exact matches

Use double quotation marks around a keyword to search for an exact match. For example, searching on "order shipping time" will match those exact keywords in an knowledge article. This type of search ignores commonly used words such as a, an, and the.



- Query syntax: Search term with double quotation marks around it.

Search the knowledge base on portals

Article • 09/28/2023

Having a knowledge base on the portal makes it a customer self-service portal where you can access and search for knowledge articles through simple queries. This functionality helps resolve issues and makes information easily accessible. You can search for your knowledge articles by selecting **Knowledge Base** from your portal.

You can search for a knowledge article after it's published to the portal. For more information, go to Publish knowledge articles. You can also share knowledge articles as URLs on an external portal. For more information, go to Set up knowledge management.

The following are the search options that you can use to search the knowledge base on the portal:

- **Lucene.Net search**: Searches within multiple tables and fields at once. More information: Search
- **Progressive search**: Lets you search without any mismatch between the results count and the number of records returned in the search results. More information: Configure progressive search counts
- **Dataverse search**: Lets you search across multiple tables sorted by relevance. For more information, go to What is Microsoft Dataverse?. To configure dataverse search on portals, go to Configure Dataverse search in portals (preview).
- **Faceted search**: Lets you search content on portals through filters based on content. More information: Use faceted search to improve portal search

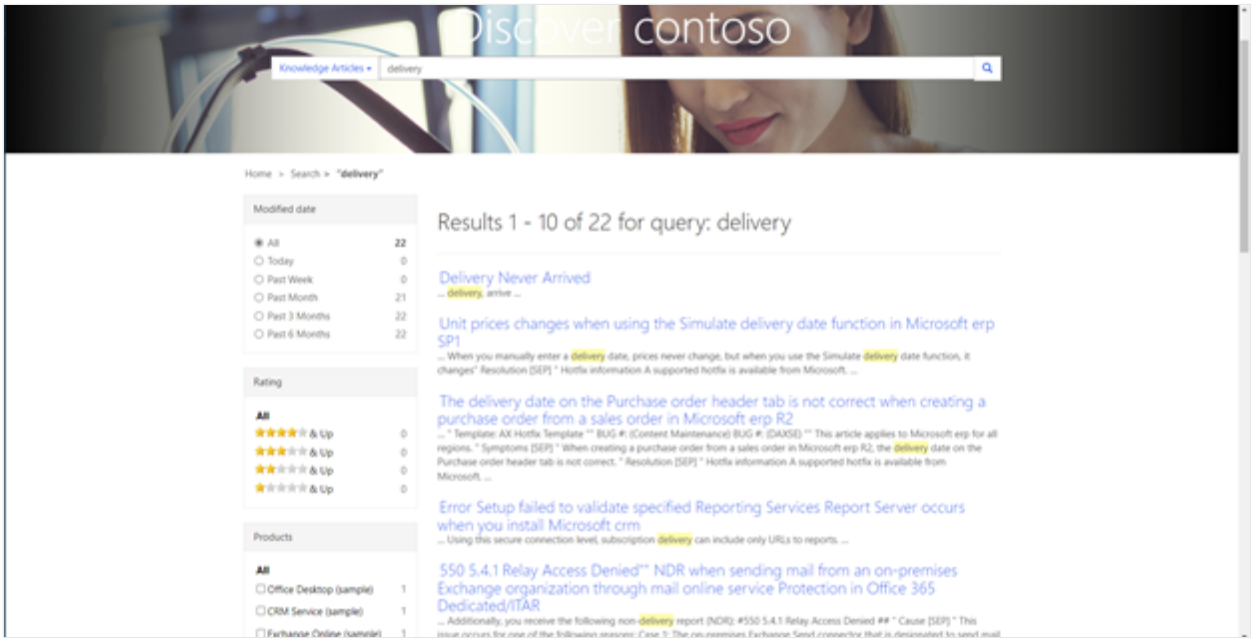
Use faceted search to refine the knowledge articles search query

Faceted search allows you to filter knowledge articles based on **Record Type**, **Modified date**, **Rating**, and **Products** to find the content you're looking for.

The following section describes how the search results are rendered:

- When you select a product from the product facet, search results only for the knowledge articles associated with that product are displayed.
- If the number of search results is less than 100, the exact number of results is displayed against the product facet.

- If the number of search results exceeds 100, a plus sign (+) appears against the product facet.
- If you go to the next page, the next 100 search results with the associated product facets are displayed.



Enable content access levels for knowledge articles from a portal

You can set the content access levels for users to control access to knowledge articles on a portal. More information: Manage knowledge articles by using content access levels

For content access level to work with relevance search, you must perform the following steps in the Dynamics 365 Portals app:

1. In the Portal Management site map, in the **Website** area, select **Site Settings**.
2. Select **New**.
3. Enter **Name** as **Knowledge Management/ContentAccessLevel/Enabled**.
4. Select your website record.
5. Set the Value to **true**. By default, the value of the site setting is set to **false**.
6. Select **Save**.

When performing a search on the portal, you might encounter an error while opening an article and also see the error message, "Update your origins allowlist if any iframe in the article doesn't work or displays error." This might be because the link types used in the article aren't a part of the origins allowlist. You must contact your administrator to update your origins allowlist. More information: Configure the origins allowlist for knowledge articles

Add the Knowledge Base Search control to forms

Article • 08/25/2022

Add a **Knowledge Base Search** control to Dynamics 365 for Customer Engagement forms to make it easy for users in your organization to find knowledge articles so they can answer common customer questions and resolve their issues right from the records, without having to switch to a different application.

You can configure the Knowledge Base Search control to:

- Show automatic suggestions in search results based on certain fields, or based on text analytics. The text analytics feature in only available for Dynamics 365 for Customer Engagement.
- Define filters that users can use on search results.
- Choose from a set of predefined contextual actions the users can take on an article.
- Add the control on any section of any entity that is enabled for knowledge management, including the timeline, and custom entities. The control is enabled in the case entity out of the box, and is added to the following forms:
  - Case main form - In the **Activity wall** section
  - Case for interactive experience main form – In the **Related** section

  > ⓘ **Note**
  >
  > The Knowledge Base Search control can be used on Microsoft Dynamics 365 for tablets and phones. However, some actions like Pop Out, Email Link, and Email Content aren't supported.

Microsoft Dynamics 365 Customer Service supports the native knowledge management, and this option is available for the Dynamics 365 Customer Service app users.

Prerequisites

Before you add the Knowledge Base Search control, make sure to:

- Set up knowledge management in Dynamics 365 for Customer Engagement. More information: Set up knowledge management
- Select the entity you want to enable knowledge management on while setting up knowledge management.

> **Note**
>
> All customization tasks for the Customer Service Hub must be done in Microsoft Dataverse.

Add the Knowledge Base Search control to main forms

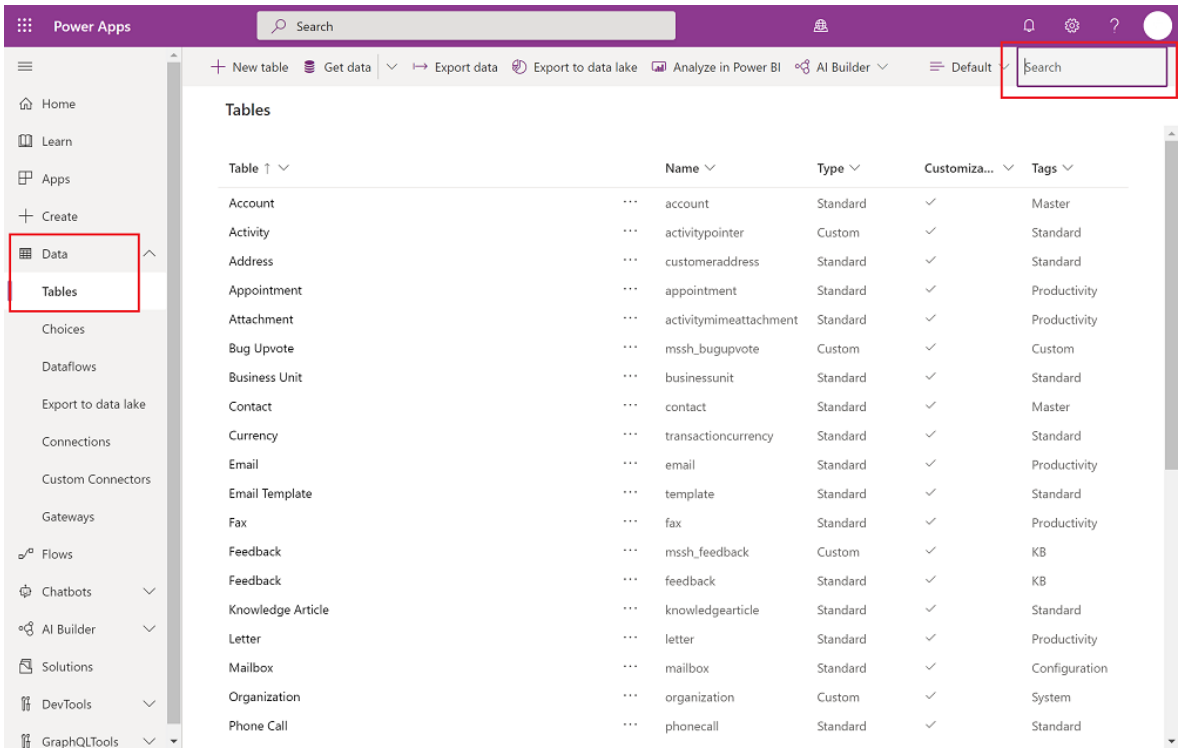
Depending on which experience you're using, you can add the knowledge base search control to main forms by using one of the following methods:

- Power Apps experience
- Web client experience

Power Apps experience

Make sure that you have the System Administrator or System Customizer security role or equivalent before you begin.

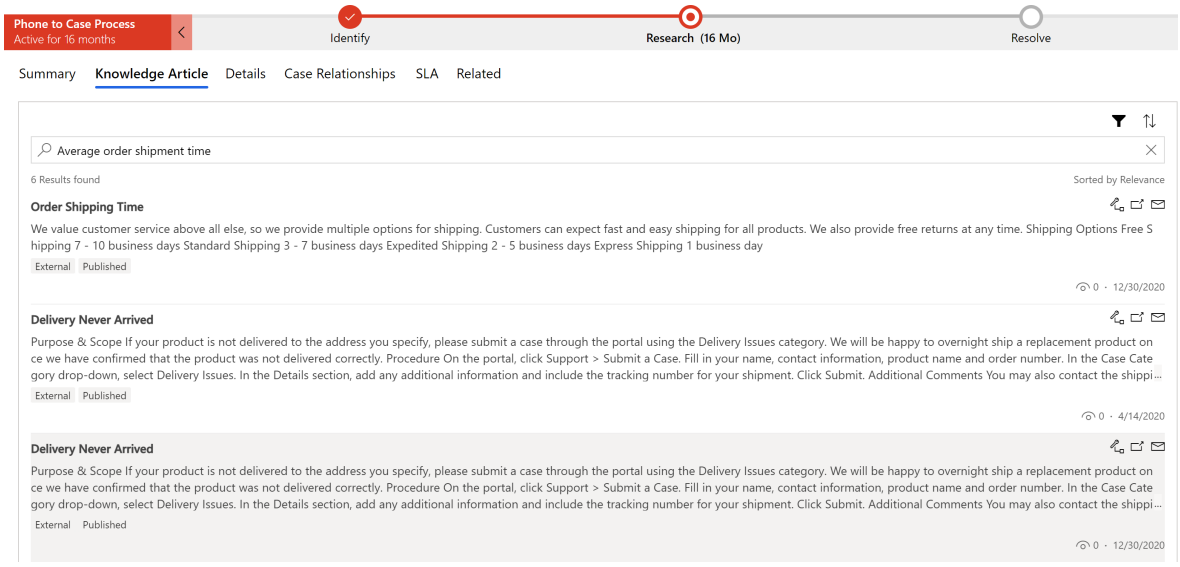
1. Go to Power Apps, and then on the left pane, select **Data** > **Tables**.
2. Ensure you have the Customer Service App installed, and then in the upper-right corner of the window, change **Default** to **All**.
3. Select the entity for which Knowledge is enabled. To search for the entity, in the **Search** field, enter the entity name.



4. Select the entity name, select the **Forms** tab, and then open the form where you want to add the knowledge control. To add the control, create a section and then add a knowledge search control within it. Select **+Component** to add a new component, select **Related Data**, and then **Knowledge Search**.

> **Note**
>
> If the option to add Knowledge Base Search is disabled, it could be because knowledge management isn't set up or isn't enabled for the entity for which you're adding the search control. Also, this control won't be enabled for reference panels until a later date.

5. After you've added your new section, select **Save and Publish**. You might need to refresh the screen to see the new section.



The knowledge properties will now be displayed in the standard view at runtime.

The following table describes the properties you can configure.

Property	Description
Reference name	**Required**: The unique name for the tab that's used when referencing it in scripts. The name must follow these rules: • Can't be empty • Must be a unique name • Must start with a letter only • Must contain only alphanumeric characters and underscores • Can't be greater than 100 characters
Label	**Required**: The localizable label for the tab visible to users. The label must follow these rules: • Can't be empty • Must be a unique name • Must start with a letter only • Must contain only alphanumeric characters and underscores • Can't be greater than 100 characters

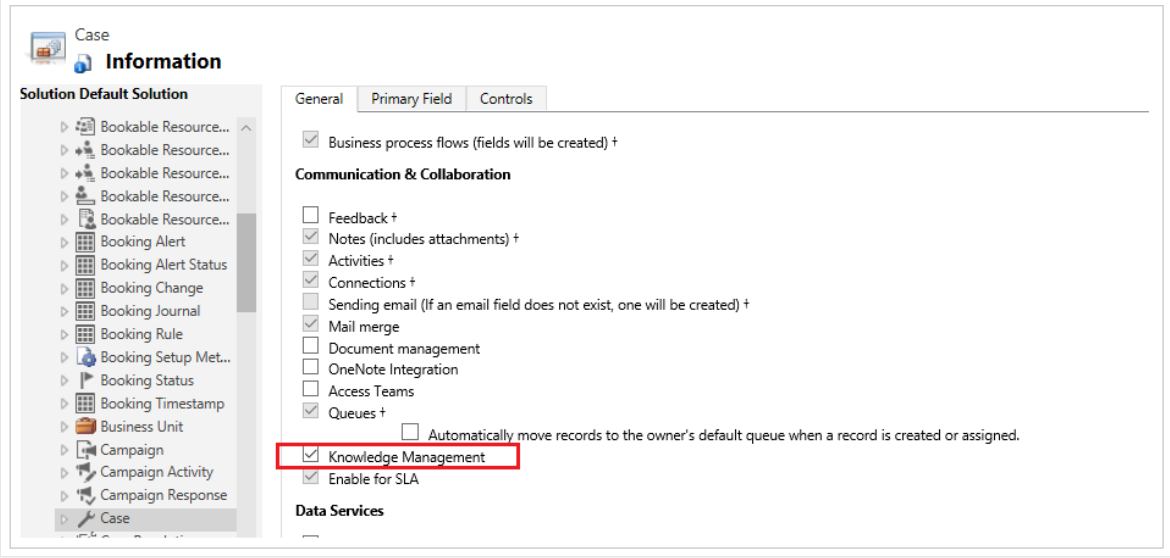
Property	Description
Results shown on page	Select the number of articles to be displayed in the search results. **Note**: What you specify in this field isn't applicable if at least one search provider is configured. For each configured search provider, three articles are displayed in the search results. More information: Set up a search provider in Customer Service Hub. If Relevance Search is enabled, the number of results that are displayed might differ from what you set due to the default Relevant Search setting. Your system administrator must disable Relevance Search or enable Simple Relevance Search for this property to work correctly. (Simple Relevance Search queries only articles, excluding attachments and notes.) For more information, see Understand knowledge base search mechanisms.
Automatic search > Provide search results using	After you open the entity form, automatic search is performed by using the field you specify in the field below. If you've enabled automatic suggestions, select the field for the entity that Dynamics 365 Customer Service will use to suggest article results in the Give knowledge base (KB) suggestions drop-down list. For example, if you're adding the search control to the Account entity and want Dynamics 365 Customer Service to automatically show search results that contain the account name, select Account Name in the drop-down list. **Note**: This drop-down list can include all fields that are text, multi-line text, or lookup type fields.
Actions	**Link article**: Lets users link a knowledge article to the record they're viewing the knowledge article search results in. **Unlink article**: Lets users unlink a knowledge article from a primary record. **Copy URL**: Lets users copy the external URL of the article so they can share it over channels like chat or email. In the native Dynamics 365 customer engagement knowledge management solution, the Copy URL option is available only for published articles. **Open in new tab**: Opens a knowledge article in a new tab within the same browser window. **Link article and email URL**: Lets users associate an article with the primary record and share the article URL with the customer through email. **Link article and send article content**: Lets users associate an article with a primary record and share the contents of the article with the customer through email.

Property	Description
Select default email recipient	Select who the email will be sent to when an agent sends the article link in email. This drop-down list includes all fields for the entity that are enabled for email (for example Customer, Contact, or Responsible contact). When the agent chooses to send a link to the article to the customer, the To field is automatically populated with the value of the field that you select here. If you leave it blank, in the email recipient display, it will show as blank and you need to fill it in manually.
Show article rating	Shows the rating on an article.
Show status filter	Allows the user to filter knowledge articles based on article status: Draft, Approved, or Published.
Show article language filter	Allows the user to filter knowledge article search results based on the language they choose. If you want users to see search results only for articles in a specific language, in the **Set Default Language** drop-down list, select a language. By default, User's Default Language is selected: • If you select User's Default Language, search results will be filtered based on the signed-in user's default language. • If the language you select isn't an active language, the search results will be filtered by using the signed-in user's default language. • If you select User's Default Language and the user's default language isn't an active language, the first active language available alphabetically is used as the default filter. • To let users select a different language filter on search results so they can see other articles in other languages, select the **Users can change Language Filter** check box. Only when you enable this option will users see an option to change the filter in the Search pane in a record.
Edit default filter selection	Allows you to change the default display for filtered articles, whether you want to show Draft, Approved, or Published articles.

Property	Description
Add refinement rules	Refinement rules function the same as automatic filtering in the web client experience. This feature opens a pop-out window where you can define more precise search results. Refinement rules help ensure that your customer service agents receive only the most relevant knowledge articles. As an administrator, you can configure rules so that knowledge articles are filtered based on source entity data without manual input from your agents. For example, if you set up refinement rules on the subject of a case, the knowledge articles that have the same subject as the case will be filtered in and will be shown to the agents. Other articles are automatically filtered out. Refinement rules can be extended to automatically filter knowledge articles on any lookup field that's present on source entities. **Note**: Polymorphic lookups aren't supported. Agents also have an option to turn off the filtering and search the entire knowledge base.

Web client experience

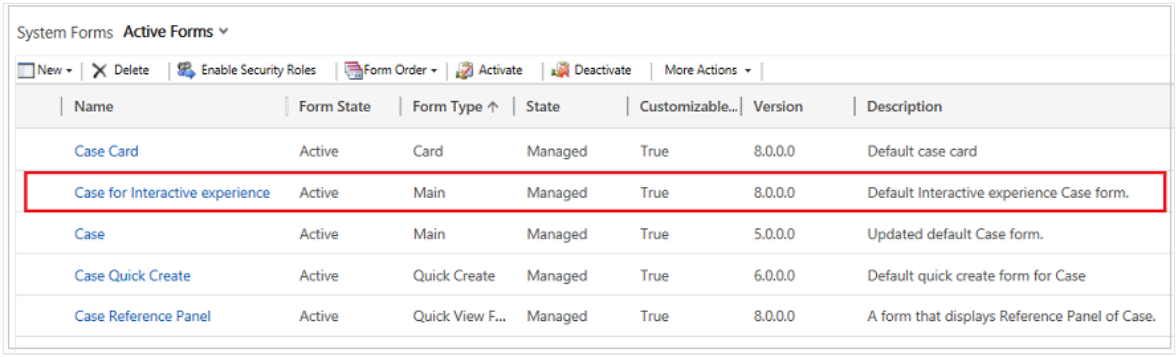
1. Make sure that you have the System Administrator or System Customizer security role or equivalent permissions.
2. Go to **Settings** > **Customizations**.
3. Choose **Customize the System**.
4. In the solution explorer, choose the entity you want to add the search control to, and under **Communication & Collaboration**, make sure the **Knowledge Management** check box is selected.



Select the **Save** icon to save the setting for the entity.

5. Expand the entity you're adding the search control to, and select **Forms**.

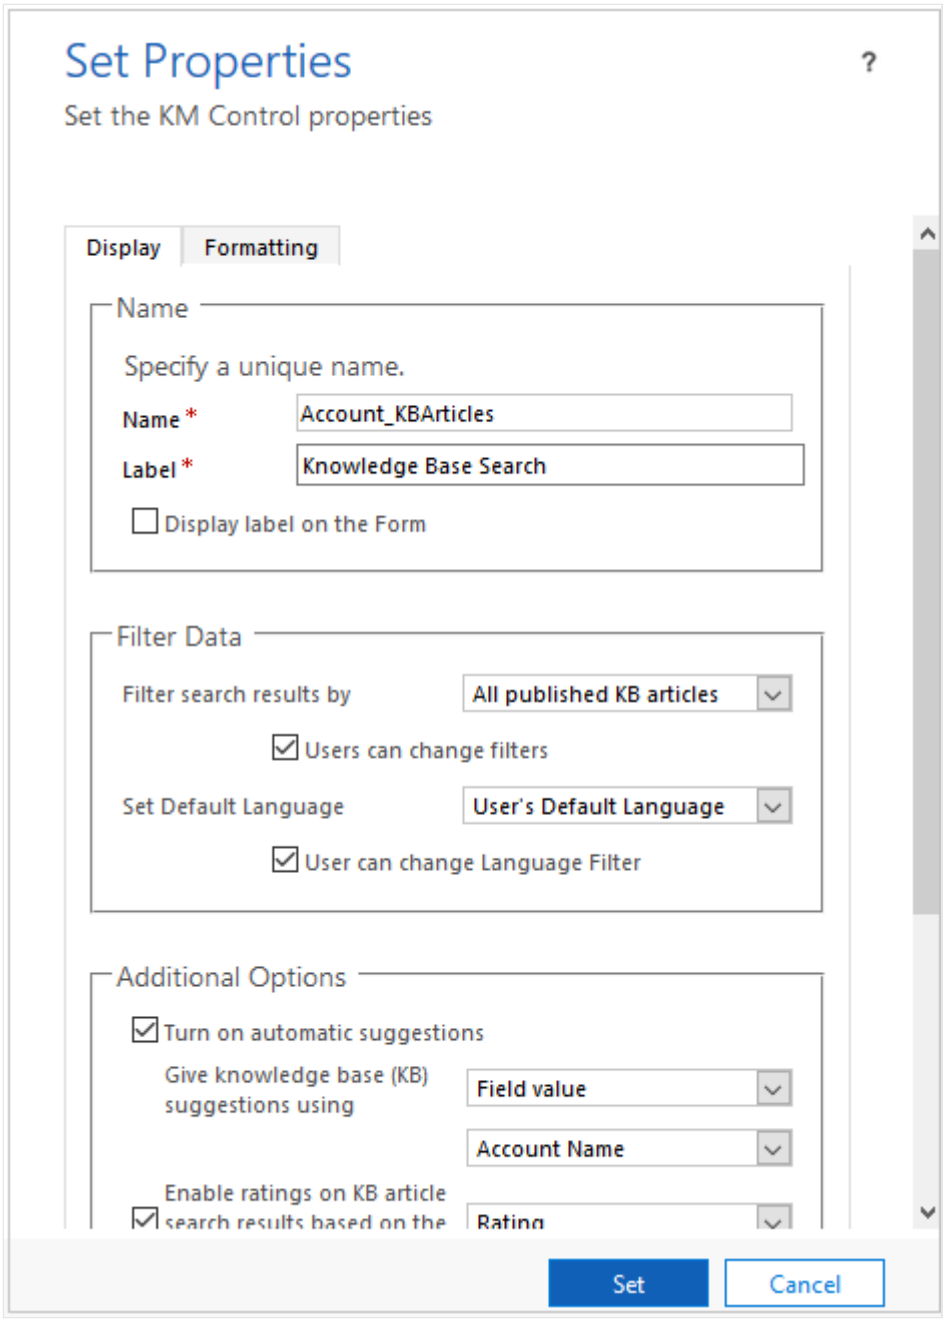
6. Choose the entity form of type **Main**.



7. Select the area where you want to place the search control, and on the **Insert** tab, select **Knowledge Base Search**.

   If the option to add Knowledge Base Search is disabled, it could be because knowledge management isn't set up or isn't enabled for the entity you're adding the search control to.

8. In the **Set Properties** dialog box, on the **Display** tab, specify fields as described in the following table, and then select **Set** to apply the settings.



Tab	Property	Description
Display	Name	**Required**: The unique name for the tab that is used when referencing it in scripts. The name can contain only alphanumeric characters and underscores.
	Label	**Required**: The localizable label for the tab visible to users.

Tab	Property	Description
	Filter Search results by	In the **Filter search results by** drop-down list, select the set of article states that you want Dynamics 365 Customer Service to search in: • In the native Dynamics 365 Customer Service knowledge solution, you can choose from all draft articles, all approved articles, or all published articles. • To let users select a different filter on search results so they can see other types of articles, select the **Users can change filters** check box. Only when you enable this option will users see an option to change the filter in the Search pane in a record. While searching for a knowledge article in the Related section (Reference panel), the following fields of a knowledge article are searched for the keywords that you enter: **Title**,**Content**, **Keywords**, **Description**, and **Article Public Number**. For more information, go to Search for knowledge articles.
	Set Default Language	If you want users to see search results only for articles in a specific language, in the **Set Default Language** drop-down list, select a language. By default, User's Default Language is selected: • If you select User's Default Language, search results will be filtered based on the signed-in user's default language. • If the language you select isn't an active language, the search results will be filtered by using the signed-in user's default language. • If you select User's Default Language, and the user's default language isn't an active language, the first active language available alphabetically is used as the default filter. • To let users select a different language filter on search results so they can see other articles in other languages, select the **Users can change Language Filter** check box. Only when you enable this option will users see an option to change the filter in the Search pane in a record.

Tab	Property	Description
	Additional Options	If you want Dynamics 365 Customer Service to suggest articles automatically based on the value in certain fields of the entity, select **Turn on automatic suggestions**. If you've enabled automatic suggestions, select the field for the entity that Dynamics 365 Customer Service will use to suggest article results in the **Give knowledge base (KB) suggestions** drop-down list. For example, if you're adding the search control to the Account entity and want Dynamics 365 Customer Service to automatically show search results that contain the account name, select Account Name in the drop-down list. **Note**: This drop-down list can include all fields that are text, multi-line text, or lookup type fields. If you want the article rating to appear for each article in the search results, select the **Enable ratings on KB article search results based on the specified field** check box, and then select the field from the drop-down list.
	Select Primary customer	In **Select primary customer**, select who the email will be sent to when a customer service rep sends the article link in email. This drop-down list includes all fields for the entity that are enabled for email, for example Customer, Contact, or Responsible contact. When the customer service rep chooses to send a link to the article to the customer, the **To** field is automatically populated with the value of the field that you select here.
	Number of results	Select how many articles to show in the search results at first. **Note**: If Relevance Search is enabled, the number of results that are displayed might differ from what you set due to the default Relevant Search setting. Your system administrator must disable Relevance Search or enable Simple Relevance Search for this property to work correctly. (Simple Relevance Search queries only articles, excluding attachments and notes.) For more information, go to Understand knowledge base search mechanisms.

Tab	Property	Description
	Actions	Select whether you want to make all the default actions available to reps or only selected ones. If you choose **Show Selected Actions**, select the actions you want to show. The following actions are available: • **Link the KB article**. Lets users link the knowledge article to the record they're viewing the knowledge article search results in. • **Unlink**. Lets users unlink the knowledge article from the primary record. • **Copy link**. Lets users copy the external URL of the article, so they can share it over channels like chat or email. In the native Dynamics 365 Customer Service knowledge management solution, the **Copy Link** option is available only for published articles. • **Link KB article and email link**. Lets users associate an article with the primary record and share the article link with the customer through email.
Formatting	Layout	Choose the type of layout to determine the number of columns the control should occupy.
	Row Layout	Select the maximum number of rows per page.

Configure automatic filtering for the web client

Improve knowledge article suggestions and search results by enabling automatic filtering. Automatic filtering ensures your customer service agents receive only the most relevant knowledge articles. As an administrator, you can configure Knowledge Base Search control to automatically filter knowledge articles based on case data without any manual input from the agents.

For example, if you set up automatic filtering of knowledge articles on the subject of the case, the knowledge articles that have the same subject as the case will be filtered in and will be shown to the agents. Other articles will be filtered out automatically.

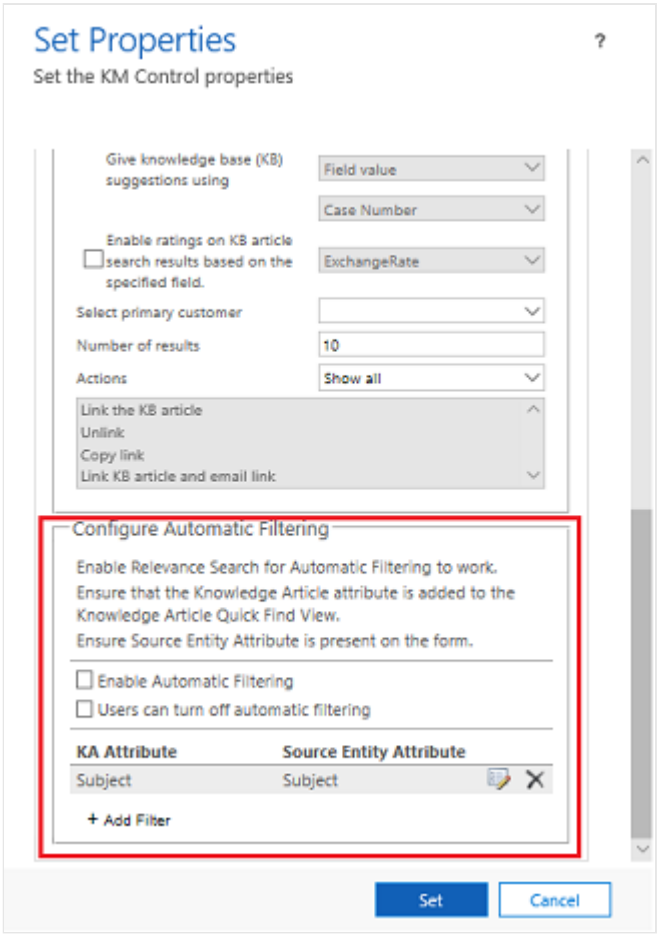
This feature can be extended to automatically filter knowledge articles on any lookup field that's present on both Case and Knowledge Article entities. Agents also have an option to turn off automatic filtering and search the entire knowledge base. Administrators can configure this option in the Knowledge Base Search control.

Open the **Knowledge Base Search** control and edit its properties to configure automatic filtering. In the **Set Properties** dialog box, on the **Display** tab, specify the following fields

in the **Configure Automatic Filtering** section.

1. Select the **Enable Automatic Filtering** check box to enable automatic filtering.
2. Select the **Users can turn off automatic filtering** check box if you want to provide your agents the option to turn off automatic filtering and search the entire knowledge base. This enables the **Auto filter results** option for agents on knowledge search control.
3. Select **Add Filter** to define filtering of knowledge articles on case subject or any other lookup field.
4. Select **Set** to save the properties.

> **Note**
>
> Ensure that Relevance search is enabled for automatic filtering to work. The Knowledge Article attribute must be added to the Knowledge Article Quick Find View. Ensure that the Source Entity Attribute is present on the form.



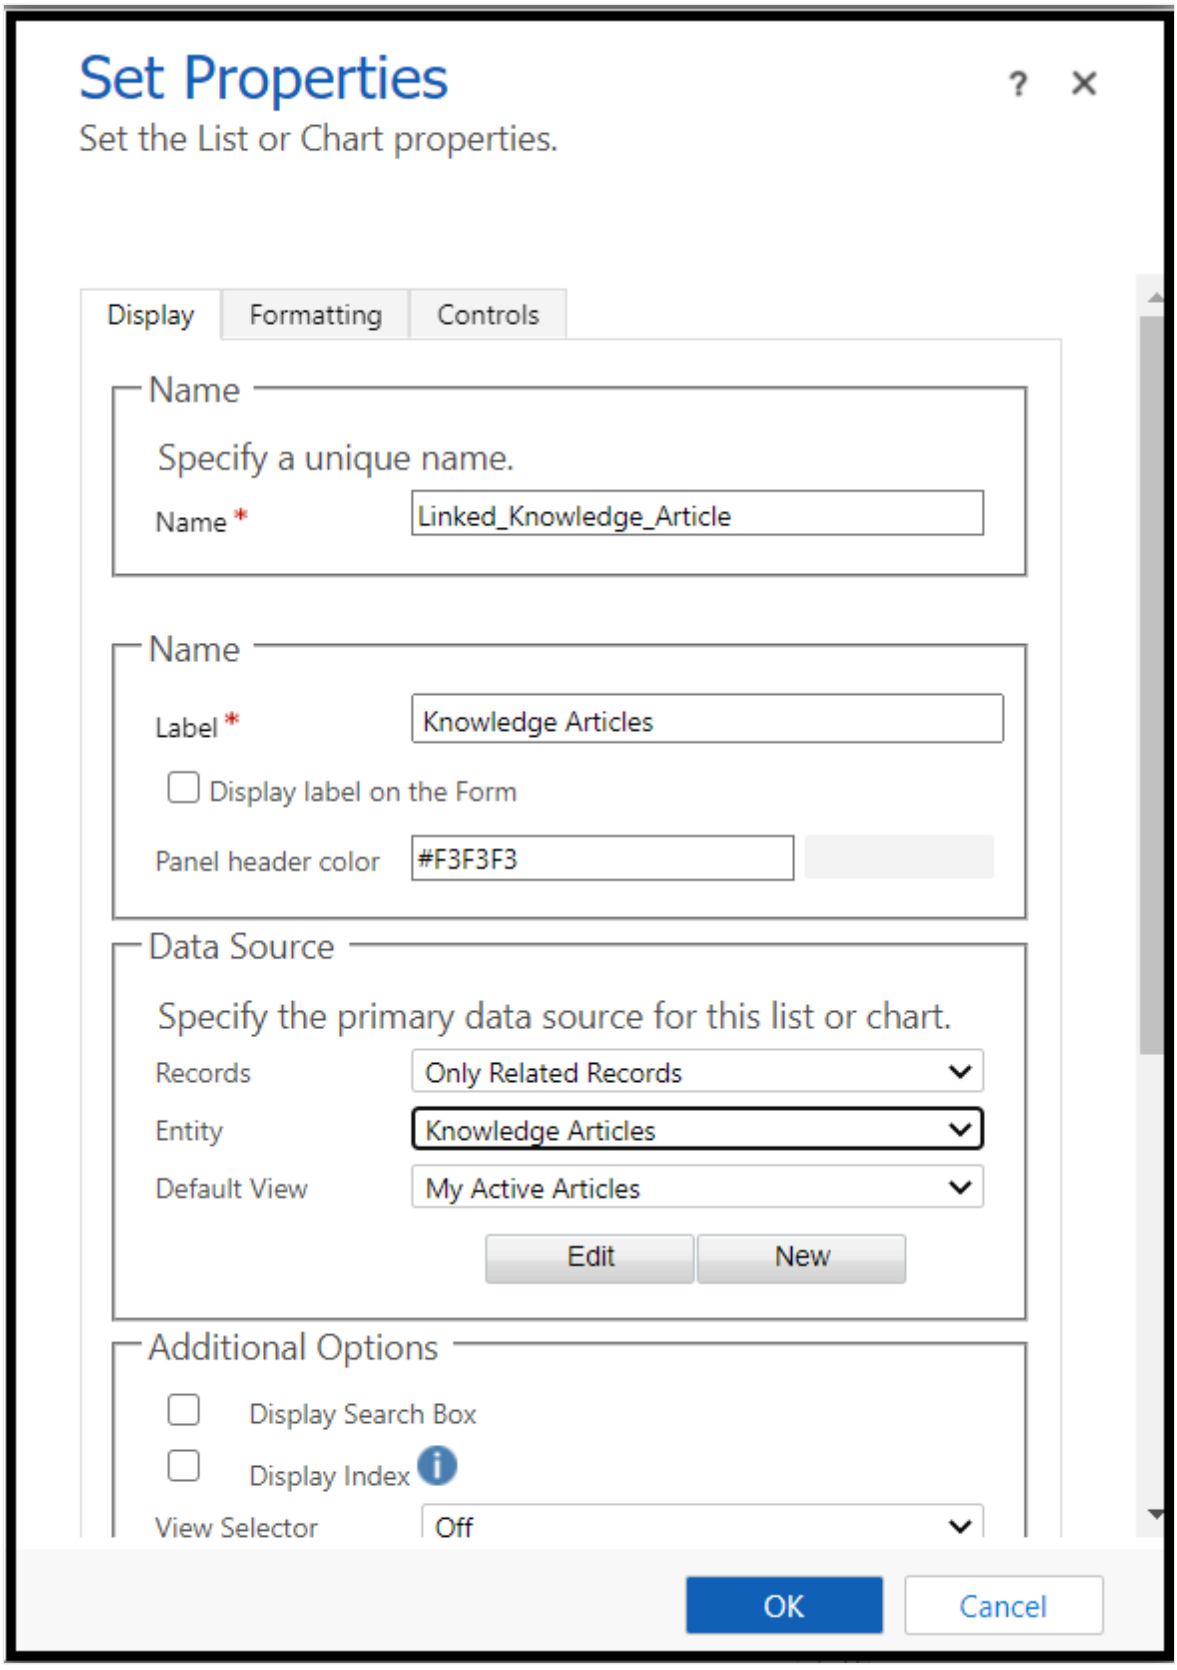
To learn more about how to use the automatic filtering option, go to View auto-filtered results

Add a knowledge article subgrid to a form

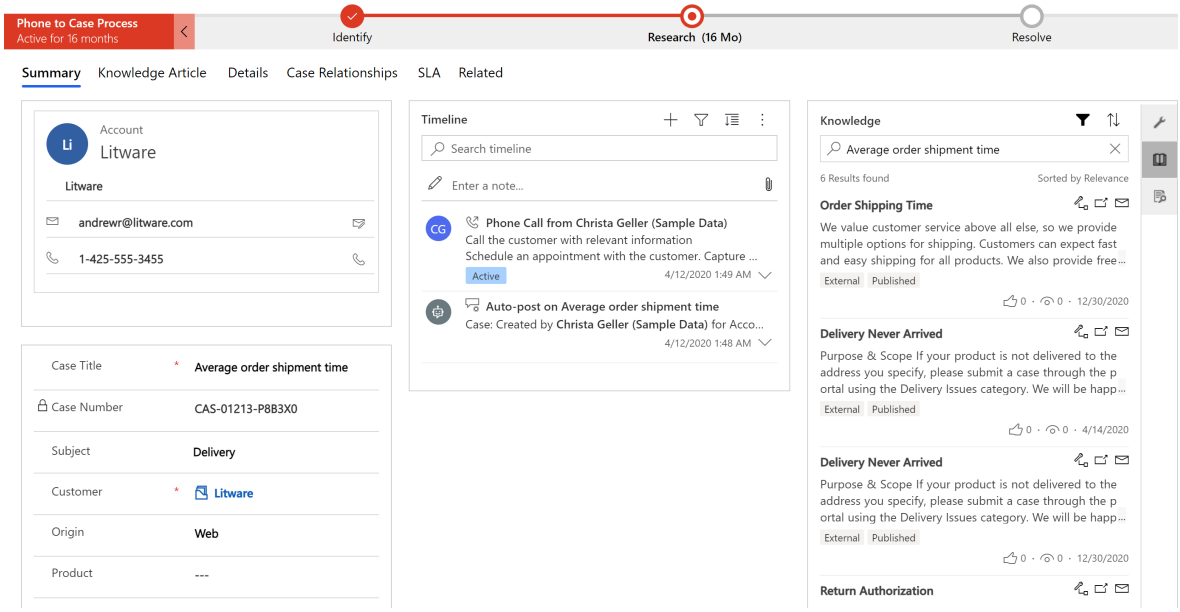
You can add a customized knowledge article subgrid to a form. To learn more about the components of a subgrid form, go to Add and configure a subgrid component on a form.

To add a subgrid

1. Sign in to the Dynamics 365 application, and then select **Settings** > **Advanced Settings**.
2. Select **Customizations** from the drop-down list, and then select **Customize the System**.
3. In the **Solution Default Solution** list, select the entity to which you want to add a subgrid, and then select **Forms**.
4. In the form designer, select **Insert** > **Sub-Grid**.
5. In the **Set Properties** dialog box, provide a unique name for your subgrid.
6. Ensure that the **Entity** value is set to **Knowledge Articles**.
7. Retain the default values for all the other fields, and then select **OK**.



8. Save your knowledge subgrid, and then select **Publish**.



The linked knowledge article subgrid that you add will be visible to the customer service representative on the entity form during runtime.

The Knowledge Search tab is available by default on the app side pane. You can use the knowledge search control either on the app side pane or embed it in the form through customization but make sure that you don't enable both simultaneously. Otherwise, when you try to access the embedded control, the "Error loading the control" message will appear.

Add a knowledge article rich text editor control to a form

Article • 01/23/2023

By default, the rich text editor functionality is available for use with knowledge articles and emails. You can add the rich text editor control to other forms as well to leverage the benefits of the rich text editor functionality. More information: Use the rich text editor toolbar

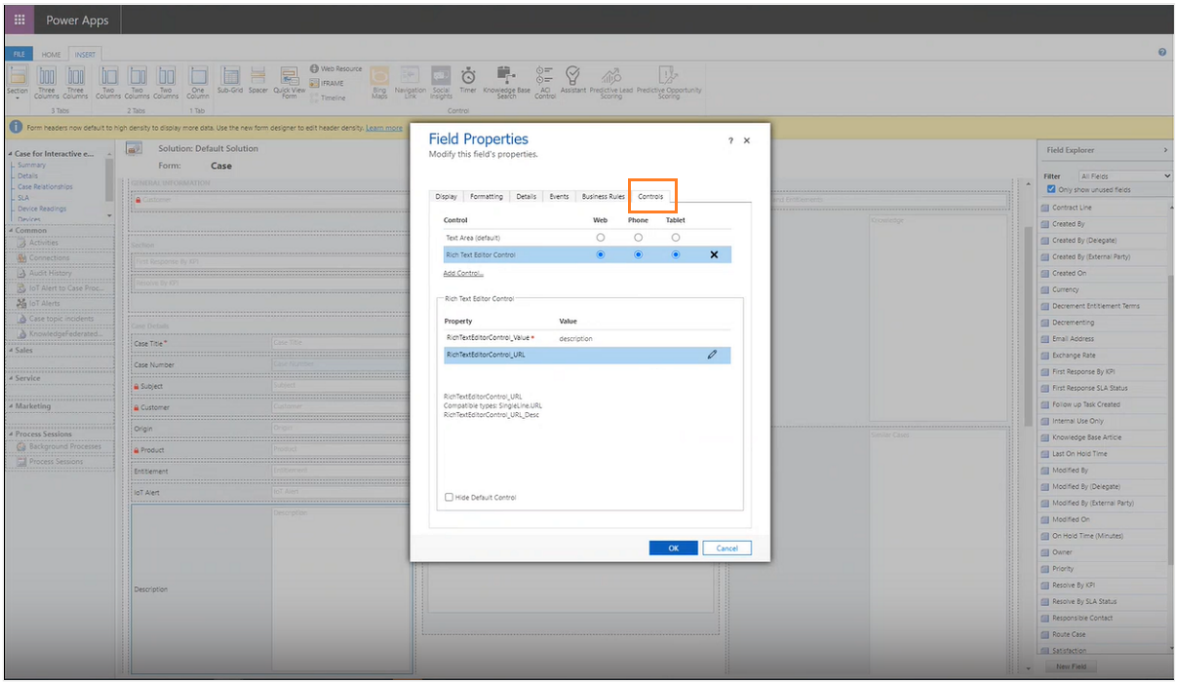
Add the rich text editor control to a form

Perform the following steps to add rich text editor control to a form.

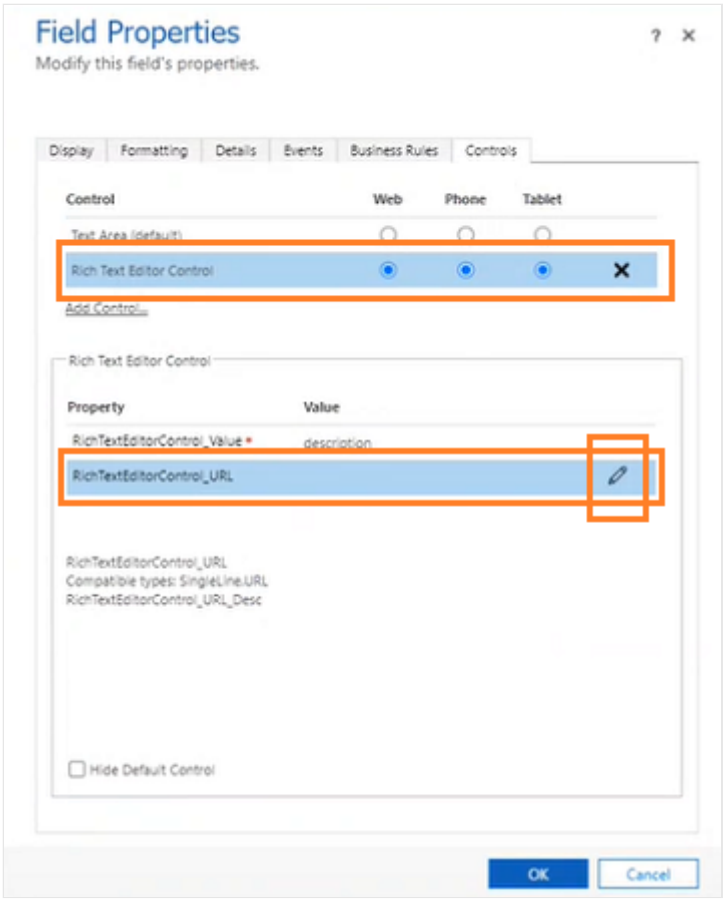
1. In Power Apps, go to the form where you want to add the rich text editor control, and double-click a field where you can enter single or multiple lines of text to open **Field Properties**.

2. On the **Field Properties** dialog, select the **Controls** tab.

3. Under **Controls**, select **Rich Text Editor Control**.

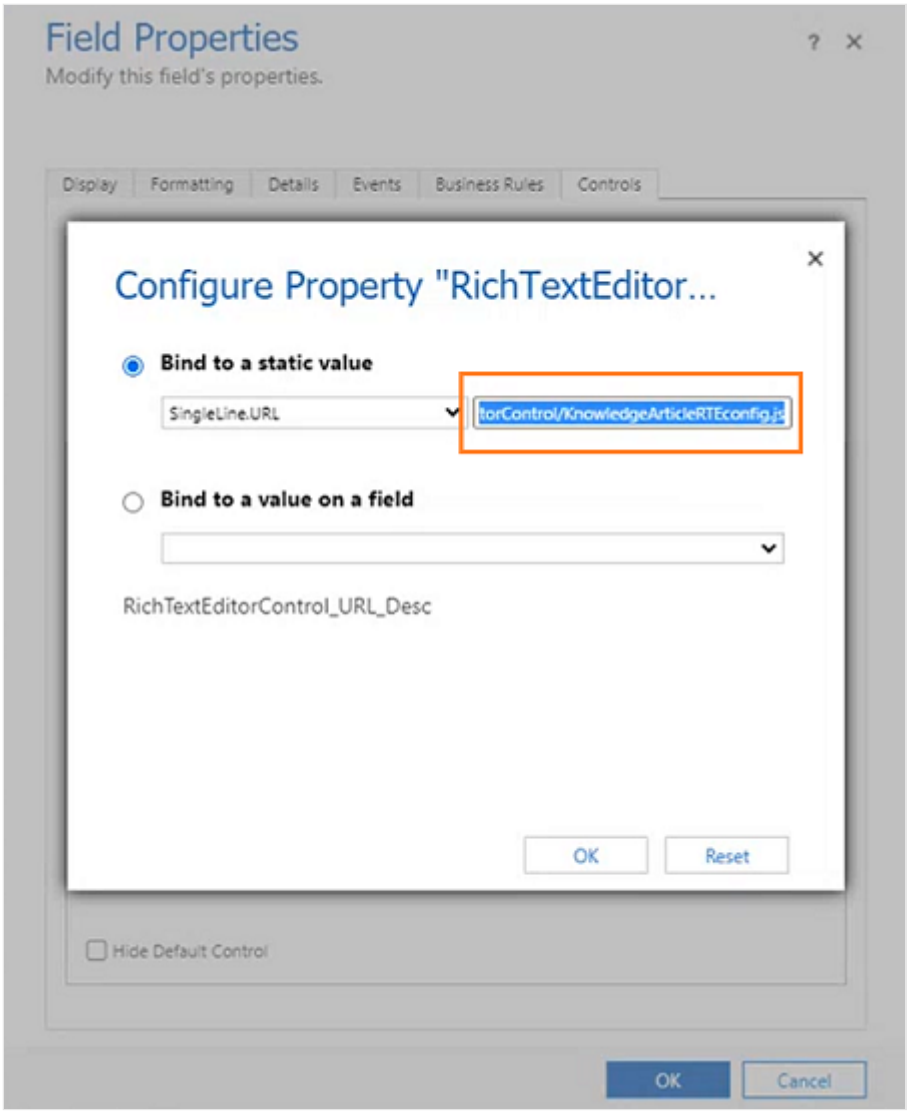


4. Under **Rich Text Editor Control** properties, select the pencil icon next to **RichTextEditorControl_URL**.



The properties configuration page is displayed.

5. In the **Bind to a static value** field, enter the following text:
   webResources/msdyncrm_/RichTextEditorControl/KnowledgeArticleRTEconfig.js



6. Select **OK** > **OK**, and then select **Save and Publish**.

For more information about rich text control properties, see Rich text editor control configuration options.

Configure the faceted search results web template from your portal

Article • 12/14/2022

You can view and search for knowledge article attachments on the portal based on Dataverse search. To do so, you must configure the faceted search results web template from your portal.

1. In the Portal Management site map **Content** area, select **Web Templates**.
2. From the **Active Web Templates** dropdown list, select your knowledge article web template.
3. On the **Web Template** page on the **General** tab, add the following snippet to the **Source** field.

JavaScript

```
                            {{#if relatedAttachments}}
                                {{#each relatedAttachments}}
                                    <li class="note-item">
                                    {{#if isImage}}
                                        <a id="kbattachment-{{entityID}}"
href="javascript:downloadKbAttachmentFile('kbattachment-{{entityID}}',
'{{title}}', {{fileSize}}, '{{fileType}}', '{{downloadBlockUrl}}',
'{{initializeDownloadUrl}}')"><span class="glyphicon glyphicon-file" aria-
hidden="true"></span> {{title}}</a>
                                    {{else}}
                                        <a id="kbattachment-{{entityID}}"
title="{{title}}" href="javascript:downloadKbAttachmentFile('kbattachment-
{{entityID}}', '{{title}}', {{fileSize}}, '{{fileType}}',
'{{downloadBlockUrl}}', '{{initializeDownloadUrl}}')"><span class="glyphicon
glyphicon-file" aria-hidden="true"></span> {{title}}</a>
                                    {{/if}}
                                    <p class="fragment text-muted">
{{{fragment}}}</p>
                                    </li>
                                {{/each}}
                            {{/if}}
<script type="text/javascript">
        function downloadKbAttachmentFile(attachmentElementId, fileName,
fileSize, mimeType, downloadBlockUrl, initializeUrl) {
                    // Download block API supports max 4MB block size
                    const blockSizeInBytes = 4096 * 1024;
                    const totalNumberOfBlocks = parseInt(fileSize /
blockSizeInBytes + 1);
                    var fileContinuationToken = "";
                    var contentString = "";
                    var numberOfBlocksDownloaded = 0;
                    var blockNumberToContentMap = {};
```

```
                    function downloadBlockCallback(i, result) {
                        numberOfBlocksDownloaded++;
                        blockNumberToContentMap[i] = result;
                        if (numberOfBlocksDownloaded == totalNumberOfBlocks)
{
                            for (var j = 0; j < totalNumberOfBlocks; j++) {
                                contentString += blockNumberToContentMap[j];
                            }
                            var isImage = mimeType.startsWith('image/');
                            const attachmentElement =
document.getElementById(attachmentElementId);
                            if (isImage) {
                                const bodyByteString = atob(contentString);
                                const bodyBuffer = new
ArrayBuffer(bodyByteString.length);
                                const bodyView = new Uint8Array(bodyBuffer);
                                for (var k = 0; k < bodyByteString.length;
k++) {
                                    bodyView[k] =
bodyByteString.charCodeAt(k);
                                }
                                var imageUrl = URL.createObjectURL(new
Blob([bodyBuffer], { type: mimeType }));
                                attachmentElement.href = imageUrl;
                                attachmentElement.target = "_blank";
                            }
                            else {
                                const linkSource = 'data:' + mimeType +
'; base64,' + contentString;
                                attachmentElement.href = linkSource;

Create a knowledge article using a template

Article • 02/17/2022

Use the **msdyn_GetKAObjectFromTemplate** action to create a knowledge article from an existing knowledge article template programmatically.

Action parameters

The **msdyn_GetKAObjectFromTemplate** action requires the following parameters:

Name	Type	Nullable	Description
TemplateId	Edm.Guid	False	The GUID of the knowledge article template to use.

Action return type

Type	Description
KnowledgeArticle	The **msdyn_GetKAObjectFromTemplate** action returns the following value.

Example

Request

HTTP

```
POST [Organization URI]/api/data/v9.0/msdyn_GetKAObjectFromTemplate
Content-Type: application/json;charset=utf-8
OData-MaxVersion: 4.0
OData-Version: 4.0
Accept: application/json

{
    "TemplateId":"{A2AC047C-507D-E911-A828-000D3A1C16AF}"
}
```

Response

JSON

```
HTTP/1.1 200 OK
Content-Type: application/json; odata.metadata=minimal
OData-Version: 4.0

{
    "@odata.context":"[Organization
URL]/api/data/v9.0/$metadata#knowledgearticles/$entity",
    "@odata.type":"#Microsoft.Dynamics.CRM.knowledgearticle",
    "isinternal":false,
    "isinternal@OData.Community.Display.V1.FormattedValue":"No",
    "keywords":"test knowledge article",
    "title":"test",
    "_languagelocaleid_value":"56940b3e-300f-4070-a559-5a6a4d11a8a3",

"_languagelocaleid_value@Microsoft.Dynamics.CRM.associatednavigationproperty
":"languagelocaleid",

"_languagelocaleid_value@Microsoft.Dynamics.CRM.lookuplogicalname":"language
locale",
    "_subjectid_value":"8069216f-297d-e911-a828-000d3a53e137",

"_subjectid_value@Microsoft.Dynamics.CRM.associatednavigationproperty":"subj
ectid",
    "_subjectid_value@Microsoft.Dynamics.CRM.lookuplogicalname":"subject",
    "_subjectid_value@OData.Community.Display.V1.FormattedValue":"Query"
}
```

Create and manage knowledge articles

Extend transformer logic on templates

Article • 03/17/2023

Transformer logic refers to moving the values of specific fields from the knowledge article template to the knowledge article. Standard fields are supported out of the box. Organizations can overwrite the out-of-the-box transformer logic by creating a plug-in and registering it as a `msdyn_GetKAObjectFromTemplate` message.

To extend the transformer logic for your knowledge article templates:

1. Create a plug-in by performing the steps mentioned in Create a plug-in project.
2. You can write your own mapping logic with the transformed `kaobject` using `context.OutputParameters["Result"]` as Entity. In this example, we'll show how you can build the knowledge article template transformer with the help of two new attributes, Article Type and Audience. In the plug-in that you created, replace the entire class with the following sample code:

```
///
```

```
    /// The plugin shows a sample of how to build a Knowledge Article
Template Transformer
    /// </summary>
    /// <remarks>
    /// To showcase the capabilities of the transformer, we have added 2 new
attributes to the Knowledge Article Template entity. These attributes have
also been added to the form.
    /// The first is Article Type with the logical name new_articletype that
is of type Option Set and points to a Global Option Set called Article Type
    /// The second is Audience with the logical name new_audience, also of
type Option Set. This is a local option set and has 3 values -
    /// Employee with value 100000000, Managers with value 100000001 and
Public with value 100000002
    /// Similarly, we have 2 new attributes on the Knowledge Article entity
which have been added to the Knowledge Article for Interactive Experience
form.
    /// The first is Article Type with the logical name new_kaarticletype
that is of type Option Set and points to the same Global Option Set Article
Type described earlier.
    /// The second is the Disclaimer with the logical name new_disclaimer
that is of type Single Line of Text. To ensure that it behaves like a
disclaimer, we have ensured that it is
    /// not editable on the form.
    ///
    /// The core goal of the transformer is to copy over the Option Set
value from the Article Type of the template record to the Article Type of
the article record.
    /// Having the same Global Option Set ensures that we don't need to
worry about mapping the values of one to the other. But that is also
```

```
possible as can be seen with the other attribute transform.
    /// Based on the audience of the template record, the disclaimer on the
article record is populated.
    /// </remarks>

                    {
                        return templateValue;
                    };
                case Tmpl_AudienceName:
                    return (object templateValue) =>
                    {
                        var audienceVal = templateValue as OptionSetValue;
                        switch (audienceVal.Value)
                        {
                            case Audience_Employee:
                                return "Internal Use Only";
                            case Audience_Managers:
                                return "For Managers Only";
                            case Audience_Public:
                            default:
                                return "Generally Available";
                        }
                    };
                default:
                    return (object templateValue) =>
                    {
                        return null;
                    };
            }
        }
        #endregion
    }
```

3. Follow the steps mentioned in Register a plug-in to register your plug-in.
4. Now, when you create a knowledge article from a template, the values of the option sets are transformed and inserted in the article.

Tutorial: Write and register a plug-in

Transform, map external source data to knowledge fields

Article • 03/01/2023

When you're mapping information from external data providers to knowledge article entities, if the source value is of a different data type, you'll have to transform the value before you can map it to the target knowledge attribute. You can create a plug-in and register it on `Create` and `Update` messages so that the target knowledge article attributes have values that are inline with the articles from the external providers.

To transform and map the source values, perform the following steps:

1. Create a custom field in the `KnowledgeArticle` entity. More information: How to create and edit columns.
2. Map the required external source value to the newly created custom field. More information: Configure knowledge article schema mapping (preview). This is a temporary mapping from which your plug-in picks up the source value.
3. Create a plug-in. For more information, see: Create a plug-in project.
4. You can write your own code to convert the external source value and map it to the required target knowledge article attribute.
   In this example, we'll show how you can map a source value that's of the type **String** to an article field attribute of type **OptionSet**. In the plug-in that you created, replace the entire class with the following sample code.

C#

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Runtime.Remoting.Contexts;
using System.Runtime.Remoting.Services;
using System.ServiceModel;
using Microsoft.Xrm.Sdk;
using Microsoft.Xrm.Sdk.Messages;
using Microsoft.Xrm.Sdk.Metadata;

namespace PowerApps.Samples
{
   /// <summary>
   /// The plug-in shows the sample code to map the external source value to
the target attribute, when they're of different types
   /// </summary>
   /// <remarks>
   /// To showcase the capabilities of the plugin, we have added 2 new
```

```
attributes to the KnowledgeArticle entity.
   /// The first attribute new_documentationcentersourcevalue is a String
attribute that is mapped to the external source value. This is a temporary
mapping that stores the source value.
   /// The plugin picks up the source value from
new_documentationcentersourcevalue. The source value can take the following
values: Develop, Content, and Test.
   ///The second attribute, new_documentationcenter, is the target attribute
of type OptionSet to which the source value must actually be mapped to.
   /// Develop with value 100000000, Content with value 100000001, and Test
with value 100000002
   /// The goal of this plugin to read the value from the
new_documentationcentersourcevalue, retrieve the option set metadata of the
target attribute new_documentationcenter, and map it to the value in
new_documentationcentersourcevalue.
   /// </remarks>
   public sealed class KnowledgePlugin : IPlugin
   {
       /// <summary>
       /// Execute method that is required by the IPlugin interface.
       /// </summary>
       /// <param name="serviceProvider">The service provider from which you
can obtain the
       /// tracing service, plug-in execution context, organization service,
and more.</param>

Overview of collaboration

Article • 05/12/2022

Collaboration features make it easy for agents to find the help they need in Microsoft Teams from within the following apps:

- Dynamics 365 Customer Service admin center
- Dynamics 365 Customer Service Hub
- Dynamics 365 Customer Service workspace
- Your custom apps

Using collaboration features, agents can find experts, chat with peers in Teams, and set meetings. Collaboration helps turn your business into a unified and cohesive customer service center.

Embedded chat using Teams

Agents can start a new chat or link an existing chat to a record in Teams without switching context or leaving the application. Linking all the associated chats to a record can help agents maintain the chats in one place. More information: Configure Teams chat

Customer support swarming using Teams

Customer support swarming helps agents more quickly resolve issues by bringing together the right experts across your business. More information: Configure customer support swarming

Share Dynamics 365 records within Microsoft Teams conversations

Agents can share the record of the chat conversation and let participants view it without navigating away from Teams. They can share any Dynamics 365 record on Teams channels and chat conversations, and share records using search in the app. More information: Share Dynamics 365 records within Microsoft Teams conversations

Configure Microsoft Teams chat in Customer Service

Article • 08/04/2023

You can configure the ability for agents to chat in Microsoft Teams from within Customer Service Hub, Customer Service workspace, and your custom apps. Teams chat is also available in other customer engagement apps such as Dynamics 365 Field Service and Dynamics 365 Sales.

> **Note**
>
> Teams chat is already enabled for Customer Service workspace and Customer Service Hub, and you can select other apps that you want to enable it for.

When the feature is enabled for an app, when they work on customer records, agents can start a new chat or connect an existing chat to a record, and thus collaborate efficiently without switching context or leaving the application. Connecting the associated chats to a record can help agents maintain all the chats related to the record in one place. You can also configure an optional introduction note that agents can use to provide further context when collaborating in Teams.

Enable or disable Teams chat

If you're using the Customer Service workspace or Customer Service Hub apps, Teams chat is automatically enabled. If you want to use it in other customer engagement apps, you must manually enable it, and it requires certain permissions to access Teams data. Review the following permissions required section to learn more.

Permissions required

When Teams chat is enabled, the app has the following permissions:

Permission	What the app does with the permission
Chat.ReadWrite.All	Reads user's chats and recent messages to display in chat list.
Directory.Read.All	Reads user's teams and channels display name.
Presence.Read.All	Reads presence information of all users to be displayed on the user avatars in chat list.

Permission	What the app does with the permission
User.Read.All	Reads users' display name and licenses to validate if the suggested participants have a Teams license assigned. This permission is used by the suggested section in the chat list.
User.ReadBasic.All	Reads users' photos.

In order to use Teams chat in multisession environments, users must have the same permissions as those in the **Productivity tools user** role.

Users need read permission for the following entities to access the productivity pane for custom roles:

- App profile
- Application tab template
- Notification field
- Notification template
- Pane tab configuration
- Pane tool configuration
- Productivity pane configuration

Data security and privacy

The following data security and privacy considerations apply for Teams chat functionality in Dynamics 365:

- Dynamics 365 doesn't store any Teams data except for the mapping between the record ID and the connected chat ID. No data from Teams is duplicated in Dynamics 365 unless the user manually adds it to the record notes or tasks.
- The communication between the applications is secured through TLS.
- The integration honors policies that apply both to Teams and Dynamics 365. For example, confidential files shared in a connected chat are only accessible to permitted users. Similarly, a record shared in a Teams chat in Dynamics 365 can only be accessed if the user has permission to view it.
- The app requires certain permissions to start a chat, display suggested contacts, show presence, and so on. For more information, review Permissions required.

Add the Teams collaboration and chat settings page to the sitemap of your app

1. Sign in to Power Apps.
2. Select the environment, and then select **Apps**.
3. Select your custom app, and then select **Edit**.
4. In the **App Designer**, edit the **Sitemap**.
5. To add the Teams **Chat and collaborate** settings page, add a subarea component, and then for the **Type**, select **URL**.
6. Copy the following value and paste it into URL field:
   `/main.aspx?pagetype=control&controlName=MscrmControls.TeamsCollaborationAdmin.TeamsCollaborationAdmin`
7. Save and publish the changes.

Access the Teams settings

> **Note**
>
> Teams settings are enabled by default for the Customer Service workspace and Customer Service Hub apps. If you're using either of these apps, you can skip this section. If you want to enable Teams chat for other apps, follow these steps.

1. In Dynamics 365, go to one of the apps, and then perform the following steps.

   Customer Service admin center

   a. In the site map, in **Agent experience**, select **Collaboration**.

   b. In **Embedded chat using Teams**, select **Manage**.

2. On the **Microsoft Teams collaboration and chat** page, turn on the toggle for **Turn on Microsoft Teams chats inside Dynamics 365**.
3. Select one of the following:

   - **Turn on for all Dynamics 365 apps** – Enables Teams chat for all supported Dynamics 365 apps in your organization, including any that you add in the future.

- **Turn on for selected Dynamics 365 apps** – Enables Teams chat for the apps you choose. If your organization already uses Teams, the selection you made previously remains. If you haven't yet set up Teams, it's enabled by default for the Customer Service workspace and Customer Service Hub apps.

4. Save the changes.
   Teams settings are now enabled for Dynamics 365 Customer Service Hub, Customer Service workspace, and your custom apps (and also Field Service and Sales customer engagement apps, if you're using them). You can open a record and verify if you're able to view the chats and channels related to the record.

Add the Teams chat settings page for specific multisession users

If you're using the default profile, once you complete the steps in Add the Teams chat settings page to the sitemap of your app, Teams chat is enabled.

If you want Teams chat to work for specific users, you must enable the feature for your custom profile. For more information about creating custom profiles in App profile manager, see Overview of App profile manager.

To enable Teams chat settings for a custom multisession user, complete the following steps:

1. Create the custom profile from the default profile in App profile manager. More info: Create an app profile

2. In Dynamics 365, go to one of the apps, and then perform the following steps.

   Customer Service admin center

   a. In the site map, in **Agent experience**, select **Collaboration**.

   b. In **Embedded chat using Teams**, select **Manage**.

3. Ensure that the toggle for **Turn on Microsoft Teams chats inside Dynamics 365** is set to **Yes**, and then in **Turn on for specific multisession users**, select **Manage**. The **Agent experiences profiles** page is displayed.

4. Select the profile to open it.

5. On the profile page, you can do the following:

- **Add users** More information: Assign profiles to users
- **Add an entity session template** More information: Manage session templates
- **Enable the inbox** More information: Configure the inbox for agents
- **Enable productivity pane features** More information:
- **Set up channel providers** More information: Overview of productivity tools

Configure the ability to connect chats to Dynamics 365 records

Once you've enabled Teams chats, you can connect the chats to different record types. Standard record types, including case, account, contacts, knowledge article, and email, are available out-of-the-box, or you can add your desired record type.

To configure the ability to connect a chat to a record type:

1. In Dynamics 365, go to one of the apps, and then perform the following steps.

   Customer Service admin center

   a. In the site map, in **Agent experience**, select **Collaboration**.

   b. In **Embedded chat using Teams**, select **Manage**.

2. Under **Connect chats to Dynamics 365 records**, select the record type you want to configure.
   If you want to add a record type, see Add record types

3. Select **Save**.

Add record types

To add a record type to connect chats to in Dynamics 365 records:

1. In Dynamics 365, go to one of the apps, and then perform the following steps.

   Customer Service admin center

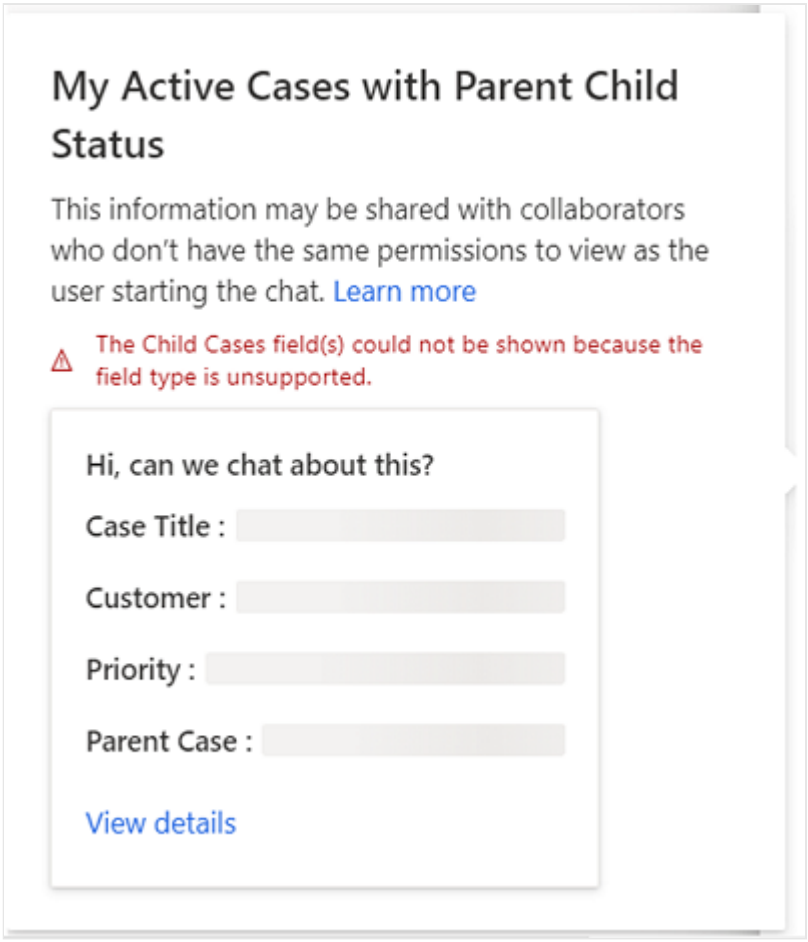
   a. In the site map, in **Agent experience**, select **Collaboration**.

   b. In **Embedded chat using Teams**, select **Manage**.

2. Under **Connect chats to Dynamics 365 records**, select **Add record types**.
3. In the **Allow chats to be connected to this record type** pane, in **Choose record type**, type the name of the record type you want to use.
4. (Optional): If you want to display content for new connected chats, toggle **Include a note** to **On**, and then use the existing views functionality to define the fields that represent the context card or create a custom view in Power Apps. You can choose up to five fields you want to include as a context card.
5. Select **Save**.

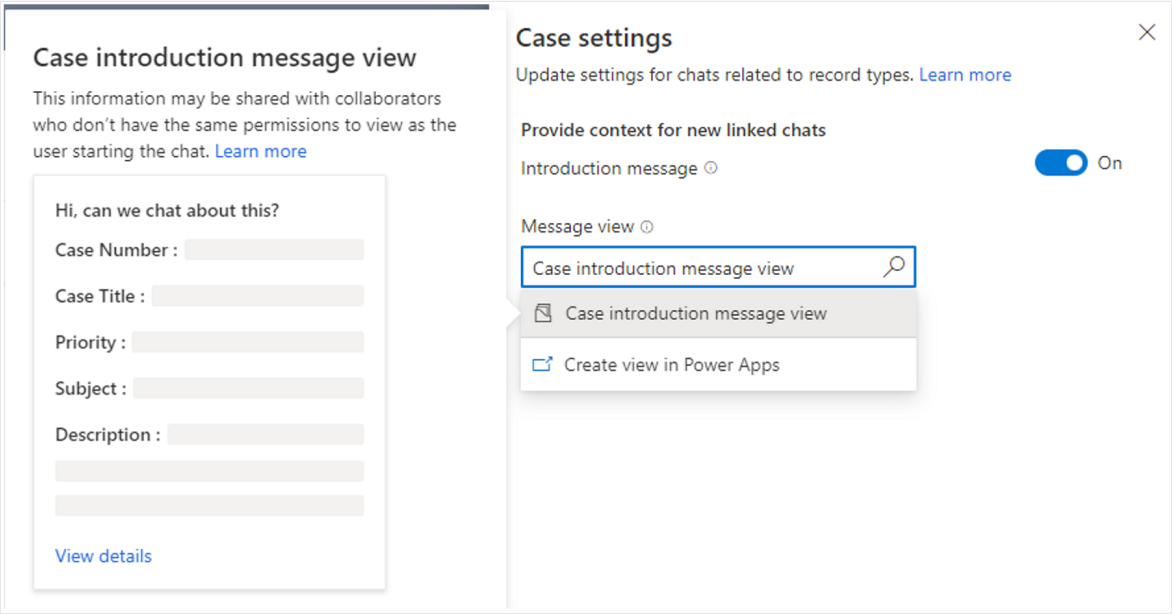
For any view that's selected, keep in mind the following details:

- The first five fields of any view are used as the context card details (in addition to a connection to the record).
- If a field isn't supported, it's skipped and the display includes the first four fields that are supported. You're able to see from the configuration experience that the specific field isn't supported.



- Because the data fields are static, field-level permissions aren't checked for collaborators. This means if the agent has the field-level permissions to view data fields, collaborators can also see those fields.

- If you don't select a view for the Case record type, agents see the default, out-of-box **Case introduction message** view.



- For other out-of-box standard record types, including account, contacts, knowledge article, and email, the default view is the **Quick find** view.

Assign permissions to disconnect chats for specific user and user roles

Agents can create Teams chats directly from Dynamics 365 apps and then connect them to records. They can also connect existing chats to Dynamics 365 records from the Teams embedded chat experience.

> **Note**
>
> The retroactive connect chat experience can only be set up in Dynamics 365 apps.

As an admin, you can control which user or role can disconnect chats that are connected. These user permissions help give you the flexibility to adapt the Teams embedded chat experience to match your business processes.

You can choose from the following options for assigning permissions to agents:

- Assign disconnect chat rights to specific users
- Assign disconnect chat rights for security roles

Assign disconnect chat rights to specific users

You can assign the ability to disconnect chats to record owners or users who connected a chat to a record. For new organizations, by default, these settings are enabled.

- **Record owner can disconnect chats**: When enabled, record owners can disconnect any chats that are connected to a record. As an admin, you can assign this permission at a record-type level (for example, a case, contact, and so forth).
- **Chat connector can disconnect chat**: When enabled, users who connected a chat to the Dynamics 365 record can disconnect that connected chat. This permission can also be assigned at the record level.

To enable or disable user-specific rights to disconnect chats:

1. In Dynamics 365, go to one of the apps, and then perform the following steps.

   Customer Service admin center

   a. In the site map, in **Agent experience**, select **Collaboration**.

   b. In **Embedded chat using Teams**, select **Manage**.

2. Select the record type (for example, **Case**), and then in the settings pane, in **Disconnecting chats**, toggle on or off **Record owner can disconnect chats** and/or **Chat connector can disconnect chat**, depending on your preferences.

3. Select **Save**.

Assign disconnect chat rights for security roles

When you assign disconnect chat rights to a security role, all users with that role can disconnect chats that are connected to any record type. Certain role types have disconnect chats rights by default.

The following table details the apps and security roles where the disconnect chats feature is configured:

App	Security role
Admin	System admin
Customer Service apps	CSR manager Customer Service Representative
Omnichannel for Customer Service	OC admin OC supervisor

App	Security role
	OC agent

To edit disconnect chat rights to security roles:

1. In Dynamics 365, go to one of the apps, and then perform the following steps.

   Customer Service admin center

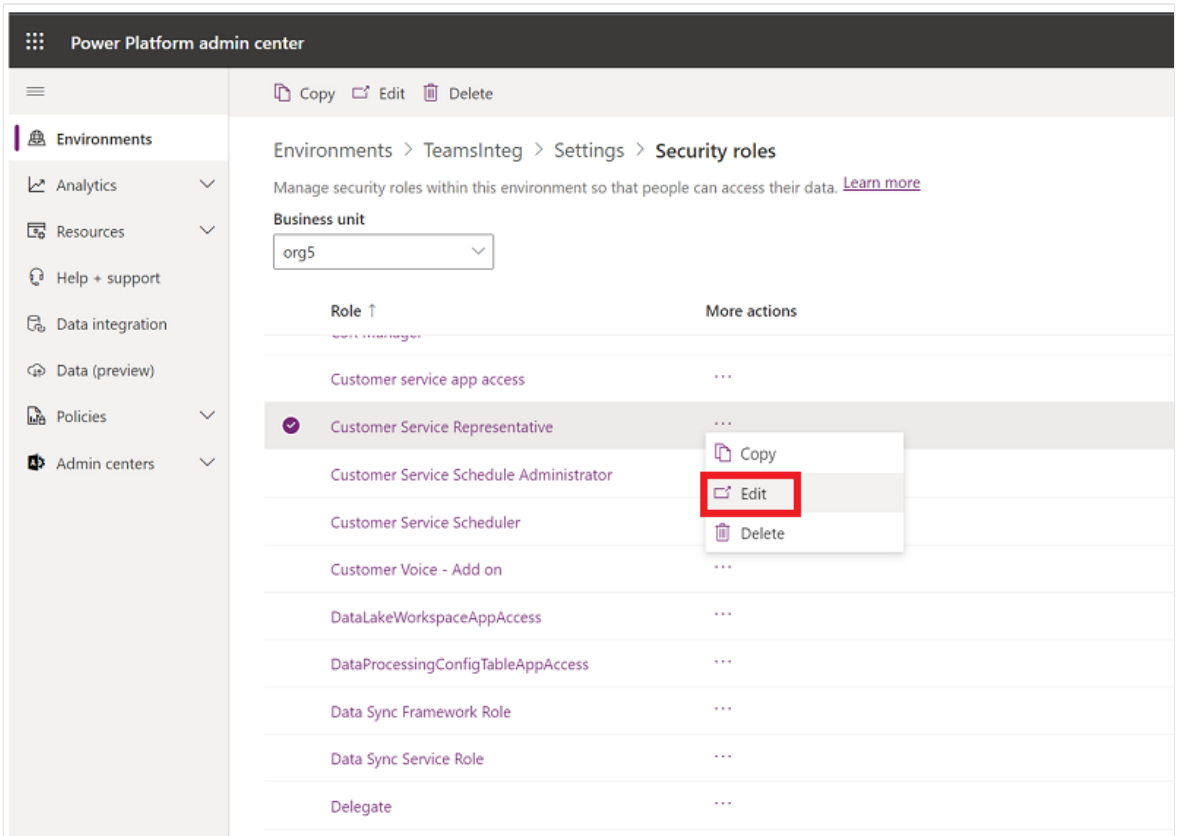
   a. In the site map, in **Agent experience**, select **Collaboration**.

   b. In **Embedded chat using Teams**, select **Manage**.

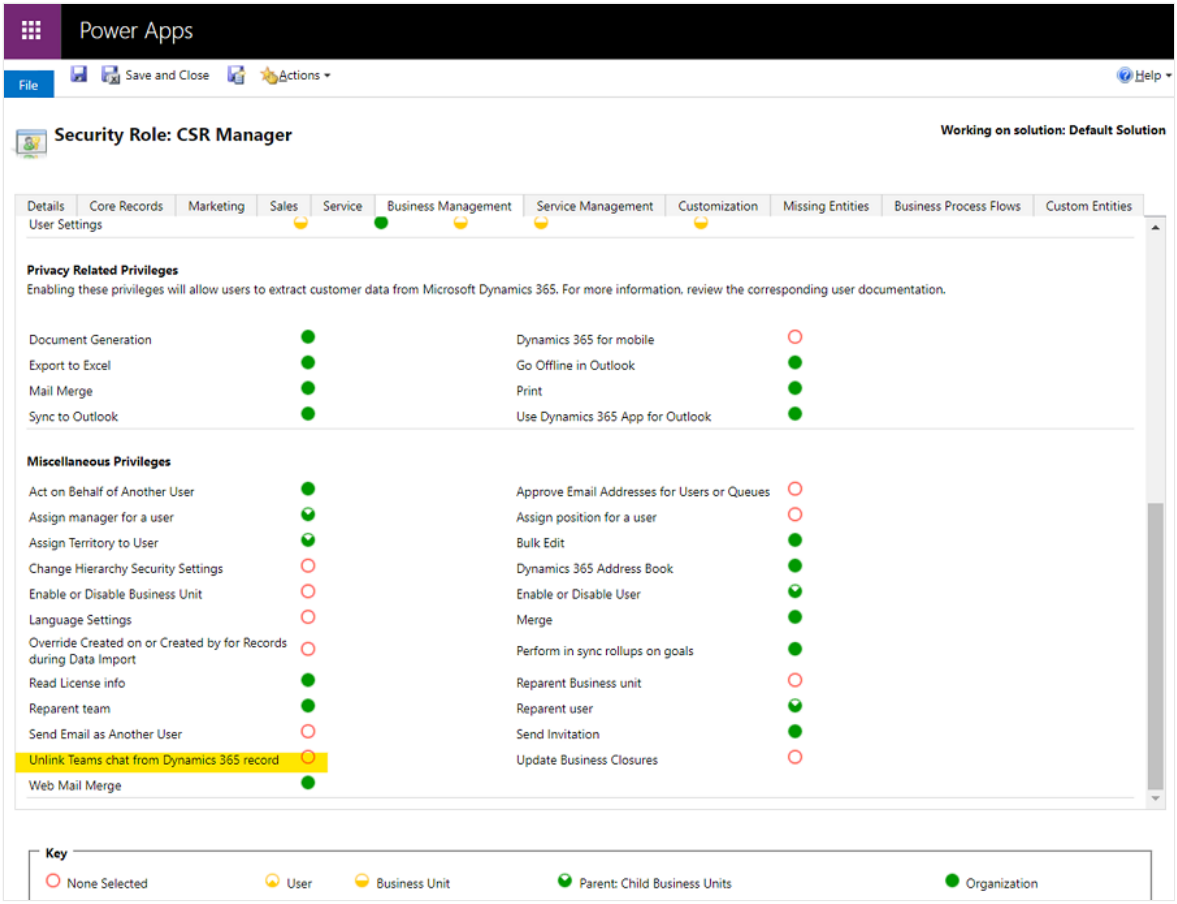
2. On the **Microsoft Teams collaboration and chat** page, scroll down to **More settings**.

3. In **Set who can disconnect chats**, select **Edit in security roles settings**. The Power Platform admin center app is opened.

4. In **Security roles**, select the role that you want to assign the rights to, and then select **Edit**.



5. For the specific security role, go to **Business management** > **Miscellaneous Privileges** > **Disconnect Teams chat from Dynamics 365 record**.



How user rights work together for disconnecting chats

The following table summarizes whether a user can disconnect a connected chat based on the rights assigned to them. You can use the table as a guide for how to use these chat rights to help you configure a secure and effective collaboration experience for your business and users.

Scenario	Scenario	Scenario	Scenario	Scenario	Result
Record is user/team-owned and current user is owner	Current user was most recent to disconnect chat	"Record owner can disconnect chat" toggle is on	"Chat creator can disconnect chat" toggle is on	Global disconnect chat permissions are assigned to user	User can disconnect?
Y	Y/N	N	N	N	N
Y	Y/N	Y	Y/N	Y/N	Y
Y/N	Y	N	N	N	N
Y/N	Y	Y/N	Y	Y/N	Y

Scenario	Scenario	Scenario	Scenario	Scenario	Result
Y/N	Y/N	Y/N	Y/N	Y	Y
N	N	Y	N	N	N
N	Y	N	N	N	N
N	N	N	N	N	N

Configure the ability for users to join chats

As an admin, you can enable users to view and easily join chats that are connected to records they have write access to, even if they weren't originally part of those chats. You can configure the ability for users to join connected chats at a record-type level. This functionality can help you tailor the user experience for your business processes.

> ⓘ **Note**
>
> The join chat feature only works for connected chats and is on by default for the case record type.

The ability for users to join existing chats related to cases is especially useful for the following scenarios:

- **Case transfers**: If an agent has onboarded to a case that was previously handled by another agent, they can join existing connected chats to better understand the context of the case and what steps the previous agent took, and then continue to collaborate with their relevant colleagues.
- **Case escalations**: If a case needs attention from someone with specific knowledge, the subject-matter expert who reviews it can participate in the relevant conversations.

To turn on or off the join chat capability for a record type:

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, in **Agent experience**, select **Collaboration**.

   b. In **Embedded chat using Teams**, select **Manage**.

2. On the **Microsoft Teams collaboration and chat** page, in **Connect chats to Dynamics 365 records**, select the specific record type (for example, Case), and then in the settings pane, toggle **Join chat** on or off.

3. Select **Save**.

Keep chat participants informed when fields are updated

You can reduce the overhead on your agents by automatically updating all participants in a chat when an essential field on a connected record is updated. This time-saving feature helps keep everyone informed without manual effort and allows agents to focus on important matters. It also helps experts in the chat be aware of important updates.

Limitations for automatic event updates

This section describes the limitations of the automatic event functionality.

Entities and attribute type limitations

The following entities aren't configurable for automatic event updates:

- Virtual entities
- Entities that don't have the Update SDKMessageFilter defined

The following attribute types aren't supported for automatic event updates:

- PartyList
- Image
- Integer
- File

Inline image limitations

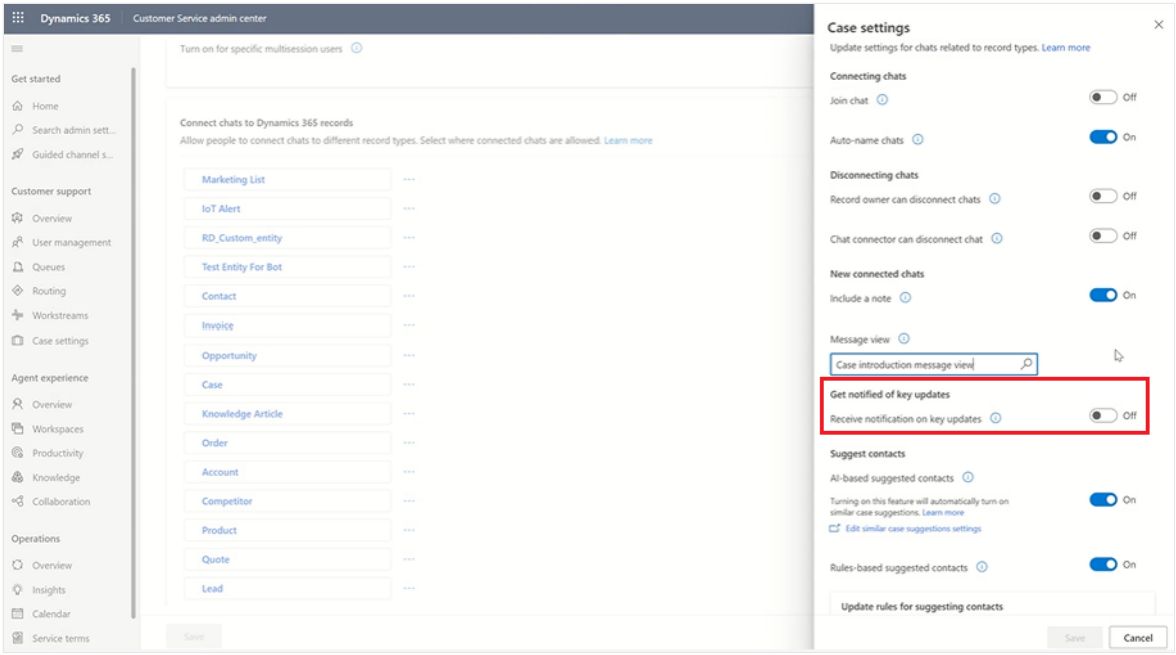
Automatic event updates can't fully render inline images in rich text fields.

Configure chat update when a field is changed

1. In **Customer Service admin center**, select **Collaboration**, and then set the toggle to **On** for **Turn on Microsoft Teams chats inside Dynamics 365**.

2. Next to **Embed chat using Teams**, select **Manage**.

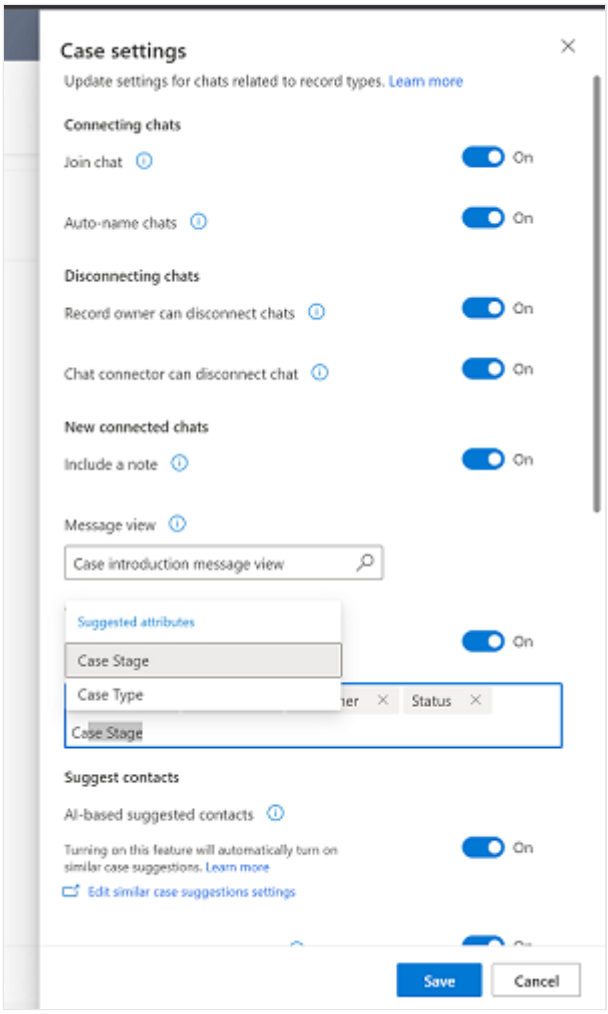
3. On the **Microsoft Teams collaboration and chat** page under **Connect chats to Dynamics 365 records**, select the entity for which you want to enable automatic event updates, or create a new one if the one you want isn't listed. The record settings pane for that entity is opened on the right side of the page.



4. Set the **Receive notification on key updates** toggle to **On**.

5. View the Suggested attributes list by placing your cursor in the field below the toggle, and then select up to five attributes for which you want notifications to be sent.

> **Note**
>
> For the Case entity, the following settings are preconfigured:
>
> - Priority
> - Status
> - Status Reason



6. Save your changes. Automatic notifications will now be sent whenever the attributes you defined for the entities are updated.

Configure the ability for agents to view Teams chats on a connected record's timeline (preview)

You can configure the ability to sync data from Teams to Dataverse so that agents can see chat entries in the timeline when they start a connected chat or connect an existing chat to a record. Agents will see the chat appear as a new activity on the timeline. It will show details about who connected the chat and when they connected, as well as the last person to send a message in the chat and the time they sent it.

Additionally, if the agent assigned to the record changes, the new agent (who may not have been part of the chat originally), can see the chat on the timeline. If the Join chat setting is turned on, the new agent can directly join the chat (and be added as a chat participant) to see the full chat exchange.

Prerequisites

- Only global administrators can configure Teams chat data to sync with Dynamics 365 records.
- For multisession users, you must enable Teams integration in the productivity pane for the app profile assigned to the signed-in user in order for them to be able to select **Open chat** on the timeline.

Enable agents to view Teams chats on a connected record's timeline:

1. In Dynamics 365, go to one of the apps, and then perform the following steps.

   Customer Service admin center

   a. In the site map, in **Agent experience**, select **Collaboration**.

   b. In **Embedded chat using Teams**, select **Manage**.

2. Set the toggle to **Yes** for **Turn on Microsoft Teams chats inside Dynamics 365**.

3. Set the toggle to **Yes** for **Sync Teams chats with records (Preview)**.

FAQ about setting up Teams chat

Article • 08/04/2023

View answers to questions about setting up Teams chat in customer engagement apps.

How do I turn off Teams collaboration?

1. In Dynamics 365, go to one of the apps, and then perform the following steps.

   Customer Service admin center

   a. In the site map, in **Agent experience**, select **Collaboration**.

   b. In **Embedded chat using Teams**, select **Manage**.

2. Set the toggle to **No** for **Turn on Microsoft Teams chats inside Dynamics 365**.

3. Save your changes.

How do I turn on Teams collaboration for specific apps?

1. In Dynamics 365, go to one of the apps, and then perform the following steps.

   Customer Service admin center

   a. In the site map, in **Agent experience**, select **Collaboration**.

   b. In **Embedded chat using Teams**, select **Manage**.

2. On the **Microsoft Teams collaboration and chat** page, turn on the toggle for **Turn on Microsoft Teams chats inside Dynamics 365**.

3. Select **Turn on for selected Dynamics 365 apps**, and then select the desired apps.

   ⓘ Note

If you're using Teams chat for the first time or previously enabled the setting, Customer Service workspace and Customer Service Hub are preselected and appear in the list of selected apps.

4. Save your changes.

Enable Microsoft Teams meeting integration in Customer Service (preview)

Article • 06/22/2023

> **ⓘ Important**
>
> To use this feature, it must be turned on and the license terms must be accepted. **What are Preview features and how do I enable them?**
>
> A preview feature is a feature that is not complete, but is made available before it's officially in a release so customers can get early access and provide feedback. Preview features aren't meant for production use and may have limited or restricted functionality.
>
> We expect changes to this feature, so you shouldn't use it in production. Use it only in test and development environments.
>
> Microsoft doesn't provide support for this preview feature. Microsoft Dynamics 365 Technical Support won't be able to help you with issues or questions. Preview features aren't meant for production use and are subject to a separate **supplemental terms of use**.

The Microsoft Teams meeting integration feature allows your Dynamics 365 Customer Service agents to quickly access and update records in Microsoft Teams before, during, and after meeting with their customers.

By enabling this feature, you can help give agents and supervisors in your organization a cohesive, seamless experience between Dynamics 365 and Teams. Agents can use the meetings functionality to more efficiently meet their customers' needs.

Prerequisites

To enable Teams integration in Customer Service, the following prerequisites must be met.

- You must have a Dynamics 365 Customer Service license for your organization.
- As an administrator, you must configure the ability for agents in your organization to add and join Teams meetings in the Power Platform admin center app. More

information: Manage feature settings - Power Platform

- Optional: Configure the ability to sync calendars so that any meetings that are created in Dynamics 365 apps will show up on calendars in Microsoft Outlook and Teams. More information: Set up server-side synchronization of email, appointments, contacts, and tasks - Power Platform

Enable Teams meeting integration

Complete the following steps to enable Teams meeting integration.

1. a. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, in **Agent experience**, select **Collaboration**.

   b. In **Meeting integration using Teams (preview)**, select **Manage**.

2. Toggle **Show Dynamics 365 data in Teams meetings (preview)** to **Yes**.

3. Select **Save**.

As mentioned in the prerequisites, the following settings are displayed on the page:

- **Sync calendars**: This optional setting ensures that the meetings created in Dynamics 365 are added to Microsoft Outlook and Teams, and show up on agent calendars. More information: Set up server-side synchronization of email, appointments, contacts, and tasks - Power Platform
- **Add and join meetings**: This required setting ensures that an agent can create and join Microsoft Teams meetings directly from Dynamics 365. More information: Manage feature settings - Power Platform

> ⓘ **Note**
>
> The **Record and get insights** setting is only available in Dynamics 365 Sales apps where customers have a premium license.

Configure record side panel

The side panel helps agents quickly view and update details of the related record during a Teams meeting. The side panel displays notes, tasks, and activities associated with the record. As an administrator, you can customize the side panel to meet the needs of your agents. The record side panel supports only Contact, Opportunity, Lead, Account, and Case entities.

> ⓘ **Note**
>
> The record side panel can be customized by customizing the **In Context Form** of a table. The following table lists the supported and unsupported customizations for the side panel.

Supported customizations	Unsupported customizations
Define (add or remove) fields in the header.	Enable or disable tabs. Rearrange tabs.
Define (add or remove) fields in the Key Details section. Change a field label. Set a field requirement (for example, read-only).	Enable or disable tabs. Rearrange tabs. Add custom tabs or sections. Add sections other than Key Details, Contacts, Notes, Tasks, Collaboration, and Recent Opportunities. Add a web resource. Add a subgrid. Change the format or layout for headers, tabs, sections, or fields. Change certain properties for headers, tabs, sections, or fields. For example, the **available on phone** property can't be changed.

To customize the record side panel:

1. Sign in to Power Apps.
2. Select the environment, and then select **Dataverse** > **Tables**.
3. In the upper-right corner, select the dropdown list, and then select **All**.
4. Search for the required table and then select it to open it.
5. Go to the **Forms** tab and select the **In Context Form** form.
6. Edit the form to manage the fields that appear in the side panel. By default, all the fields in the form are editable. If you want to set a field as read-only, select the field, and then enable the **Read-only** property.

Enable Teams meetings to be added to your Outlook calendar

To see appointments in Teams, enable mailbox record integration by following these steps.

1. In Dynamics 365, go to **Settings** > **Email Configuration** > **Mailboxes**.
2. Select the mailbox record, and then select **EDIT** on the ribbon.
3. For **Appointments, Contact, and Tasks**, select **Server-Side Synchronization**.
4. Select the mailbox record, and then select **APPROVE EMAIL** on the ribbon.
5. Select the mailbox record again, and then select **TEST & ENABLE MAILBOX** on the ribbon.
6. Refresh the record until you see **Success** for the status. Then you can create an appointment with a Teams meeting and it'll be added to the Teams calendar.

Use Microsoft Teams Meeting integration in Customer Service

Configure AI suggestions for contacts in Microsoft Teams

Article • 09/20/2022

Agents can collaborate with other contacts directly through Microsoft Teams to quickly resolve customer issues. As an administrator, you can enable the Microsoft Teams collaboration feature to help them find the right contacts.

This feature uses the AI capability to automatically suggest contacts in real-time, based on the currently open active case or support conversation when agents explore contacts in the embedded chat experience.

> **Note**
>
> Through Teams, agents can connect and engage with customers also if Omnichannel for Customer Service is enabled.

How AI-suggested contacts works

The suggestions capability uses AI to recommend contacts who might be able to help agents resolve an issue described in an active case or a support based on similar cases those contacts have worked on. It uses similar case suggestions to find similar cases, and then identifies the most logical contacts based on a few factors related to the experience and proficiency of the contacts in resolving those similar cases, including the following:

- The number of similar cases that the suggested contacts have resolved. A higher number of similar cases that the suggested contacts have resolved might indicate that they have more experience in resolving the issue described in the cases or conversations.
- The similarity level of the similar cases to the active case. A higher similarity of the cases means that the similar cases the contacts have resolved are more related to the active case or conversation that agents are currently working on.
- How recently the suggested contacts have resolved the similar cases. More recent experience might indicate the contact has more current knowledge about resolving the issue described in the cases or conversations.

- The average time that the suggested contacts use to resolve similar cases. Less time spent in resolving similar cases compared to others might indicate that the contact is more familiar than others about how to resolve the issue type.

AI-suggested contacts works with a set of out-of-the-box AI models, so that admins can enable the feature by setting the toggle without the need for extra model training.

For more information about similar case suggestions that impact the AI-suggested contacts, see How AI suggestions for similar cases and knowledge articles work.

Regional availability and supported languages

The AI suggestions are supported in geographical locations that AI suggestions for similar cases supports. More information: Regional availability and service limits for Customer Service

The AI suggestions feature is supported in the following languages:

- Dutch
- English
- French
- German
- Italian
- Japanese
- Spanish

Prerequisites

- AI suggestions for similar cases must be enabled. More information: Enable AI suggestions for similar cases
- Tenant permissions to enable the enhanced integration with Microsoft Teams feature.

Enable collaboration with Microsoft Teams

To enable collaboration with Microsoft Teams and chat

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

a. In the site map, in **Agent experience**, select **Collaboration**.

b. In **Embedded chat using Teams**, select **Manage**.

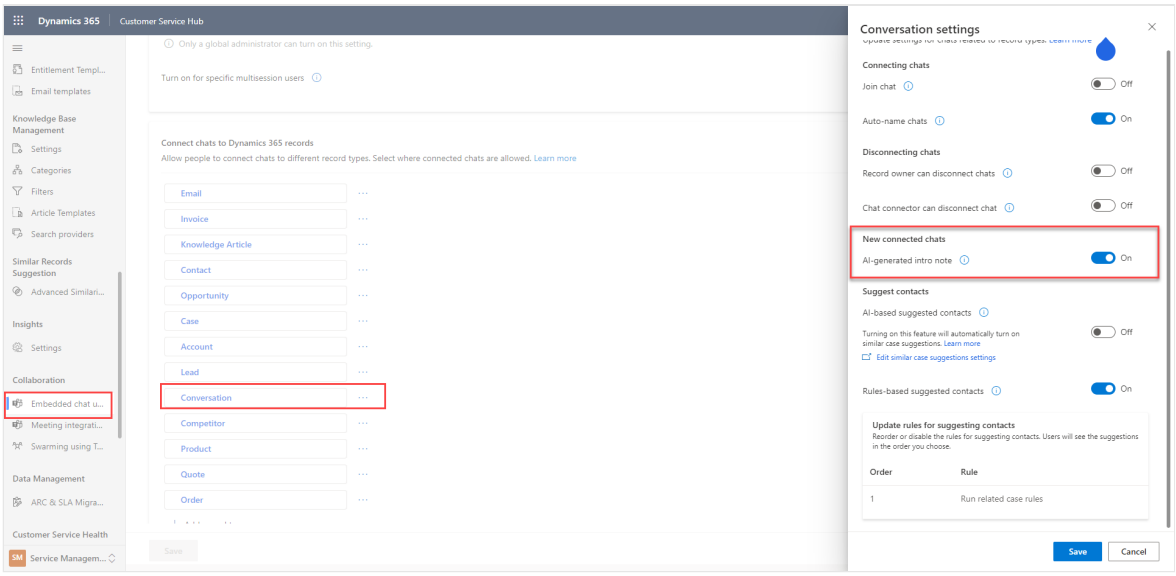
2. On the **Microsoft Teams collaboration and chat**, set the toggle for **Turn on the linking of Dynamics 365 records to Microsoft Teams channels** to **Yes**.

3. To get suggested contacts for active cases or supported conversations, perform the following steps:

   a. In **Connect chat to Dynamics 365 records**, select **Case** or **Conversation**. Based on your selection, the **Case settings** or **Conversation settings** pane appears on the right.

   b. In **Suggest contacts**, turn on the toggle for **AI-based suggested contacts**.

   It takes 24 hours for the data to be preprocessed for the first time use.



4. Optionally, set the toggle for **Turn on Enhanced Microsoft Teams Integration** to **Yes**. This setting lets agents pin records and views to a Teams channel directly from Dynamics 365 and also suggests agents who worked on similar cases.

5. Optionally, set the toggle for **Enable Confidential Labels** to **Yes** to create private Teams messages and add sensitivity or confidentiality labels in enhanced Microsoft Teams integration.

Configure rules-based suggestions for contacts in Microsoft Teams

Article • 07/22/2023

Agents can collaborate with other contacts directly through Microsoft Teams to quickly resolve customer issues. As an administrator, you can enable rules-based suggested contacts that are displayed when an agent starts a new connected chat. This feature can help agents in your organization to quickly find the right coworkers to collaborate with.

A maximum of 10 rules are supported per record type.

Turn on the suggested contacts for a record type

> **Note**
>
> For the case record type, there are two types of contact suggestions: AI and rules-based. Most record types enabled for connected chats only have rules-based suggestions. For more information about configuring AI-suggested contacts in Teams, see **Configure AI suggestions for contacts in Microsoft Teams**

To enable collaboration with Microsoft Teams and chat

1. In Dynamics 365, go to one of the apps and perform the following steps.

   Customer Service admin center

   a. In the site map, in **Agent experience**, select **Collaboration**.

   b. In **Embedded chat using Teams**, select **Manage**.

2. On the **Microsoft Teams collaboration and chat** page, set the toggle for **Turn on the linking of Dynamics 365 records to Microsoft Teams channels** to **Yes**.

3. To get suggested contacts for any record type, perform the following steps:

   a. In **Connect chat to Dynamics 365 records**, select record type for which you want to enable rules-based suggested contacts. Based on your selection, the relative settings pane appears on the right.

b. In **Suggest contacts**, turn on the toggle for **Rules-based suggested contacts**.

4. In the **Update rules for suggesting contacts** section, reorder or disable the rules for suggesting contacts. Users see the suggestions in the order you choose.

   - To reorder the rules, hover over a rule, and then select the up or down arrow to move the rules up or down, respectively.
   - To disable a rule, hover over a rule, and then select . When the rule is disabled, a check mark is displayed when you hover over the disabled rule.
   - To delete a rule, hover over the rule, and then select . Deleting a rule removes it entirely so it won't influence suggested contacts in the future.

5. Select **Save**.

Add a new rule

1. On the settings pane, in the **Update rules for suggesting contacts** section, select **Add new rule**. The **Add rule** pane is displayed for the record type you selected.

2. Type a **Rule name** for the rule. The name you enter displays on the contact, and also appears in the rule list.

3. Select from the following **Rule type** options:

   - **Relational**: Suggest a user who has a relationship with the linked record type or one of its related records. In the rule settings section, the dropdown allows you to select a user directly on the record type for which you're creating a rule or an entity that's related to it. You can select up to 10 related entities, each one being associated with the previous selection. Once you've selected a user, either on the record type or related entity/entities, you can save the rule.
   - **Custom**: You can use your own custom logic with a record type, and then apply it.

4. Select **Save**.

Use a custom action

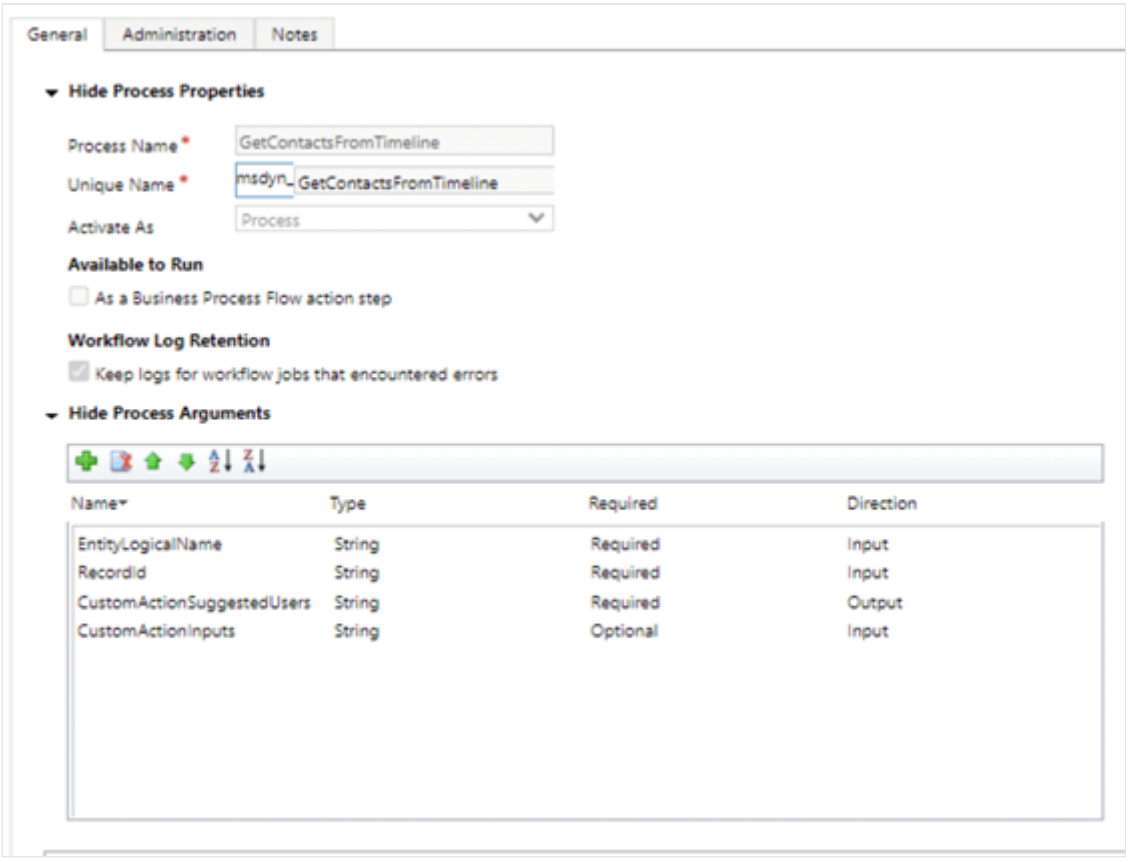
> ⓘ **Important**

We recommend that you have previous experience working with custom actions before configuring them for rules-based suggestions. More information: **Create or edit custom actions from a workflow**

You can call a custom action to handle advanced scenarios. The suggested contacts identifier passes along the ID and entity type as arguments, and expects the custom action to return users. In the rule settings section, type the name of an existing action.

To use the custom rule type, you must have an existing custom action that has the following arguments:

Name	Type	Required	Direction
EntityLogicalName	String	Required	Input
Recordid	String	Required	Input
CustomActionSuggestedUsers	String	Required	Output
CustomActionInputs	String	Optional	Input



The output, CustomActionSuggestedUsers, is a list of objects that follow this contract:

```
public class ContactSuggestionCustomActionOutput
  {
    public Guid AADUserId { get; set; }
    public Guid systemUserId { get; set; }
    public string description { get; set; }

    public ContactSuggestionCustomActionOutput(Guid AADUserId, Guid
systemUserId, string description)
    {
        this.AADUserId = AADUserId;
        this.systemUserId = systemUserId;
        this.description = description;
    }
  }
```

Language localization

To ensure that the user's language is localized, make sure they have Read privileges for the following entities:

- msdyn_contactsuggestionrule
- msdyn_contactsuggestionruleset

Set up auto-summarization for conversations

Article • 04/05/2023

Agents can collaborate with other agents and contacts directly while they're working in Dynamics 365 Customer Service. To help agents easily recap an ongoing customer interaction, turn on auto-summarization for conversations. Agents can generate a conversation summary when they either transfer a conversation, add a user to consult, or start a linked Teams chat. The summary quickly provides context and relays any steps they've already taken.

Components of an auto-summarize conversations

The conversation summary feature uses an AI natural language model to summarize a transcript of an active conversation. Summaries are limited to the first 7,000 characters of a transcript.

A summary includes the following components:

- **Issue description**: Summarizes the key customer problems to solve in a conversation. The model needs at least three customer messages to generate the issue description.
- **Resolution tried**: Summarizes any troubleshooting steps or possible solutions that agents have tried. If the model can't identify a resolution from the transcript, this section is blank. If the case is resolved or the conversation ends, the application displays this label as **Resolution**.

Regional availability and supported languages

The auto-summarization of conversations is available in United States and Europe.

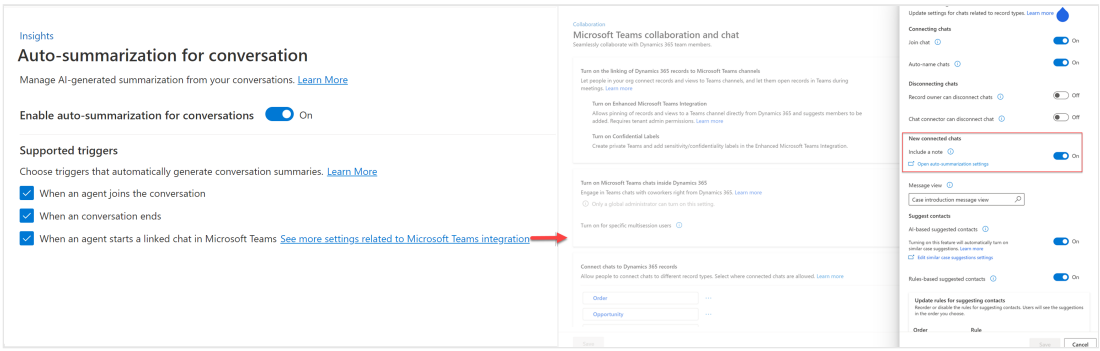
This feature is supported only in English.

Prerequisites

Tenant level access to enable the enhanced integration with Microsoft Teams feature.

Turn on auto-summarization for conversations

1. In Customer Service admin center, select **Operations** > **Insights**.
2. In **Insights**, select **Manage** next to **Auto-summarization for conversations**.
3. Turn on **Enable auto-summarization for conversations**. When you enable this option, agents can see **AI summary** in the communication panel of a session.
4. The **Supported triggers** section is displayed. Select the following options to define when you want the conversations to be summarized:
    - **When an agent joins the conversation**: To display the conversation summary when an agent has joined the conversation. This is applicable to conversations escalated to a human agent from a bot, transferred conversations, or when the agent invites a collaborator.
    - **When the conversation ends**: To display the summary when the conversation ends.
    - **When an agent starts a linked chat in Microsoft Teams**: To display the summary when the agent starts a linked Teams chat. Alternatively, you can select the **See more settings related to Microsoft Teams integration** link and turn on **Include a note** in the **Case settings** flyout of **Microsoft Teams collaboration and chat**.



Turn on the auto-summarization of Microsoft Teams conversations

You can also enable this feature from the Customer Service Hub app. Perform the following steps to enable aut-generated summary for Microsoft Teams chats:

1. In the site map, select **Service Management**.
2. In **Collaboration**, select **Embedded chat using Teams**.

3. In **Connect chats to Dynamics 365 records**, select **Conversation**.

4. In **Conversation settings**, in **New connected chats**, turn on **AI-generated intro note**.

Regional availability and service limits for Customer Service

Set up Join a Teams call for agent conversations with customers (preview)

Article • 10/02/2023

> **ⓘ Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and may have restricted functionality. These features are available before an official release so that customers can get early access and provide feedback.

Join a Teams call is a new feature that helps agents in your organization give their customers a more personalized support experience by using Teams to share their screen, cobrowse, and connect through video. Customers don't need to have a Teams license or previous experience using Teams.

Prerequisites

Ensure that the following prerequisites are met:

- Agents in your organization must be able to access and use Teams.
- Agents must be able to access the productivity pane to see the Join a Teams call app. More information: Assign templates and enable the productivity pane and channels
- If you want agents to be able to invite their customers to Teams meetings via email, their email must be configured for outbound email.

Set up Join a Teams call for agents

1. In Power Platform admin center, go to **Settings** > **Product** > **Collaboration**, and then toggle on **End users can join Teams meetings from appointments**.
2. In Customer Service admin center, go to **Agent experience** > **Collaboration**.
3. In **Join a Teams call**, select **Manage**.
4. On the **Join a Teams call** page, turn on the toggle for **Join a Teams call**.

5. If you want to enable the Join a Teams call feature for nondefault agent profiles, you must manually enable them. Select **Manage** next to **Turn on for specific multisession users.** More information: Add the Teams chat setting page for specific multisession users

6. Save the changes. The Join a Teams call feature is now enabled for Customer Service workspace.

Configure customer support swarming for complex cases

Article • 05/19/2023

> **ⓘ Important**
>
> To use this feature, it must be turned on and the license terms must be accepted. **What are Preview features and how do I enable them?**
>
> A preview feature is a feature that is not complete, but is made available before it's officially in a release so customers can get early access and provide feedback. Preview features aren't meant for production use and may have limited or restricted functionality.
>
> We expect changes to this feature, so you shouldn't use it in production. Use it only in test and development environments.
>
> Microsoft doesn't provide support for this preview feature. Microsoft Dynamics 365 Technical Support won't be able to help you with issues or questions. Preview features aren't meant for production use and are subject to a separate **supplemental terms of use**.

Customer support swarming is a way to quickly bring together experts across your business to help agents solve issues. As an administrator, you can enable your agents and subject matter experts to "swarm" together to resolve complex cases.

Customer support swarming is particularly useful when agents need to take the following actions:

- Collaborate with experts across your organization to get help on complex cases.
- Use an expert finder to locate experts with the right skills to help.

Some of the key benefits of customer support swarming include:

- Improved first contact resolution
- Reduced average time to resolution
- Accelerated on-the-job training for agents

Swarming features are available in Dynamics 365 Customer Service workspace, Customer Service Hub, and custom apps. Swarming works with either the Microsoft Teams desktop or web apps.

Prerequisites

The following licenses are required for the swarm feature.

- To configure the customer support swarming feature, you must have the Customer Service System Administrator role.
- Agents who use the swarm feature must have both a Dynamics 365 Customer Service Enterprise license and Microsoft Teams license.
- Experts who join a swarm must have a Teams license.

Guided setup experience for customer support swarming

If you're new to using customer support swarming, you can use the step-by-step guided swarm setup wizard to help walk you quickly through the configuration using default settings.

If this is your first time accessing the guided setup, follow these steps:

1. In Customer Service admin center, go to the sitemap, and then in **Agent experience**, select **Collaboration**.
2. On the **Collaboration** page, on the top banner, select **Get started**. The swarm set-up page is displayed.
3. Follow the wizard to complete the setup.

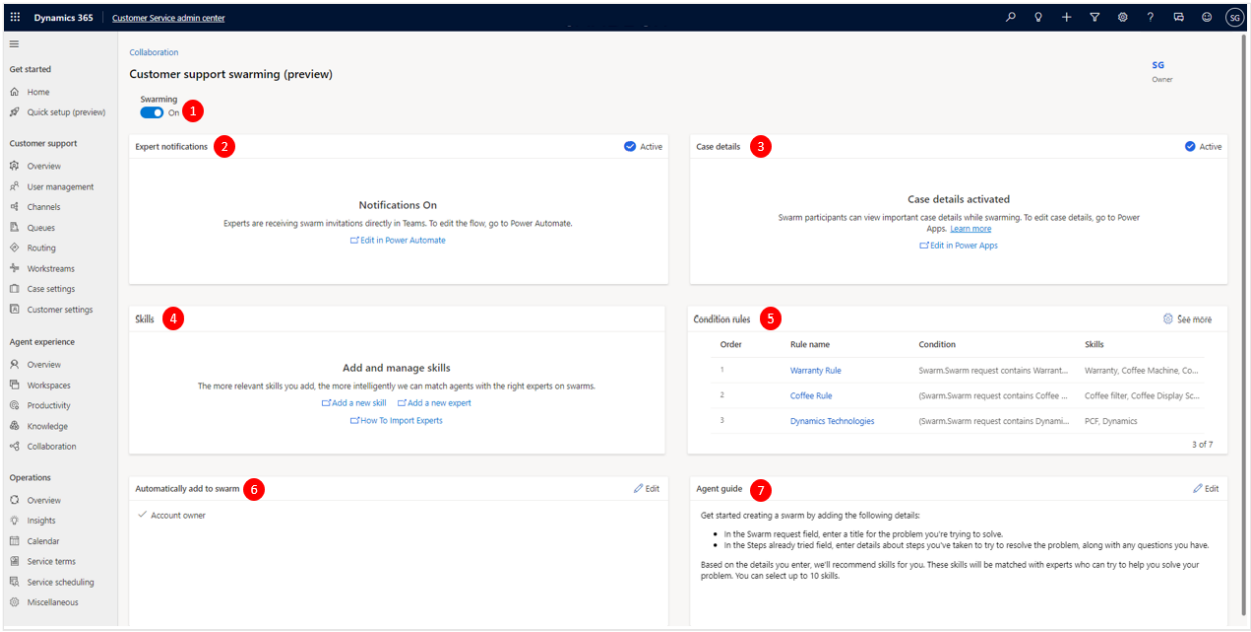
You can alternatively choose to opt out of the wizard by selecting **Skip setup**.

If you've completed at least one setup, or previously chose to skip the setup, you can launch the guided experience again using the following steps:

1. On the Collaboration page, next to Customer support swarming (preview), select **Manage**. The Customer support swarming (preview) page is displayed.
2. On the right side of the page, select **Manage setups**. The Swarming setups page is displayed.
3. Select **Start new**, and then follow the wizard to complete the setup.

Overview of the customer support swarming page

Use the following image and legend to understand the layout of the customer support swarming page.



Legend

Number	Functionality	Description
1	Swarming toggle	Turns on the swarming feature.
2	Expert notifications	The Power Automate flow that turns on and manages swarm invitations that are sent to experts.
3	Case details	Add out-of-box case fields. Administrators can configure which case fields show on the form.
4	Add and manage skills	Add relevant skills to help match experts for swarming. Onboard coworkers outside of your team as experts (through mapping or bulk-importing) so they can be recommended for swarms.
5	Condition rules	Conditions that define which skills to attach to swarms. The attached skills are then used to find and invite experts to swarms.
6	Automatically add to swarm	Team contacts automatically added to swarms because of their relationship to the customer or the agent assigned to the issue.
7	Agent guide	Administrator-provided guidance to help agents know what content to include to begin a swarm or manage the swarm process.

To configure customer support swarming, you must have administrator privileges and complete the following steps.

1. Turn on the Embedded chat using Teams feature for Microsoft Teams desktop or web apps.
2. Activate case details on swarms
3. Turn on the swarm expert notification flow in Power Automate

Turn on Embedded chat using Teams

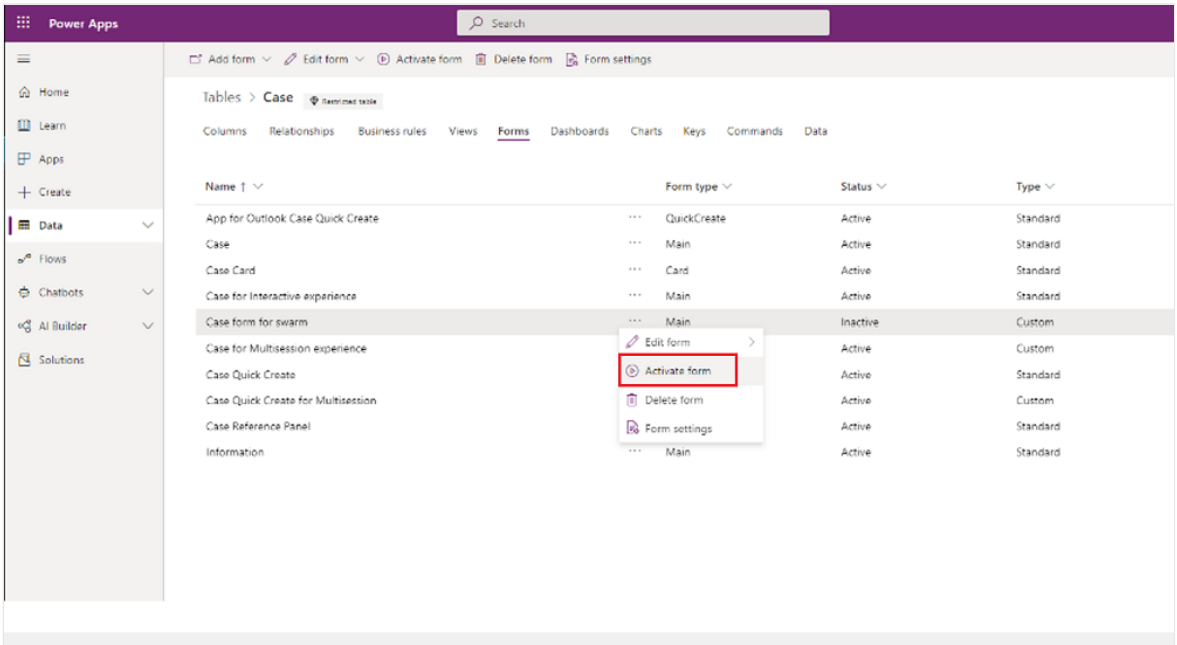
You can set up Embedded chat using Teams in the Customer Service admin center. The settings you configure for embedded chat using Teams in the Customer Service admin center app are carried over to the Customer Service Hub app.

1. Select **Collaboration** in the site map. The **Collaboration** page is displayed.
2. Next to **Embedded chat using Teams**, select **Manage**.
3. Set the **Turn on Microsoft Teams chats inside Dynamics 365** toggle to **On**.

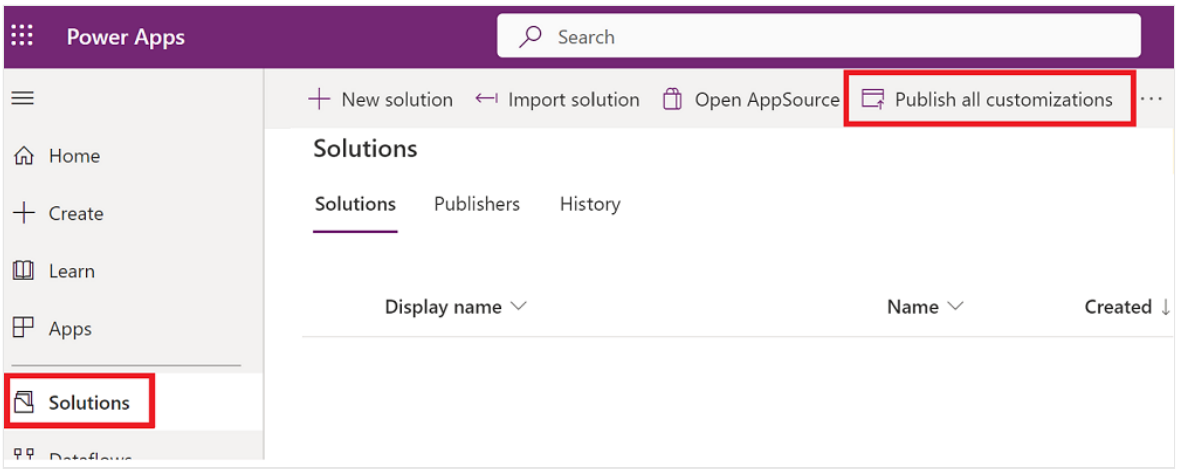
Activate case details on swarms

If you haven't already activated the case details for the swarm form, perform the following steps.

1. Select **Collaboration** in the site map. The **Collaboration** page is displayed.
2. Next to **Customer support swarming (preview)**, select **Manage**. The **Customer support swarming (preview)** page is displayed.
3. On the **Case details** card, select **Activate case form for swarming**.
4. Select the **Case form for swarming** form, select the ellipsis, and then select **Activate form**. The form becomes active.



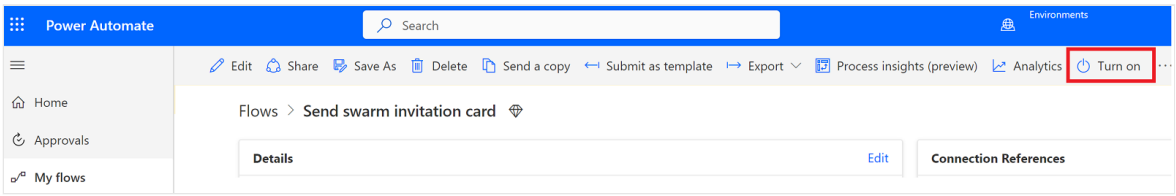
5. Go to the **Solutions** tab and select **Publish all customizations**.



Turn on the swarm expert notification flow in Power Automate

To ensure that swarm experts receive invitations directly in Teams, turn on the Microsoft Power Automate flow for swarm expert notifications. Perform the following steps.

1. On the **Customer support swarming (preview)** configuration page, go to the **Expert notifications** card.
2. Select the **Edit in Power Automate** link. The **Case form for swarming** page is displayed.
3. After completing the edits, select **Save**.
4. Return to the main form and select **Turn on** to activate the flow.



> **Note**
>
> You can configure various administration sections without turning on swarming. This is useful in ensuring you've fully configured the feature before enabling the feature. Once enabled, it appears on the agent's desktop, which might cause issues if it's not fully functional.

Edit case details

When an agent creates a swarm, the system includes fields from the related case and account to provide more context for the swarm participants who join.

You can configure which case fields to include as part of the swarm form. Out of box, the following fields are included:

- Account
  - Customer Name
  - Email
  - Phone number
- Case
  - Case title
  - Case number
  - Subject
  - Customer priority
  - Status
  - Product
  - Case description

To configure case details, perform the following steps:

1. On the **Customer support swarming (preview)** configuration page, go to the **Case details** card.
2. Select **Edit in Power Apps**.
3. Select **Case form for swarming** from the list, and then select **Edit** either from the command bar or by selecting the ellipsis next to the form.
4. Edit the form. When finished, select **Back**.
5. Select the **Solutions** from the site map, and then select **Publish all customizations**.

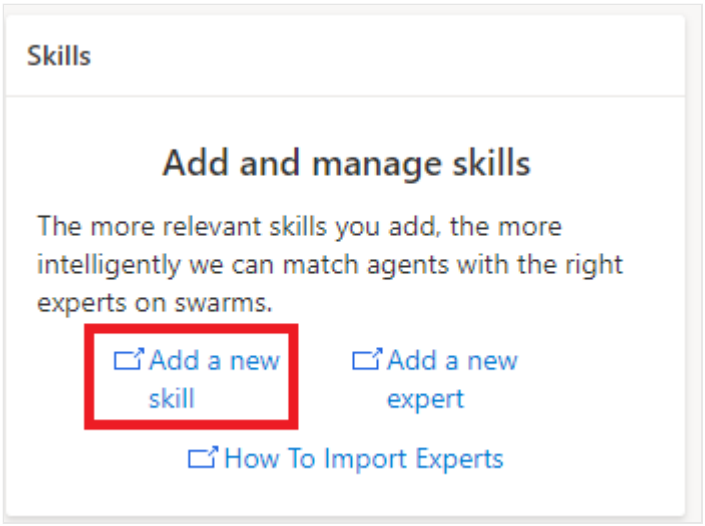
Add and manage skills

If your organization is already using skills in resource scheduling or Omnichannel for Customer Service, you can reuse the skills to define swarm rules.

If you haven't already configured skills, then complete the following steps.

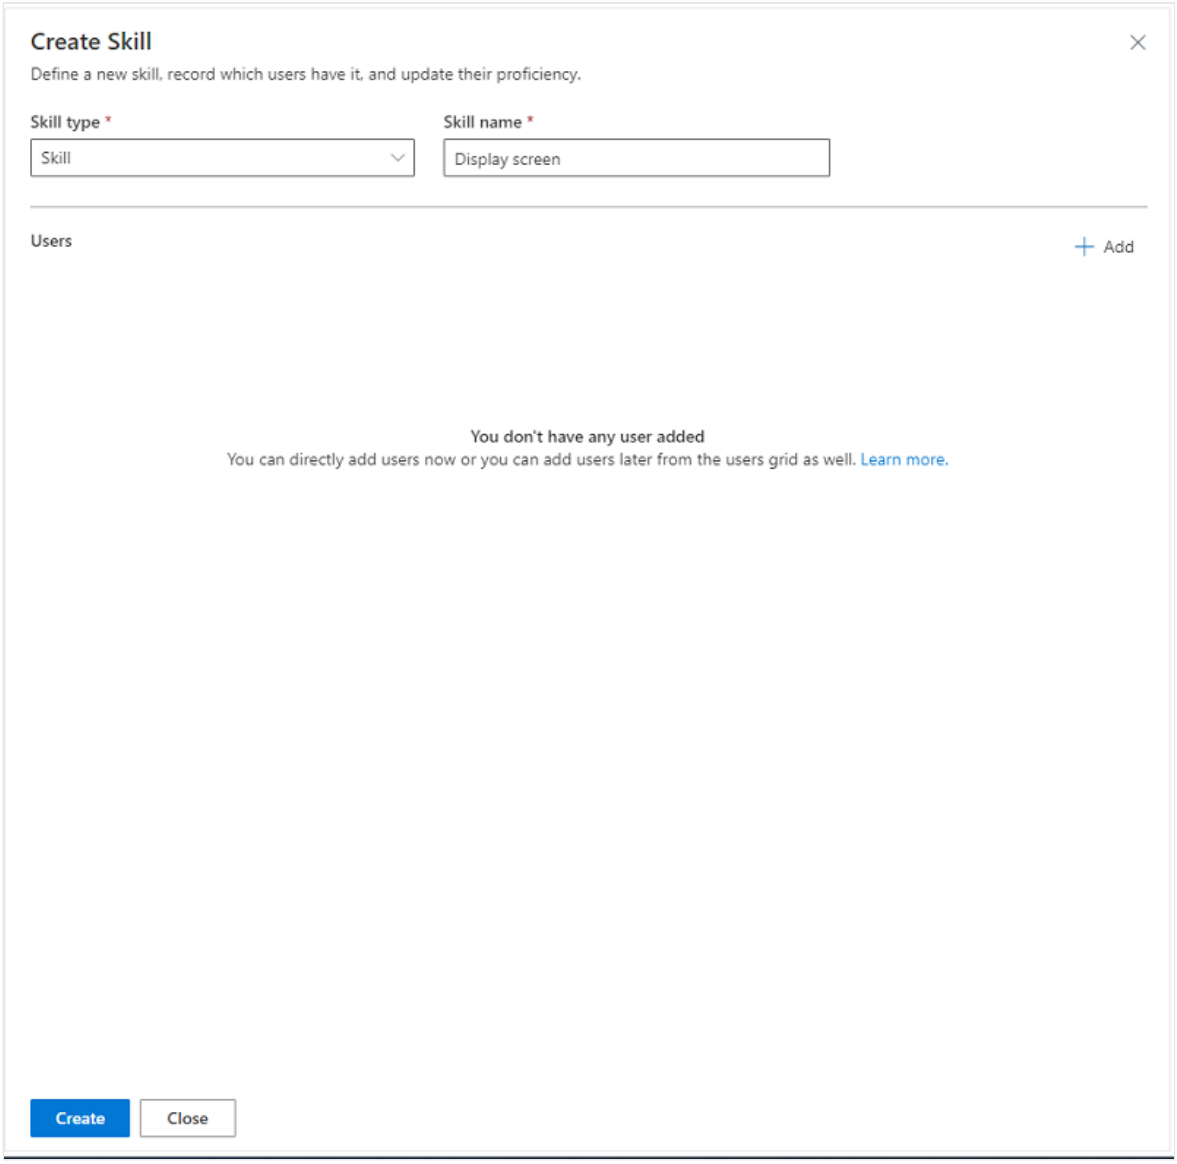
1. On the **Customer support swarming (preview)** configuration page, go to the **Skills** contact card.

2. Select the **Add a new skill** link.



3. On the **Skills** page, select **Create**.

4. On the **Create Skill** page, select the **Skill type**, and then in the **Skill name** field, type a name for the skill.



5. Select **Create**.

Attach the new skill to an expert

To use the new skill in customer support swarming, you must attach it to a user.

1. On the **Edit Skill** page, in the **Users** section, select **+ Add**.
2. On the **Add Users** page, select the user type from the dropdown list.
3. Select the name of the user you want to add, and then select **Add selected users**.
4. Select **Save**.

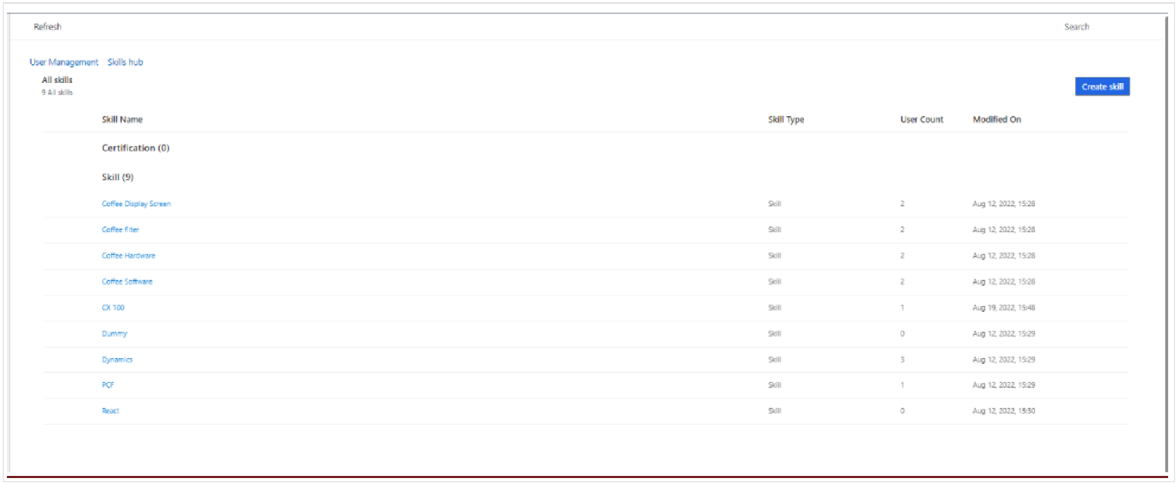
Bulk import skills (optional)

If the skills you want to use to match experts to swarms are stored in another system outside of Dataverse, you can import them using Excel using the following steps.

1. In the Customer Service admin center site map, select **User management**. The **User management** page is displayed.

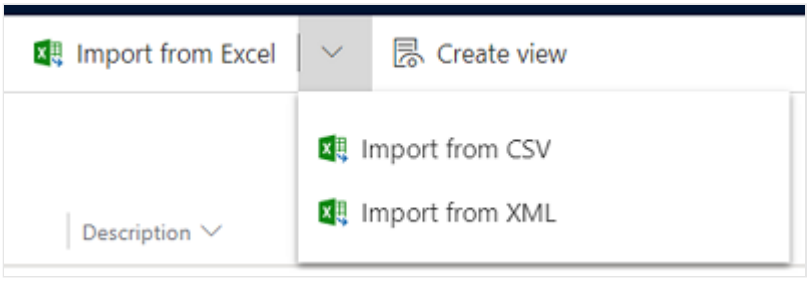
2. Next to **Skills**, select **Manage**.

3. On the skills page, select the list of skills, and then select **Export to Excel**.



4. Add the needed skills to the spreadsheet, and then save it.

5. Import it using the **Import from Excel** wizard.

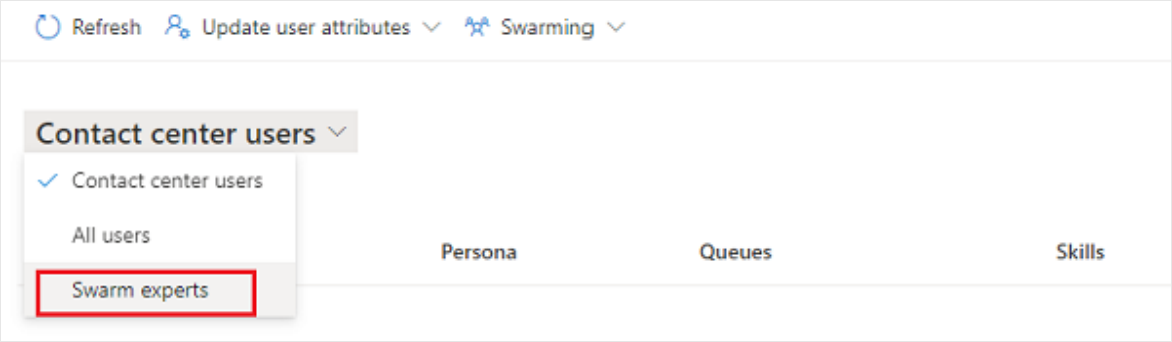


Add experts

If your organization is already using bookable resources in resource scheduling or omnichannel, you can reuse the resources to define your swarm rules.

If you haven't already configured experts, then perform the following steps.

1. On the **Customer support swarming (preview)** configuration page, go to the **Skills** card and select **Add a new expert**.
2. On the **Contact center users** page, select **Swarm experts** from the dropdown menu.



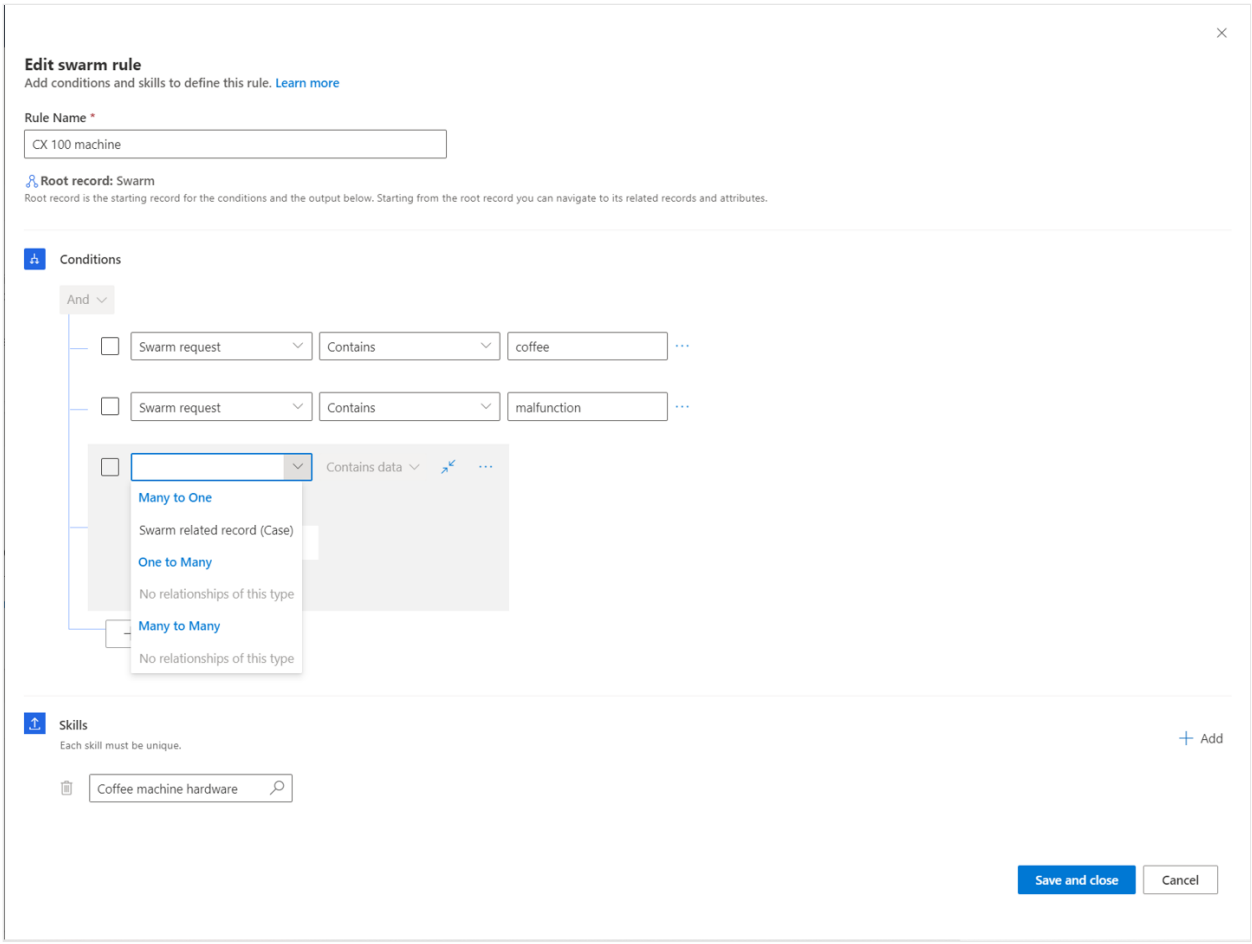
Bulk update skills

If you want to update the skills for multiple experts, you can update them in bulk using the following steps.

1. On the **Customer support swarming (preview)** configuration page, go to the **Skills** card and select **Add a new expert**.
2. On the **Contact center users** page, select **Swarm experts** from the dropdown menu.
3. Select the users you for which you want to bulk update the skills, and then on the command bar, select **Update user attributes**.
4. On the **Update Skills** page, select the skills and proficiency levels from the dropdown list, and then select **Save**.

Define condition rules

You can define swarm rules that identify the skills that should be suggested when an agent makes a swarm request. Expert suggestions are defined with the goal of finding the minimum set of experts in your organization who match the maximum number of skills suggested for a swarm.

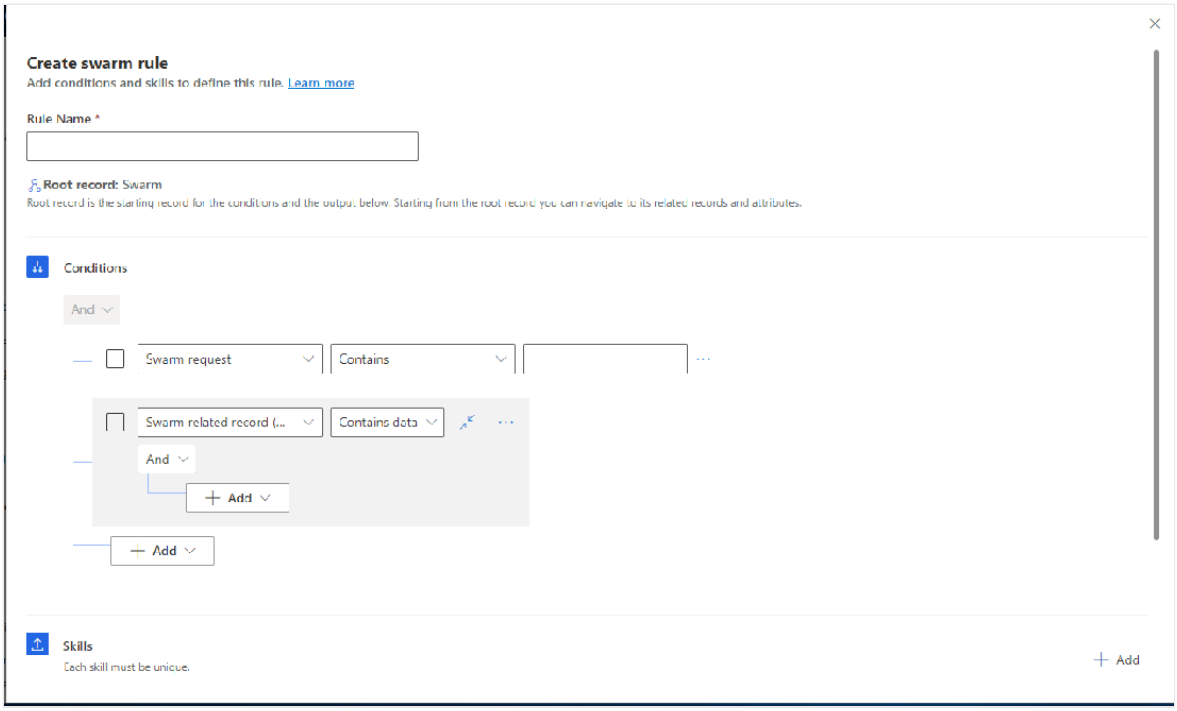


The following aspects apply to swarm rule configuration.

- Only the top three rules are shown on the main swarm page. To view more rules, select **See more**.
- You can define rules based on the related case and account attributes. By default, the swarm request, or the question the agent needs help with, is automatically suggested as one of the conditions.
- Depending on the rules you define, you can add one or more specific unique skills.
- When skills are being matched, the system runs through all possible rules, up to 100 rules.
- Rules are run in the order in which they're listed. As an administrator, you can reorder, edit, delete, or copy rules.

To add a new rule, perform the following steps.

1. On the **Condition rules** card, select **See more**.
2. On the **Condition rules** page, select **Create rule**. The **Create swarm rule** page is displayed.



3. Add a name for the rule, and then add the conditions and skills to define the rule.

4. To add a new skill from the rule builder, do the following:
   a. In the **Select skills** field, select the search icon. A **Lookup Records** pane is displayed.
   b. In the **Look for characteristic** field, select the search icon. A list of **Characteristics** is displayed.
   c. Select the characteristics you want, or select **Advanced lookup**. A page opens where you can choose skills (characteristics) using **Add new record**. If you choose **New characteristic** on the **Lookup records** pane, you have to leave the current page to create the new skill.

How contacts are added automatically to swarms

In addition to matching skills to find experts, by default, the system adds out-of-box contacts to the swarm. These participants are added to the swarm automatically without a swarm invitation. Typically, their role is to observe the swarm process and provide customer information if needed, or manage customer communications.

Swarm contacts can optionally include any of the following persons.

- The agent's supervisor. (This person can be the same for many agents on the team). If a supervisor isn't identified for the agent, the administrator who enabled the swarm is automatically added.
- The administrator of the team the agent is a member of.

- The owner of the related account.

Edit the agent guide

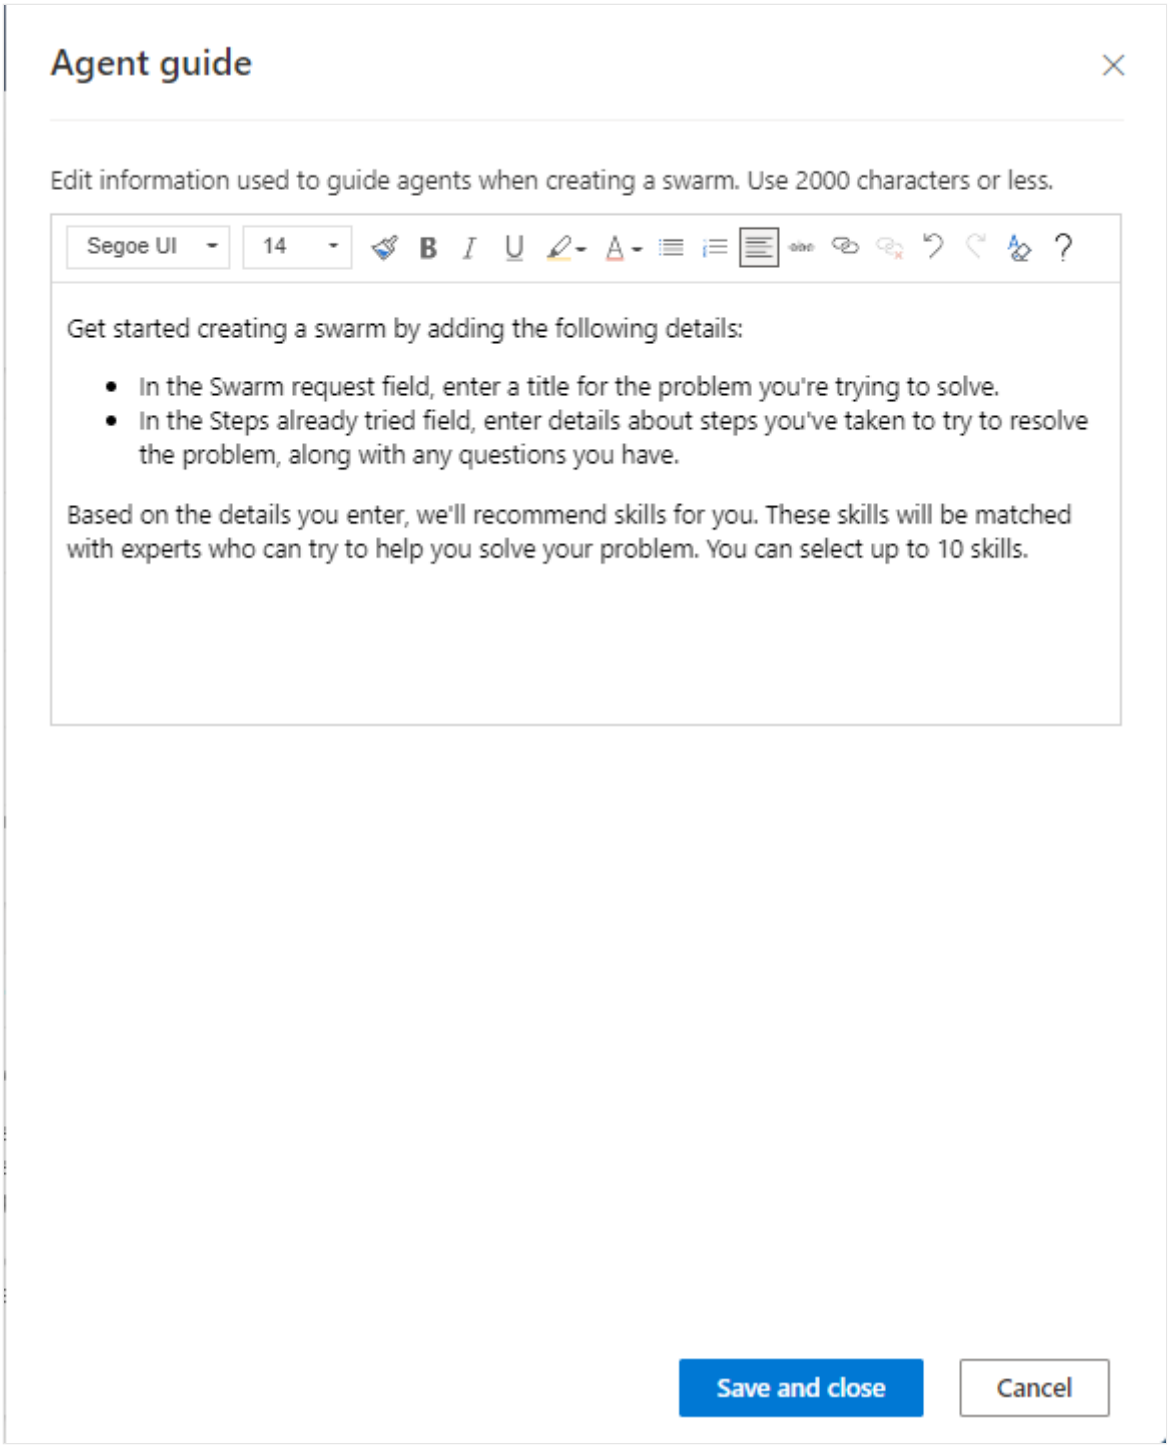
The agent guide is the direction provided by you, as the administrator, that appears in the swarm form when the agent opens it. The agent guide helps ensure that your agent types the right questions. It provides helpful context to effectively match skills and experts.

When creating the agent guide, keep the following things in mind:

- You can edit the guide content, and the guide you create will apply to all different swarm types. It can't be further customized.
- The guide template is rich text-enabled.
- The guide template has a 2,000-character limit.

To create the agent guide, perform the following steps.

1. On the **Agent guide** card, select **Edit**. The **Agent guide** page is displayed.



2. Type your details, and then select **Save and close**.

Grant swarm privileges for agents

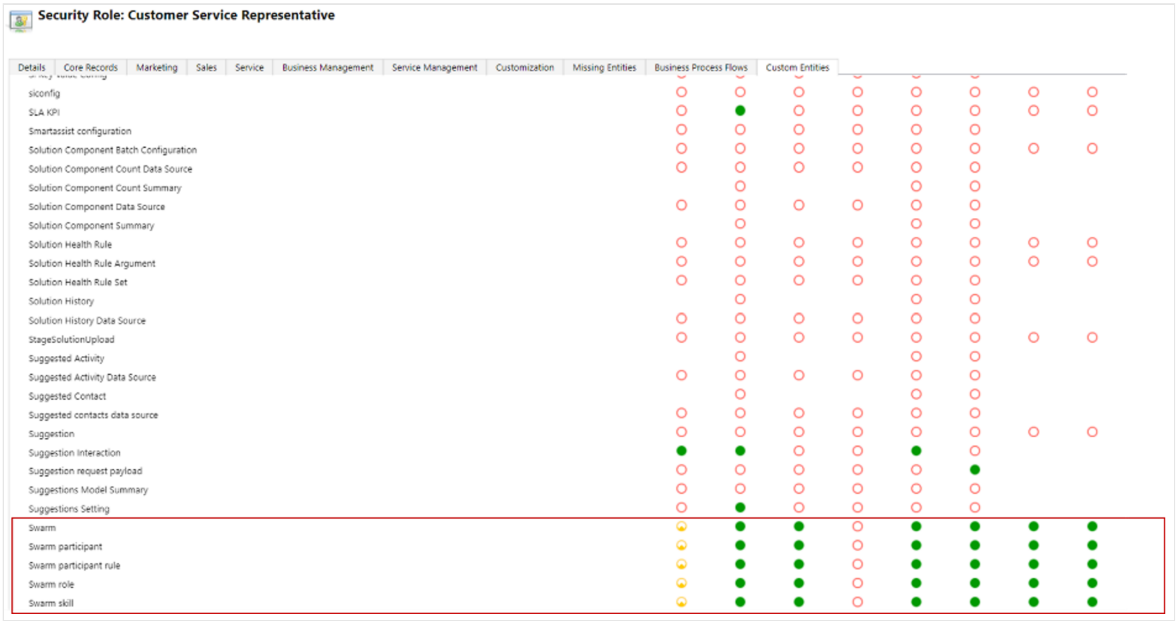
Agents need specific privileges to ensure that they can effectively swarm. Use the following table to understand the privileges and types.

Swarm privilege	Privilege type
Swarm	Read, create, update, share
Swarm participant	Read, create, update, share

Swarm privilege	Privilege type
Swarm participant rule	Read
Swarm skill	Read, create, update, share
Swarm role	Read
Characteristic	Read
System user	Read

To set up swarm privileges for agents, perform the following steps.

1. Go to Power Platform admin center, and then in **Environments** > **Environment name**, select the ellipsis, and then select **Settings**.
2. In **Users + permissions**, select **Security rules**.
3. Select the security role (for example, **Customer Service Representative**), and then select the following roles to apply the following privileges:
    - Swarm
    - Swarm participant
    - Swarm participant rule
    - Swarm role
    - Swarm skill



4. Select the **Service** tab, and then for **Characteristic**, select the security privileges.
5. Save and publish your changes.

Turn on the swarm feature on the Customer support swarming page

1. Select **Collaboration** in the site map. The Collaboration page is displayed.
2. Next to **Customer support swarming (preview)**, select Manage.
3. Set the **Swarming** toggle to **On**.

Use customer support swarming

Use Teams chat in Customer Service

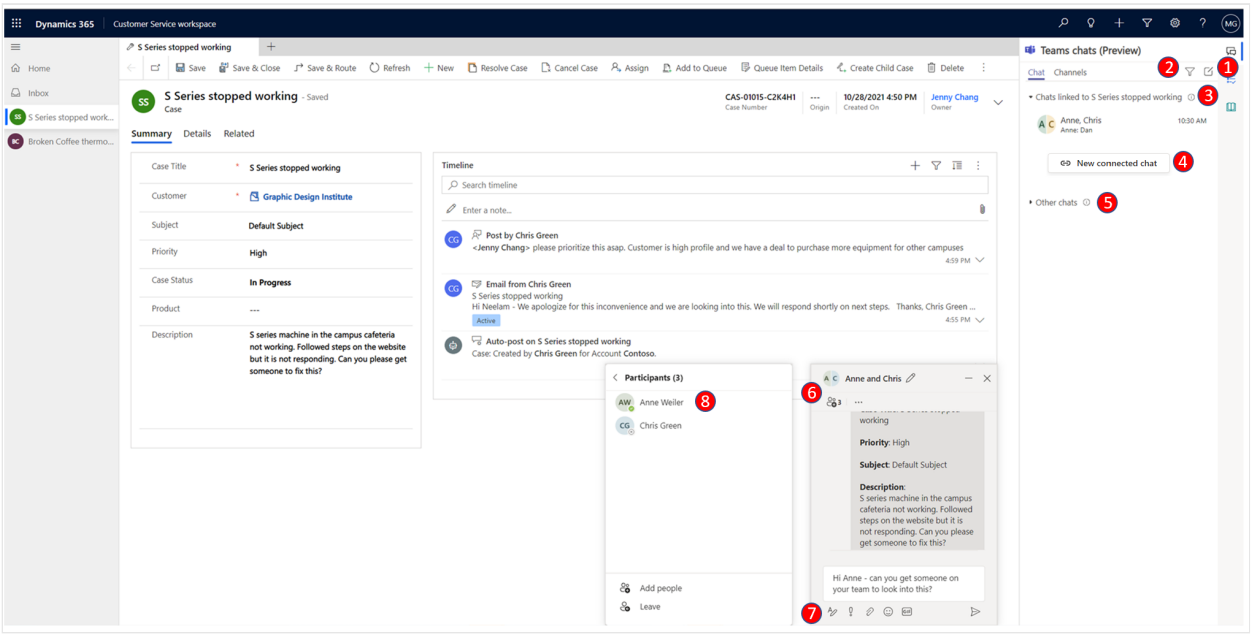
Article • 10/03/2023

As an agent, you can chat in Microsoft Teams from within Dynamics 365 Customer Service Hub, Customer Service workspace, and any custom app. While working on customer records, you can start a new chat or connect an existing chat to a record, and thus collaborate efficiently without switching context or leaving the application. Connecting all the associated chats to a record can help you maintain all the conversations related to the record in one place.

> **Note**
>
> This feature must first be enabled by an administrator, and you must have certain permissions to access Teams data. More information: **Configure Teams chat in Customer Service**

Agent overview of key features for Teams chat

The following image displays the key features of the agent Teams chat experience.



The following legend describes the numbered callouts in the above image.

Number	Feature	Description
1	New chat	Create chats that aren't associated with any Dynamics 365 records.

Number	Feature	Description
2	Filter	Filter chats by name.
3	Chats connected to other records	Chats that are associated with other Dynamics 365 records that the current user is a part of. Users can prioritize responses to these chats over other chats.
4	New connected chat	Start a new chat that is connected with the record. These chats can only be viewed in Dynamics 365 by the chat participants.
5	Other chats	Chats that aren't connected to any records or started from Teams.
6	Chat control	Allows users to multi-task across chats.
7	Basic Teams functions	Format, use emojis or .GIFs, set delivery options, and attach files.
8	Add/remove participants	Select who participates in the chat and who doesn't.

Open Teams chats that are related to a record

You can open any Dynamics 365 Customer Service record and select the **Teams chats and channels integration** icon. The **Teams chats** panel opens with the following sections in the **Chat** tab:

- Chats connected to the record: Lists Teams chats that either you've connected to the selected record or someone else has connected a chat with you as a participant.
- Suggested contacts: Lists suggested contacts depending on the users who are working on the record. For more information, see Use suggested contacts to collaborate with the right coworkers.
- Other chats/All recents: Lists your top 50 chat conversations on Teams. You can select any existing conversation and connect it to a record.

Start a new connected chat

You can start a new connected chat or convert an existing Teams chat into a connected chat to associate the chat with a Dynamics 365 record. Standard record types, including case, conversation, account, contacts, knowledge article, and email, are available out of the box, or your administrator can add your desired record type.

Your administrator can configure an optional message that you can send when using the chat to start a collaboration. This message helps you to share succinct, read-only context with your collaborators on Teams.

If you're using Teams for the first time within Customer Service Hub or Customer Service workspace, you can select the blue bubble, and then follow the interface guidance.

1. Open any Dynamics 365 Customer engagement record, and then select the **Teams chats and channels integration** icon. The **Teams chats** panel opens.

   - You can access the embedded chat from Customer Service Hub and custom apps. When you select the Teams chat icon, the chat pane opens as an app in the right-side pane.
   - If you're in a multisession app, such as Customer Service workspace, you can access the chat pane directly from the productivity pane.

     > ⓘ **Note**
     >
     > You can also access the chat pane from the home session in Customer Service workspace. When using the chat pane from the home session, you'll see two sections: Chats connected to records and Other chats (if enabled by your administrator).

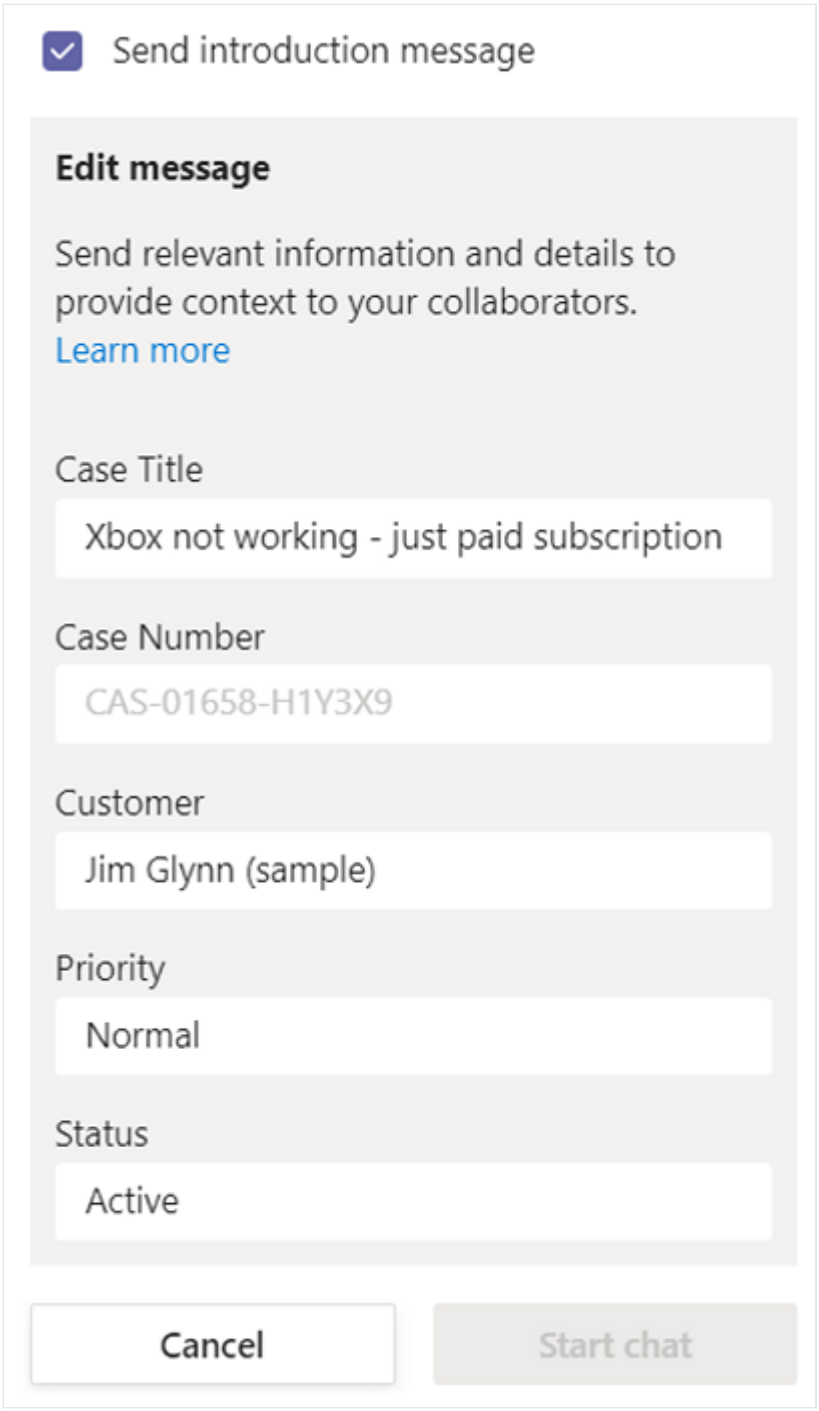
2. Use one of the following methods:
   a. To start a new connected chat with a participant, select **New connected chat** in the **Chats connected to record** section. Type the name(s) of the participant(s) you want to chat with. You can start with just one collaborator and then progressively add more as needed (see step 6). Every new connected chat starts fresh, without bringing context from one-to-one chats or other chats you may have had with the participants. Therefore, it's important to name your chats appropriately to match the context of the record and conversation. For more information, see step 3.

   b. To start a connected chat with a suggested contact directly on the chat list, select the contact with whom you want to chat.

   > ⓘ **Note**
   >
   > You can only connect group chats to records. Direct, one-to-one chats can't be connected, and will instead display an option to start a new connected chat with that contact.

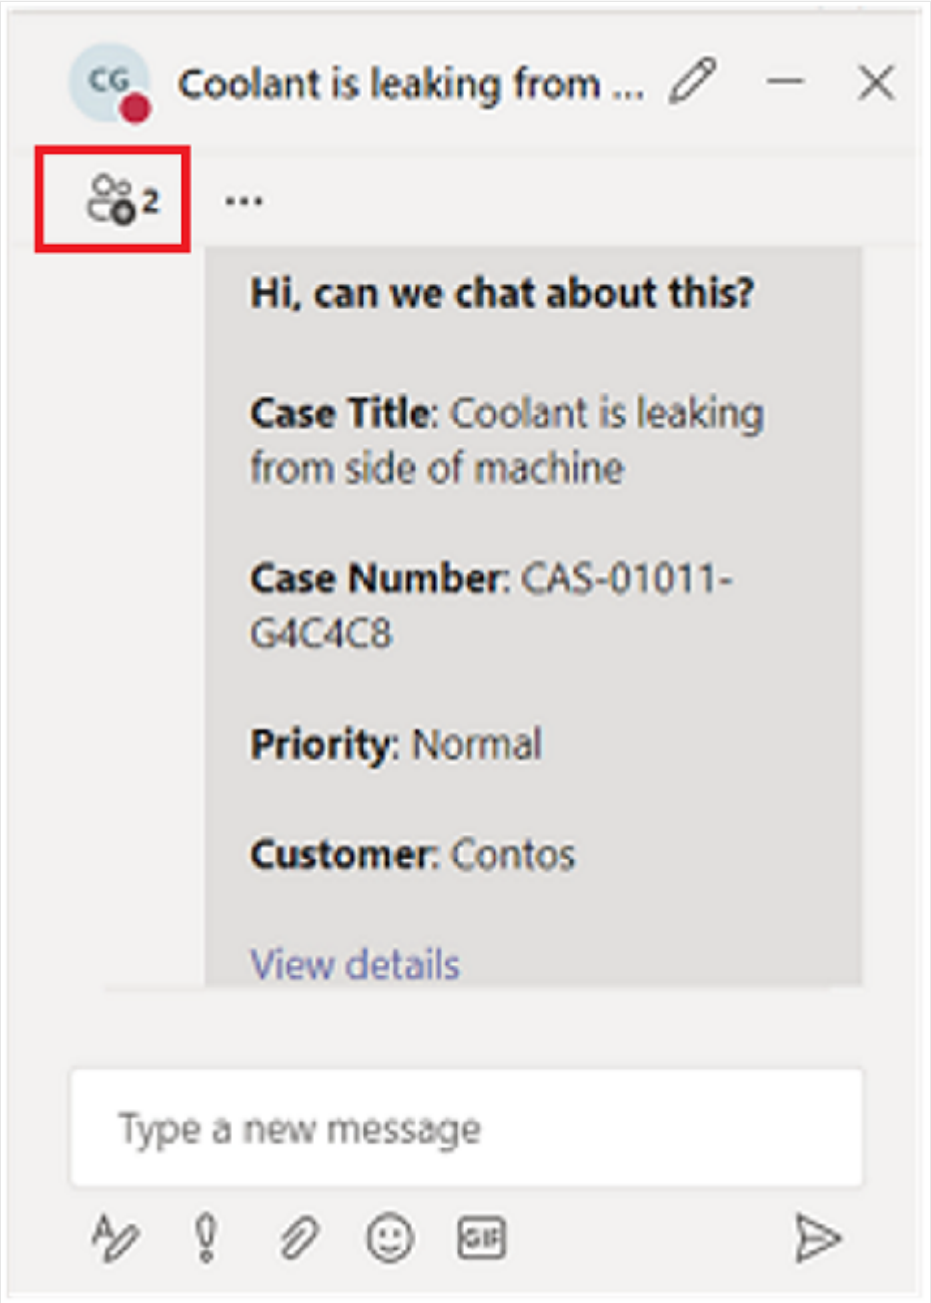
3. The chat name uses the record name or the participants' name, depending on the configuration that your administrator has set up. To set the chat name as the record name, you can ask your administrator to turn on the **Auto-name chats** setting. You can modify the chat name. Provide a meaningful name to the chat so that you can identify the chat, even on Teams. The name also helps your collaborators on Teams to easily identify chats that are associated with Dynamics 365 records.

4. Your administrator can configure an optional note that you can send when using the chat to start a collaboration. The introduction note uses selected data fields from the associated record. This note helps you to share succinct, read-only context with your collaborators on Teams. The note also includes a link to view the associated record in Dynamics 365. If your collaborators have a Dynamics 365 license and access to the record, they can view the full record details in a browser tab.



5. To convert an existing group chat into a connected chat, select a chat from the **All recents** section. Select the **More Commands** ellipsis (...), and then select **Connect chats to record**.

6. (Optional) You can add more participants to the chat directly from the chat control by selecting the **View and add participants**.



Connect or disconnect an existing chat from a record

You can connect a chat to a single record or multiple records. For example, if you have a chat about a case that turns into a work order, you can also connect the chat to the work order. If you decide later that you don't want the chat to be connected to the case, you can disconnect it if your administrator grants you permission to do so.

- To connect a chat to a record, select ellipses next to the chat, and then select **Connect to this case**.
- To disconnect a chat from a record, select ellipses next to the chat, and then select **Disconnect from this case**.

Understand how disconnected chat rights are assigned

As an agent, you have the following three options for getting rights to disconnect chats, all of which your administrator controls.

- You're the record owner, and your administrator enables this capability.
- You're the most recent user to connect the chat to the record, and your administrator enables this capability.
- Your administrator assigns the right to disconnect chats to you if you need the ability to disconnect chats from records.

If your administrator hasn't assigned any of the above rights to you or your role, you won't be able to disconnect any chat that you or other users have connected to records. If you need the ability to disconnect chats from records, ask your administrator to assign the rights to you.

Use suggested contacts

The suggested contacts list displays users who are connected or have interacted with the record. Suggested contacts might include a team administrator or members who have logged an activity in the record timeline, and so forth. There are two different types of suggestions: AI-based and rules-based. For more information, see Use suggested contacts to collaborate with the right coworkers.

Connect a Teams channel to a record

The **Channels** tab lists the channels that either you've connected to the selected record or someone else has connected a channel where you're a participant. If you've connected a record to a channel using basic or enhanced collaboration experience, that channel is also listed in this tab.

You can connect relevant Teams channels to a record, so that all the members can easily access the connected channels from the record and follow the conversation.

1. Open any Dynamics 365 Customer Service record, and select the Teams chat icon.
   The **Teams chats** pane opens.
2. Select the **Channel** tab. The tab lists the channels that are already connected to a record.
3. Select the **Connect a channel** icon in the upper-right corner of the Teams chats pane.

The **Collaborate with Microsoft Teams** dialog opens.

4. To start a new connected channel, select **Create a new connection**.
5. To connect an existing channel, select the channel from the list, and then select **Start collaboration**.

Join a chat

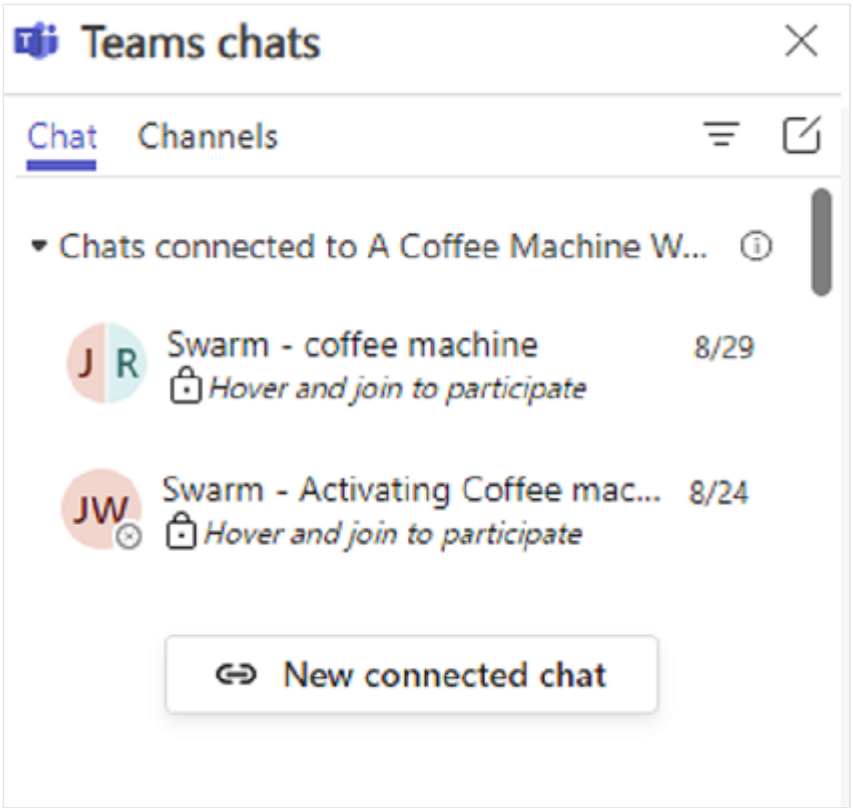
As an agent, you can view and easily join chats that are connected to a record you have write access to, even if you weren't originally a participant in the chat. Some scenarios where this feature can be useful include:

- **Case transfers**: If you've onboarded to a case that another agent previously handled, you can join the chat to better understand the context of the case, and then continue to collaborate with your relevant colleagues.
- **Case escalations**: If a case needs attention from someone with specific knowledge, the subject-matter expert who reviews it can participate in the relevant conversations.

> ⓘ **Note**
>
> You can only join connected chats, and to do so, you must have write access to the record and your administrator must have turned on the Join Chat capability for the record type for which you want to join an existing connected chat.

To join a connected chat:

1. Open the record for which you want to join the chat.
2. In the **Teams chats** page, go to any of the connected chats you want to join. A lock icon is displayed with text that says "Hover and join to participate." When you hover over the lock icon, if you have write access to the associated record, a **Join** button is displayed.

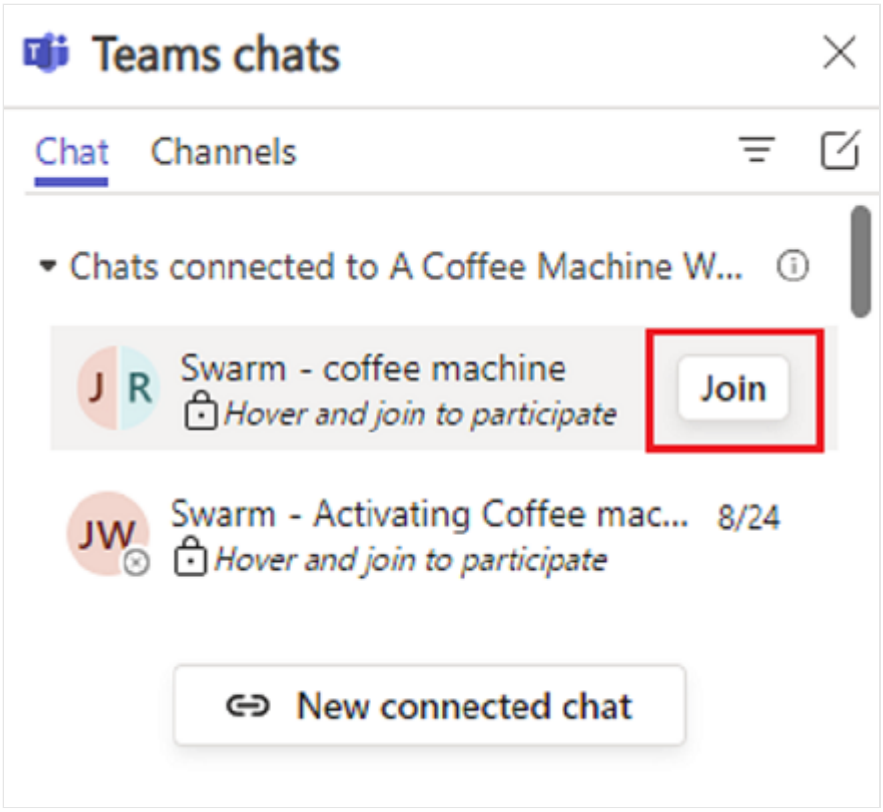


Note

If you don't see the text that allows you to hover and join a chat, there are three possible reasons for this:
- Your administrator hasn't enabled Join chat capability for the entity.
- You have read-only access to the record.
- Both scenarios in 1 and 2 apply.

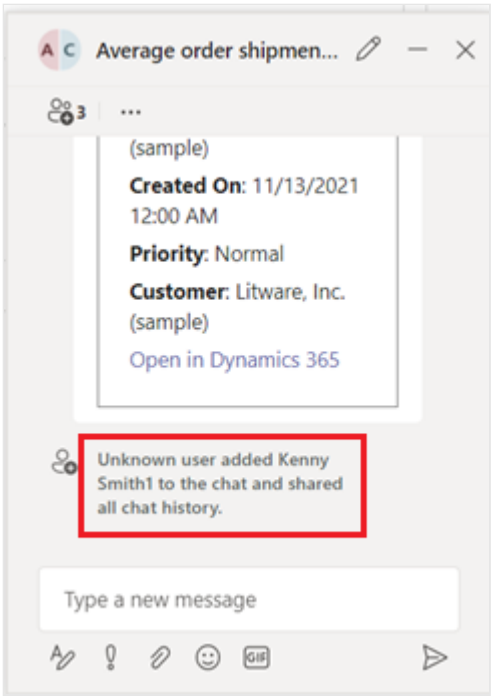
In any of these scenarios, you can ask a member of the chat to manually add you, or you can ask your administrator to turn on the Join chat setting for that record type.

3. Select **Join**.

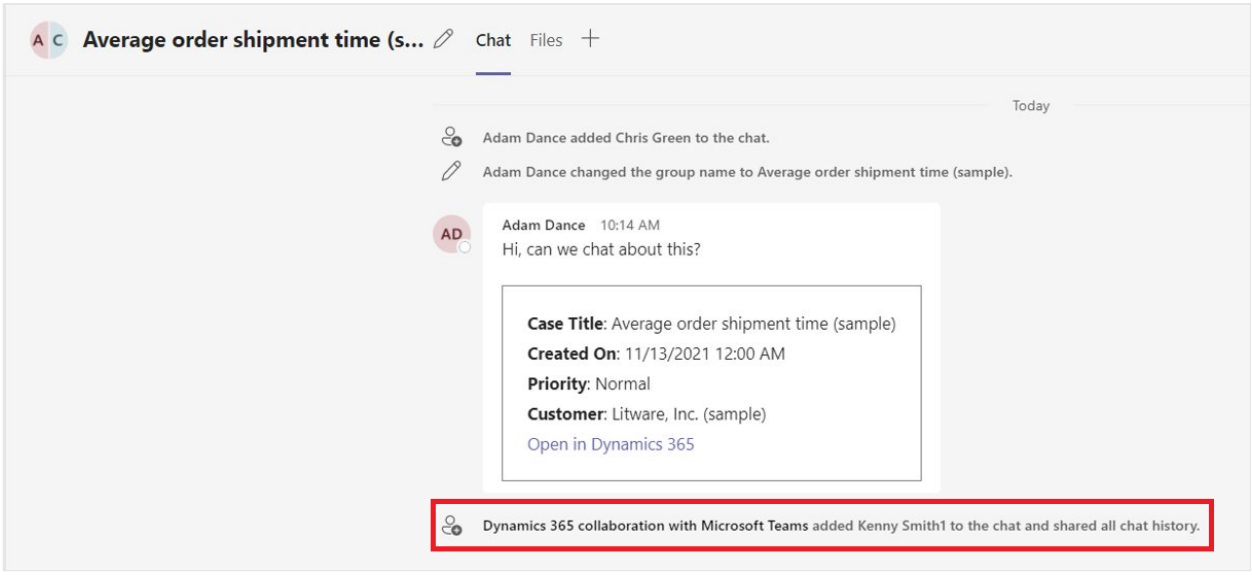


The Teams popup chat shows that you've been added to the chat, and you have access to the entire chat history. Other chat members also receive the system message that you've been added to the chat.

> **Note**
>
> When a user is added using Join chat, any users who are chatting directly from Dynamics 365 apps will see a system message that says an unknown user added the new user to the chat and shared all of the chat history. This is a known issue that is specific to the embedded chat experience, and we're working to resolve it.



If you're using the Microsoft Teams app, when joining a chat, the following message is displayed: Dynamics 365 collaboration with Microsoft Teams added <user name> to the chat and shared all chat history.

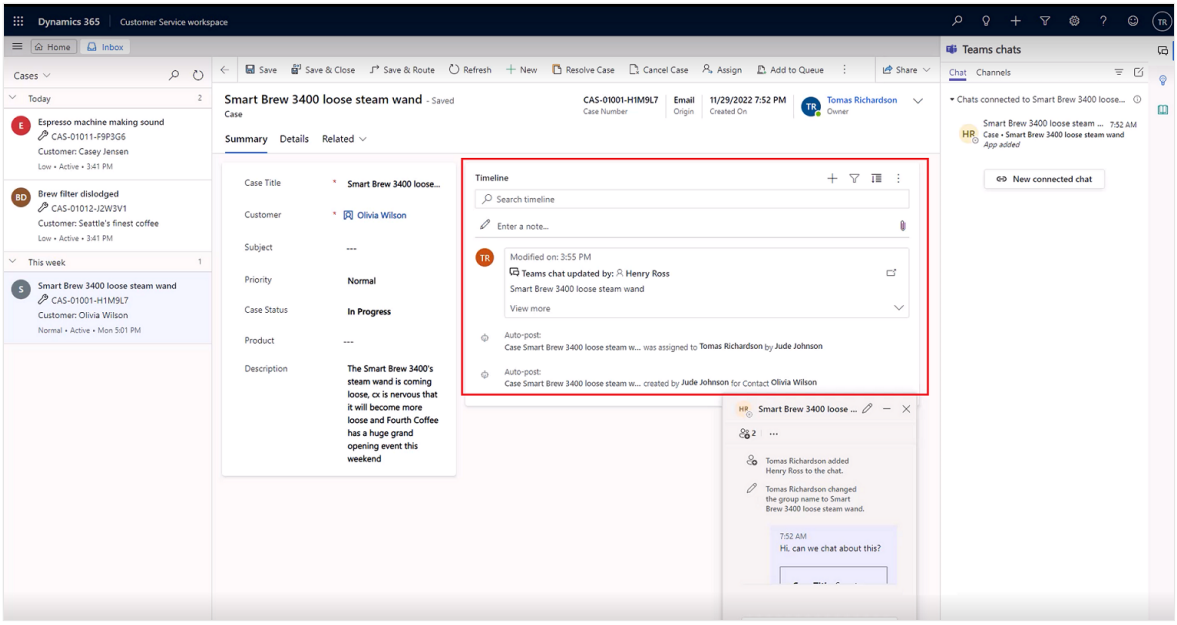


View Teams chats in the timeline for a record (preview)

As an agent, when you start a connected chat or connect an existing chat to a record, you can see the chat appear as a new activity in the timeline. The timeline entry shows details about who connected the chat and when they connected it. It also shows the last person to send a message in the chat, and when they sent it. If the Join chat setting is turned on in your organization, agents can also directly join the chat or be added as a chat participant and see the full exchange.

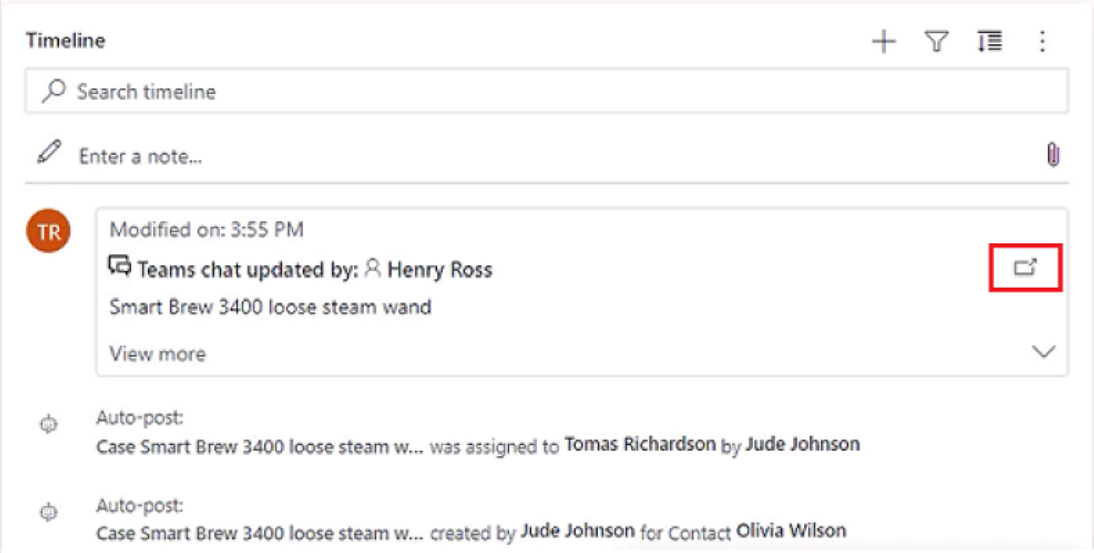
> **Note**
>
> Your administrator must enable this feature before you can use it.

1. Go to the record for which you want to view the timeline or start a chat. In the timeline, you can view all chats that are associated with the record.



2. Do any of the following actions:

   - To view changes you've made in a Teams chat, manually refresh the timeline: Select the ellipsis in the right-hand corner, and then select **Refresh timeline**.
   - To view details about who initially connected the chat, select **View more** in the timeline post.
   - If you aren't a participant in a chat and your administrator has turned on the **Join chat** setting for the record, you can join the chat from the timeline by selecting the join icon.



Dynamics 365 links are unfurled in Teams chat

When you paste a link to a Dynamics 365 Customer Service or Power Apps record into a Microsoft Teams chat, meeting, or channel, participants see an adaptive card with details about the shared link. Links to canvas apps show the app name and record name. Model-driven app links to records show the table type. When you paste the link, you can delete the card in the message compose window before sending the message if you don't want to send the link as a card.

> **Note**
>
> If you don't have access to the app or record for which you paste a link, no app or record details will be shown in the unfurled card.

Configure Teams chat in Customer Service

Use suggested contacts to collaborate with the right coworkers

Article • 10/03/2022

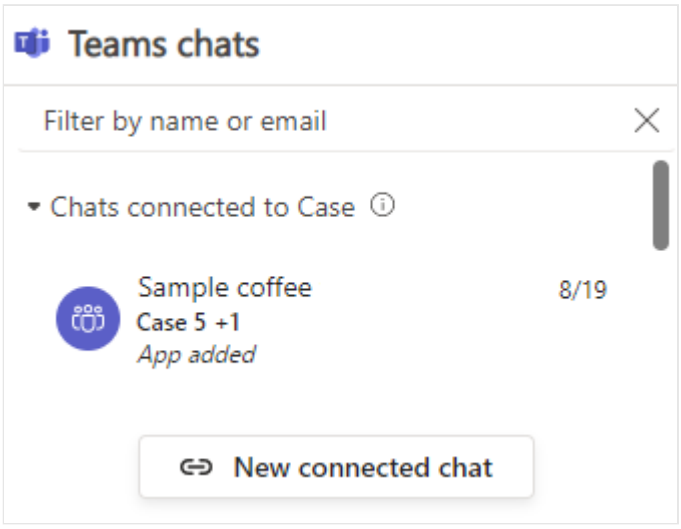
The Teams chat embedded in Dynamics 365 Customer Service Hub, Customer Service workspace, or custom apps can help you more quickly find the right coworkers to collaborate with. This collaboration can help you more quickly resolve customer issues.

To use suggested contacts, your administrator must enable the feature. For the case record type, there are two types of suggestions: AI and rules-based. Other record types enabled for connected chats may only have rules-based suggestions.

- AI: Suggestions based on cases that were resolved by other agents. More information: Collaborate with AI-suggested contacts in Microsoft Teams
- Rules-based: Suggestions of coworkers who are associated with the connected record or other related records. For example, an agent can see suggestions to collaborate with their supervisor, the account manager for the customer, or a colleague who updated the case timeline with a note or task. More information:

View suggested contacts

1. Open the collaboration pane, and then select **New connected chat**.



2. A dropdown list of suggested contacts is automatically displayed in the **Participants** section. The list has two sections: Suggested contacts who've resolved similar cases, and contacts that are related to the record. Note the following details about the suggestions that are displayed:

- The rules-based suggestions will show only contacts that have been enabled by your administrator. Additionally, the list is displayed in the order defined by your administrator.
- A maximum of three suggestions per section are displayed. If you want to see more, select **View more**.

Use Teams chat in Customer Service

Use Microsoft Teams meeting integration in Customer Service (preview)

Article • 05/26/2023

> **Important**
>
> To use this feature, it must be turned on and the license terms must be accepted. **What are Preview features and how do I enable them?**
>
> A preview feature is a feature that is not complete, but is made available before it's officially in a release so customers can get early access and provide feedback. Preview features aren't meant for production use and may have limited or restricted functionality.
>
> We expect changes to this feature, so you shouldn't use it in production. Use it only in test and development environments.
>
> Microsoft doesn't provide support for this preview feature. Microsoft Dynamics 365 Technical Support won't be able to help you with issues or questions. Preview features aren't meant for production use and are subject to a separate **supplemental terms of use**.

The Teams meeting integration feature provides a unified meeting experience that helps you, as an agent, to reduce your administrative workload and increase productivity. The Dynamics 365 records are accessible while conducting a meeting over Teams, which you can refer to and have contextually relevant conversations with your customers. You can also take notes to help save time, be more productive, and leverage better data within your organization.

As an agent, you can:

- Create and join Microsoft Teams meetings directly from Dynamics 365.
- Access and update Dynamics 365 records seamlessly within the context of a Microsoft Teams meeting.
- Capture notes and tasks seamlessly during a Microsoft Teams meeting, and have these notes and tasks automatically sync to records in Dynamics 365.

Meeting lifecycle

The lifecycle of a meeting can be divided into the following stages, with each stage catering to specific tasks:

- Pre-meeting: In this stage, you perform the following tasks:
  - Create a Teams meeting
  - Join a Teams meeting
  - Add Dynamics 365 app to a Teams meeting
  - Use the Dynamics 365 app to view and update record information
- In-meeting: In this stage, you perform the following tasks:
  - Use the side-panel to view and update record information
  - Work with notes during a meeting
  - Work with tasks during a meeting
  - Work with activities during a meeting
- Post-meeting: In this stage, you perform the following tasks:
  - Use the Dynamics 365 app to view and update record information

Create a Teams meeting

You can create a Teams meeting either from Dynamics 365 or Microsoft Outlook. While creating a Teams meeting, ensure that a Dynamics 365 record is linked to the meeting. Linking a record to the meeting enables you to view record details before the meeting, in a side panel during the meeting, and after the meeting.

You can link a Dynamics 365 record by selecting a Regarding record. When a record is linked prior to the meeting, the Dynamics 365 app is added automatically to the meeting, and you can see the details of the linked record in the side panel. If a record is not linked to the meeting, you won't be able to see the details of the linked record. In such a case, you should add the Dynamics 365 app to the meeting before it has been started, for a better experience.

Create Teams meetings in Dynamics 365

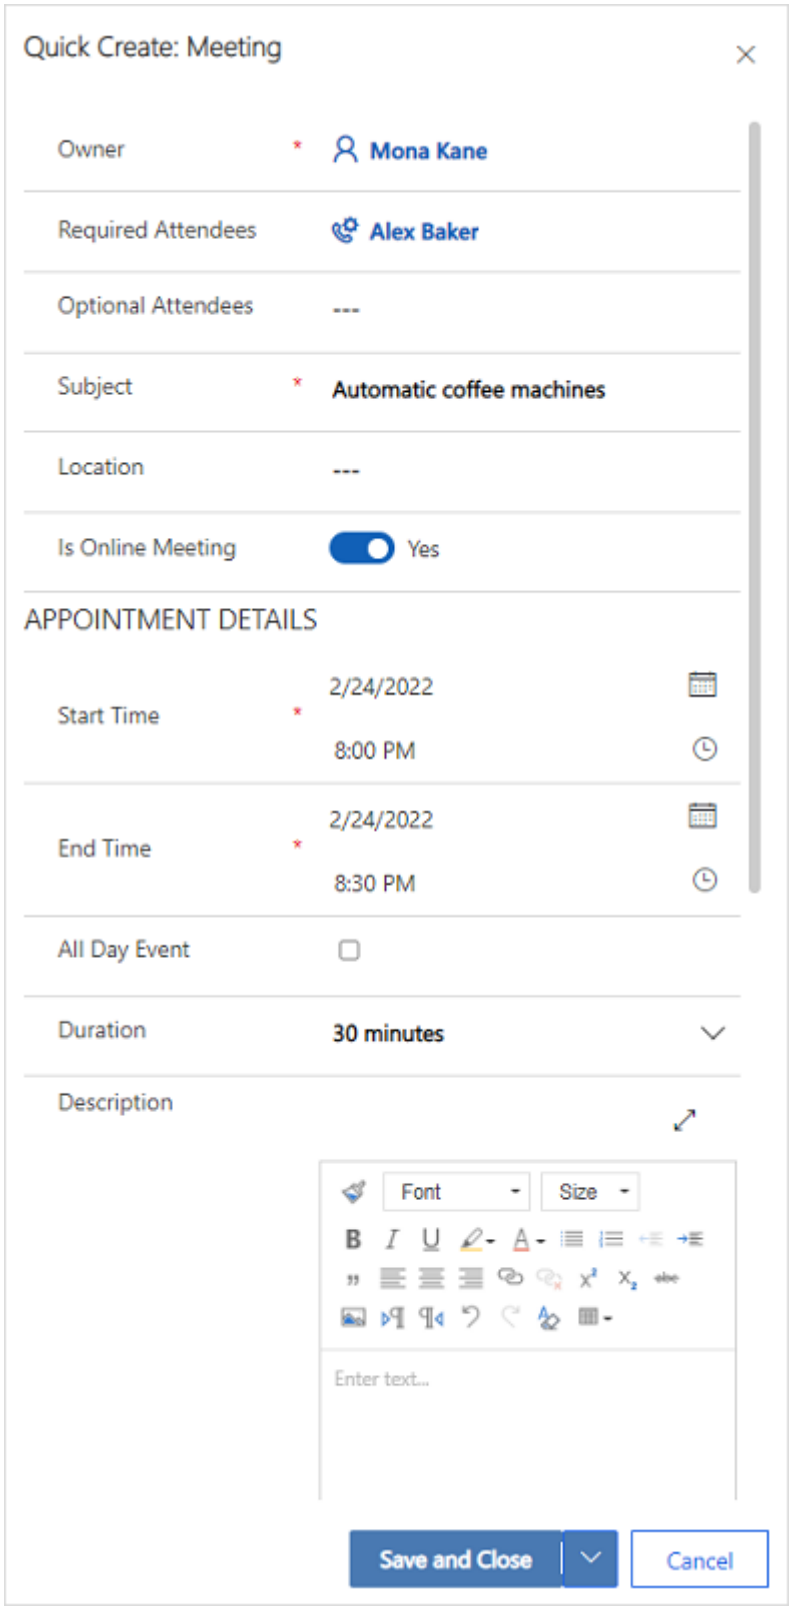
You can create a Teams meeting while creating a meeting either from the timeline of a record or from the activities page.

To create a Teams meeting from the Timeline control

1. On the timeline control of a Dynamics 365 record, select **Create a timeline record** > **Meeting**.

2. In the **Quick Create: Meeting panel**, enter the meeting information such as attendees, location, time, and description.

3. Turn on the Teams meeting toggle.



4. Select **Save and Close**. The meeting coordinates won't display until after you save and close the record.

> **Note**
>
> When you create a meeting from the Timeline control of a record, the Regarding field is automatically populated with the record name from which the meeting is

being created. This ensures that the Dynamics 365 app is added automatically to the Teams meeting and you can see the related record details during the meeting.

To create a Teams meeting from the Activities page

1. Sign in to Customer Service Hub.
2. On the sitemap, select **Activities**.
3. On the command bar at the top, select **Meeting**.
4. On the **New Meeting** page, enter the meeting information such as attendees, location, time, and description.
5. Turn on the **Teams meeting** toggle.
6. In the **Regarding** field, search and select a record that the meeting is related to. This ensures that the Dynamics 365 app is added automatically to the Teams meeting and you can see the related record details during the meeting.
7. Select **Save & Close**.

Create Teams meetings in Microsoft Outlook

You can create a Teams meeting in Microsoft Outlook, but the meeting will not be linked to a Dynamics 365 record automatically. You must install the Dynamics 365 app for Outlook to link the meeting to a Dynamics 365 record. After installing the app, open it, and search for the record in the **Set Regarding** field.

For information on creating a Teams meeting in Microsoft Outlook, see Schedule a Teams meeting from Outlook

For information on using the Dynamics 365 App for Outlook, see Basic navigation in App for Outlook (Dynamics 365 apps).

Add Dynamics 365 app to a Teams meeting

The Dynamics 365 app, when added to a Teams meeting, enables you to view record details before, during, and after a meeting. The Dynamics 365 app can be added either automatically or manually to a Teams meeting.

Automatically add the app

If you link a Dynamics 365 record to a meeting while creating it in Dynamics 365 or Microsoft Outlook, the Dynamics 365 app is added automatically to the meeting. This

allows you to view record details before, during, and after a meeting.

Manually add the app

If you don’t link a Dynamics 365 record to a meeting while creating it in Dynamics 365 or Microsoft Outlook, it's recommended that you add the app to the meeting before joining the Teams meeting for a better experience.

To add an app before a meeting, first send the meeting invite, then open the meeting in Teams. Select **Add a tab**, search for the Dynamics 365 app, and add it.

To add an app during a meeting, after the meeting starts, select **Add an app** in the meeting controls at the upper-right area of the screen, search for the Dynamics 365 app, and add it.

Work with the Dynamics 365 app

The Dynamics 365 app enables you to view information of a record that is linked with a meeting. The record details can be viewed before the meeting, in the side panel during the meeting, and after the meeting.

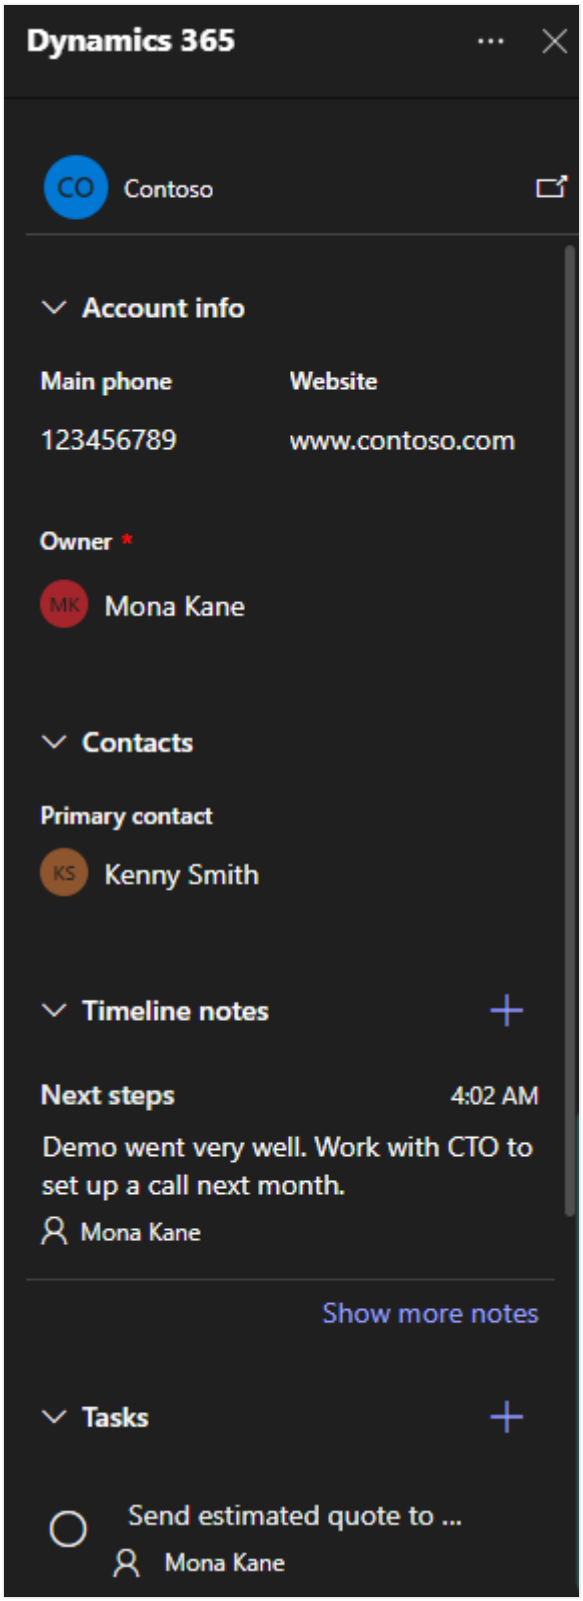
View record details before or after a meeting

Open the meeting in Teams, and then select the **Dynamics 365** tab. You can perform all actions on the linked record as you would in Dynamics 365 Customer Service.

View record details during a meeting

Select the Dynamics 365 app icon in the meeting toolbar at the upper-right area of the screen. The record details are displayed in a side panel. You can view and update information such as notes and tasks.

> ⓘ **Note**
>
> The record side panel supports only Contact, Opportunity, Lead, Account, and Case tables.



While in Teams, if you want to access a record directly in your Dynamics 365 app, you can open the record by selecting the popout icon on the side panel.

Join a Teams meeting

You can join a Teams meeting from Dynamics 365, Microsoft Outlook, or Microsoft Teams.

Join a Teams meeting from Dynamics 365

1. Open the meeting record from the **Timeline** or from the **Activities** page.
2. Perform one of the following actions:
    - On the command bar at the top, select **Join Teams Meeting**.
    - In the **Teams meeting** field, select **Join Teams Meeting**.
    - Go to the **Description** area, hold the **Ctrl** key, and select **Click here to join the meeting**.

Join a Teams meeting from Microsoft Outlook

1. Open the calendar event.
2. Perform one of the following actions:
    - On the **Meeting** tab in the ribbon, select **Join Teams Meeting**.
    - In the message body, select **Click here to join the meeting**.

Join a Teams meeting from Microsoft Teams

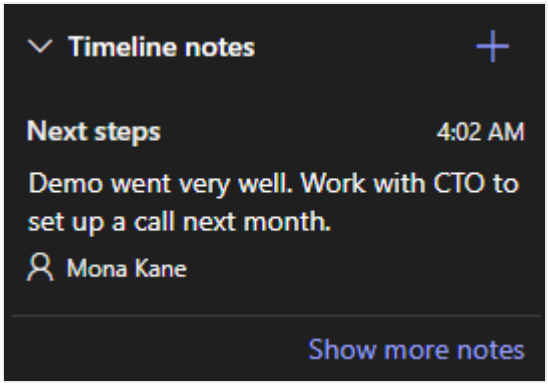
You have several options. More information: Join a meeting in Teams

Work with notes during a meeting

Prerequisites:

- A record must be linked to the meeting and the Dynamics 365 app must be added to the meeting.
- The side panel must be launched by selecting the Dynamics 365 app icon in the meeting controls at the upper-right area of the screen.

The latest note is displayed under the **Notes** section in the side panel. You can view all notes in a standalone panel by selecting **Show more notes**. If you add, edit, or delete notes from the side panel, the changes are synced with the linked Dynamics 365 record.



Add a note

1. In the **Notes** section, select .
2. In the **Add note** form, enter a title and description of the note.
3. To attach a file, select **Attach file**.
4. Select **Save**. The note is added to the record and displayed in the side panel.

Edit a note

1. In the **Notes** section, hover over the note, and then select the **Edit** icon .
2. In the **Edit note** form, update the title and description of the note as desired.
3. Select **Save**.

Delete a note

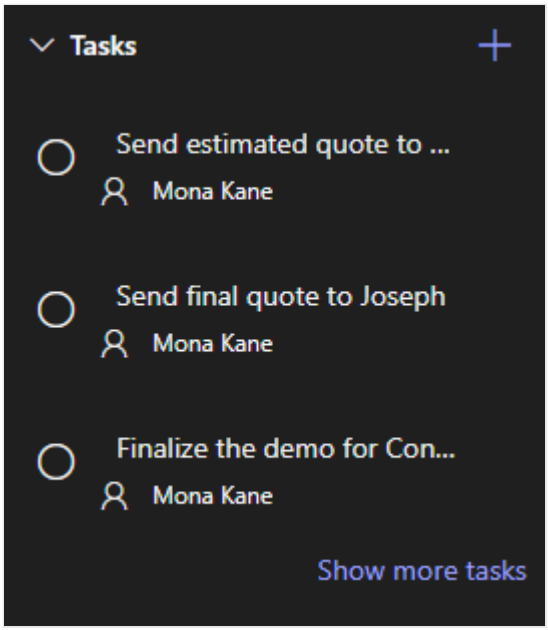
1. In the **Notes** section, hover over the note, and then select the **Delete** icon .
2. In the confirmation message, select **Delete**.

Work with tasks during a meeting

Prerequisites:

- A record must be linked to the meeting and the Dynamics 365 app must be added to the meeting.
- The side panel must be added to the meeting.

The open tasks are displayed under the **Tasks** section in the side panel. You can view all tasks in a standalone panel by selecting **Show more tasks**. If you add, edit, or delete tasks from the side panel, the changes are synced with the linked Dynamics 365 record. The tasks are sorted by their due date, prioritizing the tasks that are due soon or overdue.



Add a task

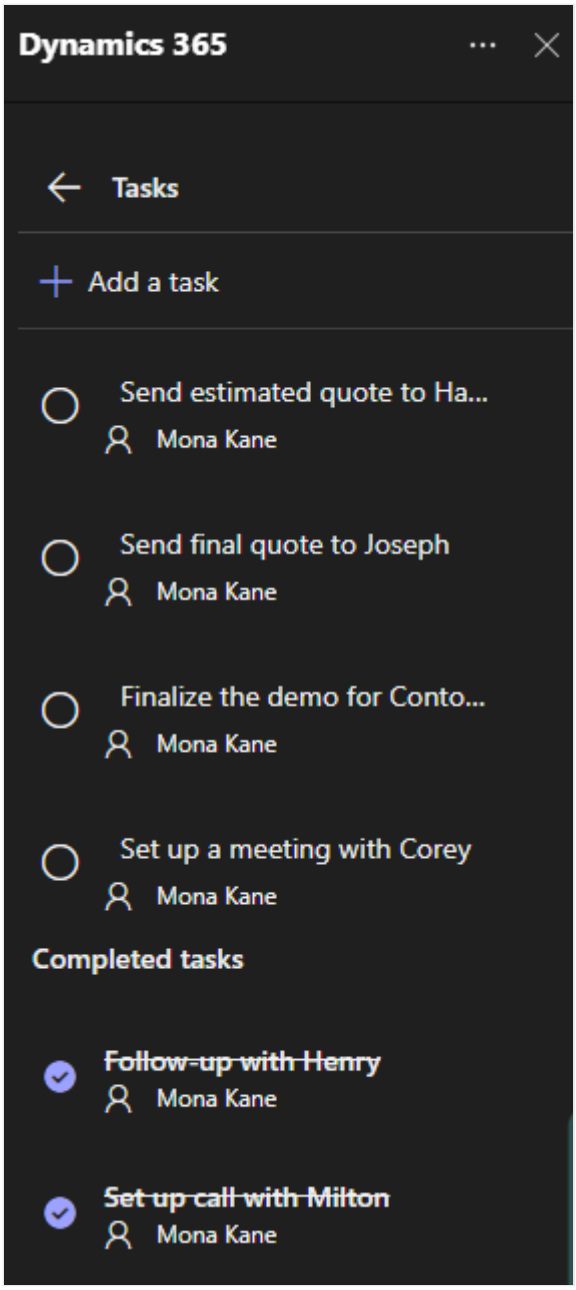
1. In the **Tasks** section, select the **Add** icon .
2. Add the task details.

Complete a task

In the **Tasks** section, select the option button for a task to mark it as complete.

Reopen a task

1. In the **Tasks** section, select **Show more tasks**.
2. In the **Completed tasks** section, select the task to reopen it.



Edit a task

1. In the **Tasks** section, hover over the task, and then select the **Edit** icon .
2. Edit the task details as desired.

Delete a task

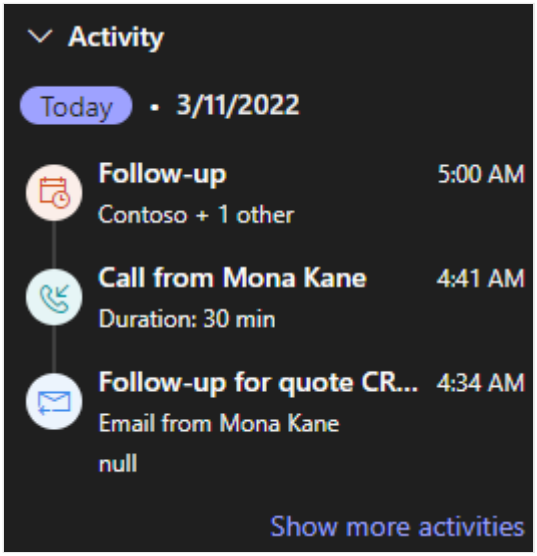
1. In the **Tasks** section, hover over the task, and then select the **Delete** icon .
2. In the confirmation message, select **Delete**.

Work with activities during a meeting

Prerequisites:

- A record must be linked to the meeting and the Dynamics 365 app must be added to the meeting.
- The side panel must be launched by selecting the Dynamics 365 app in the meeting controls at the upper-right area of the screen.

Recent activities are displayed under the **Activity** section in the side panel. To view all activities, select **Show more activities**.



You can view only appointment, email, and phone call activities that are associated with the record. To view other associated activities, go to the customer engagement app. If you want to view details of an activity, in the **Activities** section, select an activity. The activity record opens in your web browser.

Configure Microsoft Teams Meeting integration in Customer Service

Collaborate with AI-suggested contacts in Microsoft Teams

Article • 01/23/2023

If your administrator has enabled AI suggestions for similar cases and configured the ability to connect chats to Dynamics 365 records, you can view suggested contacts who have resolved cases similar to yours to help you more quickly resolve customer issues. To chat with AI-suggested contacts, your administrator must also enable the option to collaborate with other contacts in Microsoft Teams.

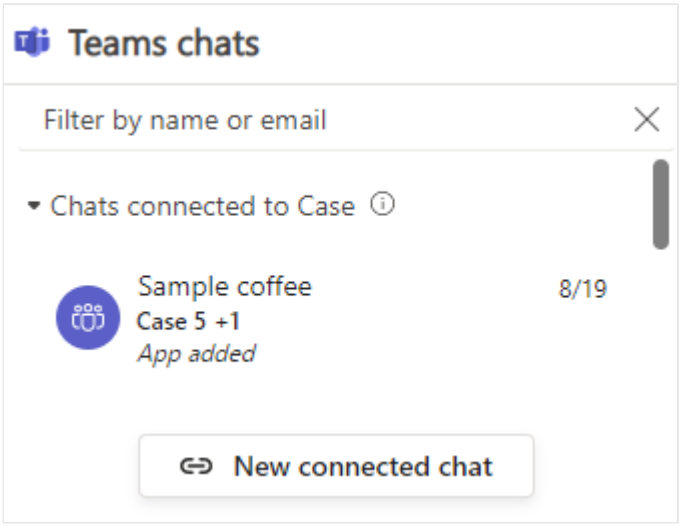
> **Note**
>
> Through Teams, agents can connect and engage with customers also if Omnichannel for Customer Service is enabled.

More information: Configure AI suggestions for contacts in Microsoft Teams

Collaborate with AI-suggested contacts in Microsoft Teams

The AI-suggested contacts in Microsoft Teams functionality is applicable for cases and support conversations in the Customer Service workspace and Omnichannel for Customer Service apps.

For a case or a support conversation, **Teams chat** appears in the app side pane on the right.



You can do the following:

1. Select **New connected chat**. The following options appear:

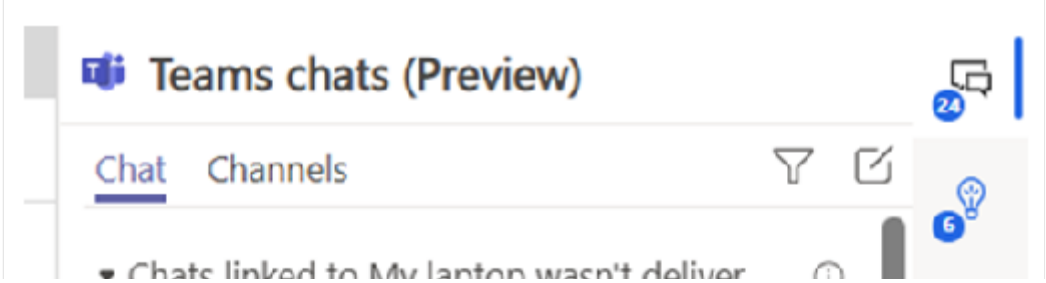
    - An option to enter participant agent names to create connected chats.
    - A dropdown list of suggested contacts who have worked on similar and related cases. AI and rules-based suggested contacts are listed if admins have enabled both of these options.
    - If the AI-suggested contacts functionality is enabled, a **Resolved similar cases** section is displayed in the dropdown list.

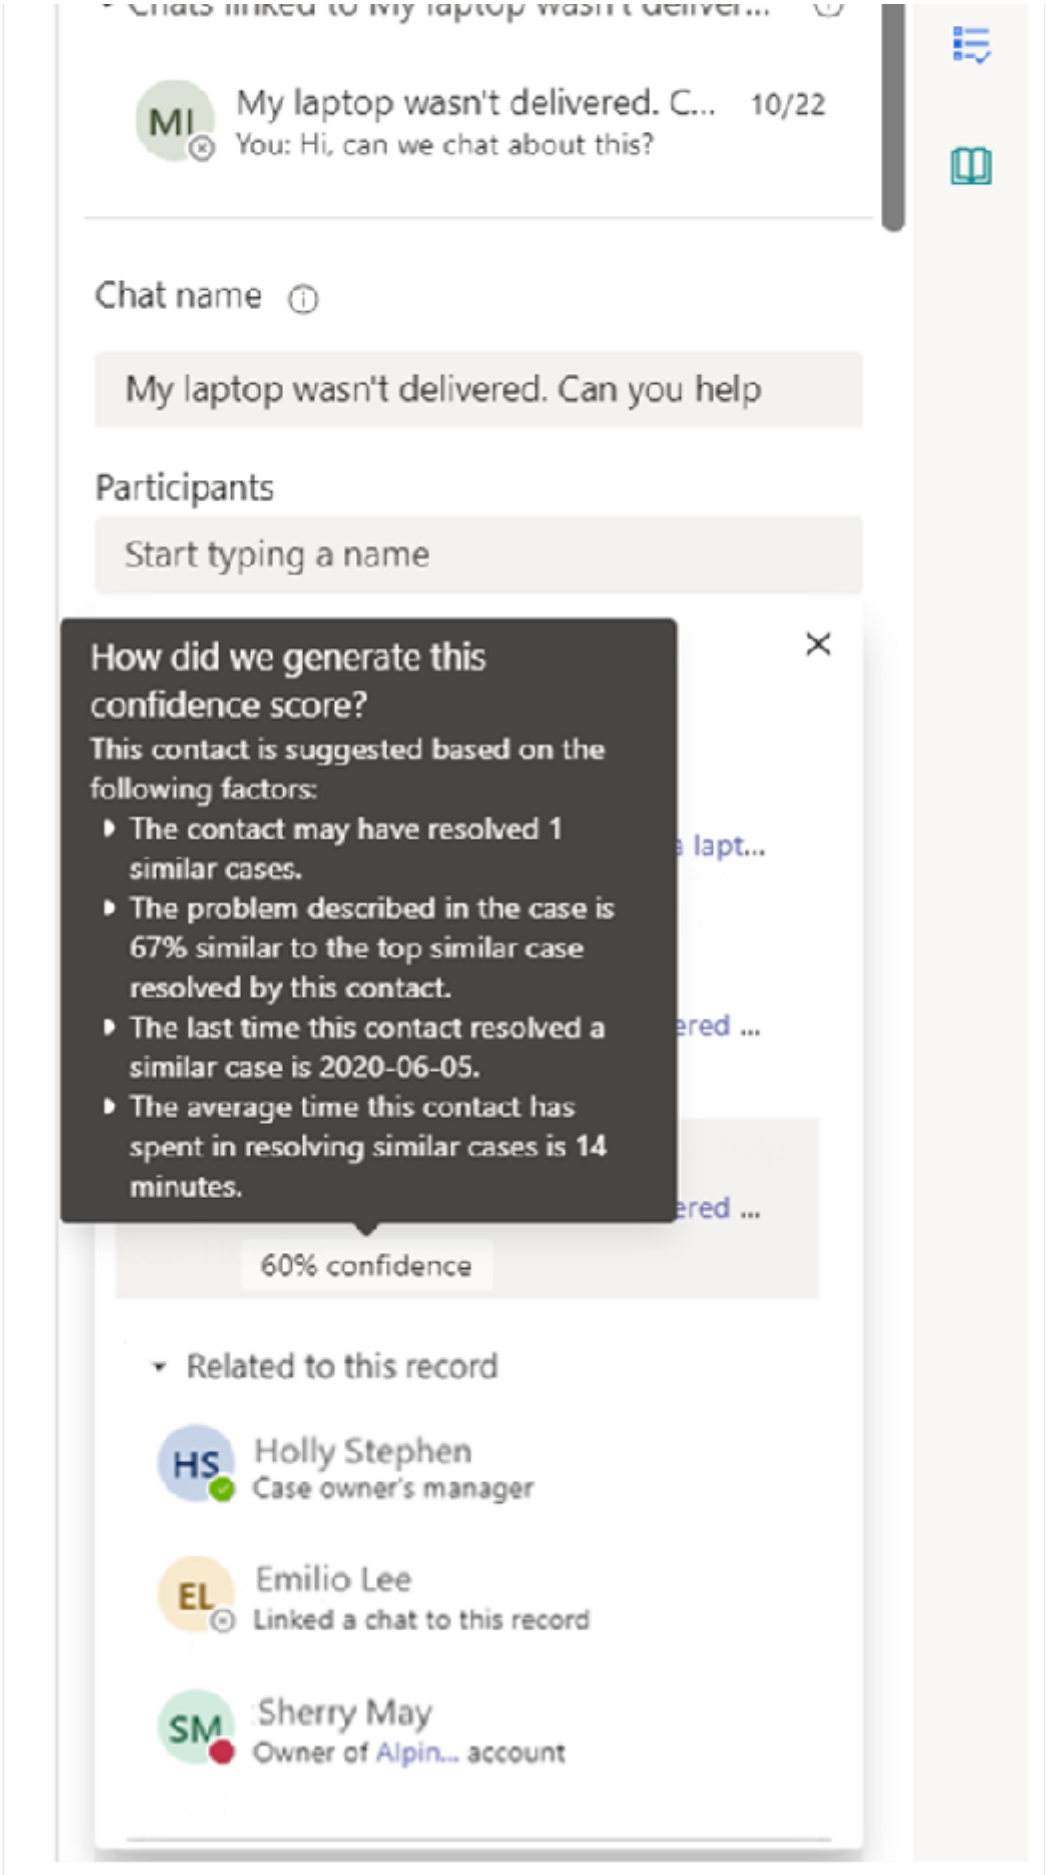
  - If no similar cases exist, a message is displayed that no suggested contacts can be found.
  - If the administrator hasn't enabled **Join chat** feature, a message is displayed that only chat participants can see this conversation. More information: Configure the ability for users to join chats

- Each AI-suggested contact is displayed with the following details:
  - Full name
  - Display picture if available
  - Link to the top similar case, which is displayed under the contact's full name. "Worked on similar case `<similar case title>`. Agents can select the link to view the similar case.
  - Confidence score that indicates how confident the AI model thinks the suggested contact can help on the active case or conversation.

- The confidence score is based on multiple factors:
  - Number of similar cases that the suggested contact resolved.
  - The similarity of the similar cases to the active case or conversation.
  - How recent the suggested contact resolved the similar cases.
  - The average time that the suggested contacts use to resolve similar cases.

- Agents can hover over the confidence score to view the details.





- The default AI-suggested contacts list shows the top three suggestions. If more contacts are suggested, agents can select **View more** in the dropdown list.

2. Type a participant name or select from the suggested contacts. You can select more than one contact and then select **Start chat**.

3. Optionally, you can edit the group name.

If the Teams chat is created for an active case, the participants who receive the chat message get a link to the case record for which you started the chat. The participant can select the link and open the case to view the details.

View and share auto-summarized conversations

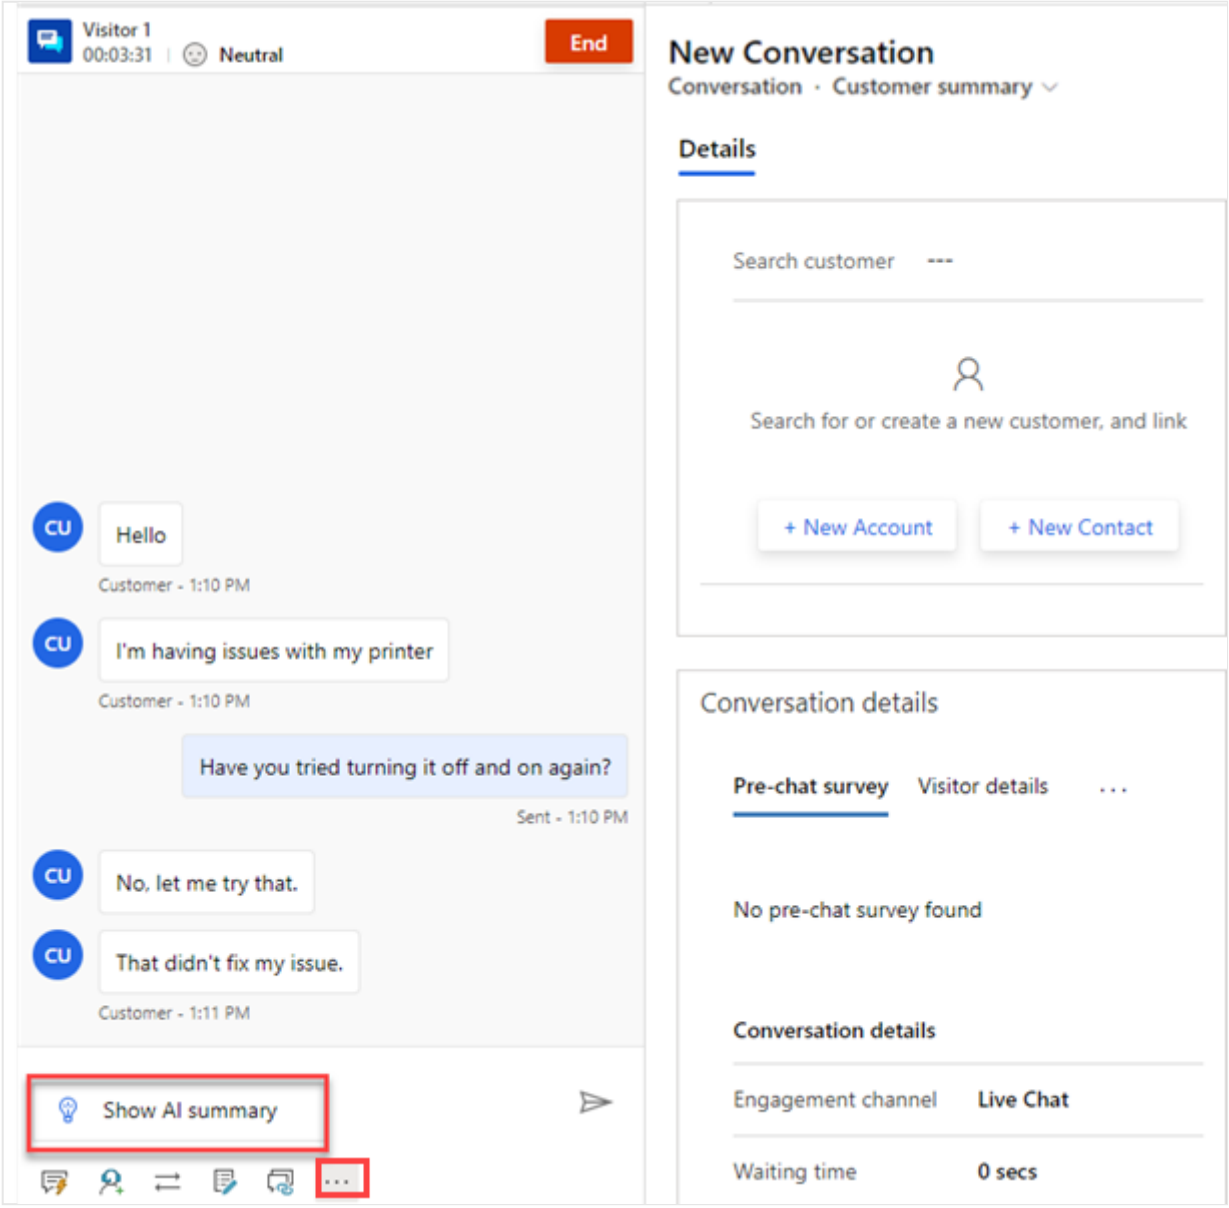
Article • 04/05/2023

Share an AI-generated summary of a customer conversation to easily collaborate on a case. A summary quickly provides context and relays steps that you've already taken to solve the issue. You can summarize all conversations that take place on messaging channels such as Live Chat, SMS, or WhatsApp. This feature also supports bot to agent conversations, voice conversations with transcription enabled, and Microsoft Teams conversations.

View and share a conversation summary for conversations

When you're working on a conversation request from a customer, select **Show AI summary**.

> **Note**
>
> You won't see a summary if the conversation doesn't include at least three messages from the customer.



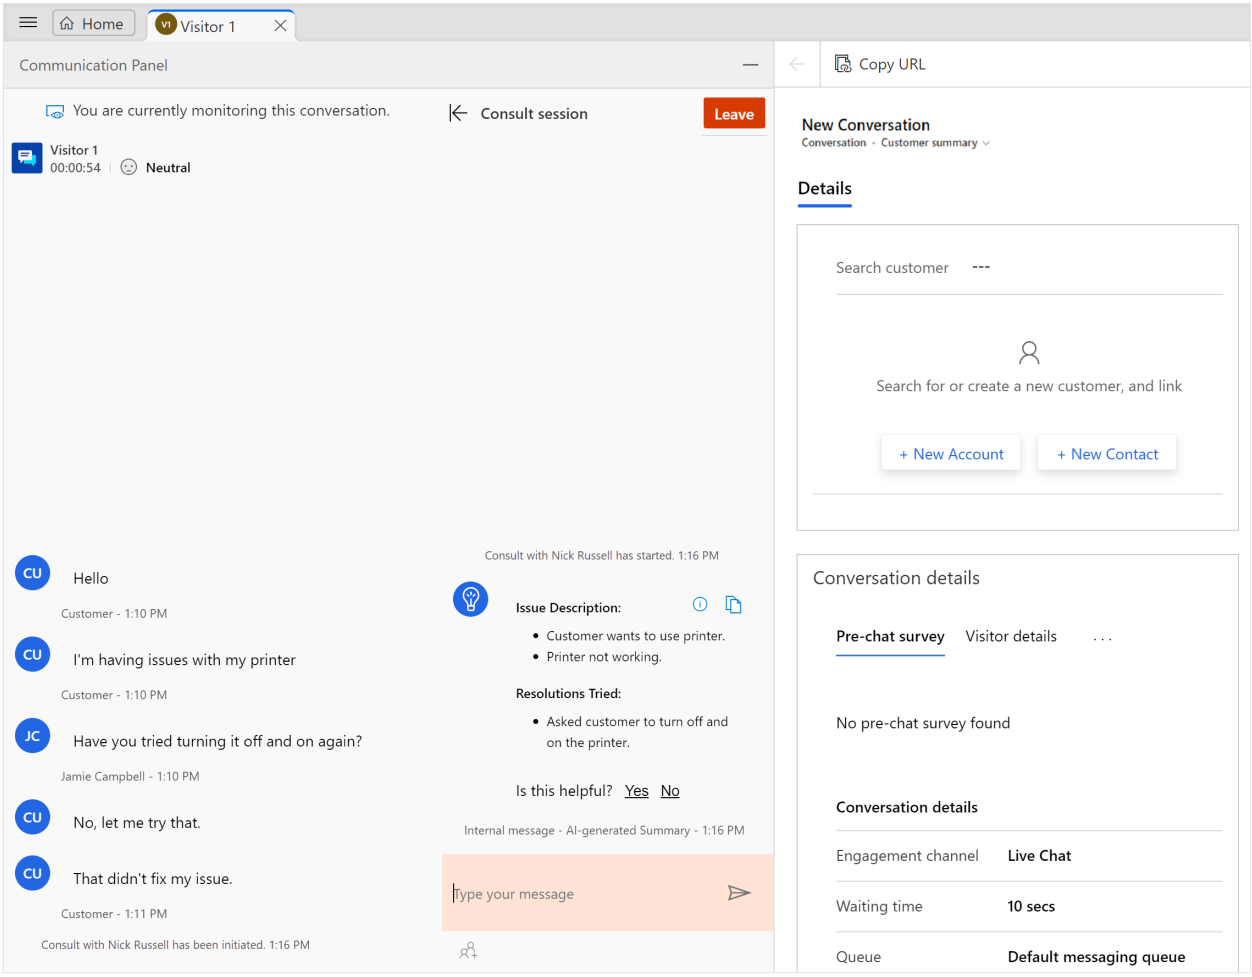
Only the agent can see the summary. The summary includes the following components:

- **Issue description**: Summarizes the key customer problems to solve in a conversation. The model needs at least three customer messages to generate the issue description.
- **Resolution tried**: Summarizes any troubleshooting steps or possible solutions that agents have tried. If the model can't identify a resolution from the transcript, this section is blank. If the case is resolved or the conversation ends, the application displays this label as **Resolution**.

You can also perform the following actions:

- Copy the summary from the card
- Select **Create a case**. The application creates a new case and populates the case description with the summary.
- Share feedback about the summary.

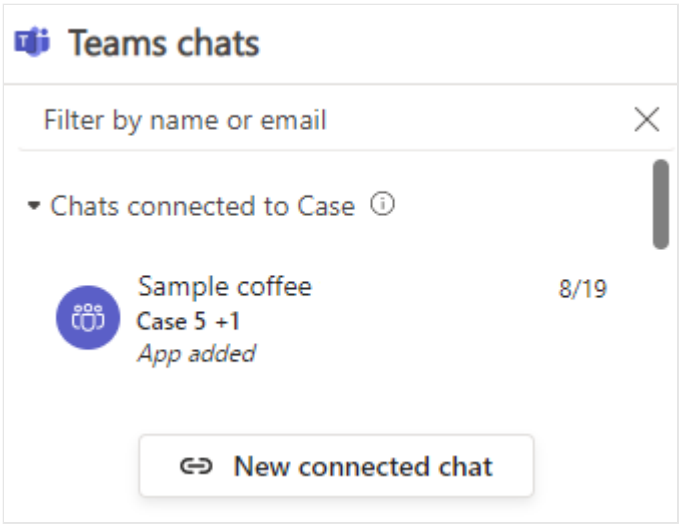
Based on the triggers enabled by your administrator, the application automatically generates and displays the summary when you request a consultation with another agent, transfer the conversation, or end the conversation.



View and share a conversation summary in Teams chat

When you open a case or a conversation, the **Teams chats** pane appears on the right side of the case or conversation.

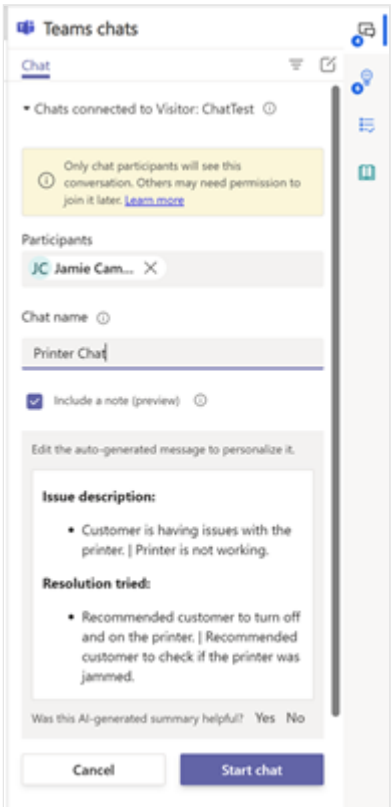
1. Select **New connected chat**.



2. Select a contact to start the chat with.
   If your administrator has turned on AI and rules-based suggestions, the system suggests contacts that you might want to chat with. They include contacts who have experience resolving similar cases or who are related to the current case. You can select more than one contact if you want to start a group chat.

   Before you start the chat, you can:

   - Edit the summary to provide more details.
   - Share feedback about the auto-generated summary. This helps the AI model summarize the conversations better.
   - Clear the **Include a note** checkbox to skip including the summary and start the Teams chat without the summary.



3. Select **Start chat**.

Use Join a Teams call to enhance your conversations with customer (preview)

Article • 10/02/2023

> **ⓘ Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and may have restricted functionality. These features are available before an official release so that customers can get early access and provide feedback.

Join a Teams call is a new way for you to have effective conversations with your customers. During an active conversation, you can quickly move your call or chat to Microsoft Teams. On Teams, you can share your screen, connect on video, and cobrowse to offer more personalized support to your customer.

If you already have Teams, you don't need any other investments to use the Join a Teams call feature. Your customers don't need a Teams license or previous experience using Teams.

Prerequisites

Ensure that the following prerequisites are met:

- Your administrator must set up Teams for your account and enable the Join a Teams call feature.
- You must have a Teams license.
- To invite customers to Teams meetings via email, your email configuration must allow outbound mail.

Use Join a Teams call

You can use the Join a Teams call feature when you're in an active, ongoing conversation by doing the following steps:

1. On the productivity pane, select the **Join a Teams call** icon. The option to **Start a Teams meeting** is displayed with the customer's name.

2. Next to the customer's name, select either of the following options:

- Link icon: Generates a Teams meeting link and copies it to your clipboard so you can send it to the customer.
- Email icon: Autosends an email that contains a Teams meeting link to the email address in the customer record.

After the link is sent, the productivity pane displays a confirmation message and prompt for you to join the meeting, along with a timestamp of the meeting duration.

3. Select **Join call**. The link opens in a browser window and prompts you to open the Teams app if it's installed or continue your conversation with the customer in the web browser. If you disconnect from the meeting during the scheduled time, you can rejoin using the same link in the productivity pane. When the end time passes, you can create a new link and reinvite the customer.

> **Note**
>
> Once you join the Teams meeting, if you were on a voice call with the customer, you must manually end your call. Joining the Teams meeting with the customer doesn't automatically end your in-progress voice conversation.

How to use Join a Teams call with unknown customers

If you're in a conversation with an unknown customer whose record isn't displayed in Customer Service and you want to invite them to a Teams meeting, you must first locate or create their record.

To locate or create a customer record:

1. Do one of the following:

   - Search for the customer record: On the active conversation page, go to **Customer** > **Search for a customer** > type the name of the customer, and then select **Enter**. If the customer has a record, it appears and you can select it.
   - Create the customer record: If the customer doesn't have an existing record, you can create it: Go to **Customer** > **New record**, and then enter the customer's details.

2. Follow the steps in Use Join a Teams call to start the Teams meeting.

Use customer support swarming (preview)

Article • 07/11/2023

> **ⓘ Important**
>
> To use this feature, it must be turned on and the license terms must be accepted. **What are Preview features and how do I enable them?**
>
> A preview feature is a feature that is not complete, but is made available before it's officially in a release so customers can get early access and provide feedback. Preview features aren't meant for production use and may have limited or restricted functionality.
>
> We expect changes to this feature, so you shouldn't use it in production. Use it only in test and development environments.
>
> Microsoft doesn't provide support for this preview feature. Microsoft Dynamics 365 Technical Support won't be able to help you with issues or questions. Preview features aren't meant for production use and are subject to a separate **supplemental terms of use**.

When you work on time-sensitive, complex customer issues, there are times when it's useful to apply the expertise of coworkers outside of your Dynamics 365 Customer Service team.

Customer support swarming is useful when you need to take the following actions:

- Collaborate with experts across your organization to get help on complex cases.
- Use an expert finder to quickly locate experts with the right skills to help.

Use customer support swarming to find the right set of experts to work with on your customer issues and collaborate with peers directly from your desktop.

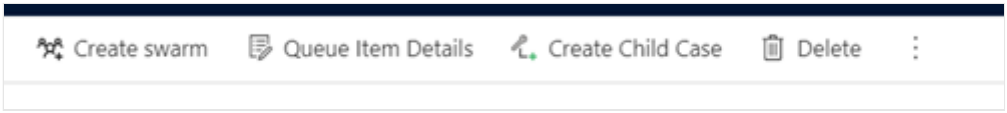
Prerequisites

To be able to create a swarm when working on a customer issue, you must have the following prerequisites in place.

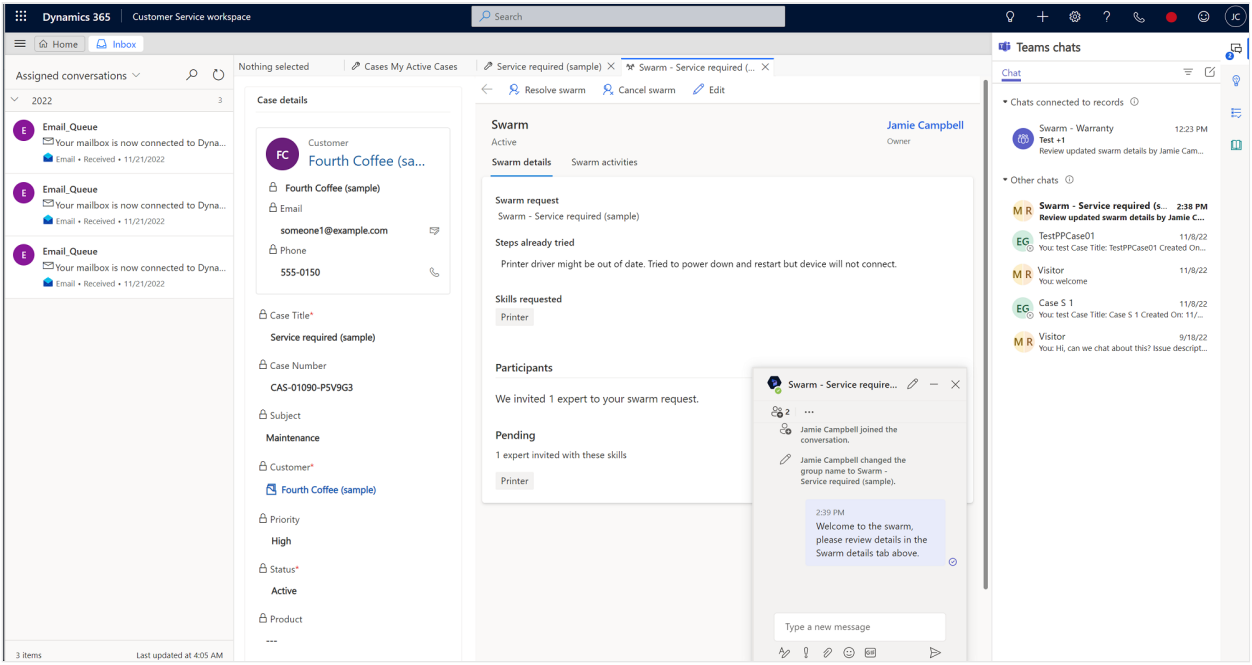
- If you're an agent, you must have both a Dynamics 365 Customer Service Enterprise license and Microsoft Teams license.
- If you're an expert joining a swarm, you must have a Teams license.
- Embedded Microsoft Teams chat must be enabled for the agent desktop or on the Teams web app.

Start a swarm

1. On the Customer Service command bar, select **Create swarm**. (You might need to select the ellipsis to see this option.)



The **Swarm** page opens with the **Case details** displayed on the left side pane. The case and account fields are read-only, and are designed to give other swarm participants the associated details about the case.



> **Note**
>
> If you don't see the **Create swarm** option, ask your administrator to assign access privileges for you.

1. On the **Swarm** form, type information into the following fields:

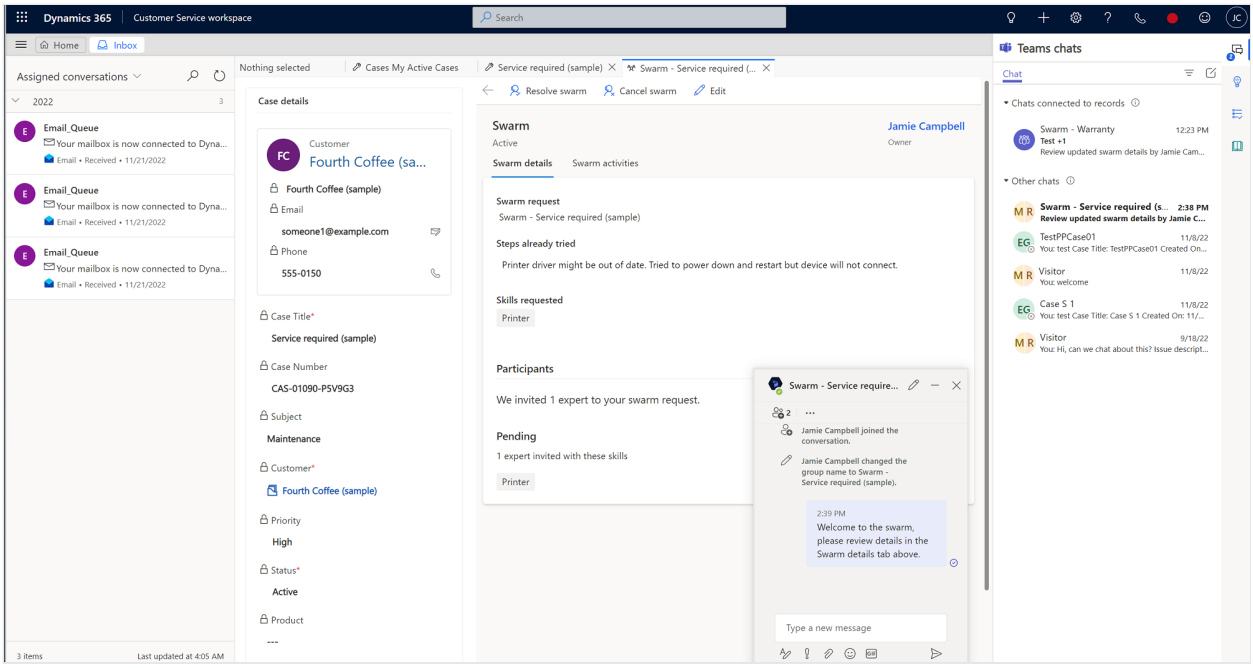
- **Swarm request**: The title of the swarm is displayed by default, but you can edit it if needed.
- **Steps already tried** (optional, 2,000-character limit): Type the details about steps you've already taken to try to resolve the issue, and any results. These details help confirm that any required processes have been followed, and also provides immediate context for other swarm participants who are invited to collaborate on the issue.
- **What skills do you need?** (optional): As part of the swarm request, the system takes the following actions:
  - Attempts to match skills based on your swarm question
  - Suggests skills based on rules your administrator has defined. These rules find the key word(s) that are present in the swarm request and/or steps that have already been tried, and then populates the matched skills based on the configured rules.

Suggested skills have the light bulb icon. You can also select up to 10 skills (both system-suggested and manually selected) that you think are relevant to the case. (Manually selected skills don't have the light bulb icon next to them.)

> ⓘ **Note**
>
> If neither the system nor you designate any skills, you can still create the swarm but no experts will be added. In this scenario, we recommend asking your supervisor for help with identifying the appropriate skills to get expert support.

2. Select **Save and send invitation**. A linked swarm chat is created, and the contacts configured by your administrator are automatically added to the chat. Once a swarm invitation has sent, you can still go back and edit the swarm details if needed.

> ⓘ **Note**
>
> By default, your supervisor is automatically added to create the swarm. If you don't have a supervisor, your administrator who configured the swarm is automatically added.



The following actions and views occur:

- The system finds the minimum set of experts needed to cover as many of the skills suggested or that you added as possible.
- A participants section opens, where you can see the number of experts invited to your swarm who match particular skills.
- You can view the names of skills not matched to an expert. If a skill is unmatched, you can work with your supervisor to find experts who match the skill.
- You can view names of automatically added participants in the chat window.
- When an invited expert accepts the swarm invitation, they're automatically added to the swarm chat.
- If you select **Edit** on the command bar, existing saved skills remain. If you edit the swarm request, then the following actions occur:
  - The system searches for skills to account for the newest information, and appends skills found to the existing ones.
  - Invited experts and experts who are already in the swarm remain.
  - A group chat is created, where you can chat with people who are experts on the issue. You might be the only one who is in the chat at first but you can message others to ask them to join if needed.

How the invitation to experts works

When you select an expert for your swarm, they're sent an automated invitation in Teams via an adaptive card. When they accept your invitation, they're attached to the swarm, and their skills are indicated. If the expert declines the invitation, the system then looks for the next expert or experts who have the needed skill(s).

For the invited expert, the swarm invitation shows the following information:

- Inviting agent: The agent who initiated the swarm and invited the expert.
- Swarm request: The question the agent needs help with.
- Steps the agent already tried: A brief description of what the agent has tried prior to creating the swarm.
- Expert skills: The required skills the expert has for the swarm.
- Accept and reject: Options for the expert to either join or decline the swarm. If an expert declines an invitation and then later decides they want to join, they can participate by asking you to add them manually. They aren't able to view the swarm form from the group chat.

When an expert joins a group chat, they see a read-only version of the **Swarm details** form added as a tab. The right-side pane displays the associated case details. The agent's swarm request and a summary of what the agent has tried to do to resolve the issue are displayed.

Experts who join a swarm can see all participants in the swarm and the skills they have that resulted in their invitation to the swarm.

Experts aren't required have access to Dynamics 365 to participate in swarms, but if they're able to access a swarm in Customer Service, they can go to the **Swarm activities** tab on the **Swarm** page, where they can view a timeline of all the key events that are related to the swarm.

Experts without a Dynamics 365 license can be invited to swarms in Teams. When they accept the invitation to join the swarm, a swarm chat appears in the **Chat** pane in Teams. The expert must select the chat to enter the swarm conversation. Both the agent and the expert can add others to the chat if needed. The agent can interact with the expert and add notes of their interaction to the swarm timeline.

Create a task in the timeline

If there are details that you or your swarm experts want to document or update in the future, you can create a task with an optional due date that appears in the swarm timeline and also in the Teams chat.

To create a swarm-related task, complete the following steps:

1. On the swarm page in Customer Service workspace, select the **Swarm activities** page.
2. In **Timeline**, select the **Add** (+) icon, and then select **Task** on the dropdown menu. The **Quick Create: Task** pane opens on the right-hand side of the page.

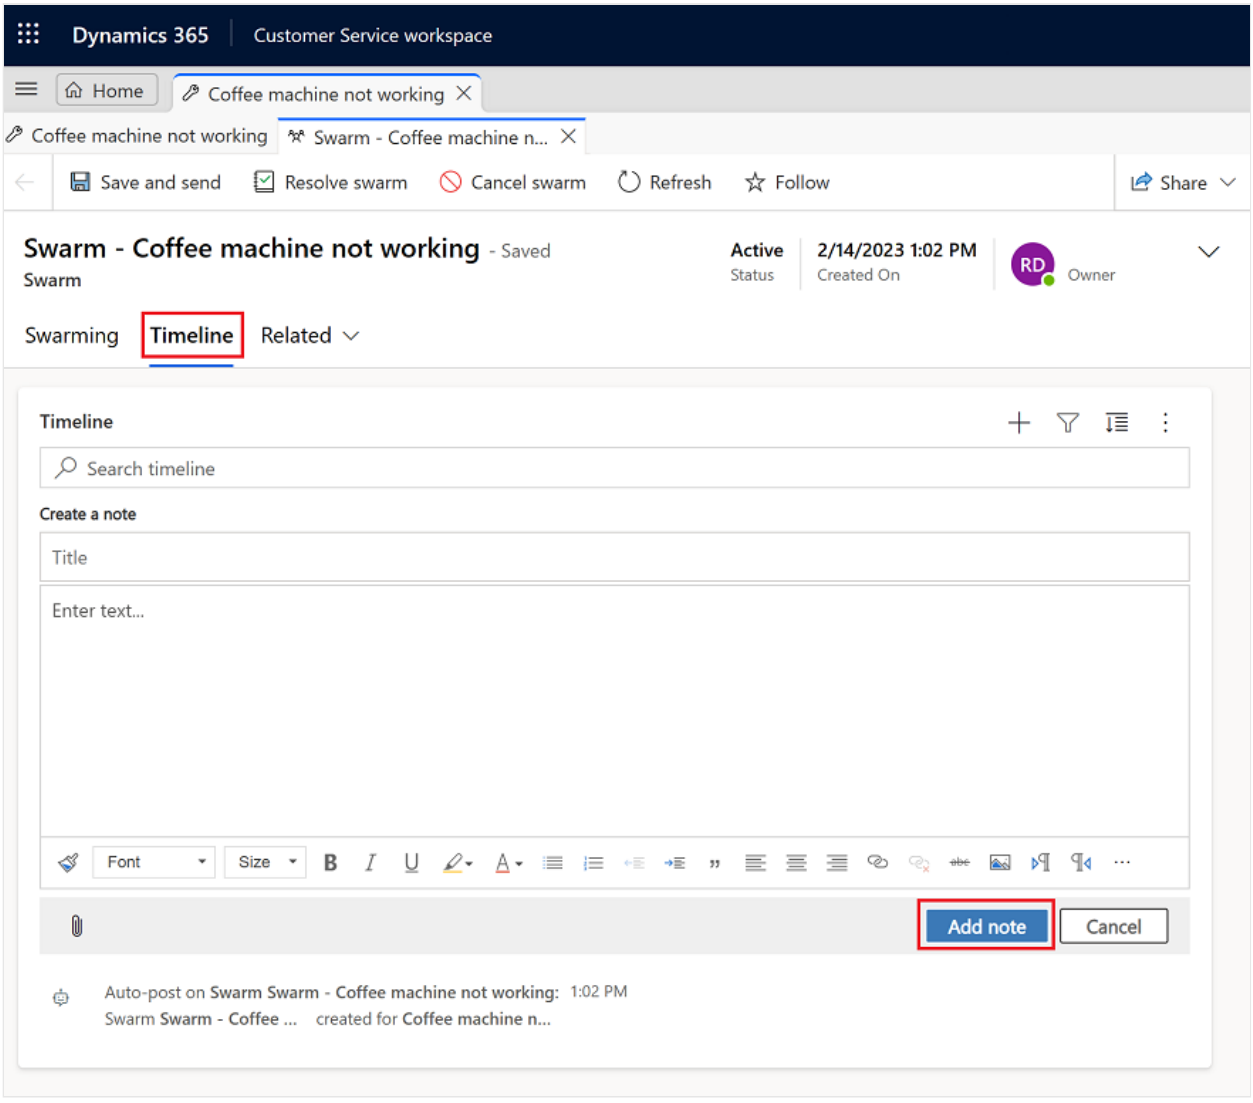
3. (Optional) In the **Owner** field, as the creator of the task, you're listed by default. You can add others if desired by typing their names.
4. (Optional) Enter a **Description** of what you need to do.
5. (Optional) Enter a **Due** date.
6. Specify the **Duration** and **Priority** details.
7. When finished, select **Save and Close**.

A Dynamics 365 bot autoposts a link to the task in the Teams chat.

Create a note in the timeline

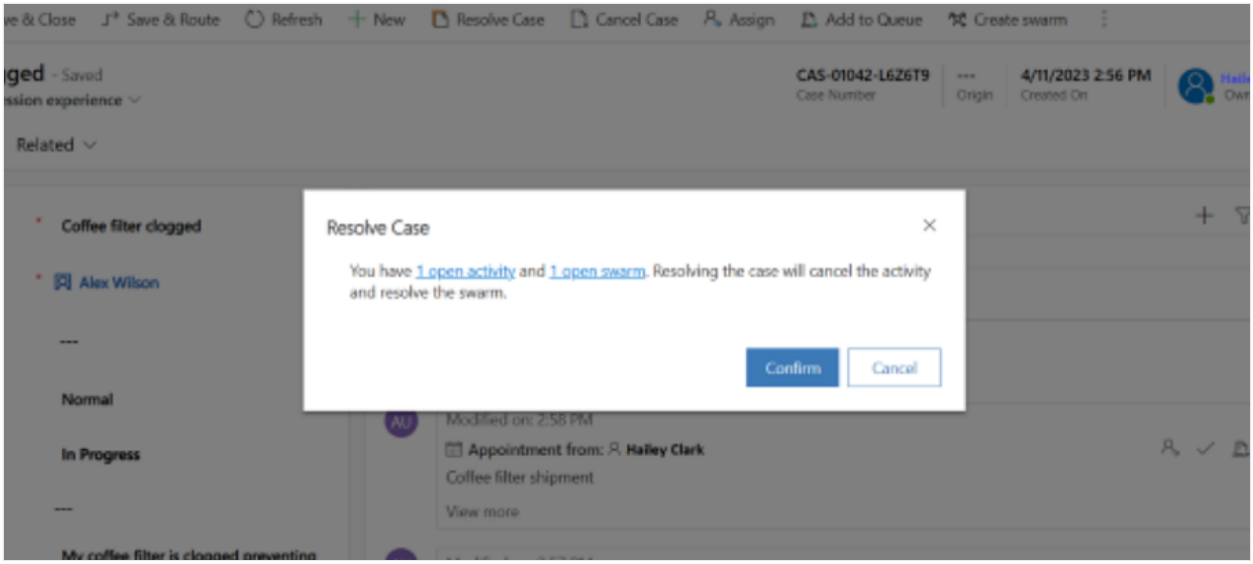
You can create notes that include specific details that appear in the swarm timeline and also in the Teams chat.

1. In **Timeline**, select the **Add** (+) icon, and then select **Note** on the dropdown menu. The **Quick Create: Note** pane opens on the right-hand side of the page.
2. Type a **Title** for the note.
3. In the rich text editor, add details.
4. When finished, select **Save and Close**.



Case closure and swarm resolution

When you close a case, either by resolving or canceling it, links to any open swarms that are associated with the case are displayed. You can choose to close or cancel those swarms by selecting the links. If you confirm, the relevant swarms are resolved. If you select cancel, you're returned to the case form.

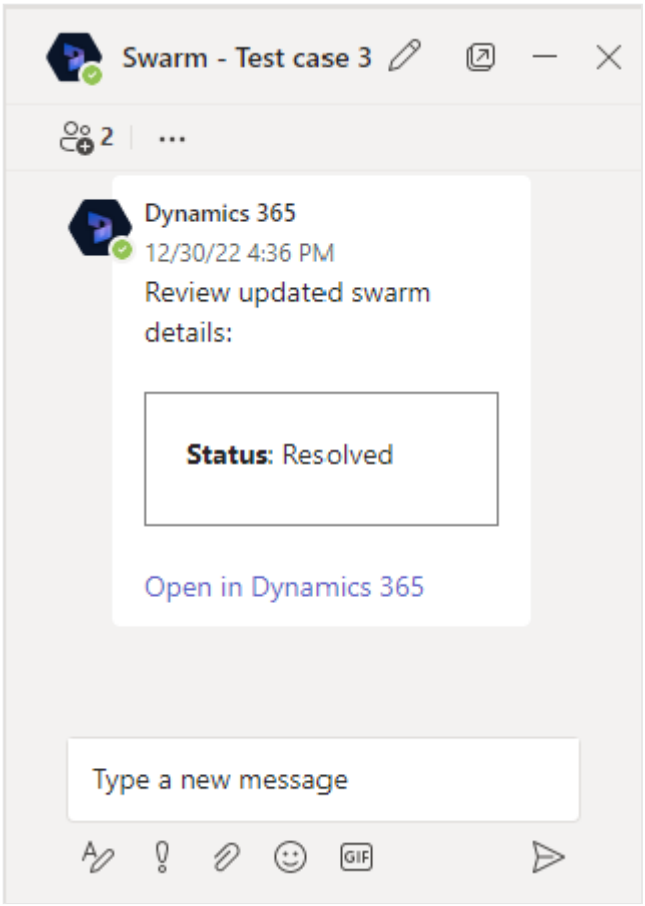


Resolve a swarm session

When a swarm has completed, you can close it by completing the following steps:

1. On the **Swarm** page in Customer Service workspace, select **Resolve swarm**.
2. (Optional): In the **Resolve this swarm?** dialog box, enter details that describe the solution.
3. Select **Resolve swarm**.

After the swarm is resolved, a Dynamics 365 bot posts to the Teams chat to indicate that the swarm has been resolved with a link to the swarm details in Dynamics 365.



Reactivate a swarm

You can reactivate a swarm by completing the following steps:

1. In Customer Service workspace, on the sitemap, select **Swarms** in **Service**.
2. On the **Swarm** page, from the dropdown list, select **All swarms**, and then select the swarm you want to reactivate.
3. On the **Case details** page, select **Reactivate swarm**.

After the swarm is reactivated, a Dynamics 365 bot posts to the Teams chat to indicate that the swarm has been reactivated with a link to the swarm details in Dynamics 365.

Cancel a swarm

You can cancel a swarm that's in progress by completing the following steps:

1. In Customer Service workspace, on the sitemap, select **Swarms** in **Service**.
2. On the **Swarm** page, select **Active swarms** from the dropdown menu, and then select the swarm you want to cancel.
3. On the **Case details** page, select **Cancel swarm**.
4. On the **Cancel this swarm?** dialog, select the reason you want to cancel the swarm from the dropdown list, and then select **Cancel swarm**.

After the swarm is canceled, a Dynamics 365 bot posts to the Teams chat to indicate that the swarm has been canceled with a link to the swarm details in Dynamics 365.

View associated swarms

You can see the swarms that are associated with a case from the record. To view the associated swarms, in Customer Service workspace, go to the **Details** tab, and then view the **Associated swarms** card.

Swarm views

To view a list of swarms, go to **Swarms** on the site map. The following views are available:

- All swarms
- Canceled swarms
- My active swarms
- Resolved swarms
- Swarms being followed
- Swarms I follow

Share and update Dynamics 365 records within Microsoft Teams conversations (production-ready preview)

Article • 06/20/2022

Important

- This topic is prerelease documentation and is subject to change.
- Preview features designated as production-ready employ privacy and security measures typically present in generally available features, as further explained in our **preview terms**.

When having a conversation with other people over Teams, you might want to share Dynamics 365 records with them within a Teams chat or a channel. You can do this by using the Dynamics 365 app. The Dynamics 365 app allows you to search for information in Dynamics 365, share with other participants in their chats or channels, and even allow them to perform tasks from within the Teams chat conversation. Using the Dynamics 365 app, you can:

- Send a quick summary of a record in a Microsoft Teams chat or channel as an interactive card.
- Search for and filter Dynamics 365 records to share with your conversation participants.
- Paste the URL of a Dynamics 365 record and have it rendered as an interactive card.
- Edit records through interactive cards.
- Add chat conversations as notes and tasks with the click of a button.

Note

The functionality of sharing Dynamics 365 records in Teams is not supported on mobile devices.

The information in the interactive card is displayed using the view of type **Quick Find View** of a table. To change the information displayed in the cards, admins can edit the

columns in the **Quick Find View** view of a table as per the requirement.

Access the Dynamics 365 app through messaging extensions (production-ready preview)

Article • 08/10/2022

> **Important**
>
> This topic is pre-release documentation and is subject to change.

If you've already added the Dynamics 365 app to Microsoft Teams, proceed with the Access the Dynamics 365 app section. If you haven't added the app to Microsoft Teams, proceed with the Add the Dynamics 365 app section.

License and role requirements

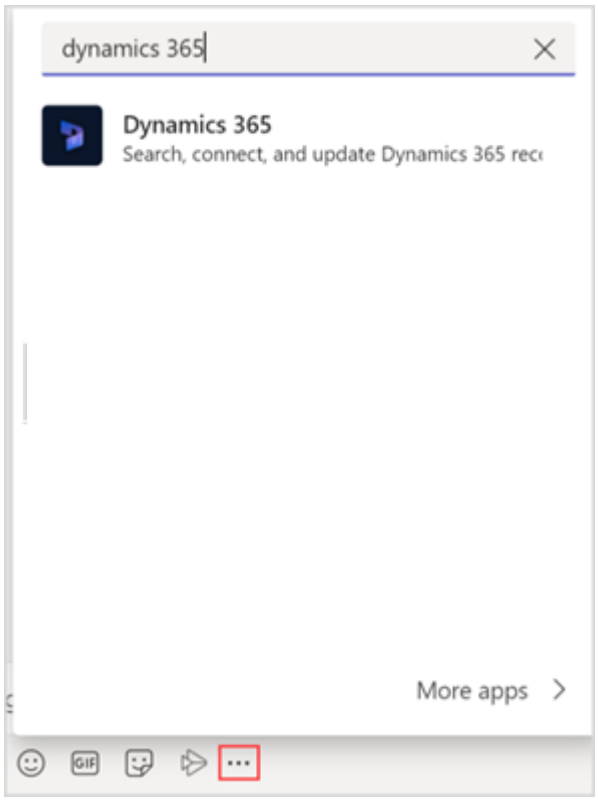
Requirement type	You must have
License	• Dynamics 365 Sales Premium, Dynamics 365 Sales Enterprise, Dynamics 365 Sales Professional, Dynamics 365 Team Members, or any Dynamics 365 customer engagement app license • Microsoft Teams license More information: • Dynamics 365 Sales pricing • Microsoft Teams pricing • Dynamics 365 Team Members • Dynamics 365 Licensing Guide
Security roles	• Any primary sales role, such as salesperson, or sales manager • Any role that has access to a Dynamics 365 record More information: Primary sales roles

Add the Dynamics 365 app

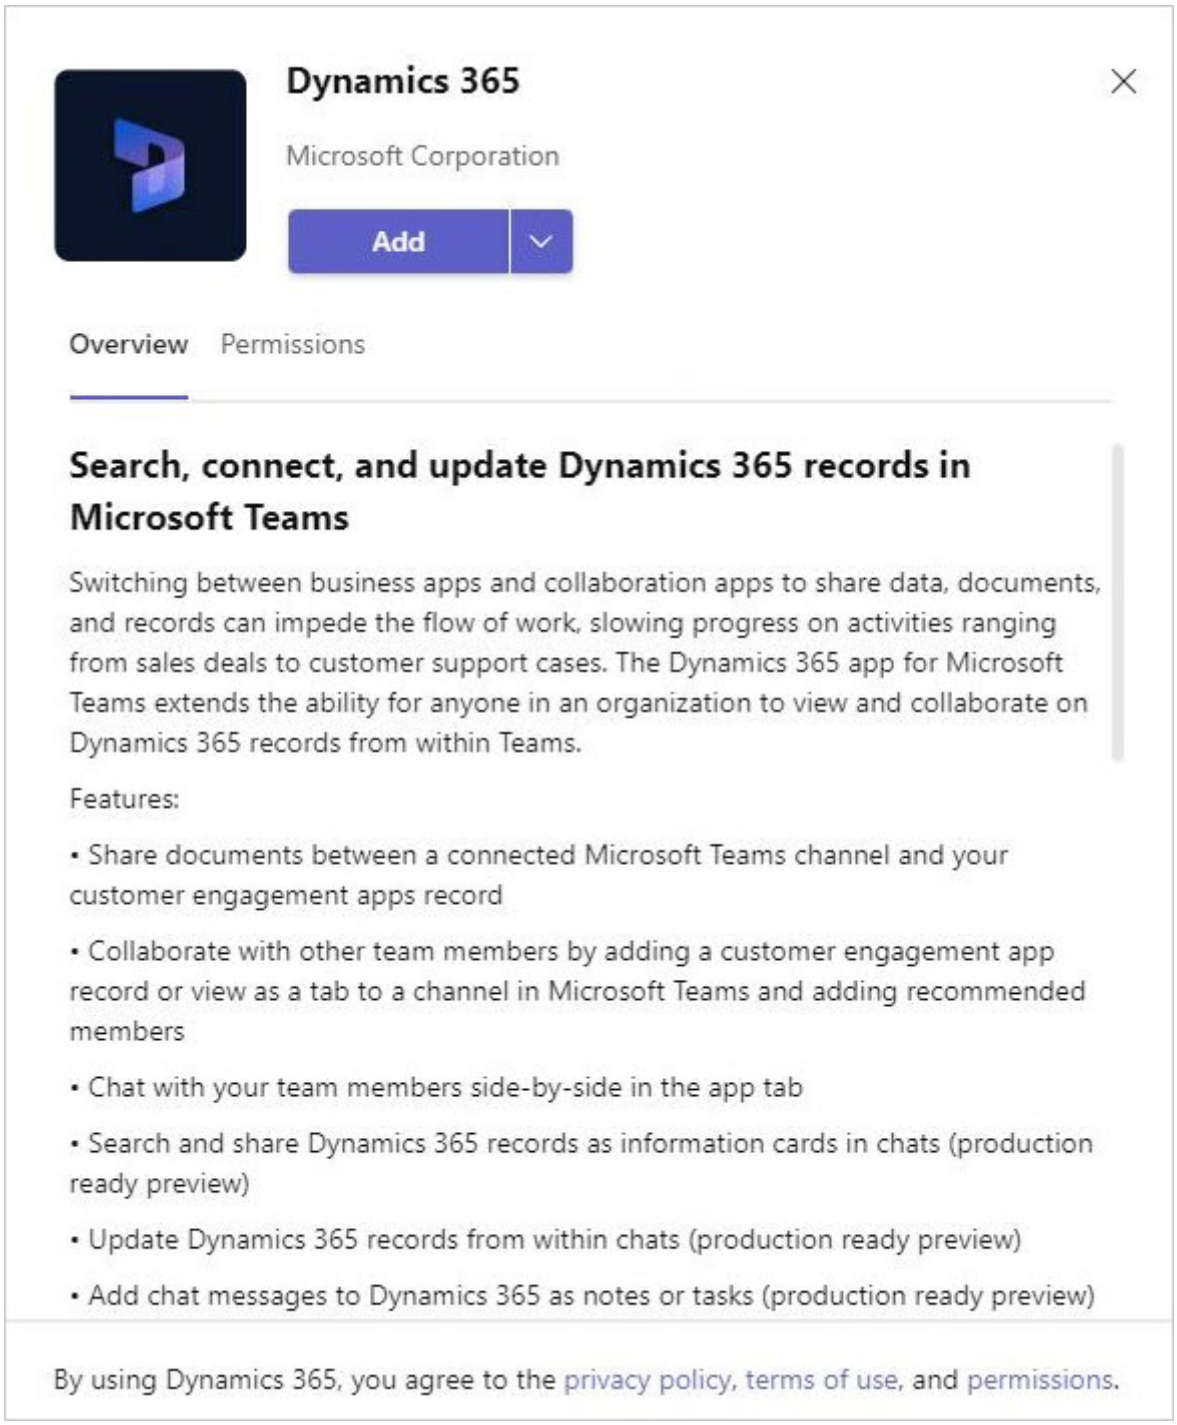
1. Open a channel in Teams and select **New conversation**.

Alternately, open any chat conversation with a person or group.

2. Select **Messaging extensions** (...) on the command bar, search for **Dynamics 365**, and select it.



3. Select **Add** in the Dynamics 365 window.



The app is added to the channel or a chat conversation in Teams.

> **Note**
>
> Once you install the app for one channel or chat, it's available for use in all other channels and chats.

Access the Dynamics 365 app

After the Dynamics 365 app is added to a channel, it's available through messaging extensions in Teams.

1. In Teams, open the channel to which you added the Dynamics 365 app and select **New conversation**.

   Alternately, open the chat conversation with a person or group to which you added the Dynamics 365 app.

2. Select the Dynamics 365 icon ( ) on the command bar.

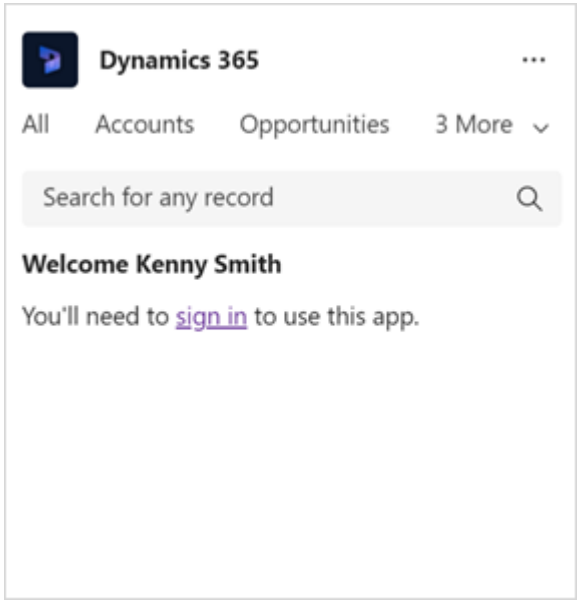
   If you don't find the Dynamics 365 icon ( ) on the command bar, select the **Messaging extensions (...)** icon on the command bar, search for the **Dynamics 365** app, right-click and then select **Pin**.

   The Dynamics 365 app icon is pinned to the command bar.

Set up the Dynamics 365 app

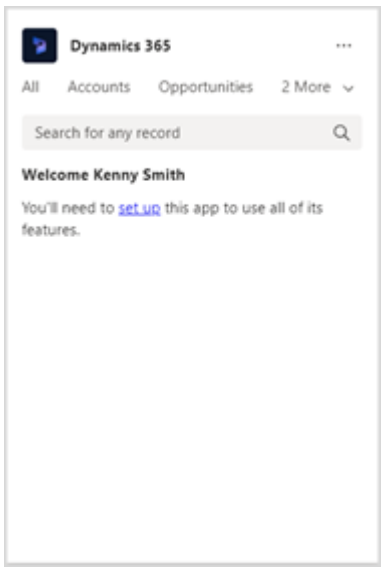
1. Access the Dynamics 365 app.

2. In the **Dynamics 365** window, select **sign in**.



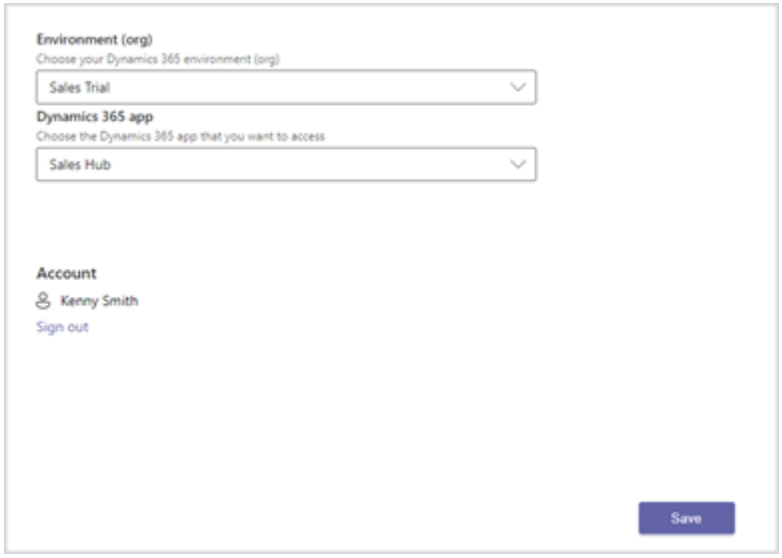
3. After you sign in to the app, select **set up**.

> **Note**
>
> You'll see this step only if you are using the Dynamics 365 app in Teams for the first time. Otherwise, you'll be taken to the next step to select an environment and an app.



4. In the browser window that opens, provide the following information:

   - **Environment (org)**: Select an environment that you want to connect to.
   - **Dynamics 365 app**: Select an app that you want to share records from.



5. Select **Save**.

After you've set up the app, you can change the settings later as required. More information: Edit settings of the Dynamics 365 app

Article • 08/10/2022

> **Important**
>
> This topic is pre-release documentation and is subject to change.

This article provides information on how to edit settings of the Dynamics 365 app.

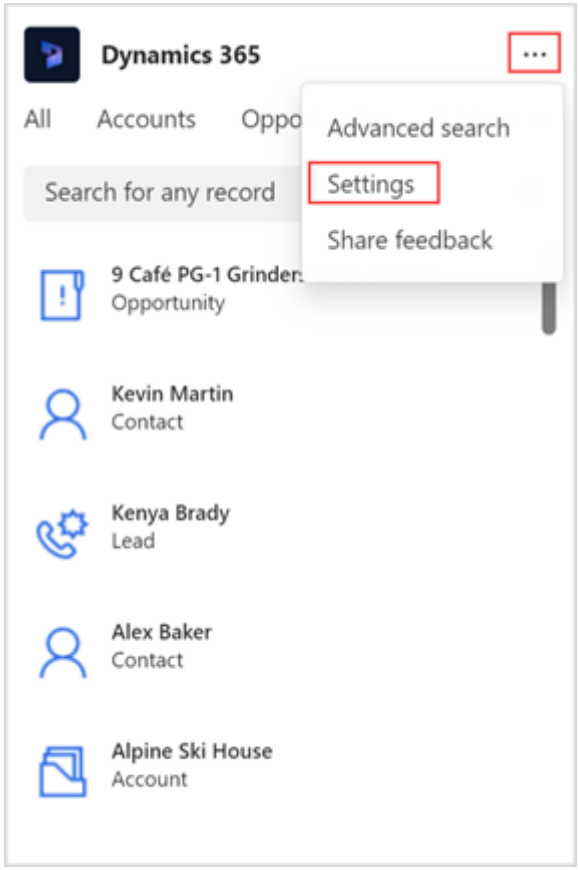
License and role requirements

Requirement type	You must have
License	• Dynamics 365 Sales Premium, Dynamics 365 Sales Enterprise, Dynamics 365 Sales Professional, Dynamics 365 Team Members, or any Dynamics 365 customer engagement app license • Microsoft Teams license More information: • Dynamics 365 Sales pricing • Microsoft Teams pricing • Dynamics 365 Team Members • Dynamics 365 Licensing Guide
Security roles	• Any primary sales role, such as salesperson, or sales manager • Any role that has access to a Dynamics 365 record More information: Primary sales roles

Edit settings

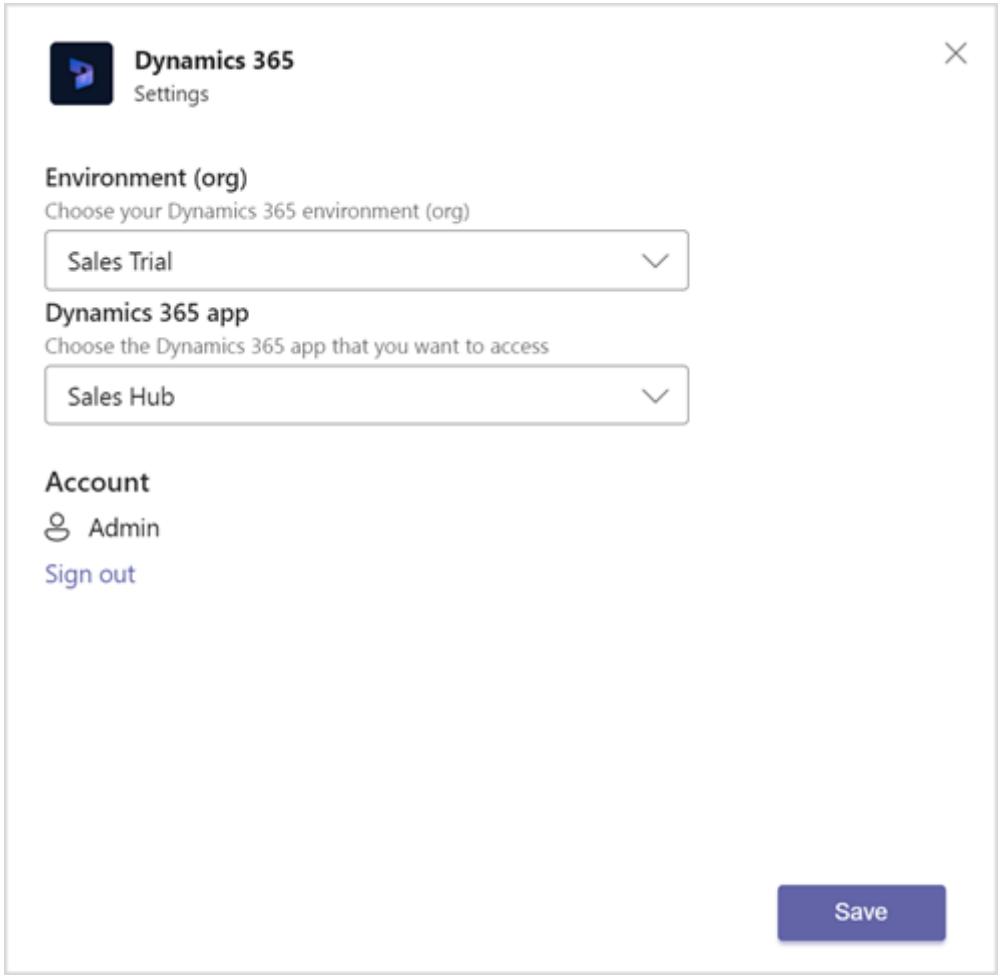
1. Access the Dynamics 365 app.

2. Select **Action Commands** (...) in the upper-right corner, and then select **Settings**.



3. In the **Settings** window, select the following information:

    - **Environment (org)**: Environment that you want to connect to.
    - **Dynamics 365 app**: App that you want to share records from.



4. Select **Save**.

Share feedback (production-ready preview)

Article • 08/10/2022

> **Important**
>
> This topic is pre-release documentation and is subject to change.

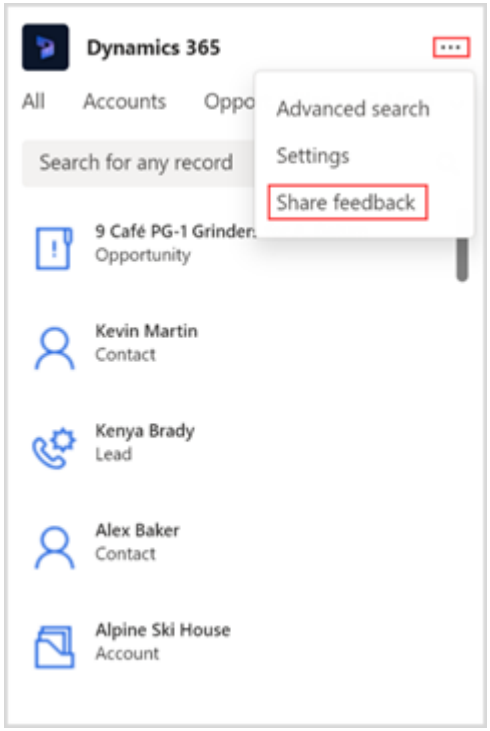
If you have any feedback about the Dynamics 365 app, you can share it from within the app.

License and role requirements

Requirement type	You must have
License	• Dynamics 365 Sales Premium, Dynamics 365 Sales Enterprise, Dynamics 365 Sales Professional, Dynamics 365 Team Members, or any Dynamics 365 customer engagement app license • Microsoft Teams license More information: • Dynamics 365 Sales pricing • Microsoft Teams pricing • Dynamics 365 Team Members • Dynamics 365 Licensing Guide
Security roles	• Any primary sales role, such as salesperson, or sales manager • Any role that has access to a Dynamics 365 record More information: Primary sales roles

How to share feeback

1. Access the Dynamics 365 app.
2. Select **Action Commands** (...) in the upper-right corner, and then select **Share feedback**.



3. Enter your responses in the survey and then submit it.

Share Dynamics 365 records within Microsoft Teams conversations (production-ready preview)

Article • 08/10/2022

> **Important**
>
> This topic is pre-release documentation and is subject to change.

Discussing a particular opportunity on Teams? Share the record of the chat conversation and let participants view it without navigating away from Teams. You can share any Dynamics 365 record on Teams channels and chat conversations.

License and role requirements

Requirement type	You must have
License	• Dynamics 365 Sales Premium, Dynamics 365 Sales Enterprise, Dynamics 365 Sales Professional, Dynamics 365 Team Members, or any Dynamics 365 customer engagement app license • Microsoft Teams license More information: • Dynamics 365 Sales pricing • Microsoft Teams pricing • Dynamics 365 Team Members • Dynamics 365 Licensing Guide
Security roles	• Any primary sales role, such as salesperson, or sales manager • Any role that has access to a Dynamics 365 record More information: Primary sales roles

Share a Dynamics 365 record through search

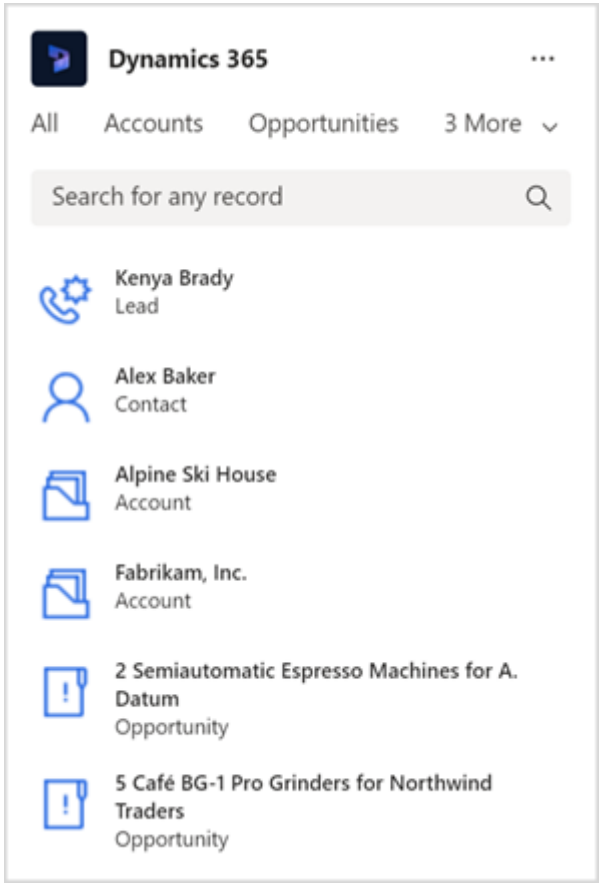
As a sender, you can share records using search in the app. The search displays the record name and the table type in the search results. However, if you want to search records as per a table type and preview a record in the search results, you must use the advanced search functionality.

> ⓘ **Note**
>
> You can also share a record by typing `@Dynamics 365` followed by a message to the Dynamics 365 app during a Teams conversation. The app allows you to search for the record and then it shares the record on your behalf in the Teams conversation. For example, if you type `@Dynamics 365, help me find the Alpine deal`, the app responds with a message to search for the record. You can then search for the record and share it.

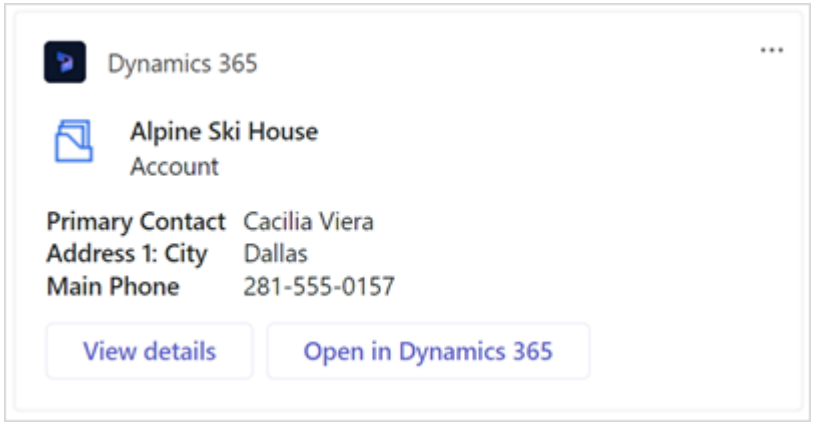
To share a record using search:

1. Go to the new or an existing conversation in which you want to share a record, and then open the Dynamics 365 app.
2. In the **Dynamics 365** window, search for the record to share, and then select it to share as a card on the chat.

   > ⓘ **Note**
   >
   > - By default, the recently accessed records are displayed, without performing any search. You can either search for the record or use the record type tabs available above the search field to search for a particular record type.
   > - The **All** tab allows you to search for all table type (out-of-the-box and custom) records. Other tabs are specific to a table type and allow you to search for that record type.

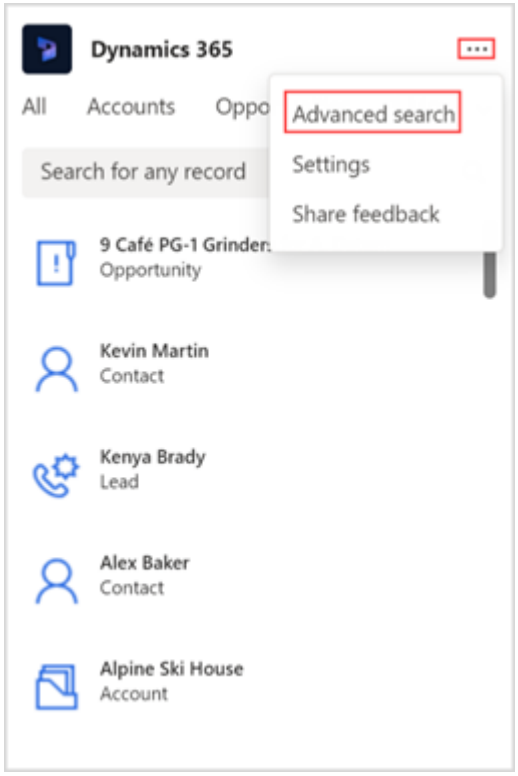


The selected record is shared on the Teams chat.



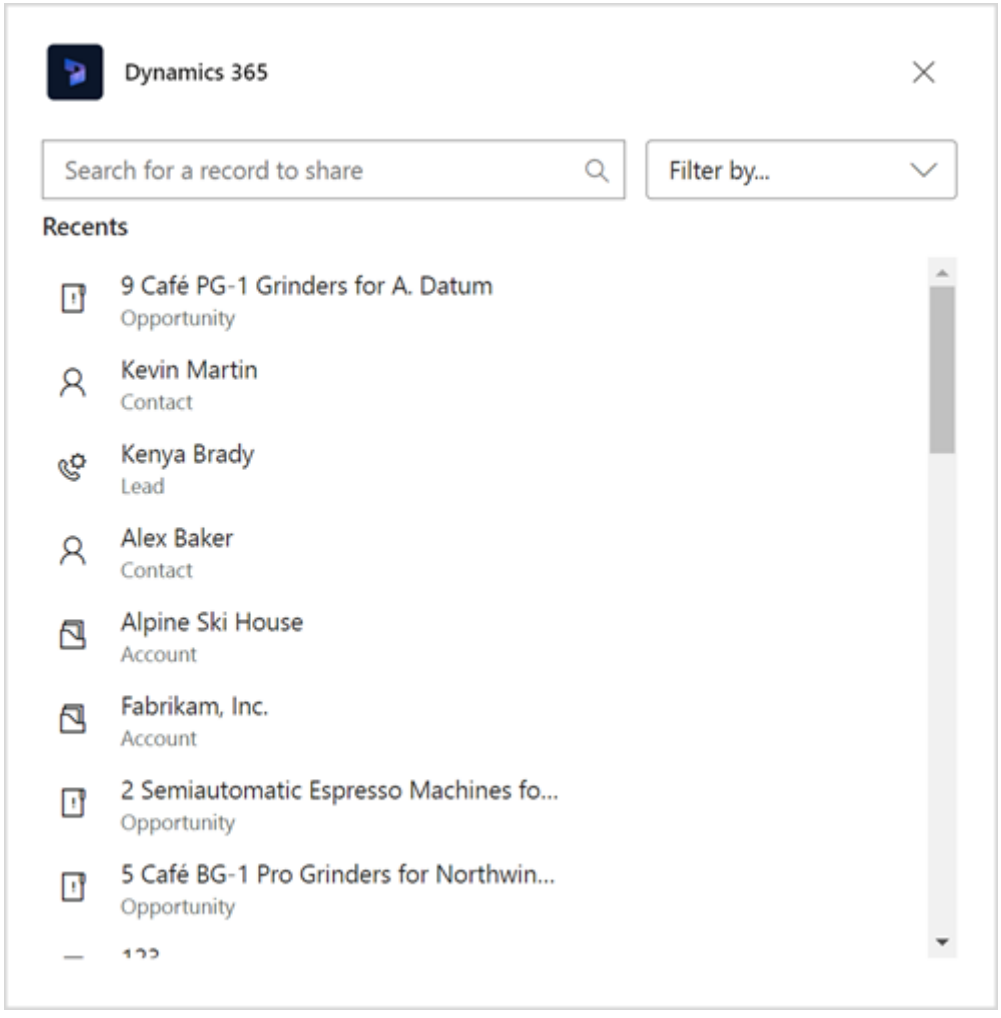
To share a record using advanced search:

1. Go to the new or existing conversation in which you want to share a record, and then open the Dynamics 365 app.
2. Select **Action Commands** (...) in the upper-right corner, and then select **Advanced search**.

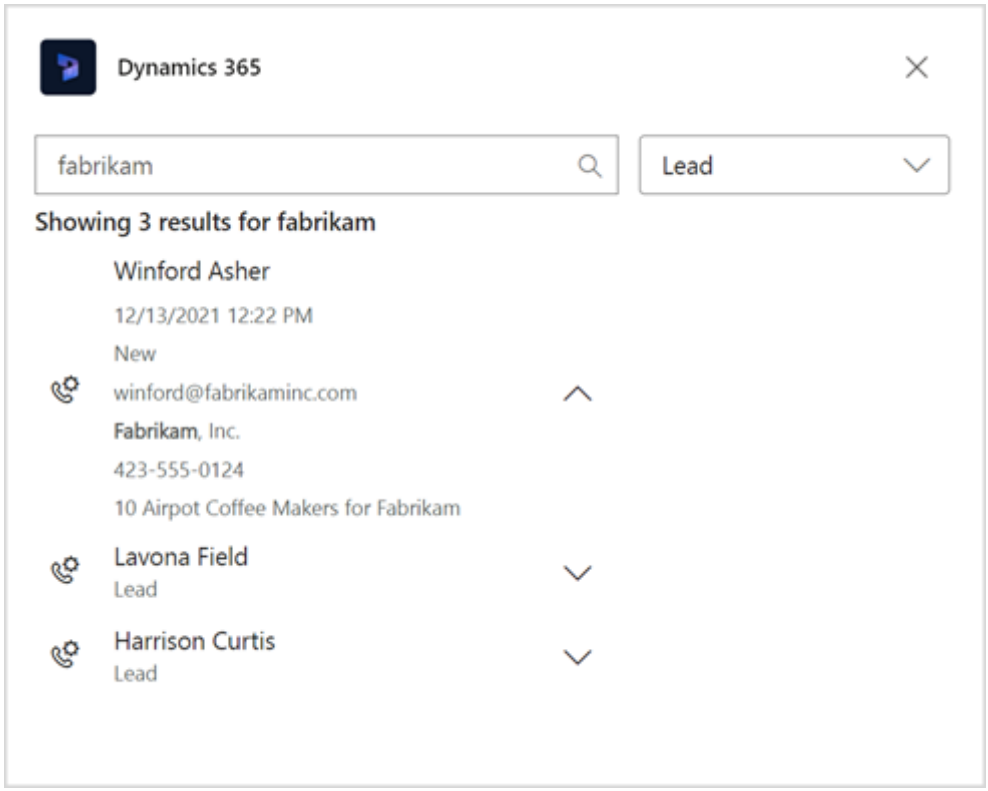


3. In the **Advanced search** window, enter or select the following values:

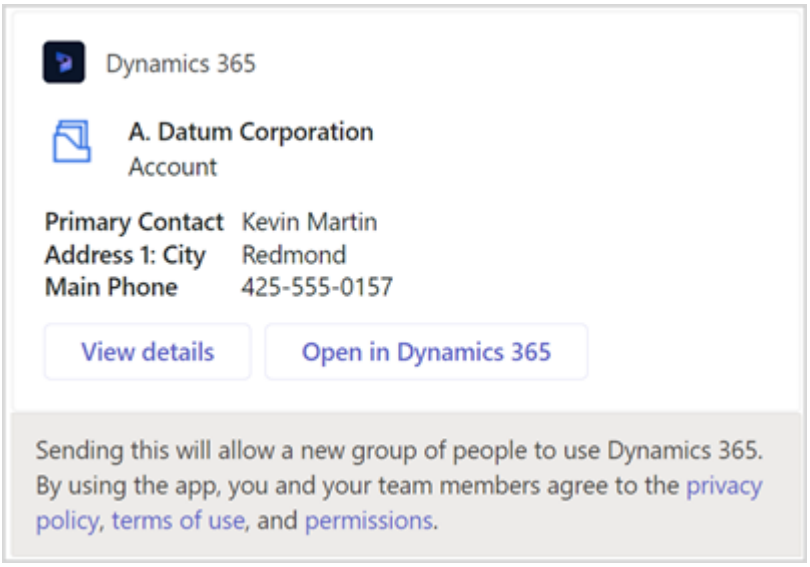
   - **Search for a record to share**: Name of the record to share.
   - **Filter by**: Record type to search for.



4. From the results, preview a record by selecting the down arrow next to the record name. Select a record to share it as a card on the chat.



If you see a disclaimer while sharing a record over Teams, it means that the app isn't yet added for that conversation or team.

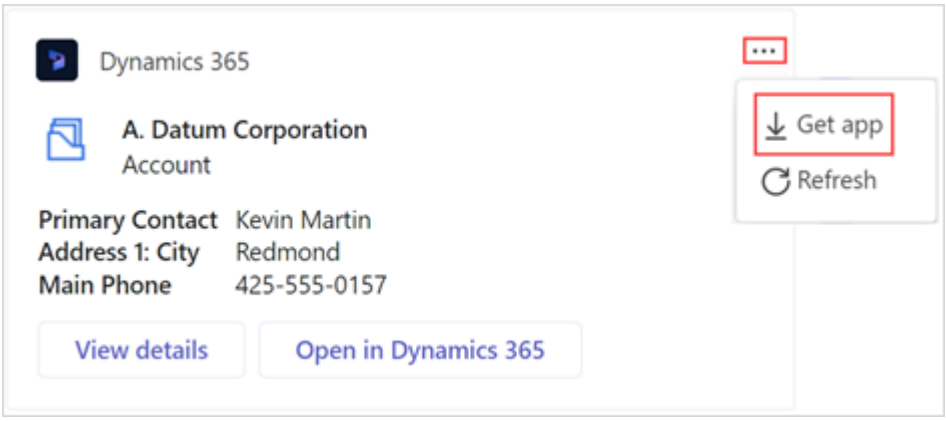


You can still share the record over Teams. The recipients must add the Dynamics 365 app to their Teams.

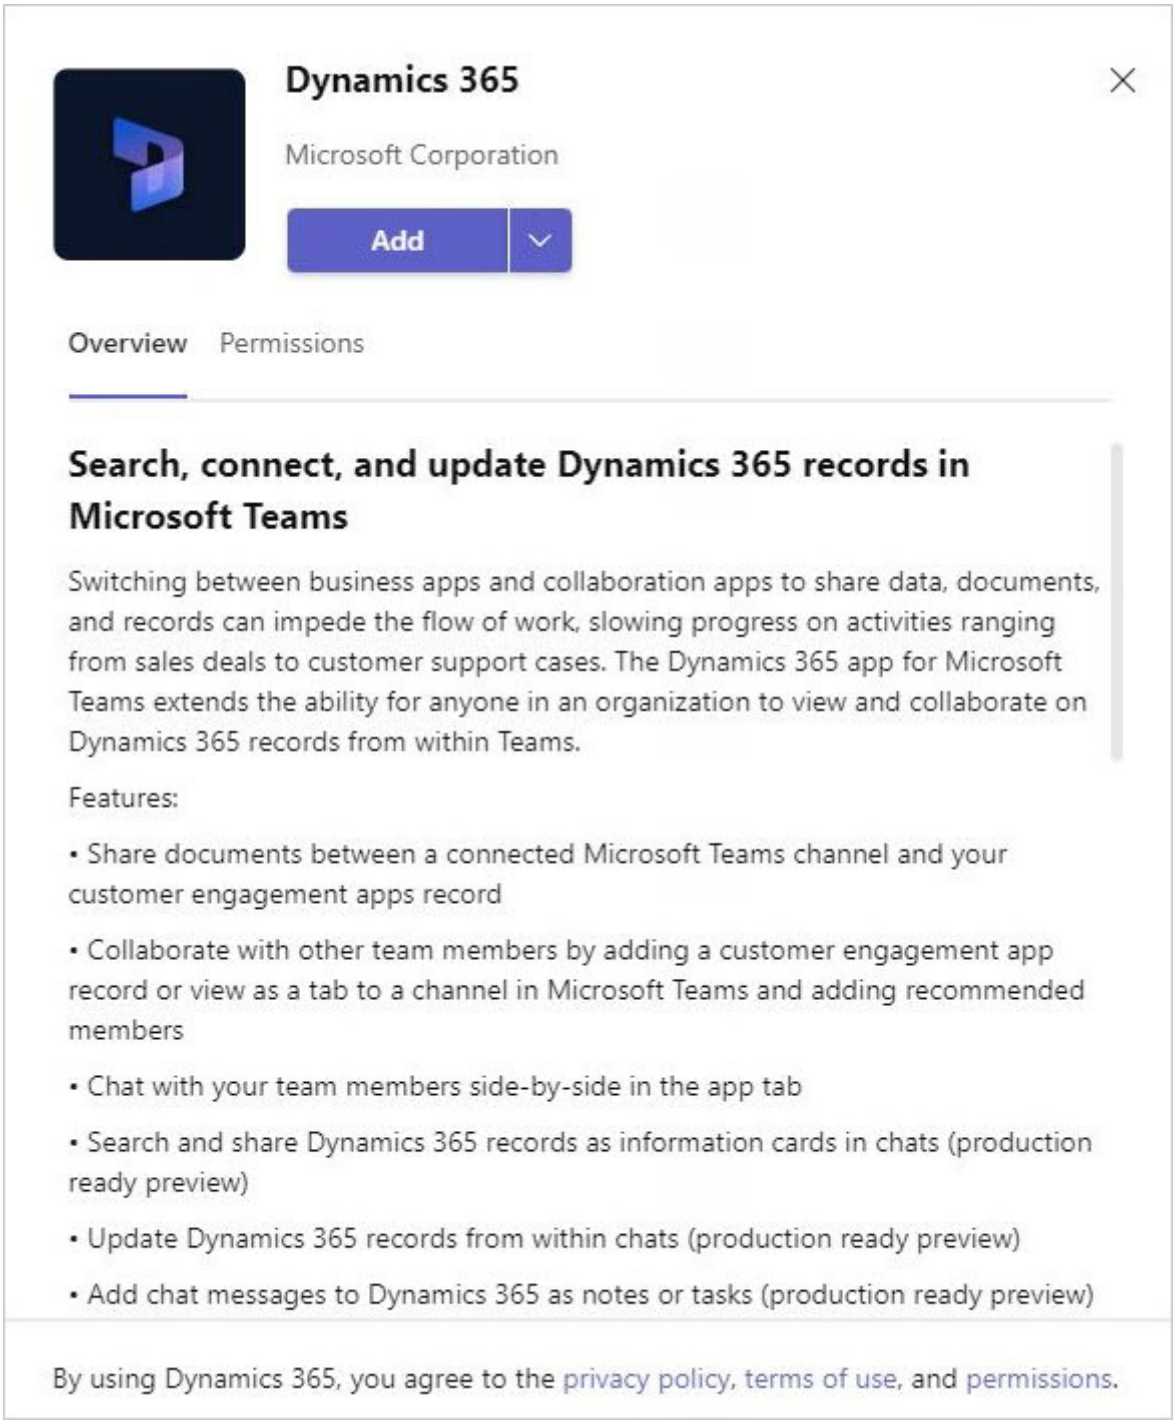
Each person in the team must add the Dynamics 365 app to their personal scope. To add the Dynamics 365 app:

1. Select **View details** on the card.

Alternately, hover over the card, select **More options** (...), and then select **Get app**.



2. Select **Add** in the Dynamics 365 window.



Share a record through URL

You can also share a record by pasting the URL of a Dynamics 365 record. You can get the URL of a record from the web browser.

The record is displayed as an information card with actions.

Add chat messages to Dynamics 365 as notes or tasks

View and update record details (production-ready preview)

Article • 08/10/2022

> **Important**
>
> This topic is pre-release documentation and is subject to change.

After you receive a card in a Teams chat, you can view its details and update them as required.

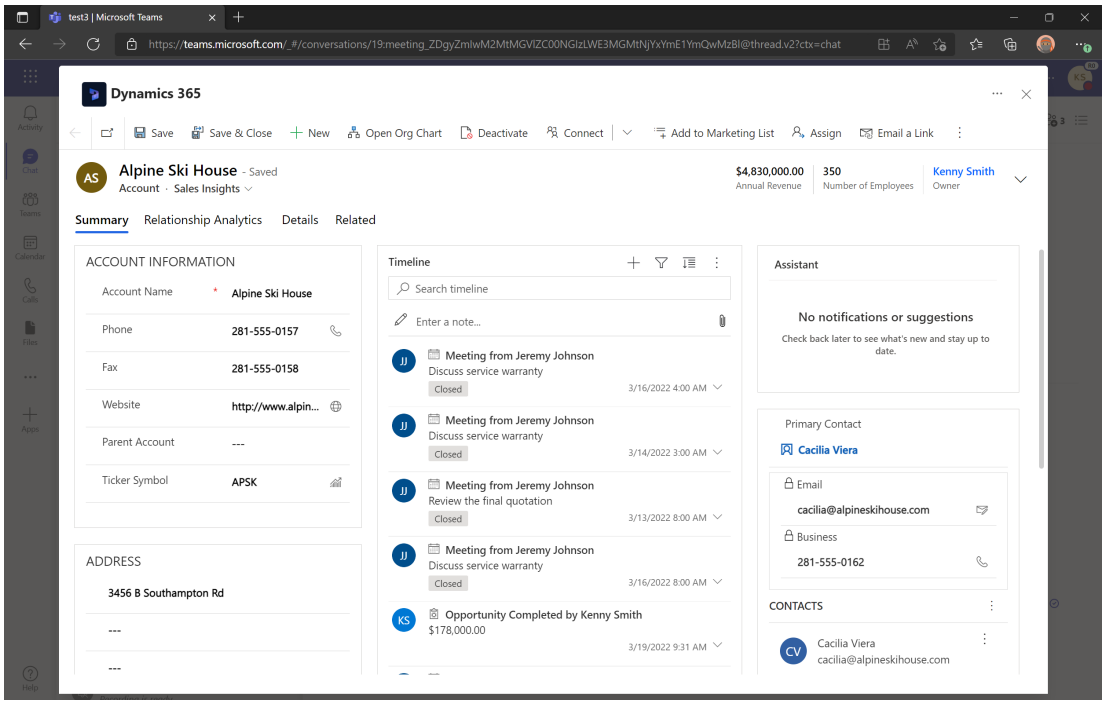
License and role requirements

Requirement type	You must have
License	• Dynamics 365 Sales Premium, Dynamics 365 Sales Enterprise, Dynamics 365 Sales Professional, Dynamics 365 Team Members, or any Dynamics 365 customer engagement app license • Microsoft Teams license More information: • Dynamics 365 Sales pricing • Microsoft Teams pricing • Dynamics 365 Team Members • Dynamics 365 Licensing Guide
Security roles	• Any primary sales role, such as salesperson, or sales manager • Any role that has access to a Dynamics 365 record More information: Primary sales roles

How to view and update record details

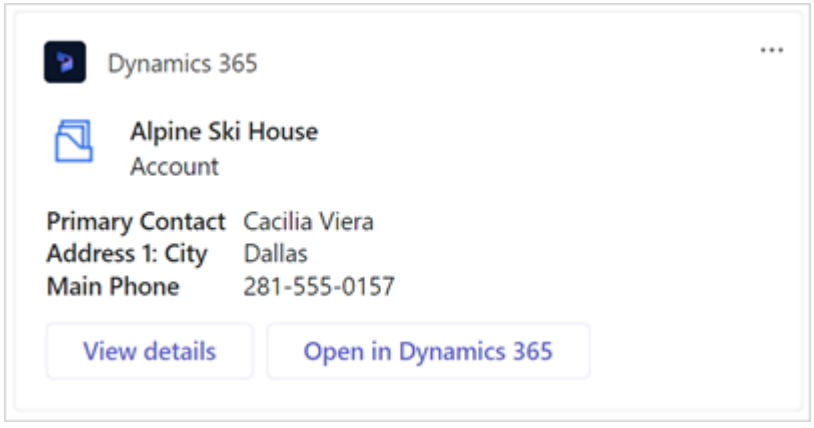
1. In a record card whose details you want to update, select one of the following:

   - **View details**: The record is opened in a new window inside Teams.



- **Open in Dynamics 365**: The record is opened in the customer engagement app.

> **Note**
>
> The recipients can view and update the record if they have the necessary permissions in Dynamics 365. Otherwise, they'll see a permission error.



2. Update the details as required and save the changes.

3. To see the updated changes in the card, hover over the card, select **More options** (...), and then select **Refresh**.

Add chat messages to Dynamics 365 as notes or tasks (production-ready preview)

Article • 08/10/2022

> **Important**
>
> This topic is pre-release documentation and is subject to change.

While you're in a conversation about a particular record, you might discuss certain action items, or important points that you want to capture in Dynamics 365. The app makes it easy for you to add such messages as notes or tasks to the corresponding record.

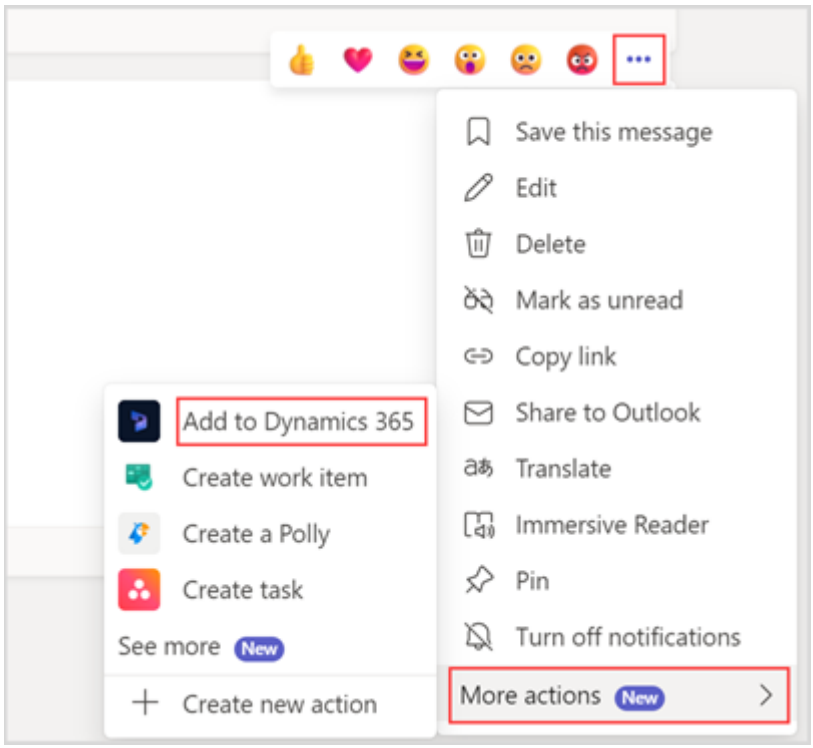
License and role requirements

Requirement type	You must have
License	• Dynamics 365 Sales Premium, Dynamics 365 Sales Enterprise, Dynamics 365 Sales Professional, Dynamics 365 Team Members, or any Dynamics 365 customer engagement app license • Microsoft Teams license More information: • Dynamics 365 Sales pricing • Microsoft Teams pricing • Dynamics 365 Team Members • Dynamics 365 Licensing Guide
Security roles	• Any primary sales role, such as salesperson, or sales manager • Any role that has access to a Dynamics 365 record More information: Primary sales roles

Add a chat message to a Dynamics 365 record

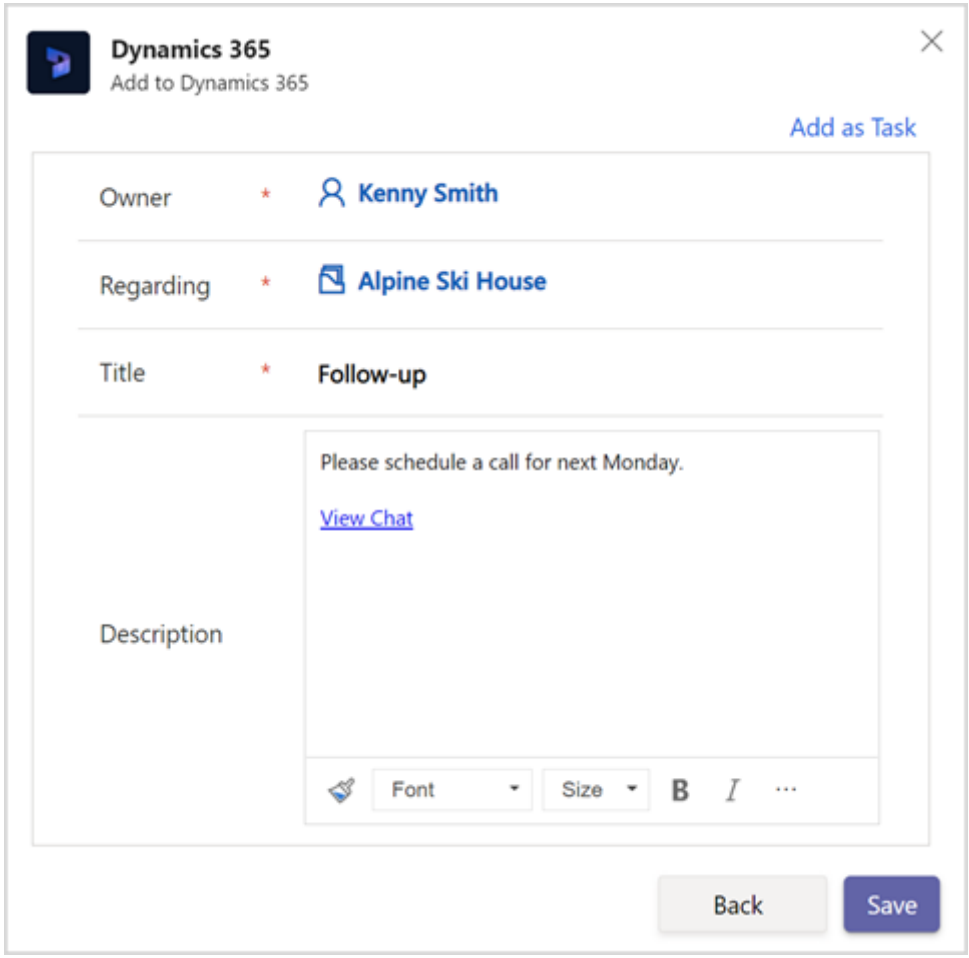
1. Hover over the message that you want to add as a note or task, and then select **More options** (...).

2. In the context menu, select **More actions** > **Add to Dynamics 365**.



3. In the **Regarding** field, select the record to which you want to add the message as a note or task.

4. In the **Title** field, enter a title for the note or task.



By default, the message is added as a note. If you want to add the message as a task, select **Add as Task** in the upper-right corner of the window. The values from the **Regarding** and **Title** fields are populated in the task accordingly.

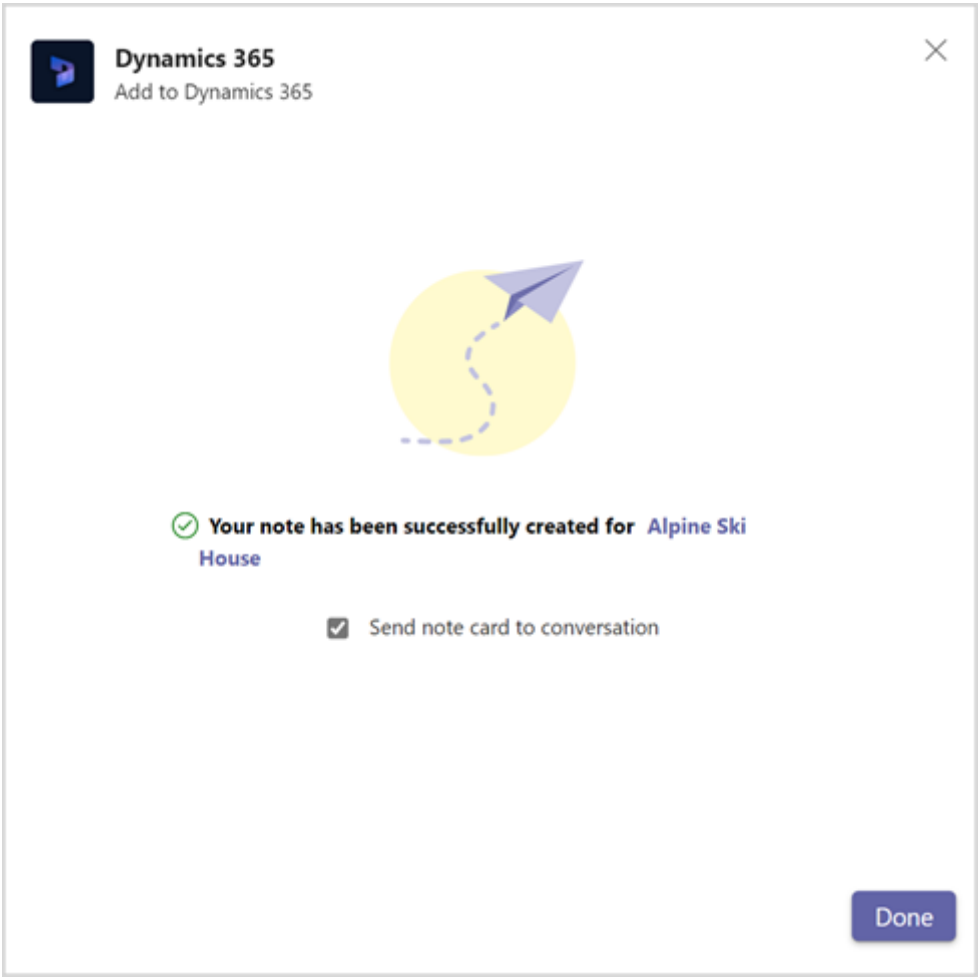
> **Note**
>
> The message is added to the description field of the note or task. Rich text format is not supported for tasks. So, if you try to add rich text messages, you'll only see the chat URL in the description for tasks. You can manually copy and paste the chat message in such cases.

5. Select **Save**.

   The note or task is added to the timeline of the record.

   By default, the note or task card is sent to the conversation. If you don't want to send the note or task card to the conversation, clear **Send note card to conversation** or **Send task card to conversation**.

6. Select **Done**.



The note or task is added to the record's timeline. A **View Chat** link is added to the note or task. Selecting the **View Chat** link opens the conversation in Teams.

Introduction to the voice channel

Article • 10/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Tip**
>
> If you'd like to try Dynamics 365 Customer Service for free, you can sign up for a **30-day trial**.

Enable your customer service representatives to communicate with customers on the phone to resolve issues using the voice channel in Dynamics 365 Customer Service. While many customers increasingly use chat, SMS messages, and social media to engage and request support from organizations, phone calls continue to be an important communication channel. The voice channel provides agents with the ability to receive and make public switched telephone network (PSTN) calls through a native calling experience in Dynamics 365. Real-time AI-powered features such as live call transcription, sentiment analysis, and AI-based suggestions are available to boost agent productivity. Omnichannel for Customer Service also provides a rich set of analytics and insights, including AI-driven topic clustering and call insights.

Why choose the voice channel

Most organizations manually integrate standalone telephony and customer relationship management (CRM) solutions, which result in fragmented experiences for agents and customers across engagement channels. Such solutions from multiple providers are complex to roll out and maintain, and create data silos with disconnected insights of customer interactions and agent performance across channels.

Native platform

The voice channel is built, owned, and operated completely by Microsoft. It's an all-in-one customer service solution that reduces time to value by enabling quick and easy deployment of the voice channel for your business. Also, the voice channel is built on

Microsoft Azure Communication Services with the scalability and reliability of the calling platform.

Built alongside existing omnichannel capabilities with a common data framework

The voice channel in Dynamics 365 Customer Service is another channel to engage customers with Chat, SMS, and social media, ensuring consistent, personalized, and connected support across all channels of engagement. As an example, agents can escalate web chat conversations to voice and video calls. As another example, routing a voice call to an agent is completed with unified routing, the same way an incoming chat message is assigned to an agent. By using the same platform, the voice channel works well with other features like a Power Virtual Agents bot. The process to create and deploy a conversational interactive voice response (IVR) bot is the same as the process to create and deploy a chat bot.

Beyond workflows and processes, the voice channel benefits from a common data framework with the other channels, allowing organizations to better understand each customer's journey whether the customer sent a chat, made a phone call, or used social channels. This means the solution provides a single view of the customer that empowers agents to provide personalized service across all channels, and true omnichannel analytics and insights for agents and supervisors alike.

Differentiating AI

The voice channel has Microsoft's award-winning AI built into the product. This enables agents to resolve issues faster with tools like call transcriptions and sentiment analysis, and gain instant insights into trends.

Support for emergency calling

The voice channel supports emergency calling where agents can dial in the emergency number in a crisis. Any omnichannel voice agent with a capacity profile associated with a voice outbound profile can make an emergency call. The emergency responders can call the agent back over a temporary callback number if the call is dropped (even if the agent had called via a shared outbound number).

Key capabilities of the voice channel

Take a look at some of the key capabilities that makes the voice channel great for IT administrators, supervisors, agents, and customers.

User experience	Capability
Agent	• Call controls: Mute, Hold, End • Music on hold • Music on wait • Integrated customer and case history lookup • Notes and knowledge search • Mark a number as spam • Dial the emergency number during crisis (currently supported in the United States and Puerto Rico only) • Receive calls from emergency responders over a dedicated callback number
Calling and routing	• Ability to handle and distribute incoming calls, automatic call distribution (routing) • Voicemail • Ability to make outbound calls • Transfer to external phone number • Phone number provisioning and management • Skills-based assignment
AI	• Call insights • Real-time sentiment analysis • Real-time transcription and recording • Real-time translation of call transcripts • Real-time smart assist suggestions • No-code virtual agent as IVR
Supervisor	• Consulting and transferring • Monitoring and barging • Ability to record and manage phone calls • Operations management through supervisor dashboards
Customer	• Post-call survey • Queue position and wait time announcements • Music on hold and wait

Supported cloud locations for voice channel

Article • 09/28/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

This article provides information about the supported cloud locations for the voice channel.

For information about international availability of live chat and digital messaging channels, see International availability of Omnichannel for Customer Service.

> **Important**
>
> - Your Microsoft 365 tenant must be colocated in one of the following geographic locations where Omnichannel for Customer Service is available.
> - The geographic locations refer to your Microsoft 365 tenant only and not the data center where your Power Platform environment or org instance resides.

Global cloud deployments

The following table lists the global region, URL, and general and trial availabilities of the voice channel. Use the global cloud deployments if the voice channel in Customer Service isn't yet available for your local cloud deployments.

Geographic location	URL	General availability	Availability in Customer Service trial
North America	crm.dynamics.com	Available	Available
Europe, Middle East, Africa	crm4.dynamics.com	Available	Available
Asia Pacific	crm5.dynamics.com	Available	Available

Local cloud deployments

If you need your data to stay within a region, the following table lists the local region, URL, and general and trial availabilities of the voice channel in local regions. Stay tuned for country or region-specific local deployment of the voice channel. More information: Datacenter regions

Geographic location	URL	General availability	Availability in Customer Service trial
Australia	crm6.dynamics.com	Available	Available
United Kingdom [1]	crm11.dynamics.com	Available	To be announced
Canada [1]	crm3.dynamics.com	Available	To be announced
Switzerland [1]	crm17.dynamics.com	Available	To be announced
India [1]	crm8.dynamics.com	Available	To be announced
Japan [1, 2]	To be announced	In preview	To be announced
South America	To be announced	To be announced	To be announced
France	To be announced	To be announced	To be announced
Germany	To be announced	To be announced	To be announced
United Arab Emirates	To be announced	To be announced	To be announced
South Africa	To be announced	To be announced	To be announced
Norway	To be announced	To be announced	To be announced
Korea	To be announced	To be announced	To be announced
Singapore	To be announced	To be announced	To be announced

Note

[1] The geographic location currently doesn't have business continuity and disaster recovery (BCDR) support. BCDR support will be a fast follow in this region.

[2] The geographic location won't have Power Virtual Agents support.

Sovereign cloud deployments

The following table lists the sovereign region, URL, and general availability of the voice channel in Customer Service.

Sovereign region	URL	General availability
Government Community Cloud (GCC) Moderate	To be announced	To be announced
GCC High	To be announced	To be announced
GCC Department of Defense (DoD)	To be announced	To be announced
China	To be announced	To be announced
Germany	To be announced	To be announced

Microsoft calling plans

Microsoft calling plans are available for customers with billing locations in select geographies around the world. To learn more about your eligibility, see Subscription eligibility and number capabilities.

You can purchase new phone numbers through the Azure portal, and then sync with Omnichannel for Customer Service. More information: Import phone numbers

You can also port existing US or toll-free phone numbers. More information: Port a phone number

Azure direct routing

You can bring your own carrier through Azure direct routing. This feature is supported across all geographic locations using certified Session Border Controller (SBC). More information: Bring your own carrier

In the geographic locations where the voice channel is generally available, Azure direct routing extends general availability support.

The voice channel in Omnichannel for Customer Service doesn't support emergency calling when Azure direct routing is used.

FAQ about the voice channel in Omnichannel for Customer Service

Supported languages and locale codes for voice channel

Article • 05/22/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

This article provides information about the supported languages and locale codes for the voice channel.

Supported languages and locale codes

Omnichannel for Customer Service uses the Azure Cognitive Services speech-to-text service for transcription. So, all languages supported by speech-to-text can be transcribed. More information: Speech-to-text documentation

> **Note**
>
> - End-to-end voice and IVR support is available only if a language is supported in Power Virtual Agents and Omnichannel for Customer Service.
> - Sentiment and AI insights are optional for the voice functionality.

See the information in the following table to know about the supported languages and locale codes.

Language	Locale code	Voice channel	Power Virtual Agents	Speech-to-text	Text-to-speech	Sentiment	AI suggestions	UI language support
Afrikaans - South Africa	`af-ZA`	x	x	x	x	x	x	x
Amharic	`am-ET`	x	x	x	x	x	x	x

Language	Locale code	Voice channel	Power Virtual Agents	Speech-to-text	Text-to-speech	Sentiment	AI suggestions	UI language support
Arabic - Algeria	`ar-DZ`	x	x	✓	✓	x	x	x
Arabic - Bahrain	`ar-BH`	x	x	✓	✓	x	x	x
Arabic - Egypt	`ar-EG`	x	x	✓	✓	x	x	x
Arabic - Iraq	`ar-IQ`	x	x	✓	✓	x	x	x
Arabic - Israel	`ar-IL`	x	x	✓	x	x	x	x

Install the voice channel

Article • 10/11/2023

To configure and use the voice channel for your business needs, you need to install the channel in Omnichannel for Customer Service.

Prerequisite

You must obtain an active subscription of **Dynamics 365 Customer Service Voice Channel Add-in** or **Dynamics 365 Customer Service Digital Messaging and Voice Add-in**. For more information about licenses and pricing, see the Dynamics 365 licensing guide. You can also purchase add-ins on the Microsoft 365 admin center.

Install the voice channel

1. Perform the steps outlined in Set up Omnichannel for Customer Service.
2. In the **Voice** section, set the **Add voice** toggle to **Yes** to enable the voice channel. Ensure that you select the **Voice and SMS Terms** checkbox.
3. Save and close.

Next steps

Connect to Azure Communication Services
Manage phone numbers

> **Note**
>
> The voice channel supports a maximum call duration of two hours, after which the call is disconnected. As a workaround, we recommend that you activate the callback feature.

System requirements for using the voice channel
Set up inbound calling

Use trial phone numbers

Article • 03/17/2023

The voice channel provides up to two trial phone numbers with limited free calling time for your organization. When you run the voice trial for the first time, you're automatically assigned a toll-free trial phone number. The total free calling time for the two trial phone numbers is 60 minutes.

For information about setting up the trial and licensing requirements, see Customer Service trial FAQ and Licensing.

How trial phone numbers work

The trial phone number is a toll-free US number, so you'll be able to call this number from within US only. To be able to receive international calls, we recommend that you use a geographic US number as your second trial number. If you're calling the geographic number from outside the US, then international carrier rates will apply.

Your voice trial automatically ends after the free calling time elapses. You can also manually end the trial before the free calling time elapses. More information: End the trial

You can't reuse or purchase the trial phone number. After your free calling time has elapsed, you can either purchase new phone numbers or request Microsoft Support for more calling minutes.

> **Note**
>
> You don't need to connect to Azure Communication Services to use trial numbers.

End the trial

If you want to end the trial before it expires, select **End trial** on the **Phone numbers** page. Then, you'll be able to connect to Azure Communication Services using new or existing resources. More information: Connect to Azure Communication Services

> **Important**

You can't recover trial phone number and any related data after the trial organization has expired and been deprovisioned.

Import phone numbers

Connect to Azure Communication Services

Article • 09/19/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

The voice channel in Omnichannel for Customer Service is built over Azure Communication Services. This capability lets you provision phone numbers for your business by connecting to Azure Communication Services. However, to acquire phone numbers, you must first establish connection with Azure Communication Services. You can do this in the following ways:

- Quickstart: Connect using a new Azure resource
- Advanced: Connect using an existing Azure resource

You can also import phone numbers or connect your existing telephony infrastructure with Azure.

> **Note**
>
> - After you've connected to a resource in a Power Platform environment, the phone numbers purchased via the resource that are linked to the Power Platform environment can't be transferred or migrated to another environment.
> - While the system allows multiple instances of Omnichannel for Customer Service to connect with one Azure Communication Services resource, we recommend that you must map one Omnichannel for Customer Service instance only with one Azure Communication Services resource for optimal performance and to avoid issues.
> - We recommend that you **test your network** before connecting to Azure Communication Services.

Quickstart: Connect using a new Azure resource

Article • 08/18/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

In the voice channel, you can quickly connect to Azure Communication Services, provision phone numbers, and set up outbound and inbound calling for your business by creating and deploying a new Azure resource. More information: Azure Communication Services

Prerequisites

Before you connect an Azure resource to Azure Communication Services, you must perform the following steps.

- Check whether the **Get started** button to connect to an existing Azure resource is visible on the **Phone numbers** page. The **Get Started** button appears only in the following scenarios.
  - The trial has ended after the free calling time has elapsed.
  - You've manually ended the trial.
  - You've disconnected from the Azure resource. More information: Disconnect from Azure Communication Services resource
- Have an Azure subscription that's in the same tenant as your Dynamics 365 account. Ensure that your Azure subscription meets the Subscription eligibility and number capabilities requirements.
- Have at least contributor-level permissions to the Azure subscription. To check your role, open your subscription and view the **My role** column of your subscription on the Azure portal. You'll be able to deploy your Azure Communication Services resource only if you have contributor-level permissions.

Connect using a new Azure resource

1. In Dynamics 365, go to one of the admin apps, and perform the following steps.

Customer Service admin center

a. In the site map, select **Channels** in **Customer support**. The **Channels** page appears.

b. Select **Manage** for **Phone numbers**.

2. Select **Get started**. The **Connect to Azure Communication Services** dialog opens.

3. Select **Create new resource** and enter the following details.

   - **Azure subscription**: Select a subscription from the dropdown list.
   - **Azure resource group**: Select an existing resource group or select **Create new**, and enter a name for a new resource group.

     > ⓘ **Note**
     >
     > The resource group name should be unique within a subscription.

   - **Resource name**: Enter a name for the resource. The resource name can contain only letters, numbers, and hyphens.

4. Select **Deploy** to create and deploy the resource.

Your new Azure resource is connected to Azure Communication Services. You can now acquire new phone numbers for your organization via the new resource and also enable call recording and SMS services.

Article • 10/18/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> Azure Active Directory is being renamed to Microsoft Entra ID: No action is needed from you. **Learn more**

You can connect your voice or SMS channels to Azure Communication Services using an existing Azure resource from any of your Azure subscriptions, *available under any tenant*. If you disconnected a resource and want to use it now, you can do so using this option.

Prerequisites

- The organization that you're using isn't a trial version.
- The **Get started** button that connects to an existing Azure resource is visible on the **Phone numbers** page of Customer Service admin center. The **Get Started** button appears only when:
  - The trial has ended after the free calling time has elapsed.
  - You've manually ended the trial.
  - You've disconnected from the Azure resource.
- Your active Azure subscription is in the same tenant as your Dynamics 365 account.
- Your role has **Contributor** privileges.

Get Azure resource information

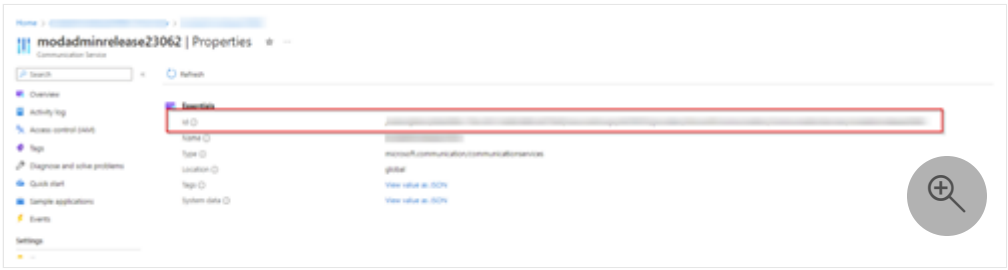
Before you connect an existing Azure resource to Azure Communication Services, you must retrieve the following information from the Azure portal:

1. Go to **Resource groups** and select the required resource group.

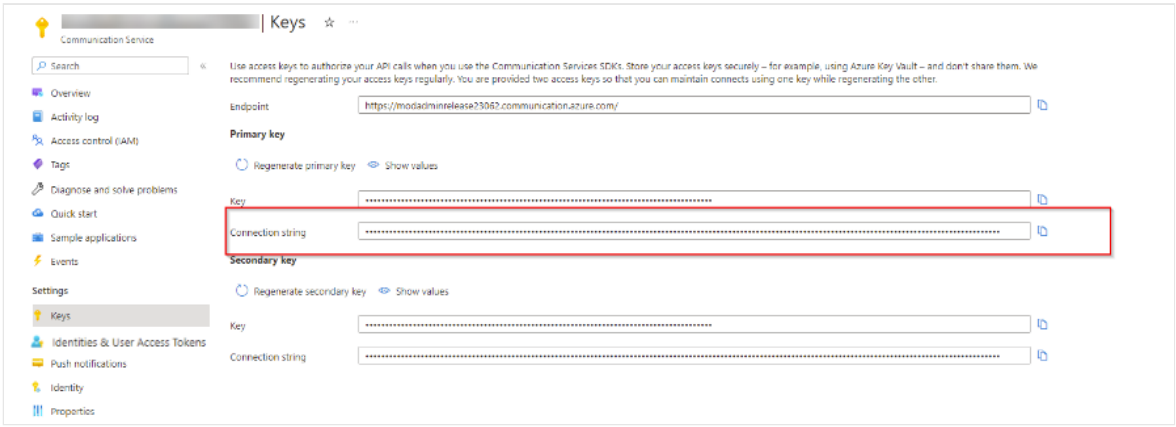
2. Select the required **Resource** from the resource group.

3. Select **Properties** in **Settings**.

4. On the **Properties** page, copy the **Name** and **Resource ID** field values, which you must specify as **ACS Resource Name** and **ACS Resource ID** values in Customer Service admin center.



5. Select **Tools** in **Keys**. On the **Keys**, copy **Connection string** in **Primary key**, which you'll use as the value of **Connection string** in Customer Service admin center.



Get application and tenant IDs from the Azure portal

You'll need to specify the values of **Application (client) ID** and **Directory (tenant) ID** in **Event grid app id** and **Event grid app tenant id** in Customer Service admin center. Perform the following steps to get these values:

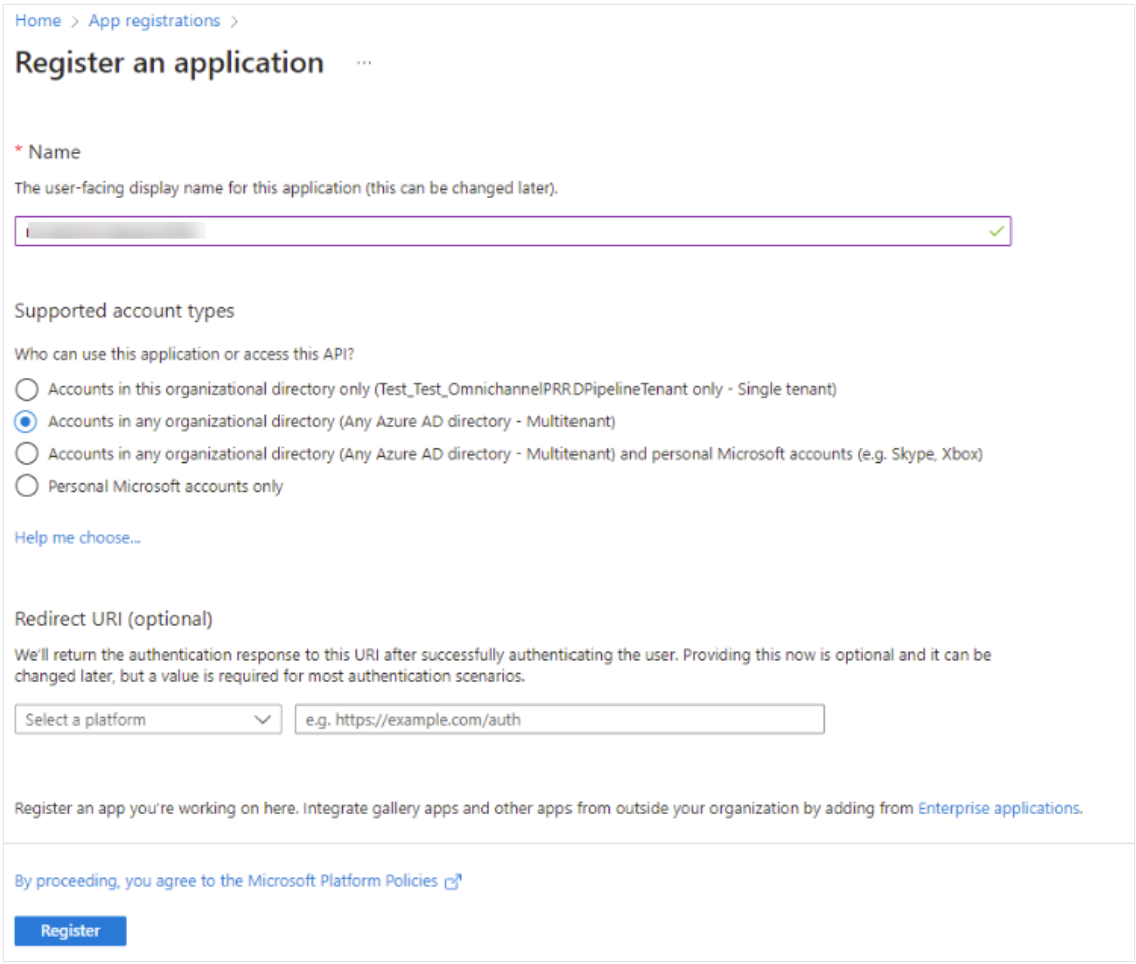
1. Open the **App registrations** page on the Azure portal.

   If you're registering your app on the Azure portal for the first time, then perform the following steps:

   a. On the **Register an application** page, enter the following details:

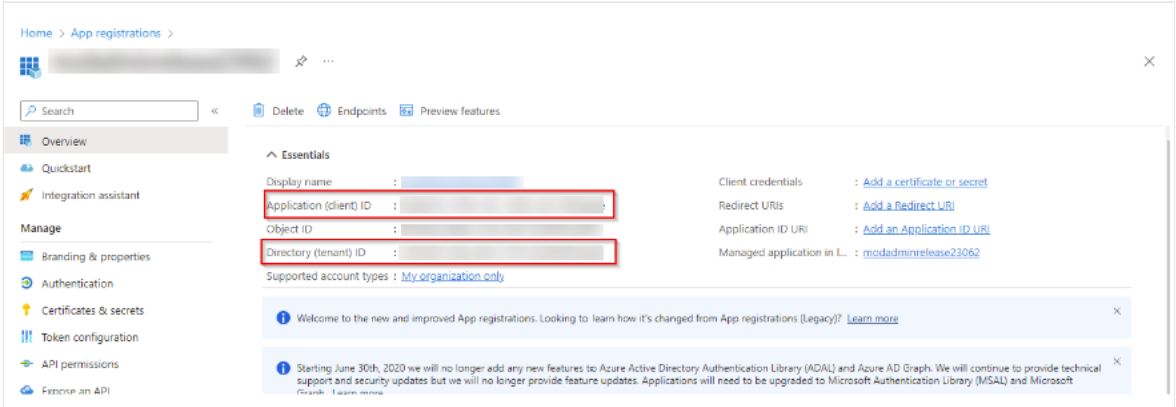
- **Name**: Enter a name for your application.
- **Supported account types**: Select **Accounts in any organizational directory (Any Azure AD directory - Multitenant)**.

b. Select **Register**.



2. Select the value of the **Application (client) ID** field, and then select the **Copy to clipboard** button. You'll need to enter this as the value of **Event grid app id** in Customer Service admin center.

3. Select the value of the **Directory (tenant) ID** field, select the **Copy to clipboard** button, and then note the value. You'll need to enter this as the value of **Event grid app tenant id** in Customer Service admin center.



Connect using an existing Azure resource

1. In Dynamics 365 Customer Service admin center or Omnichannel admin center, open the phone number settings.

    - Customer Service admin center:
      a. In the site map, under **Customer support**, select **Channels**.
      b. Select **Manage** for **Phone numbers**.

    - Omnichannel admin center: In the site map, under **General settings**, select **Phone numbers**, and then select **Get started**.

2. Select **Use existing resource**.

3. Fill in the fields using the resource information you retrieved from the Azure portal.

4. Select **Connect** to connect the resource to Azure Communication Services.

5. Select **Add number**.

6. Add a new phone number.

Next, configure voice workstream settings for the phone number, set up inbound and outbound calling, and enable call recording and SMS services.

Enable call recording and SMS services

Azure Communication Services integrates with Azure Event Grid to send real-time notifications for chat, telephony, SMS, video, and voice calling events. The Azure Event Grid, in turn, uses event subscriptions to route event messages to subscribers.

To enable call recording and SMS services, you must first configure your applications to listen to Azure Communication Services events by registering Event Grid system topics. Then, subscribe to the specific call recording or SMS events by creating Event Grid subscriptions on the Azure portal.

> **ⓘ Important**
>
> - You can only set one web hook endpoint at a time using the following procedure. To enable both SMS and call recording services, you must perform the procedure two times to set a web hook endpoint for each service.
> - When you connect your event subscription, you must use the same application (client) ID and tenant (directory) ID for the app registration as you

did when you first connected to your Azure resource. To get the event grid app and tenant IDs from the Power Apps portal, see **Get event grid app and tenant IDs from the Power Apps portal**.

1. Open the **Event Grid System Topics** service on the Azure portal.
2. Create and deploy an Event Grid system topic.
3. On the **Event Grid System Topic** page, select the **Subscription** link.
4. In the resource subscription page, select **Settings** > **Resource providers**, and then check whether the **Microsoft.EventGrid** provider is listed as **Registered**. If the Event Grid isn't registered, then select the record, and then select **Re-register** to register it.
5. Open the resource on the Azure portal. Select **Events**, and then select **Event Subscription**.
6. Enter the following details in the **Basic** tab:
    - **Name**: Enter a name for the recording event subscription.
    - **Event Schema**: Select **Event Grid Schema** in the list.
    - **Topic Types**: Select **Azure Communication Services** in the list.
    - **Subscription**: Select your subscription in the list.
    - **Resource Group**: Select the resource group.
    - **Resource**: Select the resource.
    - **System Topic Name**: This field is automatically populated with the system topic name you created. However, if you see multiple values, select the specific system topic name from the list.
    - **Filter to Event Types**: You can filter events for either call recording or SMS services.
        - To filter event types for recording services, select **Recording File Status Updated** in the list.
        - To filter event types for SMS services, select **SMS Received** and **SMS Delivery Report Received** in the list.
    - **Endpoint Type**: Select **Web Hook** in the list.
    - **Endpoint**: Select **Select an endpoint**, and then enter the recording or SMS web hook endpoint:
        - To enable recording services, get the **Recording Web Hook Endpoint** from Customer Service admin center, paste the value in **Subscriber Endpoint**, and then select **Confirm Selection**.

    - To enable SMS services, get the **SMS Web Hook Endpoint** from Customer Service admin center, paste the value in **Subscriber Endpoint**, and then select **Confirm Selection**.

7. Select the **Additional Features** tab. Select the **Use AAD authentication** checkbox, and enter the following details:

    - **AAD Tenant ID**: Enter the tenant (directory) ID of your Azure resource.
    - **AAD Application ID or URI**: Enter the application (client) ID of your Azure resource.

8. Select **Create** to create the event subscription endpoint for recording.

    It can take up to 15 minutes to sync. If you get an error like "Webhook validation handshake failed," then retry this step after a few minutes.

Learn more about configuring call recording and transcription for a voice workstream in Omnichannel for Customer Service.

Get event grid app and tenant IDs from the Power Apps portal

1. Open the Power Apps portal and select your environment.
2. In the site map, select **Dataverse** > **Tables** > **All**.
3. Search for the **Communication Provider Setting Entry** table and open it.
4. In the **Communication Provider Setting Entry columns and data** section, view the **EventGridAppID** and **EventGripAppTenantID** fields in the **Key** column, and note down the corresponding ID values from the **Values** column.

Get the subscriber endpoint for recording

1. In Dynamics 365 Customer Service admin center or Omnichannel admin center, open the phone number settings.

    - Customer Service admin center:
        a. In the site map, select **Channels** in **Customer support**. The **Channels** page appears.
        b. In **Accounts**, select **Manage** for **Phone numbers**.

    - Omnichannel admin center: In the site map, under **General settings**, select **Phone numbers**, and then select **Get started**.

2. Select a phone number, and then select **Advanced**.

3. Select **Copy** next to **Recording Web Hook Endpoint** and note the value.

Get the subscriber endpoint for SMS

1. In Dynamics 365 Customer Service admin center or Omnichannel admin center, open the phone number settings.

   - Customer Service admin center:
     a. In the site map, under **Customer support**, select **Channels**.
     b. To the right of **Phone numbers**, select **Manage**.

   - Omnichannel admin center: In the site map, under **General settings**, select **Phone numbers**, and then select **Get started**.

2. Select a phone number, and then select **Advanced**.

3. Select **Copy** next to **SMS Web Hook Endpoint** and note the value.

Sync from Azure Communication Services

Article • 06/09/2022

You can import phone numbers that you purchased or acquired earlier via Azure Communication Services resources into Omnichannel for Customer Service.

1. In Dynamics 365, go to one of the admin apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Channels** in **Customer support**. The **Channels** page appears.
   b. Select **Manage** for **Phone numbers**.

2. Select **Advanced** on the menu.

3. Select **Sync** for **Sync from Azure**. A dialog requesting you to confirm the sync action is displayed.

4. Select **Sync**.

   After you perform the sync, all the phone numbers that were acquired previously are listed on the **Phone numbers** page with the numbers that have been acquired in Omnichannel for Customer Service.

Disconnect from Azure Communication Services resources

Article • 07/13/2023

If you're no longer using an Azure Communication Services resource or want to connect to a different resource, you can disconnect the current resource, and later reconnect to a new or existing resource by selecting the **Get started** button.

To permanently release or remove one or more phone numbers from your organization, see Release phone numbers.

> **Important**
>
> When you disconnect a resource, all phone numbers associated with it are also released from Dynamics 365; therefore, disconnect a resource only when you no longer need it.

Disconnect from an Azure Communication Services resource

1. In Dynamics 365, go to one of the admin apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Channels** in **Customer support**. The **Channels** page appears.
   b. Select **Manage** for **Phone numbers**.

2. Select **Advanced** on the menu. The **Manage Azure Communication Services** dialog opens.

3. Select **Disconnect** for **Disconnect from Azure**. A dialog that asks you to confirm the disconnection is displayed.

4. Select **Disconnect** again. Any phone numbers associated with the resource are no longer displayed on the **Phone numbers** page.

5. Delete and clean up the event grid subscription to avoid errors.

Manage phone numbers

Article • 07/06/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Omnichannel for Customer Service lets you enable and use voice and SMS services seamlessly within Dynamics 365. The voice channel comes with trial phone numbers with limited free calling time. More information: Use trial phone numbers

As an administrator, you can purchase phone numbers and calling plans, decide whether you want to avail calling and SMS services, and whether you'd like to set up inbound and outbound calling options for your business. You can also bring your own phone number via Azure direct routing. More information: Bring your own carrier

Prerequisites

- Check for the following criteria:
  - Azure subscriptions eligibility
  - Service limits for Azure Communication Services
  - Country or region availability
- Deploy the voice channel in Omnichannel for Customer Service.
- Connect to Azure Communication Services using an existing or new Azure resource, and then deploy the resource through Dynamics 365.
- Verify that you have permissions on the secure columns. More information: Configure permissions to access secure columns

> **Important**
>
> You can purchase one phone number per tenant for Azure Communication Services via the Azure Portal. However, if you'd like to acquire numbers in bulk or request a specific phone number, follow the instructions to create a special number request order **here**.

View phone numbers

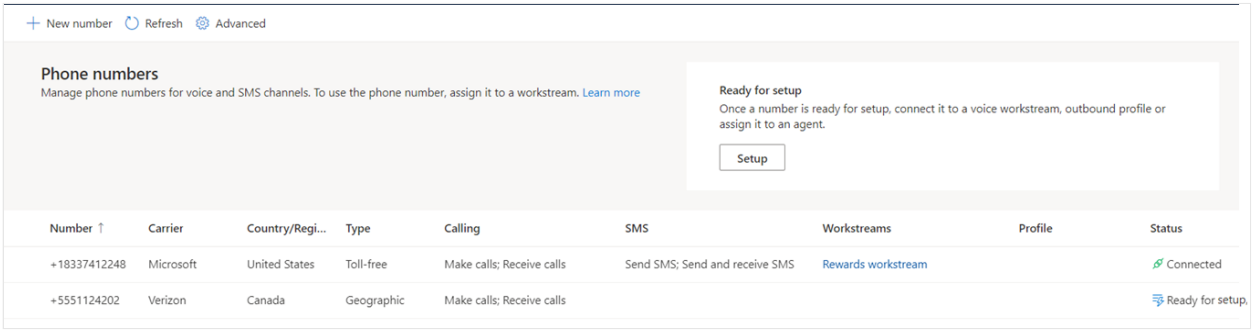
1. To view the available phone numbers in your organization, go to one of the apps in Dynamics 365, and do the following:

   Customer Service admin center

   a. In the site map, select **Channels** in **Customer support**. The **Channels** page appears.

   b. Select **Manage** for **Phone numbers**.

You'll see a list of all available phone numbers together with their carrier name, calling plan details, associated workstream, connection status, and other details.



If you don't have any phone numbers set up for your business, see **Acquire new phone numbers** to learn how you can purchase new numbers.

> ⓘ **Note**
>
> If your direct routing phone number is in the inactive state, delete the number and add it again.

Acquire new phone numbers

You can purchase new phone numbers for your organization after you've checked for the prerequisites, installed the voice channel, and have successfully connected to an Azure Communication Services resource.

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

a. In the site map, select **Channels** in **Customer support**. The **Channels** page appears.

b. Select **Manage** for **Phone numbers**.

2. On the **Phone numbers** page, select **New number**. The **Add phone number** dialog opens.

3. On the **Features** page, do the following:

   a. Select **Country/Region** from the dropdown list. The list of available plans for the selected country or region appears.

   b. Select the **Number type**, whether **Toll-free** or **Geographic**. More information: Number types and features

   c. Select the **Calling plans**—**Receive calls**, **Make calls**, or both.

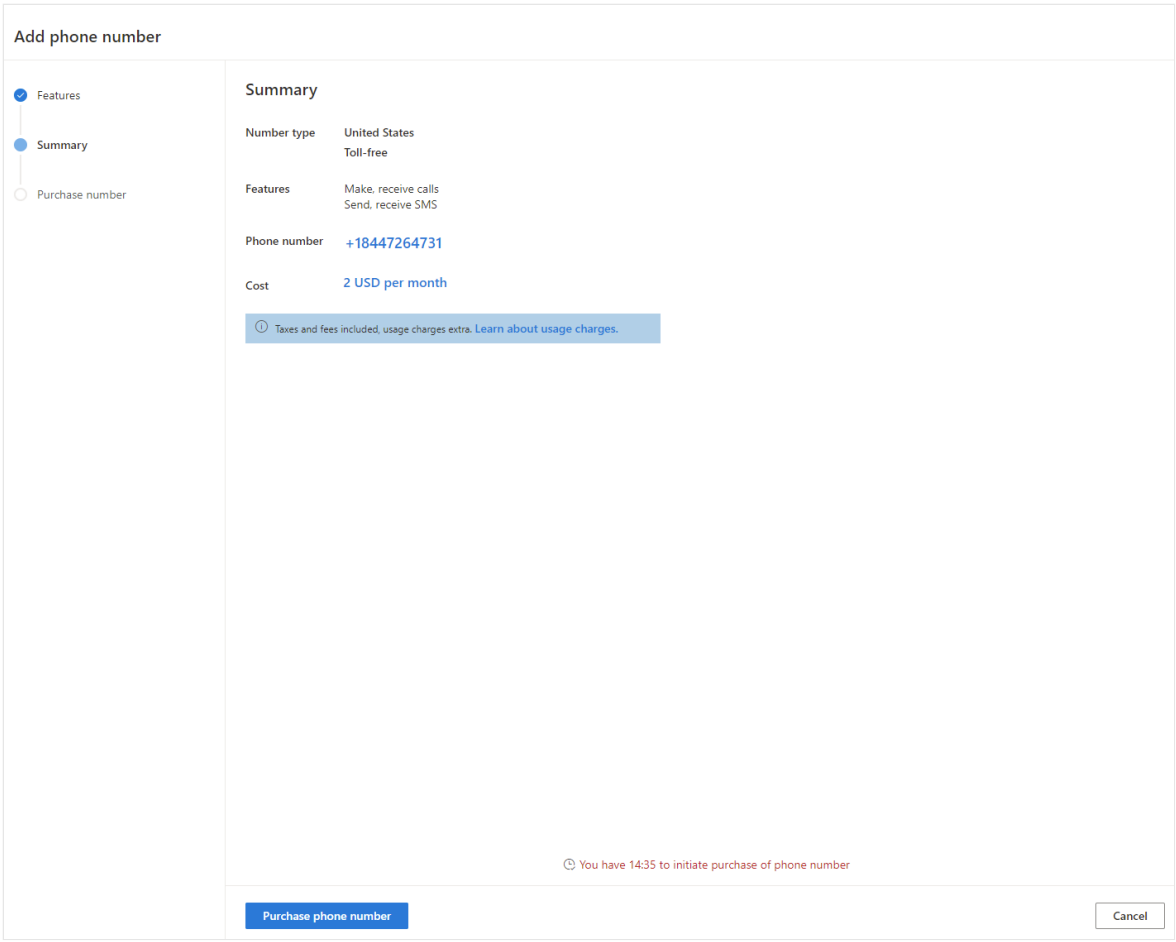
   d. Select any one of the **SMS plans**—**None**, **Send SMS**, or **Send and receive SMS**. SMS facility is currently available only on toll-free numbers.

   e. In **Location**, select the area or state code from the dropdown lists.

   f. Then, select **Find numbers** to search for available numbers in your area.

   A **Summary** with the newly allotted phone number and its details is displayed.

4. On the **Summary** page, select **Purchase phone number**. Your new phone number will be displayed after purchase and you can select **Done** to get back to the **Phone numbers** page.



The new phone number is displayed in the numbers list with the status **Ready for setup**.

> **Note**
>
> - After you're allotted a new phone number, you must purchase it within the next 15 minutes. If the time elapses, you'll have to try purchasing again.
> - After you select **Purchase phone number**, you can select **Close** and return to the **Phone numbers** page. The purchase happens in the background and the new phone number appears in the phone numbers list with the **Ready for setup** status.

5. (Optional) Select **Setup Workstream** to add the phone number to a voice workstream.

6. Select **Done** to go back to the **Phone numbers** page where you can view details of the phone number that you just acquired.

> **Note**

- To port your phone number into an Azure Communication Services resource, see **Port a phone number**.
- You can port your Teams number in regions where Azure Communication Services is available. Use the information in **Create a Special Order for Telephone Numbers**.

Add a phone number to a voice workstream

After you've acquired a phone number, you must add it to a voice workstream to be able to use it. You can associate a phone number with only one voice workstream.

1. In Customer Service admin center or Omnichannel admin center, go to the **Phone numbers** page, and then select the phone number that's marked **Ready for setup** in the **Status** column.
2. Select **Setup workstream**. The **Workstreams** page with a list of all workstreams is displayed.
3. If you want to create a new workstream, select **New workstream**, and then follow the steps to set up a voice workstream.
4. Select an existing workstream from the list.
5. Follow the steps to configure a voice channel.

   The phone number is added to the workstream, and you can view the **Connected** status for the phone number on the **Phone numbers** page.

Configure phone numbers for outbound calling

After you've purchased phone numbers and associated them with voice workstreams, you can configure them for outbound calls so your agents can actually make calls to customers. More information: Configure the phone number for outbound calling

Configure voice channel for inbound calling

You can also enable your agents to receive customer calls, create queues for the voice channel, and set up routing rules. More information: Set up workstreams and queues for the voice channel

Assign phone numbers to agents

You can also assign personal phone numbers to agents, so they're able to make and/or receive calls exclusively on that number. More information: Assign personal phone numbers to agents

Edit phone numbers

If you want to change the calling plan, or upgrade the calling or SMS plans on a particular number, you can do so by editing the phone number. For example, if you hadn't selected any SMS plans, you can upgrade to the **Send SMS** or **Send and receive SMS** plans; if you had selected only the **Send SMS** option, you can now upgrade to the **Send and receive SMS** plans.

1. In Customer Service admin center or Omnichannel admin center, go to the **Phone numbers** page. The list of the available phone numbers for your business is displayed.
2. Select a phone number and then select **Edit**. The **Edit phone number** dialog with the current plan type, calling plan, and SMS plan is displayed.
3. Make any changes to your call or SMS plans, and select **Save and Close**.

> **Important**
>
> - You can't upgrade a phone number or change your call or SMS plans, after it's connected to a workstream.
> - You can't remove features once granted to a phone number, but you can upgrade phone number features. For example, if you chose both **Make calls** and **Receive calls** options in your calling plans, you can't change it. However, if you selected **None** for SMS plans, you can upgrade to **Send SMS** or **Send and receive SMS** plan.

Release phone numbers

If you no longer need a phone number, you can release it from your organization's phone number list. However, before you plan to remove the phone number from your business, you must remove the number from any associated workstreams or outbound profiles. Also, if the number is assigned as a personal number to any agent, you must disable the number, and then try releasing it again.

> **Important**
>
> When you release a phone number, you actually delete it from Dynamics 365, so release a number only if you're sure that you don't need it at all. To disconnect phone numbers from an Azure Communication Services resource, see **Disconnect from Azure Communication Services resource**.

1. In Customer Service admin center or Omnichannel admin center, go to the **Phone numbers** page. The list of the available phone numbers for your business is displayed.
2. Select a phone number and select **Release number**. The **Release number** dialog requesting you to confirm the number deletion is displayed.
3. Select **OK** if you're sure you don't need the number. The phone number is removed from your organization and is no longer displayed in the **Phone numbers** list.

Set up inbound calling

Article • 06/07/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Configure inbound calling to set up the voice channel in Customer Service. You can enable your customer service representatives to communicate with customers on the phone to resolve issues using the voice channel.

Prerequisites

Ensure that the following prerequisites are met:

- Voice channel is provisioned. More information: Provision Omnichannel for Customer Service
- Unified routing is enabled. More information: Provision unified routing

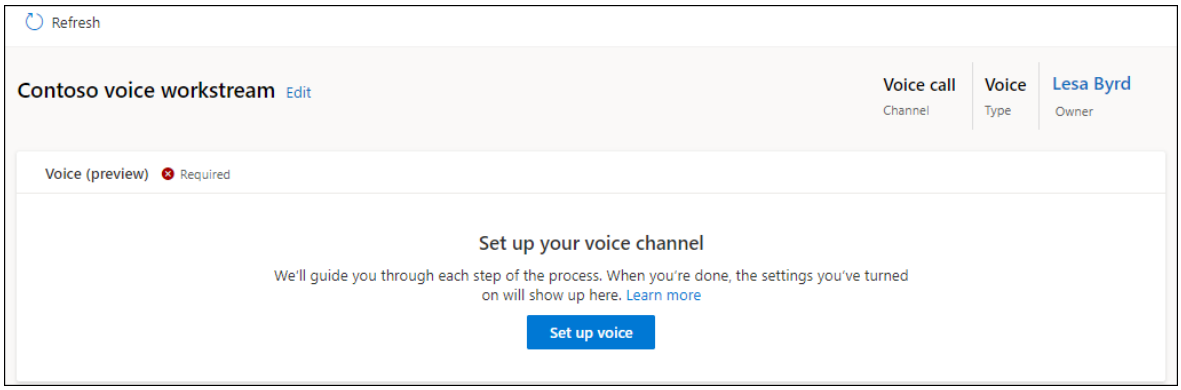
Set up a voice workstream

Do the following to configure a workstream for voice:

1. On the left pane, select **Workstreams**, and then on the **Create a workstream** dialog, enter the following.
2. Enter the following details for the workstream:
    - **Name:** An intuitive name, such as Contoso voice workstream.
    - **Type:** Select **Voice**.

    > **Note**
    >
    > By default, **Owner** and **Channel** are predefined and unavailable, and only push is available for work distribution mode.

3. Select **Create**. The workstream that you created is displayed.



Configure a voice channel

To configure the voice channel, you'll need to associate the workstream with a phone number for routing the calls. You can view the list of available phone numbers by selecting **Phone numbers** in the left pane. To get a new number, you can select **Add number** on the **Phone numbers** page. More information: Acquire a phone number

1. Go to the workstream that you created, and on the page that appears, select **Set up voice**.

2. On the **Phone number** page, select a number from the list, and select **Next**.

   > ⓘ Note
   >
   > - Only those numbers are displayed that have inbound calls enabled and are not already associated with any other workstream. Use the steps in **Acquire a phone number** if you want to configure a new number.
   > - The voice channel supports anonymous inbound calls on those numbers only that are configured via Azure Communication Services direct routing.

3. On the **Language** page, select **Add primary language** and perform the steps to configure the primary language. More information: Allow customers to choose a language

4. On the **Behaviors** tab, turn on the **Customer wait time** toggle, and select the following options:

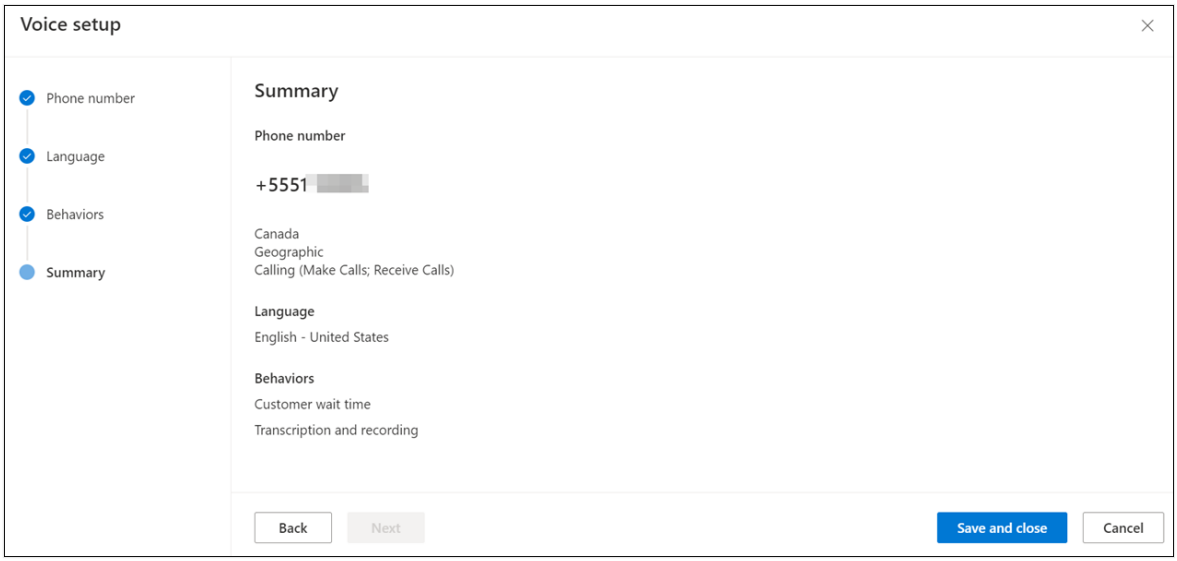
   - Notify position in queue
   - Notify average wait time

5. Turn on the **Channel operating hours** toggle, and select an operating hour record. More information: Configure operating hours for your business

6. Configure the settings for transcription and recording of the calls in the **Transcription and recording** area. More information: Configure call recordings and transcripts

7. Select **Add** for **Custom automated messages**, then select a default template message as the trigger, and then enter the custom automated message text. For information about automated messages, see Configure automated messages

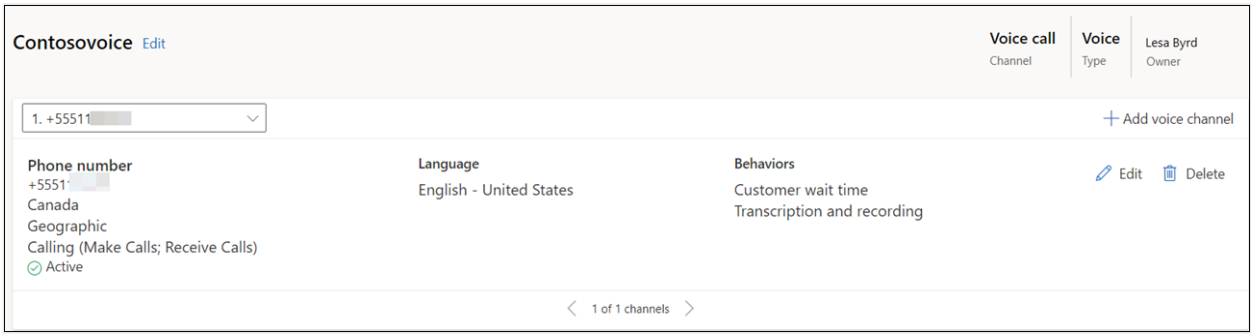
8. Turn on the **Call transfer to external phone number** toggle to allow agents to transfer the call to an external number.



9. Turn on the toggle for **Consult with Microsoft Teams user** to enable the agents to consult other agents on Microsoft Teams. More information: Voice consult with a Microsoft Teams user

10. On the **Summary** page, select **Save and close**.

The phone number is associated with the workstream.



Acquire a phone number

Do the steps mentioned in Manage phone numbers to acquire a phone number.

Create queues for voice channels

In Customer Service, work items are assigned to a queue and agent with the help of unified routing. Unified routing is an intelligent, scalable, and enterprise grade routing and assignment capability that can assign the incoming work item to the best suited queue and agent while adhering to work item requirements and matching them with the agent's capabilities using round robin routing. More information: Overview of unified routing

In this section, we'll cover information on how to create a queue for the voice channel and routing rules to evaluate conditions and assign work items.

Create a queue for the voice channel

In the left pane, select **Queues**, and then complete the following steps to create a queue for the voice channel:

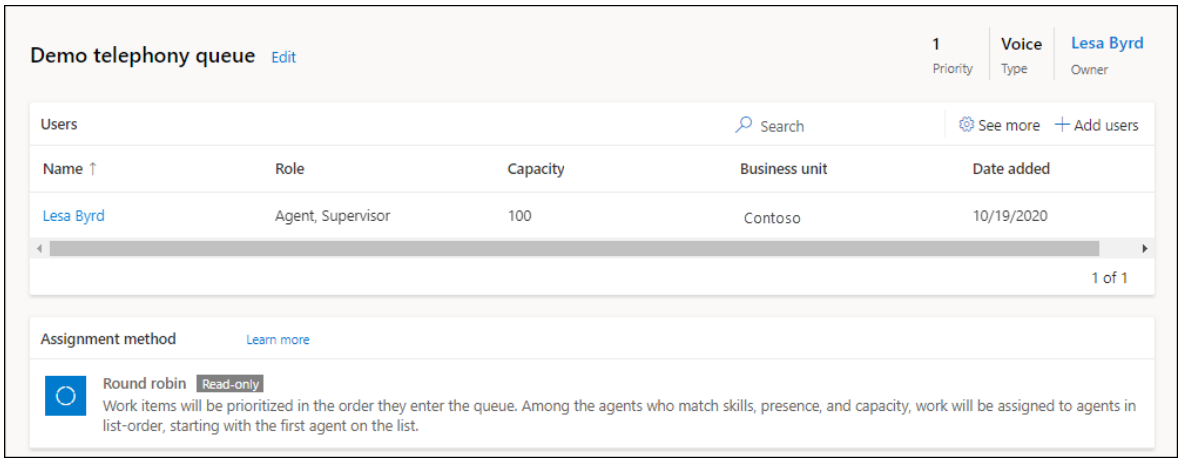
1. On the **Queues** page, select **New**, and on **Create a queue** dialog, enter the following details.

    - **Name**: Specify a name.
    - **Type**: Select **Voice**.
    - **Group number**: Enter a number.

2. Select **Create**. The queue is created.

3. On the queue page, select **Add users**, and on the **Add users** flyout menu that appears, select the users and select **Add**.

    > ⓘ **Note**
    >
    > - You can add only those users who are configured for unified routing.
    > - After 20 minutes of being added to a queue, agents must refresh their dashboards to be able to receive calls.



Configure call overflow for the voice queue

With call overflow, you can reduce the wait time for customer calls by setting options for voice queues. More information: Manage overflow

Assignment rules for a queue

By default, the assignment method for a voice queue is round robin. In the round robin method, work items will be prioritized in the order they enter the queue. Among the agents who match skills, presence, and capacity, work will be assigned to agents in the order they're listed. The agent listed on the top is assigned first. You can also choose highest capacity or create custom assignment methods. More information: Assignment methods

For a simple and quick voice call routing, you don't need to set up any rules for unified routing. By default, all the incoming voice calls will be routed to the "default voice queue" and will be assigned to the agents with the round robin assignment method.

Configure routing rules for the voice workstream

Go to the workstream for which you've configured the voice channel and do the following steps:

1. In the **Routing rules** area, in the **Route to queues** option, select **Create ruleset**.
2. On the **Create route-to-queues ruleset** dialog, provide a name and description, and then select **Create**.
3. On the page that appears, select **Create rule**.

4. On the **Create rule** page, enter a rule name, and in **Conditions**, define the set of conditions using the conversation entity and related entity attributes.
5. In **Route to queues**, select the queue that you created and to which the voice call must be routed when the conditions specified are met.
6. To configure percentage-based distribution of work items, see Percentage-based allocation of work to queues
7. Select **Create**. The rule is created and appears in the list of rules.
8. Create as many rules as your business requires.

Configure work classification rules

You can configure work classification rules for the voice workstream to add detailed information to incoming work items. This information can be used to route the calls optimally. More information: Configure work classification

Set up outbound calling

Article • 08/10/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

This article describes how you, as an administrator, can set up outbound calling for phone numbers in your organization. After you set up outbound calling, your agents can make calls to customers in the Omnichannel for Customer Service or Customer Service workspace app.

If you don't have any phone numbers provisioned for your business, then see Acquire a new phone number to learn how you can acquire new phone numbers. Phone number calling plans must be provisioned to support making calls to be used for outbound voice.

Prerequisites

Before you set up outbound voice calls for your business, you must perform the following steps.

1. Configure one or more phone numbers for outbound calling.
2. Create a voice type queue or use an existing voice queue to associate with the outbound profile.
3. Configure capacity profiles and add users.
4. Create outbound profiles

Configure phone numbers for outbound calling

To check whether a phone number is enabled for outbound calling, go to **General settings** > **Phone numbers**, and check whether the number has **Make calls** mentioned in the **Calling** column. You can configure the calling plan for a phone number if it is not enabled for outbound calling.

1. In Dynamics 365, go to one of the apps, and perform the following steps.

Customer Service admin center

a. In the site map, select **Channels** in **Customer support**. The **Channels** page appears.

b. Select **Manage** for **Phone numbers**.

2. In the **Edit number** dialog, in the **Calling plans** area, select the **Make calls** option, and then select **Upgrade**. Your phone number is now upgraded for outbound calling.

The phone number will now be displayed to your customers when your agents call them.

> **Note**
>
> - Though you can use the same queue for both inbound and outbound calling, we recommend that you create separate queues for inbound and outbound calling. This will help your supervisors monitor and gauge traffic and customer sentiment, specific to outbound calls.
> - To configure call transfer to an external number to manage overflow, outbound calling must be enabled.

Configure capacity profiles and assign users

You must create or use existing capacity profiles to define and set the workload of your agents. For your agents to be able to make calls to customers, they must be assigned or added to an outbound capacity profile. If an agent is not assigned to a capacity profile associated with an outbound profile, then outbound calling features won't be available to the agent. So, ensure that after you create or update the capacity profile, you add users to the profile.

For detailed information on how to manage capacity profiles and add users, see Create and manage capacity profiles.

For outbound calls, set the capacity profile fields as follows:

- **Work item limit**: Indicates the number of outbound calls an agent can make at a time. If the value is set to 1, it means that the agent can make only one call at a

time, and cannot make a second call until the first call is ended. If the value is set to 3, it means that the agent can make 3 outbound calls at a time.

- **Reset frequency**: Indicates whether the agent can immediately make another call when the current ends or has to wait until end of day. For voice calls, set this field to **Immediate** so that the agent will be able to make another call as soon as the current one has ended.
- **Assignment blocking**: Indicates whether you want to block any incoming calls when the agent is already on a call. Set this value to **Yes**, if you want to ensure the agent does not receive any incoming calls when an outbound call is in progress.

> **Note**
>
> - When you name your capacity profiles, we recommend that you clearly indicate in the capacity **Profile name** field whether they're outbound, inbound, or both, so it's easy for you to assign users or agents to the appropriate profile.
> - Though you can use the same capacity profile for both inbound and outbound calling, we recommend that you create separate profiles because the considerations and settings for outbound calling and inbound calling can differ.
> - If your agents are assigned to receive customer calls only and not assigned to any capacity profile used for outbound calling, call features will not be displayed to the agent.

Assign personal phone numbers to agents

You can assign personal phone numbers to agents to make outbound calls to customers.

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Channels** in **Customer support**.
   b. On the **Channels** page, select **Manage** for **Phone numbers**.

2. On the **Phone numbers** page, select **Setup** in **Ready for setup**, and in the dialog that appears, select **Assign to user**. The **Omnichannel Users** page displays a list of

all agents.

3. Select an agent to open the agent details page.
4. Select the **Omnichannel** tab and select a phone number from the **Omnichannel Phone** field. The phone number is now assigned exclusively to the agent to call customers.

> **Note**
>
> - You can assign to agents local phone numbers only as personal phone numbers; toll-free numbers can't be assigned. Personal agent phone number calls always apply the default scoped outbound profile.
> - You can add only those users who are configured for unified routing.
> - After 20 minutes of being added to a queue, agents must refresh their dashboards to be able to make calls.

Support emergency calls made by agents

Article • 10/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

This article describes how emergency calling works in Customer Service when agents dial an emergency number during crisis situations.

> **Note**
>
> - Emergency calling is currently supported in the United States, Puerto Rico, and Canada only where the emergency calling number is 911.
> - If the **Customize active conversation** form is enabled and an agent initiates an outbound call to emergency services, the active conversation form doesn't display the **Save** and **Refresh** options.

Prerequisites

Make sure that the following prerequisites are complete so that the emergency calls work properly:

- The omnichannel agent user has a capacity profile associated with a voice outbound profile. For more information, see Configure capacity profiles and Create outbound profiles.
- Browser location setting is enabled, and set to United States or Puerto Rico.
- For the email notification, the mailbox for the agents is enabled.
- For the emergency call to be handled, one of the following conditions must be fulfilled:
  - The number from which it originates must be a Microsoft calling plan number.

> **Note**
>
> If you use a third-party public switched telephone network (PSTN) carrier, discuss the emergency calling behavior with the carrier and then configure it.

- When the Azure Communication Services resource (tenant) has both direct routing (third-party PSTN carrier number) and at least one direct offer (Microsoft calling plan number) enabled and there's no direct routing rule for the emergency number, the call will follow the direct offer path and will be routed to our direct offer emergency calling service. More information: Voice routing considersations

How emergency calls work

In Customer Service workspace or Omnichannel for Customer Service, agents can use the dialer to call the emergency number during a crisis.

Here's how the emergency calls work:

1. The agent calls the emergency number such as 911 in the United States or Puerto Rico.
2. The agent status automatically changes to "Do not disturb," irrespective of the current status.
3. A temporary callback number is assigned to the agent for a duration of 60 minutes.
4. If the emergency call is dropped or gets disconnected, then the emergency responder can call back the agent via this callback number. The emergency callback gets the highest priority, bypassing all configured routing rules, capacity profiles, and presence settings.
5. During the ongoing emergency conversation, the **Communication Panel** displays the device settings and the **End call** button only. An alert appears indicating that an emergency call is in progress.
6. To ensure confidentiality, the application doesn't record or store the outgoing and incoming emergency calls as activities in call history.
7. If you configure emergency contacts, an automated email message goes out to the contacts when the agent dials the emergency number.
8. When the agent ends the emergency call, the agent presence changes back to the prior status.

Set up email recipients

When the agent makes an emergency call, the system can send an automated email to their supervisors or whoever needs to be informed about the call to ensure efficient emergency responder access. The system uses the **Emergency Call Notification Template** to send the email. You can use the **Editor** to modify the template.

1. In the Customer Service admin center, go to **User management** under **Customer support**, and for **Users**, select **Manage**.
2. On the page that appears, select the **Omnichannel Users** view, and then select the user that you want to update.
3. Select the **Omnichannel** tab, and in **Emergency Call Notifications**, add the email addresses of the recipients separated by a semicolon.
4. Save the changes.

Introduction to Nuance Gatekeeper integration (preview)

Article • 08/09/2023

[This article is prerelease documentation and is subject to change.]

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and may have restricted functionality. These features are available before an official release so that customers can get early access and provide feedback.

Nuance Gatekeeper is a biometric authentication and fraud prevention technology that can be integrated with Microsoft Dynamics 365 Customer Service. It offers a streamlined verification process that allows contact centers to identify customers through natural conversation without relying on specific questions, security codes, or secret questions and answers.

By using voice biometrics, Nuance Gatekeeper can quickly and accurately verify a customer's identity, significantly reducing the risk of fraud and protecting customers' personal data from unauthorized access. The integration with Nuance Gatekeeper in Customer Service helps agents deliver efficient, personalized service and helps fraud teams prevent, detect, and investigate more fraud.

How Nuance Gatekeeper works in Customer Service

After Nuance Gatekeeper is integrated with the voice channel in Customer Service, it analyzes how a person sounds, how they talk, while characterizing their device, network, location, and other factors for signs of fraud. The check happens seamlessly in the background of each engagement, so your customers can get the service they need without remembering pass codes, PINs, or security questions.

Nuance Gatekeeper uses deep neural networks to determine a single, transparent authentication decision for every engagement. The platform is built on the following pillars of biometric security and AI decision-making:

- **Voice**: Authenticate customers based on the distinct characteristics of their voice, regardless of age or language.
- **Channel**: Identify device, ANI, channel, location, and network to flag suspicious signals such as hidden network origins, SIM swapping, and spoofing.
- **AI risk engine**: Deep neural networks analyze interactions to determine true matches and prevent fraud.

Next steps

Add an authentication setting for Nuance Gatekeeper

Configure contact center for Nuance Gatekeeper integration (preview)

Article • 08/09/2023

[This article is prerelease documentation and is subject to change.]

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and may have restricted functionality. These features are available before an official release so that customers can get early access and provide feedback.

Use the information in this article to configure the following settings:

- Conversation Conductor Service
- Omnichannel Event Grid Writer Service

Configure Conversation Conductor service

The Conversation Conductor handles the audio stream that's required to support biometric authentication and fraud prevention capabilities. This service requires the Contributor role on the specific Azure Communication Services resource that's connected to the Power Platform environment. This step must be performed by an Azure administrator.

1. Go to Azure portal.
2. Go to **Azure Communication Services resource** > **Properties** > **Id**. Use the SubscriptionId and ACSResourceId that's connected to the Power Platform environment.
3. Create service principals in the Azure tenant by using the following PowerShell commands:
   - `Connect-AzAccount -SubscriptionId "<SubscriptionID>”`
   - `New-AzADServicePrincipal -ApplicationId "c880d6fb-5c66-49ef-9cf5-e53e31900be5" -DisplayName "Conversation Conductor"`

4. Provide contributor access to the Conversation Conductor so it can answer calls on the Azure Communication Services resource. (Application id: c880d6fb-5c66-49ef-9cf5-e53e31900be5).

5. Go to **Communication Service** > **Select the specific ACS resource** > **Access Control** > **Add role** assignment, and then select **Conversation Conductor** app in **Contributor**.

Configure Omnichannel Event Grid Writer service

Create a new Omnichannel Service Principal account to configure new Event Grid subscriptions for incoming call events to the Conversation Conductor Service. This service requires EventGrid EventSubscription Contributor privilege on the specific Azure Communication Services resource connected to the Power Platform environment. This step must be performed by the Azure administrator.

1. Go to **Azure Communication Services resource** > **Properties** > **Id**. Use the SubscriptionId and ACSResourceId that's connected to the Power Platform environment.

2. Create the Service Principal for Omnichannel for Customer Service.

   - `Connect-AzAccount -SubscriptionId "<SubscriptionId>”`.
   - `New-AzADServicePrincipal -ApplicationId "a950df6d-e658-48fc-b494-ec69d8d9731b" -DisplayName "Omnichannel EventGrid Writer App"`.

3. Provide access to the Omnichannel Event Grid Writer with permission to configure Event Grid subscriptions on the Azure Communication Services resource.

   - `Connect-AzAccount -SubscriptionId "<SubscriptionId>”`.
   - `New-AzRoleAssignment -ApplicationId "a950df6d-e658-48fc-b494-ec69d8d9731b" -RoleDefinitionName "EventGrid EventSubscription Contributor" -Scope "<ACSResourceId>"`.

Add an authentication setting for Nuance Gatekeeper (preview)

Article • 08/31/2023

> **ⓘ Important**
>
> Azure Active Directory is being renamed to Microsoft Entra ID: No action is needed from you. **Learn more**

[This article is prerelease documentation and is subject to change.]

> **ⓘ Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and may have restricted functionality. These features are available before an official release so that customers can get early access and provide feedback.

Use the information in this article to add an authentication setting for Nuance Gatekeeper in Customer Service.

Prerequisites

Make sure that the following prerequisites are met:

- Nuance Gatekeeper instance is provisioned.
- Omnichannel for Customer Service with the voice channel is provisioned.
- Azure Communication Services must be configured on the Customer Service tenant.
- OpenID basic configuration in the Microsoft Entra ID to allow single sign-on process for the administrator, fraud analyst credentials, and Nuance portals.
- Azure Service Principal for Conversation Conductor and Omnichannel Event Grid Writer are provisioned.
- The following information is shared by the Nuance Gatekeeper team:
  - Gatekeeper Client ID and Client Secret.
  - Gatekeeper Scope ID, such as b6f1a330-xxxx-xxxx-a03c-387ac9axxxxx.
  - Gatekeeper Config Set ID, such as ContactCenterDemo.

Check for Azure tenant requirement

The Customer Service instance and the Azure Communication Services resource that's connected to the organization must be in the same Azure tenant. We also recommend that the Azure Communication Services resources used for Customer Service instance that's using Gatekeeper be isolated in their own Azure subscription.

To verify, do the following steps:

1. In Customer Service admin center, go to the workstream and voice channel you'll use.
2. Verify that the Customer Service instance and Azure Communication Services resource with phone numbers are in the same tenant.

If your Customer Service instance isn't in the same tenant, you can't register the new service components that share the audio stream between the Digital Contact Center Platform and Nuance Gatekeeper. Instead, you'll see an error message when you try to create the authentication setting.

Create application registration for single sign-on

You'll need to do some of the Gatekeeper actions in the Nuance portals. Therefore, to simplify access and credentials, the Nuance Gatekeeper team configures single sign-on access to your Microsoft Entra ID, so that you can use your regular username and password to access the functionality.

Create a new application registration in your Microsoft Entra ID and share the OpenID Connect metadata document by following these steps:

1. Go to Azure portal.
2. Select **Azure Active Directory** in the site map.
3. On the **Azure Active Directory** page, select **App registrations** in the site map.
4. If you're an existing Nuance Gatekeeper customer, you probably have a registered app for Nuance Gatekeeper. Search in the **All applications** tab for Nuance Gatekeeper. If you don’t have it registered, do the following steps:
   a. Select **New registration**.
   b. Type the name **Nuance Gatekeeper** for your app registration, and select **Register** at the bottom of the page. After the app is registered, the **App Registration Details** page appears.
5. Select **Endpoints** to get the URL needed for single sign-on.
6. On the **Endpoints** page, copy the value in the **OpenID Connect metadata document** field.

Add the authentication setting for Gatekeeper

1. In the Customer Service admin center site map, select **Customer Settings** in **Customer support**. The **Customer settings** page appears.

2. In **Authentication settings**, select **Manage**. The **Authentication settings** page appears.

3. Select **New Authentication Settings**, and provide the following information on the **Add authentication setting** page:

   - **Name**: Enter a name for the authentication setting.
   - **Channel type**: Select **Voice call**.
   - **Authentication type**: **Gatekeeper Biometric Authentication** is selected and not editable.

4. Select **Next**.

5. On the **Details** page, enter the following information:

   - **Endpoint region**: Is selected as US and not editable.
   - **Client ID**: The Nuance Gatekeeper client ID.
   - **Client Secret**: The Nuance Gatekeeper client secret.
   - **Scope ID**: The Nuance Gatekeeper scope ID.
   - **Config Set ID**: The Nuance Gatekeeper config set ID.

6. Save and close.

Apart from the default ID, you can optionally configure another ID to uniquely identify the contact between the Omnichannel and Nuance platforms. Do the following steps to configure another ID:

1. On the **Create new authentication setting** page, expand **Gatekeeper integration advanced settings**.

2. Select **Contact (ContactId)** and **Account (AccountId)** in **Contact** and **Account** fields.

   > ⓘ **Note**
   >
   > You can't edit the contact and account fields after the authentication setting is created.

After you select save and close, the components will be provisioned and your settings tested. Errors at this step means either the settings aren't correct, or the Azure Communication Services resources are running in a different Azure tenant from your Dynamics 365 environment.

Configure a workstream and authentication option

In Customer Service admin center, do the following steps:

1. Select an existing voice workstream or perform the steps in Create and manage workstreams to create a voice workstream.
2. Edit the phone number setting of the voice workstream, and select the **Behaviors** tab.
3. Scroll down and turn on the toggle for **Authentication (preview)**.
4. Select the authentication option for Gatekeeper in **Authentication setting** and select **Save**.

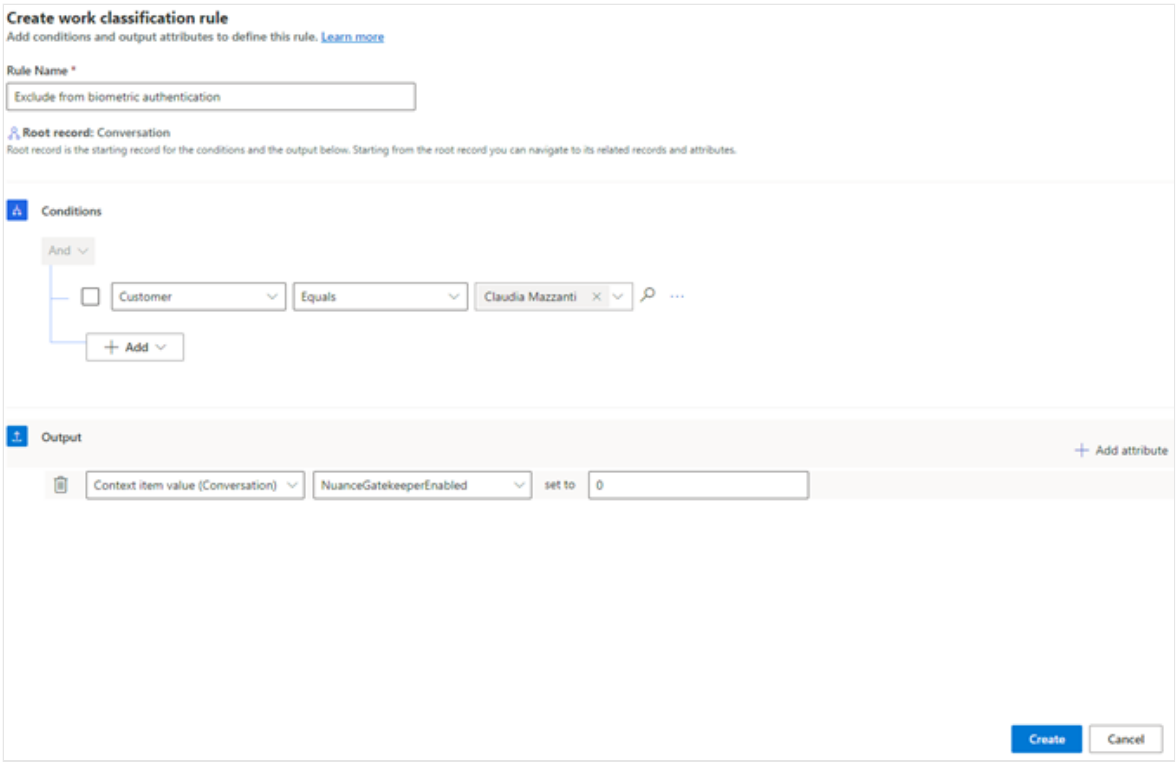
Exclude a conversation from being authenticated

You can configure classification rules to exclude a conversation from the authentication process.

Do the following steps:

1. Configure a context variable with the name "NuanceGatekeeperEnabled" and of the Number type.

2. Configure a work classification rule for the workstream through which the conversation will be handled. Ensure that the output value for the context variable is set to zero. When it’s set to zero, the conversation is excluded from the authentication process.



> **Note**
>
> The routing rule isn't evaluated for transferred calls or supervisor-assigned calls.

How the conversation is excluded from authentication process

If you have configured the setting to exclude a particular customer call, when the call comes, on the communication panel, the agent will see a message that authentication is unavailable for the call or the authentication is not available by design.

Introduction to Nuance Gatekeeper integration

Enroll customers in biometric authentication using Nuance Gatekeeper (preview)

Article • 07/31/2023

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and may have restricted functionality. These features are available before an official release so that customers can get early access and provide feedback.

Enroll customers in biometric authentication

When the agent picks up a customer call, if the customer is new, the following actions happen:

- Agent creates a customer profile.
- Asks the customer if they can be enrolled in Nuance authentication.
- The agent needs to ask for explicit consent to record the customer's voice.

If the customer agrees to enroll and gives consent, the agent selects **Enroll**. The following events occur:

- The bot states that audio capture is starting. The agent informs the customer that the audio capture will start.
- The agent starts the audio capture for the customer.
- The agent can see the visual display of the enrollment progress.

The agent can then go on to address the customer issue.

If the customer declines to be enrolled in the Nuance Gatekeeper authentication, the agent selects the opt-out option and selects an opt-out reason that's displayed for the agent.

Authenticate customers using Nuance Gatekeeper

Customers who are enrolled in biometric authentication are validated automatically through the Gatekeeper feature when they call.

If the enrolled customer doesn’t pass the biometric authentication, the agent receives a “no match” response from Nuance Gatekeeper. If the agent suspects a fraud attempt, they flag the conversation as suspicious.

If the agent has flagged a conversation as suspicious, the fraud detection analyst analyzes it and adds the caller’s voice to the suspected fraudsters watch list.

Nuance Gatekeeper checks for fraud and will notify the agent about a potential fraud if it detects a voice that's flagged as a known suspicious caller.

Forward Teams calls to your digital contact center

Article • 07/11/2023

If an agent isn't available when a customer calls a Microsoft Teams number in your voice channel, the call can be automatically forwarded to your organization's digital contact center. Standard charges for Teams calls apply to forwarded calls. Calls that are forwarded to your digital contact center numbers are charged based on the PSTN inbound rate.

To turn on call forwarding:

- Set up auto attendants.
- Set up call queues.

How call forwarding in Teams works

When a Teams call is forwarded to the digital contact center, the contact center agent sees the phone number the customer called from. If the customer is in Dynamics 365, more contact details are provided.

Call forwarding is supported in the following scenarios:

- **Calls to Teams user numbers**
- **Calls to auto attendants**
  Calls can also be forwarded directly to the digital contact center number without the auto attendant flow.
- **Calls in call queues**
  To forward the calls in a queue, enable the following settings in the Microsoft Teams admin center:
  - To forward all calls, set **Call overflow handling** > **Maximum calls in the queue** to 0. The default is 50 and the maximum is 200.
  - To forward calls that have been in the queue longer than five minutes, set **Call timeout handling** > **Maximum wait time** to five minutes.

Configure voicemail to manage inbound calls

Article • 10/27/2023

Voicemails help your customers record messages for agents when they come across long wait times or their direct calls to agents are unanswered. You can reduce on-hold calls when customers communicate their concerns promptly through voicemails and call back later for a status check.

The salient features of voicemail are as follows:

- Callers can record voicemails for up to five minutes only.
- If you don't want to use the out-of-the-box prompt for the voicemail, you can customize it in the automated message or workstream settings.
- Voicemails are always transcribed irrespective of whether you've enabled the voice call transcription.
- If the customer is unable to record the voicemail, an automated message plays for the customer that informs them that the system couldn't record their voicemail and they should call back again.
- The bot can't offer to take a voicemail. The call must be escalated to an agent. The system offers the voicemail option if the agent isn't available.

Prerequisites for voicemail

The prerequisites are as follows:

- You must be on the latest version of the product to use voicemail.
- Unified routing is enabled. More information: Provision unified routing
- To open a voicemail, agent presence must load. More information: Manage presence status

Configure voicemail to manage overflow of voice calls

You can redirect the caller to record a voicemail for the agent when an incoming call reaches the voice queue and the queue is in one of the following conditions:

- Exceeds a defined number of calls that are waiting in the queue
- The call comes during the after hours of the call center operations

- Exceeds the estimated wait time

For information on how to configure the conditions and actions, go to Manage overflow of work items in queues.

You can also configure overflow override in the route-to-queue rule of a workstream.

Out of the box, **Default Group Voicemail Workstream** is available to route the group voicemails to the default group voicemail queue.

You can configure routing rules to route voicemail that your customer has recorded on your organization's phone number. In the rule condition, select **Organization phone number** in **Work classification** or **Create Intake rule** and add the required phone number to route the voicemail. When you define the intake or classification conditions, specify the following settings:

- The phone number with the country/region code, if you select the **Equals** operator.
- The phone number without the country/region code, if you select the **Contains** operator.

The following considerations apply:

- To route voicemails, avoid defining rules based on skills or sentiment category for the missed conversation attribute because the rules might not work as expected.
- You can't route voicemails to voice queues because the system categorizes them as records.

Use voicemail to manage direct calls to agents

If an agent misses a direct call and voicemail is configured, the system presents an option to the customer to record a voicemail. The agent might not answer the call because of one of the following reasons:

- Agent has rejected the call
- Call timed out
- Agent presence shows as "offline" or "do not disturb"

Out of the box, **Default Individual Voicemail Workstream** is available to route the individual voicemails to the default individual voicemail queue.

Configure voicemail views in inbox for agents

1. In Customer Service admin center, in the site map, select **Workspaces** under **Agent experience**.
2. Select **Manage** for **Agent experience profiles** and select the profile that you want to edit.
3. Edit the inbox and enable it.
4. Select **Add**.
5. On the **Add a new view** dialog, enter the following details:
    - **Name**: Name for the view.
    - **Agent visibility**: Select Show.
    - **Record type**: Select **Voicemail**.
6. In the **Settings** dropdown list, select one or all of the following options:
    - Assigned
    - Unassigned
    - Resolved

More information:

- Configure the inbox
- Create and use agent experience profiles

How voicemail works

The voicemail record is set up for routing out of the box. Voicemails are categorized into individual and group voicemails.

Individual voicemails

Individual voicemails are triggered through direct inward dialing and are routed to the default individual voicemail workstream.

- The workstream routes the voicemail to the individual voicemail queue.
- By default, the individual voicemail queue has no agents.
- The custom assignment rule assigns the voicemail to an agent based on their direct inward call number.
- The assignment method is round robin.
- You can add all your agents who are configured for direct inward dialing to the individual voicemail queue. The voicemails left for their numbers are automatically

assigned to the agents.

Group voicemails

If an overflow condition of a queue triggers the voicemail, it's routed to the default group voicemail workstream, which is a pick workstream.

- The workstream routes the voicemail to the default group voicemail queue.
- By default, the queue has no agents. Add those agents to the queue who triage voicemails.
- The assignment method is highest capacity.
- Voicemails left for every voice queue are routed to the group voicemail queue.
- For a more elaborate routing set up for voicemails, configure the required voicemail queues and route-to-queues rules to route to these queues.
- The operating hours at the workstream level override the queue-level overflow setup. The operating hours message at the workstream level is played and the system disconnects the call.

Manage voicemail capacity

By default, the voicemail workstream capacity is set to zero.

However, if you let voicemails take up capacity, the capacity restriction applies for group voicemail workstreams of push type only and not the default pick workstreams. In all cases, if an agent is at nil capacity and picks a work item, the work item is still assigned to them even if all their capacity is consumed.

Because the individual voicemail workstream has a custom assignment rule, capacity isn't taken into account, and voicemails are always pushed to the agent corresponding to the direct inward dialing number.

Supervisors can view the voicemails on the **Omnichannel Ongoing Conversations Dashboard**.

View the default settings

1. In Customer Service admin center, select **Routing** in the site map, and then select **Manage** for **Setup record routing**. Voicemail is listed under **Record types** on the page that appears.

2. Select **Voicemail**. The **Voicemail routing hub** page displays the following default settings:

- **Intake rules**: The rules check whether the voicemail is for individual or group and then routes the voicemail accordingly.
  - **Route to Individual Voicemail Workstream**: The rule routes the voicemail to **Default Individual Voicemail Workstream** if the voicemail type is individual.
  - **Route to Group Voicemail Workstream**: The rule routes the voicemail to **Default Group Voicemail Workstream** if the voicemail type is group.
- **Workstreams**
  - **Default Individual Voicemail Workstream**: Contains the settings to handle individual voicemails.
  - **Default Group Voicemail Workstream**: Contains the settings to handle group voicemails.

Omnichannel Voicemail dashboard

Configure direct callback

Article • 10/27/2023

Direct callback enables customers to request a callback as soon as an agent is available instead of waiting on the call. You can configure the direct callback option at the queue level by using the overflow action "direct callback" for a specific queue condition. After the call reaches the number one position in the queue, the direct callback work item is assigned to the next available agent through a notification just like any regular work item that's waiting in queue. Except that the notification identifies the work item as a callback versus a regular inbound call. After the agent accepts the work item, a callback to the customer who requested a direct callback is automatically initiated and connected to the agent. In summary, direct callback helps provide better customer experiences by avoiding waiting in queue and helps administrators staff queues more efficiently to handle peak volume periods.

Prerequisites for direct callback

The following prerequisites must be met:

- Voice queues and workstreams must be created. More information: Set up inbound calling
- Agents must be configured for the queues. More information: Create queues and add users
- Unified routing must be enabled. More information: Provision unified routing

Configure direct callback to manage overflow of voice calls

The customer disconnects the call after acknowledging the message for the direct callback offer. Direct callback can be the action when the queue is in one of the following conditions:

- Exceeds a defined number of calls that are waiting in the queue
- Exceeds the estimated wait time

Direct callback uses two automated messages that are available by default and can be customized:

- The initial message offers the callback option to the customer as follows: "Current wait times are longer than expected. If you would like a call back, please press 1 or

continue to wait for the next available agent."
- The second message confirms the callback selection when the customer presses 1 and notifies the customer that the call will end. The message played to the customer is, as follows: "You have requested a callback. We will call you back as soon as an agent is available. Goodbye!"

For more information, go to Configure automated messages. For information on how to configure the conditions and actions, go to Manage overflow of work items in queues.

You can also configure overflow override in the route-to-queue rule of a workstream.

How direct callback works

The direct callback is triggered by the queue overflow conditions where the corresponding action is direct callback.

1. The system presents an automated message to the customer that asks if they prefer a callback by the agent instead of waiting in the queue. The first automated message plays after the customer waits for 30 seconds and then repeats after every 120 seconds until one of the following actions takes place:
    - The customer selects the option
    - Ends the call
    - The customer is connected to an agent
2. If the customer acknowledges the callback option by pressing 1, a second message is played for the customer that acknowledges the customer choice and lets the customer know about receiving a callback.
3. The call ends for the customer but the work item remains in the queue.
4. When the work item reaches the position 1, a voice callback is initiated automatically.
5. The callback is of the type preview dialing, in which the agent has to accept the callback using a callback-specific notification before the call is dialed.

Configure routing for the voice channel

Configure voicemail

Configure outbound and inbound profiles

Article • 09/21/2023

Use the information in this article to create profiles that will be used during inbound and outbound calls directly to or from agents. These profiles help you configure settings, such as language, wait music, and transcription settings for the calls. The profiles that you create are listed on the **Outbound and inbound profiles** page. The **Profile type** column helps distinguish the profiles.

Inbound profiles enable direct calls to individual agents and therefore differ from workstreams that are used to define how inbound calls are routed and assigned to agents via queues. Direct inbound calling doesn't use unified routing and therefore the direct calls aren't tracked in unified routing historical analytics.

Prerequisites

The following prerequisites must be met:

- To create inbound profiles, a personal number of geographic type enabled to receive calls must be provisioned and assigned to the agent via the **Omnichannel** tab in user settings. More information: Manage phone numbers
- To create outbound profiles, shared or geographic type numbers enabled for outbound calls must be configured and available in the system. In your calling plan for the number, the **Make calls** checkbox must be selected.
- Capacity profiles to be used in profiles must be configured. Manage capacity profiles
- Voice queues must be configured. More information: Configure voice queues

Create inbound profiles

1. In Customer Service admin center, in the site map, select **Productivity** in **Agent experience**.
2. On the **Productivity** page, select **Manage** for **Outbound and inbound profiles**.
3. Select **New profile**.
4. On the **Create new profile** dialog, enter a profile name, select the profile type as **Inbound**, and then select **Next**.

5. On the **Phone number** page, select a personal number in the **Number** list, and select **Next**. You can add only one phone number at a time while creating a profile.

6. In **Inbound info**, select a queue and one or more capacity profiles in the **Queue** and **Capacity** dropdown lists, and then select **Next**.

7. In **Inbound behaviors**, configure the following settings:

- **Language**: Accept the default language as **English - United States** or select a language from the list.
- **Hold music**: Select a music to play when the call is on hold.
- **Wait music**: Select a music to play when the call is in waiting.
- **Call transfer to external phone number**: Set the toggle to **On** if you want the agents to transfer the call to a phone number outside of your organization.
- **Consult with Microsoft Teams user**: Set the toggle to **On** if you want the agents to consult or transfer the voice calls to subject matter experts on Microsoft Teams.
- **Transcription and recording**: Select whether you want to transcript the call and record it. Select **None** if you don't want to.
  - **Start setting**: Is enabled when you select transcript or transcription and recording. Set to Automatic if the call recording and transcription needs to start immediately.
    - **Allow agents to pause and resume**: Is enabled when you set the **Start setting** to Automatic. Set to **Yes** to let agents pause and resume the recording and transcription.

1. Select **Next**, verify the settings, and select **Save and close**.

Create outbound profiles

You can define the way outbound calls are made and also who can make them.

1. Perform the steps 1 through 3 in Create inbound profiles.

2. On the **Create new profile** dialog, in the **Profile settings** section, enter a profile name in **Profile name**, select **Outbound** in **Profile type**, and select **Next**.

3. In **Phone number**, select a phone number in the **Shared numbers** list, and select **Next**.

> **Note**
>
> The phone numbers list shows only those numbers that are enabled for outbound calling and aren't used as a personal phone number. If you don't

see any numbers in the list, **configure a number for outbound calling**.

4. In **Outbound info**, do the following:

   - **Number label**: Enter a label to denote the business context, like Billing, that's displayed with the phone number at the agent end when they call a customer. This value is automatically populated with the phone name string on the agent dialer that the agent can edit.
   - **Queue**: Select a queue from the dropdown list.
   - **Capacity**: Select one or more capacity profiles from the dropdown list.

5. In **Outbound behaviors**, do the following:

   - **Allow list for countries/regions**: Select the countries whose numbers your agents can call. If an agent has multiple outbound profiles, they'll see a list of countries that have been selected in all profiles.

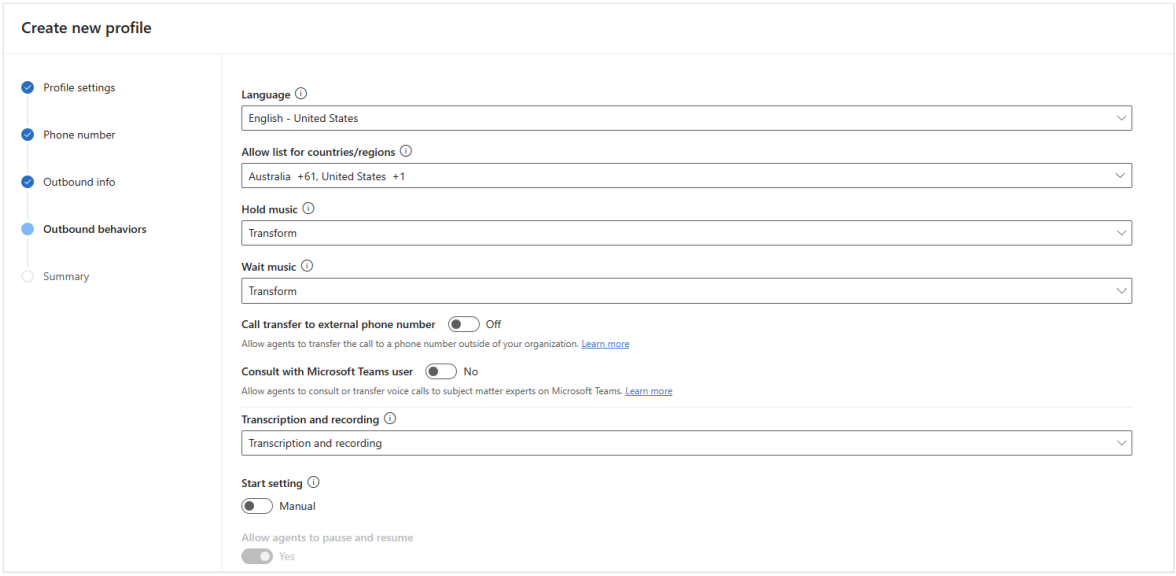
     > ⓘ **Note**
     > - The **Allow list for countries/regions** is an early access feature. You can opt in early to enable these features in your environment, which will allow you to test these features and then adopt them across your environments. For information about how to enable these features, see **Opt in to early access updates**.
     > - In **Power Apps**, add the **Enhanced outbound dialer experience** setting definition to enable the enhanced outbound dialer, and then set the **Setting environment value** to **Yes**. More information: **Add an existing setting definition**.

   - **Hold music**: Select a music file that you want played when the customer is put on hold during a call.
   - **Wait music**: Select a music file that you want played when the customer is waiting to get into a call.
   - **Call transfer to external phone number**: Set the toggle to **On** if you want the agents to transfer the call to a phone number outside of your organization.
   - **Consult with Microsoft Teams user**: Set the toggle to **On** if you want the agents to consult or transfer the voice calls to subject matter experts on Microsoft Teams.
   - **Transcription and recording**: Select **None**, **Transcription only**, or **Transcription and recording**, based on your business scenarios and requirements. As an administrator, you may want to set the value to **None** for

business transactions like customer billing where you don't want to record financial data.

- **Start setting**: Indicates whether you want to start transcription and/or recording when the call begins. The default value is **Automatic**, which means transcription and recording will automatically begin at the start of the conversation.
- **Allow agents to pause and resume**: Indicates whether you want to allow your agents to pause and resume call transcription and recording. The default value is **Yes** which means that your agents can choose when to pause or resume call transcription and recording in the conversation panel.

6. Select **Save and close**.



Default profiles

The default profiles are available out of the box if you use the first-run experience in the new organization. Some of the features are as follows:

- The default profiles are used as fallback profiles when agents aren't assigned a profile.
- You can edit the behavior and templates only but not the profile type for the default profiles.
- The locale settings for the default profiles should be same. The locale settings can be edited in one of the default profiles only and the setting will be applicable to both the default profiles.
- The phone number column for the default inbound profile is "undefined" because it's used as a default for all calls to agent phone numbers. When a customer calls, if no other inbound profile exists, the default profile is used to route the call to the

agent whose phone number is enabled for inbound calling and their capacity matches the capacity profile condition of the default profile.

Edit profiles

Edit the profiles to update the behavior and advanced settings. You can delete profiles that aren't required.

1. On the **Outbound and inbound profiles** page, select a profile from the list and select **Edit**. On the **Edit profile settings** dialog, update details in the required sections.

2. The **Advanced settings** section that's available only after you save a profile, select the default templates for session, consult notification, and transfer notification. For information on session and notification templates, see Manage session templates and Manage notification settings and templates.

3. Select **Save and close**.

Configure historical analytics for voice

Article • 03/08/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

To view the rich analytics and insights for your organization, you must enable **Omnichannel historical analytics for voice** in the Customer Service admin center or Omnichannel admin center app.

Enable historical analytics for voice

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Insights** in **Operations**. The **Insights** page appears.
   b. In the **Omnichannel historical analytics** section, select **Manage**.

   The **Omnichannel historical analytics** page is displayed. Select the **Add historical analytics for voice** check box.

2. Select **Save** or **Save & Close**.

Configure Power Virtual Agents bots for voice

Article • 06/19/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

To route customers call to the best department, diagnose issues, collect information, and give recommendations, conversational IVR bots speak to customers when they call in. Power Virtual Agents makes it easy to author IVR bots and you can use the same bots for other channels, like chat and voice.

Some of the features of the Power Virtual Agents bots for voice are as follows:

- Customizable voices in the Omnichannel for Customer Service configuration experience.
- Questions in Power Virtual Agents using "Boolean" types do not prompt users with "Options are *Yes* or *No*".
- All bot messages can be interrupted by the caller.

Prerequisites

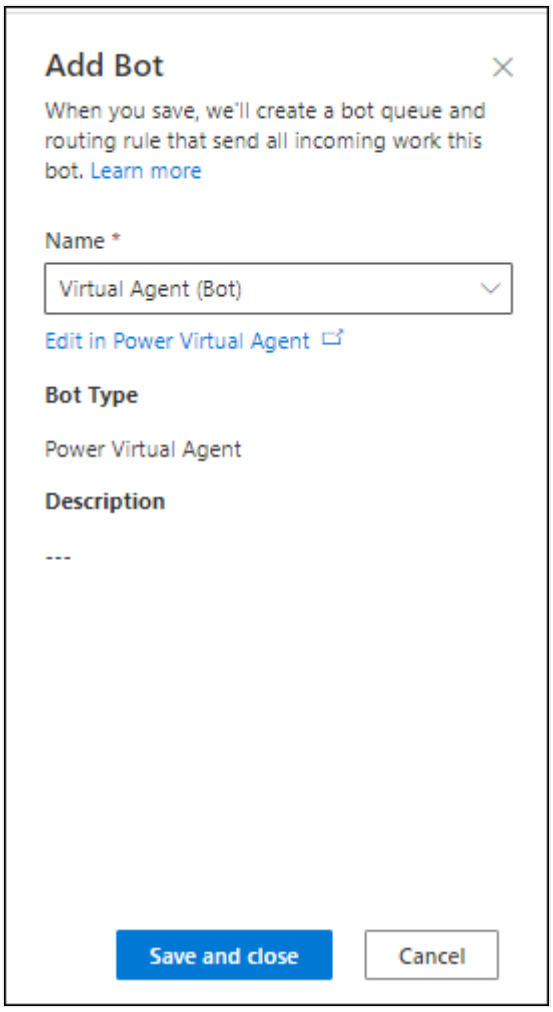
The following prerequisites must be met for the Power Virtual Agents bot:

- The bot is published, and the **Agent transfers** setting is configured by selecting **Omnichannel**. More information: Configure seamless and contextual hand-off to Omnichannel for Customer Service
- The **Enable voice** option is selected in the **Omnichannel** section of the **Agent transfers** setting.

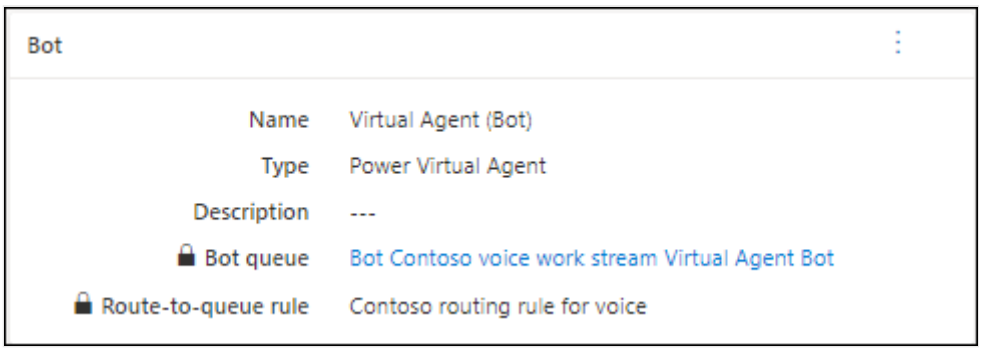
Configure a bot for voice

1. In the Customer Service admin center or Omnichannel admin center app, go to the workstream that you created for the voice channel, and then in the **Bot section,** select **Add Bot**.

2. On the **Add Bot** pane, select a bot from the **Name** box.



3. Select **Save and close**. The bot is added to the workstream.



More information:

- Author template topics in Power Virtual Agents
- Create topics and test your bot

Configure handoff from Power Virtual Agents to Omnichannel for Customer Service

1. In Power Virtual Agents, open the bot that you've configured to integrate with Omnichannel for Customer Service.

2. Go to **Manage** and select **Agent transfers**.

3. In the **Agent transfers** section, select **Omnichannel**, and on the Omnichannel panel that appears, do the following:
   a. Select **Enable**. One of the following messages appears:

      - That Omnichannel is enabled is displayed at the top of the page.
      - If you're using Application Lifecycle Management (ALM), you might see the following message: "We can't determine if omnichannel integration is enabled for the environment". For more information, see Bots with ALM.

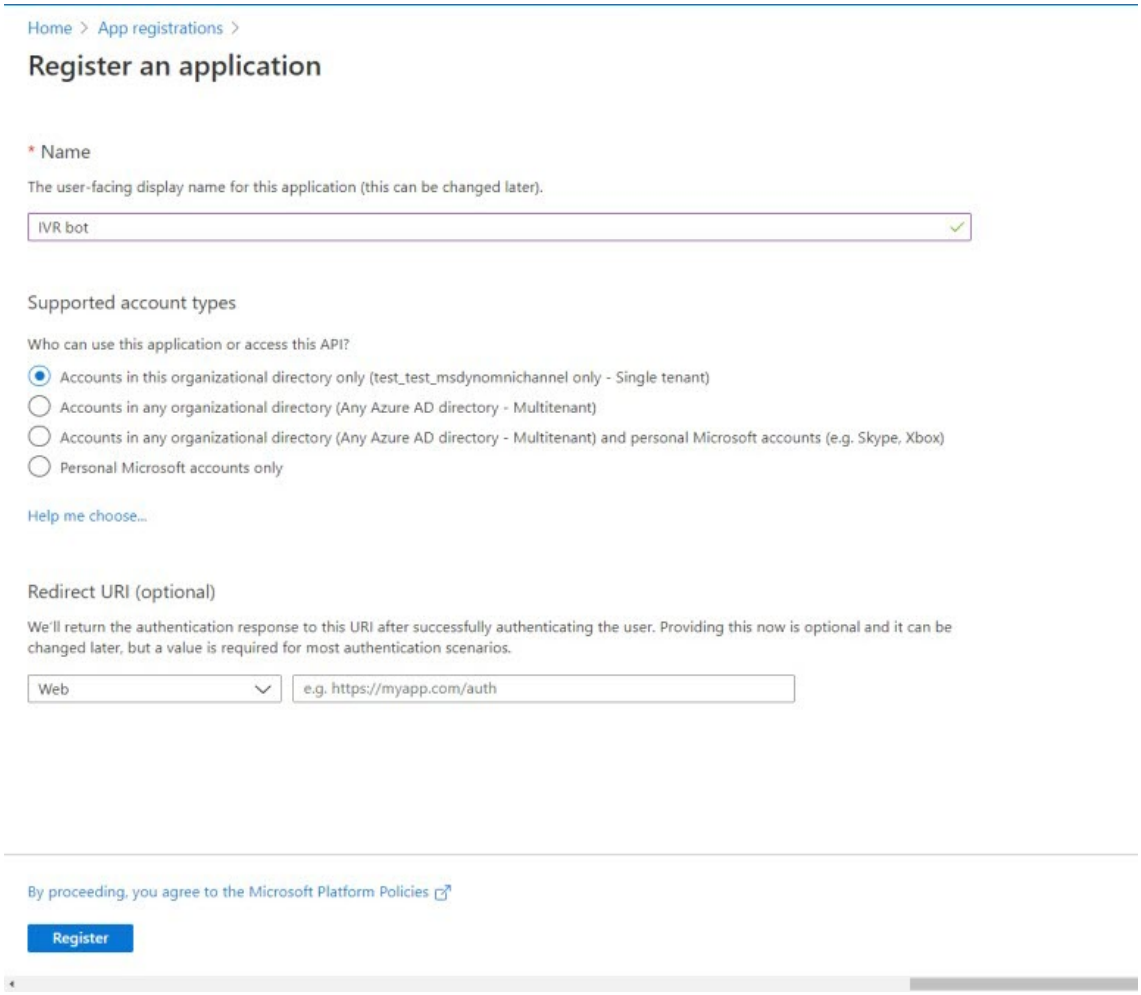
   a. Turn on the **Enable voice** toggle.

   b. Select **See how to register a new Application ID**, and follow the instructions to register an application identifier.

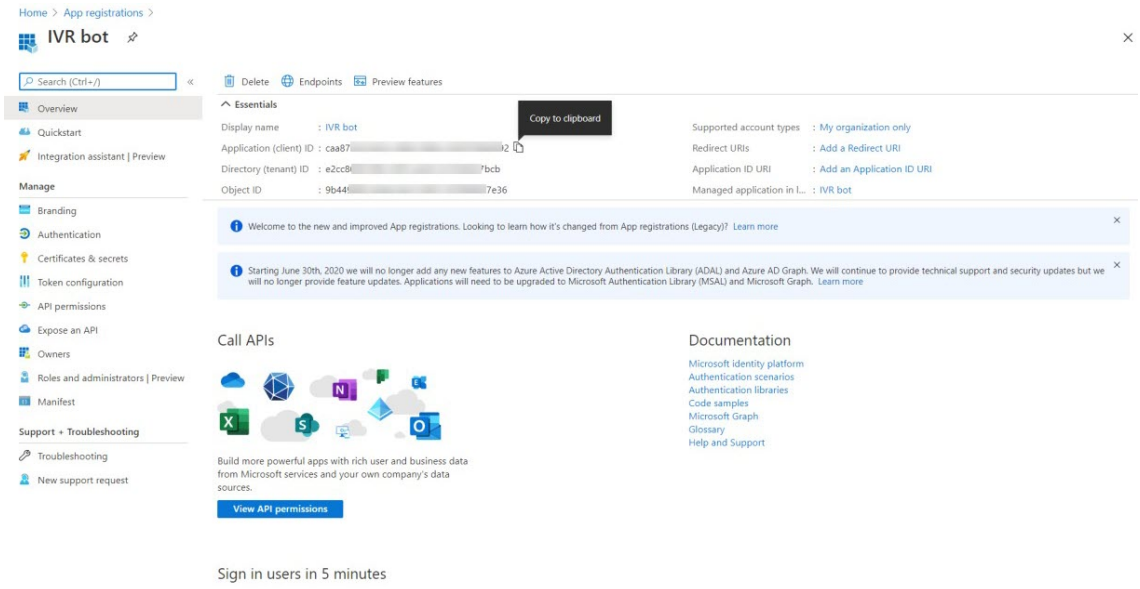
      i. Select **App Registration**.

      ii. Select **New registration**.

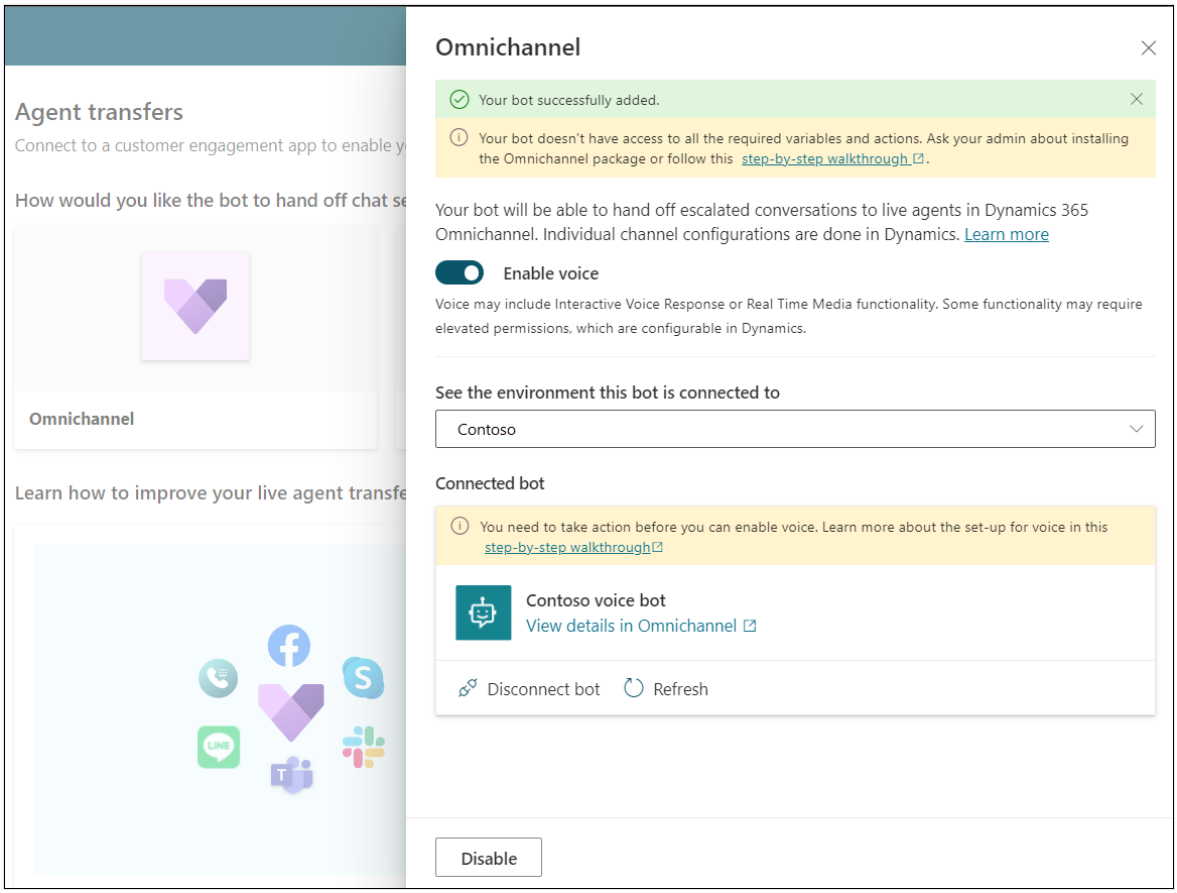
      iii. Enter the name of your bot, and then select **Register**.



i. Copy the **Application ID** to the clipboard.



c. Return to Power Virtual Agents, paste the copied ID in the **Application ID** field, and then select **Add your bot**. After the bot is added, a message is displayed and the bot is listed.



a. Optionally, you can view the bot details in Omnichannel for Customer Service.

> **ⓘ Important**
>
> In voice, we don't listen for the **closeOmnichannelConversation** context variable. You must configure an **end of conversation message** for the call to end in Omnichannel for Customer Service.

View minutes used in voice calls

Article • 04/04/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Introduction

The Voice minutes report lets Omnichannel administrators view a Power BI report in Omnichannel admin center that helps them to get insights about how many call intelligence minutes and intelligent voicebot minutes from the voice quota have been consumed.

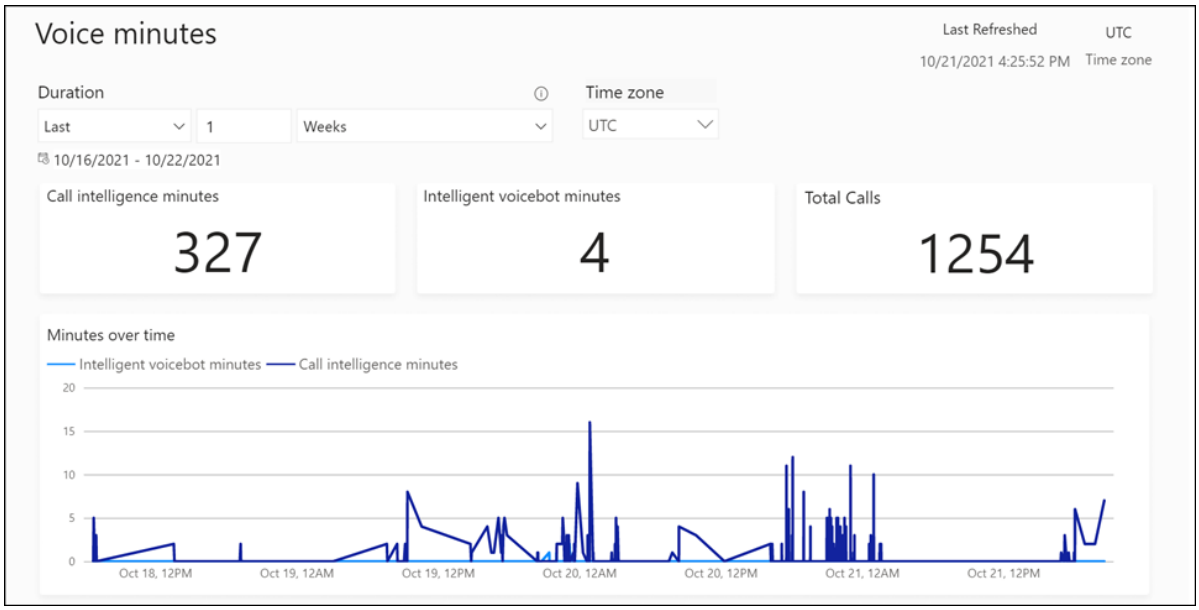
Prerequisites

- The voice channel should be configured and in use for the report to display data.
- The Omnichannel administrator role for accessing the report.

View the Voice minutes report

To view the Voice minutes report, do one of the following steps:

- In the site map of Customer Service admin center, select **Insights**, and in **Admin reports**, select **View report** for **Voice minutes**.
- In the site map of Omnichannel admin center, in **Insights**, select **Voice minutes**.



The following table contains the metrics.

Metric	Description
Call intelligence minutes	Number of minutes of calls for which call transcription is generated. Number is rounded to a whole number.
Intelligent voicebot minutes	Number of minutes used by voicebot. Number is rounded to a whole number.
Total Calls	Number of calls that consumed the minutes.
Minutes over time	Overtime trending of call intelligence minutes and intelligent voicebot minutes.

View the IVR transcripts

The **Voice details** table in the report provides the following information.

Attribute	Description
Date	Date when the conversation is logged.
Conversation ID	Identifier of the conversation record.
Type	Type of call, either "Call intelligence" or "Intelligence voicebot".
Start	Time when the recording of the minutes starts.
End	Time when the recording of the minutes stops.
Duration	Total number of minutes consumed for the current row.

Attribute	Description
Phone number	Agent phone number used in the call.
Workstream	Workstream through which the call was handled.
Call direction	Indicates whether the call was an "Incoming" or "Outgoing" one.

Slice metrics by time and time zone

The **Duration** option lets you filter the report details and affects all metrics in the report. More information: Slice metrics by time

The **Time zone** option lets you filter the report for the selected time zone.

Configure a post-call survey

Article • 03/25/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Introduction

Post-call surveys help measure customer satisfaction in the contact center. Surveys are also an incentive for agents to provide high-quality service. You can configure the survey to take place immediately after the call so that customers can provide their feedback while the conversation is fresh on their minds.

You can obtain customer consent for post-call surveys as follows:

- **Automatic - implicit**: The IVR bot informs the customer about a post-call survey at the end of the call. After the agent disconnects, the call is automatically transferred to a post-call survey bot.
- **Automatic - explicit**: The IVR bot asks the customer if they want to participate in a post-call survey. The consent is saved in a `va_SurveyConsent` Boolean variable. If the customer consents, the call is automatically transferred to the post-call survey bot at the end of the agent call. If the customer says no, the call ends when the bot hangs up.
- **Agent-initiated**: Towards the end of a call, the agent can ask the customer if they want to take a survey. If the customer says yes, the agent manually transfers the call to the survey bot.

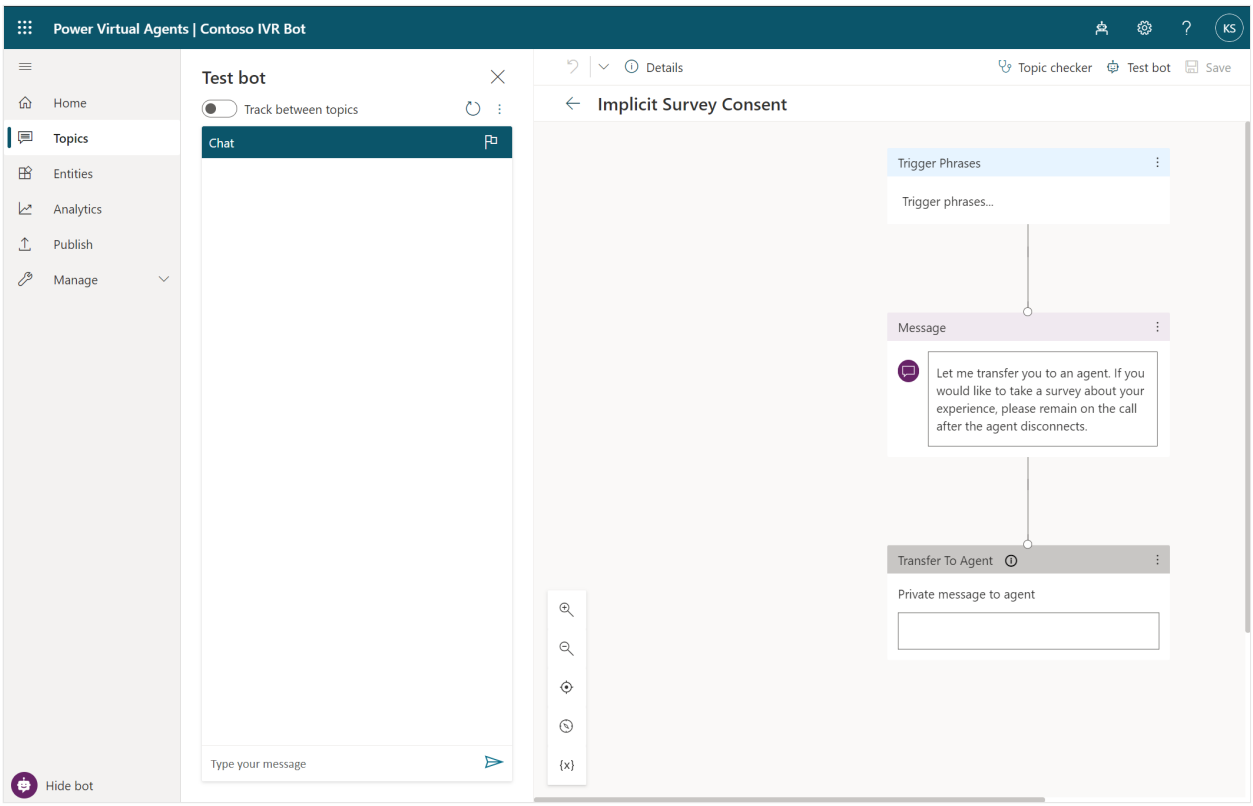
> **Note**
>
> We recommend that you have two bots if your organization wants to use Power Virtual Agents for both IVR and survey scenarios.

Create a survey bot in Power Virtual Agents

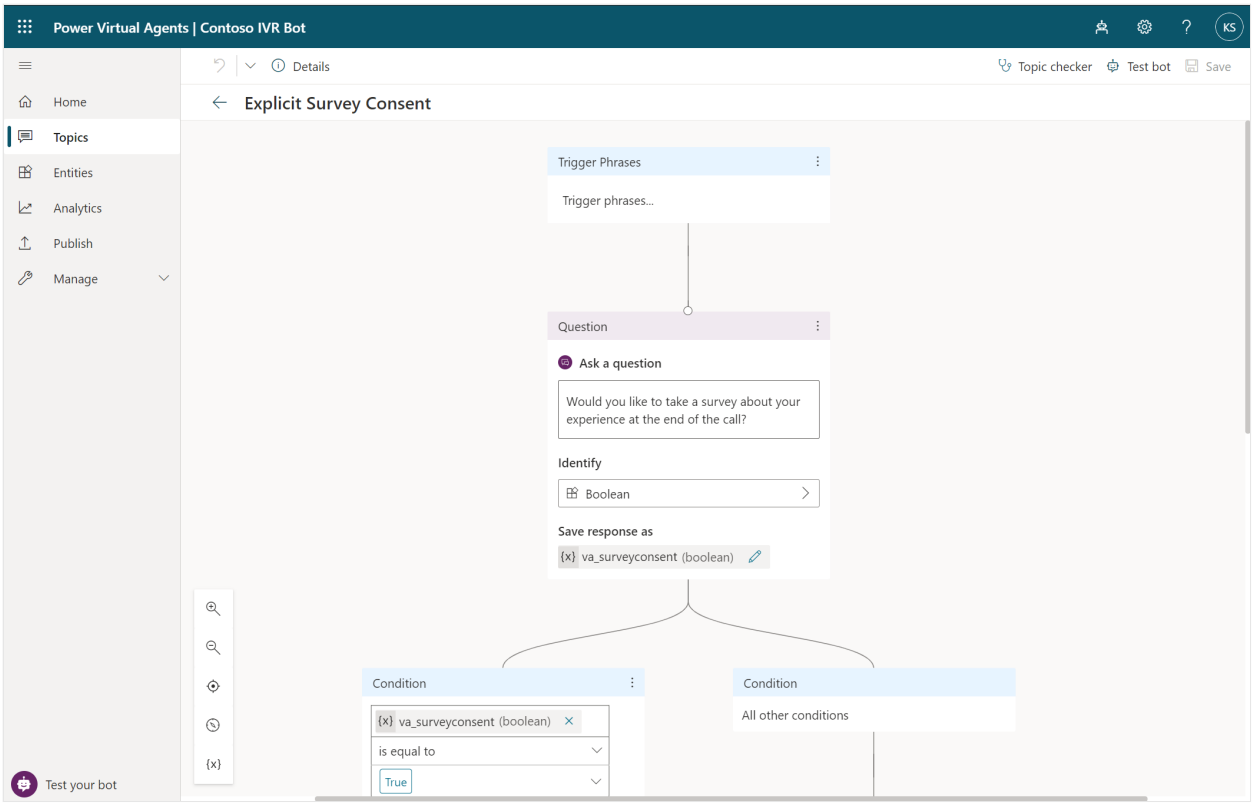
Use either Power Virtual Agents (no-code or low-code experience) or Azure bot Service (pro-developer experience).

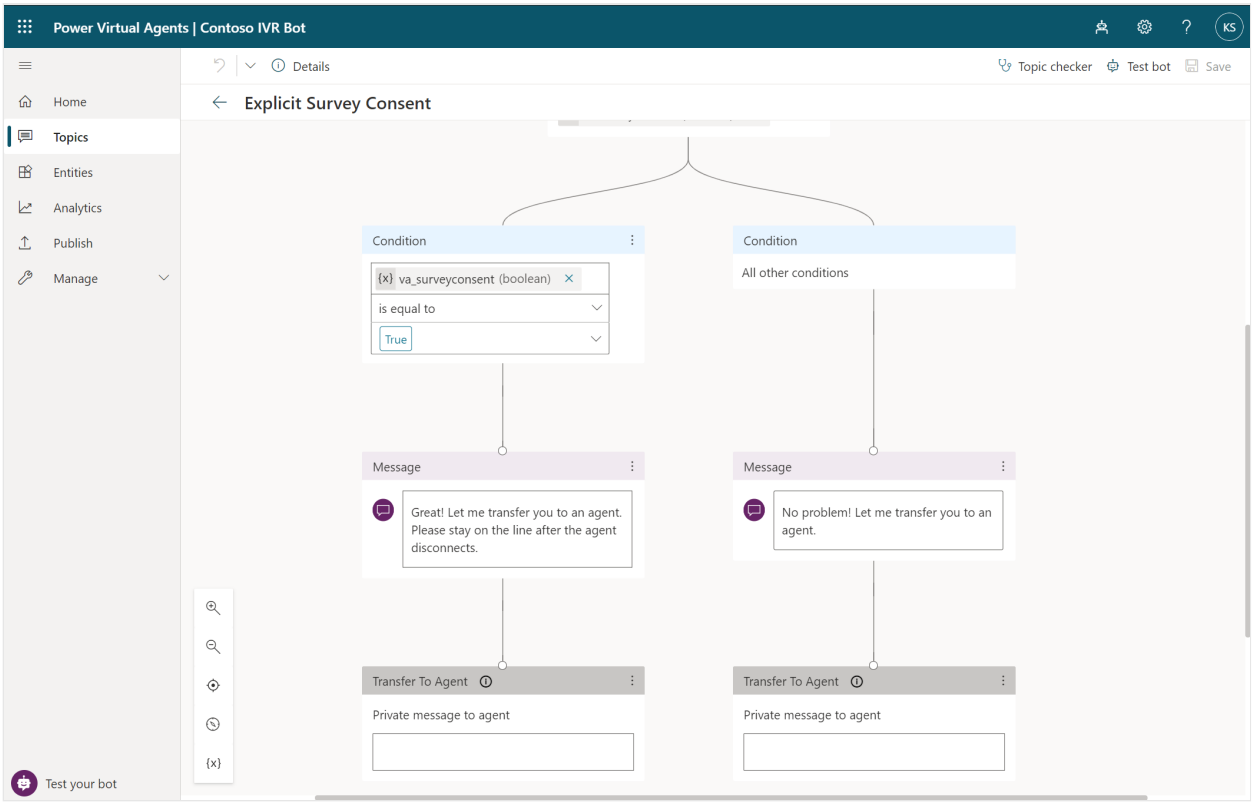
You can add messages or questions in the **Escalation** topic to obtain a customer consent for a post-call survey. Examples of the messages are as follows:

Implicit survey



Explicit survey

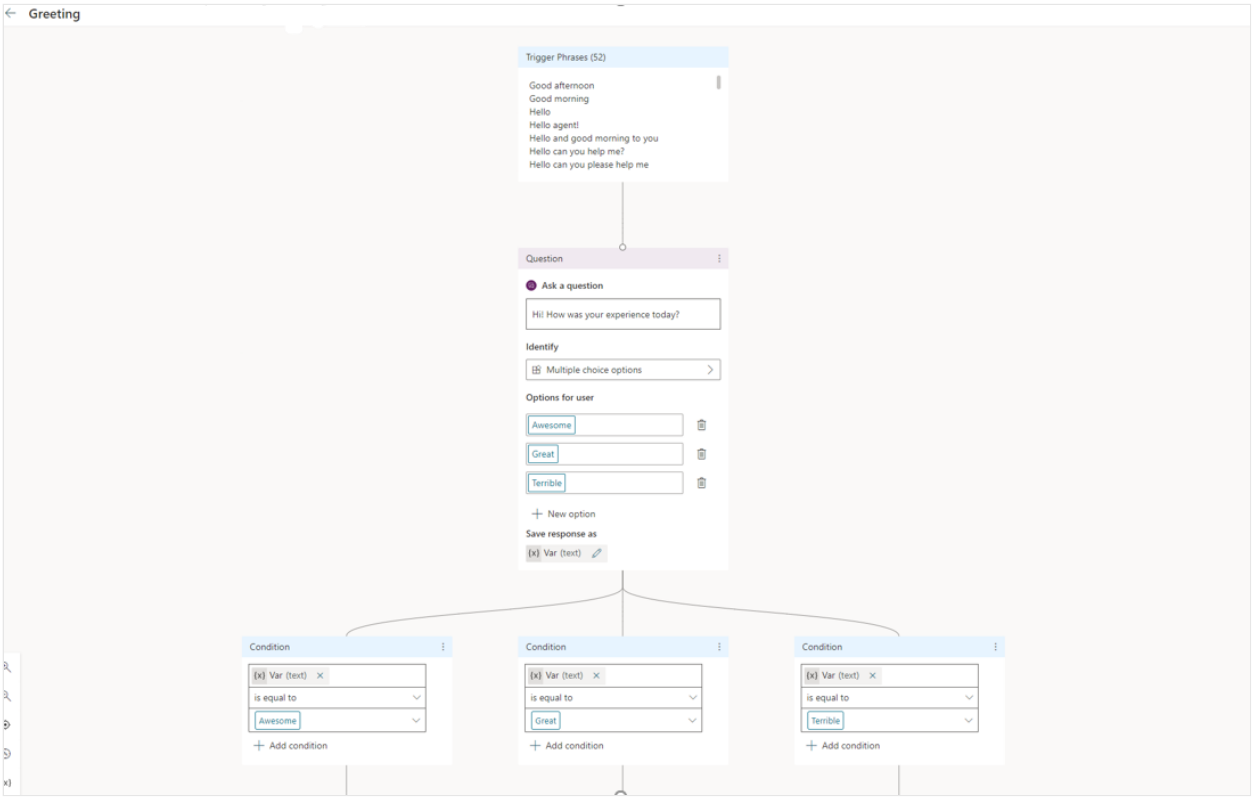


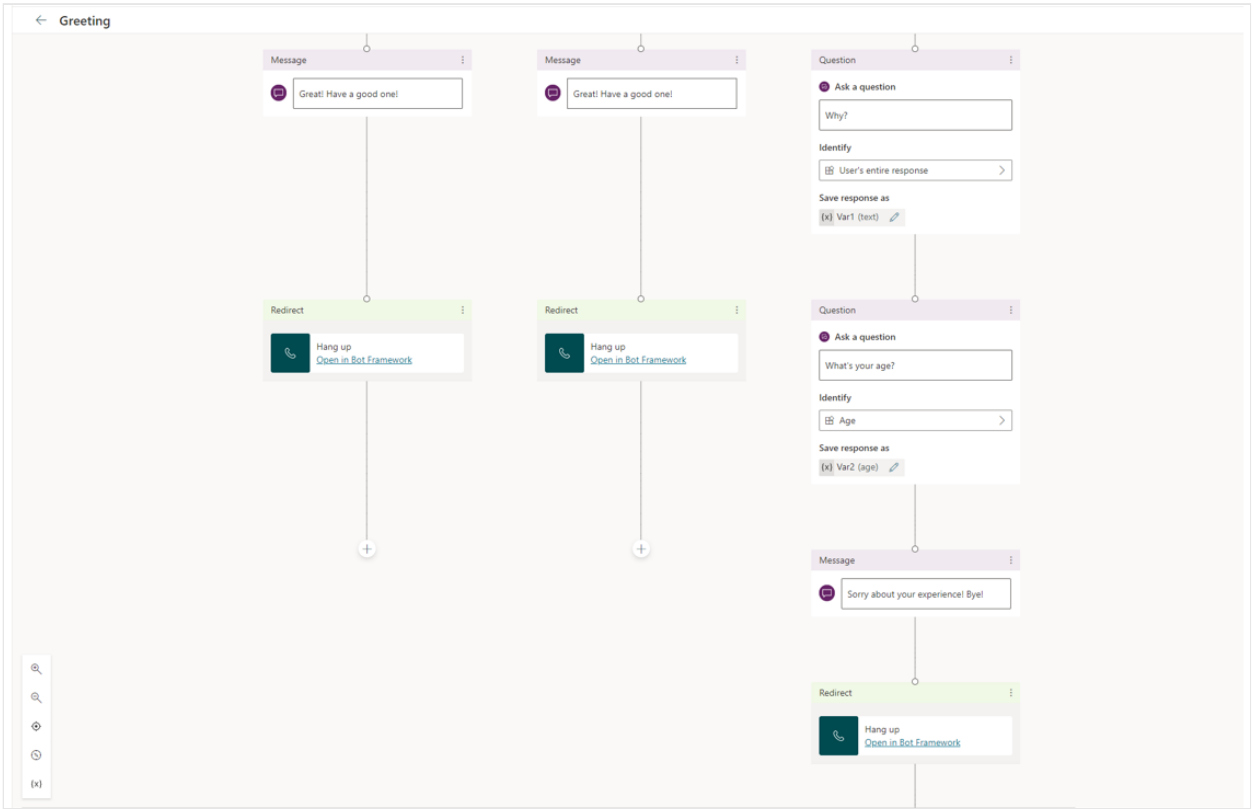


Configure a survey bot

You can add messages or questions to a Power Virtual Agents IVR bot to create a post-call survey. A bot greets the customer when the call routed to the survey queue is answered. Examples of messages or questions configured in the **Greetings** topic for the bot to greet the customer are as follows:

> **Note**
>
> We recommend that you have two bots if your organization wants to use Power Virtual Agents for both IVR and survey scenarios.





> **Tip**

The bot author can use Power Automate to implement custom business logic to decide who receives a survey (for example, the bot may decide to survey someone random, VIP customers, and so forth)

Connect your bot to Omnichannel for Customer Service

- Configure your Power Virtual Agents bot. Perform the steps in Configure handoff to Omnichannel for Customer Service and Integrate a Power Virtual Agents bot.
- Configure your Azure bot. More information: Integrate an Azure bot

Enable post-call survey in phone number settings

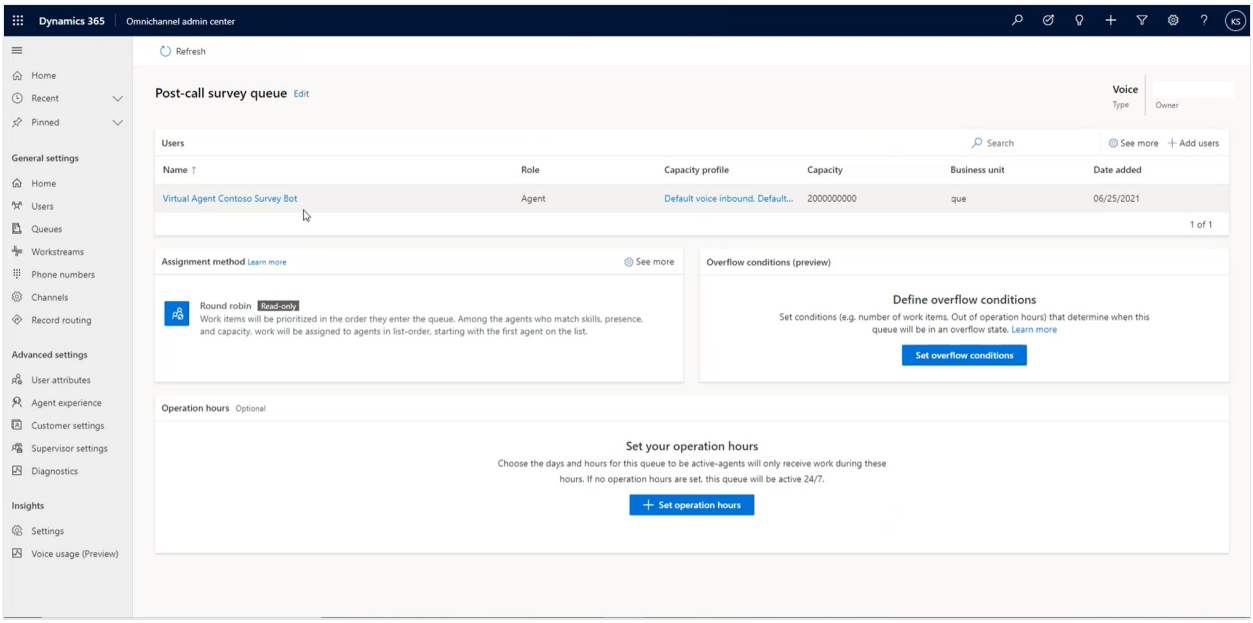
> ⓘ **Note**
>
> Enabling the post-call survey feature isn't required for the human agent initiated scenario.

To route the customer to the Power Voice Agent survey bot automatically after the agent hangs up, perform the following steps:

1. In Customer Service admin center or Omnichannel admin center, select your voice workstream, and then select **Edit** next to the pencil icon to modify the settings.
2. Under **Language**, scroll to the bottom of the dialog, and then toggle **Post-call survey** to **On**.
3. From the dropdown menu, select the survey bot.
4. Select **Confirm**.

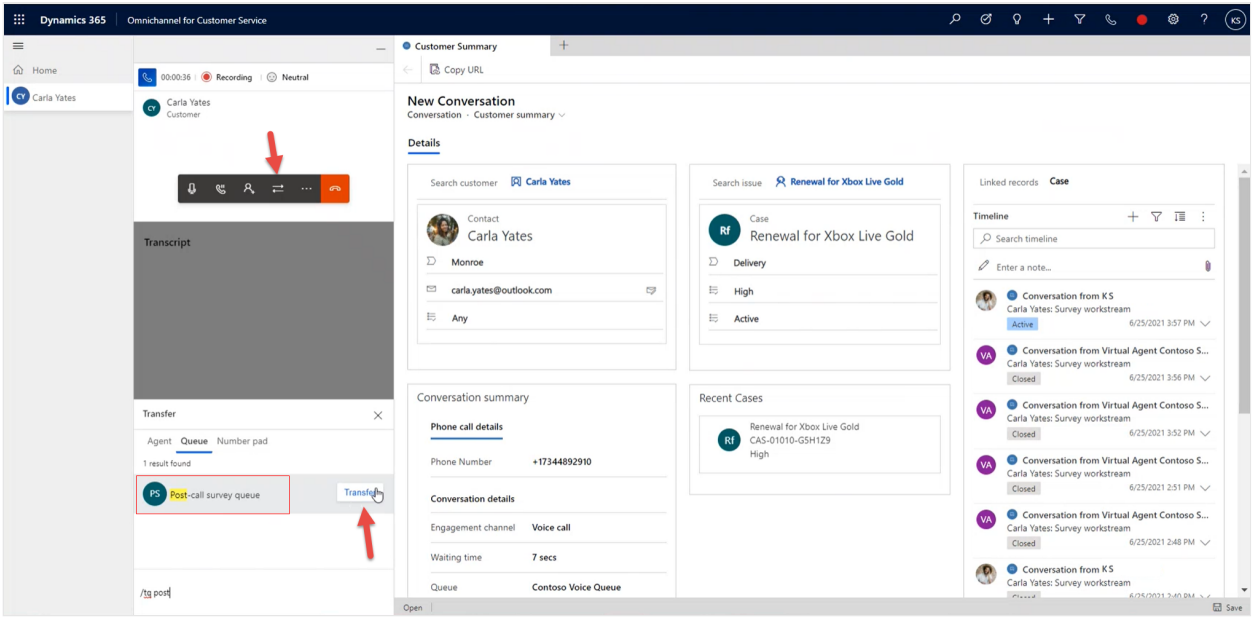
Set up human agent initiated survey

To enable agent initiated feedback, create a queue where the only agent is the survey bot user.

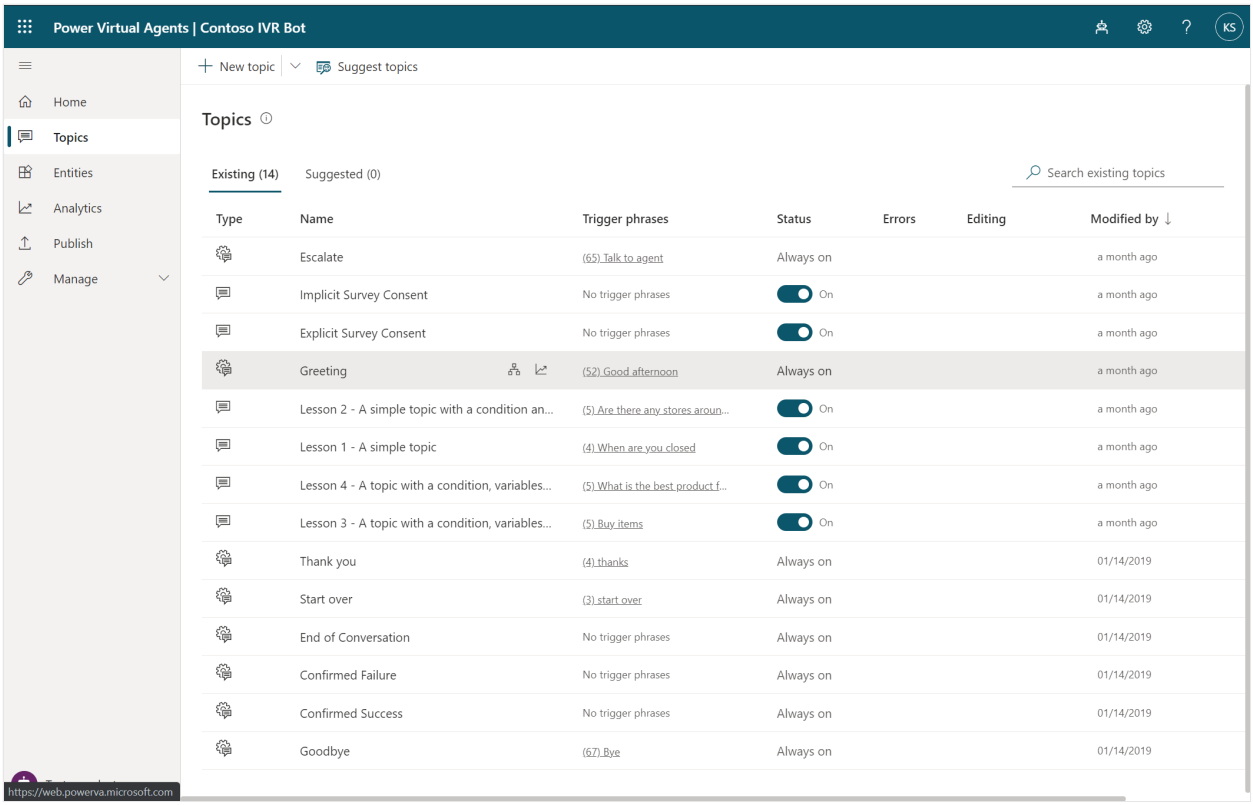


Try out the human agent initiated survey

Transfer the call to the survey queue.



When answered, this sends the user to the bot's greeting topic.



View Survey Results

You can view the survey results on the **Analytics** > **Sessions** tab.

Block spam numbers

Article • 05/31/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

In Omnichannel for Customer Service, as an administrator, you can block spam phone calls that your agents receive as part of their incoming customer calls. By blocking spam calls, you can help improve efficiency and productivity of agents and prevent long wait times for actual customers who are in the queues. Your agents and supervisors can also flag off incoming calls as spam, that you can later review and block as spam.

Review phone numbers marked as spam

You can review phone numbers marked as spam in the Customer Service admin center or Omnichannel admin center app.

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Customer Settings** in **Customer support**. The **Customer settings** page appears.
   b. In the **Blocked numbers** section, select **Manage**.

   The **Blocked numbers** page is displayed.

2. In the **Blocked numbers** section, you can do the following:

   - **Pending review** tab - Shows the list of numbers that have been flagged as spam by your agents and supervisors. You can view the report for each phone number, and then block the specific number as spam. Select any number from the **Pending review** list, and then you can do the following:
     - **Block** - Select to block the number; the agent will no longer receive any calls from the blocked number.
     - **Remove from list** - Select to remove the number from the **Pending review** numbers list and clear the number from the spam numbers list.

    - **View report history** - Select to view the reports for the specific phone number in the **Pending review** list. You can review all spam notification reports by viewing the report history. You can visit the conversation history page to review the conversation or recordings. You can also choose to either block the number or remove the number from the pending review list.

- **Blocked** tab - Shows the list of phone numbers that have been blocked as spam.

Manually block phone numbers

1. Navigate to **Blocked numbers** and select **Manage**.
2. Select **Block a number**.
3. In the **Block a phone number** dialog, enter a phone number, add any comments if you'd like, and then select **Block this number**.

Automatically block phone numbers

You can set conditions so that some numbers are automatically added to the blocked numbers list if they match certain conditions based on the number of reports. Using the **Auto-block** option, you can also automatically block numbers if they're reported as spam, say two or more times. This not only saves time in reviewing every blocked call report received from your agents, but also helps remove any delay from your end when you have too many spam numbers to review. The auto-block option is also useful in situations or instances where there might be a surge in spam calls from different numbers.

1. Navigate to **Blocked numbers**, and select **Manage**.
2. In the **Auto-block** section, select **Set up**.
3. In the **Auto-block** dialog that appears, do the following:
    a. Enable the **Turn on auto block** toggle.
    b. Enter a value for the number of reports in the **Block reported phone numbers if they receive** field. For example, if you entered **2**, then the phone number would automatically get blocked as spam after two reports are received.
4. Select **Save and close**.

Configure call recording, transcription, and real-time translation

Article • 06/07/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

As an administrator, you can enable live translation, transcription and recording of calls, which allows agents and supervisors to view the conversations with the customers in the language that's set as the default for them, and also transcripts of customer calls.

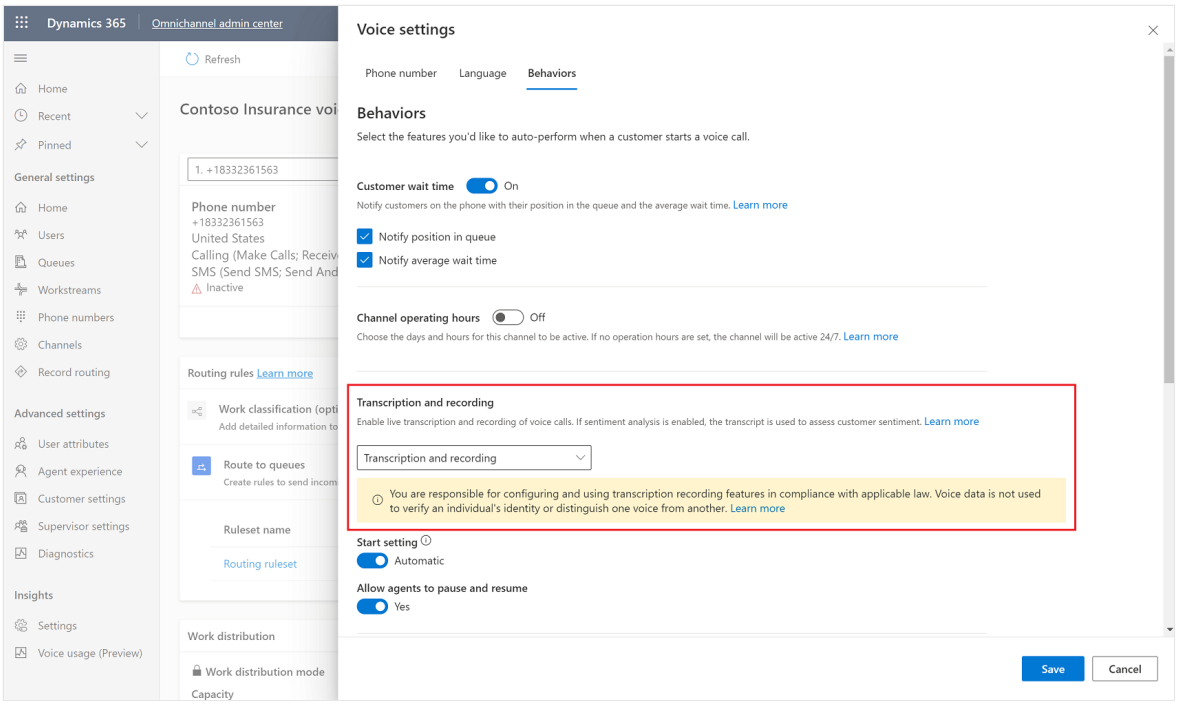
Important

- Many countries and states have laws and regulations that apply to the recording of PSTN (Public Switched Telephone Network), voice, and video calls, and may require that users first consent to the recording of their communications. It is your responsibility to use the call recording and transcription capabilities in compliance with the law. Before using call recording features, you must obtain consent from the parties of recorded communications in a manner that complies with all applicable laws for each participant.
- If you use Power Virtual Agents bots as the interactive voice response (IVR) with the voice channel, the calls are transcribed in Power Virtual Agents even if the transcription and recording setting isn't enabled in the voice workstream.

Enable call recording and transcription for voice

1. In Customer Service admin center or Omnichannel admin center, select the workstream for which you want to enable recording and transcription.
2. In the **Phone number** section, next to the pencil icon, select **Edit**.

3. On the **Voice settings** page, select the **Behaviors** tab.



4. In the **Transcription and recording** section, select the **Transcript and recording** dropdown menu, and then select **Transcription** or **Transcription and recording**.

5. Under **Start setting**, set the toggle to **Automatic** if you want calls to be automatically recorded and transcribed when they begin, or **Manual** if you want agents to record and transcribe their calls.

6. Set **Allow agents to pause and resume** if you want to allow agents to control the portions of conversations that they record and transcribe.

7. Select **Save**.

Enable real-time translation of calls

To view translated voice transcripts for calls, you must enable call recording, transcription, and real-time translation. To enable real-time translation, see Enable real-time translation for agent and customer conversations

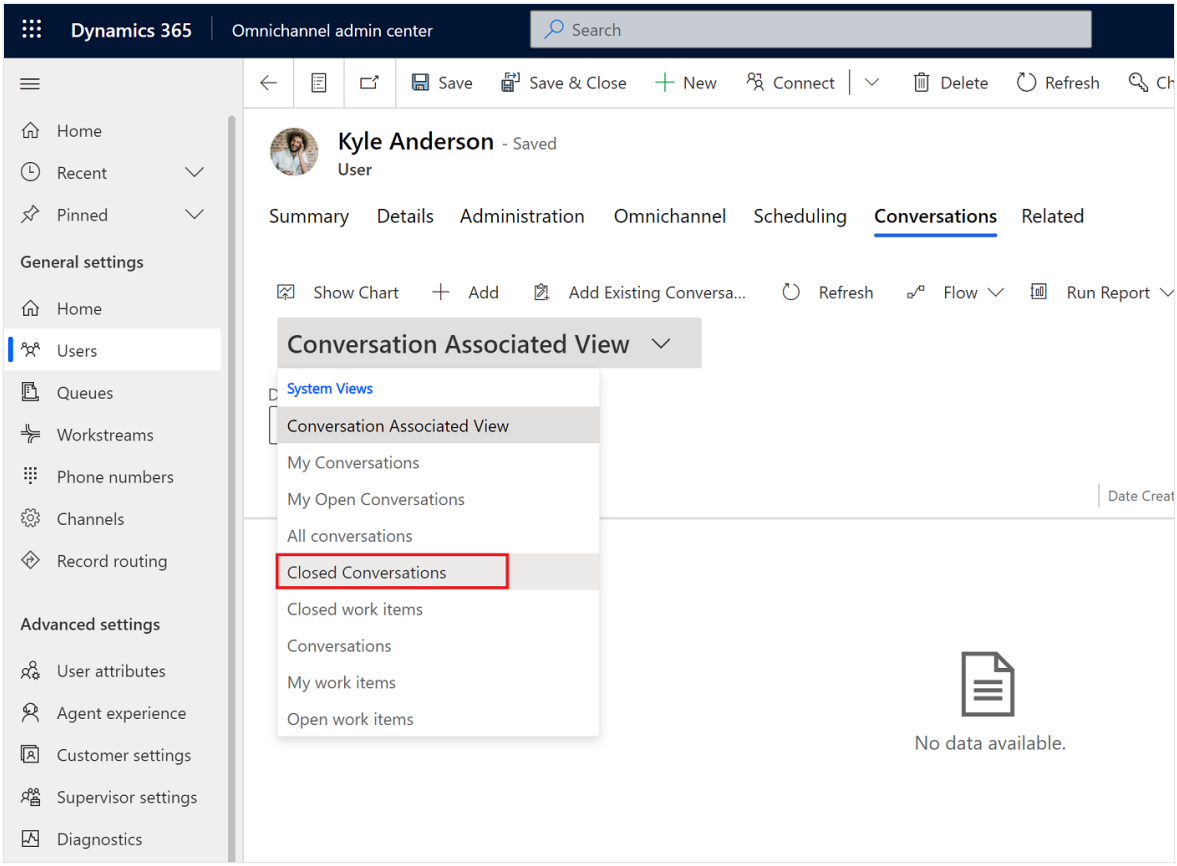
View call transcripts

You can view the call transcripts in Customer Service admin center or Omnichannel admin center.

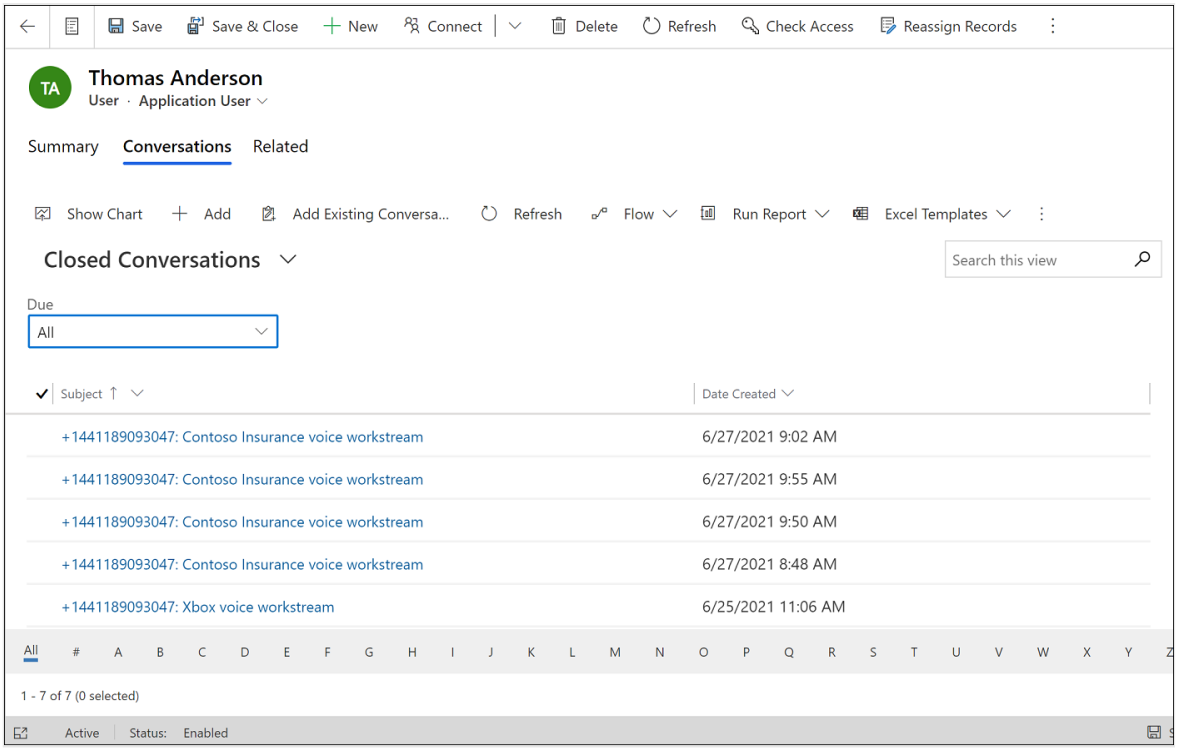
1. In Customer Service admin center or Omnichannel admin center, go to manage **Users**, and then select the user whose conversations you want to view.

2. Select the **Related** tab, and then select **Conversations** from the dropdown menu.

3. Select **Closed conversations** from the dashboard dropdown menu.

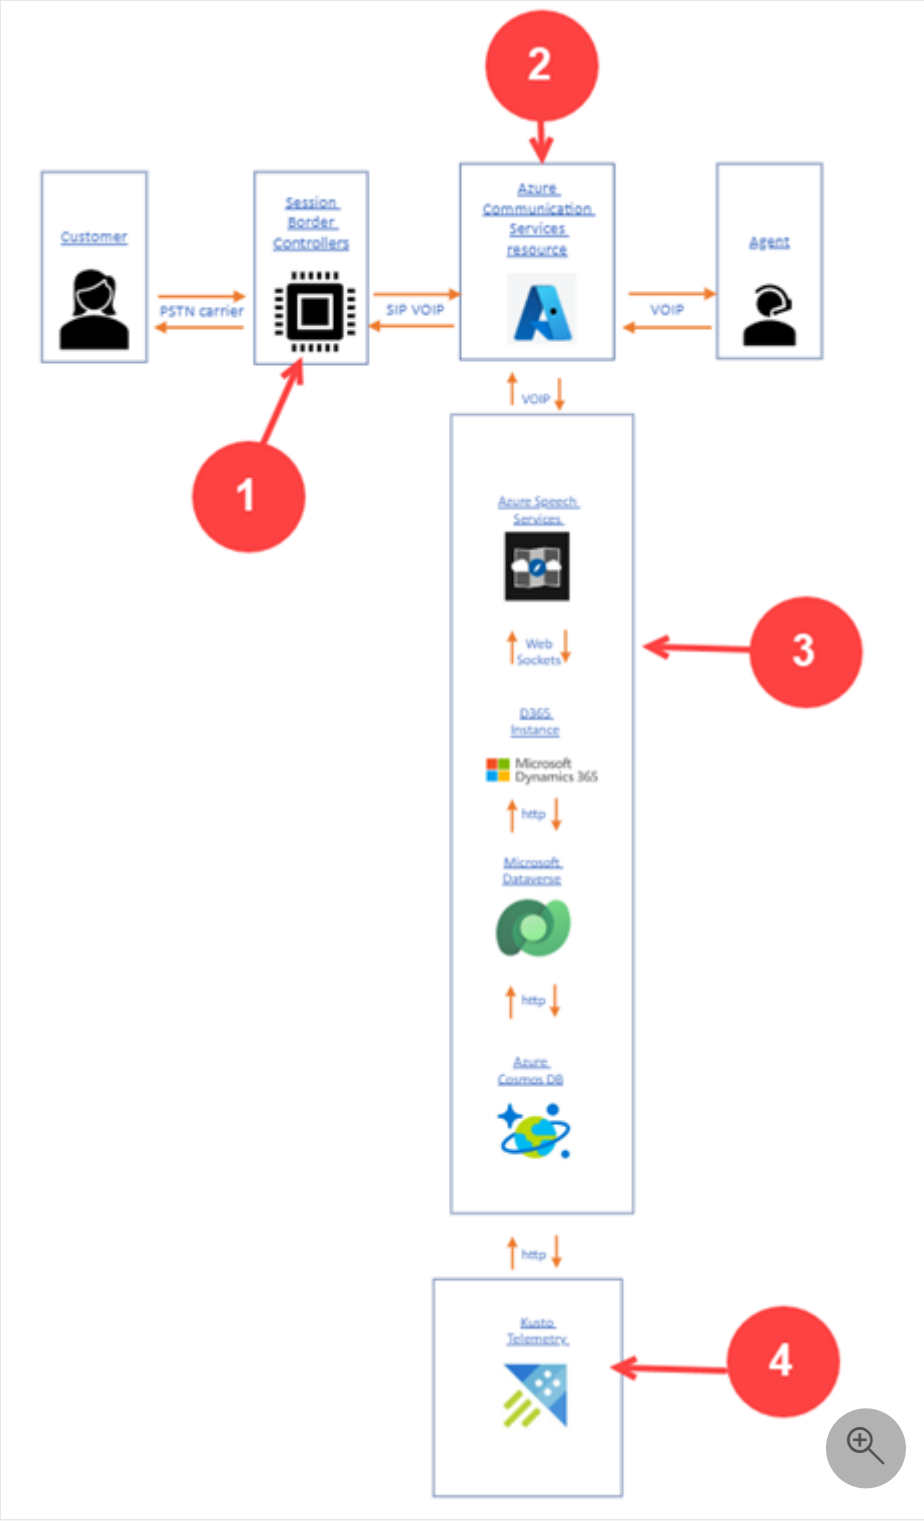


4. Select the conversation for which you want to access the recording and transcript.



Storage location of your recordings and cost

For components within the Microsoft stack, the data doesn't cross geographical boundaries during transit. The bring-your-own-carrier model has dependencies on third parties with components outside the Microsoft stack, and the data needs to be reviewed end-to-end. The components can be in a different geographic location from the Azure Communication Services location as shown in the following illustration.



Legend

Number	Description

Number	Description
1	**Session Border Controller** For Microsoft calling plans where Microsoft is the carrier, Microsoft determines the location to store data. **Direct Routing**: For the bring-your-own-carrier model, the data resides in the region where the Session Border Controller is hosted.
2	**Azure Communication Services**: The data resides in the location where the Azure Communication Services subscription is acquired.
3	**Microsoft Dataverse**: The Microsoft Dataverse server location, Dynamics 365 tenant, Cosmos DB, and Azure Speech Service should all be in the same location chosen during purchase.
4	**Kusto**: Microsoft stores the data for telemetry in Kusto, which is located either in the EMEA or the East US cluster.

The maximum file size of a recording can be 512 MB. The data storage costs with two participants only is calculated approximately as follows and the cost can fluctuate:

- 20-minute call recording = 10240 KB
- 20-minute call transcript = 40 KB

Delete call recordings

Article • 06/07/2023

You can delete call recordings that are no longer required. To delete the call recordings, perform the following steps:

1. In the Dynamics 365 instance, go to the app and select the **Advanced Find** icon displayed on the menu.
2. On the **Advanced Find** page, select **Recordings** in the **Look for** dropdown list. More information: Create, edit, or save a view using legacy advanced find
3. Select the required recording.
4. Select the **Delete** icon.

Alternatively, you can delete the recordings from the msdyn_ocrecording entity by using the DELETE request.

You can also delete call recordings in bulk. More information: Bulk deletion

Enable voice consult with Microsoft Teams users

Article • 08/31/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> Azure Active Directory is being renamed to Microsoft Entra ID: No action is needed from you. **Learn more**

Customer service is not always limited to contact centers. Employees within the enterprise are often required to assist agents in customer service scenarios and talk to customers directly for highly technical or VIP engagements. You can enable your agents to consult with or transfer voice calls in Omnichannel for Customer Service to subject matter experts (SMEs) in Microsoft Teams.

The SMEs can participate in customer service conversations directly from Microsoft Teams to help agents in Dynamics 365 and customers on the phone call to resolve issues expertly.

Prerequisites

The following prerequisites must be set for the Microsoft Teams users:

- **Assign phone numbers to SMEs in Microsoft Teams**: Must have a phone number assigned to them in Microsoft Teams to participate in the voice call as an SME consult. More information: Assign, change, or remove a phone number for a user.

To update the Teams phone number in the user profile, perform the following steps:

1. Sign in to the Azure portal and go to **Azure Active Directory**.
2. Select **Manage** > **Users**
3. Select the required user and select **Edit** to add the phone number in the **Contact info** > **Office phone** field.

> **Note**
>
> When you're adding a business phone number, make sure that you prefix the number with the plus sign (+) followed by the country code.

- **Update the Azure profile for SMEs with phone number**: Add SMEs with phone numbers as guest users to the Microsoft Entra ID for them to participate in a voice call as an SME consult. To add a guest user and update a phone number in the user profile, perform the following steps:

  1. Add a guest user in the Azure portal. More information: Add a new guest user
  2. On the guest user profile page, select **Edit** to add the phone number in the **Contact info** > **Office phone** field.

  Dynamics 365 uses Graph API to retrieve the number in the **Office phone** field. Agents can then search for the guest user in the Teams tab of transfer or consult.

Enable agents to consult with Microsoft Teams users

To allow the agents to consult with Microsoft Teams users, enable the **Consult with Microsoft Teams user** setting in the voice channel section of the workstream for voice. More information: Configure the voice channel

Agent consult with Microsoft Teams users

Manage phone music

Article • 09/18/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Omnichannel for Customer Service comes with out-of-the-box music files that you can use to set hold tunes and wait tunes. You can replace them with your own music files, or even upload new ones to be used for hold or wait music in your customer calls. The hold or wait music will automatically be played on loop.

You can also configure hold and wait music for each language in each of the workstreams.

The following characteristics are applicable to the music files.

- The files can be up to 20 MB; for best experience, upload MP3 files.
- The files must have the ID3 tags so that they play successfully when the call is put on hold.
- The quality of the audio files that you upload might be reduced because audio file URLs are embedded in Speech Synthesis Markup Language (SSML). The telephony gateway gets Pulse Code Modulation (PCM) 16k audio bytes as part of the speech orchestration. More information: Add recorded audio.
- When audio files pass through public service telephone networks (PSTN), their quality might be reduced to a sample rate of 8 kHz (narrowband). While the voices in these files remain audible, the music quality isn't good. We recommend that you lower the sample rate of the music file to 8 kHz and assess whether the sound quality is good.
- Hold music files are played directly and aren't embedded in SSML.

Edit music files

You can update existing music files and replace them with your own music files in the Customer Service admin center or Omnichannel admin center app.

To update existing music files

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Customer Settings** in **Customer support**. The **Customer settings** page appears.
   b. In the **Phone Music** section, select **Manage**.

   The **Phone music** page is displayed.

2. Select any music file from the list and then select **Edit**.

3. In the **Edit phone music** dialog, you can do the following:

   - **Name**: Edit the name of the music file.
   - **Replace**: Select **Replace** to update the music file with any other music file from your computer.
   - You can play the music file to test it.

4. Select **Save and close**.

Add custom hold and wait music

You can also add new music files to use them in calls as hold and wait music.

To add new music files

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Customer Settings** in **Customer support**. The **Customer settings** page appears.
   b. In the **Phone Music** section, select **Manage**.

   The **Phone music** page is displayed.

2. Select **Add new**.

3. In the **Add new phone music** dialog, enter the following details:

   - **Name**: Enter a name for your music file.

- **Sound file**: Select **Upload** to upload any sound file from your computer with a file size no more than 20 MB. Be sure to choose some music that loops well.

4. Select **Save and close**.

Add hold and wait music to the workstream

1. In Customer Service admin center or Omnichannel admin center, go to the voice workstreams, and then select the workstream to configure the phone music.
2. Select **Edit** next to the pencil icon, and then on the **Voice settings** page, select **Language**.
3. Select the type of hold and wait music you want the customer to hear. For example, for the primary language, you might always want to use a certain type of hold music, but for a secondary language, you might choose a different type of music.
4. When you've finished configuring the settings, select **Confirm**.

Set up a multilingual bot in Power Virtual Agents

Article • 05/22/2023

You can configure routing rules to route voice calls to appropriate agents based on the language that your customer has selected. A multilingual contact center helps you serve global customers who want to interact with your contact center in the language of their choice. You can also set up bots as the first contact who can handle such requests.

Use Bot Framework Composer in Power Virtual Agents to set up a bot for a multilingual contact center.

The process for setting up the multilingual bot in Power Virtual Agents is as follows:

1. Create a bot in Power Virtual Agents.
2. Create a topic in Bot Framework Composer.
3. Configure the greeting topic in Power Virtual Agents.
4. Configure the transfer to agent node by using the escalate topic.
5. Configure workstreams and queues.
6. Verify the multilingual bot.

Prerequisites

- You must install Bot Framework Composer locally on the computer that you'll use to configure the multilingual bot.
- Your bot must be registered in the Azure app registration page. Note the application ID. More information: Create an app registration

Create a bot in Power Virtual Agents

You'll create a bot in Power Virtual Agents by selecting the environment in which Omnichannel for Customer Service is configured. For detailed instructions, go to Create a bot.

For example, you can create a bot with the following details:

- **Name**: A descriptive name for the bot, such as **Greeter bot**.

- **Language**: The primary language for the bot, such as **English (US)**.
- **Environment**: The environment where Omnichannel for Customer Service is configured, such as **contoso-printers**.

Create a topic in Bot Framework Composer

1. In Power Virtual Agents, for the bot that you created, select **Topics** in the site map, and then in the **Topics** pane, select the dropdown arrow for **New topic**. A message appears stating that the application is trying to open Bot Framework Composer. For more information on how to navigate the Bot Framework Composer, see: Tutorial: Create a weather bot with composer.

2. Select **Open**, and on the **Import your bot to new project** dialog that appears, enter the following details:

   - **Name**: A name for the project, such as **Multilingual bot**.
   - **Location**: Select a folder on the computer.

3. In Bot Framework Composer, select **More commands** (...), select **Add a dialog**, and enter the following details:

   - **Name**: A name such as **PVA greeter dialog**.
   - **Description**: A brief description.

4. In the site map, select **BeginDialog**, select the **Add** (+) node, and then select **Send a response**.

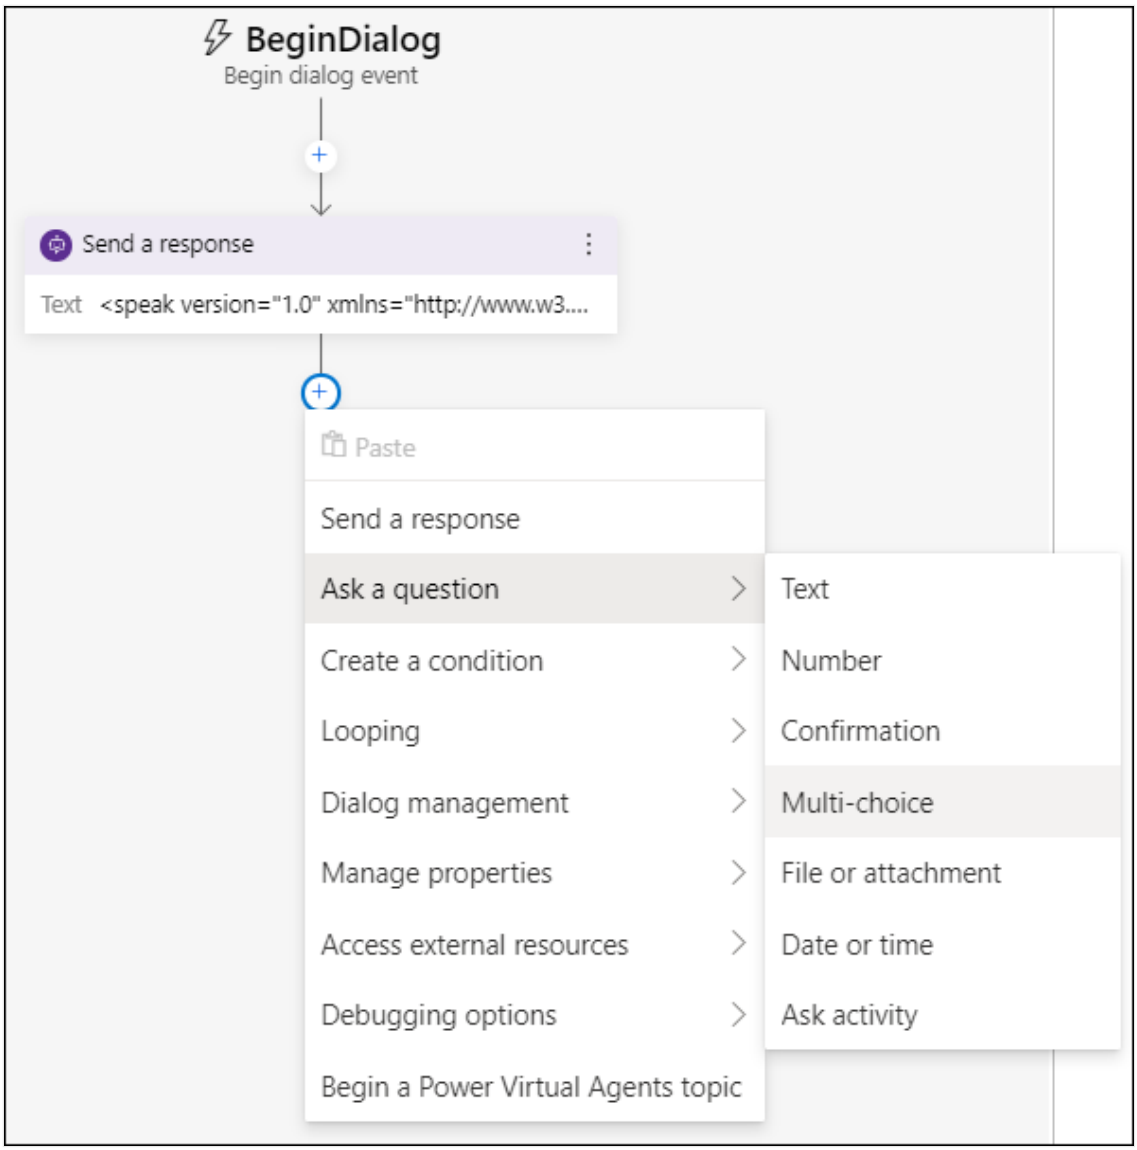
   a. In the **Bot responses** section, select the **Add** (+) node, and then select **Speech**.

   b. Select **Add alternative**, and then add the following text.

   ```
   <speak version="1.0" xmlns="http://www.w3.org/2001/10/synthesis" xml:lang="en-US"><voice name="en-US-AriaNeural"><lang xml:lang="en-US">Hello ${virtualagent.msdyn_CustomerName}. Welcome to contoso customer support.</lang></voice></speak>
   ```

   > **Note**
   >
   > The ${virtualagent.msdyn_CustomerName} variable will provide the customer name for authenticated customers only through record identification. More information: **Identify customers automatically**

c. Select the **Add** (+) node in **BeginDialog**, point to **Ask a question**, and then select **Multi-choice**.



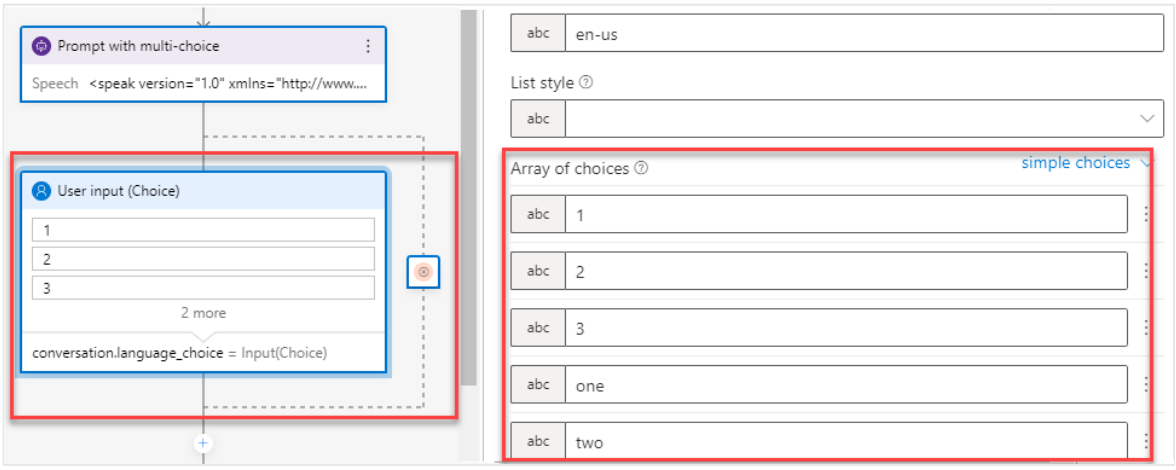
d. Repeat steps a and b to add the following text.

```
<speak version="1.0" xmlns="http://www.w3.org/2001/10/synthesis" xml:lang="en-US"><voice name="en-US-AriaNeural"><lang xml:lang="en-US">Press or say 1 for English.</lang><break strength="medium"/><lang xml:lang="fr-FR"> Appuyez ou dites 2 pour le français.</lang><break strength="medium"/><lang xml:lang="pt-PT">Pressione 3 para português.</lang></voice></speak>
```

e. Select the **User input** box, and enter the following details on the rightmost pane:

- **Property**: conversation.language_choice
- **Array of choices**: 1, 2, 3, one, two, three, un, deux, trois, um, dois, três

In **Array of choices**, specify one choice per expression.



f. Select the **Add** (+) node, select **Create a condition**, and then select **Branch Switch (multiple options)**. Enter the following details:

- **Condition**: conversation.language_choice
- **Value**: 1, 2, 3, One, Two, Three, Un, deux, trois, Um, dois, três

  Enter one choice per value.

g. Select the **Add** (+) node and then select **Manage properties** > **Set a property** and enter the following details:

- **Condition**: virtualagent.va_CustomerLocale
- **Value**: en-US

Repeat the steps to **Set a property** for fr-FR, pt-PT, hi-IN.

The value for the virtualagent.va_CustomerLocale variable will be updated with the language selected by the customer.

> ⓘ **Note**
>
> You must set the va_CustomerLocale context variable with the locale codes for the languages that you want to support. More information: **Supported locations and locale codes**

h. Select the **Add** (+) node, and then select **Begin a Power Virtual Agent topic**.

i. In **Dialog name**, select **Escalate**.

5. In the site map, select **Publish**, and then select **Publishing profile**.

   a. Select **Edit**, and then select **Login to proceed**.

   b. Select the environment and bot, and then select **Save**.

   c. Select the **Publish** bot, select the bot, and then select **Publish selected bots**.

   d. Select **Okay** .

6. In Power Virtual Agents, refresh **Topics**. You'll see the topic listed.

7. Select **Publish**.

Configure the greeting topic in Power Virtual Agents

1. In Power Virtual Agents, open the **Greeting** topic in the authoring canvas, and delete all the default messages except the trigger phrases.

2. Select **Add node** (+), and then select **Redirect to another topic**.

3. Select the greeter dialog that you created, which is, **PVA greeter dialog** in our example.

4. Save the **Greeting** topic.

Configure the transfer to agent node by using the escalate topic

1. In Power Virtual Agents, open the **Escalate** topic in the authoring canvas, and delete all the default messages except the trigger phrases.

2. Select **Add node** (+), select **End the conversation**, and then select **Transfer to agent**.

3. Optionally, in **Private message to agent**, enter the following to fetch the preferred language of the customer.

   `Customer preferred language is {x} bot.va_CustomerLocale`

4. Save the topic.

5. In the site map under **Manage**, select **Channels**, and then select **Microsoft Teams** on the **Channels** page.
6. Publish the bot with the latest content.
7. In the site map under **Manage**, select **Agent transfers**, and then select **Omnichannel** on the **Agent transfers** page.
8. On the Omnichannel pane, configure the following settings:
    - **Enable voice**: Set to **Yes**.
    - **See the environment this bot is connected to**: Select the environment in which the bot will be used.
    - **Application ID**: Enter the application ID that was generated when you registered the app in Azure.
9. Select **Add your bot**.
10. After the bot is connected, select **View details in Omnichannel**. The Omnichannel admin center page opens on a new tab and displays the details of the bot.
11. Note the bot user information that you'll need for further configuration steps.

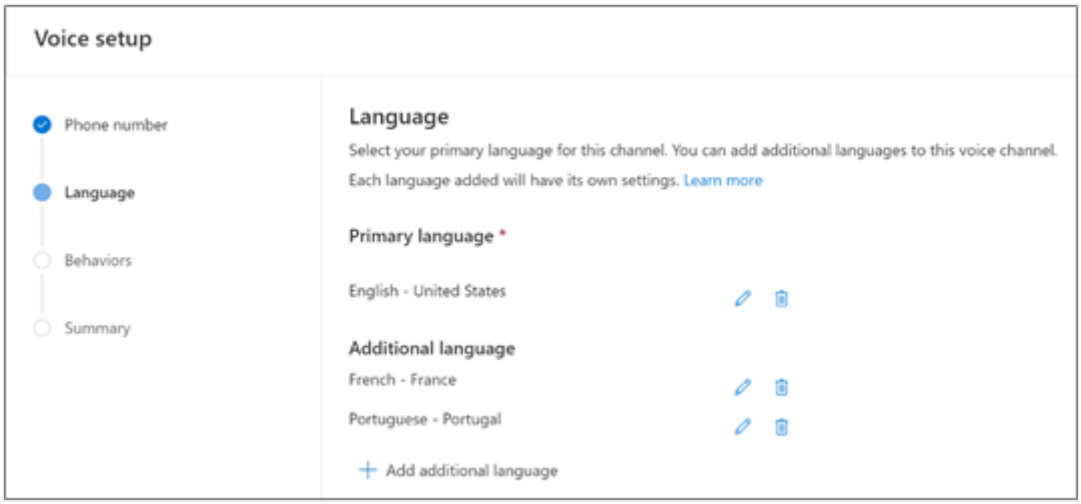
Configure workstreams and queues

Use the information in the following articles to configure a voice workstream and a voice queue, and their routing rules.

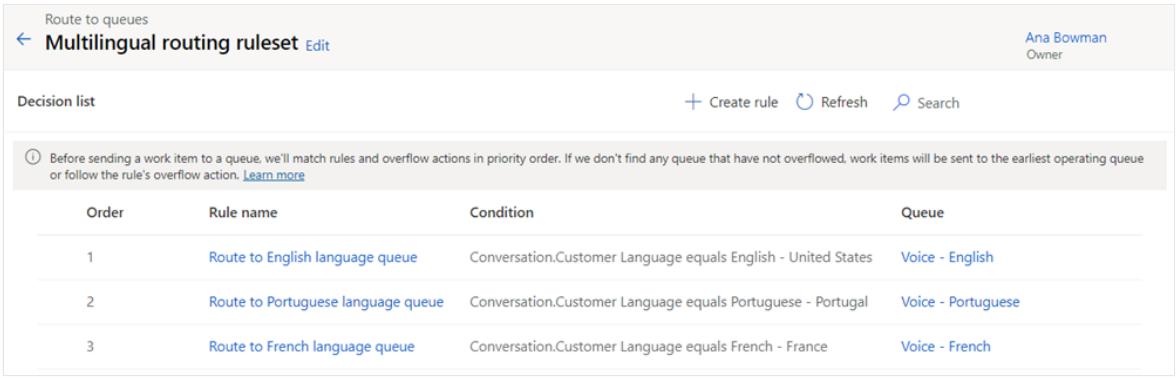
- Configure a workstream
- Configure work classification
- Configure a queue
- Configure assignment methods

For example, ensure the following settings:

1. Configure three voice queues—one each for English, French, and Portuguese—and add the required agents.
2. Configure a voice workstream with English as the primary language, and French and Portuguese as additional languages.



3. In the route to queues rule set of the workstream, use **Conversation.CustomerLanguage** as the criteria to route the incoming call to different language queues based on the option that's selected by the customer.



4. In the **Bot** area of the workstream, edit to add the Power Virtual Agents bot that you configured.

Verify the multilingual bot

1. As a customer, call the number that's registered with the voice workstream.

2. When you're prompted with an interactive voice response (IVR) message, select a language. Verify that the bot routes the call to an agent who can speak with you in the language that you've selected.

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Agents are increasingly serving global and diverse customers who speak multiple languages, so it's important that the communication tools they use be able to work across languages.

You can configure a phone number in a workstream that allows the customer to choose the language in which they speak, as well as choose the language of the bot.

Prerequisites

- Set up a phone number. More information: Manage phone numbers
- Create the queues you need for your business, based on the customer's language. For the **Type**, select **Voice**. More information: Create and manage queues
- Create a workstream. For the **Type**, select **Voice**. More information: Create and manage workstreams

Add a phone number to the workstream and configure language settings

1. In Customer Service admin center or Omnichannel admin center, go to the voice workstreams, and then select the workstream to configure the phone number.
2. Select **Edit** next to the pencil icon, and then on the **Voice settings** page, select the number to add to the workstream, and then select **Next**.
3. On the **Language** tab, select **Add primary language**. A language page is displayed, where you set the primary language for the channel. You can add additional languages to this voice channel, and each language added will have its own settings. The **Primary language** is the first language the bot uses to greet the customer. This allows your organization to have one phone number that services

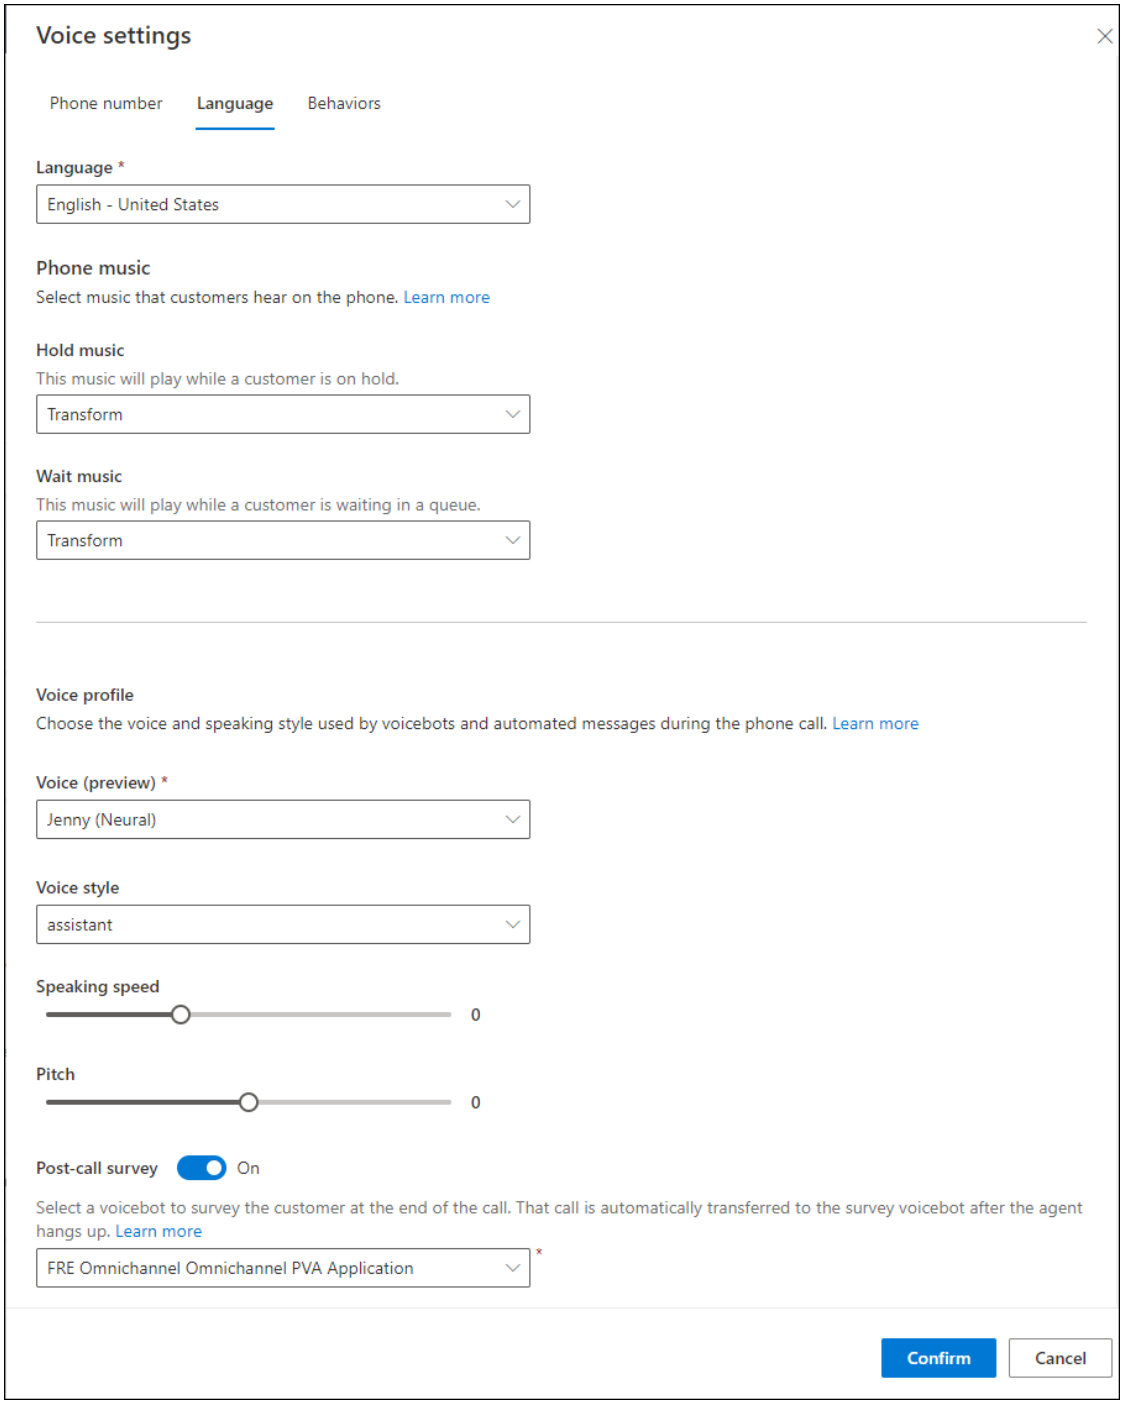
multiple languages, rather than have multiple phone numbers, each with one language, and then ask customers to call the right number.

4. Select the type of hold and wait music you want the customer to hear.

5. In **Voice profile**, select a voice, voice style, speaking speed, and pitch for the bot.

6. Turn on the **Post-call survey** toggle if you want the bot to present a survey to the customer at the end of the call. If this feature is turned on, the call will automatically get transferred to the survey bot after the agent hangs up.

7. When you've finished configuring the settings, select **Confirm**.



Create language-specific routing rules

Define the language-based routing rules. More information: Configure work classification rulesets for unified routing

Considerations

Here are a few things to consider when you configure your bots for multilingual contact center.

- The language of the bot must be the same as that of the voice workstream to which the bot will be attached.
- You can configure different geographic locales for the bot and voice workstream. For example, you can set English-UK in the voice profile and English-US in the bot.
- The bot's accuracy depends on the similarities between locales. However, if you configure different locales, the preconfigured entities for the bot, such as zipcode, might not be accurate.

Bring your own carrier

Article • 09/28/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Azure Communication Services direct routing enables you to connect your existing telephony infrastructure with Azure so that you can retain your existing carrier and phone numbers, and streamline inter-office call transfers.

Prerequisites

- Connect to an Azure Communication Services resource to bring in your carrier via direct routing. You must then set up direct routing for the connected Azure resource.
- Be familiar with the following concepts:
  - Azure Communication Services
  - Azure Communication Services direct routing
- Ensure that the following settings are in place to enable your carrier to work with Azure Communication Services.
  - Check your direct routing infrastructure requirements.
  - Get a certified Session Border Controller (SBC).
  - Connect the SBC to Azure Communication Services.
  - Ensure that the SBC responds with a Session Initiation Protocol (SIP) status code in the 100s to the invite request from direct routing. SIP status codes beginning with 4, 5, or 6 indicate failures.
  - Ensure that the phone number of your Dynamics 365 organization is encoded in E.164 format so that the calls can be forwarded by your SBC.
  - Deploy the SBC and DNS server in the same region. Azure Communication Services hosts group calls in the region where the DNS server is deployed. If the SBC and DNS server are in different regions, users can experience a delay. Ensure that your DNS server is not delegated to a sub domain.

Bring your own phone number via direct routing

1. In Dynamics 365, go to one of the admin apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Channels** in **Customer support**. The **Channels** page appears.

   b. Select **Manage** for **Phone numbers**.

2. Select **Advanced** on the menu.

3. Select **Add Number** for **Bring your own number via Azure Direct Routing**.

4. In the **Add your own phone number** dialog, enter the following details.

   - **Phone number**: Indicates the phone number that you own and have configured in your SBC.
   - **Carrier**: Indicates the carrier to which the phone number belongs. If the carrier doesn't exist yet, you can create a new record.
   - **Country/Region**: Select the country or region the phone number belongs to.
   - **Number type**: Select whether toll-free or a local phone number.
   - **Calling plans**: Select whether you can make or receive calls on the phone number.

     > ⓘ **Note**
     >
     > SMS is not supported with direct routing.

5. Select **Add number**.

The new phone number will be displayed in the **Phone numbers** list and is ready for setup. You can now connect it to a voice workstream, configure outbound calling, or even assign it to an agent.

SBC best practices

- For Microsoft Teams and Azure Communication Services direct routing, you might use the same port number, but you must use a different fully qualified domain

name (FQDN).

- To avoid call timeout, ensure that the following settings for Secure Real-time Transport Protocol (SRTP) are configured:
  - Reset SRTP Upon Re-key = Disable
  - Generate SRTP Keys = Only if Required
- Ensure that you have sufficient transcoding licenses if your service provider and Azure Communication Services don't support the same codec.

Introduction to Nuance Cloud IVR bot integration

Article • 10/27/2023

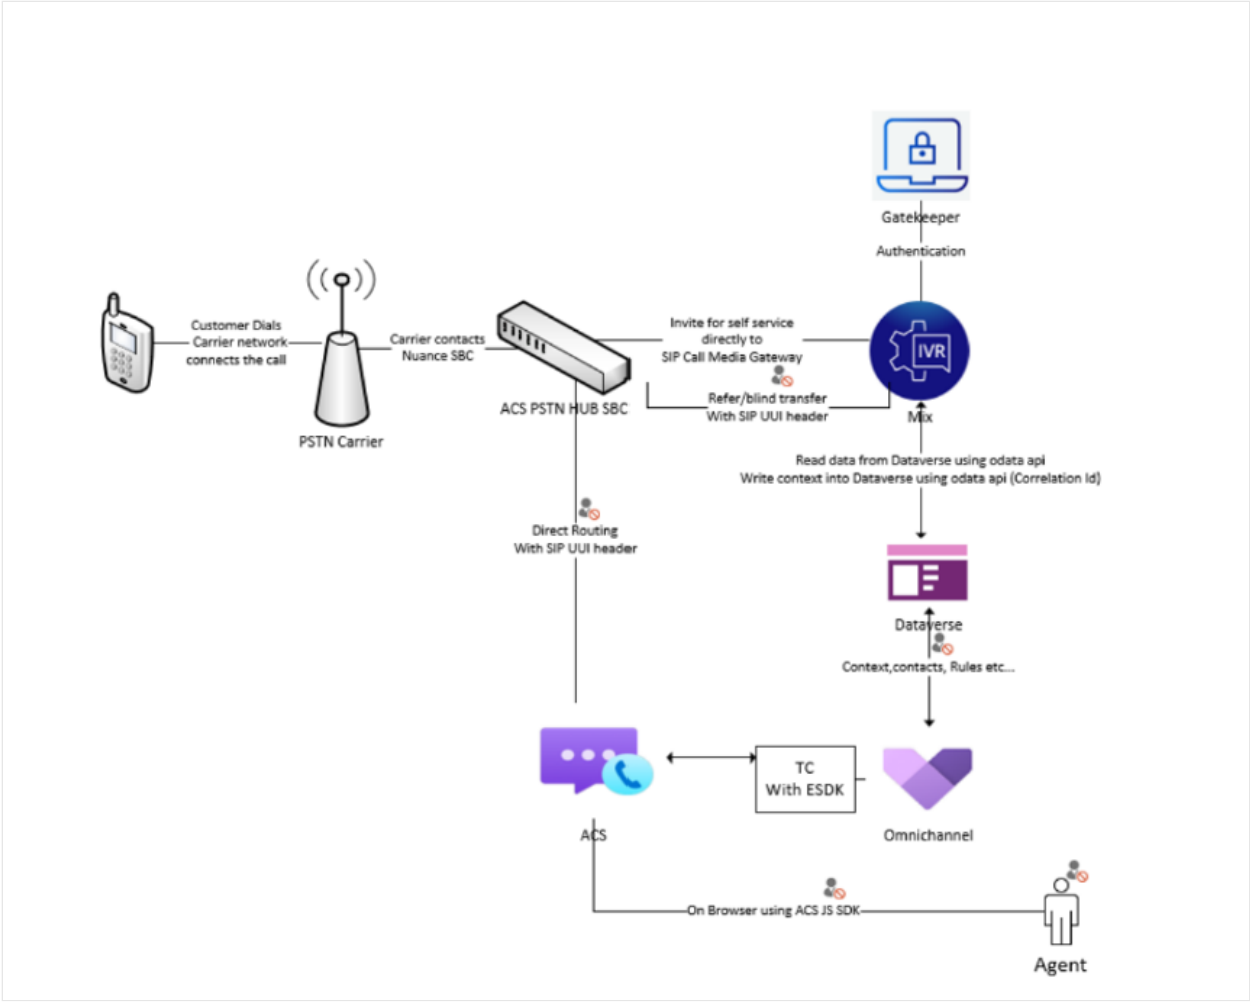
Nuance Cloud IVR bot is part of the Digital Contact Center Platform—an open, extensible, and collaborative platform for seamless omnichannel customer engagement.

The bot can be integrated with the voice channel in Omnichannel for Customer Service to enable contextual call transfers. Customers can interact with the Nuance Cloud IVR bot first and then an Omnichannel agent if the call is escalated.

How the integration works

The integration for Nuance Cloud IVR uses Azure Communication Services to route incoming calls to the Nuance Cloud IVR bot and then from the bot to the voice channel. The customer call comes in through Direct Routing or Public Switched Telephone Network (PSTN) and is routed through Nuance's Session Border Controller (SBC).

The call is then escalated to an agent through Azure Communication Services using the Session Initiation Protocol. The SIP header data is used to route the call and display details to the agent such as the IVR transcript and call intent, which are captured during the IVR session.



Next steps

Set up Nuance Cloud IVR bot integration with voice channel

Integrate Nuance Cloud IVR bot with voice channel in Customer Service

Article • 09/01/2023

Integrate the Nuance Cloud IVR bot with the voice channel using Azure Communication Services.

Prerequisites

- You must obtain an active subscription of **Dynamics 365 Customer Service Voice Channel Add-in** or **Dynamics 365 Customer Service Digital Messaging and Voice Add-in**. For more information about licenses and pricing, see the Dynamics 365 licensing guide. You can also purchase add-ins on the Microsoft 365 admin center. More information: Buy add-ons.
- Nuance Professional Services must perform the steps in Verify the domain ownership to confirm that the domain name is valid before connecting a Session Border Controller to Azure Communication Services. The Azure portal generates a value for the TXT record. Authorize the domain for the validation to succeed.

If you haven't added a domain, follow the steps in Add a new domain name. Enter staging.ivr.nuance.com or nuance.com as the domain.

Connect Azure Communication Services to voice channel

Azure Communication Services allows you to obtain phone numbers for customers to reach your business. Follow the steps in Azure resource to provision phone numbers to provision a new phone number. You can also import phone numbers or connect your existing telephony infrastructure with Azure. If you already have voice channel configured, you can skip this step.

Connect Azure Communication Services to Nuance Cloud IVR bot

Use the information in this section to set up the Nuance Cloud IVR bot as the deflection bot. Typically, Nuance Professional Services performs these steps.

Create Azure Communication Services resource

Create an Azure Communication Services resource. See: Quickstart: Create and manage Communication Services resources.

Obtain a phone number

Provision a phone number. See: Get and manage phone numbers

Enable Direct Routing

Direct Routing lets you to connect to the existing Nuance telephony infrastructure. Perform the steps in the section below to connect a supported Nuance Session Border Controller (SBC) to Azure Communication Services to enable Direct Routing.

Configure a Session Border Controller

1. Specify the **Fully Qualified Domain Name** of the SBC to be configured in Direct Routing. Follow the steps in Adding a Session Border controller to ensure that messages are exchanged between Azure Communication Services and the configured SBC.
2. Configure outbound voice routing rules for Azure Communication Services direct routing. Follow the steps in Creating Voice Routing rules to set up the voice routing rules.
3. Create an Azure Function to redirect the call from Azure Communication Services to the SBC with the following environment variables:

    - `redirectNumber`: Number that you want your incoming calls to be redirected to.
    - `dialedNumberConnectionString`: Azure Communication Services connection string for the dialed number.
    - `dialedNumber`: outbound number that your incoming calls are routed to.

4. Navigate to your Azure Communication Services number and integrate the Event Grid event type, `Microsoft.Communication.IncomingCall`, with your Azure function. You can perform one of the following actions:

    - Through the Azure portal:
        - Select **Event** and then select **Create Event Subscription**.
        - Specify the following information on the Create Event Subscription page:
            - Name

    - Event Schema: Event Grid Schema
    - Filter to Event Types: **Incoming Call (Preview)**
    - Endpoint Type: Azure Function and then specify the function you've created.

- Run the following armclient command at the prompt:

```
armclient put
"/subscriptions/[your_azure_subscription_guid]/resourceGroups/[your_resou
rce_group_name]/providers/Microsoft.Communication
/CommunicationServices/[your_acs_resource_name]/providers/Microsoft.Event
Grid/eventSubscriptions/[subscription_name]?api-version=2022-06-15" "
{'properties': {'destination': {'endpointType':
'AzureFunction','properties': {'maxEventsPerBatch':
'1','preferredBatchSizeInKilobytes': '64','resourceId': ' /subscriptions/
[your_azure_function_subscription_guid] /resourceGroups/[Your Azure
Function RG Name]/providers/Microsoft.Web/sites/[Your AzureFunction name
in Portal]/functions/[Your AzureFunction Name in your C#
code]'}},'filter': {'includedEventTypes': ['Microsoft.Communication.
IncomingCall']}}}" -verbose
```

Deploy the bot

Configure the session.xml with dynamic parameters such as **dataverse_organization_url**, **dataverse_tenant_id**, **dataverse_client_id**, **dataverse_client_secret_name**, and **dataverse_azure_key_vault_url** in Nuance IVR tools. The Nuance Cloud IVR bot is then deployed.

Set up voice channel to receive escalated calls from Nuance Cloud IVR bot

When the bot escalates a call, a record is created in the **msdyn_ocexternalcontext** table. The SIP UUI header includes the msdyn_ocexternalcontext recordID. This recordID is transferred to the Azure resource that's connected with Omnichannel for Customer Service.

The voice channel in Customer Service receives the call and the system creates a new msdyn_ocliveworkitem record. The system links the msdyn_ocexternalcontext and msdyn_ocliveworkitem tables if it finds the msdyn_ocexternalcontext recordID in the SIP UUI header.

The Omnichannel administrator must perform the actions in the following sections to route the call to the appropriate agent and display the bot conversation transcript on the **Active Conversation** form.

Set up routing rules and configure rulesets

Create a new work classification rule to classify the incoming call, match the call intent to the agents' skills, and route it to the appropriate queue and agent.

1. In Customer Service admin center, select a workstream, and follow the steps to Configure work classification rulesets
2. In the **Conditions** area, select **Add related entity** and then select **External Context** from the **Many to One group**, and then select **Contains Data**. Specify the call intent.
3. Configure a new rule set for Route to Queues, creating a queue for that skill. More information: Configure route-to-queue rules.

Customize Active Conversation form to view transcripts

Customize the conversation form for agents to view the transcripts from Nuance Cloud IVR bot on the Active Conversation form in Customer Service workspace.

1. In Power Apps, select the environment that contains your solution
2. Select **Tables**, select the **Conversation** table, and then select the **Forms** area.
3. Select the required form.
4. On the left navigation pane, select **Components**.
5. Select **CC_Transcript_Control** in the list of available components. This component is available out-of-the-box.
6. Specify the required **TableName** and **TableColumn** in **CC_IsExternalContext**.
7. Save and publish the form. The form on the application UI displays the transcript from the IVR.

You can use a web resource to disable the transcript from being displayed if a transcript of the bot conversation isn't available. More information: Create a JavaScript web resource.

Use the following sample code to disable the transcript from being displayed:

```
    export class FormWebResource {
    public static async onFormLoad(context: XrmClientApi.EventContext):
Promise<void> {
```

```
    var formContext = context.getFormContext();
    formContext.tabs.get("<Your form tab name>").sections.get("<Your section
name>").setVisible(false);
   }
  }
```

Define field requirements for call intent

Nuance Professional Services can extend the **msdyn_ocexternalcontext** to include additional customer metadata that is added to the context of the Nuance IVR application. They must modify the payload file to include the newly added fields.

See Create and edit columns in Dataverse to extend the table.

View IVR transcripts

When an agent accepts a call that's been transferred from the Nuance Cloud IVR bot, the Customer Summary page displays the complete information about the customer, along with the conversation transcript of the steps taken by the IVR to resolve the customer issue.

The app displays an error message if there's no data or partial customer data.

Integrate a third-party IVR system with voice channel

Article • 09/28/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Azure direct routing lets you integrate a third-party interactive voice response (IVR) system with Omnichannel for Customer Service voice channel, and perform a contextual call transfer between them.

Prerequisites

Before you proceed with this section, you must be familiar with the following concepts.

- Azure direct routing
- Azure direct routing infrastructure requirements
- Session Border Controllers and voice routing

Set up contextual call transfer using Azure direct routing

This section lists the high-level steps you must perform to enable contextual call transfer between a third-party IVR system and the voice channel.

1. Set up Azure direct routing and connect a Session Border Controller (SBC), which is linked to the third-party IVR system, with Azure Communication Services resource, which is in turn connected to Omnichannel for Customer Service.

2. Follow the steps in the section Bring your own phone number to register the phone number that's assigned to the third-party IVR system with Omnichannel for Customer Service.

3. To transfer a call from the IVR system, issue an SIP (Session Initiation Protocol) INVITE request to the Azure Communication Services resource that'll transfer the call to the Azure resource that's connected to Omnichannel for Customer Service.

4. To include context in the payload, populate the SIP UUI (User-to-User Information) header with context data: "User-to-User": "param1=value1;param2=value2". For SIP UUI header with context data, the following formats are supported:

- Plain text or string. Seperate the key value pairs by a semicolon. For example, *"sipkey1=sipval1;sipkey2=sipval2"*
- Hex encoding format. Specify the encoding key word. For example, *"7369706B6579313D73697076616C313B7369706B6579323D73697076616C32;encoding=hex"*

5. Create context variables with the same names as the SIP UUI header.
   a. In Customer Service admin center, go to **Customer support** > **Workstreams**. If you're using Omnichannel admin center, go to **General settings** > **Workstreams**. A list of workstreams including voice workstreams is displayed.
   b. Select a voice workstream and then select **Edit** to configure the workstream.
   c. In the **Advanced settings** area, select **Add context variable**.
   d. In the **Edit** dialog that opens, select **Add**, and then select **Add context variable**.
   e. Enter the values for **Name** and **Type**. Ensure that the names of the context variables match exactly with the param names in the SIP UUI header.
   f. Select **Create**.

   The SIP UUI payload is automatically converted into context data that can be used in the voice channel for routing and to show relevant information to the agent.

You can now call the phone number assigned to the third-party IVR system and achieve a contextual call transfer with the voice channel.

> ⓘ **Note**
>
> Call record and transcriptions from the third-party IVR call with the customer aren't available for agents.

Call a customer

Article • 09/22/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

To be able to call customers, your administrator must configure outbound calling, add you as user to the outbound capacity profile, and then set up outbound profiles. More information: Outbound calling

1. In Customer Service workspace or Omnichannel for Customer Service, go to **Contacts**, and then select a customer to call.
2. On the **Active Conversation** page, locate the **Mobile Phone** field, and then select the call icon to call the customer. You can also select the **Launch dialer** phone icon on the menu bar to quickly call a customer. The **Dial number** panel appears. You can perform the following actions:

    - On the dial pad, you can copy, type in a number, or select a number from the recently dialled numbers. The country code dropdown displays the list of supported countries and regions that you can call. You can also view and call from the most recently dialed called numbers. By default, the last 20 calls that you've received or made are displayed.
    - In the profile dropdown, the outbound profile and the phone number that you're using to make the call is displayed. This is the outbound calling number that is displayed on the customer's phone when they receive your call.
    - You can call those phone numbers only whose regions are configured in the outbound profiles.
    - The dropdown displays the list of supported countries and regions from all the outbound profiles assigned to you.
    - When you enter the number you'd like to call, the application identifies the outbound profile that has the dialed number's country or region configured.
    - By default, the number pad is hidden. To display the number pad, select the number pad icon.

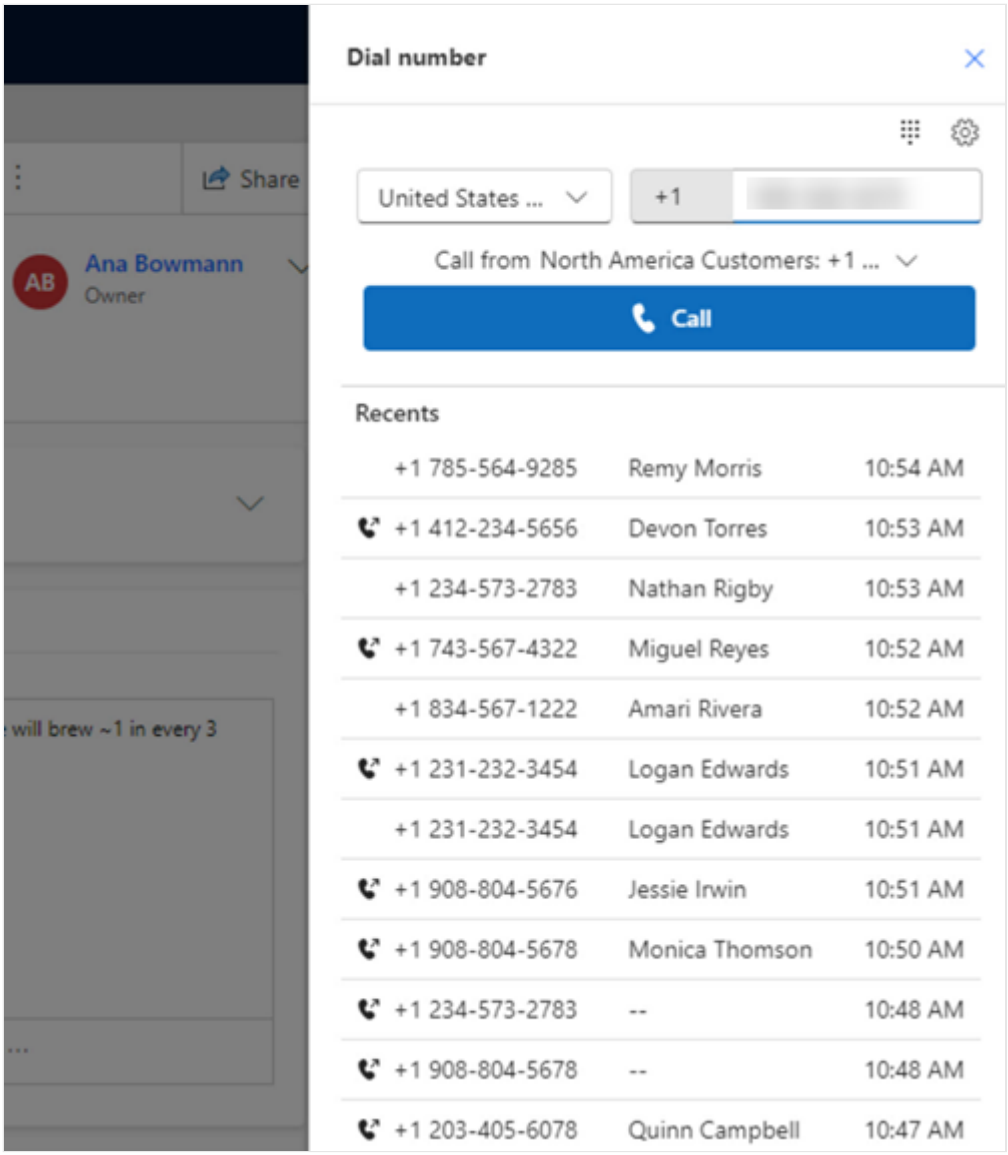
    > ⓘ **Note**

- The enhanced outbound dialer is an early access feature. You can opt in early to enable these features in your environment, which will allow you to test these features and then adopt them across your environments. For information about how to enable these features, see **Opt in to early access updates**.
- Your administrator must also enable the **Enhanced outbound dialer experience** setting definition in Power Apps.

If your administrator hasn't enabled the early access feature, when you call a customer, on the number pad that appears, enter the customer's country code, phone number, and then select **Call** to make your call. You don't have to add the plus sign (+) to the number.

3. Select **Call**.

> **Note**
>
> If you aren't assigned an outbound profile, you won't be able to make a call.



When the call connects, you see the customer details on the conversation page. Based on your outbound calling profile, the transcription and recording starts. If your capacity profile has a limit of one outbound call at a time, you can't make another call when a call is in progress.

> **Note**
>
> If you need more trial minutes or phone numbers, we recommend that you file a request with Microsoft Support.

Next steps

Use agent dashboard and call controls in the voice channel

Article • 09/04/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

The voice channel in Omnichannel for Customer Service is integrated directly with Dynamics 365 by way of the agent dashboard. The dashboard offers you a consolidated view of the calling interface, the customer summary, case history, and timeline. The dashboard helps you provide quick, effective, and proactive solutions to customer issues. The agent experience in the voice channel is similar to the chat and other channels, which reduces agent training time and costs.

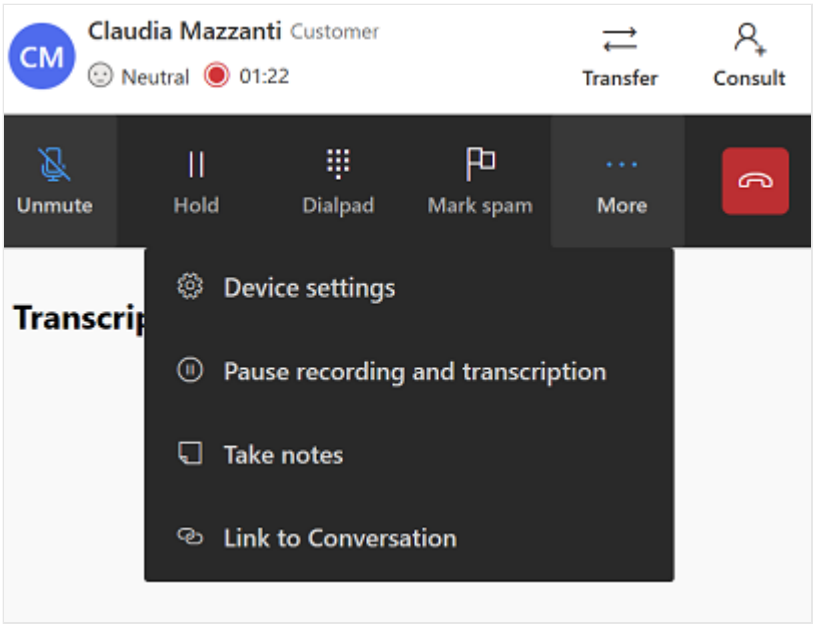
Make and receive customer calls

You can call a customer by using the phone dialer on the **Active Conversation** page or the **Launch dialer** button on the menu. More information: Call a customer

When a customer calls your business, an intelligent bot receives the incoming call. The bot gathers basic information about the customer issue and then transfers the call to you for further action. You'll receive a notification about the incoming call on your agent desktop so you can accept it. The following section describes the call controls and other features you can use during your conversation.

Call controls

The conversation panel in the agent dashboard includes the following call controls that you can use when you call or answer phone calls from customers.



- **Mute**: Mute your microphone so your voice isn't audible to the customer.
- **Hold**: Put the customer on hold; the customer will hear the hold music. You can keep only one caller on hold at a time.
- **Consult**: Select this option to consult with a participant. You can consult with or bring another agent or supervisor into the call. You can have a *public* consultation, where the customer is actively involved in the conversation. Or you can have a *private* consultation, where you can put the customer on hold before you talk to your peers or supervisor.

  > ⓘ Note
  >
  > When you initiate a consult, you are the primary agent and the new participant has a consult role. Select **Transfer** next to the participant to transfer the call to the consulting agent or supervisor. Once the call is transferred, you are the consulting agent and can leave the call without ending the call. The consulting agent becomes the primary agent. If the primary agent leaves the call, the call will end for the customer.

- **Transfer**: Select this option is to transfer the call to an agent, queue, a Teams user, or an external phone number. After you transfer the call, the agent to whom the call is transferred is the primary agent and you'll no longer be on the call. During a transfer to the queue, the customer is automatically put on hold. When you transfer a call to another agent, your number is displayed on the caller ID. The transcription and recording of transferred calls will continue if the administrator has enabled the option. You can disable recording from the dashboard. See: Transfer and consult scenarios

- **End**: End the call.
- **Dialpad**: Select this option to dial an extension number. If you must use the dial pad to send a response while navigating an IVR, select the dial pad icon next to the external participant in the participant list.
- **Mark spam**: Report the incoming call as spam. If you happened to accidentally mark a number as spam, you can select the **Unmark as spam** option.
- **Device settings**: Configure your microphone and speaker settings.
- **Take notes**: Make note of important information or specific details from your conversation with the customer. It's in addition to the call recording and transcription that happen during the conversation.
- **Pause recording and transcription**: If you don't want to capture some details of the conversation—such as bank details, billing, or payment information—you can temporarily pause the transcription and resume it later.
- **Knowledge Articles**: Get a list of knowledge base articles pertaining to the conversation that you can use to resolve the customer issue.
- **Link to conversation**: You can link another conversation, case, customer, or knowledge article to the conversation.

  > ⓘ Note
  >
  > The **Link to conversation** button is disabled after you end the voice call. Open account or contact on a new tab and select **Link to conversation** to link record (customer or case) to conversation.

- **Transcription**: When the transcription and recording service is enabled by your administrator, the conversation between you and the customer is automatically transcribed in real time, which means that you as an agent don't need to take notes during the call. This feature also helps your supervisor or agent (in a call transfer) to see the call history.
- **Sentiment analysis**: The transcript also powers *live* sentiment analysis. This means that you or your supervisor can instantly view and gauge the customer's mood and feeling via the sentiment icons.

Report a phone number as spam

You can report a phone number as a spam call while you're on the call by using the call controls on the conversation panel. A notification is then sent to your administrator for review and further action.

To report a phone number as spam, select **Mark spam**.

You can add notes to help your administrator review and block numbers. After you mark a number as spam, it goes into the pending review tab on the **Blocked numbers** page.

How to avoid call disconnection

Avoid the following actions to prevent call drops:

- Refresh your browser or select browser bookmark icons when you're in an active call. When you select refresh, and select leave on the confirm refresh dialog, the page will unload and you'll be disconnected from the call. The customer will hear hold music until you rejoin the call from the **My work items** section of **Omnichannel Agent Dashboard**. If you're disconnected from your browser for more than 90 seconds the call is reassigned to another agent in the queue. The call won't be reassigned if you reconnect within 90 seconds.
- Open other apps that will need access to the microphone. It will result in loss of your audio connection, and the customer won't be able to hear you.
- Open the Customer Service workspace or Omnichannel for Customer Service app in more than one tab in the browser. It causes issues in agent presence.
- Close the session directly to end call. If you do, the conversation moves from active to wrap up. Then if you close the session, the state goes from wrap up to closed. So, we recommend that you go through the conversation status route and select the **End** button and then close the session to take care of the wrap-up activities.

Best practices

- Make sure that you have enabled notifications, and audio and video options in the browser.
- When your shift ends, ensure that you sign out and close your browser through which you access Customer Service workspace. Doing so helps avoid work items being incorrectly assigned to you.
- When you face network or hardware issues, the application displays error or warning messages on the communication panel. Use the information in the messages to resolve the problems. More information: Use diagnostic messages to troubleshoot call issues

  > ⓘ Note
  >
  > When you initiate a consult, you are the primary agent and the new participant has a consult role. Select **Transfer** next to the participant to transfer the call to the consulting agent or supervisor. Once the call is transferred, you are the consulting agent and can leave the call without ending the call. The consulting agent becomes the primary agent. If the primary agent leaves the call, the call will end for the customer.

- **Transfer**: Select this option is to transfer the call to an agent, queue, a Teams user, or an external phone number. After you transfer the call, the agent to whom the call is transferred is the primary agent and you'll no longer be on the call. During a transfer to the queue, the customer is automatically put on hold. When you transfer a call to another agent, your number is displayed on the caller ID. The transcription and recording of transferred calls will continue if the administrator has enabled the option. You can disable recording from the dashboard. See: Transfer and consult scenarios

- **End**: End the call.
- **Dialpad**: Select this option to dial an extension number. If you must use the dial pad to send a response while navigating an IVR, select the dial pad icon next to the external participant in the participant list.
- **Mark spam**: Report the incoming call as spam. If you happened to accidentally mark a number as spam, you can select the **Unmark as spam** option.
- **Device settings**: Configure your microphone and speaker settings.
- **Take notes**: Make note of important information or specific details from your conversation with the customer. It's in addition to the call recording and transcription that happen during the conversation.
- **Pause recording and transcription**: If you don't want to capture some details of the conversation—such as bank details, billing, or payment information—you can temporarily pause the transcription and resume it later.
- **Knowledge Articles**: Get a list of knowledge base articles pertaining to the conversation that you can use to resolve the customer issue.
- **Link to conversation**: You can link another conversation, case, customer, or knowledge article to the conversation.

  > ⓘ Note
  >
  > The **Link to conversation** button is disabled after you end the voice call. Open account or contact on a new tab and select **Link to conversation** to link record (customer or case) to conversation.

- **Transcription**: When the transcription and recording service is enabled by your administrator, the conversation between you and the customer is automatically transcribed in real time, which means that you as an agent don't need to take notes during the call. This feature also helps your supervisor or agent (in a call transfer) to see the call history.
- **Sentiment analysis**: The transcript also powers *live* sentiment analysis. This means that you or your supervisor can instantly view and gauge the customer's mood and feeling via the sentiment icons.

Report a phone number as spam

You can report a phone number as a spam call while you're on the call by using the call controls on the conversation panel. A notification is then sent to your administrator for review and further action.

To report a phone number as spam, select **Mark spam**.

You can add notes to help your administrator review and block numbers. After you mark a number as spam, it goes into the pending review tab on the **Blocked numbers** page.

How to avoid call disconnection

Avoid the following actions to prevent call drops:

- Refresh your browser or select browser bookmark icons when you're in an active call. When you select refresh, and select leave on the confirm refresh dialog, the page will unload and you'll be disconnected from the call. The customer will hear hold music until you rejoin the call from the **My work items** section of **Omnichannel Agent Dashboard**. If you're disconnected from your browser for more than 90 seconds the call is reassigned to another agent in the queue. The call won't be reassigned if you reconnect within 90 seconds.
- Open other apps that will need access to the microphone. It will result in loss of your audio connection, and the customer won't be able to hear you.
- Open the Customer Service workspace or Omnichannel for Customer Service app in more than one tab in the browser. It causes issues in agent presence.
- Close the session directly to end call. If you do, the conversation moves from active to wrap up. Then if you close the session, the state goes from wrap up to closed. So, we recommend that you go through the conversation status route and select the **End** button and then close the session to take care of the wrap-up activities.

Best practices

- Make sure that you have enabled notifications, and audio and video options in the browser.
- When your shift ends, ensure that you sign out and close your browser through which you access Customer Service workspace. Doing so helps avoid work items being incorrectly assigned to you.
- When you face network or hardware issues, the application displays error or warning messages on the communication panel. Use the information in the messages to resolve the problems. More information: Use diagnostic messages to troubleshoot call issues

Manage voicemails

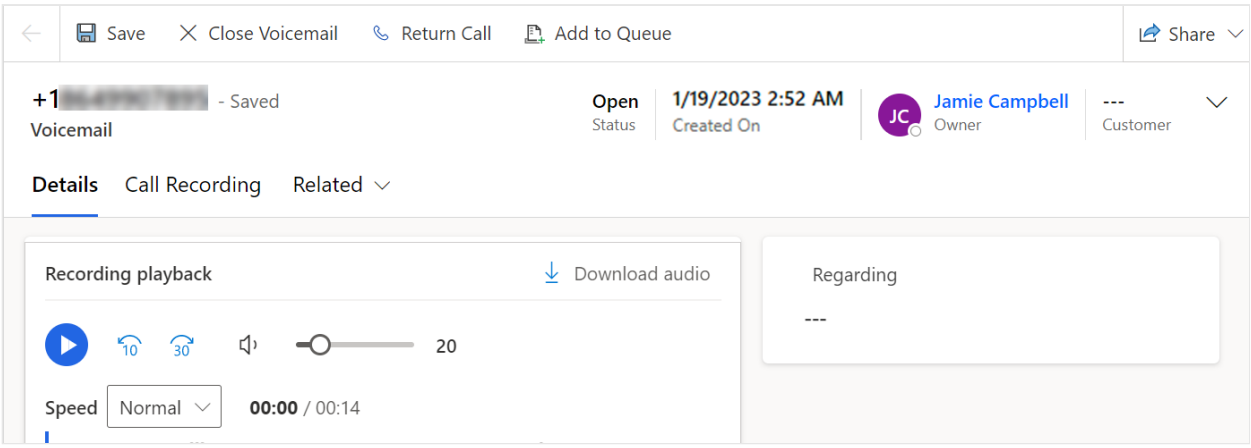
Article • 02/02/2023

As an agent, you can access the voicemails recorded by customers on your direct inward dial number or through work items that have been routed to you.

Manage the voicemails that you receive

You can view the voicemails in one of the following ways:

- On the **Customer Service Agent Dashboard**, in **My Open Activities**, select the vertical ellipses, and then select **Other Activities** > **Voicemail**.
- On the **Omnichannel Agent Dashboard**, in **Open work items**, select the vertical ellipses for your number, and then select **Assign to me**.
- If an inbox is configured for you, you can view the assigned and unassigned voicemails. Go to your inbox, and select **Assigned voicemails**, and then select the voicemail that you want to hear. If you access an unassigned voicemail and then close it, you won't be able to access it again.



You can do the following tasks for the voicemail that you open:

- **Regarding**: Set the regarding of the voicemail.
- **Customer**: If the customer isn't automatically identified, set the customer of the voicemail.
- **Save**: Save changes to the voicemail. Some settings require an explicit save action.
- **Close Voicemail**: Moves the voicemail to the closed state.
- **Return Call**: Displays a dialer with the customer number automatically filled in if you have outbound profiles configured. More information: Outbound profiles
- **Add to Queue**: Add the voicemail to a different queue. If the voicemail is routed to a pick workstream, it will be available as a pick item in the new queue. If the

voicemail is routed to a push workstream, it will be assigned to an agent in the new queue.

- **Call Recording**: Select the tab to view the original voice call recording that preceded the voicemail. If the call goes straight to voicemail and the customer didn't talk to a bot, a recording or transcript won't be available on this tab. Additionally, if your voice workstream was set to have transcription only and the customer talked to a bot, you won't see a call recording here, only the transcript will be available.
- **Download audio**: Select to download the voicemail.
- **Share**: Select to email or copy the link to the voicemail. You can also manage the user access to the voicemail.

Transfer calls and consult with users in the voice channel

Article • 08/23/2023

You can transfer calls or consult with other agents or supervisors to collaborate with them on questions that you might have when you're on a call with a customer.

To familiarize yourself with the call controls, see Understand how to use the agent dashboard and call controls.

How you can transfer calls

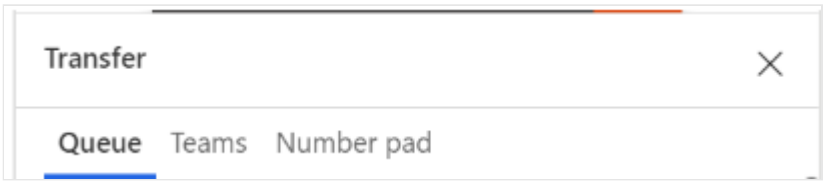
When you receive an incoming call, you can transfer the call to an agent, a queue, a public switched telephone network(PSTN) Teams user, or an external PSTN number. After you transfer the call, the following actions occur:

- The customer is automatically put on hold. Hold music plays for the customer.
- The primary agent must manually remove the customer from hold.

Transfer the call

1. Select **Transfer** in the call window.

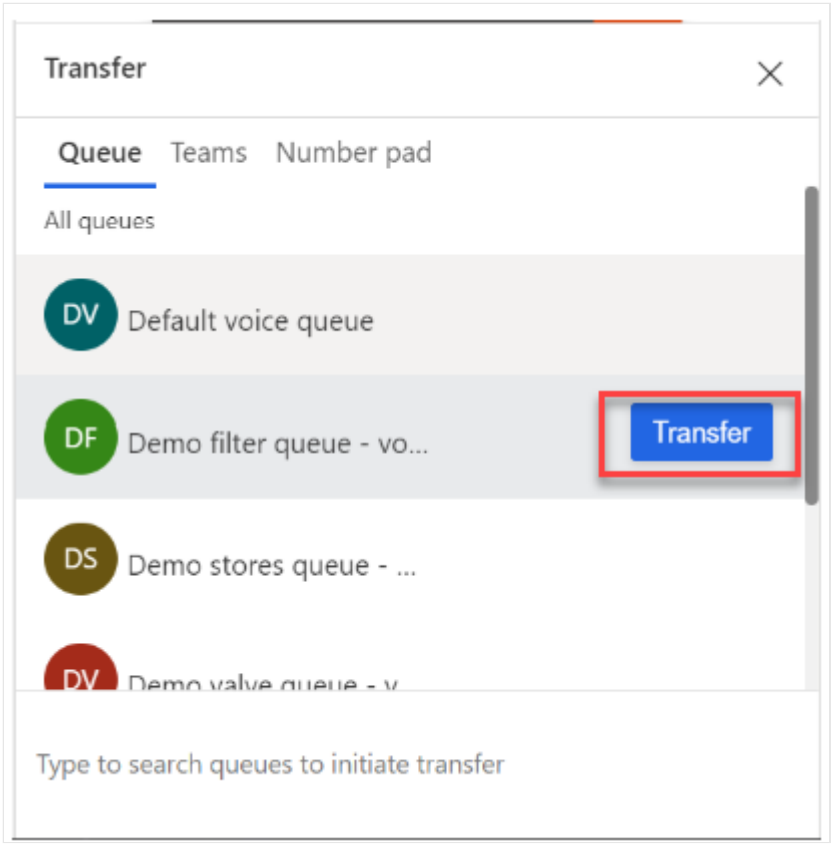
   The **Transfer** dialog box appears. The **Queue**, **Teams**, and **Number pad** tabs are displayed.



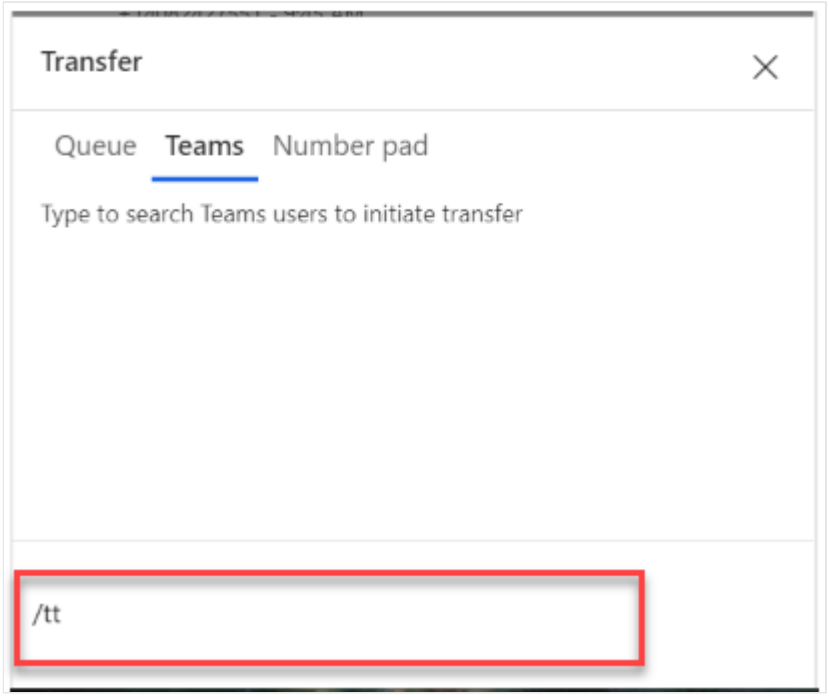
2. Based on your requirement, perform one of the following steps.

   - **Transfer to a queue**: Select **Queue**, search for the queue you want to transfer the call to, and then select **Transfer**. The customer is put on hold. The agent who picks up the transferred call will become the primary agent and you will

become the secondary agent and will be removed from the call. The primary agent must manually remove the customer from hold.



- **Transfer to an external PSTN number**: Select **Number pad**. On the number pad that appears, enter the customer's country code, phone number, and then select **Call** to make your call.
- **Transfer to Teams user via PSTN**: Select **Teams**, and use the search option to search for a Microsoft Teams user. The results are filtered based on the name and the live presence of the users in Microsoft Teams.



If you've selected either the external PSTN number or Teams to transfer the call, you can talk to the secondary agent who picks up the call, while the customer is on hold. To complete the call transfer, you must select the transfer button next to the secondary agent name in the call window. The secondary agent is now the primary agent and you will be removed from the call. However, the secondary agent is disconnected from the call if the transfer is not completed by primary agent within eight minutes.

> **Note**
>
> The call recording and transcript of the conversation with the Teams user is saved in the application for reporting and compliance.

How you can use consult to collaborate with other agents or supervisors

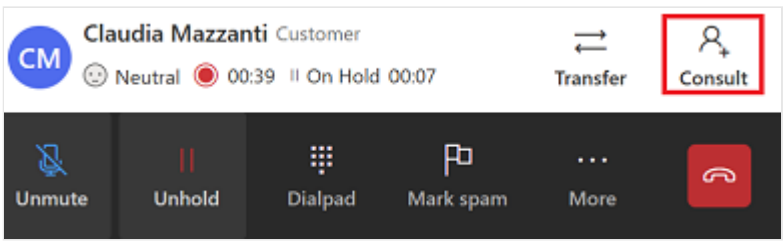
You can collaborate with another agent, a supervisor, or an external participant (PSTN number or a Teams PSTN number) by using the consult option.

When you initiate a consult, the following actions occur:

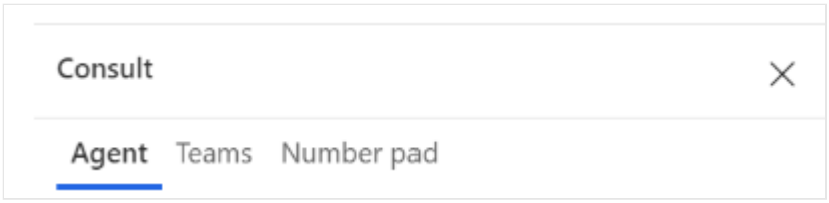
- You are the primary agent.
- The customer is automatically put on hold. Hold music plays for the customer.
- When the invited collaborator joins the call, they have a consult role.
- The primary agent must manually remove the customer from hold. During a consult, the primary agent can choose to transfer the call to the new participant.
- If the primary agent ends the call, the call will end for everyone.
- If the primary agent refreshes their browser, all the participants will be on hold until the primary agent returns to the call.

Consult with another user

1. Select **Consult** in the call window.

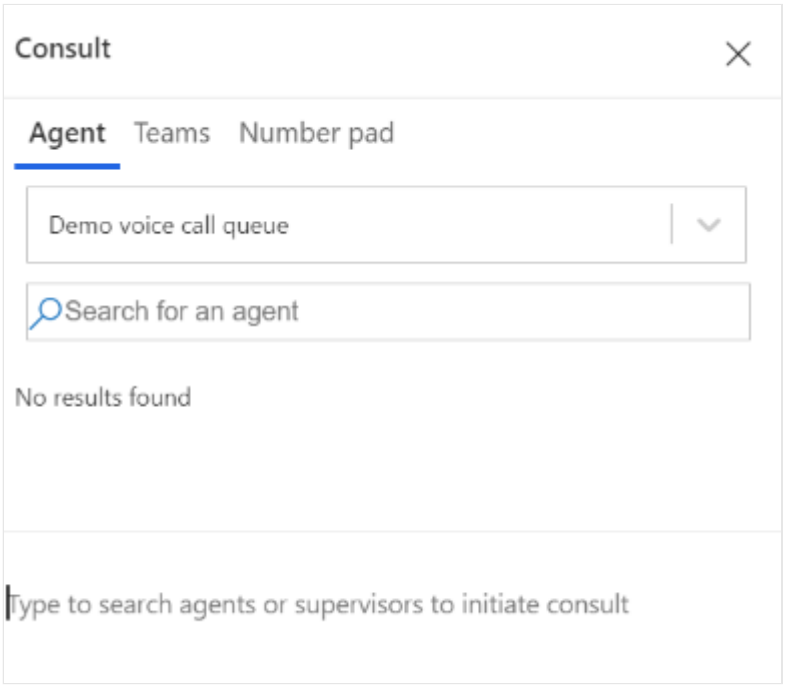


The **Consult** dialog box appears. The **Agent**, **Teams**, and **Number pad** tabs are displayed.



2. Based on your requirement, perform one of the following steps. 4

- **Consult with an internal agent or supervisor**: Select **Agent**. You can either have a call or chat with an internal agent. Select the conversation channel and then search for the agent you'd like to consult with.

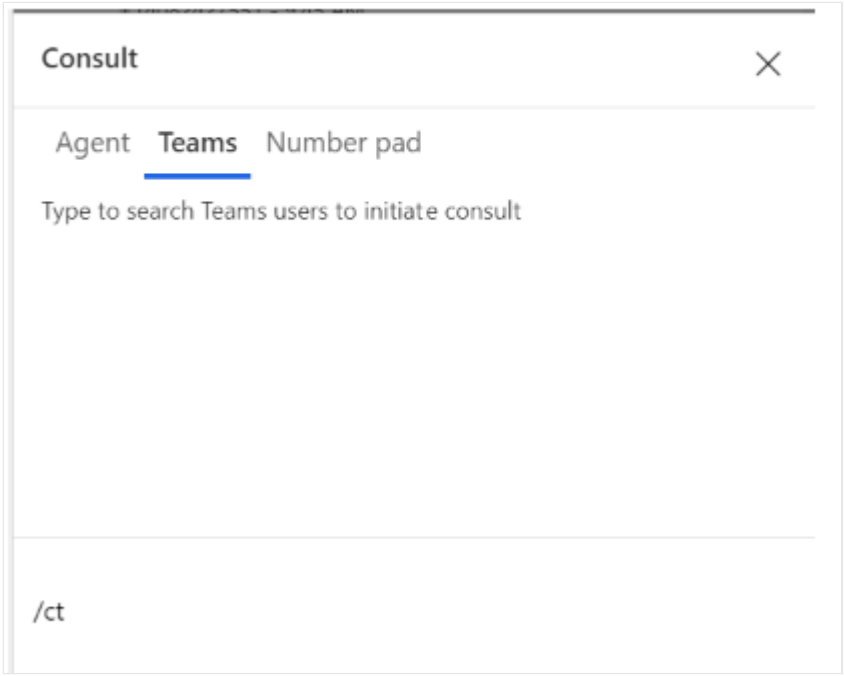


- **Consult, then transfer**: The primary agent who initiated the consult can transfer the call to any participant involved in the consult. To transfer a conversation to the consulting agent in the conversation, perform the following steps:
  - If the consult is with an external participant (PSTN or Teams through PSTN), select **Transfer** next to the external phone number in the call window.
  - If the consult is with an internal agent or a supervisor, select **Transfer** on the call controls. See: Call controls
  - After the call is transferred, the primary agent becomes the consulting agent and can leave the call without ending the call. The consulting agent becomes the primary agent. If the primary agent leaves the call, the call will end for the customer.

- **Consult with external PSTN number**: Select the **Number Pad**. On the number pad that appears, enter the customer's country code, phone number, and then select Call to make your call. By default, the consultation is private, the

customer is on hold while the primary agent speaks with the new participant. You can also have a public consultation, where the customer is actively involved in the conversation.
To make the consultation public, select **Hold** to put the call on hold. When the secondary agent has joined the conversation, remove the customer from hold to continue the consultation.

- **Consult with Teams user with PSTN**: Select **Teams** and use the search option to search for and select the Microsoft Teams user you'd like to consult with.
  See: Enable voice consult with Microsoft Teams users



The call recording and transcript of the conversation with the Teams user is saved in the application for reporting and compliance.

View call recordings and transcripts

Article • 08/02/2023

If your administrator has enabled the option to view call recordings and transcripts, when conversations between agents and customers end, both supervisors and agents can view the recordings and transcripts of those conversations, play back the recordings, and view the sentiment analysis and other analytics related to the conversations.

> ⓘ **Note**
>
> Many countries and states have laws and regulations that apply to the recording of public switched telephone network (PSTN), voice, and video calls, and may require that users first consent to the recording of their communications. It is your responsibility to use the call recording capabilities in compliance with the law. Before using call recording features, you must obtain consent from the parties of recorded communications in a manner that complies with all applicable laws for each participant.

Introduction

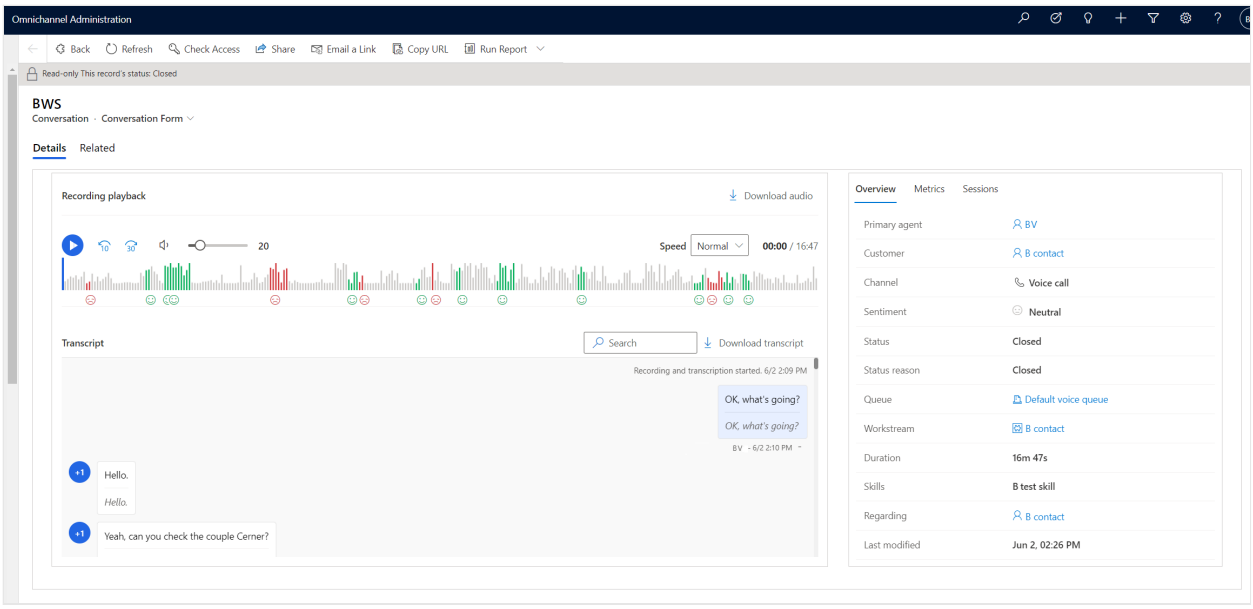
As an agent, you can access the recordings and transcripts for completed calls by accessing the closed conversations in one of the following ways:

- If the form selector is available, on your session window, select the dropdown button for **Active Conversation** and select **Closed Conversation**.
-
- Select the name of the contact, and then in the **Timeline** section, hover the mouse over the closed conversation that you want to view, and then select the **Open Record** icon.

> ⓘ **Note**
>
> Users with the System Administrator role can access conversations that are handled by other agents.

Call recording and transcript controls

The **Details** tab of the **Conversation - Conversation Form** displays the call recording details.



Recording playback

- **Play**: Select the button to listen to the conversation audio.
- **Rewind** or **Fast-forward**: Select the buttons to either rewind in 10-second increments or fast-forward in 30-second increments.
- **Volume**: Move the slider to adjust the volume to your desired level.
- **Download audio**: Download an .mp4 audio file of the complete conversation.
- **Speed**: From the dropdown menu, select the playback speed of the conversation, whether slower or faster. **Normal** is the default, and is the speed in which the conversation was recorded.
- **Conversation scroll bar**: Move the scroll bar to any point of the conversation, or listen to it from beginning to end. When you select a location in the recording visualization, the transcript also moves to same place in the conversation.
- **Sentiment**: Colors and emojis help you quickly analyze the sentiment of the conversation. Green indicates positive sentiment, red indicates negative sentiment, and grey indicates neutral sentiment.

Transcript

- **Search**: Enter keywords in the search field to locate desired sections of conversation.

- **Download transcript**: Open an HTML file of the conversation transcript in your browser.

> **Note**

> Inline images and rendering of videos is not supported in downloaded transcripts.

The **Overview** section of the Conversation Form displays the following details:

- **Primary agent**: The name of the agent who conducted the call.
- **Customer**: The name of the customer the call was with.
- **Channel**: The type of communication conducted.
- **Sentiment**: The average sentiment of the call.
- **Status**: The state of the communication.
- **Status reason**: The reason for the status of the call.
- **Queue**: The queue the call was conducted in.
- **Workstream**: The workstream the call was conducted in.
- **Duration**: The total amount of time of the call, from start to finish.
- **Skills**: The list of agent skills.
- **Regarding**: The link to the customer record.
- **Last modified**: The date and time that the call was last edited.

The **Metrics** tab of the Conversation Form displays the following details:

- **Talking speed**: The rate of speed in which participants conversed during the call.
- **Talk to listen ratio**: The ratio in which the agent spoke versus listened to the customer.
- **Average pause**: The average amount of time in which the conversation was paused.
- **Longest customer monologue**: The longest amount of time that the customer spoke during the conversation.
- **Switches per conversation**: The number of times the conversation switched from agent to customer, and vice versa.

The **Sessions** tab displays details about the number of voice calls between the agent and the customer, and the duration, date, and time of the conversation.

Monitor calls

Article • 02/16/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

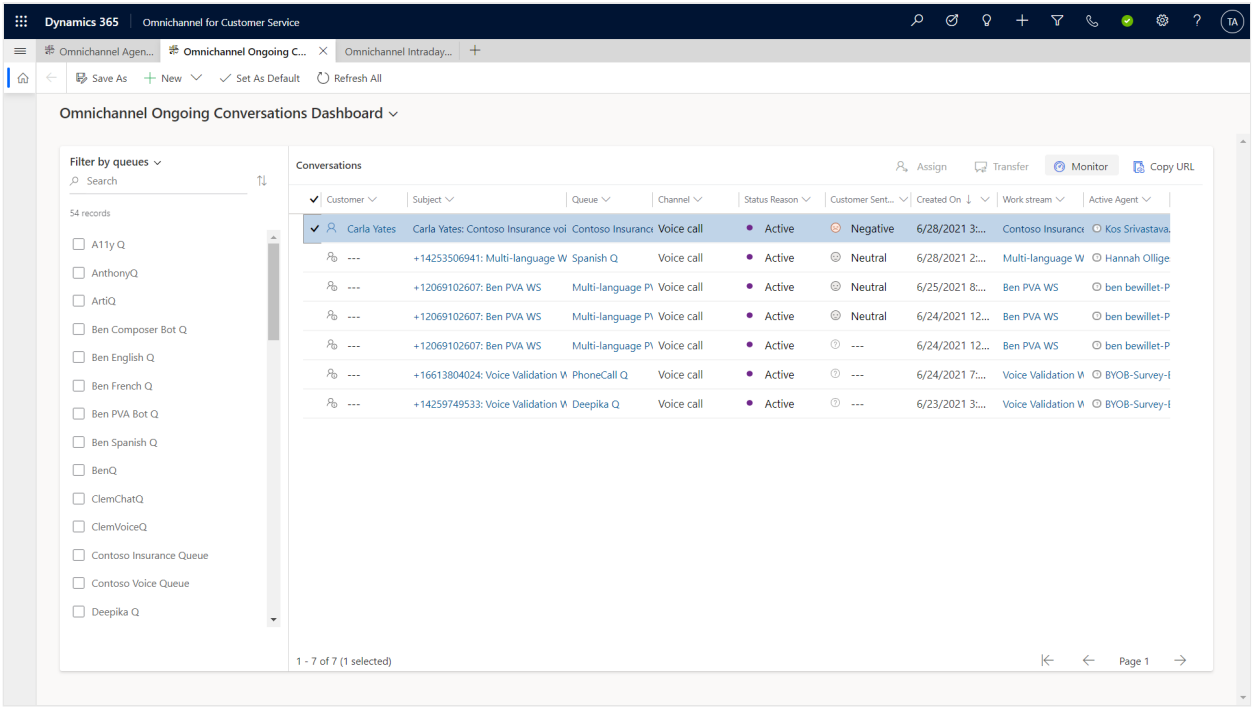
As a supervisor, it's useful to be able to monitor the calls between your agents and their customers without interrupting them to help identify which calls need attention. You can monitor the conversations without being seen as a participant by the agent or customer, as well as step into conversations when additional support is needed.

Prerequisites

To monitor calls in the voice channel, you must have the **Omnichannel Supervisor** role. This role allows you to join and consult in ongoing conversations.

Monitor ongoing conversations

On the **Omnichannel Ongoing Conversations** dashboard, you, as a supervisor, can view a list of active conversations, including customer sentiment analysis for each call.

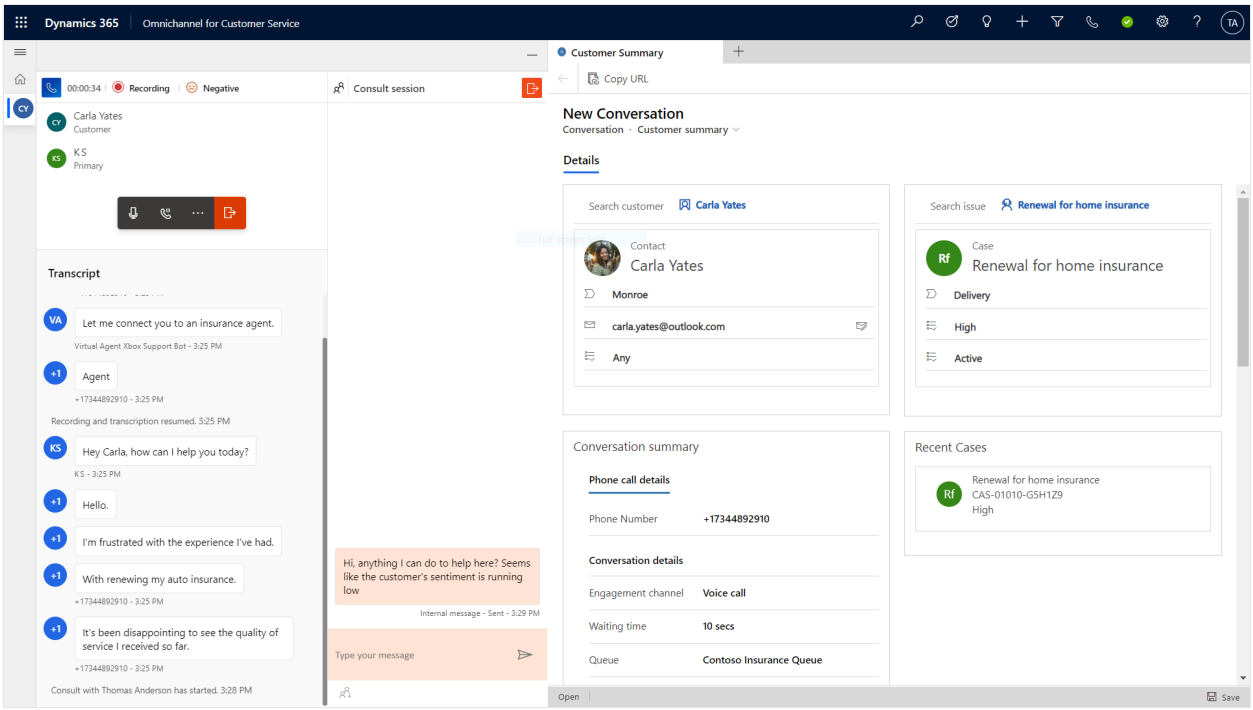


To find out details about an individual conversation:

- On the **Omnichannel Ongoing Conversations dashboard**, select it in the list of active conversations, and then select **Monitor**.

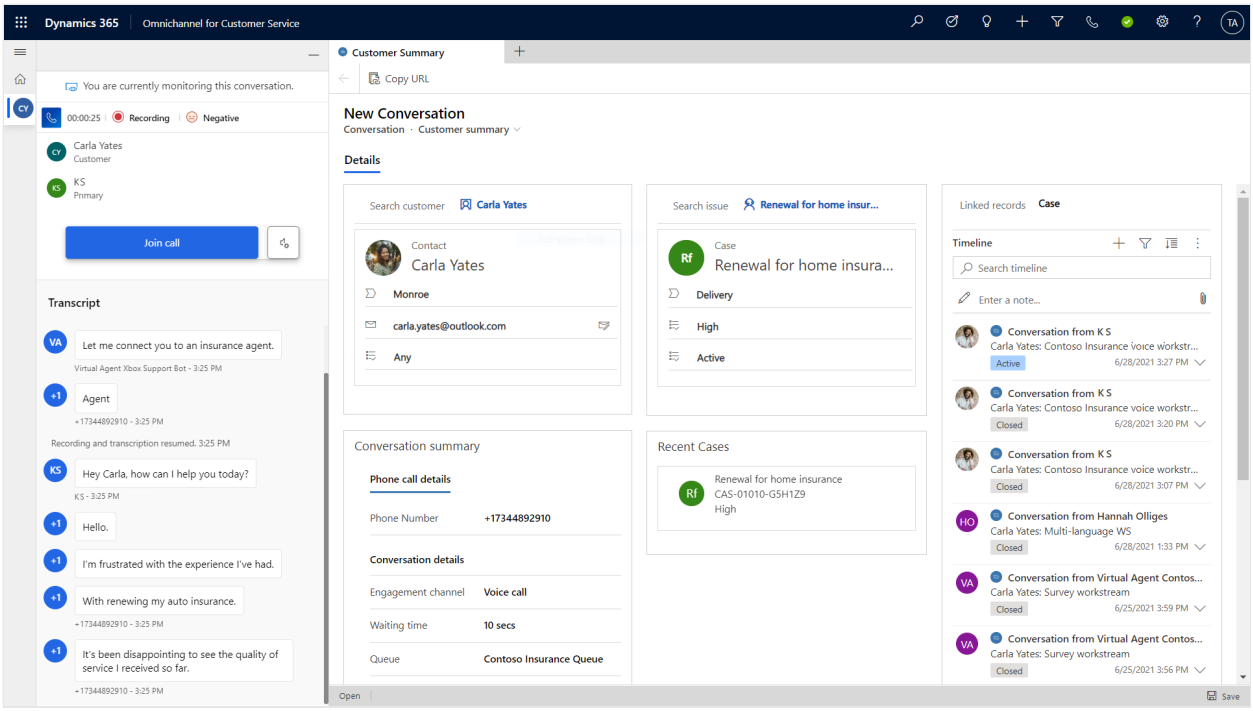
Consult with an agent during a conversation

As a supervisor, you can privately consult with an agent by sending them messages that are hidden from the customer.



Join a conversation (also known as barge)

If needed, you can select **Join call** to enter the conversation and speak with the agent, customer, or chat with the agent privately. When you join a conversation, the agent can see that you have joined.



By joining a conversation, you have access to call controls that allow you to capture details about the conversation, pause the conversation if needed, and engage with the agent and customer as needed.

Pricing scenarios for voice calling

Article • 06/27/2023

The Dynamics 365 Customer Service voice channel is built on Azure Communication Services. Billing for Azure Communication Services uses a pay-as-you-go model and varies per country. Calling and screen-sharing services are billed per minute per participant. More information: Pricing Scenarios.

Azure Communication Services doesn't charge for data egress.

Several call flows are possible. This article describes pricing calculations for the following call scenarios:

- Inbound: A customer calls from a mobile device; an IVR bot escalates the call to a human agent
- Inbound: A customer calls from Microsoft Teams
- Inbound: A customer calls from Teams; a supervisor joins the call to monitor the conversation
- Inbound: A customer calls from a mobile device; the supervisor is invited to consult
- Inbound: A customer calls from Teams; the call is transferred to an agent through Teams PSTN
- Outbound: An agent calls a customer
- Inbound: Azure direct routing
- Outbound: Azure direct routing

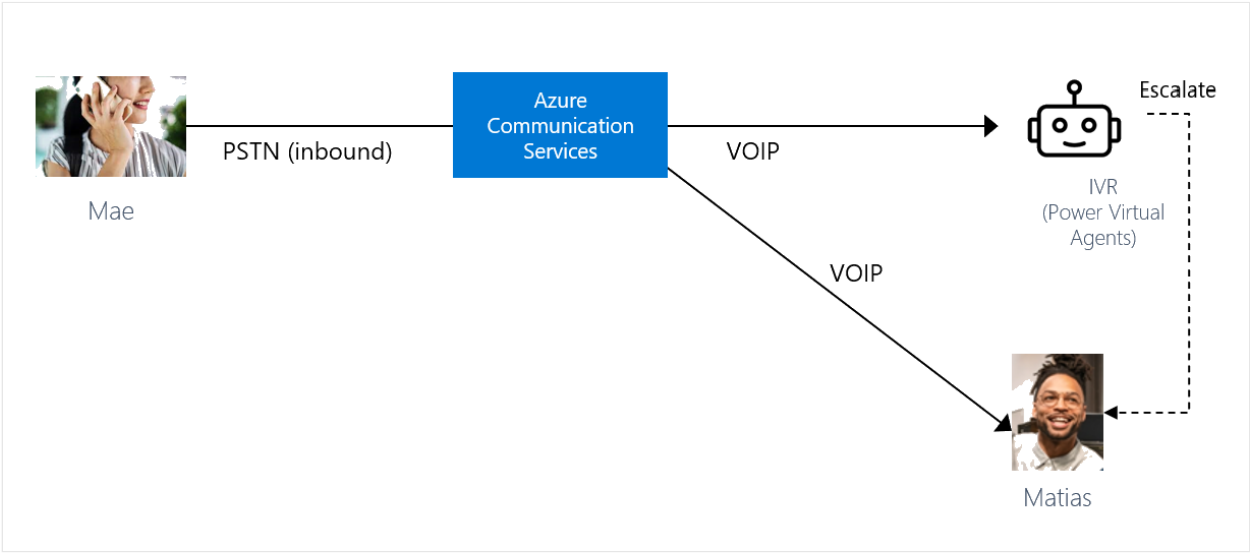
The following table summarizes the pricing for each scenario. The prices in the following examples are for illustrative purposes and might not reflect the latest Azure pricing in your region.

Scenario	Price
PSTN inbound	$0.022 per minute
PSTN outbound	$0.013 per minute
VOIP inbound	$0.004 per minute
SBC to Azure Communication Services	$0.004 per minute
ROW Consumption Unit – Inbound -> PSTN inbound rate	$0.022 per minute
App to App Group Calling User Minute –> VOIP rate	$0.004 per minute
ROW Consumption Unit – Outbound –> PSTN outbound rate	$0.013 per minute

Scenario	Price
Single Channel Mixed Audio Recording –> Recording rate	$0.004 per minute

Inbound: Customer calls from a mobile, call is escalated to a human agent from an IVR bot

Mae calls your Azure Communication Services US toll-free number from a mobile device. The call is routed to a Power Virtual Agents interactive voice response (IVR) bot. Mae interacts with the bot for two minutes. The bot escalates the call to a human agent, Matias. This call lasts eight minutes.



Cost calculation:

- One participant on PSTN (inbound from Mae) x 10 minutes x 0.022 per participant per minute = $0.22.
- One participant on Voice over Internet Protocol (VOIP) (inbound to Power Virtual Agents bot) X 2 x $0.004 per minute = $0.008.

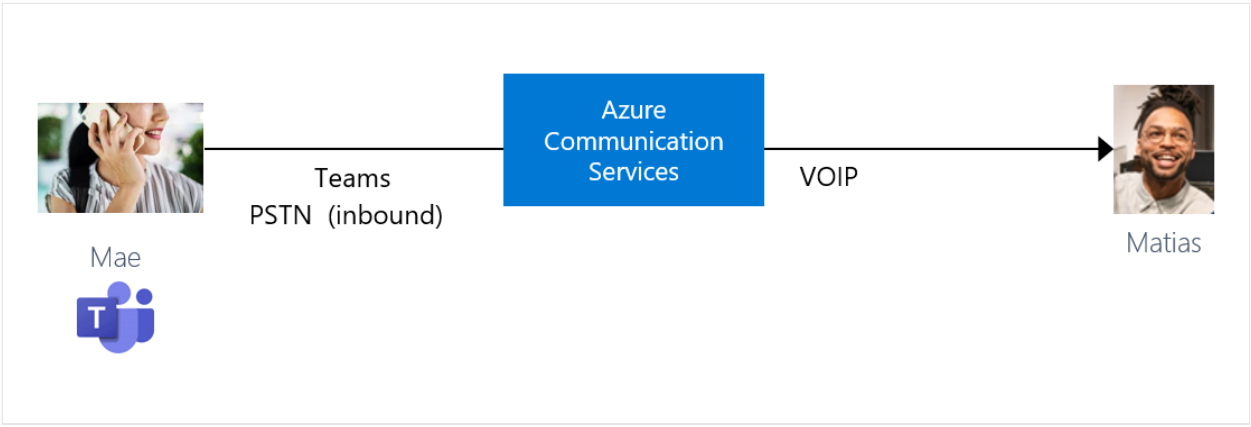
  > **Note**
  >
  > The VOIP call to the Power Virtual Agents bot isn't covered by the intelligent voice bot minutes included in the Voice Channel Add-in license.

- One participant on VOIP (inbound to Matias) x 8 x $0.004 per participant per minute= $0.032.

Total cost for the call: $0.22 + $0.008 + $0.032 = $0.26.

Inbound: A customer calls from Microsoft Teams

Mae calls your Azure Communication Services US toll-free number from Microsoft Teams. The call is routed to Matias and lasts 20 minutes.



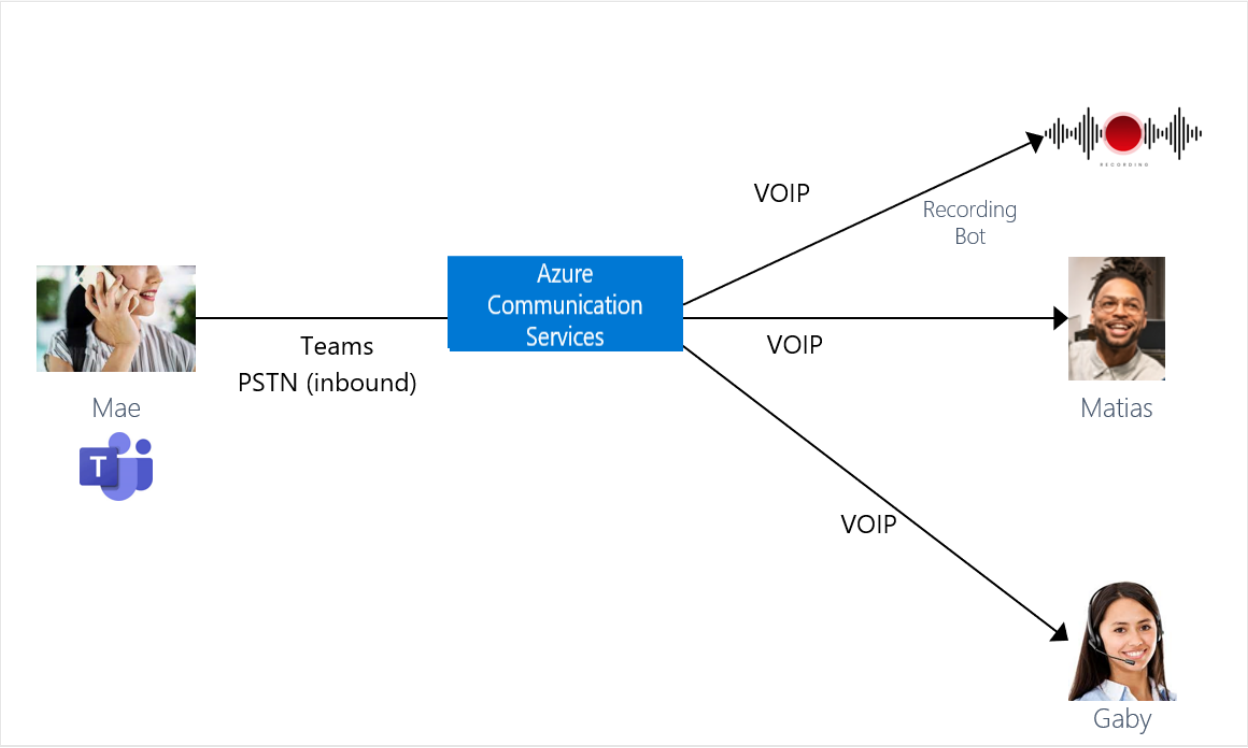
Cost calculation:

- One participant on Teams (inbound from Mae) x 20 minutes x rate per minute (Mae's call is covered by the Teams license)
- One participant on PSTN (inbound from Mae) x 20 minutes x $0.022 per minute = $0.44
- One participant on VOIP (inbound to Matias) x 20 minutes x $0.004 per minute = $0.08

Total cost for the call: $0.44 + $0.08 = $0.52 + applicable Teams charges

Inbound: A customer calls from Teams; a supervisor joins the call to monitor the conversation

Mae calls your Azure Communication Services US toll-free number from Teams. The call is routed to Matias, who starts recording it. Gaby, Matias's supervisor, joins to monitor the conversation. The call lasts 10 minutes. The recording stops when the call ends.



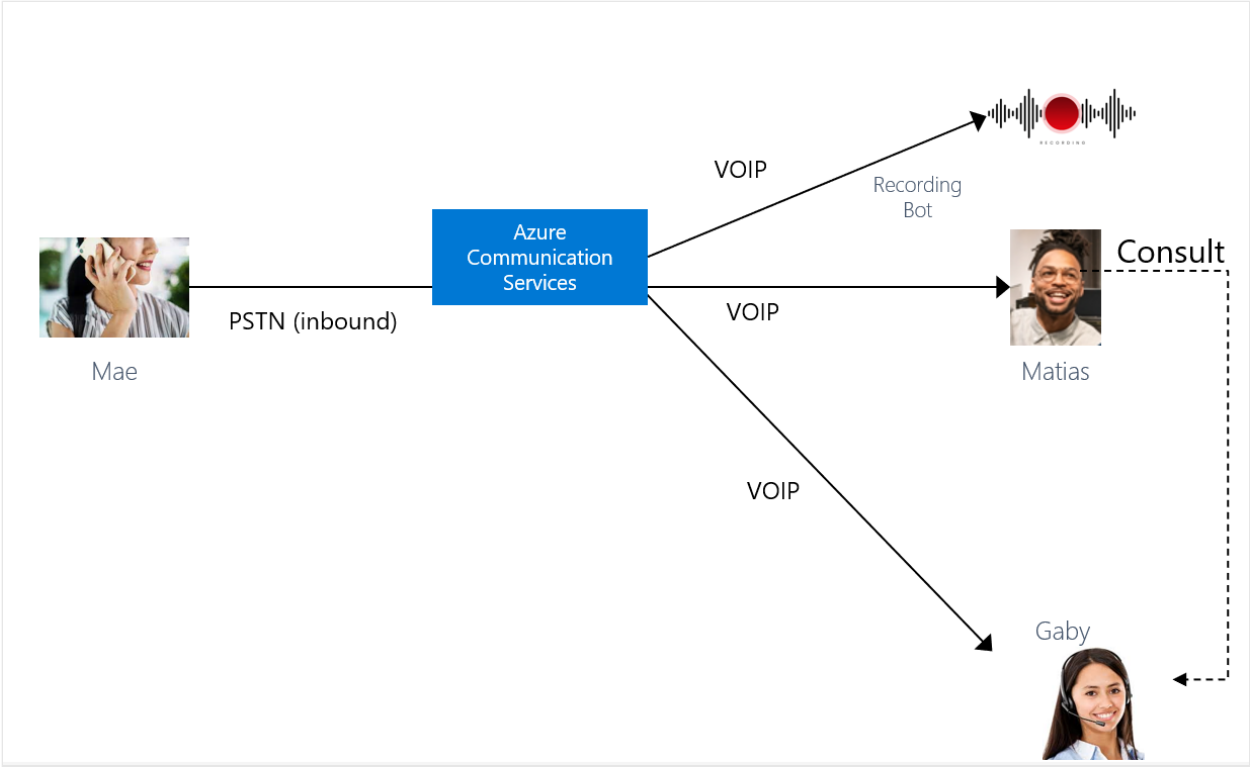
Cost calculation:

- One participant on Teams (inbound from Mae) x 10 minutes x rate per minute (Mae's call is covered by the Teams license)
- One participant on PSTN (inbound from Mae) x 10 minutes x $0.022 per minute = $0.22
- One participant on VOIP (inbound to Matias) x 10 minutes x $0.004 per minute = $0.04
- One participant on VOIP (Gaby joins to monitor) x 10 minutes x $0.004 per minute = $0.04 (charged only when Gaby joins the call)
- Cost to record = 10 minutes x $0.002 per minute = $0.02
- Omnichannel for Customer Service recording bot doesn't introduce extra Azure Communication Services VOIP charges.

Total cost for the call: $0.22 + $0.04 + $0.04 + $0.02 + applicable Teams charges = $0.32 + applicable Teams charges

Inbound: A customer calls from a mobile device; the supervisor is invited to consult

Mae calls your Azure Communication Services US toll-free number from Teams. The call is routed to Matias, who starts recording it. Matias invites supervisor Gaby to join in to consult. The call lasts 20 minutes. The recording stops when the call ends.



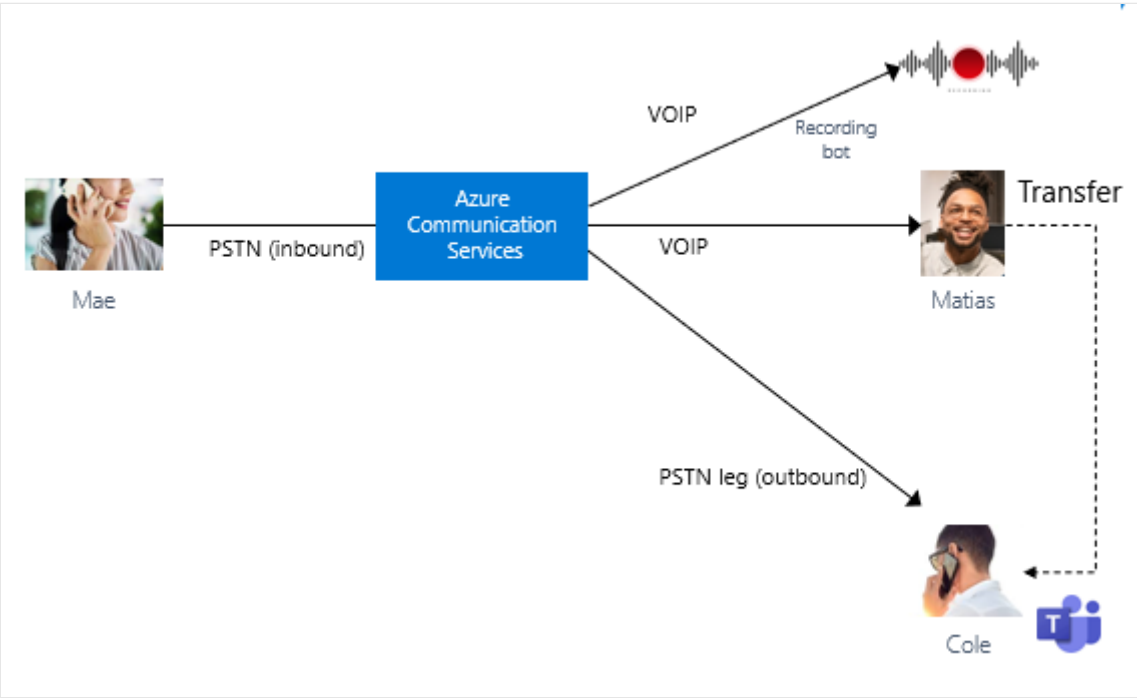
Cost calculation:

- One participant on PSTN (inbound from Mae) x 20 minutes x $0.022 per minute = $0.44
- One participant on VOIP (inbound to Matias) x 20 minutes x $0.004 per minute = $0.08
- One participant on VOIP (Gaby joins to consult) x 10 minutes x $0.004 per minute = $0.04 (charged only when Gaby joins the call)
- Cost to record = 20 minutes x $0.002 per minute = $0.04
- Omnichannel for Customer Service recording bot doesn't introduce extra Azure Communication Services VOIP charges.

Total cost for the call: $0.44 + $0.08 + $0.04 + $0.04 = $0.60

Inbound: A customer calls from Teams; the call is transferred to an agent through Teams PSTN

Mae calls your Azure Communication Services US toll-free number from Microsoft Teams. The call is routed to Matias, who starts recording it. Matias talks to Mae for five minutes and then transfers the call to a product expert, Cole, on Cole's Teams PSTN number. Cole speaks to Mae for another five minutes and ends the call. The recording stops when the call ends.



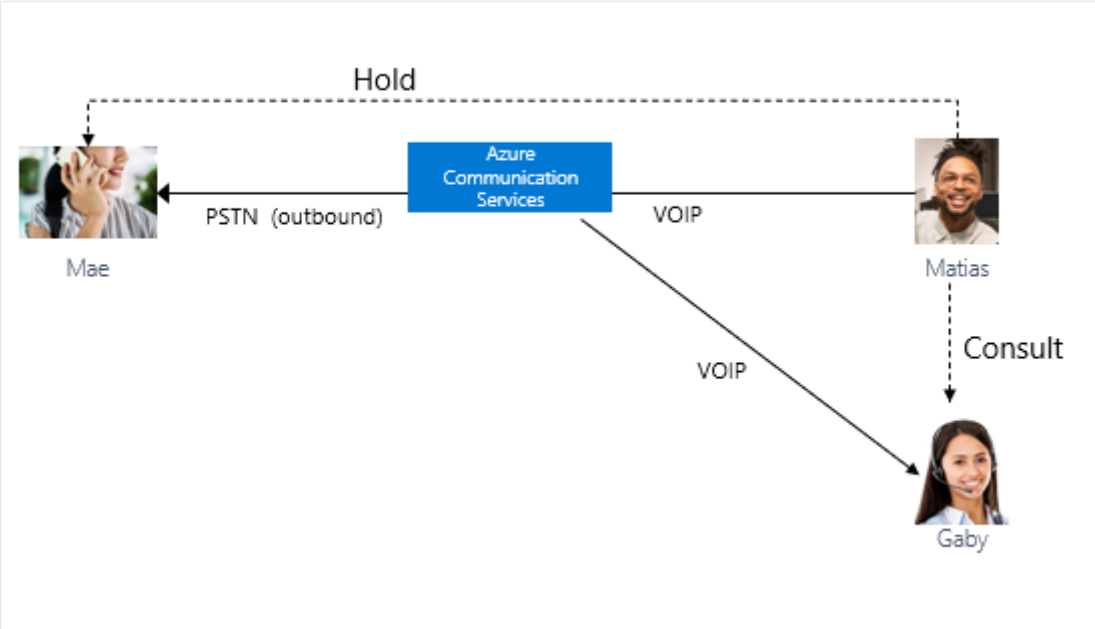
Cost calculation:

- One participant on Microsoft Teams (inbound from Mae) x 10 minutes x rate per minute (Mae's call is covered by the Teams license)
- One participant on PSTN (inbound from Mae) x 10 minutes x $0.022 per minute = $0.22
- One participant on VOIP (inbound to Matias) x 5 minutes x $0.004 per minute = $0.02
- One participant on PSTN (outbound to Cole) x 5 minutes x $0.013 per minute = $0.065
- One participant on Microsoft Teams (outbound to Cole) x 5 minutes x rate per minute (Cole's call is covered by the Teams license)
- Cost to record = 10 minutes x $0.002 per minute = $0.02
- Omnichannel for Customer Service recording bot doesn't introduce extra Azure Communication Services VOIP charges.

Total cost for the call: $0.22 + $0.02 + $0.065 + $0.02 + applicable Teams charges = $0.325 + applicable Teams charges

Outbound: An agent calls a customer

Matias, the contact center agent, makes an outbound call from Omnichannel for Customer Service to Mae, the customer. Matias talks to Mae for two minutes, then puts the call on hold to consult with supervisor Gaby. Matias talks to Gaby for five minutes, ends the consultation, and resumes the call with Mae. The call lasts another three minutes.



Cost calculation:

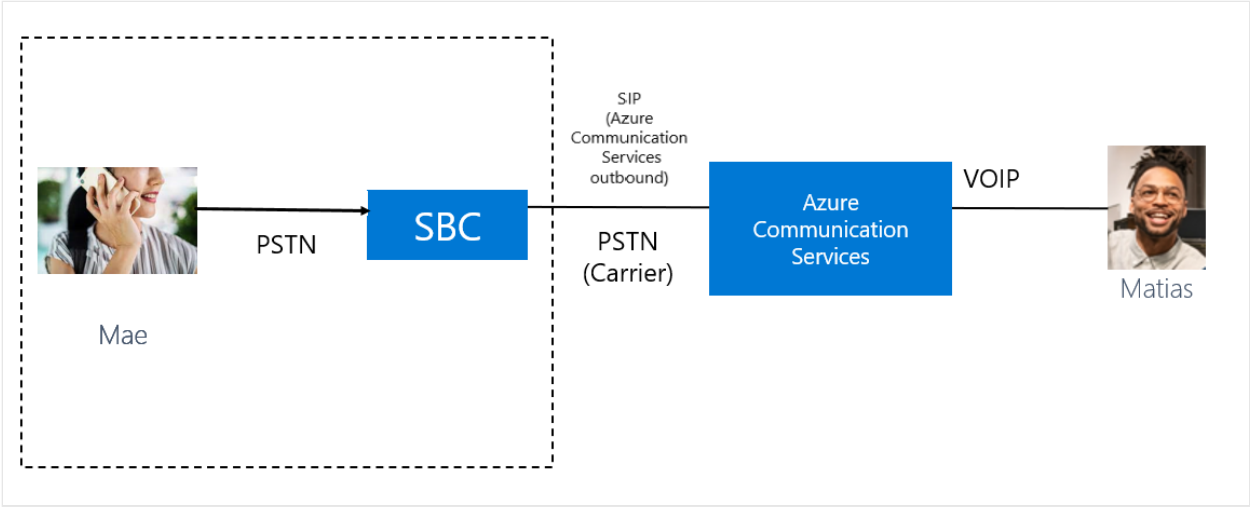
- One participant on PSTN (outbound from Matias) x 10 minutes x $0.013 per minute = $0.013 (the call continues to be charged when Matias puts it on hold)
- One participant on VOIP (Matias to Azure Communication Services) x 10 minutes x $0.004 per minute = $0.04
- One participant on VOIP (Matias to Gaby) x 5 minutes x $0.004 per minute = $0.02

Total cost for the call: $0.13 + $0.04 + $0.02 = $0.19

Inbound: Azure direct routing

Mae calls your Azure direct routing toll-free number from a mobile device. The call is routed to Matias and lasts 10 minutes.

- Matias uses the Omnichannel for Customer Service client application.
- The call goes to a Session Border Controller (SBC) connected through Azure Communication Services direct routing.
- An Omnichannel for Customer Service bot adds Matias to the call by escalating the direct routing call to a group call.



Cost calculation

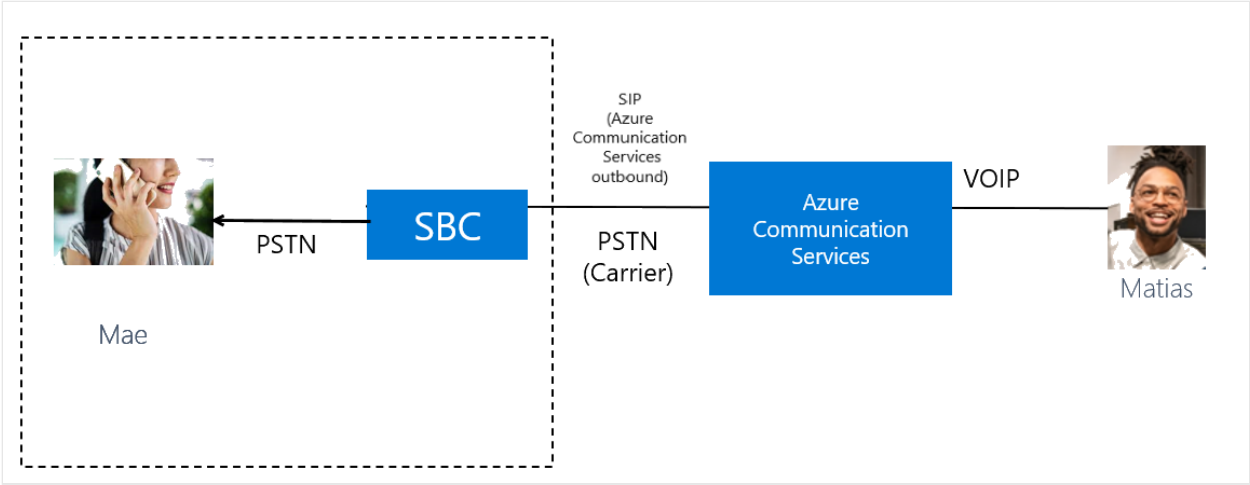
- One participant on PSTN (inbound from Mae) x 10 minutes x rate per the contract with the carrier
- One participant on PSTN (SBC to Azure Communication Services) x 10 minutes x rate per the contract with the carrier
- One participant on Session Initiation Protocol (SBC to Azure Communication Services) x 10 minutes x $0.004 per minute = $0.04
- One participant on VOIP (inbound to Matias) x 10 minutes x $0.004 per minute = $0.04

Total cost for the call: $0.04 + $0.04 + applicable carrier charges = $0.08 + applicable carrier charges

Outbound: Azure direct routing

Matias makes an outbound call from Omnichannel for Customer Service to Mae through Azure direct routing. The call lasts 10 minutes.

- Matias uses the Omnichannel for Customer Service client application.
- A bot in Omnichannel for Customer Service starts an outgoing call through direct routing.
- The call goes to an SBC connected through Azure Communication Services direct routing.
- The bot in Omnichannel for Customer Service adds Mae to a call by escalating the direct routing call to a group call.



Cost calculation:

- One participant on PSTN (outbound from Matias) x 10 minutes x rate per the contract with the carrier
- One participant on PSTN (SBC to Azure Communication Services) x 10 minutes x rate per the contract with the carrier
- One participant on SIP (SBC to Azure Communication Services) x 10 minutes x $0.004 per minute = $0.04
- One participant on VOIP (outbound from Matias) x 10 minutes x $0.004 per minute = $0.04

Total cost for the call: $0.04 + $0.04 + applicable carrier charges = $0.08 + applicable carrier charges

FAQ about the voice channel in Omnichannel for Customer Service

Article • 08/25/2023

This article includes frequently asked questions (FAQ) about the voice channel.

Why is the agent unable to make an outbound call?

The agent must be a part of the outbound voice queue to make an outbound call. See Set up outbound calling for information.

Are overflow actions like voicemail and direct callback fulfilled for fallback queues?

No, overflow settings aren't applicable to fallback queues. The settings are ignored, and the routed work item is assigned to the queue. More information: How overflow works

Does the voice channel include real-time keyword recognition or sentiment tracking while an agent is on a call?

Yes, features such as sentiment analysis, agent suggestions for similar cases or knowledge articles, are available in the voice channel.

Is the voice channel PCI DSS compliant?

The voice channel is compliant with Payment Card Industry Data Security Standard (PCI DSS) today, but support for credit card data capture over voice isn't yet available. Agents have the ability to pause or resume call recording and transcription to avoid capturing sensitive information. Agents can also pause transcription to avoid dual-tone multi-frequency (DTMF) tones being captured in the transcript. All data is stored in Dynamics 365 and can be scrubbed by the customer.

Where does Azure Communication Services provide native PSTN services?

To register as a calling provider is a legally complex and country-specific process. Azure Communication Services has a multiyear road map to provide calling plans in different

countries and regions. To see all the countries where PSTN services are available, check the country availability page.

An alternative to Microsoft calling plans is Azure direct routing that allows you to bring your own phone numbers. More information: Azure direct routing

What about countries where Azure Communication Services doesn't provide native PSTN services?

Azure Communication Services is available worldwide, even if it isn't acting as the calling provider in certain countries. For these countries, Azure Communication Services provides a direct routing for local carriers, such as AT&T and Verizon, to connect to Azure Communication Services. With this mechanism, you'll still be able to deploy and use all the features of the voice channel in Dynamics 365.

What codecs are implemented in the voice channel?

The voice channel supports the G.711 and Opus codecs for PSTN and VoIP services.

Can I bring my own phone number?

Yes, you can bring your existing numbers to Omnichannel for Customer Service in the following ways:

- **Import numbers to Omnichannel for Customer Service**

    1. You must first port your existing phone numbers to Azure Communication Services. More information: Quickstart: Port a phone number into Azure Communication Services
    2. You can then import the phone numbers from Azure Communication Services to Omnichannel for Customer Service. More information: Sync from Azure Communication Services

- **Configure Azure direct routing**

    1. Configure a Session Border Controller (SBC) that's connected to your local carrier with Azure Communication Services.
    2. Register the phone number in Dynamics 365. More information: Bring your own carrier

Can my SBC and DNS server be deployed in different regions?

No. We recommend that the DNS server and SBC are deployed in the same region. More information: Bring your own carrier

How can I acquire extra phone numbers from Azure Communication Services?

You can purchase one phone number per tenant for Azure Communication Services through the Azure portal. To acquire phone numbers in bulk or request a specific phone number, follow the instructions to create a special number request order here .

Can I keep my existing contract with my carrier?

Yes, you can.

Can I configure a third-party voice provider in Omnichannel for Customer Service?

Yes, you can use the Dynamics 365 Channel Integration Framework 2.0 connector to integrate third-party contact centers, such as Genesys Engage, Solgari, and NICE inContact.

Does the voice channel tie in with Azure Communication Services or is it an entirely different technology?

The voice capabilities for Dynamics 365 Customer Service are built on Azure Communication Services.

Do I have to buy phone numbers from Azure Communication Services?

No, you don't have to. You can bring phone numbers from another carrier to use in the voice channel using Azure direct routing. More information: Bring your own carrier

If you've already brought numbers from another carrier into Microsoft Teams via Azure direct routing, then you can reuse your SBC and existing telephony infrastructure to bring those numbers into Azure Communication Services for use in the voice channel.

> **Note**
>
> Currently, you can't bring native Teams phone numbers to use in the voice channel.

Is it possible to enable voice integrations outside of the Omnichannel for Customer Service app, such as, by adding omnichannel capabilities to a customer's Dynamics 365 app?

No, the voice channel isn't supported in the other apps of Dynamics 365. It's supported in the Customer Service workspace and Omnichannel for Customer Service apps only.

How can I set up an IVR bot in the voice channel?

See the following articles to set up the interactive voice response (IVR) bot in the voice channel:

- Configure Power Virtual Agents bots for voice
- Integrate third-party IVR systems with voice channel

Should the language of the bot be the same as the primary language configured in the Customer Service admin center or Omnichannel admin center app?

Yes, the primary language of the bot must be the same as that of the voice workstream to which the bot is attached, but you can configure different geographic locales for the bot and the voice workstream to which it's attached. Let's consider an example where English is set as the primary language for the bot and its voice workstream. You can set different locales, such as **English-UK** in the voice workstream and **English-US** in the bot; the bot will speak in English-UK as the workstream locale setting takes precedence.

You can transfer conversations from one bot to another with different primary languages. For example, you can transfer conversations from an English bot to a Spanish bot. But, if you configure different locales:

- The bot's accuracy will depend on the similarities between the two locales.
- The preconfigured entities for the bot such as postal code might not be accurate.
- A bot-to-bot transfer of the conversation with the same language but two different locales isn't possible. For example, the transfer of a conversation from an **English-**

UK bot to an **English-US** bot can't happen. As a workaround, you can make the **English-UK** bot transfer the conversation to another phone number attached to a workstream to which the **English-US** bot is attached.

Can I recover data and phone numbers from a voice trial organization after it has expired?

No, you can't recover your data and phone numbers after the voice trial organization has expired and been deprovisioned.

Is disaster recovery supported for the voice channel?

- Business Continuity and Disaster Recovery (BCDR) for production instances of the voice channel are supported on a geographical basis. In certain regions BCDR will be a fast follow. For details on the geographies that are currently supported and the geographies where BCDR is a fast follow, see Local cloud deployments.
- In supported regions, BCDR policies are based upon business continuity and disaster recovery for Dynamics 365 and SLA for Azure Communication Services. For more information, see Business continuity and disaster recovery and SLA for Azure Communication Services.

Do you provide voice quality SLA for voice in Omnichannel for Customer Service?

No, we don't publish a voice quality SLA as many factors related to voice quality like network connectivity, speed, and bandwidth, can't be controlled. The SLA published for Azure Communication Services applies to the voice channel as well.

What tools are available to isolate performance and quality of voice channel?

The tools for isolating voice performance and quality are available through Azure Communication Services and can be found at Azure Communication Services media quality metrics. It might take up to two hours for the data to appear in the logs.

More information:

- Enable Azure Communication Services logs
- Azure Communication Services voice and video logs
- Integrate with user-facing diagnostics

- Use media quality statistics
- Use pre-call diagnostics
- Enable logging in Diagnostic settings
- Use Azure Communication Services communication monitoring plug-in

Does the voice channel support emergency calling?

Yes, the voice channel supports emergency calling; agents can call the emergency number during a crisis. This feature is currently supported in the United States and Puerto Rico where the emergency calling number is 911. More information: How emergency calling works in the voice channel

What are the applicable pricing scenarios for using the voice channel?

To understand the pricing calculation of various call scenarios, see Pricing scenarios for voice calling.

Why do my customers sometimes hear "Sorry! We couldn't serve you" when they call the contact center number?

Sometimes, when a Power Virtual Agents bot isn't added or an agent is unable to answer the call, your customers will hear the message that they couldn't be served. We recommend agents to refresh their presence regularly to ensure their availability to customers. If the problem persists, reconnect your Power Virtual Agents bot.

Introduction to the chat channel

Article • 10/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Chat is a widely desired channel through which customers prefer to reach customer support. Customers appreciate being able to chat with human agents when self-service options don't allow them to solve their own issues.

Dynamics 365 Customer Service offers full featured, first-party chat capabilities for agents to support customers. Chat transcripts from Power Virtual Agents or other live agents and pre-conversation survey data transfers to live agents to maintain full context of the customer issue as it moves between channels and people. Agents can help customers in the language of their choice with real-time translation, and escalate to voice and video if a visual demonstration and audio are needed to help customers. Features like quick replies, whisper, barge, consult, and transfer to other agents ensure agents can handle any workflow while chatting with customers.

A chat widget lets your customers connect with your customer service agents and resolve their queries quickly.

You'll learn how to:

- Add a chat widget
- Configure agent display name
- Configure a pre-conversation survey
- Configure file attachment capability
- Embed chat widget in your website or portal

> **Note**
>
> The chat widget requires session storage and local storage to be functional in your customers' browsers. Make sure to notify your customers to enable cookies in their browsers so these services can work properly.

Disclaimer

Microsoft automatically collects data to improve the reliability and performance of our products and to understand how the products are being used. This information is used to make improvements to the product capabilities over time. The live chat widget in Chat for Dynamics 365 collects telemetry automatically from end users to serve the same purposes.

A few examples of data collected by the live chat widget are as follows.

Data	Example value
OrganizationId	8e9071c2-4415-47aa-b1cb-693631e7fafb
Chat Widget Version	prod
BrowserName	Edge
OSName	Windows
Scrubbed IP Address (last octet redacted)	19.207.000.000

No personally identifiable information (PII) is collected.

If your organization is concerned about the data collected by this service, you have the option to turn off automatic data collection by adding an html attribute to the chat widget script.

```
"data-enable-telemetry" = "false"
```

Add a chat widget

Configure a chat widget

Article • 04/25/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

You can configure a live chat widget that can be displayed on your portal for customers to interact with bots and human agents.

To add a chat widget, you need to have configured a workstream that defines how chat conversations are routed to queues. More information: Create a workstream

Configure a chat widget

1. In Dynamics 365, go to one of the apps, and perform the following steps.

   Customer Service admin center

   a. In the site map, select **Channels** in **Customer support**. The **Channels** page appears.

   b. Select **Manage** for **Chat**. The **Chat channels** page appears.

   c. Select **Add chat channel**.

2. On the **Channel details** page, enter a name and select a language in the **Name** and **Language** fields, respectively.

3. On the **Chat Widget** page, enter the following details:

   - **Title:** Display name for the chat widget.
   - **Subtitle:** Additional title, such as "We're online".
   - **Theme color:** Choose a color from the list.
   - **Logo URL:** Select the default value or enter the link to the logo that you want to be displayed.
   - **Agent display name:** Select a value from the list.

4. Switch the toggle to **Yes** to enable the following options:

- Proactive chat
- Reconnect to previous chat
- Only show widget during operation hours
  - **Operation hours name**: Select an operating hour setting. More information: Configure operating hours.
- **Only show widget on the provided domains**: Enter the link of the portal.

5. On the **Behaviors** page, configure the following options:

- Custom automated messages
- Pre-conversation survey
- Post-conversation survey
- Authentication settings
- Customer wait time

  > **Note**
  >
  > These settings aren't configurable for the persistent chat feature. More information: **Configure persistent chat**

  - **Show position in queue:** Select this if you want to show customers their position in the queue when they're waiting to interact with an agent. More information: Show customers their queue position
  - **Show average wait time:** Select this if you want to show to customers the average wait time in the queue when they're waiting to interact with an agent. More information: Show customers their average wait time in a queue

- **Customer location detection:** Select a location provider. More information: Set up visitor location detection.

6. On the **User features** page, configure the following options:

- File attachments
- Customer notifications
- Conversation transcripts
- **Voice and video calls**: Switch the toggle to **On** and select the calling option.

- **Screen sharing**: Switch the toggle to **On** and select a provider.
- **Co-browse**: Switch the toggle to **On** and select a provider if you want the agents to see and interact with a customer's web browse.

  > ⓘ Note
  > - You must install a third-party provider from AppSource to use the screen sharing or co-browse feature.
  > - You can select only one co-browse provider and or one screen sharing provider for each chat widget. Only those co-browse and screen sharing providers that have published a solution on AppSource will appear in the lists.

7. Select **Save and close**.

Configure customer notifications

You can configure visual and sound notifications to be sent to customers when they're interacting with agents through the chat widget on your organization portal. If the chat window is minimized or isn't active, a sound notification is played when a message arrives and a count of the unread messages is displayed.

Perform the following steps to enable the customer notifications:

1. In Customer Service admin center or Omnichannel admin center, edit a chat widget, and on the **Chat channel settings** page, select the **User features** tab.
2. For **Customer notifications**, switch the toggle to **On**. The following checkboxes are displayed as selected:

   - **Show number of new messages**
   - **Play sound notifications for new messages**

3. Keep the default settings or select one of them depending on your requirement.

You can also configure the customer notifications when you're configuring the chat channel.

Configure a chat widget in Omnichannel Administration

> ⓘ Important

Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

The information in this section is not applicable if you are using the Omnichannel admin center app in the latest version of Omnichannel for Customer Service.

1. Sign in to Dynamics 365 and select Omnichannel Administration.
2. Go to **Channels** > **Chat**.
3. Select **New**. The **New Chat Widget** page is displayed.
4. On the **General settings** tab, specify the information for the following fields, depending on the type of chat you want to configure. The **Customer waiting** and **Chat Reconnect** options are available only for live chat.

Section	Field	Description	Example value
General information	**Name**	Specify the name of the widget.	Contoso chat
	Language	Select the language of the chat widget from the list.	English - United States
	Agent display name	Select an agent display name type from the list: **Full name**, **First name**, **Last name**, and **Nick name**. More information: Configure agent display name	Full name
	Authentication settings	Select an authentication setting from the list. This is an optional field. More information: Create chat authentication settings	Chat authentication

Section	Field	Description	Example value
Conversation Mode	**Select mode**	Select the conversation mode from the list. For more information, see: Persistent chat	Persistent chat or Live Chat

Section	Field	Description	Example value
Work distribution	**Work stream**	Select a work stream from the list. Initially, a default work stream is selected. More information: Understand and create work streams **Note:** If you save the chat widget, you can't edit the **Work stream** field. If you want to edit the field, you must delete the chat widget and create a new one.	Live work stream

Section	Field	Description	Example value
Proactive chat	**Enable Proactive Chat**	Select whether to enable proactive chat. More information: Configure proactive chat	Yes

Section	Field	Description	Example value
File attachments	**Enable file attachments for customers**	Select whether to allow customers to attach and send files as attachments. More information: Configure file attachment capability	Yes
	Enable file attachments for agents	Select whether to allow agents to attach and send files as attachments. More information: Configure file attachment capability	Yes

Section	Field	Description	Example value
Chat Transcripts	**Allow download of transcript**	Select whether to allow chat transcripts to be downloaded. More information: Configure download and email of chat transcripts	Yes
	Allow email of transcript	Select whether to allow chat transcripts to be emailed. More information: Configure download and email of chat transcripts	Yes

Section	Field	Description	Example value
	Email Template	If you selected **Yes** for the **Allow email of transcript** field, the **Email Template** field is displayed. Select the email template you want to use to send the chat transcript as an email to the customer.	Conversation transcript email template
	From mailbox	If you selected **Yes** for the **Allow email of transcript** field, the **"From" mailbox** field is displayed. Select the mailbox from which you want to send the chat transcript email to the customer.	Contoso

Section	Field	Description	Example value
Customer waiting	**Show position in queue**	Select whether to show customers their position in the queue when they're waiting to interact with an agent. More information: Show customers their position in a queue	Yes
	Show average wait time	Select whether to show customers average wait time in the queue when they're waiting to interact with an agent. More information: Show customers their average wait time in a queue	Yes

5. Select **Save**. The following sections are displayed:

   - **Code snippet:** The code snippet that you need to embed in the HTML source of your website to display the chat widget is displayed in the **Widget snippet** box.
   - **Chat Reconnect:** The toggle to configure options for providing a reconnect link to the chat user is displayed. More information: Configure reconnection to a previous chat session

6. On the **Automated messages** tab, set up automated messages for your chat widget. More information: Configure automated messages

7. On the **Surveys** tab, specify the information for the following fields.

Section	Field	Description	Example value
Pre-conversation survey	Pre-conversation survey	Select whether to set up a pre-chat survey in the chat widget. The survey will be shown to users before a conversation is initiated.	Yes
Pre-chat unauthenticated questions	Pre-chat unauthenticated questions	If you set **Yes** for the **Pre-conversation survey** field, the **Pre-chat unauthenticated questions** section is displayed. Add the pre-chat questionnaires More information: Configure a pre-conversation survey	Product
Post-conversation survey	Turn on	If you set to **Yes**, you can configure a post-conversation survey to be presented to customers. More information: Configure a post-conversation survey	

8. On the **Conversation options** tab, specify the information for the following fields.

Section	Field	Description	Example value
Voice and video calls	Call options	Select a call option from the list: **No calling:** Agents can't make voice or video calls. **Video and voice calling:** Agents can make both voice and video calls. **Note:** Video calling is not available in Unified Service Desk. **Voice only:** Agents can make only voice calls.	Video and voice calling
Visual engagement	Screen sharing	Select whether to enable third-party screen sharing. You must install a third-party provider from AppSource to use the feature.	Enabled
Visual engagement	Screen sharing provider	Select the provider from the list.	*Screen sharing provider*

Section	Field	Description	Example value
Visual engagement	Co-browse	Select whether to enable third-party co-browse. You must install a third-party provider from AppSource to use the feature.	Enabled
Visual engagement	Co-browse provider	Select the provider from the list.	*Co-browse provider*

> **Note**
>
> You can select one co-browse provider and/or one screen sharing provider for each chat widget. Only co-browse and screen sharing providers that have published a solution on AppSource will appear in the lists.

9. On the **Design** tab, specify the information for the following fields. The offline settings are available only when the operating hours are set.

Section	Field	Description	Example value
Online	Theme color	Select a color from the list for the chat widget.	Blue
Online	Logo	Enter a link for the image that's hosted on a publicly available site.	https://oc-cdn-ocprod.azureedge.net/livechatwidget/images/chat.svg
Online	Title	Specify the name for the widget that's displayed for customers in the chat widget.	Let's Chat!

Section	Field	Description	Example value
Online	Subtitle	Specify the name for the widget that's displayed for customers in the chat widget.	We're Online
Online	Position	Specify the position of the widget.	Bottom right
Online	Operating hours	Select an operating hour window for the chat widget from the list. More information: Create and manage operating hours	Regular shift
Online	Turn on sound notifications	Set to **Yes** if you want your customers to receive a sound notification when the chat widget is minimized or not active	

Section	Field	Description	Example value
Online	Turn on unread message indicator	Set to **Yes** if you want to display the count of unread messages when the chat widget is minimized or not active for the customer.	
Offline	Show widget during offline hours	Set to **Yes** to display the chat widget during the offline hours.	Yes. The default is No; the chat widget will be hidden.
Offline	Theme color	Select a color from the list.	Grey
Offline	Title	Specify a title to be displayed.	We're offline.
Offline	Subtitle	Optionally, specify a subtitle.	No agents are available.

10. On the **Location** tab, perform the following steps:
    a. In the **Widget location** section, select **Add** to specify the website domain where the chat widget must be shown. The domain format should not include the protocol (for example, **http** or **https**).
    b. In the **Visitor location** section, specify whether you need to detect the visitor's location, and then select a **Geo Location Provider**. More information: Set up location detection

> ⓘ **Note**

If no domains are specified, the chat widget can be embedded on any website without restrictions. If you specify a domain, the chat widget can be hosted only on the specified domain.

11. On the **Related** tab, view activity associated with your chat widget, such as survey responses, chat widget locations, and system messages.

12. Select **Save** to save the configurations.

After you configure, agents can get the capabilities while they are in a conversation. To learn more, see Call options and visual engagement in live chat.

Enable resizing of the communication panel

Article • 10/04/2023

Agents can increase or decrease the width of the communication panel for a specific channel by dragging the right edge of the communication panel to the left or right. The resized width of the communication panel is channel specific.

Do the following steps to enable the resizing of the communication panel:

1. In Customer Service admin center, select **Miscellaneous** in **Operations**.
2. Select **Manage** for **New and upcoming features**. The **New and upcoming features** page appears.
3. Select **Resizable Communication Panel**.

Next steps

View the communication panel for conversations

Configure download and email of chat transcripts

Article • 03/21/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Chat for Dynamics 365 Customer Service allows customers to download and email a copy of their chat transcripts. When your administrator enables download and email options, customers can download or request an email of their chat transcript at any time during a chat session. At the end of the conversation, customers can request a transcript. If the customer requests an email of the chat transcript, the email is sent at the end of the conversation.

Prerequisite: Administrators should set up mailboxes before enabling this feature, and must select the **Allow other Dynamics 365 users to send email on your behalf** checkbox for it to work. For more information, see Dynamics 365 Email Setup and Dynamics 365 Email tab options.

Download and email chat transcripts

To configure options to download and email chat transcripts for both customers and agents:

1. In Customer Service admin center or Omnichannel admin center, select the workstream of the chat widget in which you want to configure the settings.
2. Select **Edit** for the chat channel that you want to update, and then select the **User features** tab.
3. For **Conversation transcripts**, set the toggle to **On**, and then select the following check boxes:
    - Allow download of transcripts
    - Allow email of transcripts
4. Select a template in **Email template**.

5. Select a mailbox in **From mailbox**.
6. Select **Save and close**.

Download and email chat transcripts in Omnichannel Administration

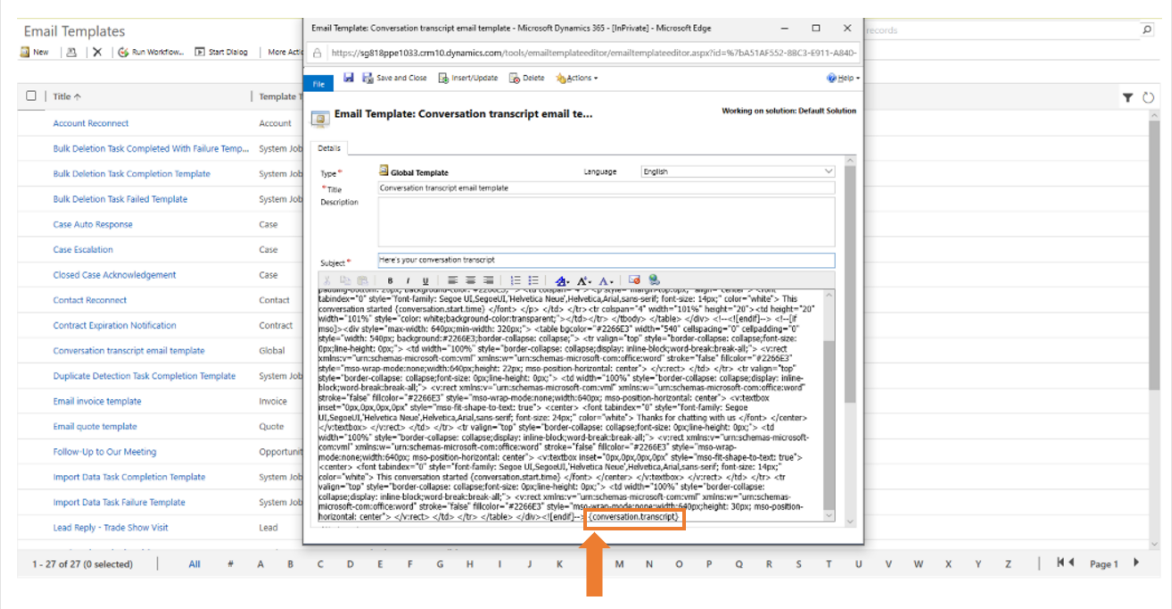
1. Sign in to Omnichannel Administration.
2. Go to **Channels** > **Chat**.
3. Open the chat widget in which you want to configure download and email of chat transcripts.
4. Go to the **General settings** tab.
5. Under **Chat Transcripts**, select **Yes** or **No** for the following:

   - **Allow download of transcript:** Allows your customers to download the chat transcript.
   - **Allow email of transcript:** Allows your customers to send the chat transcript as an email.

   By default, both the options are set to **No**.
6. If you select **Yes** for **Allow email of transcript**, you must select an email template and a mailbox from which the email will be sent. Administrators have a choice to either:

   - Use an email template provided by Chat for Dynamics 365 Customer Service by selecting an option from the **"From" mailbox** drop-down list.
   - Modify the email template provided by Chat for Dynamics 365 Customer Service.
   - Create their own email template.

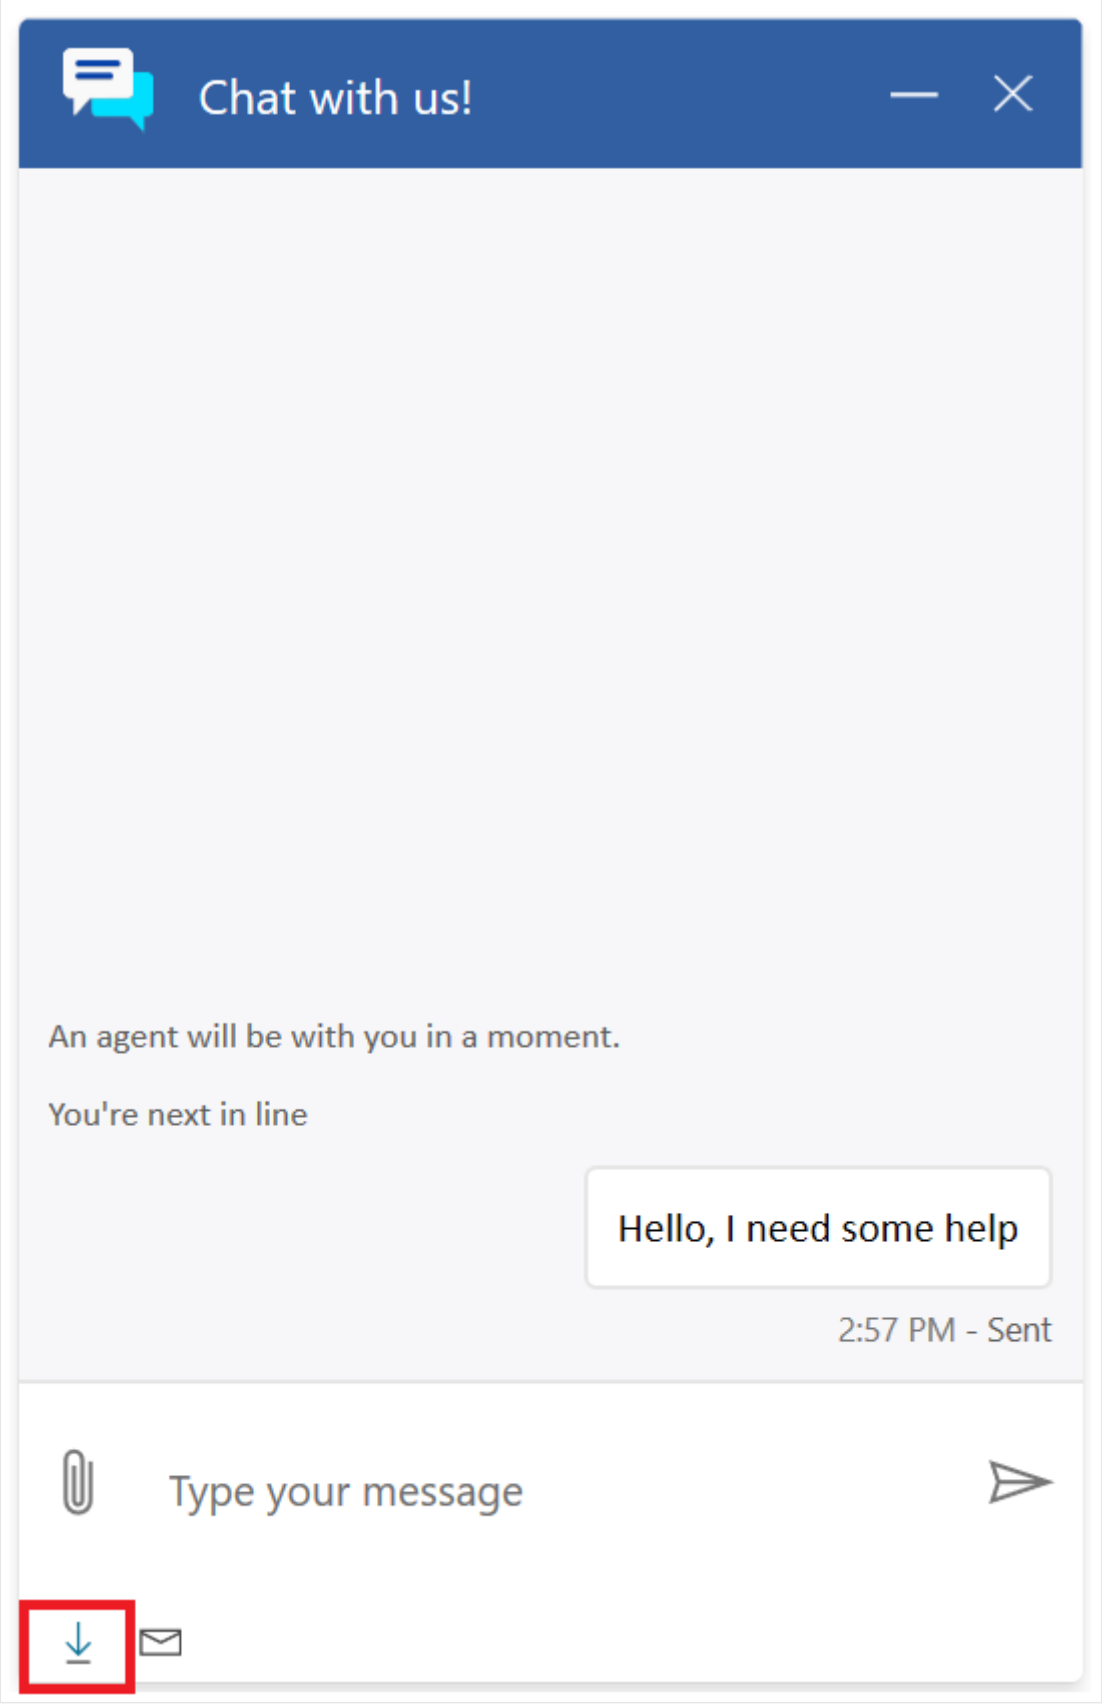
   > ⓘ **Note**
   >
   > Whether an administrator chooses to use the email template provided or create their own, the "{conversation.transcript}" text determines where the transcript is injected into email.



Customer experience

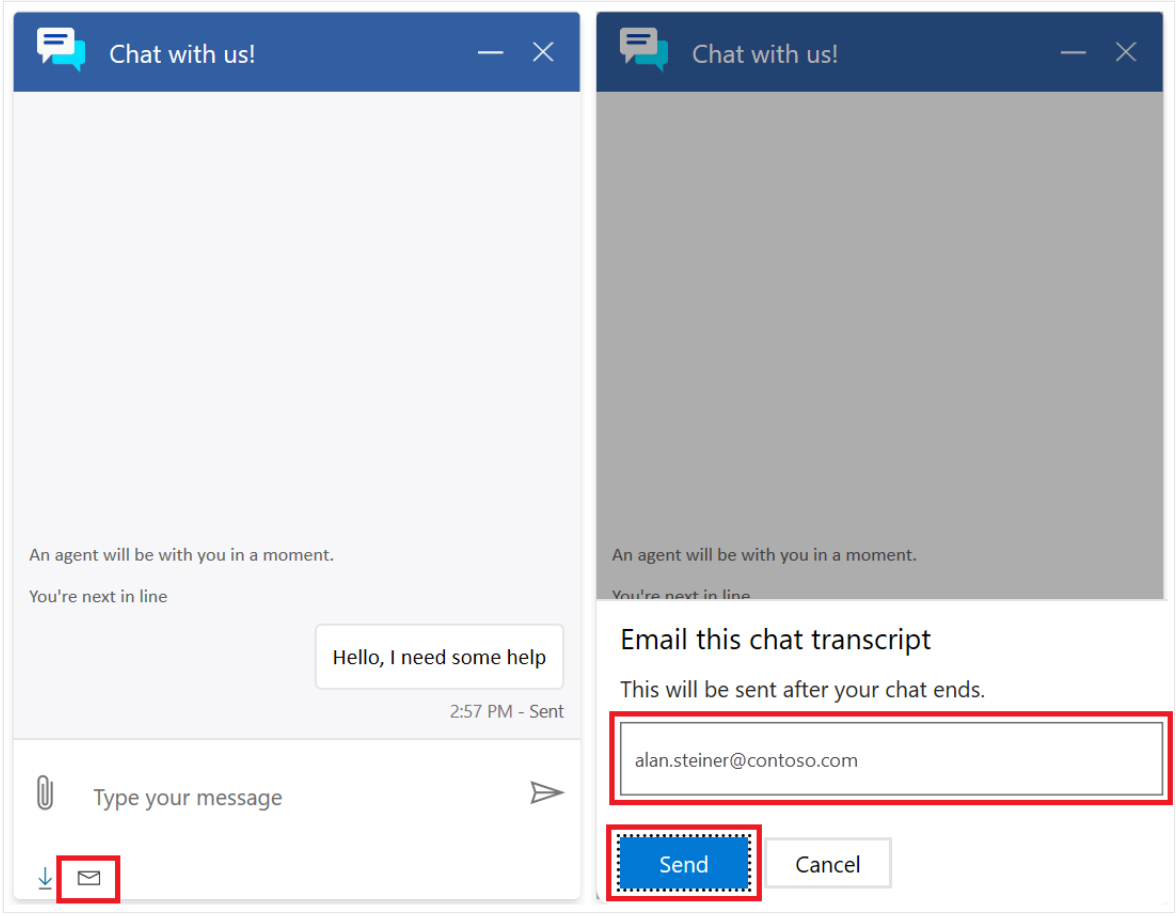
Customers can choose to download and email a copy of their chat transcript conversation from the chat window:

- **Download the chat transcript:** Select the download icon at the bottom of the chat screen.



- **Email the chat transcript:** Select the email icon at the bottom of the chat screen.

    1. Enter email address in pop-up window.
    2. Select **Send** to receive a copy of the chat transcript once the conversation ends.



At the end of the chat conversation, the following window appears, reminding the customer they can either download or email a copy of their chat transcript to keep for themselves.

>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

To protect an agent's privacy, you can configure your chat widget to display either the full name, first name, last name, or nickname of the agent to the customers. If you'd like to hide your agent's identity and anonymize, choose to display the nickname. The values for the names are retrieved from the user record created in Omnichannel for Customer Service. For information on creating users, see Create users in model-driven applications and assign security roles. You can add nickname of a user in the Omnichannel user record in Web Client.

> **Note**
>
> The selected agent's name is displayed in the chat widget only while the agent is chatting with a customer. For consultation or chat transfer, the full name of the agent is used.

1. In Customer Service admin center, go to the workstream of the chat widget in which you need to configure the settings, select edit for the required chat widget, and on the **Chat channel Settings** page, go to the **Chat widget** tab.
2. In the **Agent display name** field, select one of the following options:
   - **Full name:** Full name of the agent.
   - **First name:** First name of the agent. By default, first name is selected.

- **Last name:** Last name of the agent.
- **Nick name:** Nickname of the agent. If a nickname is not available in the user record, the full name is displayed to the customers.

3. Select **Save**.

Configure proactive chat

Article • 04/04/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

A chat channel allows your customers to engage with customer service agents using the chat widget on a website. Proactive chat allows customer service agents to engage with customers by automatically inviting them to a chat conversation based on the configured rules. Proactively engaging with a customer at the time when they need help improves customer experience and satisfaction.

Information about the user journey, time spent on a web page, and more can be used to decide when to engage with a customer. You can control the proactive chat experience by using personalized trigger messages and configurable rules to define the target audience, time frame, and target location.

> **Note**
>
> Proactive chat can be triggered only on pages where the chat widget is embedded.

Enable proactive chat in new admin apps

In Customer Service admin center or Omnichannel admin center, go to the workstream of the chat widget in which you need to configure the settings, select edit for the required chat widget, and on the **Chat widget** tab of the **Chat channel settings** page, set the toggle for **Proactive chat** to **On**.

Enable proactive chat in Omnichannel Administration

1. Sign in to Omnichannel Administration.
2. Open the chat widget for which you need to turn on proactive chat.

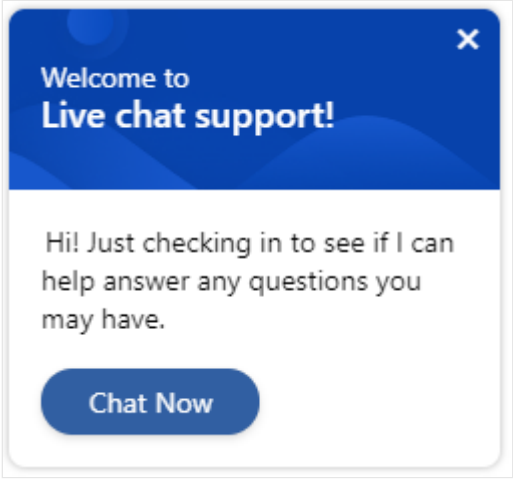
3. Go to the **General settings** tab.
4. Under **Proactive chat**, select **Yes** for **Enable Proactive Chat**. By default, it is set to **No**.

The conditions to trigger the proactive chat are defined in the web page code in which the chat widget is embedded. If the conditions are fulfilled, the proactive chat invitation is displayed with the help of an API.

For example scenarios and sample code, see Start chat proactively.

Customer experience of proactive chat

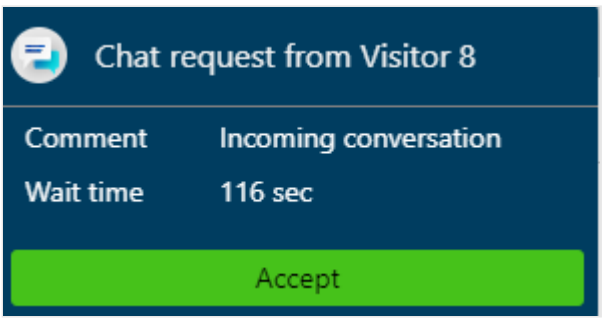
When proactive chat is enabled, the chat invitation is displayed to customers based on the configured triggers.



The customer can accept the chat invitation or close it. If the customer doesn't accept, the chat invitation is closed automatically after a minute. The one-minute timer for automatic closure can't be configured.

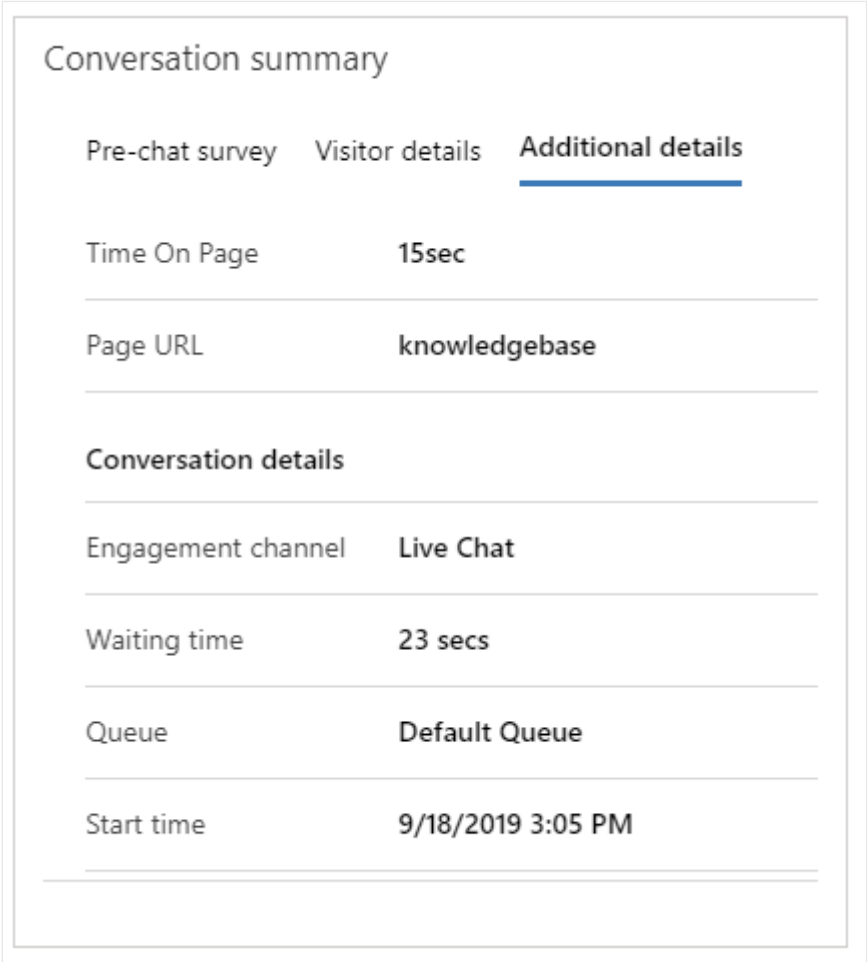
Agent experience of proactive chat

When a customer accepts the proactive chat invitation, an agent receives the notification.



The agent then accepts the chat request and starts conversing with the customer to provide the required help. The **Active Conversation** is loaded and displayed if the customer's details match the stored data.

If your administrator or developer configures the **Additional details** tab and if there are additional context variables, such as time spent on a page and the page URL from where the chat is initiated, they are displayed on the **Additional details** tab.



To learn more, see setContextProvider.

Proactive chat in Omnichannel for Customer Service

To view more videos on Omnichannel for Customer Service, see Videos.

Configure persistent chat

Article • 08/05/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Persistent chat is an asynchronous mode for the chat channel that allows conversations to happen over multiple sessions. Unlike in live chat, where customers and agents need to be available simultaneously, persistent chat allows users to leave the conversation between sessions and pick it up later.

Live chat and persistent chat share the same channel. If you need to configure both live and persistent chat widgets, create two separate workstreams and update the settings accordingly.

The primary differences between live chat and persistent chat are as follows:

Feature	Persistent chat	Live chat
Agent availability outside of operation hours	Allows customers to reach out to agents outside of working hours. If no agents are available, the conversation will remain open and the agent will receive the customer's messages during the operating hours.	Outside of operating hours, customers might not be able to chat with live agents.
Ending conversations	Customers can't end conversations from their side. Only agents can do it.	Both customers and agents can end the conversation by closing the chat.
Default system messages	Persistent chat doesn't display default messages about average wait time and queue positions, because a customer doesn't need to wait for an agent.	In live chat, the customer receives system messages about wait time. These messages can be overwritten in the **Settings** tab.

How persistent chat works

From the start of a conversation until the agent explicitly ends it, agents and customers will be able to see the history of the conversation in the chat widget. Customers can

close the chat widget and come back after a long time, and still see their history, with the ability to pick up where they left. When a customer is unresponsive for a long time, agents can attend to other conversations by moving their current conversation into a waiting stage, by selecting the ✕ button. Chats in a waiting stage do not take up agent capacity. When the customer comes back to the chat, the agent is notified and the conversation can be picked up and resolved.

Prerequisites

Make sure that the authentication settings are configured. More information: Create chat authentication settings

Set up persistent chat

In Customer Service admin center or Omnichannel admin center, select the **Make chats persistent** checkbox when you create the chat workstream. More information: Create and manage workstreams

Make sure that you set the **Keep same agent for entire conversation** toggle to **Yes** in the **Work distribution** settings of the workstream. More information: Configure work distribution

Set up persistent chat in Omnichannel Administration

> ⓘ **Important**
>
> Support for the Omnichannel Administration app ended on April 30, 2022. The app will be removed in July 2023. We recommend that you use the Customer Service admin center app to configure the latest features, such as unified routing and voice channel. More information: **Omnichannel Administration app is deprecated**

You can enable persistent chat in the chat widget settings for a chat channel.

Configure reconnection to a previous chat session

Article • 01/23/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

When customers are disconnected in the middle of a conversation—for reasons that can range from restarting their system while troubleshooting to network disruption—they can reconnect to the same agent, if you've enabled the settings for reconnection. The options to reconnect to the same agent help save time and effort, and improve customer satisfaction.

How reconnection to a previous chat works

When enabled, reconnection to the disconnected chat session can be initiated by using one of the following options:

- **Reconnect with a link**
  You can configure link information as a quick response for agents. If the agent anticipates that there will likely be a need to reconnect during a conversation, the agent shares the reconnection link with the customer. This option is available for both authenticated and unauthenticated chat widget settings. To configure the link, see Slug for reconnection link.

- **Reconnect through a prompt**
  Customers interacting through chat widgets that have authentication settings configured are presented with the option to continue with the previous session or start a new conversation when they come back to the chat session.

Additionally, you can cater to the timeout scenario by setting the following option:

- **Redirection link**
  You can optionally configure a redirection link for the customer to navigate to when they come back after a timeout period that is configured in the reconnection

settings. If no redirection link is configured, a fresh conversation will start when the customer selects the reconnect link.

> **Important**
>
> The reconnection feature works as designed only when the following prerequisites are met for the conversation:
>
> - The customer connected again within the reconnection time that's configured for the feature.
> - The agent didn't end the session by using the **End** button.
> - The customer didn't end the session by closing the chat window.
> - If the agent closed the chat window, the customer might not be reconnected to the same agent.

Enable reconnection to a previous chat session

You can enable the reconnection options in the chat widget either while setting up the chat widget for the first time, or later, based on your needs.

To enable reconnection to a previous chat session

1. Go to one of the apps, and perform the following steps.

   Customer Service admin center

   - In the site map, select **Workstreams** in **Customer support**.

2. On the **Workstreams** page, select the workstream.
3. Select the chat widget for which you want to enable the reconnection option.
4. On the <***widget_name***> **Chat Widget** page, in the **Chat widget** area, select **Edit**.
5. On the Chat channel settings dialog, go to the **Chat widget** tab and set the **Reconnect to previous chat** toggle to **Yes**. The following options are displayed:

   - **Time limit**: Select a value to indicate the time within which the customer can connect back to the same agent. The agent's capacity is blocked for the specified duration unless the agent closes the session. If the customer fails to reconnect within the duration the conversation moves to the **Wrap-up** state.

- **Portal URL**: Specify the link that will be shared by the agent with the customer to reconnect to the chat session. This must be the portal link on which the chat widget is displayed.
- **Redirect URL**: Optionally, specify the link that the customer will be redirected to when the reconnect timeout occurs. If this is left blank, the customer will see the option to start a new chat conversation.

6. Select **Save and Close**.

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

During live chat, a customer can no longer chat with the agent if they leave the conversation or stay disconnected for more than three minutes. When a customer is disconnected for more than three minutes, Omnichannel for Customer Service detects the disconnection, and automatically updates the conversation state of the chat.

When an ongoing chat gets disconnected, Omnichannel for Customer Service:

- Moves the chat from an **Open** to **Closed** state, so the agent knows that there's no customer to respond to.
- Moves the chat from an **Active** to **Wrap-up** state, and updates agent capacity, so the agent knows that the customer isn't available. You can configure agent capacity for the wrap-up state in the work distribution settings of the workstream. More information: Wrap-up state and Configure work distribution
- Record an automated message in the transcript to indicate that the customer has disconnected. More information: Configure automated messages

What happens when a chat gets disconnected

Chat widgets are connected to browsers via a web socket connection. The connectivity can be lost for reasons like:

- The customer closed the browser but didn't close the chat widget at the end of the conversation.
- The customer navigated away from or closed the browser tab or app during the conversation. In some mobile devices, locking the screen or switching apps can also disconnect the chat.
- The customer lost internet connectivity, or had a network or system issue.

In such situations, if the customer returns to the chat within three minutes, then they can continue the conversation.

If the customer reopens the chat widget after three minutes of disconnection, a new chat will begin. However, you can help your customers connect back to the previous chat by enabling reconnection. More information: Configure reconnection to a previous chat session

> **Note**
>
> A delay in sending messages doesn't affect your chat connection.

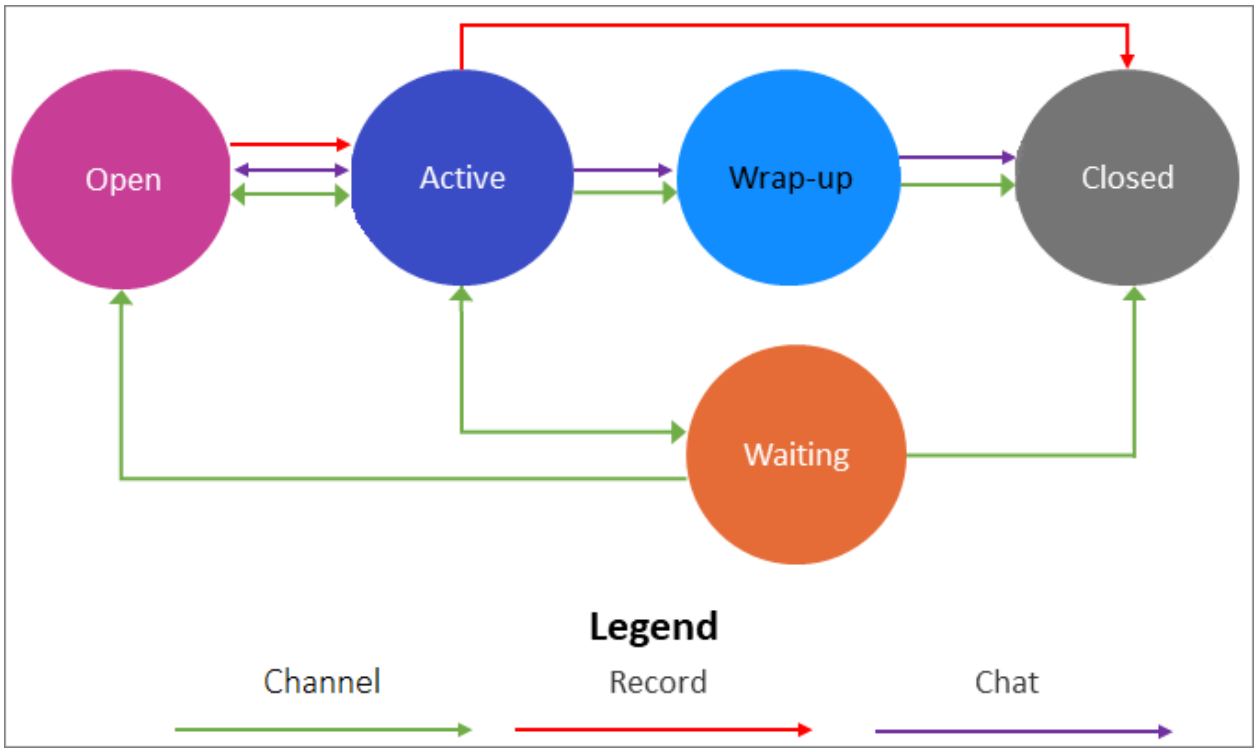
Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

This article explains the various states and status reasons of the conversation (work item) in Omnichannel for Customer Service.

The conversation can be in an open or closed state, and can have the following status reasons:

- Open
- Active
- Waiting
- Wrap-up
- Closed



Channel refers to SMS, voice, social, and Microsoft Teams channels supported in Omnichannel for Customer Service.

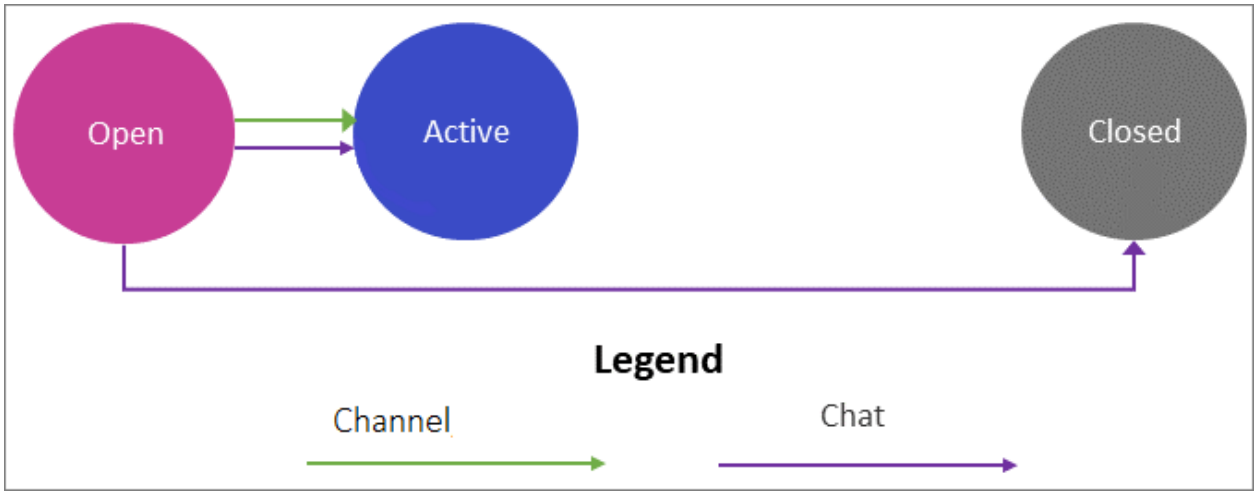
> **Note**
>
> Additionally, the conversation might have the resolved or scheduled status reason, which is for internal use only.

Open

The conversation (work item) that is in the queue and not assigned to the agent is classified under **Open** state.

The conversation (work item) transitions from **Open** to **Active** or **Closed** under the following scenarios.

From status reason	To status reason	Scenario	Type
Open	Active	When an agent picks the conversation from the **Open work items** stream. When the routing and work distribution feature pushes (assigns) the conversation to the agent.	Channel Chat
Open	Closed	When the customer disconnects or ends the chat before the conversation is assigned to the agent. More information: Understand disconnected chats	Chat

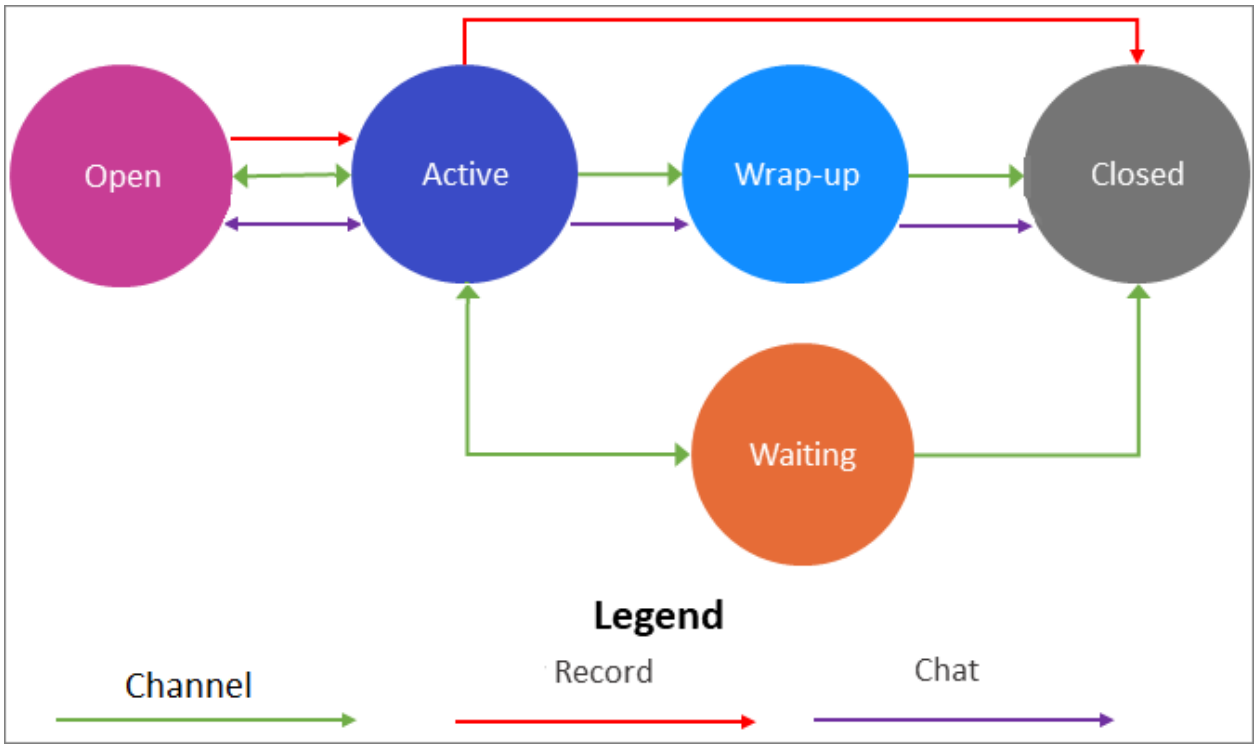


Active

The conversation that an agent picks or is assigned to the agent is classified under **Active**. In **Active**, the agent capacity is consumed.

The conversation (work item) transitions from **Active** to **Closed**, **Open**, **Waiting**, or **Wrap-up** under the following scenarios.

From status reason	To status reason	Scenario	Type
Active	Wrap-up	When an agent selects the **End** button on communication panel during the conversation with the customer. When customer ends the conversation by selecting the **End** button on the portal chat widget (only for a chat channel). When the customer is disconnected from the conversation (applicable only to Live chat channel).	Channel Chat
Active	Open	When an agent disconnects the conversation and don't reconnect within a specified timeout period. When an agent releases the conversation to the queue. When an agent transfers the conversation to another queue. When an agent closes the session while the conversation is active (applicable only to Live chat channel).	Channel Chat
Active	Waiting	When an agent closes the session (not ending the conversation by selecting the **End** button) while the conversation is active.	Channel The status change isn't applicable to Live chat.
Active	Closed	When an agent resolves the case (or get a record to non-active state) and closes the session.	Record

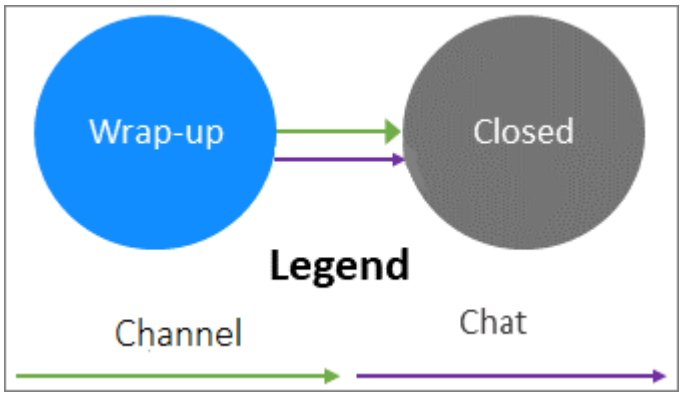


Wrap-up

This is an intermediate state after the agent ends the conversation, and does post-conversation activities such as taking notes and updating the customer information, before moving the conversation to the **Closed** state. In the **Wrap-up** state, the agent capacity is blocked according to the duration that the agent selects in the **Block capacity for wrap up** field in the workstream. If the agent selects **Always block**, their capacity is blocked as long as the conversation is in the **Wrap-up** state. If the **Don't block** setting is selected, the agent capacity is released as soon as conversation moves from **Active** to **Wrap-up** state. The agent might also select a duration ranging from 1 to 60 minutes. More information: Configure work distribution

The conversation (work item) transitions from **Wrap-up** to **Closed** under the following scenario.

From status reason	To status reason	Scenario	Type
Wrap-up	Closed	When the agent selects the **End** button in communication panel and closes the session.	Channel Chat



> ⓘ Note
>
> When a live chat conversation gets disconnected, Omnichannel for Customer Service will automatically move **Active** conversations to the **Wrap-up** state. More information: **Understand disconnected chats**

Waiting

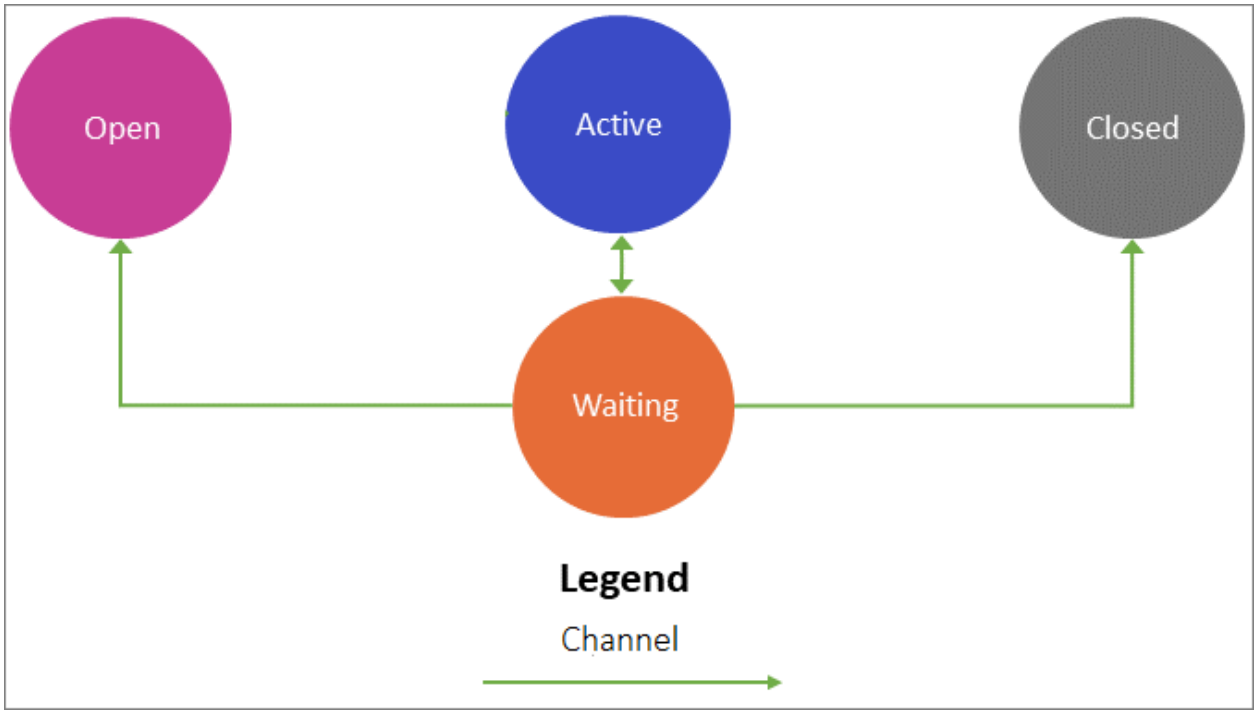
> ⓘ Note
>
> Waiting state applies only to asynchronous and persistent chats, and not live chats.

A conversation in waiting doesn't block their capacity. The conversation gets transitioned to waiting when the agent closes the session without ending the conversation (that is, without selecting the **End** button on the communication panel) or when the customer closes the browser window without closing the chat widget. For example, the agent is waiting for some information from customer and don't want to end the conversation or the customer's browser closes unexpectedly.

The conversation (work item) transitions from **Waiting** to **Closed**, **Active**, or **Open** under the following scenarios.

From status reason	To status reason	Scenario	Type
Waiting	Closed	When there's no activity on this conversation from either customer or agent, within inactivity timeout period.	Channel
Waiting	Active	When an agent revives the session from the **My work items** stream on **Omnichannel Agent Dashboard**.	Channel
Waiting	Open	When the customer revives the conversation within a specified timeout period while the session is still active in	Channel

From status reason	To status reason	Scenario	Type
		the browser.	



Closed

The conversations that are completed by ending them or closing the session are classified as **Closed** conversations. Agents can't reactivate or reopen closed conversations.

Show customers their position in a queue

Article • 04/25/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

As an administrator, you can turn on the feature that notifies a customer of their position in the queue and the average wait time when they're waiting to chat with an agent. You can help set customer expectations when wait times are longer due to higher volumes of customers needing support, understaffing, or longer-than-expected handle times (for example, new issues or new agents). Knowing their queue position can help the customer decide whether to wait in the queue or come back later.

When this feature is turned on, a customer who submits a request when other customers already are waiting is placed in the queue and notified with the following message: **People ahead of you: <n>.**

The number of customers waiting to chat gets updated each time a customer in line is served. When no other customer is ahead in the queue, the customer waiting is notified with the message: **You're next in line....**

> **Note**
>
> - The queue position is shown only when there is a queue of customers waiting (for example, when no agents are currently available).
> - In a scenario where a customer is waiting in the queue and another customer who has been waiting longer is transferred over by an agent, the customer who has been waiting longer is served first, and the other customer does not see a position change in the queue.
> - If skill-based routing is configured with exact skill match, the queue position that is displayed to a customer on the chat portal widget might not be accurate; therefore, the assignment of an agent to the customer might take longer than expected.

- The queue position isn't supported for persistent chats. More information: **Configure persistent chat**

Enable queue position setting

To configure the queue position setting:

1. Sign in Customer Service admin center, and then go to the workstream of the chat widget for which you want to configure the queue setting.
2. Select **Edit** for the required chat widget, and on the **Chat channel Settings** page, go to the **Behaviors** tab.
3. Enable the **Customer wait time** toggle and select the checkboxes to show customers their position in the queue and the average wait time when they're waiting to interact with an agent.
4. Select **Save and Close**.

Show customers their average wait time in a queue

Article • 04/04/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Overview

As an administrator, you can enable the feature that displays a customer's average wait time in the queue to start a chat with an agent. It helps set customer expectations when wait times are long because of a high volume of customers needing support, understaffing, or long call-handling times. When you display the average wait time to the customer, the customer can decide whether to wait in the queue or return to the chat later.

With this feature turned on, when customers are placed in the queue, they'll receive the notification: **Average wait time <n> mins.**

The average wait time is calculated based on wait times from the previous 48 hours and a minimum of 50 conversations for the specific queue. This is an estimated time, and doesn't change for the customer. The average wait time is displayed only if the wait is one minute or longer. When there's no wait, the average wait time isn't displayed.

> **Note**
>
> If skill-based routing is configured with exact skill match, the queue position that's displayed to a customer on the chat portal widget might not be accurate; therefore, the assignment of an agent to the customer might take longer than expected.

Enable average wait time

If you're using Customer Service admin center or Omnichannel admin center, follow these steps:

1. Go to the workstream of the chat widget in which you need to configure the settings, select edit for the required chat widget, and on the **Chat channel Settings** page, go to the **Behaviors** tab.
2. Select **Customer wait time** if you want to show to customers their position in the queue and the average wait time when they're waiting to interact with an agent.
3. Select **Save and Close**.

If you're using Omnichannel Administration, follow these steps:

1. Go to **Channels** > **Chat**, and open the chat widget in which you need to configure the settings.
2. Select the **General settings** tab.
3. In the **Customer waiting** area, change **Show average wait time** to **Yes**. By default, it's set to **No**.
4. Select **Save**.

Delete a configured channel

Article • 05/27/2022

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

You can delete an instance of a configured channel or SMS number in scenarios such as when it isn't required, you don't want to receive messages on it, or the settings are corrupted.

Delete a configured channel

You can delete a channel instance in Customer Service admin center, Omnichannel admin center, or Omnichannel Administration.

1. Select a messaging channel such as Facebook.
2. On the page toolbar, select **Delete**.
3. On the confirmation dialog that appears, confirm the deletion.

If you want to reconfigure your social channel or SMS number in Omnichannel for Customer Service, follow the channel-specific instructions.

Delete a Facebook page

If you no longer want to receive messages on a Facebook page that you've configured for your Facebook channel in Omnichannel for Customer Service, you can go to the page and delete it.

1. In Omnichannel Administration, in the left pane under **Channels**, select **Facebook**.
2. Select the channel that contains the page you want to delete. The <***Channel_name***> **Facebook Application** page appears.
3. In the **Facebook Pages** area, do one of the following:

- Use **More Commands** to the right of the list to delete the required Facebook page.
- Select the required Facebook page, and then select **Delete** on the page that appears.

Manage enhanced Active Conversation settings

Article • 09/25/2023

The enhanced Active Conversation experience displays the customer and case details that are relevant to your business. When you enable the **Enhanced active conversation form** option, the **Customer 360**, **Case details**, and **Recent cases** components are available on the **Active Conversation** form by default. You can further customize these components in Power Apps.

- **Customer details**: Use the **Customer 360** component in **Account** > **Account form for Conversation Customer Card** form or **Contact** > **Contact form for Conversation Customer Card** to customize the details displayed on **Customer details**.
- **Case details**: Use the **Customer 360** component in **Case** > **Case for Customer Card** form to customize the details displayed on **Case details**.
- You can also set the required view to display case details in the **Issue Snapshot**. By default, the **Default view** is set to **Case Lookup View**.

More information: Configure components to display customer details and recent records.

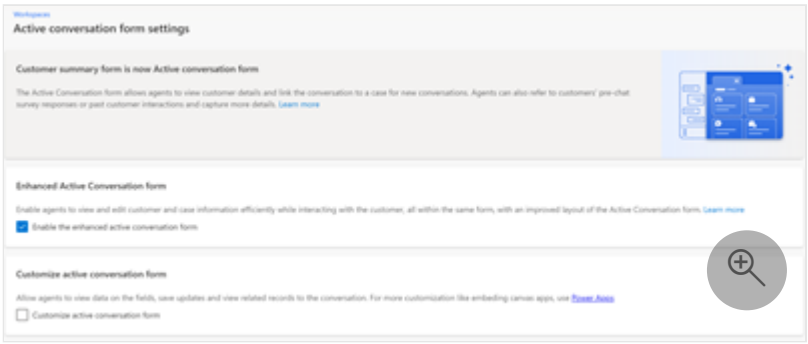
Manage Active Conversation form settings

To enable the enhanced Active Conversation form and customize the form, perform the following steps:

1. In Customer Service admin center, go to **Workspaces**.
2. Select **Manage** for **Active conversation form settings** in **Workspaces**.
3. Select the following options:
    - **Enhanced active conversation form** to enable the enhanced Active Conversation experience. The following features are available as a part of the enhanced experience:
        - Configurable **Customer 360** and **Case details** card with inline edit capabilities.
        - **Recent cases** card with color coded priority and status fields.
        - The default form selector to switch between active and closed conversations is hidden.

- **Customize active conversation form** to display **Queue**, **Start time**, options to save and refresh on the **Active Conversation** form, and enable customizations in Customizations supported by the Conversation form. Select **Power Apps** to further customize the form. If you're customizing the form in Power Apps, we recommend the following guidelines:
  - Reduce the number of custom controls. Keep only the most frequently used controls on the default tab. The remaining data-driven controls should be distributed into secondary tabs to allow the default tab to load quickly.
  - Limit the amount of customizations using the form Onload event.
  - Limit the amount of external data coming from Canvas apps for efficient and productive forms. More information: Design forms for performance in model-driven apps

> **Note**
>
> When **Customize active conversation form** is enabled:
>
> - If an agent initiates an outbound call to emergency services, the active conversation form doesn't display the **Save** and **Refresh** options.
> - If an agent initiates a consult with other agents who are from a different business unit and don't have the read permissions at the organization level for the conversation entity, they won't have access to the conversation.



Display the form selector on Active Conversation form

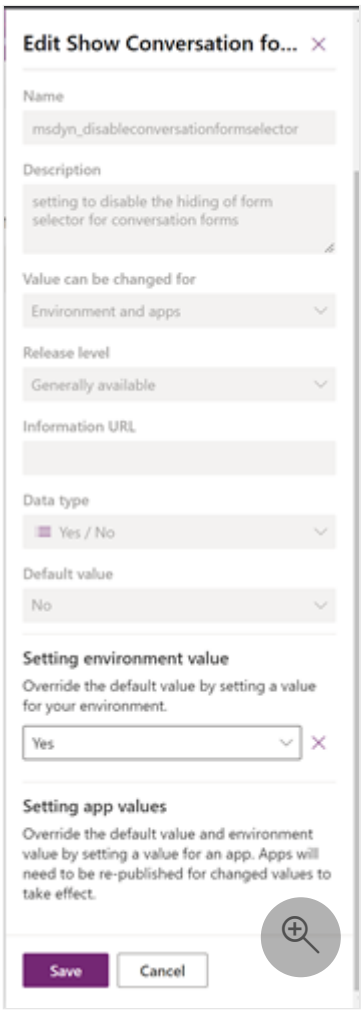
By default, the enhanced **Active Conversation** form doesn't display the form selector to switch between open and closed conversations. To allow your users to toggle between open and closed conversations, perform the following steps:

1. In Power Apps, add the **Show Conversation form selector** setting definition. More information: Add an existing setting definition

2. In the **Edit Show Conversation form selector**, set the **Setting environment value** option to **Yes**. More information: Update a setting definition

3. Optionally, in the **Setting app values** section, for a required app, you can set the value to **Yes** in the **New app value**. The tab set at the application level overrides the environment level setting.

4. Save and publish your customizations.



Customize recent cases

If you set the **Enhanced Active conversation form** toggle to **Yes**, the enhanced **Recent cases** control is available on the **Active Conversation** form, out of the box. If you've set the default view to a custom view in the legacy recent cases control, when you switch to the enhanced experience, your custom views aren't set as the default view automatically. You must set the default view to your required custom view in Power Apps.

To add your custom view as the default view and customize the form further, perform the following steps:

1. In Power Apps, select the environment that contains your solution.
2. Select **Tables**, select **Conversation**, and then select the **Active Conversation** form.
3. Select **Recent cases** on the **Form** area.
4. Perform the following actions in **Properties**:

    - Specify the **Table**. The card displays records from this table.
    - Select the **Default view** to your required custom view.

Disable enhanced customer details, case details, or recent cases

You can choose to display the default **Customer profile**, **Issue snapshot**, or **Recent cases** cards on the enhanced **Active Conversation** form even when **Enhanced active conversation form** is enabled.

The following options are available out of the box in Power Apps:

Option	Description
Disable Customer 360 card for Open Conversation	Set this option to **Yes** to display the default **Customer profile** card.
Disable Linked Case card for Open Conversation	Set this option to **Yes**, to display the default **Issue Snapshot** card.
Disable the recent cases control for Open conversation	Set this option to **Yes**, to display the default **Recent cases** card.

Perform the following steps to revert to the required default experience:

1. In Power Apps, select the environment that contains your solution.
2. Select **Solutions**, and then select the required solution.
3. Select **Add Existing** > **More** > **Setting**.
4. On the **Add existing Setting Definition** pane, select the required option.
5. Select **Add**.
6. Go to **Add Existing** > **App** > **Model-driven app**> **Add existing model-driven apps** pane.
7. On the edit pane for the required option, set **Setting environment value** to **Yes**.
8. Optionally, select **New app value** for the app. For a specified app, the value set at the application level overrides the environment level setting.

9. Select **Publish All Customizations**.

Agents using Omnichannel for Customer Service app

Article • 04/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Overview

The Omnichannel for Customer Service application on a web browser provides a unified and consistent single-view experience for the agents to view conversation details, Customer information, and access Line-of-Business applications from within the Omnichannel for Customer Service app. As an agent, you can use the app to manage the work items assigned, simultaneous customer sessions without losing the context of each session. You view the holistic data of the customer with the details of their previous interaction, which ensures you have all the available information to resolve the customer issue.

> **Note**
>
> - The omnichannel provisioning provides the Omnichannel for Customer Service app and is available to the users working with Chat for Dynamics and SMS.
> - As of now, administrators or system cutomizers can't integrate third-party channels with Omnichannel for Customer Service app.
> - Omnichannel for Customer Service uses third-party cookies for authentication. Make sure that the cookies are not blocked in your browser in any mode so that certain services, such as agent or supervisor presence, can work properly.

Introduction to the agent interface of Omnichannel for Customer Service

Article • 08/19/2021

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

The Omnichannel for Customer Service app for Dynamics enables organizations to instantly connect and engage with their customers via channels like Chat for Dynamics 365 Customer Service and SMS. The app provides context rich multitasking experience across different customer sessions.

Value propositions of Omnichannel for Customer Service app

- **Unified experience:** The app provides unified and consistent single-view experience for the agents to view conversation details, Customer information, and access Line-of-Business applications from within the Omnichannel for Customer Service app.
- **Multiple session and application management:** The app enables agents to handle multiple sessions and manage contextual applications (app tab panel) related to the sessions with ease, which in turn leads to less errors, faster case resolution, and customer satisfaction.
- **Deployment and upgrade:** The app is available as a web application (thin client), which makes the maintenance easy and the upgrades are seamless.
- **Extensibility:** The app is built on the Unified Interface framework, which makes easy for the developers and system customizers to customize and extend the app.

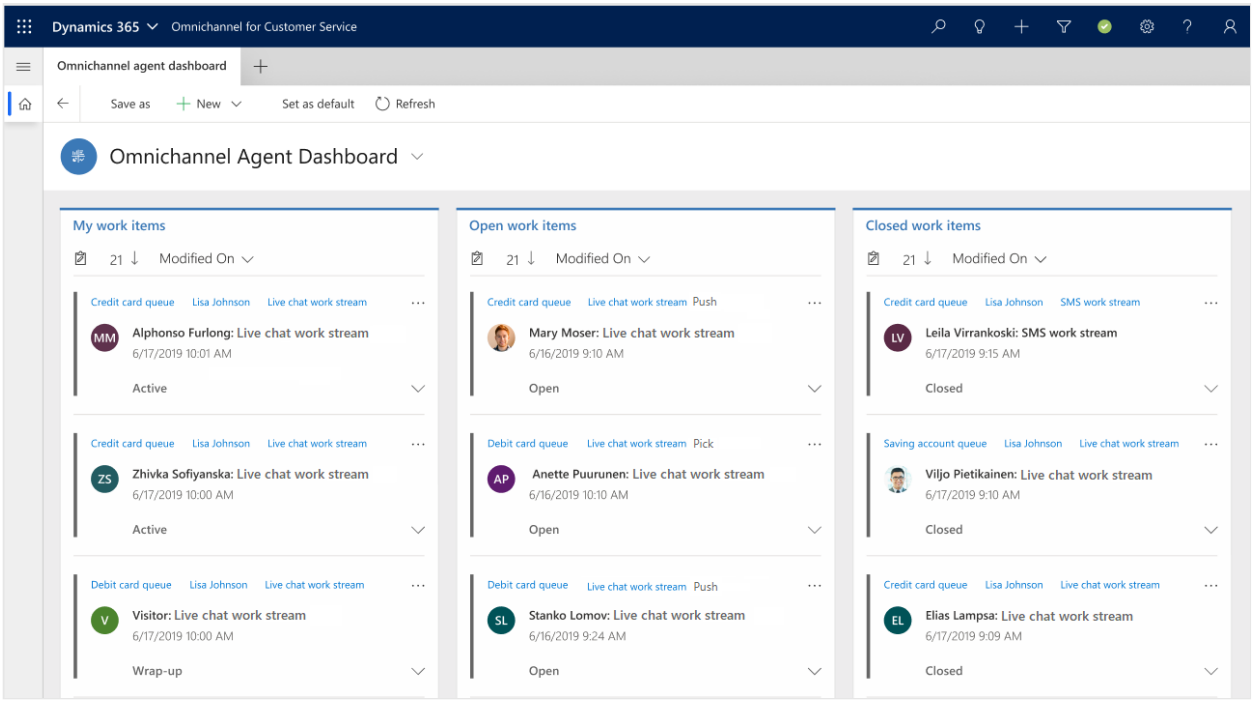
High-level feature capabilities for the agents

As an agent, you might engage with several customers simultaneously across different channels but managing all the customer sessions is a challenge, especially switching

between the sessions while understanding the context of the engagement. Omnichannel for Customer Service provides a consistent experience regardless of the support channel and organizations can maximize agent productivity.

Omnichannel for Customer Service provides the following key capabilities:

- Agent dashboard
- Multiple sessions
- Application tabs associated with sessions
- Active Conversation
- Communication panel
- Presence management
- Notifications
- Consult with agents and/or supervisors
- Transfer conversation to another agent or queue
- Capture notes specific to the conversation

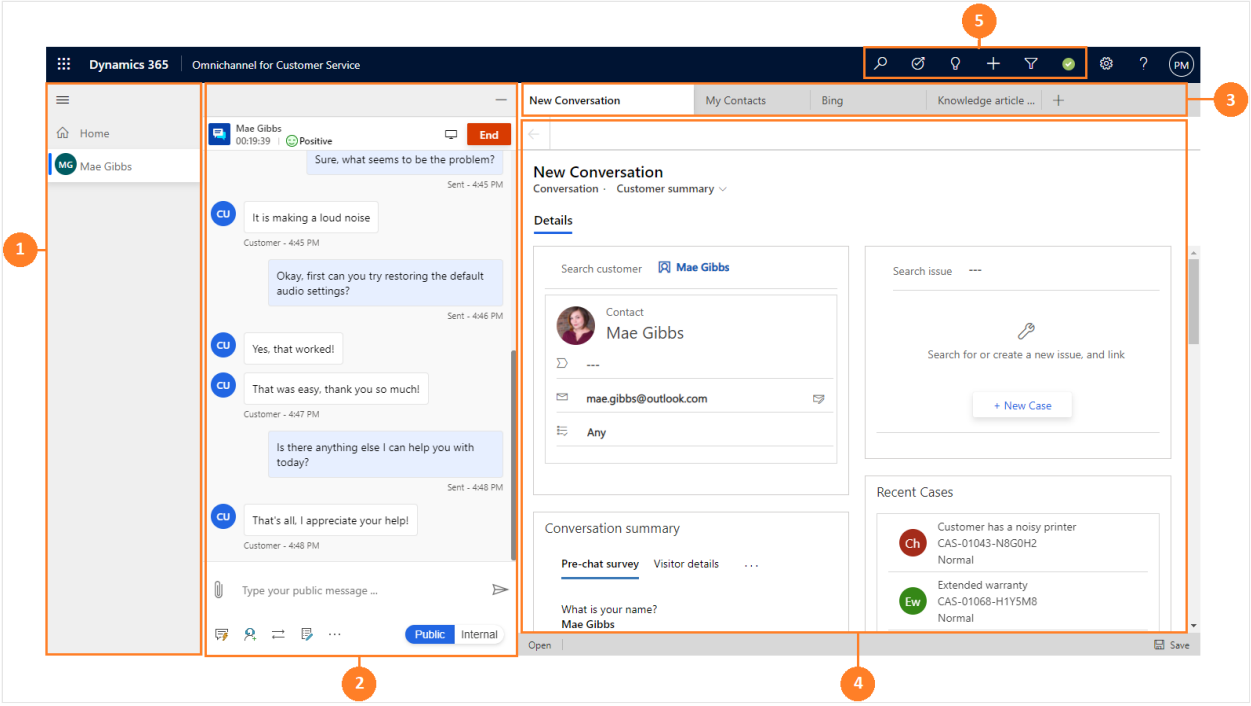


Components in the agent interface

When you start a chat session in Omnichannel for Customer Service, the agent interface has the following components:

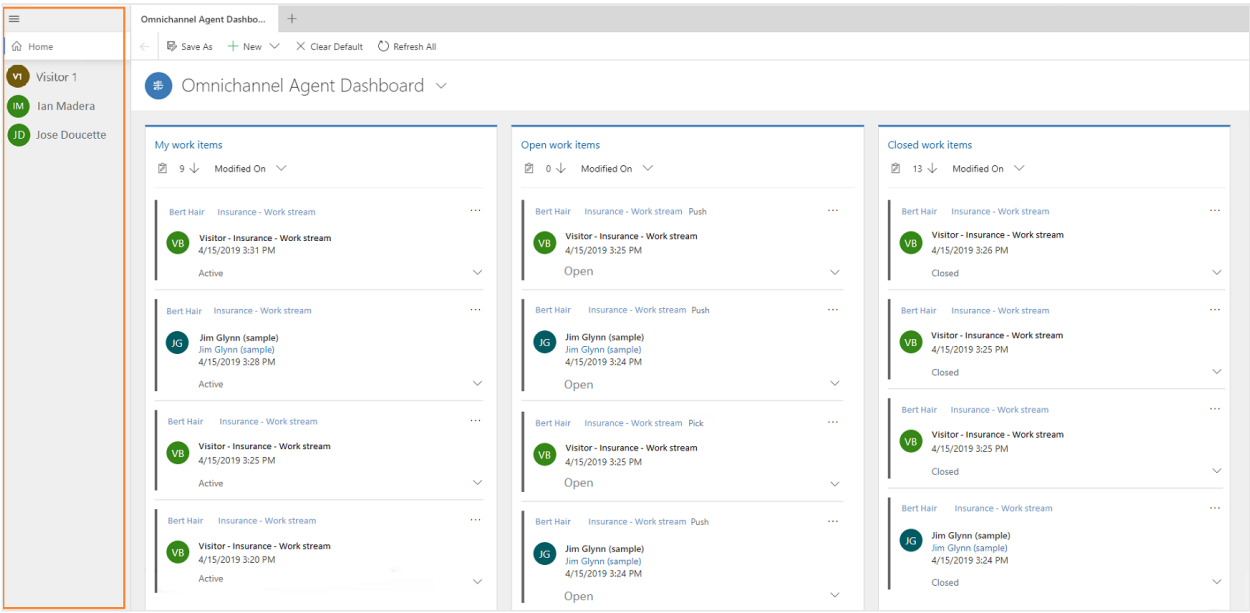
- Session panel
- Communication panel
- Application tab panel

- Unified Interface application area
- Search, quick create, and presence



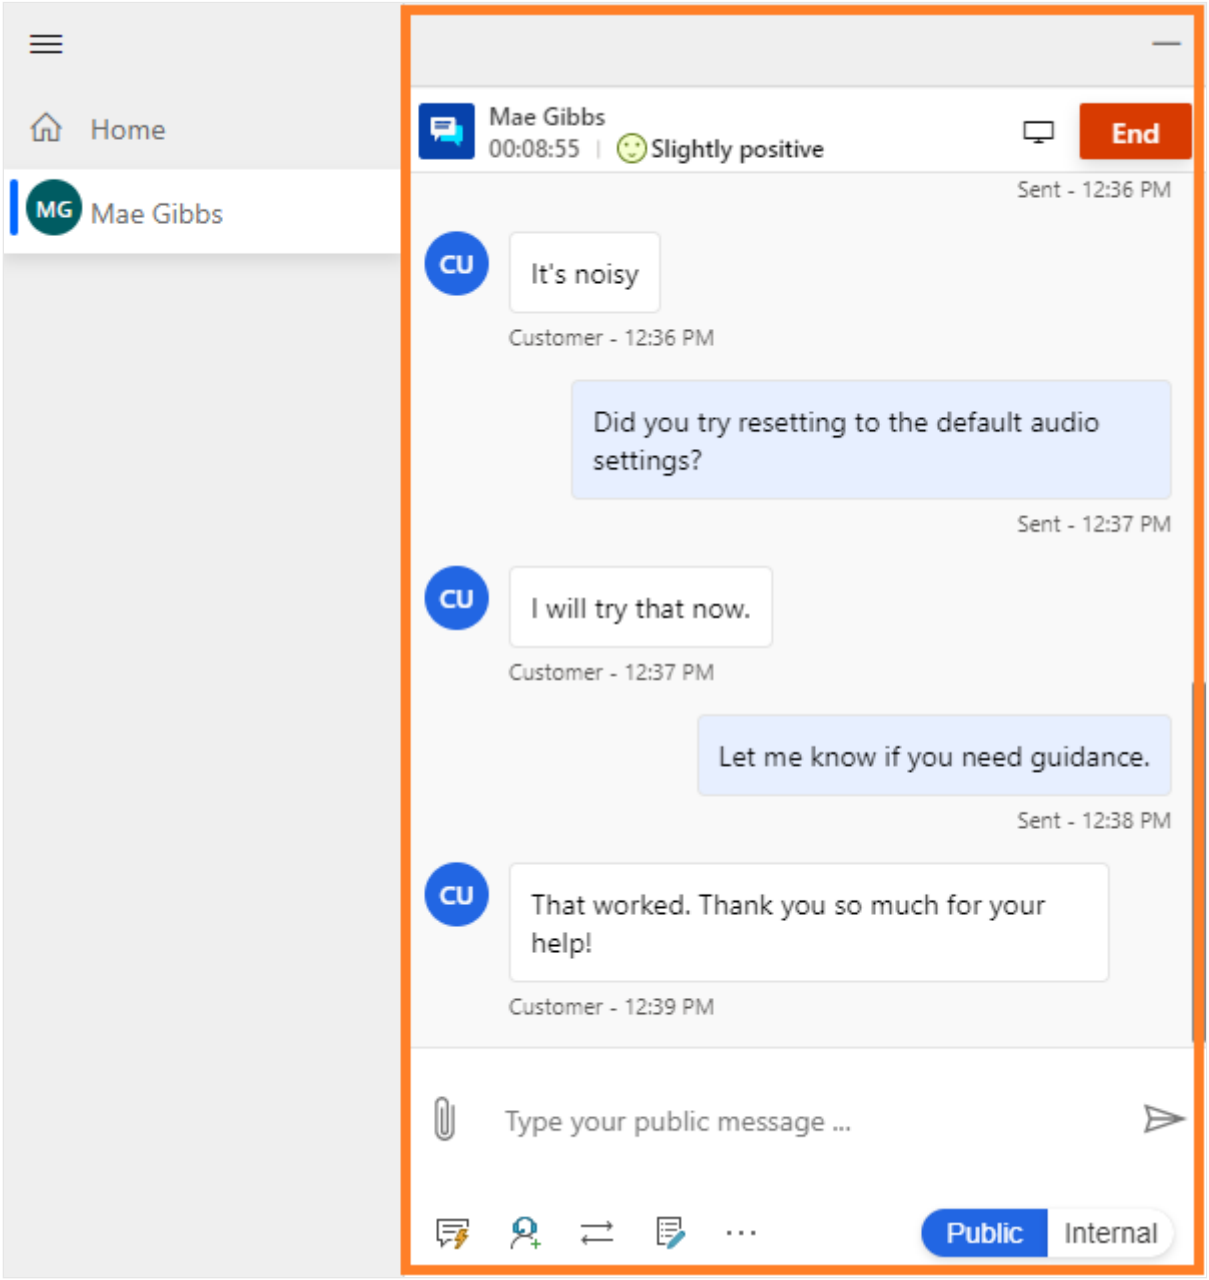
Session panel

The vertical panel on the left side is the session panel that allows you (the agent) to work on multiple customer sessions simultaneously. In addition, as an agent you can switch between sessions without losing context of the conversation and customer details. The ability to handle multiple sessions simultaneously (while preserving customer context) allows you to resolve issues faster and achieve higher productivity.



Communication panel

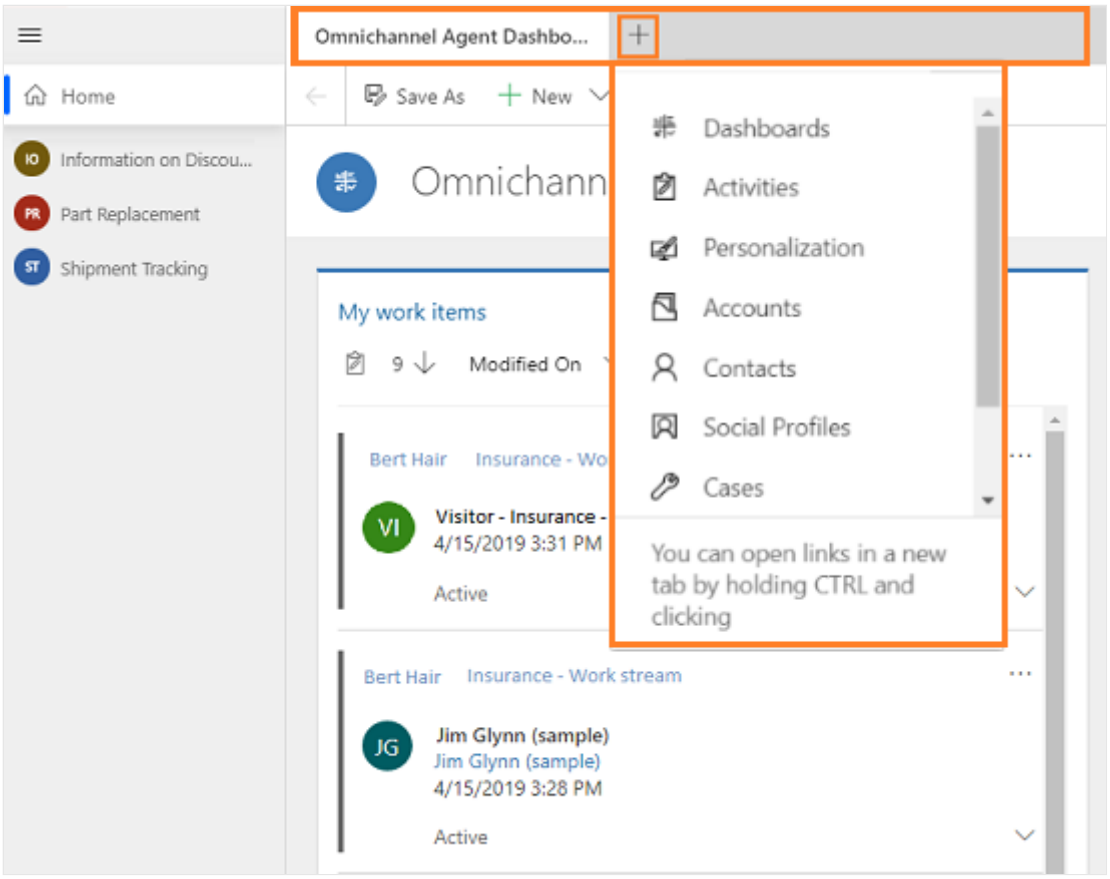
The communication panel is where you, as an agent, interact with your customer. When you sign in to the application, by default, the communication panel is in hidden mode. That is, the communication panel appears on the left side next to the session panel only when you accept an incoming conversation request. To learn more, see View communication panel.



Application tab panel

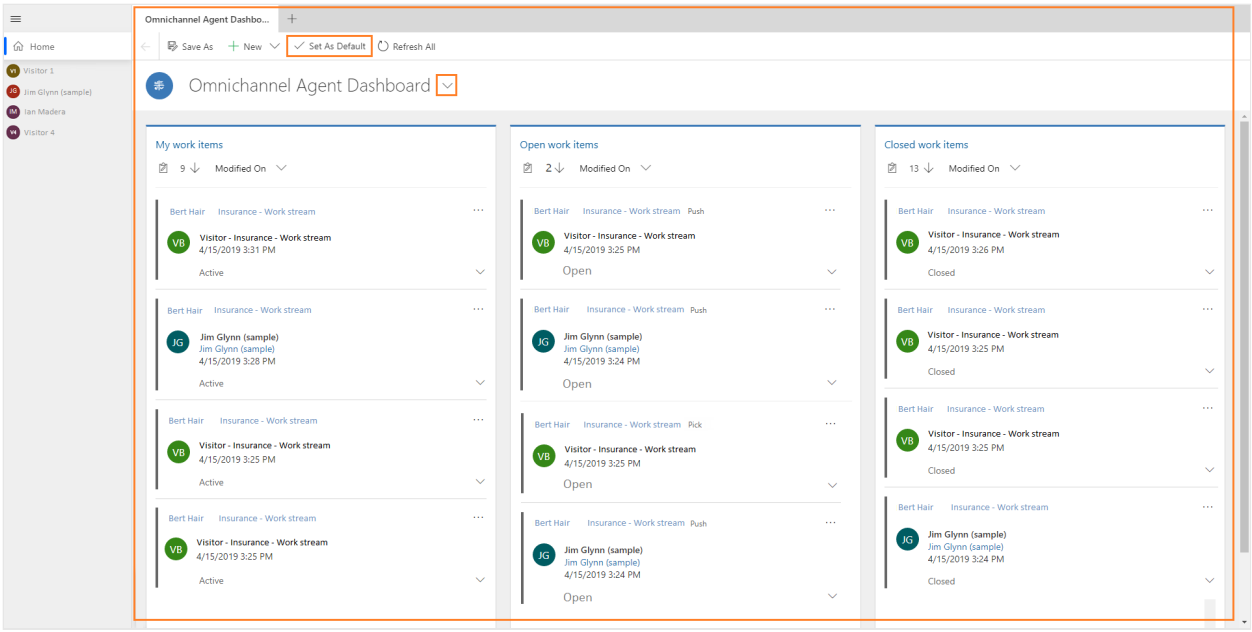
The horizontal bar below the navigation bar is called the application tab panel. Every customer session has at least one that is not closable. The Application tab has a + icon. If you select the icon, the menu that has options that are made available by your administrator. The menu shows the out-of-box and custom entities. Also, you can access

any third-party applications that are extended within Omnichannel for Customer Service app. Select the option from the list to open it in the application tab.



Unified Interface application area

When you sign in to Omnichannel for Customer Service, as an agent, in the application area, you see a dashboard that is set as default by your administrator. If set as default, Omnichannel Agent Dashboard shows the different work items in streams, and the dashboard is present in the application tab of the **Home** session and you can't close the dashboard tab.

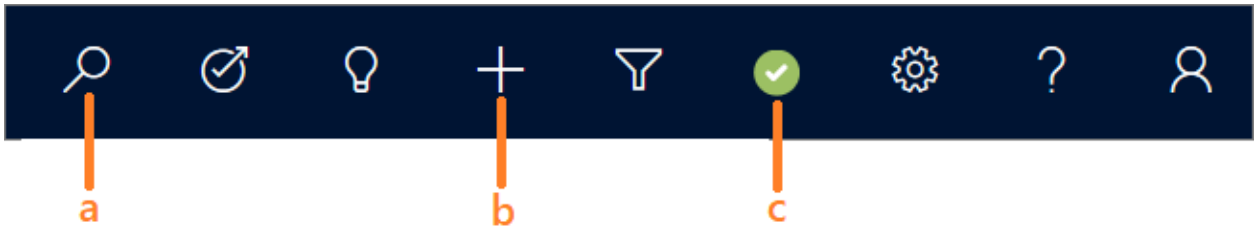


The dashboard shows the following work items: - **My work items** - **Open work items** - **Closed work items**

To learn more, see View agent dashboard and conversations (work items).

Search, quick create, and presence

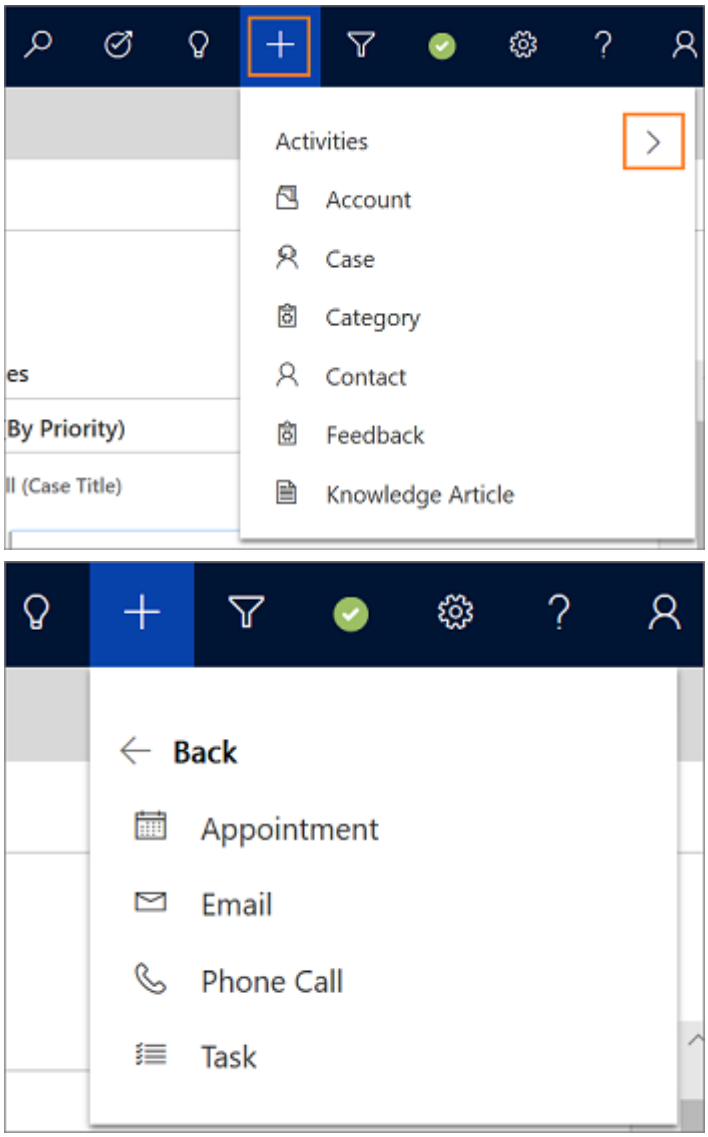
Search, quick create, and presence are the options present in the nav bar.



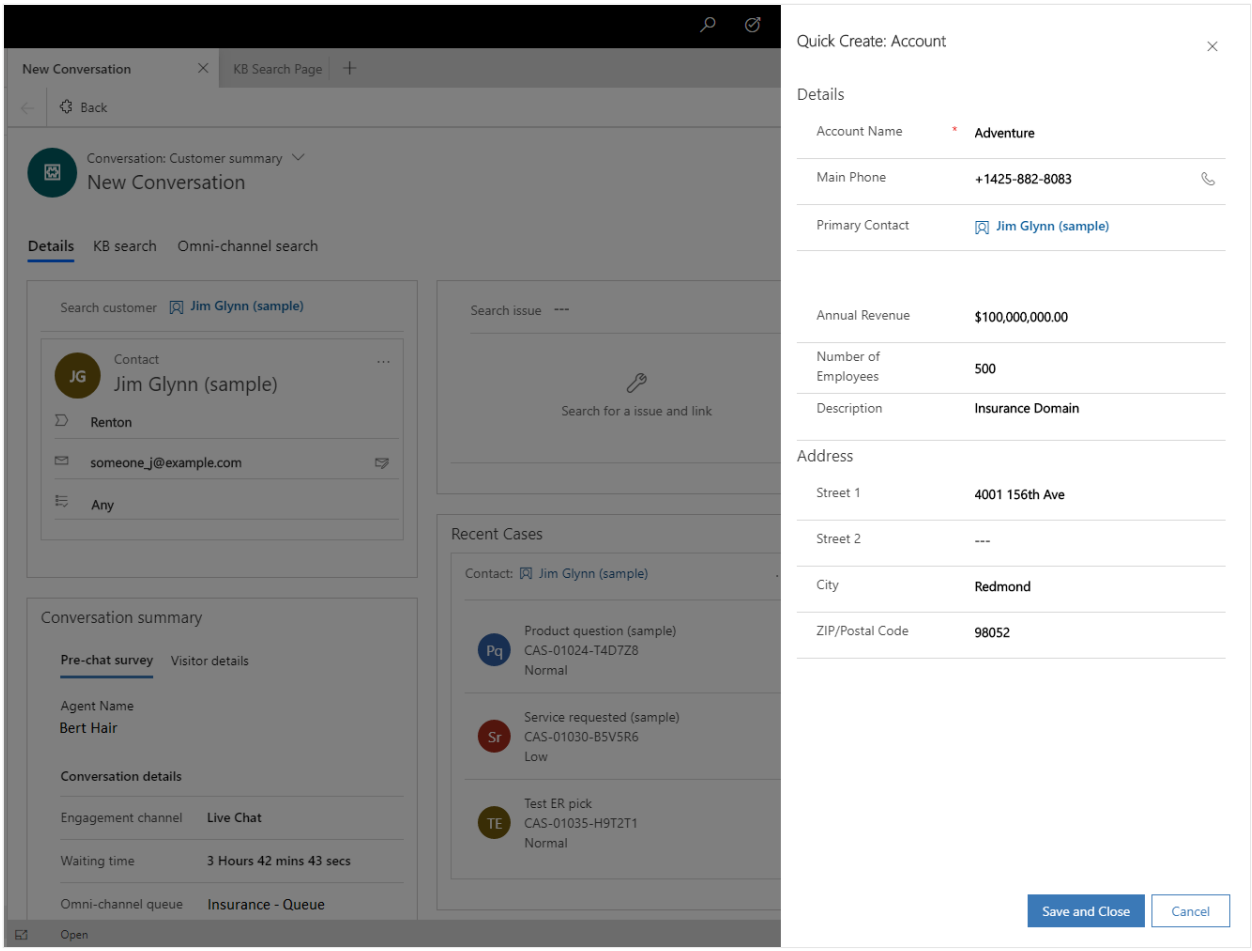
- **Search:** Do a simple search for records using the advanced search option and open the record in an application tab. Advanced Search is also called Categorized Search.
- **Quick create:** Add a new record. This option provides the list of related records that you can create. The following are the record types that you can create:
  - Activities
  - Appointment
  - Email
  - Phone Call
  - Task
  - Account
  - Case

- Contact
- Knowledge Article

Select the expand button next to Activities to create different activities.



When you select any record, the application displays a new quick create form. For example, select the **Account** record from the list. The application displays the **Quick Create: Account** form. Specify the details in the fields and save the form.



- **Presence:** Set presence as per your availability. Select the icon to launch the presence dialog and use the dropdown list to select a status. To learn more, see Manage presence status.

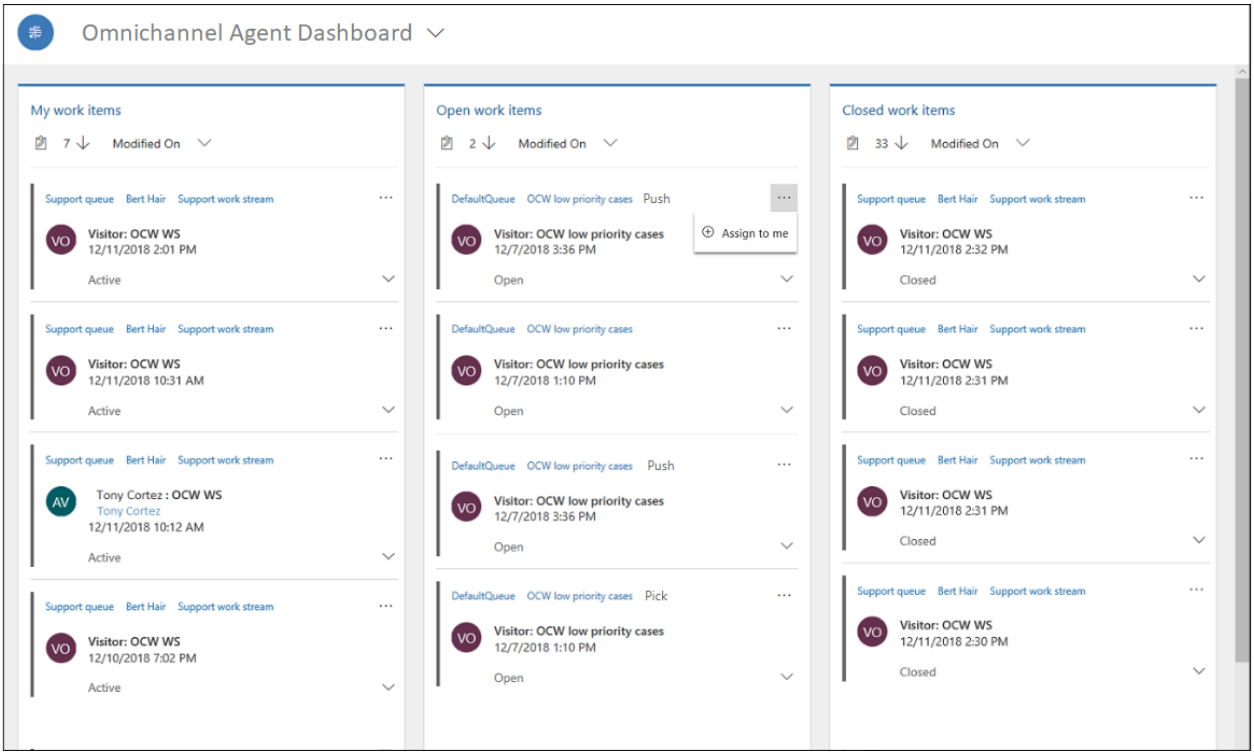
Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

When you sign in to the Customer Service workspace or Omnichannel for Customer Service app, the Omnichannel Agent Dashboard is the default view. You can set any dashboard as the default view by selecting the **Set As Default** option. The dashboard displays the following streams:

- My work items
- Open work items
- Closed work items



My work items

In the **My work items** section, you can see the conversations (work items) that you are actively working on. Select the ellipsis and select the **Open** option to open the work

item in a session.

Open work items

In the **Open work items** section, you can see the conversations (work items) that are in an open state from all queues in which you are added as member. Select the ellipsis and select the **Assign to me** option to assign the work item to yourself. A session starts for the pick action. When you select a work item, you get a notification, and when you accept it, a session starts and the **Active Conversation** or case page loads.

The work item that you pick is moved from the **Open work items** section to the **My work items** section. If you reject the request, then the work item remains in the **Open work items** section.

Closed work items

In the **Closed work items** section, you can see all the conversations that you've closed on the same day. To view a closed work item, select its ellipsis button (**...**), and then select **Open** to view the details.

When you open a record from the **Closed work items** section, you can view the attributes of the closed conversation record. This will not reopen or reactivate the conversation.

Sort work items

On the dashboard, you can sort work items by the following categories:

- Modified On
- Work distribution mode (for open work items only)
- Customer
- Work stream
- Created On
- Transfer Count

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> This feature is intended to help customer service managers or supervisors enhance their team's performance and improve customer satisfaction. This feature is not intended for use in making, and should not be used to make decisions that affect the employment of an employee or group of employees, including compensation, rewards, seniority, or other rights or entitlements. Customers are solely responsible for using Dynamics 365 Customer Service, this feature, and any associated feature or service in compliance with all applicable laws, including laws relating to accessing individual employee analytics and monitoring, recording, and storing communications with end users. This also includes adequately notifying end users that their communications with agents may be monitored, recorded, or stored and, as required by applicable laws, obtaining consent from end users before using the feature with them. Customers are also encouraged to have a mechanism in place to inform their agents that their communications with end users may be monitored, recorded, or stored.

A notification is a visual alert that appears each time you get a chat or an SMS conversation request from a customer. When you get the notification, you see the details about the customer with whom you're going to interact. When you accept the request, a session is started, and you can view the contextual information of the customer and case on the **Active Conversation** page.

Here are some scenarios where you might receive notifications:

- Case assignment if record routing is configured using workstreams for unified routing
- Incoming chat conversation
- Incoming SMS conversation
- Conversation (work item) assignment

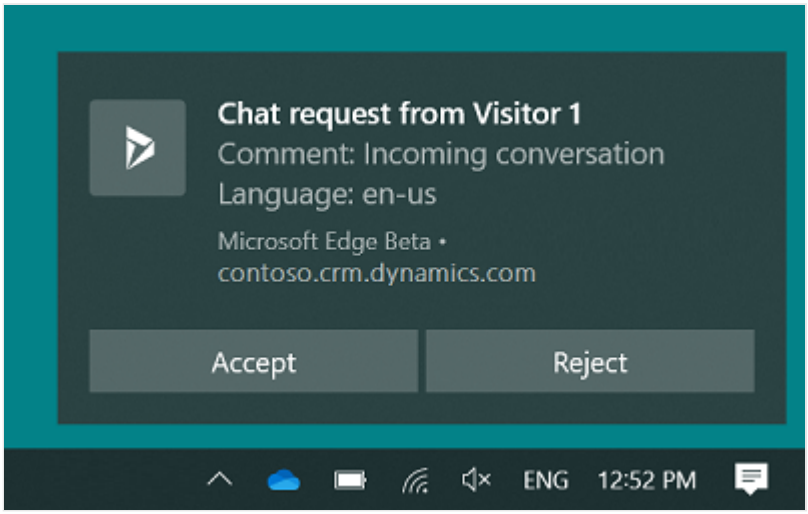
- Conversation transfer
- Conversation escalation
- Conversation escalation from a bot

Receive notifications when the app is in the background

Agents can receive notification alerts on their desktop always or only when the Customer Service workspace or Omnichannel for Customer Service app isn't in focus. These notifications help ensure that agents won't miss any conversation requests. Some scenarios where the app isn't in focus might include:

- The agent has minimized the app.
- The agent is working in another browser window.
- The agent is working on another tab of the browser.
- The agent is using two screens, and is on the screen that doesn't have either the Customer Service workspace or Omnichannel for Customer Service app.

> **Note**
>
> The **Always(preview)** option for **Show Desktop Notifications** is in preview. To use this feature, it must be turned on and the license terms must be accepted. **What are Preview features and how do I enable them?**.



You can accept or reject the conversation request by selecting a button on the desktop notification. When you accept the conversation request, the app is made active and displayed to you, and a session is started.

If you select the notification message body and not a button, the app is made active, and the notification is displayed to you in the app. Then you can choose to accept or reject the conversation by selecting the appropriate button.

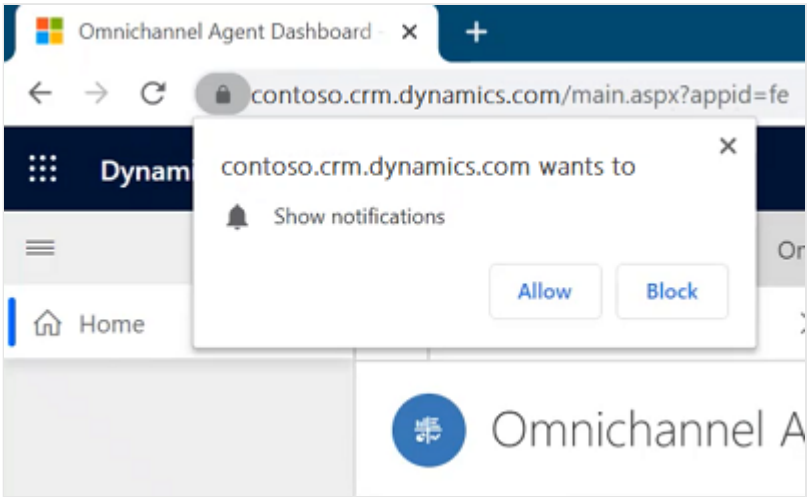
The wait time that's configured by your administrator applies to the desktop notification but doesn't display on it.

That is, your administrator has configured the wait time as 90 seconds and set the **Show Timeout** field to **No**. Now, when you get a notification, the wait time won't be displayed on the notification. However, you have 90 seconds to take action. More information: Manage notification templates and settings

> **Note**
>
> The desktop notification theme is based on the Windows operating system theme and settings.

Allow your browser to show notifications

To get desktop notifications, you need to allow your browser to show notifications. When you get a browser notification, select **Allow**.



Types of notifications

There are two types of notifications:

- **Toast notifications:** Also known as a floating notification, is a notification message type where you receive information in a dialog that disappears after a stipulated time. This type of notification appears for conversation (work item) assignments, conversation escalations, and conversation transfer scenarios.

- **Alert notifications:** A type of notification where a dialog appears with action buttons. When you select **Accept**, a screen pops up with the active conversation details. You need to take an action within the stipulated time, and the notification disappears when the time is up.

Based on your organization's configurations, you can't reject conversations. The application performs one of the following actions when an incoming notification appears:

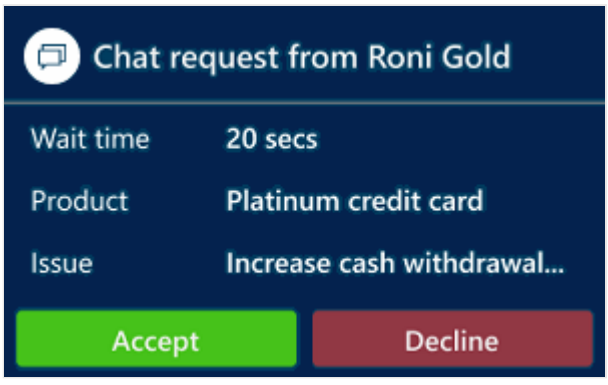
- Creates a work item and assigns it to you automatically.
- Automatically accepts the conversation and opens a new session.

Incoming voice call notifications

You'll receive a voice call notification for an incoming call request after an intelligent bot processes the call. For information on how the call is processed and the call controls that are available to you, see Use agent dashboard and call controls in the voice channel.

Incoming chat notifications

You receive a notification for an incoming chat request. When you accept the chat request, you'll see details about the customer in the **Active Conversation** page. A simultaneous session starts, and a chat window expands so you can exchange messages with the customer.

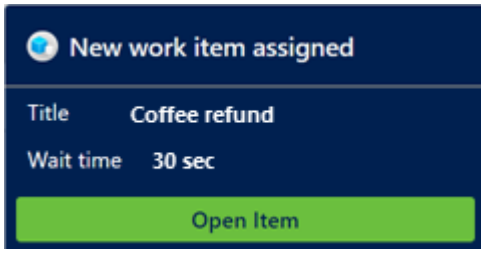


The details you'll see for a chat channel are as configured by your administrator.

Case assignment notification

If record routing is configured using unified routing and notifications are enabled, then when a case is assigned to you, you'll receive a notification with the open item option.

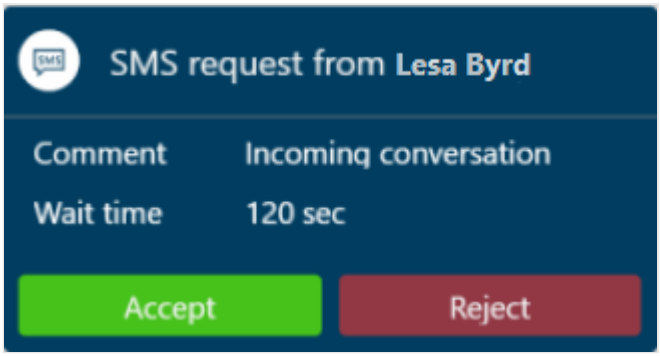
You can't reject the assignment, and irrespective of the notification timeout, the case will be assigned to you.



Incoming SMS notification

When you receive a notification for an SMS conversation request and you accept the SMS request, a session starts, and the communication panel appears in which you can exchange messages with the customer.

The customer is identified based on the **Mobile Phone** field information stored in the Contact record in Dynamics 365 Customer Service. That is, if the incoming SMS conversation is from a phone number stored in the mobile phone field of a Contact record, the conversation is automatically linked to the record.

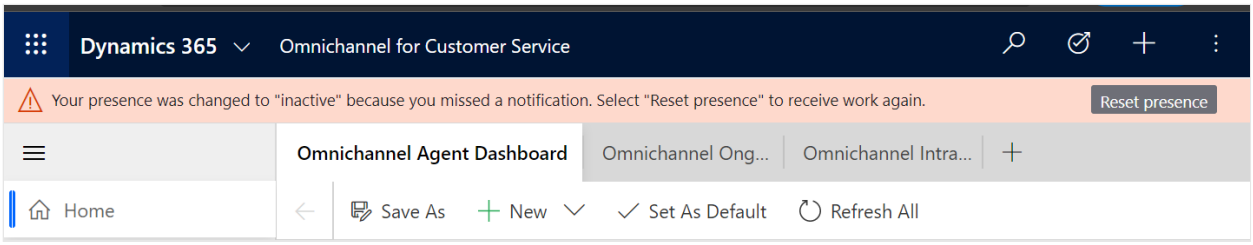


The details you see for an SMS channel are as configured by your administrator.

Missed notifications

> ⓘ **Important**
>
> - The alert is displayed only when the missed notifications feature is enabled by your administrator.
> - Missed notification alerts are not supported in Omnichannel for Customer Service on Unified Service Desk.

When you don't respond to an incoming conversation notification, you'll see an alert at the top of your dashboard and your presence status will be set to inactive. You can respond to the alert or change your status. Your presence will be reset to the status that was last defined by the system. You won't be assigned new tasks until your presence is reset to a state in which you can be assigned tasks, which is based on the allowed presence set in the workstream. Your supervisor can also reset your presence.



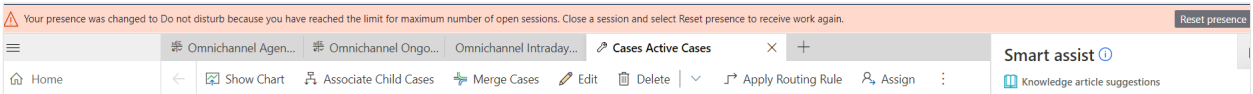
Notification time-out and rerouting of conversations

When you don't respond to an incoming conversation notification, the conversation will time out based on the time-out settings configured by your administrator and be rerouted.

Sometimes, you might see that conversations have been assigned to you without notifications showing up. This can happen when the notifications are sent by the system but they aren't seen because you had either closed the browser, navigated away from the app page, or had lost network connectivity before the notifications could be displayed. In such a case, while the system might take a few seconds to mark you as unavailable, it ends up assigning conversations to you. The conversations are then rerouted after eight minutes.

Maximum session limit notifications

When you already have 10 sessions open, which is the maximum multi-session limit, and a new work item comes in, you'll see an alert at the top of your dashboard and your presence status will be automatically set to **Do not disturb**. You won't be assigned new tasks until your presence is reset to a state in which you can be assigned tasks, which is based on the allowed presence set in the workstream. Your supervisor can also reset your presence.



Agent reject notifications

> **Important**
>
> - This alert is displayed only when the agent reject feature is enabled by your administrator.
> - Agent reject notification alerts aren't supported in Omnichannel for Customer Service on Unified Service Desk.

When you reject a work item notification, you'll see an alert at the top of your dashboard and your presence status will be set to **Do not disturb**. You can respond to the alert or change your status. Your presence will be reset to the status that was last defined by the system. You won't be assigned new tasks until your presence is reset to a state in which you can be assigned tasks, which is based on the allowed presence set in the workstream. Your supervisor can also reset your presence.

View the communication panel for conversations

Article • 09/28/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

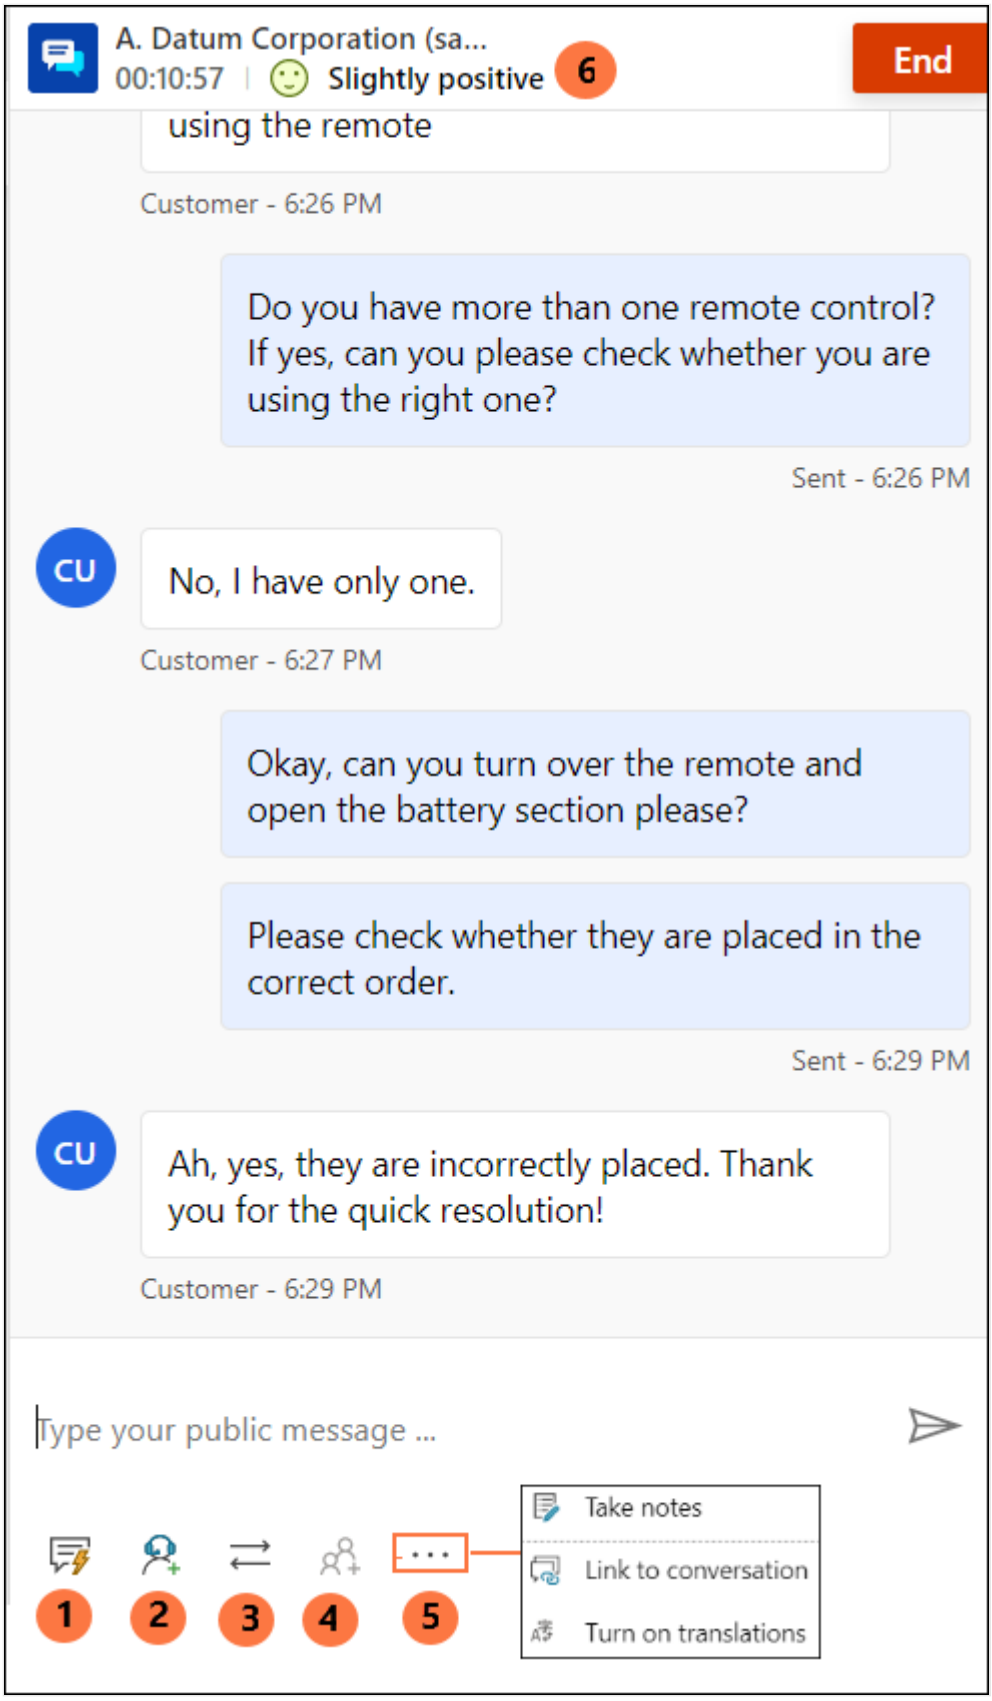
The communication panel is where you, as an agent, interact with your customer. When you sign in to the application, the communication panel is in hidden mode by default. You can view the communication panel only when you accept an incoming conversation to communicate with the customer.

If you want to minimize the communication panel, select **Minimize**. The communication panel is collapsed to a window in the left corner of the Active Conversation form, giving you more screen space.

You can increase or decrease the width of the communication panel for a specific channel by dragging the right edge of the communication panel to the left or right. The resized width of the communication panel is channel specific. For example, if you increase the width of the communication panel for chat, the next time you get a chat conversation, you'll see the resized panel. However, the width remains the same for another channel, such as WhatsApp. You can resize the communication panel when it is in the expanded mode only.

You can do the following tasks in the communication panel:

- Send quick replies.
- Search for and share knowledge articles with the customer with whom you are interacting.
- Transfer the conversation (work item) to another agent or queue.
- Use the consult option if you need help with resolving the work item.
- Generate a summary of the conversation. More information: View and share auto-summarized conversations



Enhance agent productivity using keyboard commands

The communication panel has options that you can use to perform actions, such as see quick replies, consult, and transfer, and launch notes control. You can also use keyboard

commands to perform these actions.

The following table lists the options and the keyboard shortcuts that you can use.

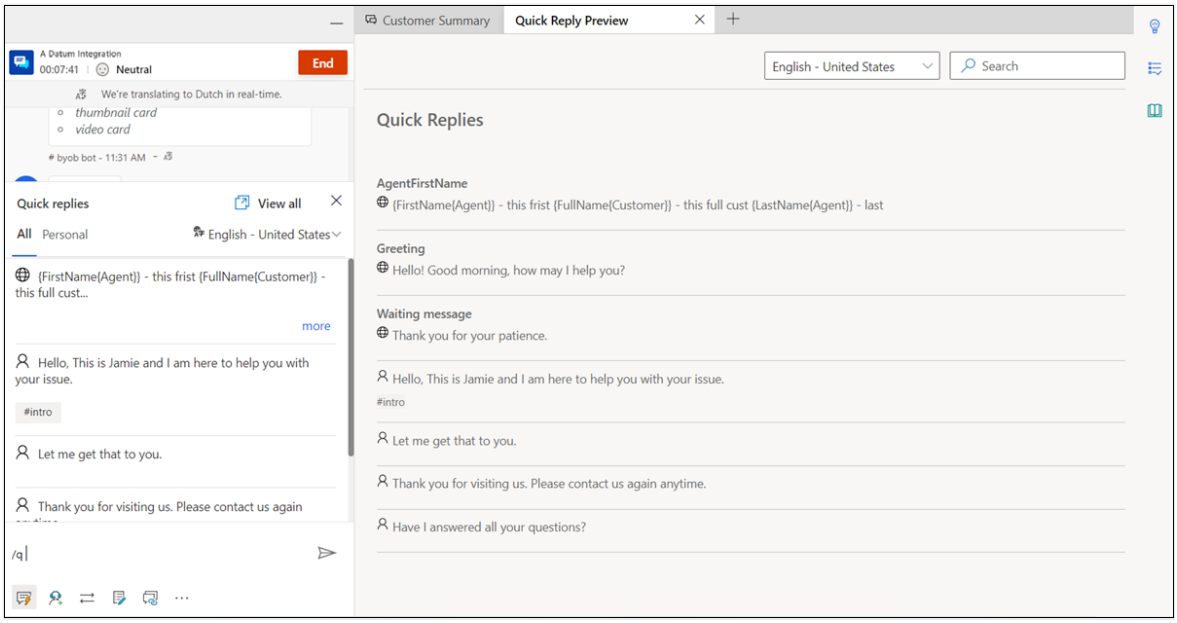
Annotation	Option	Description	command
1	Quick replies	Send templatized messages created by you as personal quick replies or quick replies created by your administrator	`/q`
2	Consult	View list to consult with other users	`/c`
3	Transfer	View list to transfer the request	`/t` and `/tq`
4	Add to chat	Is enabled when the second agent accepts a consult request	
5	- Take notes - Link to conversation - Translation	- Take notes specific to conversation - Link the record to this conversation - If translation of messages is enabled, you can turn on or off the translation	
6	Customer sentiment	View real-time customer satisfaction levels	

Send quick replies

The communication panel allows you to send predefined messages to a customer with whom you're interacting. These predefined messages are stored as quick replies.

Use the following options to use quick replies in your conversation:

- Select the **Quick replies** button to retrieve the messages and send them to the customers and or agents with whom you consult.
- Use a keyboard command to see the list of quick replies. Type the forward slash (/) key and the letter q (**/q**). When you type **/q**, the **Quick replies** panel is displayed.
- Select **View all**. The quick replies are displayed in the right pane. You can select a quick reply in the list to send to the customer. You can also choose a language of your choice and search for the quick replies.

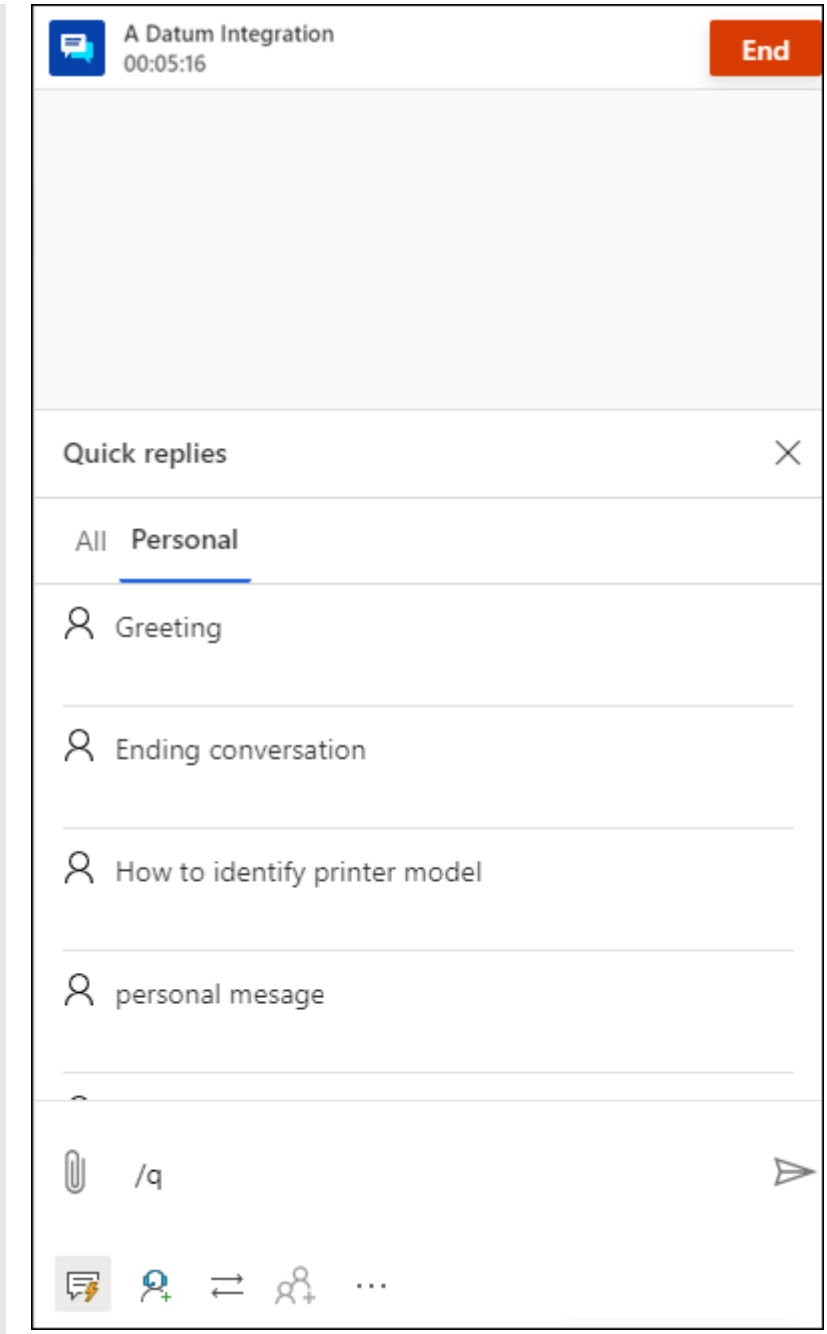


The quick replies can be created either by the administrator or by you. You can create personal quick replies if the administrator has enabled the option. The quick replies you created are available on the **Personal** tab of the **Quick replies** panel, and those created by the administrator are available on the **All** tab. Use the personal quick replies when you're in a conversation with a customer by doing the following:

1. Select the quick responses icon at the bottom of your conversation window. The **Quick replies** panel displays the available predefined messages on the **All** and **Personal** tabs.

2. Select the **Personal** tab, and type the number sign (#) in the compose box to list the tags and search for the personal quick replies that are available for your use.

3. Use the **more** option to view the complete text of the quick reply.



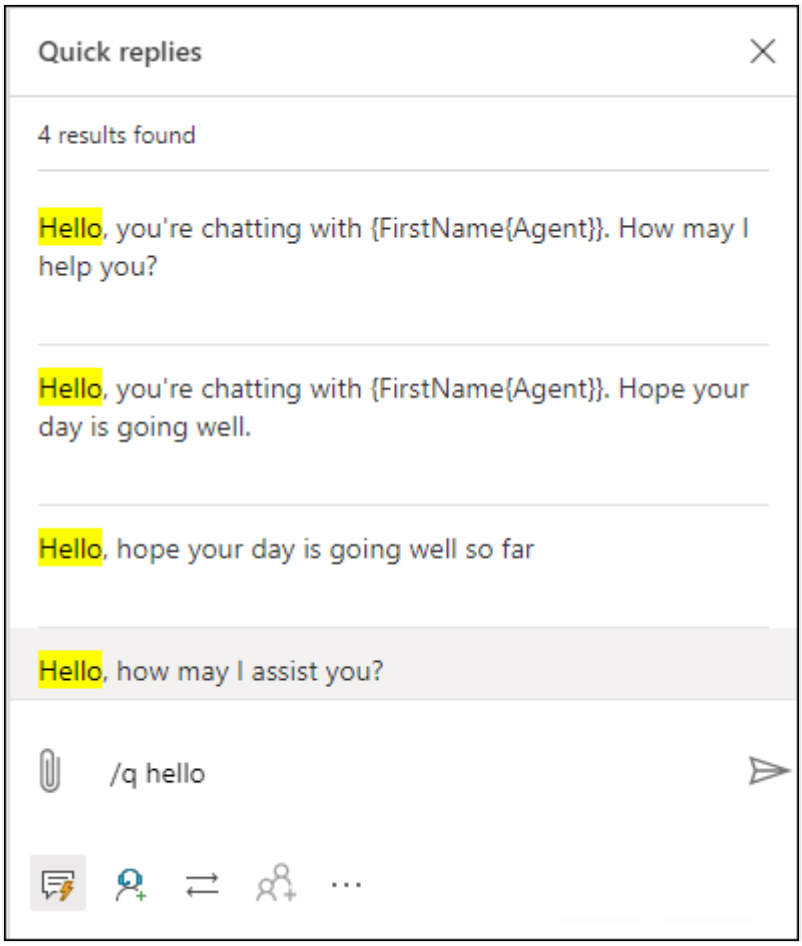
Search for quick replies and tags

After you type **/q** in the communication panel messaging area, you can continue typing any keywords and if the **Quick replies** library has at least one message associated with the word, it's filtered and displayed to you. You can also use the number (#) sign to search for the predefined messages.

You can type any of the following options in the compose box to search for the messages that are available for your use:

- Type **/q**, followed by <**keyword**>, to list messages that match the keyword.
- Type **/q**, followed by the number sign (**#**), to list all tags.
- Type **/q**, followed by <**tagname**> <**keyword**>, to list quick replies that match the tag and keyword.

- Type **/q**, followed by <**tagname**>, to list all quick replies that match the tag. Additionally, you can also add another tag after the <**tagname**> for example, type **/q**, followed by <**tagname**> <**tagname**>, to further refine the quick replies matching both the tags.



Share reconnection link with customers

If the reconnection link is configured by your administrator, you can share the link with customers during the session that they can use to connect back to the chat when they're disconnected for some reason, such as loss of connectivity or restart of their computer. The reconnection link information is available as a quick response.

> ⓘ **Important**
>
> You can share the reconnection link only when you don't end the chat session using the **End** button.

Consult with agent or supervisor

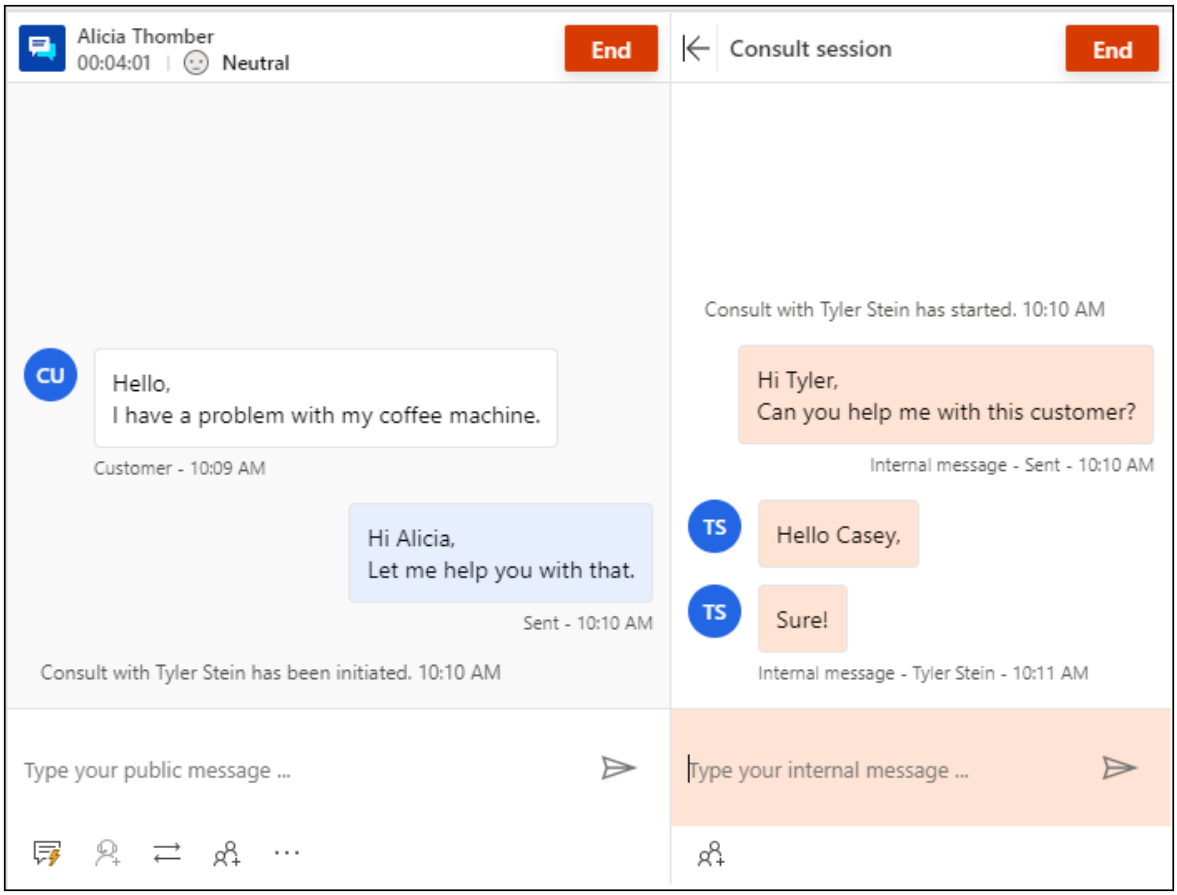
You can consult with other agents or supervisors using the consult option. You can invite the agent or supervisor by selecting the **Consult** button in the communication panel and choosing an agent from the list of available agents.

The following events occur when you select the **Consult** button:

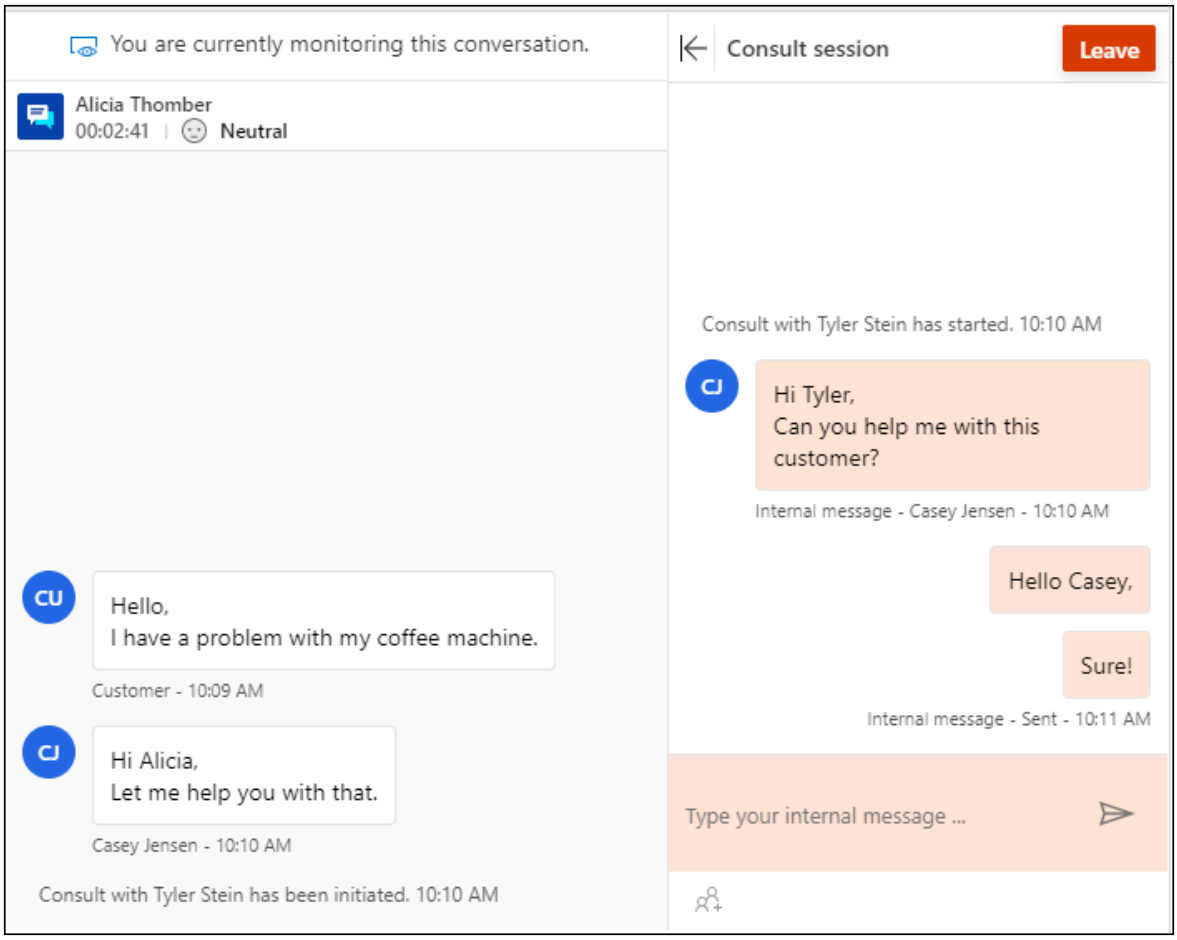
1. The agent can search for agents to consult within the same queue or other queues, select and invite an agent, and then start a consultation.

2. The secondary agent receives a notification for the consult request.

3. When the secondary agent accepts the consult request, a separate pane with an option to end will open beside the communication panel for the primary agent.



4. The secondary agent sees a consultation window on the page with an option to leave. They'll also have a read-only view of the messages exchanged between the primary agent and customer.



5. The primary agent can add the secondary agent to the customer conversation by selecting the people icon. The secondary agent can join the customer conversation only after the primary agent selects to add the agent.

Additionally, the following considerations apply:

- You can use the UI buttons to collapse and expand the consult pane. When the primary agent selects the option to take notes, the consult pane is in collapsed mode.
- The primary agent can end the consult or the secondary agent can leave, after which, the secondary agent won't be able to view the interaction between the primary agent and customer.

You can also use a keyboard command to see the list of agents and or supervisors who are available for consultation. Type the forward slash (/) key and the letter c (**/c**). Type forward slash and the letters cq (**/cq**) to view the list of queues.

> **Note**
>
> We recommend that you invite no more than five consulting agents when conversing with the customer.

After you type **/c** in the communication panel messaging area, you can continue typing the name of the participant and if it's present, the names are filtered and displayed to you.

Transfer conversations

In the communication panel, you can transfer the work item either to an agent or a queue. The transfer to the agent can be performed only after consult with the agent has been established. Without bringing agents in to consult, only transfer to queues are available. If operating hours have been configured for the queues, you can successfully transfer the conversation to only those queues that are operational at the transfer time.

After the transfer is complete, the agent who initiated the transfer will no longer be able to participate in the conversation.

Agents whose presence is set to Busy-DND, Away, or Offline don't appear in the agent list of the transfer pane.

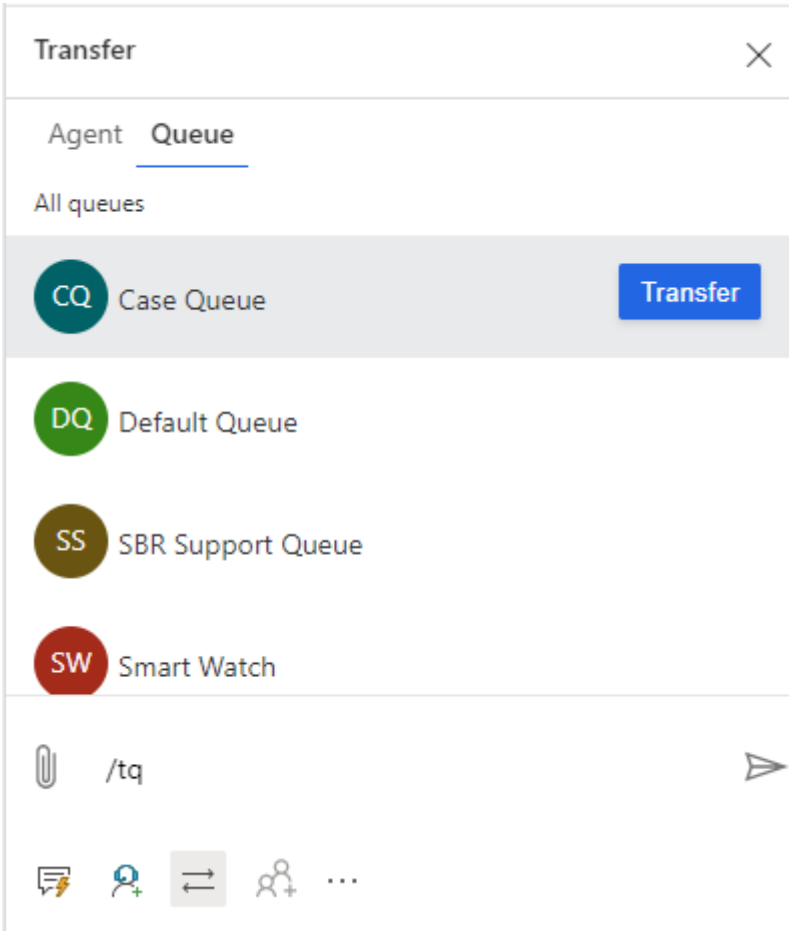
Use the keyboard command to see the list of agents and/or the supervisor who is available for transfer. Type the forward slash (/) key and the letter t (**/t**).

Use the keyboard command to see the list of queues to transfer the conversation request. Press the forward slash (/) key and the letters T and Q (**/tq**).

/t (forward slash, letter t) launches the **Agent** and **Queue** tabs. Select either tab and then select the agent or the queue from the list to transfer the conversation. The **/t** command keeps the focus on the Agent tab whereas the **/tq** command keeps the focus on the Queue tab.

When skill-based routing is enabled, then during the transfer, the **Transfer** panel shows users sorted in the order of matching skills. A check for agent skills isn't done by the app and the conversation can be transferred to any agent irrespective of the skill match.

When a conversation needs to be transferred from one queue to another, the matching criteria that were used in the conversation will be reused to find an agent in the new queue. For example, if exact match had been used to attach the skills to the conversation, the same criteria is used to find the agent in the new queue.



Search agents or queues for transfer of conversation requests

After you type **/t** or **/tq** in the communication panel messaging area, you can continue typing the name of the participant and if it's present, the agent or queues names are filtered and displayed to you.

Take notes specific to conversations

Use the notes option to capture information specific to the conversation when you interact with customers. Use the More commands option in the communication panel to launch the notes.

To learn more, see Take notes specific to conversation.

Link to conversations

When you have a conversation with a customer, you can use the link option that's at the bottom of the conversation control to link the conversation to the case, account, or contact record.

To learn more, see Search, link, and unlink a record to the conversation.

Monitor real-time customer satisfaction

As an agent, you can view the real-time customer satisfaction levels on the communication panel. A sentiment icon is displayed at the top of the communication panel based on the previous six customer messages sent to you.

To learn more, see Monitor real-time customer sentiment

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

> **Important**
>
> The **Customer Summary** form is renamed as **Active Conversation** form.

One of the major challenges that customers face when contacting customer support is repeatedly giving the same information about the issue to each support agent they talk to. And if they want to review the status of their request later, they have to share the same information with another support agent to explain the context of the engagement. To avoid this situation, support agents need access to all the information the customer has provided, including details about the product or service, issue, case history, related cases, and location.

Having this information ready can help support agents reduce the hold time that they spend retrieving customer information, reduce average handling time, and increase customer satisfaction by resolving issues faster.

What is Active Conversation?

Active Conversation (formerly **Customer Summary**) is a page that appears when you accept an incoming request from any channel and gives you complete information about a customer. The **Active Conversation** view provides the following sections:

- Customer (Contact or Account)
- Conversation summary
- Case
- Recent cases
- Timeline

If your administrator has enabled the **Customise active conversation form** in Customer Service admin center, you'll see the following options on the **Active Conversation** page:

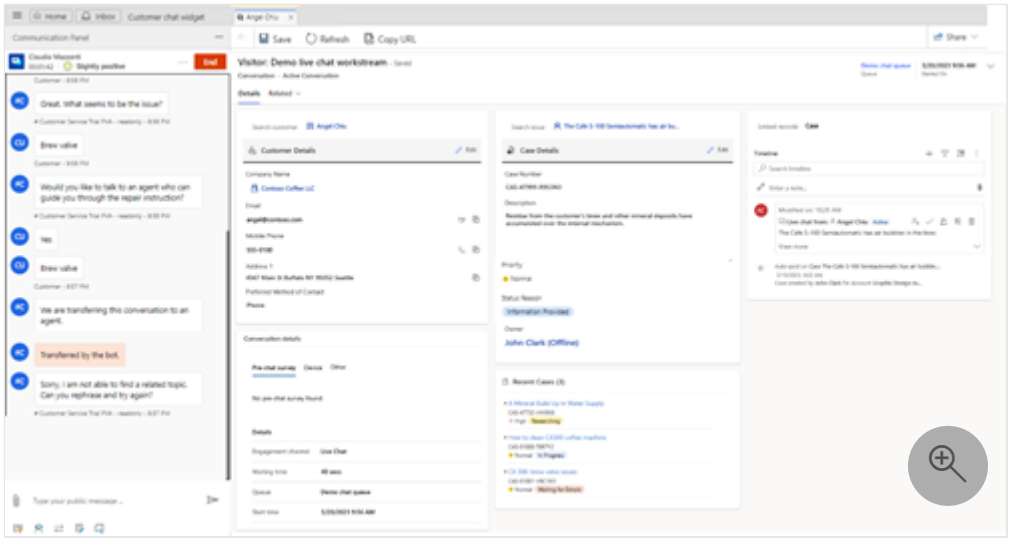
- **Save**: You can edit and save standard and custom field values added to the **Active Conversation** form by your administrator. However, the following Logical column names aren't supported. If a default value is already set for a field, the value appears on the form automatically.
- **Refresh**: Refreshes the data in the form.
- **Queue:** The queue through which the conversation has been assigned to you.
- **Start time:** The time when you started the conversation.
- **Related**: To select and navigate to the required entities.

Depending on the settings that are enabled for you, you'll see one of the following layouts:

Enhanced Active Conversation page

If your administrator has enabled the **Enhanced Active conversation form** in Customer Service admin center, you see the enhanced **Active Conversation** page. The application displays the customer or account, and case details cards with inline edit capabilities. You can also view the Recent cases card with color coded priority and status fields.

> **Note**
>
> - The form selector to switch between **Active Conversation** and **Closed Conversation** is hidden. You can't switch to closed conversation form from the **Active Conversation** form while the conversation is still active or vice versa.
> - You can see the form selector on the enhanced Active Conversation form if your administrator has enabled it for you. More information: **Display the form selector on Active Conversation form**



View customer details

This section provides details such as the contact name or account name. For a contact, you can view the location, email, and other details. For an account, you can view location, telephone number, and primary contact person for the account.

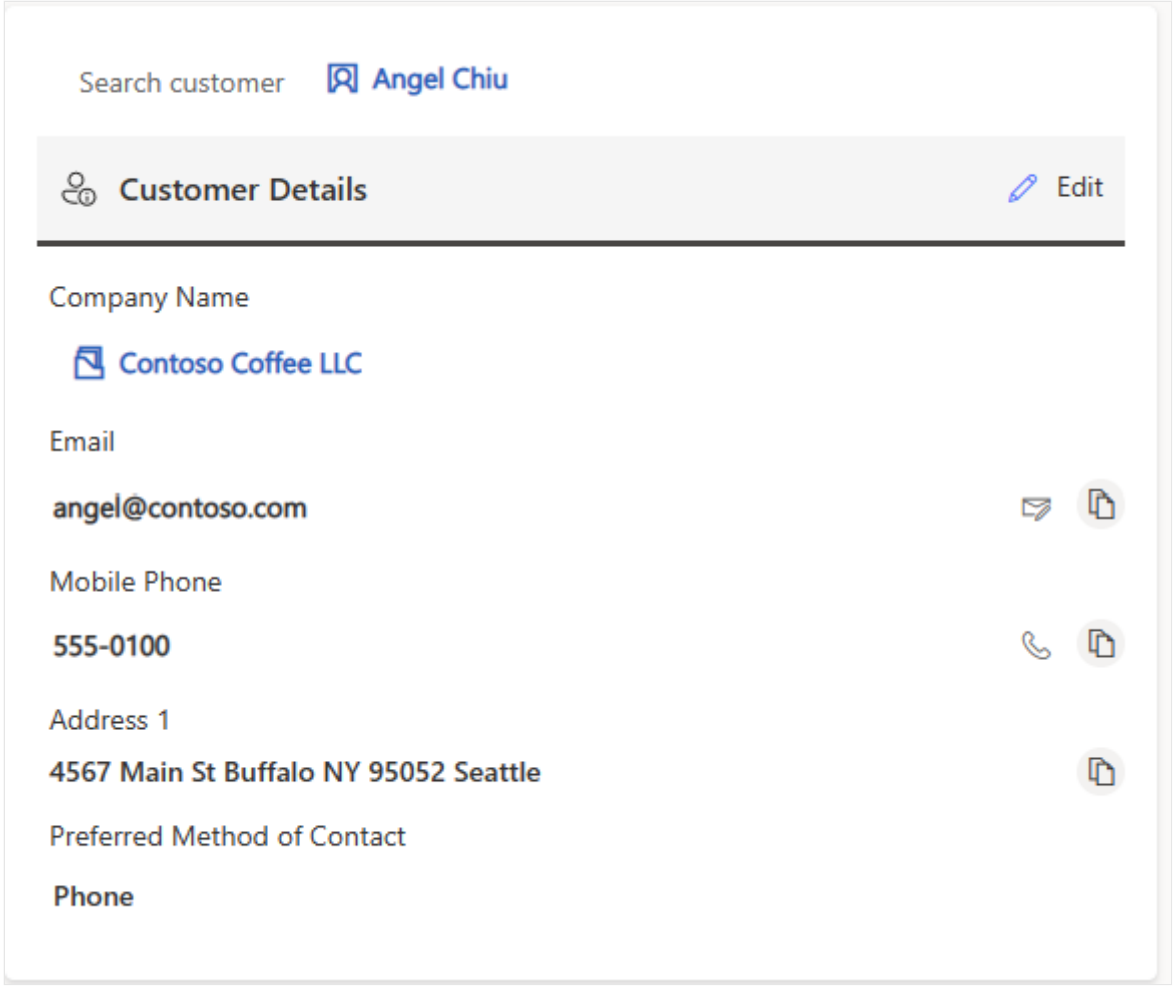
Use the customer section to search for an existing contact or account record, and select the record to link it to the conversation. If the record doesn't exist, you can create a new contact or account record by using the **Add Contact** or **Add Account** button, respectively. After you create it, search for the record and then select it to link it to the conversation.

Depending on the settings that are enabled for you, you'll see one of the following layouts:

Enhanced Active Conversation—Customer Details

Displays the customer or account details. The fields displayed on this card are based on your administrator's configuration. For more information, go to Add the Customer 360 component to a case form.

You can edit the customer or account details inline, without navigating to another tab. However, if you see the default **Customer(Contact or Account)** card, your administrator has disabled the enhanced **Customer Details** experience for the **Active Conversation** form.



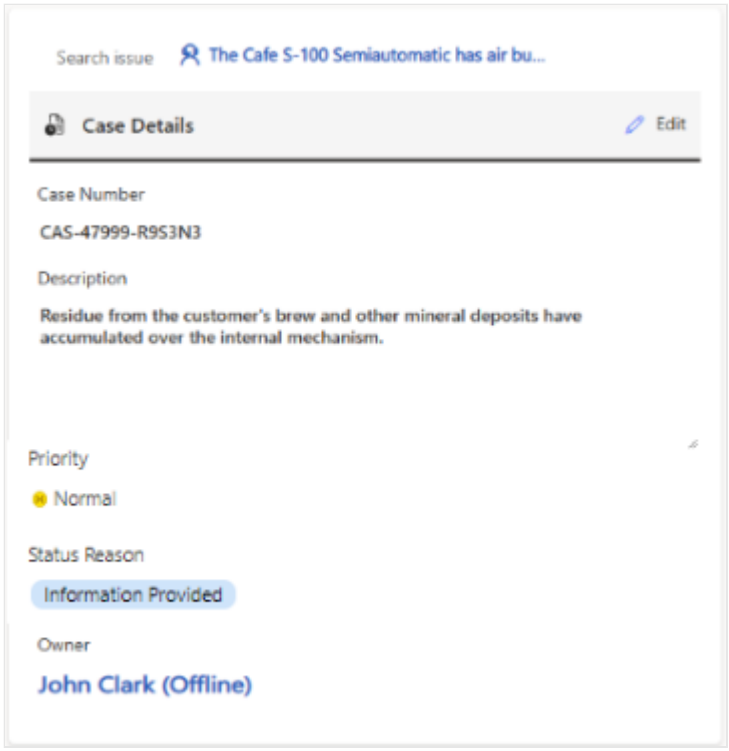
View case details

Use the **Case** section to search for an existing case, and select the case to link it to the conversation. If the record doesn't exist, you can create a new case by using the **Add Case** button. After you create it, search for the record and then select it to link it to the conversation. More information: Case management in multisession apps

Depending on the settings that are enabled for you, you'll see one of the following layouts:

Enhanced Active Conversation — Case Details

Displays the details, configured by the of the case linked to the conversation. You can edit case details inline, without navigating to another tab. However, if you see the default **Issue Snapshot** card, your administrator has disabled the enhanced **Case Details** experience for the **Active Conversation** form.



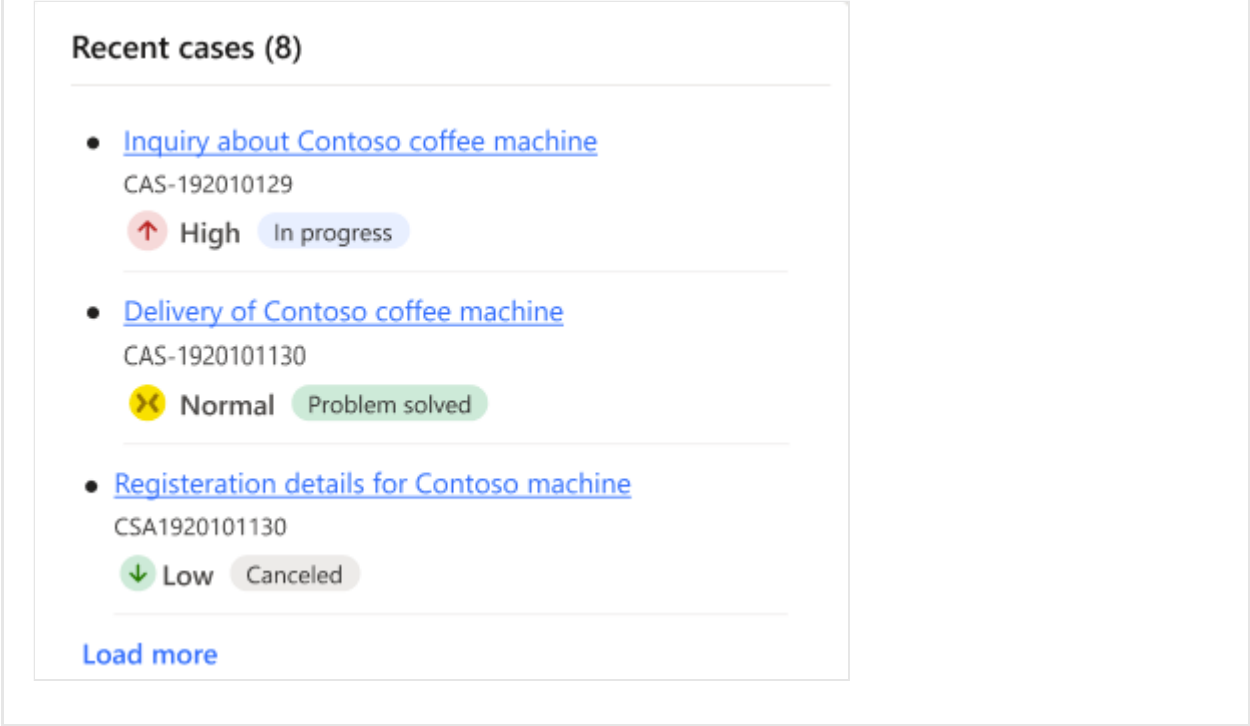
View recent cases

This section displays recent cases related to the customer.

Depending on the settings that are enabled for you, you'll see one of the following layouts:

Enhanced Active Conversation—Recent case

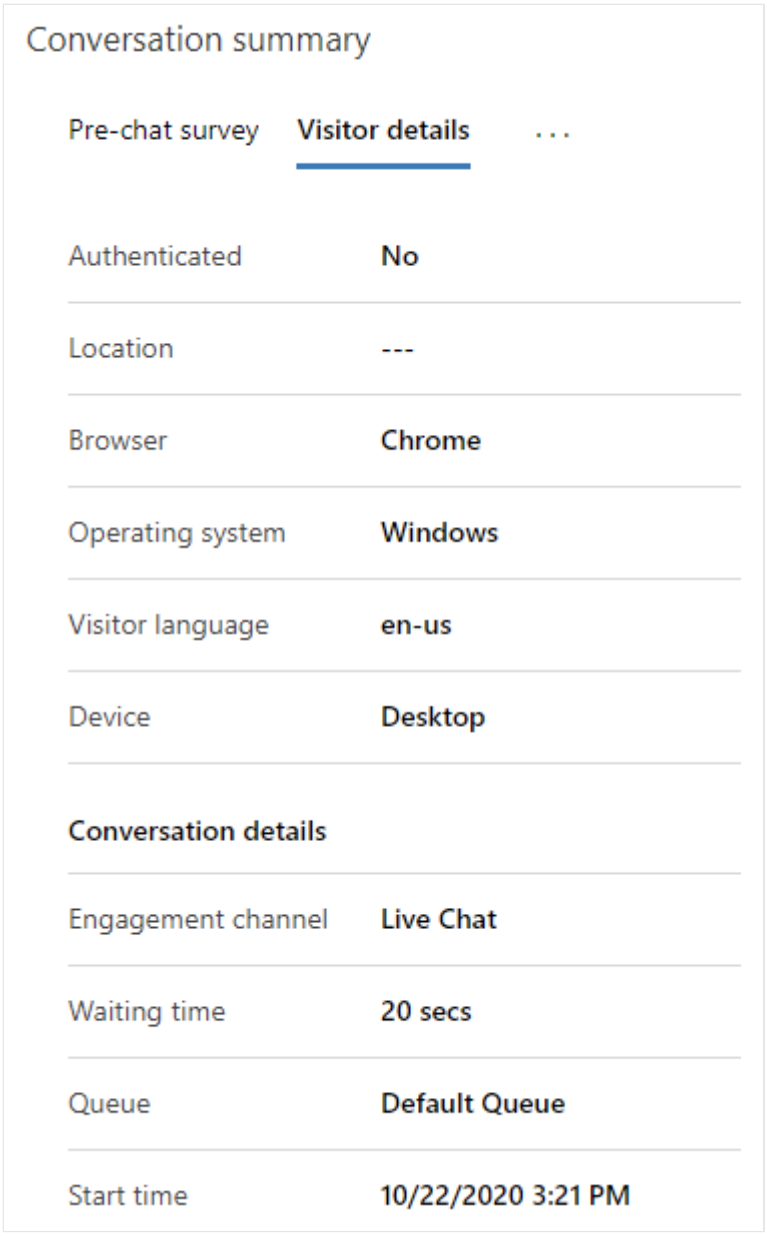
Displays the recent cases raised by the customer. The fields displayed on this card are based on your administrator's configuration. For more information, go to Customize recent cases.
However, if you see the default **Recent cases** card, your administrator has disabled the enhanced recent case experience for the **Active Conversation** form.



View Conversation summary

The **Conversation summary** section provides detailed information about the conversation between the agent and customer. The information shown in the **Conversation details** area includes the following:

- **Engagement channel:** The channel, such as live chat or custom channel, through which the conversation is taking place.
- **Waiting time:** The time the customer had to wait before the conversation was assigned to the agent.
- **Skills:** The skills that had been attached for routing the conversation. If your administrator has enabled the setting for agents to update skills, you can add or remove skills.
- **Queue:** The queue through which the conversation has been assigned to you.
- **Start time:** The time when you started the conversation.



In addition, the **Conversation summary** section includes several tabs:

- Pre-chat survey
- Self service
- Visitor details
- Additional details, if they've been configured and other context variables are available

These tabs are described in the following sections.

View Pre-chat survey

The **Pre-chat survey** tab displays the customer's answers to the survey questions that were posed by your organization, which helps your interaction with the customer.

View Self service

The **Self service** tab displays information about the activities that the customer performed before starting a conversation with an agent. This information helps you understand why the customer reached out and helps you provide a personalized service for enhanced customer satisfaction. The activity information, which is categorized into the following action types, appears in reverse chronological order.

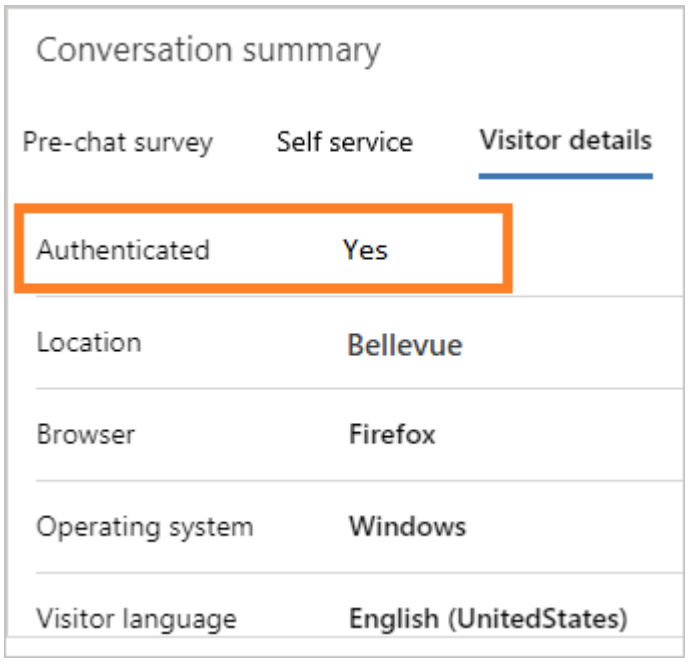
Action type	Description
Page visited	The page visited on the portal, with time stamp.
Phrase searched	The keyword or phrase that was searched for, with time stamp.
Knowledge article viewed	The knowledge article viewed, with time stamp.
Custom action performed	Any other custom action that's tracked by your organization, with time stamp.

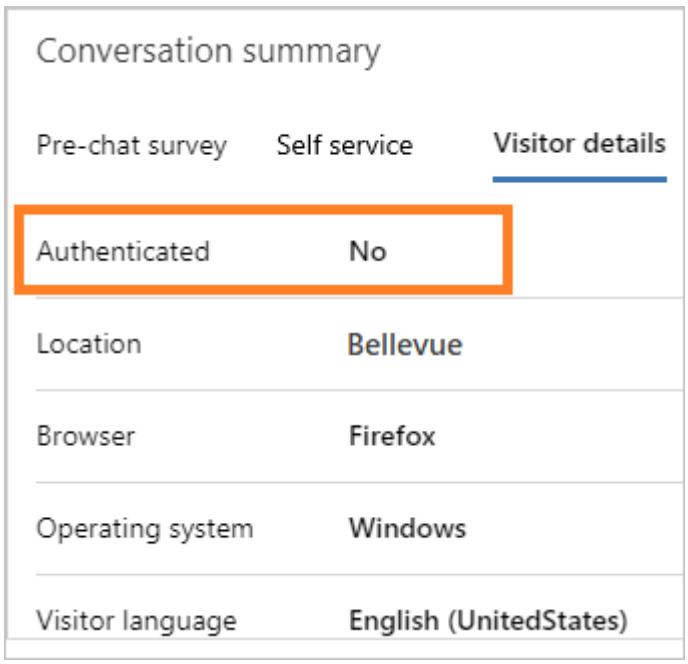
To configure the appearance of the **Self service** tab, see Enable self-service settings for customer actions in a conversation summary.

View Visitor details

The **Visitor details** tab provides information such as whether the customer is authenticated, the browser the customer used to contact support, the operating system used by the customer, the customer's location, and the language used during the interaction.

If the customer has signed in to the portal to initiate the chat with a support agent, the **Authenticated** field value is **Yes**; otherwise, the **Authenticated** field value is **No**.





To learn more, see Create chat authentication settings.

View Additional details

If your administrator or developer has configured the **Additional details** tab and if any other context variables exist, they're displayed on the **Additional details** tab.

To learn more, see setContextProvider.

View Timeline

This section displays case-related and customer-related activities in the form of a timeline. You can create quick notes based on your discussion with the customer. Use

the **Linked records** field to switch the timeline based on the case, contact, or account record linked to the conversation.

The **Linked records** field shows the record that's linked to the conversation. For example, if you link a contact and case to the conversation, the **Linked records** dropdown list shows **Contact** and **Case**, respectively.

Create a record for conversations

Article • 04/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

When no records are linked to the conversation in Omnichannel for Customer Service, you can create a record. You can create a record in one of the following ways:

- Create a record from the **Active Conversation** page
- Create a record using the **Quick Create** option
- Create a record using the **New** option

Create a record from the Active Conversation page

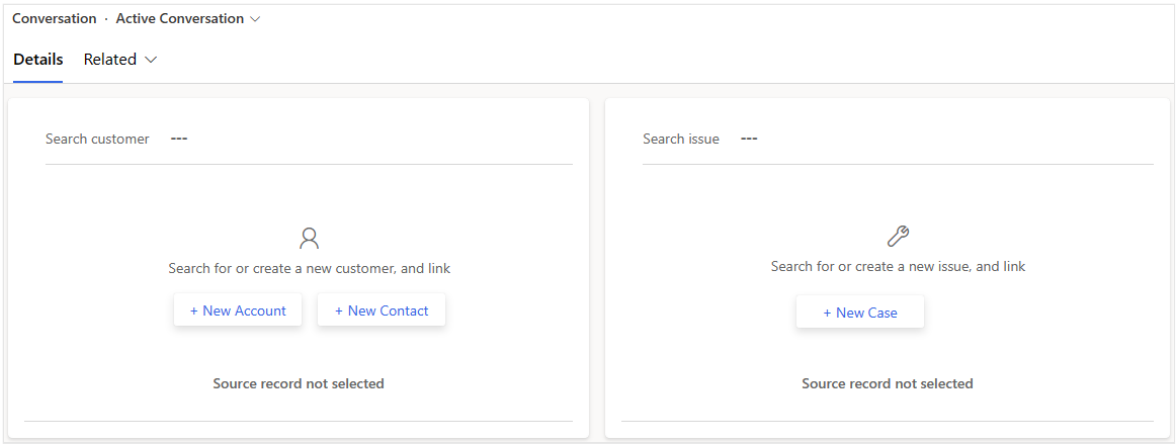
In the **Active Conversation** page and on the customer and case forms, you'll see an option to create a new record. When you select the **New** option, a corresponding form opens in a new tab. You can fill in the details and save the record, and the record is auto-linked to the conversation.

Depending on your administrator's settings, you'll see the enhanced **Active Conversation** or the default **Active Conversation** page.

To create a record from the **Active Conversation** page:

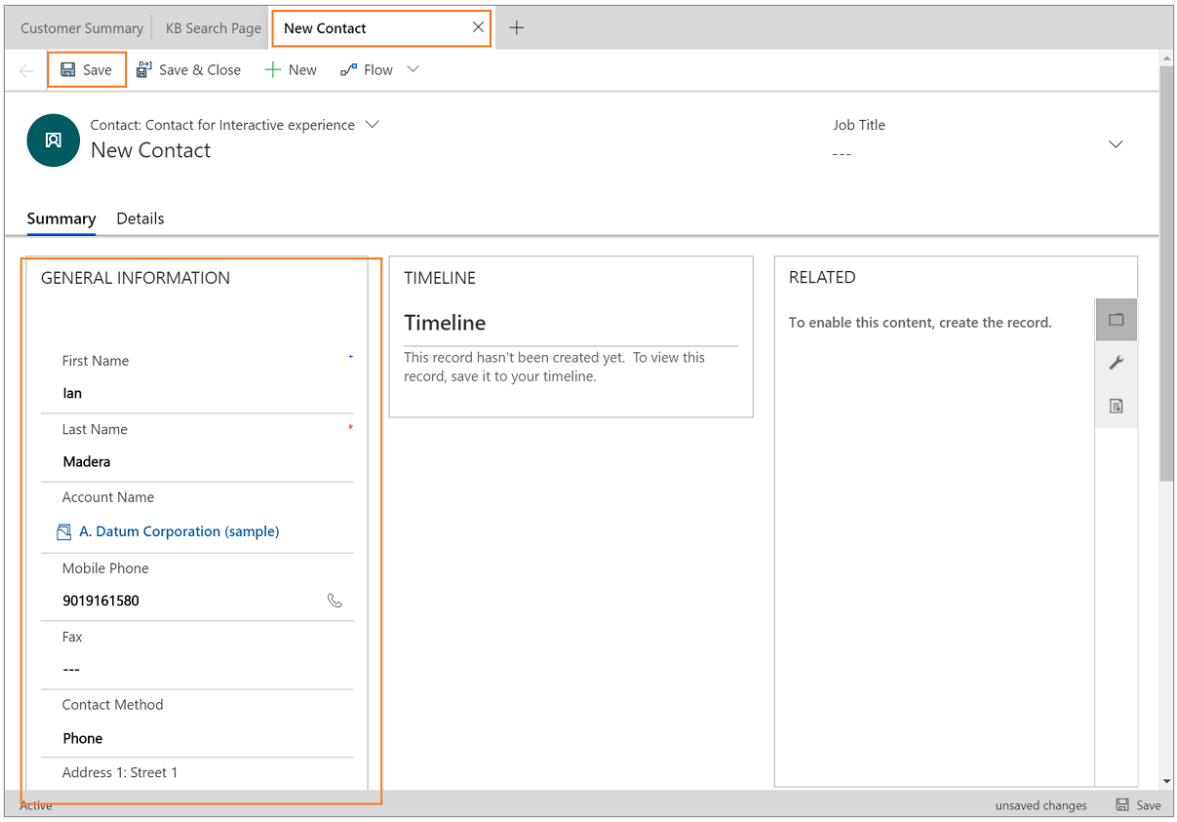
1. Select an option in the Customer or Case section based on the record you want to create. After you select the option, a form opens in an application tab panel.

Option	Section	Description
New Account	Customer	Select this option to create a new account record
New Contact	Customer	Select this option to create a new contact record
New Case	Case	Select this option to create a new case record



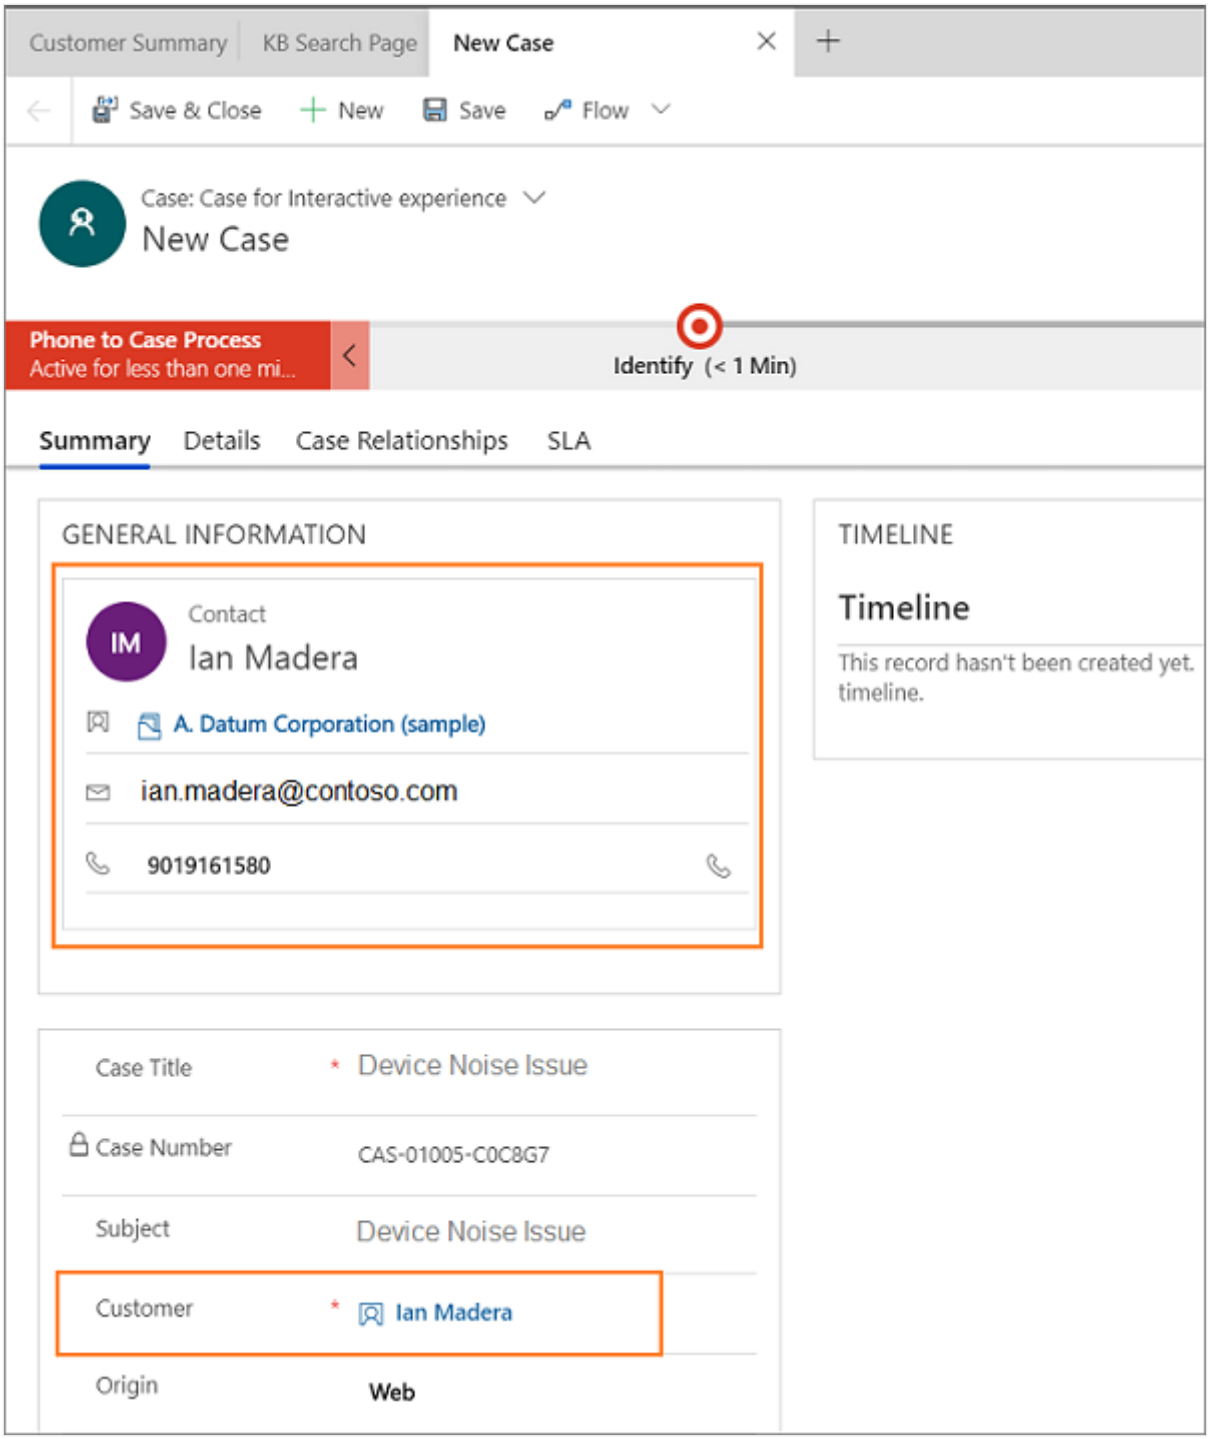
2. Specify the details in the form fields.

3. Select **Save**.



After you save, the record is automatically linked to the conversation. When you switch to the **Active Conversation** page, you can view the auto-linked record.

If you create the account or contact first and then start to create a case record, the case form shows the linked customer name in the **Customer** field.



Create a record using the Quick Create option

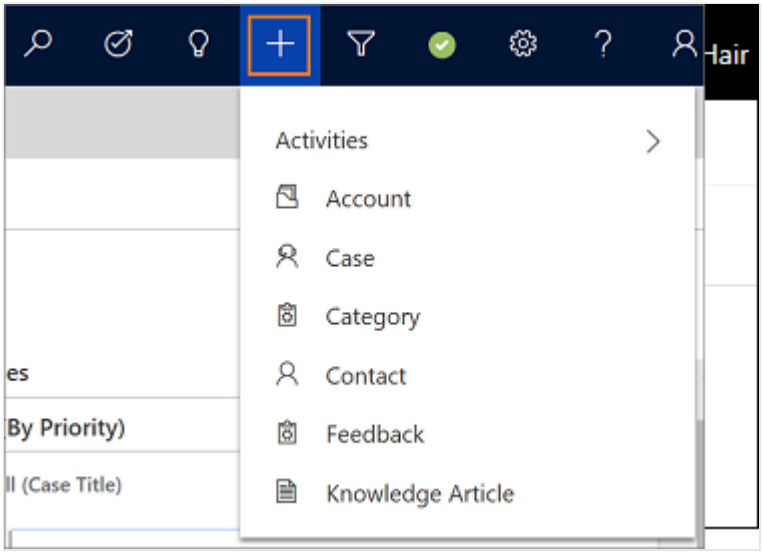
Use the quick create (+) option in the nav bar to create a record. After creating the record, you must manually search and link the record to the conversation.

To create a record

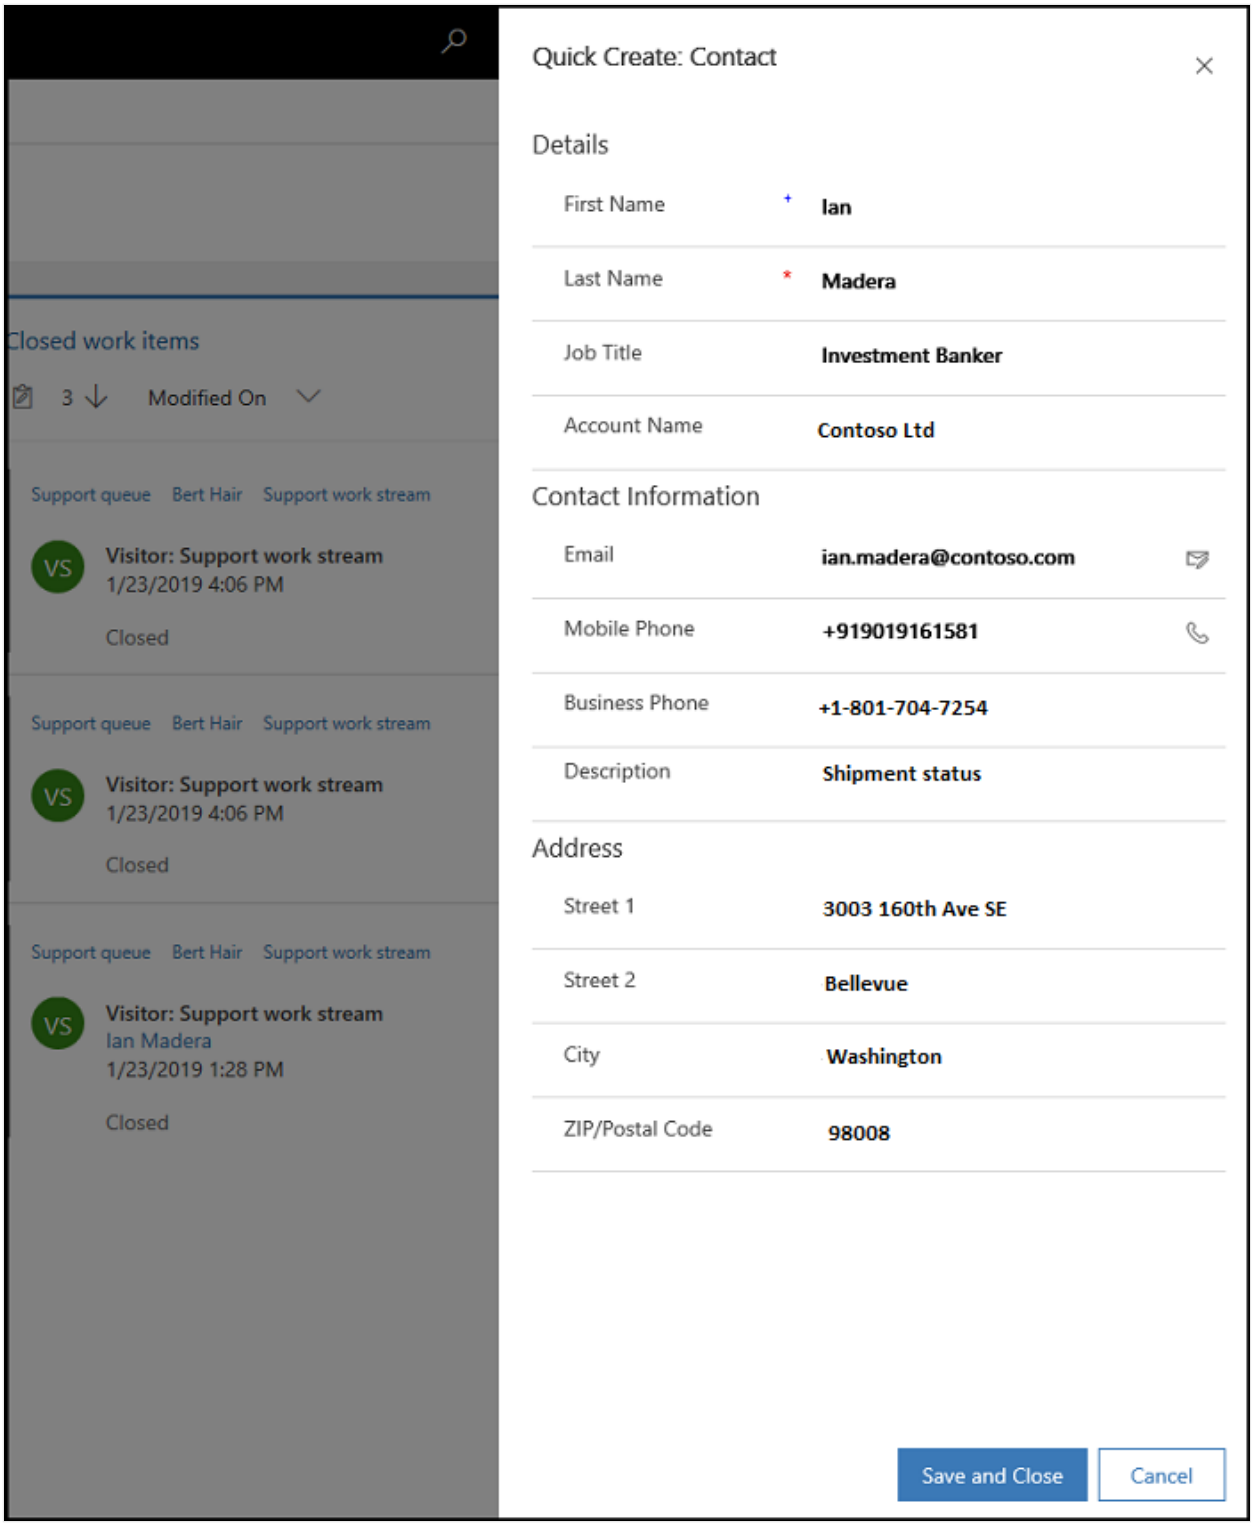
1. Select the + icon to create a record.
2. Select a record type from the list:

- Case

- Contact
- Account



3. In the left pane, you can see a new record page. Specify the details in the form.
4. Select **Save and Close** to save the changes and close the form.



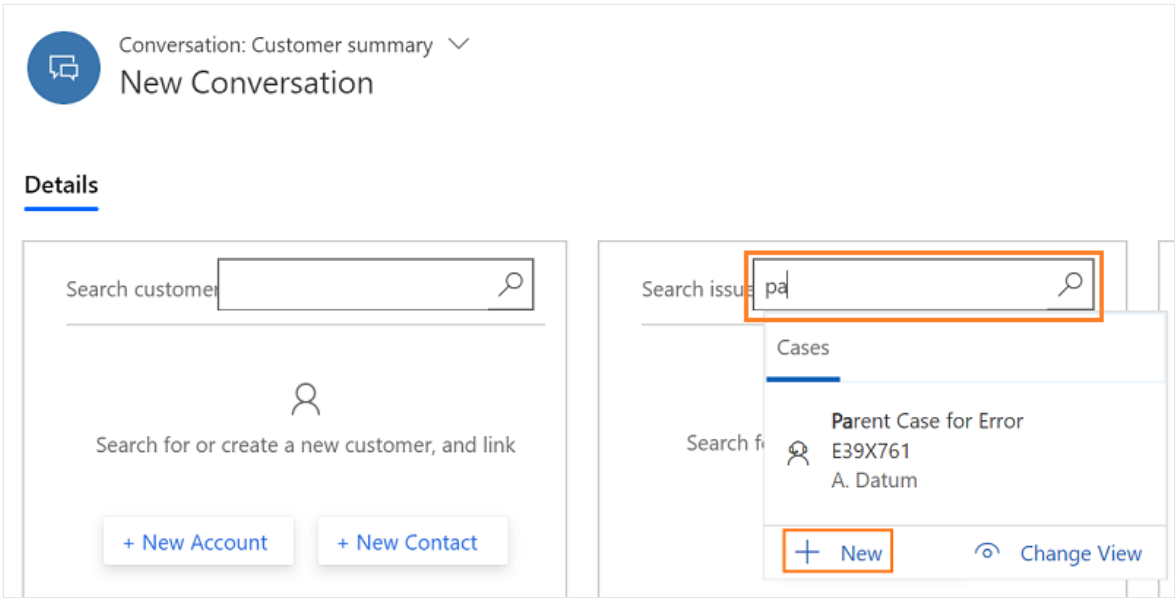
After you save the changes, you can link the record to the conversation. To learn more, see Search and link a record to the conversation

Create a record using the New option

In the **Active Conversation** page, when you are trying to search a record in customer or case section, after you type few characters to search, you can use the inline **New** button to create a record. After you select the button, the **Quick Create** pane of the record appears.

1. Type to search in the search box. The records appear as a list that matches your search criteria.

2. Select **New** below the list of records. The **Quick Create** pane appears.



3. Fill in the form and select **Save and Close**. The **Quick Create** pane closes and the **Active Conversation** page refreshes. The record you created is auto-linked in the customer or case section.

Search, link, and unlink a record in Omnichannel for Customer Service

Article • 06/09/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

The topic explains how to search for records, link a record to a conversation, and unlink the record from the conversation in Omnichannel for Customer Service.

You can search for records in two ways:

- Inline search
- Relevance search

Search for records by using the inline search option

When you accept an incoming conversation request and there's no customer record identified in Omnichannel for Customer Service, use the inline search option in the customer (**Contact** or **Account**) section and **Case** section to search for a contact or account and case, respectively. Inline search is based on the Lookup View and Quick Find View. You can search the fields (attributes) that are included in the Lookup View and Quick Find View fields.

For the customer (**Contact** or **Account**) section, you can search for a Contact or Account record. By default, you can search by using the following fields.

Record	Fields
Account	• Account Name • Account Number • Email • Main Phone

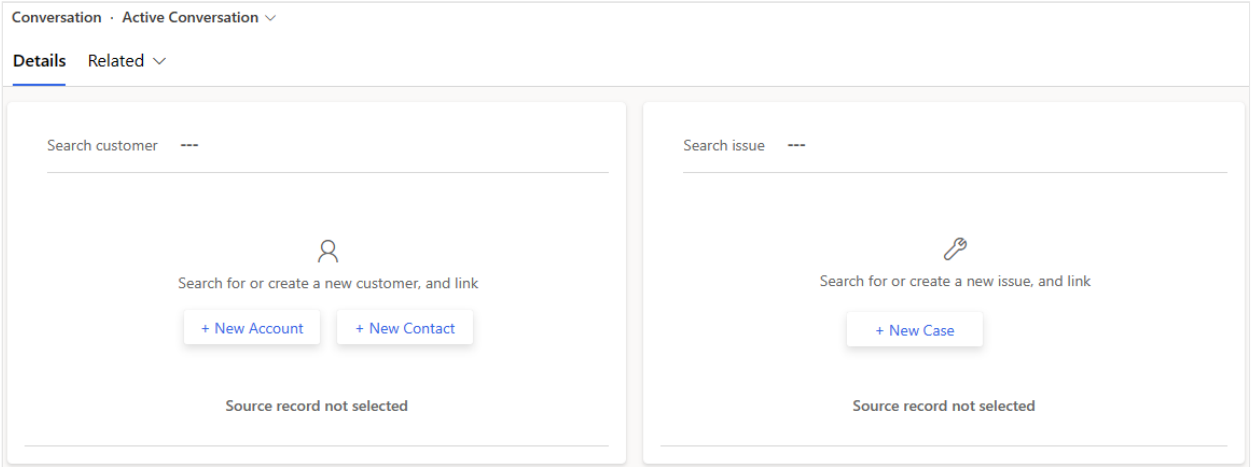
Record	Fields
Contact	• Company Name • Email • First Name • Last Name • Middle Name • Full Name • Mobile Phone

For the **Case** section, you can search for a Case (Incident) record. By default, you can search by using the following fields.

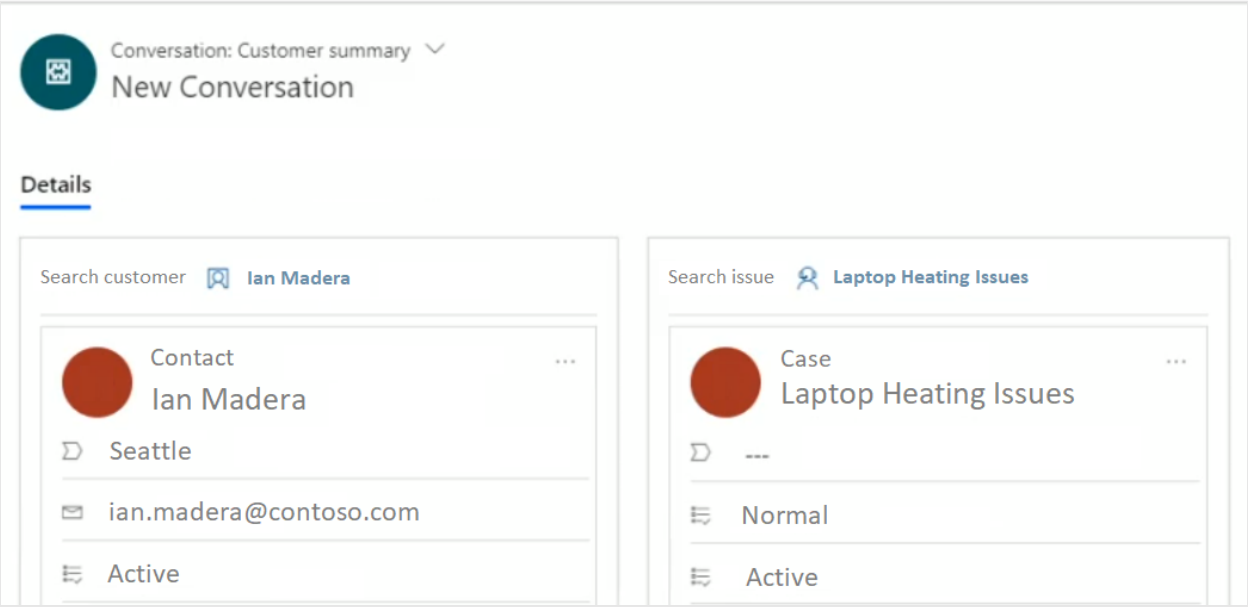
Record	Fields
Case	• Case Number • Case Title

Active views only are displayed for the search results. You can customize the Quick Find View and Lookup View to change the search fields based on your business requirements. More information: Understand views and Unified Interface Lookup view leverages Quick Find View

Link a record to the conversation when doing an inline search



During an inline search, the search results are displayed and you can select a record to link the conversation to the selected record. After you link the record, the **Active Conversation** page is updated with the details.



You can link one contact or account only in the customer (**Contact** or **Account**) section and one case in the **Case** section.

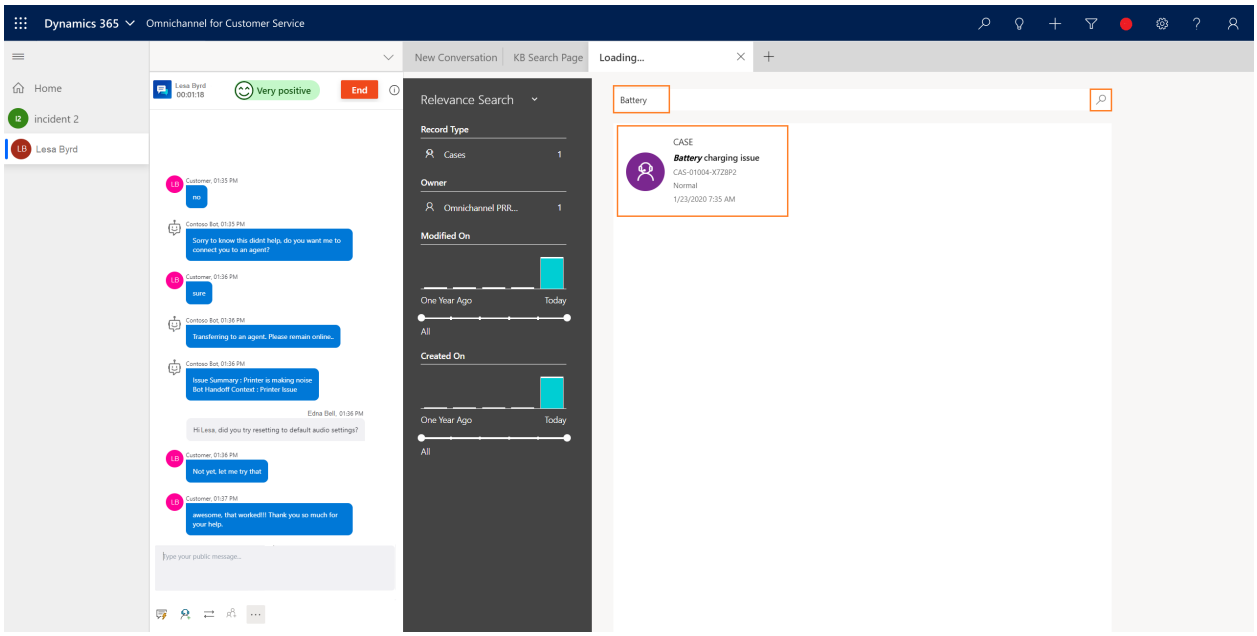
If you close a linked conversation, the case won't be closed automatically.

Search for records by using relevance search

You can also search for records by using the relevance search option. When you select the search icon, the search page opens in the application tab. Specify the details for your search, and then select the search icon. The results appear in a list.

You can search for a case, account, contact, and associated fields as enabled by your administrator.

1. Select **Search** . The **Relevance Search** tab opens.
2. In the search box, specify the entity or attribute details based on your search requirements, and then select **Search** .



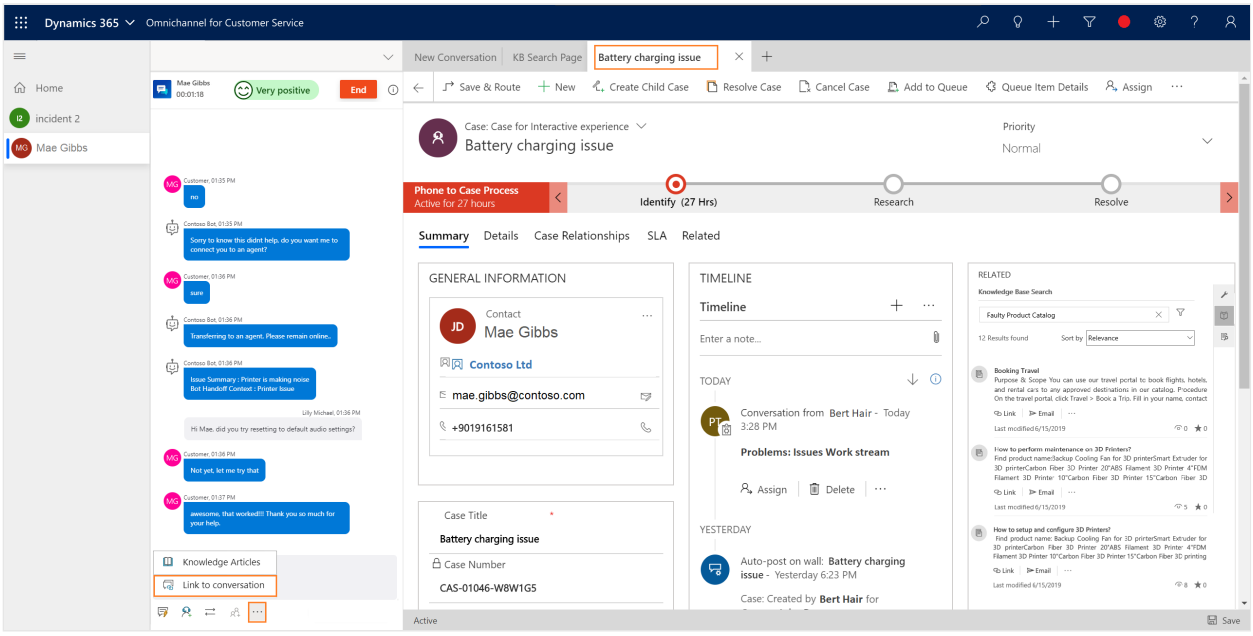
Link a record to the conversation when doing relevance search

After you search for a record by using relevance search, you can link the record to the conversation from the communication panel.

You can link one record only to a conversation.

1. Select the record from the list of search results. The record opens in the application tab.

2. Select **More options** in the communication panel, and then select **Link to conversation**.

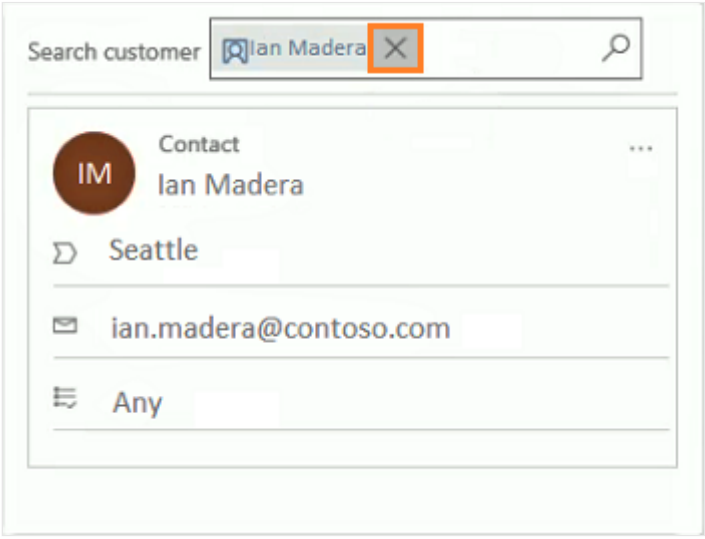


Now, the **Active Conversation** page is refreshed and updated with details from the record. Similarly, you can link other record types.

You can link and unlink one contact or account only in the customer (**Contact** or **Account**) section and one case in the **Case** section.

Unlink a record from the conversation

You can unlink a record only when you are interacting with a customer by using the communication panel. That is, after you accept an incoming conversation request and view the **Active Conversation** page, you can unlink the record from the conversation.



To unlink a record, select **Close** next to the customer name in the customer (**Contact** or **Account**) section. After the record is removed, the customer (**Contact** or **Account**) section is blank.

Take notes specific to conversation

Article • 04/05/2023

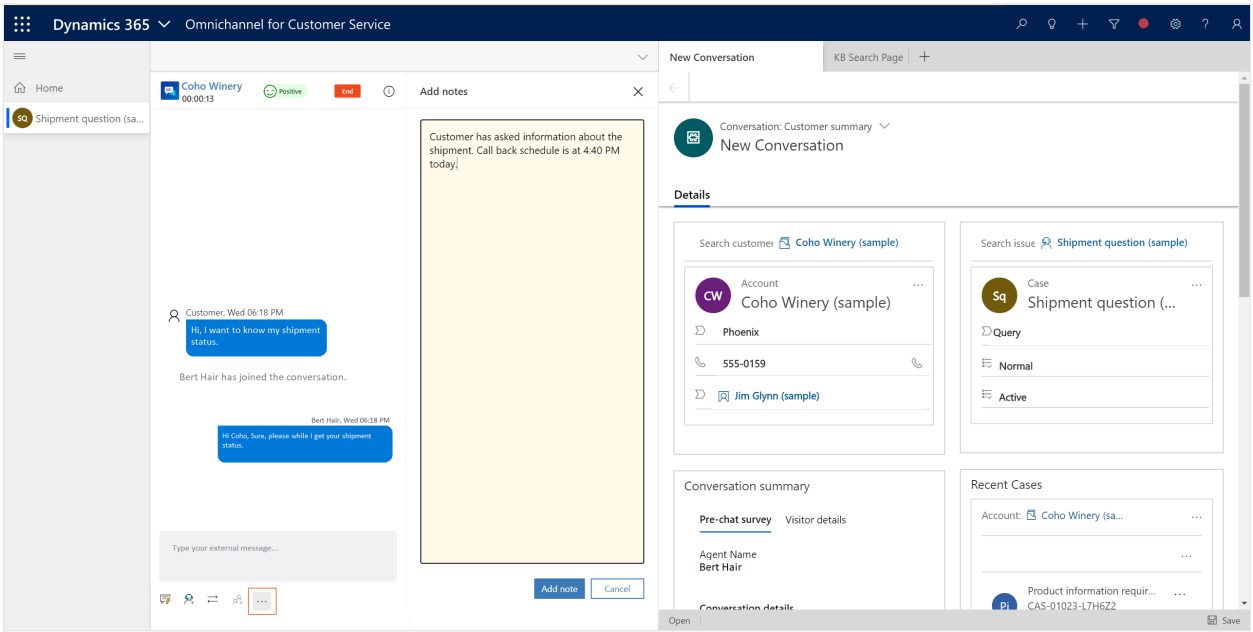
Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Take notes

The communication panel allows you to capture information specific to the conversation when you interact with the customers. Use the notes option in the communication panel or the shortcut key to launch the notes.

For an unauthenticated conversation request, you can capture notes only when you link the contact to the conversation. That is, when the contact is either not present in the Omnichannel system or not identified, you cannot take notes unless you link to a conversation.

When you select the notes option from the communication panel, the application launches the notes panel next to the communication panel. You can capture the points and select **Add**. The notes are linked to the conversation for you to access at a later point. You can view the notes activity in the **Recent activities** timeline.



Take notes for multiple sessions

When you're working on multiple customer sessions, and while capturing notes, you might switch the session. In this scenario, even though you did not add the notes, the notes are saved, and **Recent activities** timeline is updated.

Again, when you switch back to the session, launch the notes panel and take the notes. After you add the notes, these notes are appended to the previously added notes in the timeline.

Call options and visual engagement in live chat

Article • 02/02/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Call options in live chat

With calling options in a live chat conversation, you can start a voice or video call while you're communicating with the customer over chat.

As an agent, you exchange a lot of information when you communicate with a customer via chat. This can slow down your effort to resolve the customer's issue. The customer might prefer to show you the problem and explain the issue by using a physical product. In these scenarios, you might want to initiate a voice or video call during the chat conversation to resolve the issue quickly. The calling options in the communication panel help you to easily make these calls.

Advantages of voice and video call in live chat

With calling options in live chat, you can:

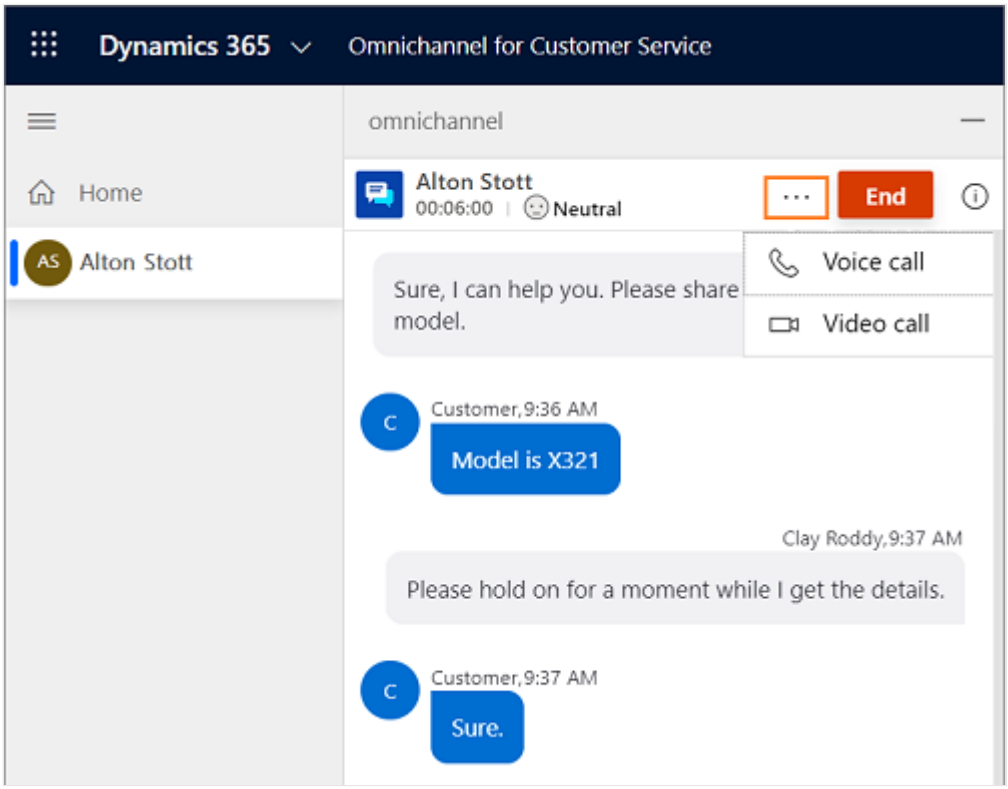
- Resolve customer issues quickly.
- Reduce your average handling time (AHT) and improve your productivity.
- Improve customer satisfaction.
- Develop a positive relationship with customers.

Prerequisites

You'll need network connectivity and a web browser. For supported browsers and required Internet bandwidth, see System requirements.

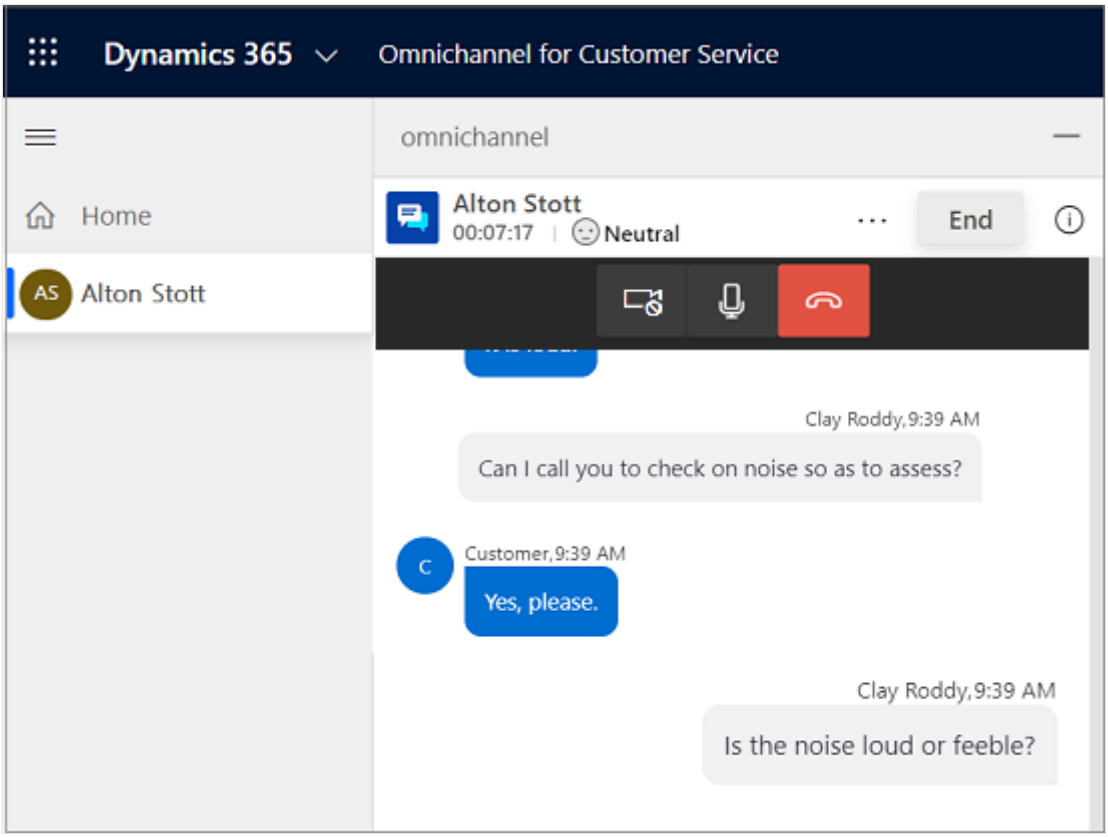
Initiate voice and video call

When you're chatting with the customer, you can start a voice or video call. In the communication panel, beside the **End** button, select More commands ···. The **Voice Call** and **Video Call** options are displayed. (Depending on your system configuration, you might see **Voice Call** and **Video Call**, or just **Voice call**.)



When you start a voice call, you can view the flyout call control, which includes the following buttons.

Button	Name	Description
	Turn on video / Turn off video	Use this button to turn on or off the video while in a call with the customer.
	Mute / Unmute	Use this button to mute or unmute the call while in a call with the customer.
	End call	Use this button to end the call.



> **Note**
>
> If your organization is in the Government Community Cloud (GCC) region, the audio and video calls will be transmitted via a North American data center.

Capacity of the agent

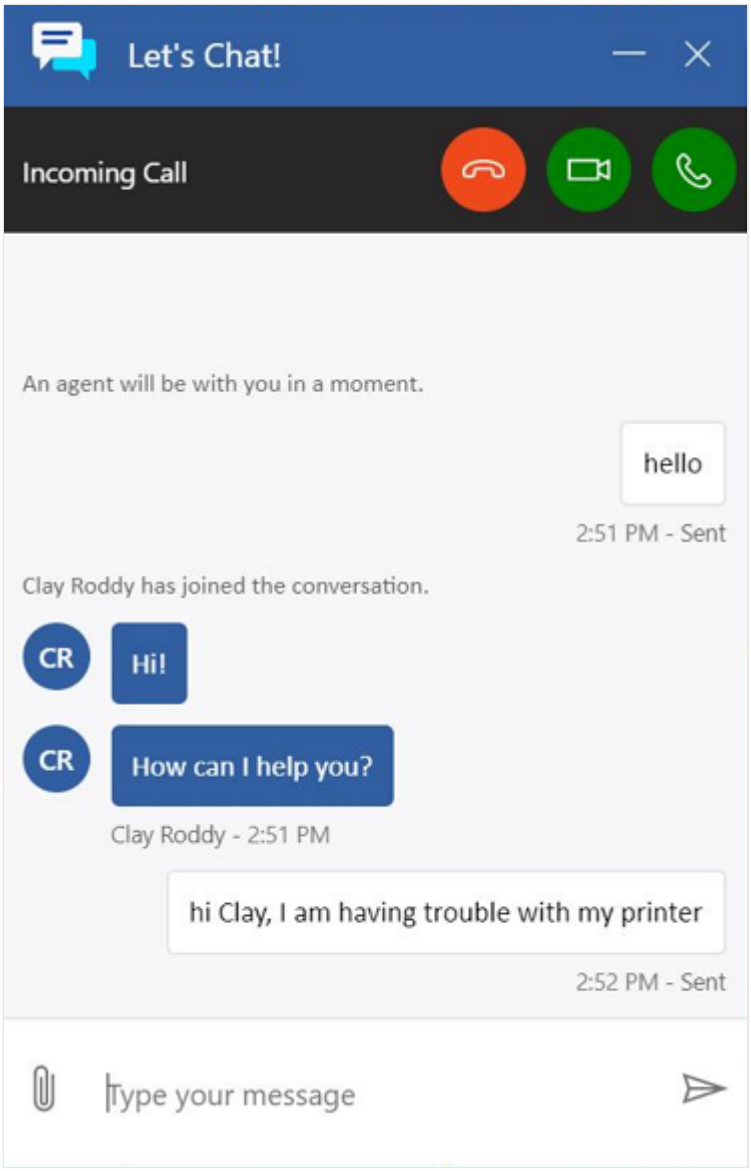
When you start a voice or video call, your capacity is consumed, and you can't take any conversation requests until you hang up. However, your supervisor can still assign conversations to you.

Site permissions

As an agent, you need to enable camera and microphone access in the browser to make a video and audio call, respectively.

Customer experience

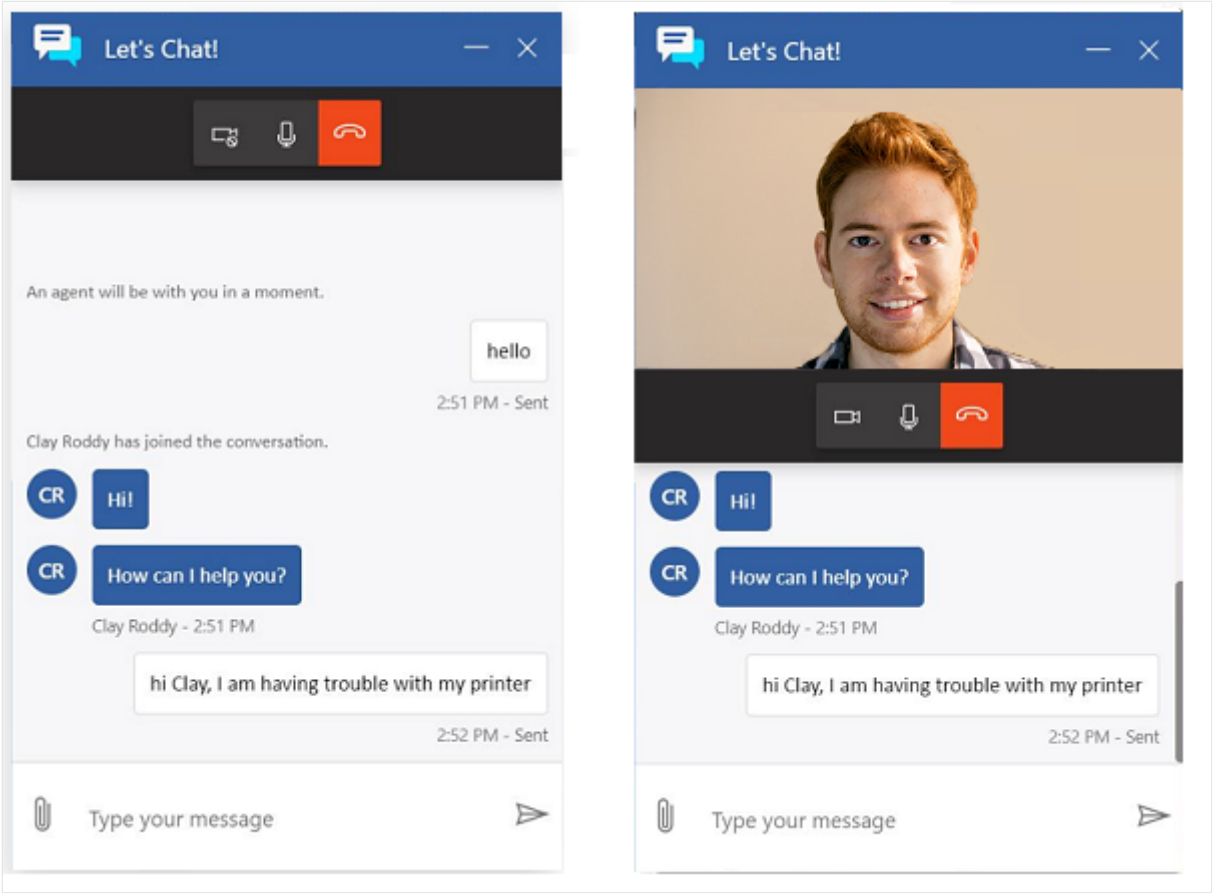
When a customer on the portal receives a call, they can accept the voice call with audio, accept the voice call with video, or reject the call.



After accepting the call, the customers can view and use the following options.

Button	Name
	Turn on video / Turn off video
	Mute / Unmute
	End call

After accepting the call, the customer can turn on or turn off the video, mute or unmute the conversation, and end the call.



Site permissions

Customers need to provide the camera and microphone access in the browser.

Co-browse and screen share in live chat

The co-browsing and screen sharing features help to quickly and easily understand the customer's issue when you communicate via the chat channel. These visual engagement channels allow agents to interact with customers within their browsers for a precise and effective support experience. This integration capability allows agents to start a third-party co-browse or screen sharing session from the chat conversation.

> **ⓘ Important**
>
> Third-party providers of co-browse or screen share capabilities may have separate pricing and licensing requirements. Before enabling and using these features through third-party applications, ensure you understand the terms of using these applications.

Prerequisite

To use the co-browsing and screen sharing features, your administrator must have selected a third party screen sharing and or co-browse provider. More information: Configure a chat widget

Initiate a co-browsing or screen sharing session

When you're chatting with a customer, you can initiate a co-browsing or screen sharing session by doing the following:

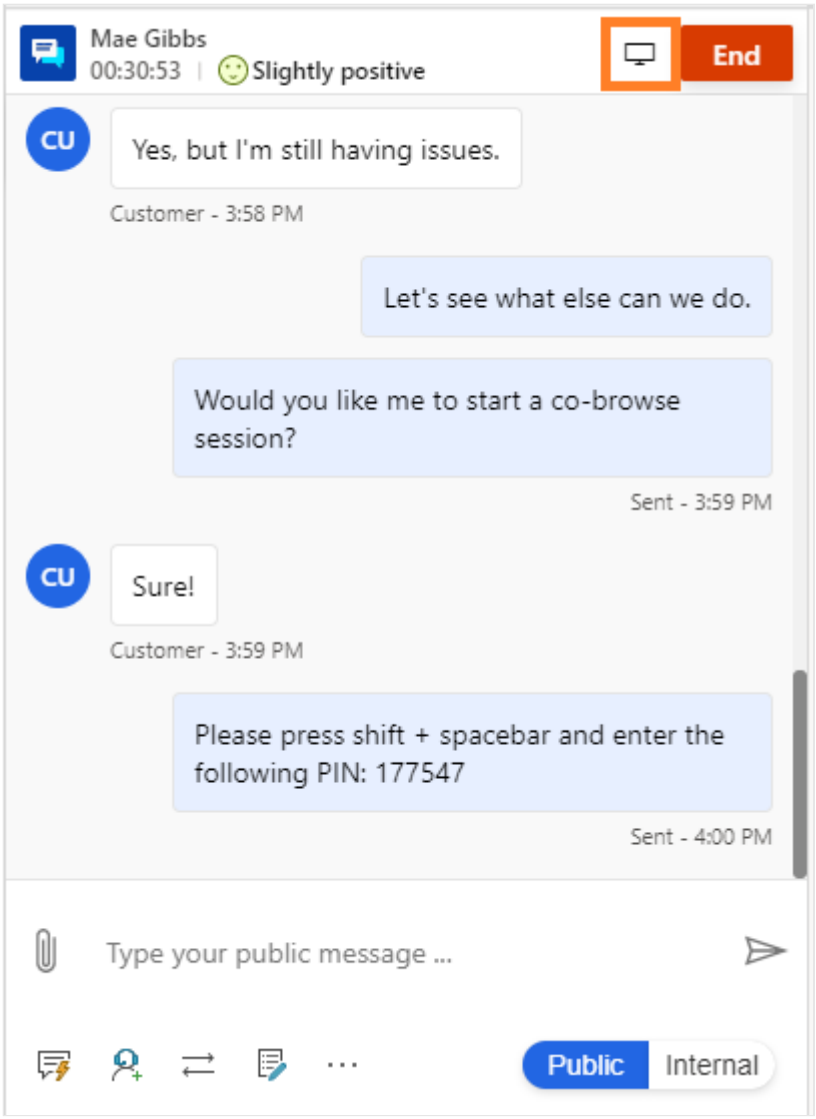
1. Select the computer icon (co-browse or screen share) next to the **End** button in the communication panel.

   An app tab opens, providing a way to sign in to the third-party provider and create a new session.

   > **Note**
   >
   > The sign-in experience will vary depending upon the co-browse or screen share provider selected by your administrator. For more information about co-browsing or screen sharing sessions, see the third-party provider's documentation.

2. In the communication panel, share the password or PIN with the customer that you received from the provider.

3. Ask the customer to enter the password or PIN, if applicable, and accept the invitation to co-browse or share their screen.



After the customer accepts your invitation, you'll be able to see the customer's screen and more accurately diagnose the issue.

When you enter a co-browse session, you can:

- See the customer's screen.
- Use a laser pointer to call attention to important items.
- Navigate and make changes within the customer's browser.

When you enter a screen sharing session, you can:

- See the customer's screen.
- Use a laser pointer to call attention to important items.

The customer experience will vary depending upon the co-browse or screen share provider selected by your administrator.

Monitor real-time customer sentiment

Article • 04/05/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

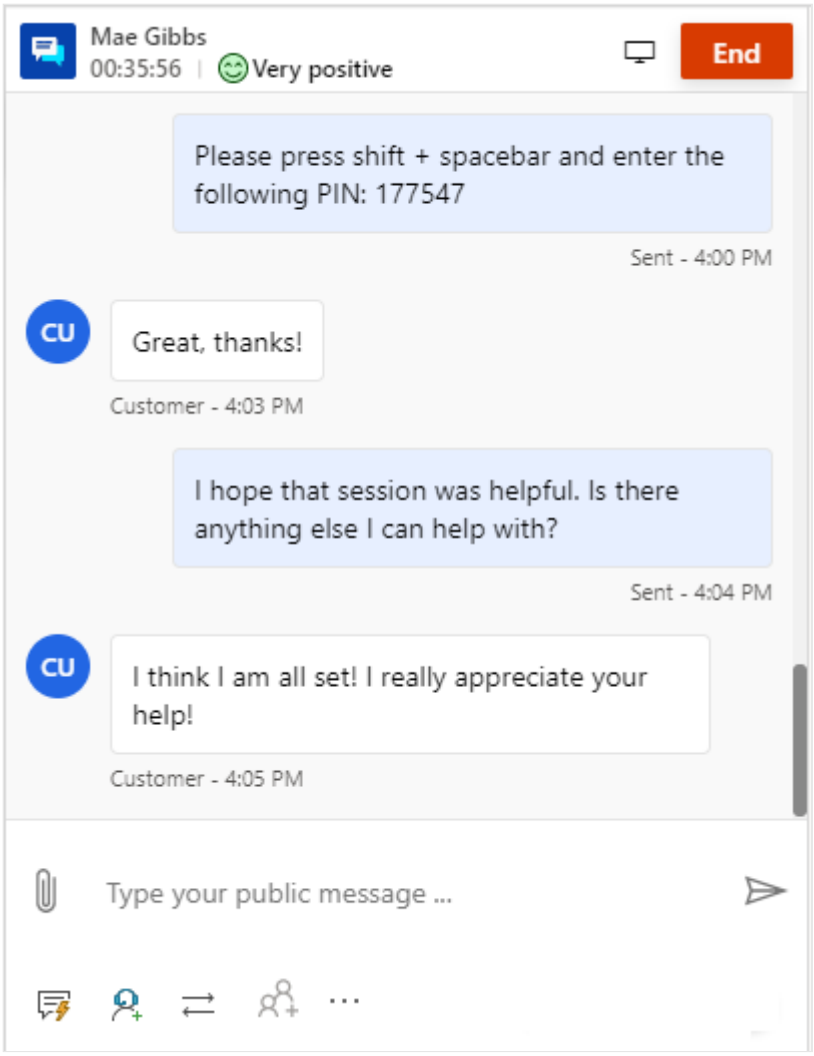
As an agent, when you interact with your customers, you want to know the sentiments they're experiencing in real time. Analysis of the customer's satisfaction level helps you understand how serious the problem is and develop a course of action to solve it. In Omnichannel for Customer Service, you can see the customer's satisfaction levels instantly while you communicate with the customer.

View real-time customer sentiment

A customer's real-time sentiment is displayed at the top of the communication panel. The sentiment icon changes dynamically based on the six most recent customer messages sent to you.

When you get an incoming conversation request, you accept the request and communicate with the customer. By default, you see the neutral sentiment icon, which indicates that at this moment the customer satisfaction level is neutral. As you continue to communicate with the customer, the sentiment icon changes dynamically according to the conversation.

When a conversation is escalated from a bot, the sentiment icon you see is based on the previous messages exchanged between the customer and the bot.



Understand real-time customer sentiment

The sentiment analysis is an automatic and unbiased measurement of customer satisfaction levels in real time.

The following sentiment icons are displayed on the communication panel.

Sentiment	Icon
Very positive	Very positive
Positive	Positive
Slightly positive	Slightly positi...
Neutral	Neutral

Sentiment	Icon
Slightly negative	
Negative	Very negative	
> **Note**
>
> The real-time sentiment is shown to you only if the supervisor or administrator has enabled sentiment analysis for a queue where you've been added as a member.

If profanity is detected in English, the sentiment is displayed as **Negative** or **Very negative**.

Next topic: Manage presence status

Multi-language sentiment

Multi-language sentiment displays sentiment scores on some non-English conversations.

> **Note**
>
> Multi-language sentiment is available only if the administrator enables it for you.

To learn more, see multi-language sentiment.

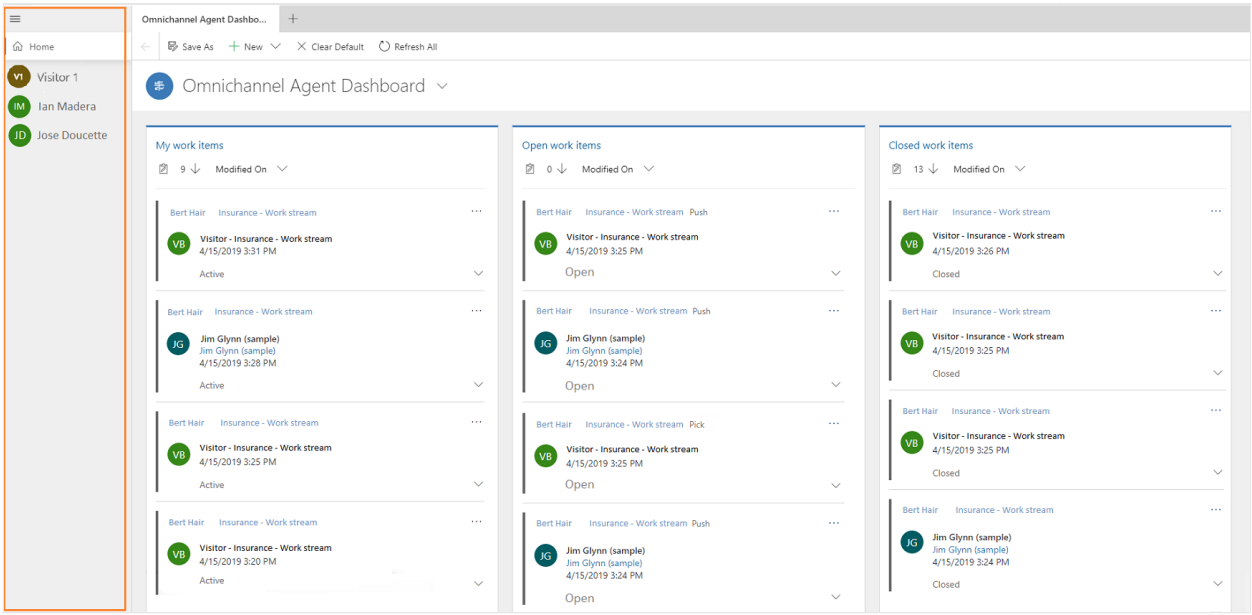
Manage sessions in Omnichannel for Customer Service

Article • 08/19/2021

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

The vertical panel on the left side is the session panel that allows you (the agent) to work on multiple customer sessions simultaneously. As an agent, you can switch between sessions without losing context of the conversation and customer details. The ability to handle multiple sessions simultaneously (while preserving customer context) allows you to resolve issues faster and achieve higher productivity.



When a session is started:

- The presence status is updated as per the configuration set by your administrator.
- The Communication panel is displayed so you can interact and exchange messages with the customer.
- The **Active Conversation** page is loaded with the details of customer such as contact or account name, case, and conversation summary.
- The KB Search page opens in the app tab panel.

Start a session

As an agent, you can start the sessions in two ways:

- Manually start a session
- Automatically start a session using the incoming notification

When you start a session from a notification request that is a chat or SMS channel, the presence status is updated as per the configuration set for you by your administrator. In addition, the communication panel is displayed so you can communicate with the customer.

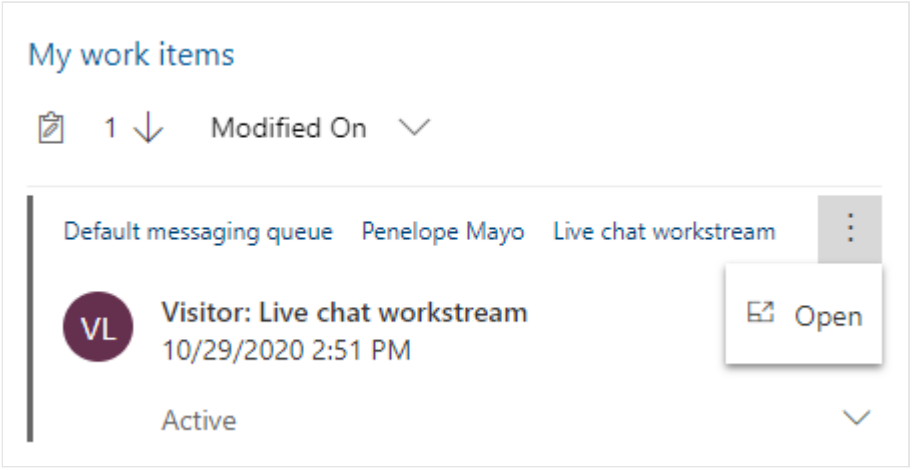
Manually start a session using the gestures

Contact and Case session

Use a combination of keyboard and mouse-click gesture to start a session. You can press **Shift** and select the work item to open a case or contact session. You can also select the **Open** option from the Omnichannel Agent Dashboard to start a case or contact session.

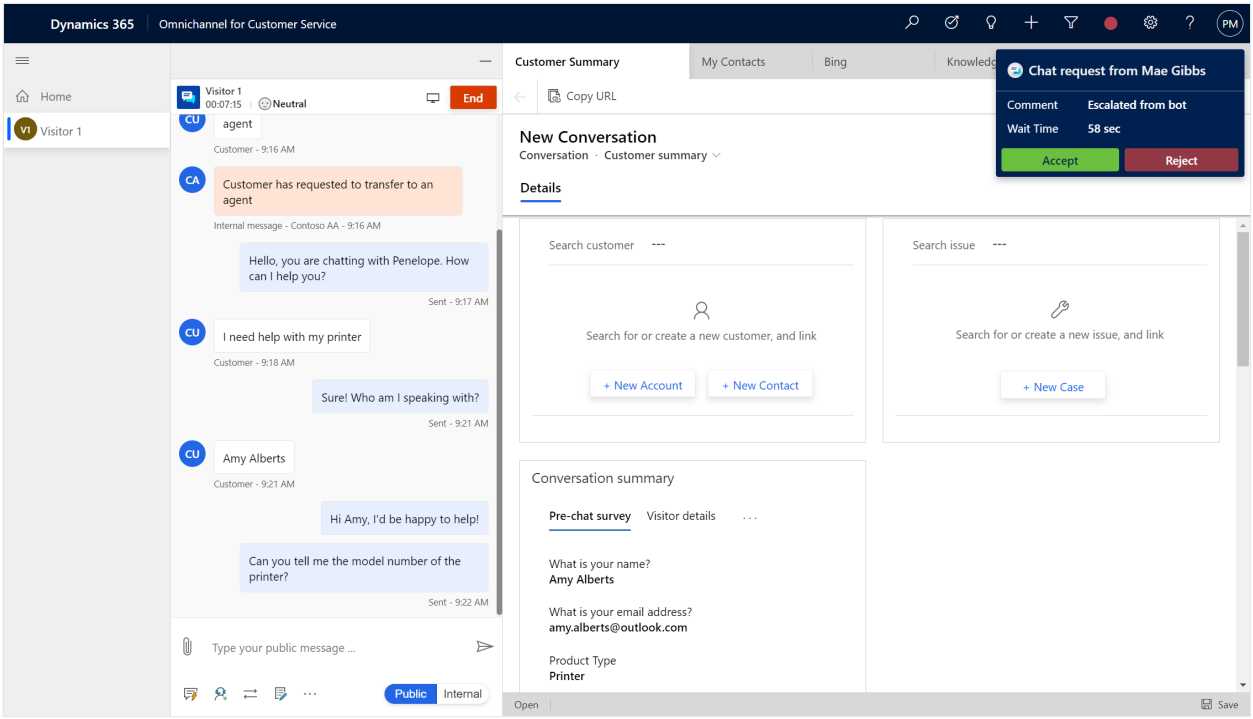
Channel session

You can start a session on a channel manually from the Omnichannel Agent Dashboard. Select **More options** (...) and select **Open** or **Pick** to start the session. The **Open** option is available for **My work items** and **Closed work items** streams. The **Pick** option is available in **Open work items** streams.



Automatically start a session using the incoming notification

When you accept an incoming conversation request by selecting the **Accept** button, a session is started and the **Active Conversation** page is loaded in the Unified Interface application area.



Work on multiple customer sessions

As an agent, when you are working on a case, you get an incoming conversation request, and you accept the request. This starts a new session and the **Active Conversation** page is loaded with context of the session. You can open applications such as KB Search, Open records, and any Line-of-Business applications made available in the application tab panel sitemap. You can open these applications using the gestures and the options in the communication panel. To learn more, see Manually start a session using the gestures and View communication panel.

When you switch sessions, unsaved changes are not lost and you can continue to work on them.

For example, you are working on a case by entering the title of the case and not yet saved the form. Now, you get a notification about the incoming conversation and you accept the request, which leads to starting of a new session. Again, you can switch back to case session and the data entered is present for you to continue.

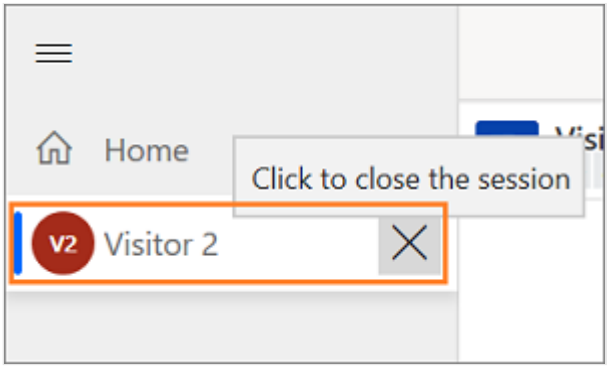
Persistent chat for agents

If your organization has chosen persistent chat as the mode of conversation, you should make sure of the following:

- You shouldn't end the conversation; instead, you should close the conversation so that it is moved into a waiting state, which is typically 28 days or the value that is configured in the workstream.
- You must confirm with the customer that their issue is resolved, and then end the session by selecting **End**. After you end the chat, the chat history will not be shown when the customer comes back; a fresh chat session is initiated instead.

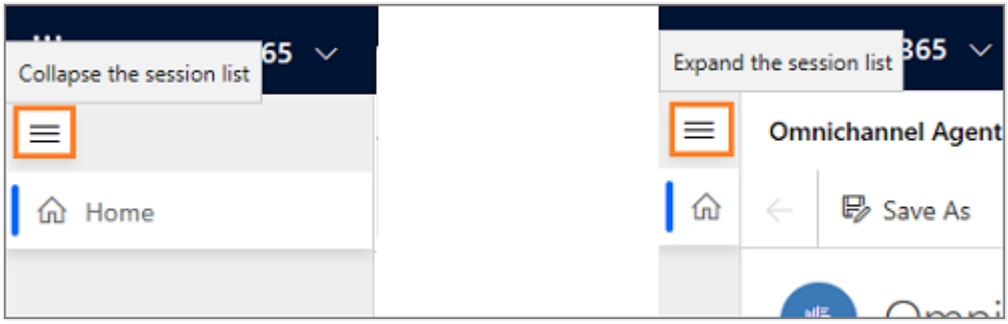
Close a session

You can close any session manually by selecting the **X** button next to the session title. When you hover the cursor on a session, you'll see the **X** button, and if you select the button, a confirmation dialog is shown to you.



Mode of the session panel

By default, the session panel is in expanded mode. Use the burger icon to toggle between expand or collapse mode. At all times, the **Home** session is anchored and you can't close it. The Home session shows the default dashboard set for you by your administrator.

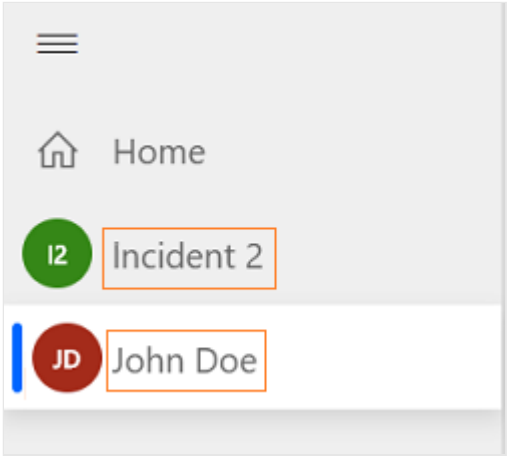


Title and icon of the session

- **Session title**

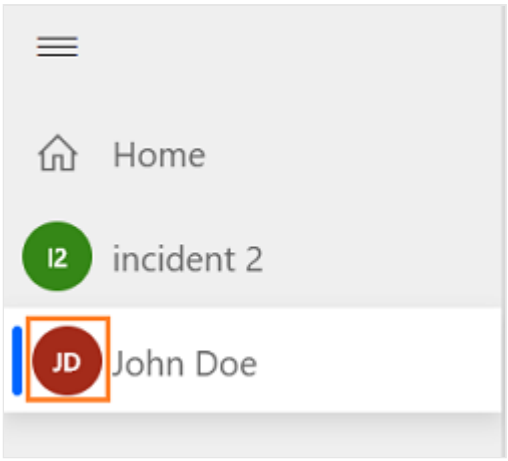
By default, the title of the session is the name of the customer, account, or title of the case. For an unauthenticated conversation request, the title will be displayed as visitor with a number. For example, **Visitor 1**.

For an authenticated chat, name of the contact, account, or title of the case is displayed.



- **Session icon**

  By default, the first two letters of the session title are displayed as the session icon.



Session sentiment alert and unread message count

- **Sentiment alert**

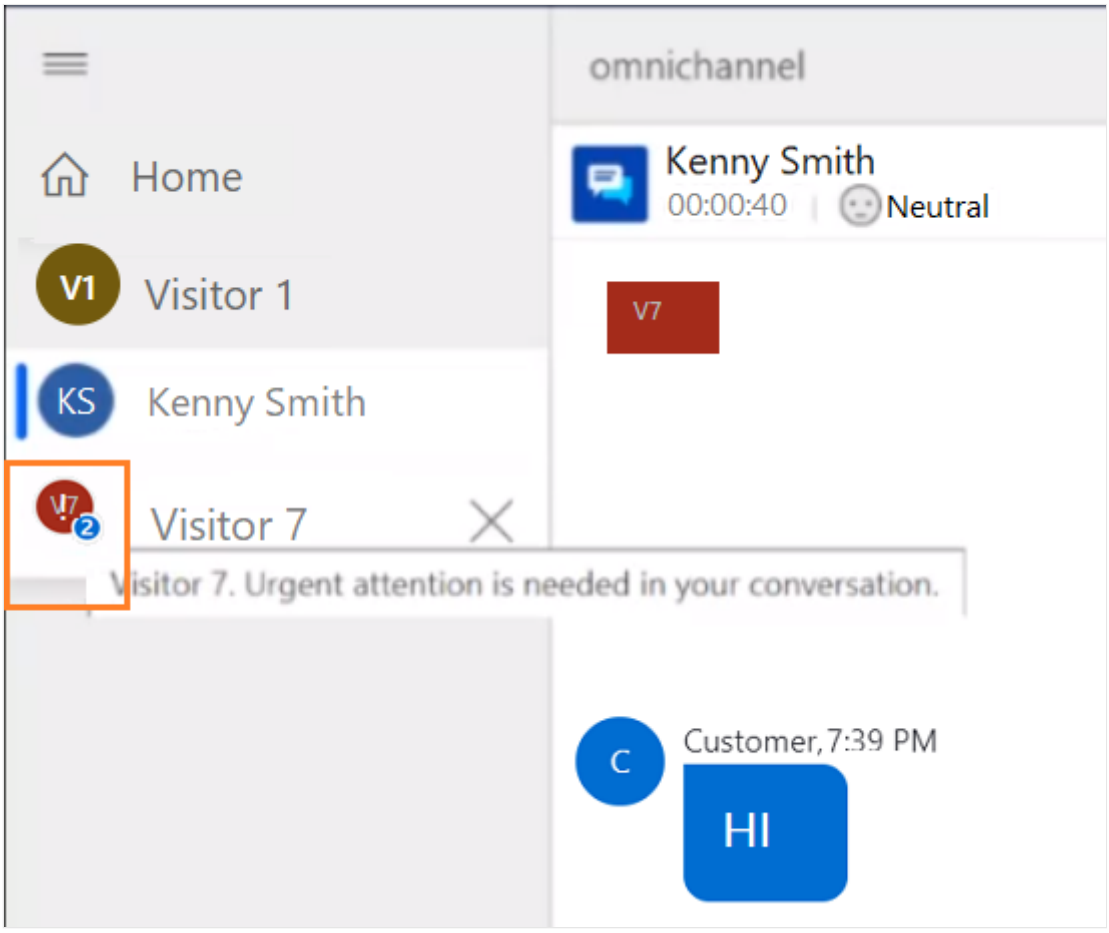
  When you are working on multiple customer sessions, there may be a scenario where a customer may not be happy. Since you are working simultaneously on multiple sessions, and if that session is not focused, you need a way to identify the sentiment of that session.

Session sentiment displays an alert to you when the sentiment reaches the threshold value as set by your administrator. For example, your administrator has set the threshold as **Slightly negative**. So, when the sentiment reaches **Slightly negative**, you can see an alert in the session panel on the session icon. An exclamation icon is displayed on top of the session icon to indicate that the requires your attention. When you hover the cursor on the session icon, you can see a tooltip, which displays a message in the following format:

<session title>. Urgent attention is needed in your conversation.

Example 1: **Visitor 7. Urgent attention is needed in your conversation.**

Example 2: **Kenny Smith. Urgent attention is needed in your conversation.**



- **Unread message count**

  When you're working on multiple customer sessions, there may be a scenario where you may receive many messages across different sessions. Since you are working simultaneously on multiple sessions, and if that session is focused, you need a way to identify the number of messages you received for a particular session.

  A count of unread messages is displayed on the session icon in the session panel. If the number of messages is 10 or more, then a plus icon (+) is displayed.

When you hover the cursor on the session icon, you'll see a tooltip that displays a message in the following format:

<session title>. <X> new updates in your conversation

X - count of unread messages

Example 1: **Visitor 7. 5 new updates in your conversation.**

Example 2: **Kenny Smith. 5 new updates in your conversation.**

When you select a session with unread messages, the session will be focused and the unread message count will disappear from the session icon.

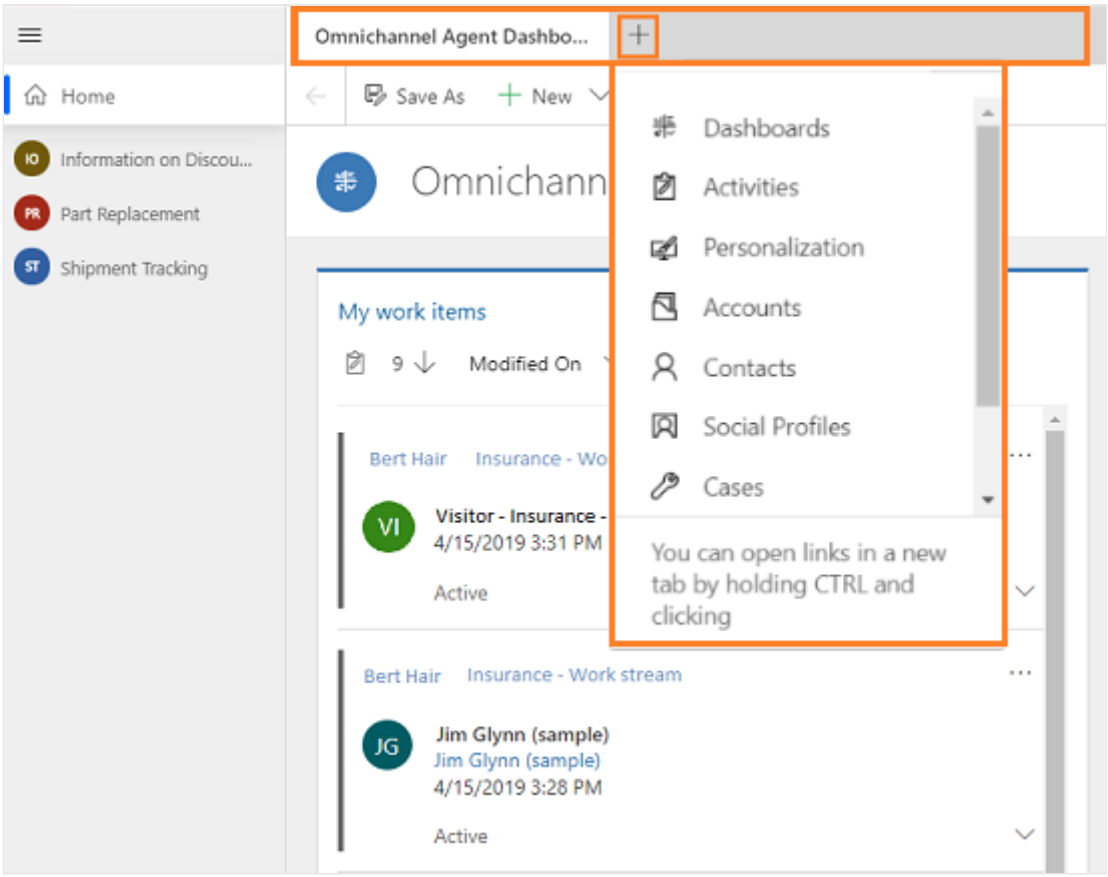
Manage applications in Omnichannel for Customer Service

Article • 08/19/2021

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

The horizontal bar below the navigation bar is called the application tab panel. Every customer session has at least one application that is not closable; it is called an **anchor** tab. In the following image, **Omnichannel Agent Dashboard** is the anchor tab.

The application tab has a + icon. If you select the icon, a menu appears that lists the out-of-the-box and custom entities. Also, you can access any third-party line-of-business applications that are extended within the Omnichannel for Customer Service app. Select the option from the list to open it in the application tab.



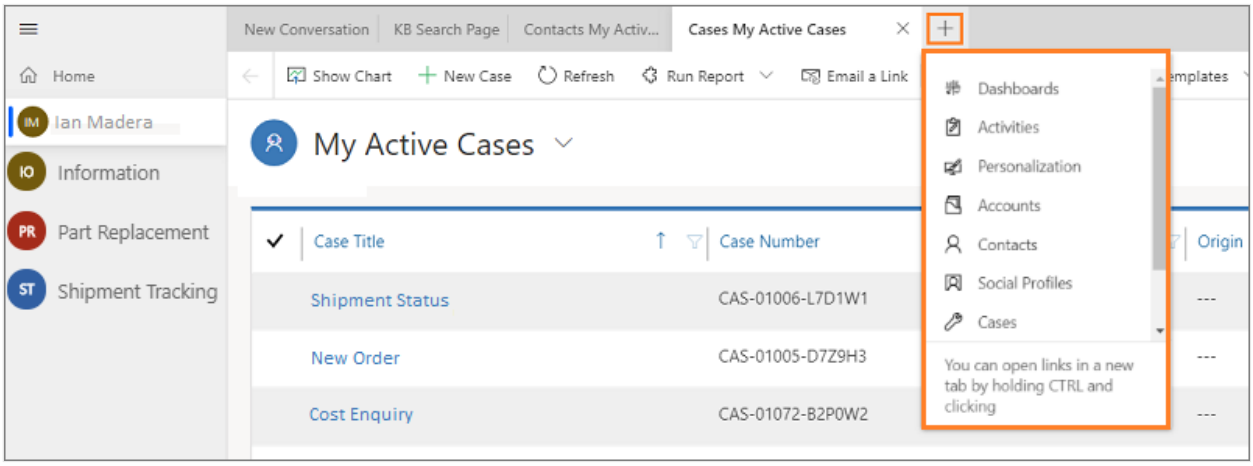
Open an application

You can open an application in the application tab panel in the following ways:

- Use the application tab menu.
- Use the **Ctrl + click** gesture.

Use the application tab menu

On the application tab panel, select + to view the menu that has a list of out-of-the-box and custom entities. Selecting an option from the menu opens the application in the application tab panel. The application opens in the current active session.



Use gesture (Ctrl + click) to open an application

Use a combination of keyboard and mouse-click gesture to start an application. You can press **Ctrl** and select a link to open it in a new application tab. The application opens in the current active session.

Work with applications

Every session has an application tab that is called the Anchor tab. A session can have a maximum of one Anchor tab and there is no close option on the application tab. When you are working on an Omnichannel conversation request, the **Active Conversation** page is the default anchor tab.

When you switch sessions or between applications in the current session, your unsaved changes are not lost and you can continue to work on them.

For example, you are working on a case by entering the title of the case. Before saving the form, you can open an account record in a new application tab. Now, the application focus changes to the account record. However, the unsaved changes are preserved for you to continue working on the form.

You can close an application tab manually by selecting the close icon on the application tab. After closing the application tab, the focus moves to the next available application tab on the left.

You can switch between applications by selecting the application tab title.

Title of the application tab

The title of the application tab is the name of the entity. For example, dashboard names, case, contact, account names, and so on. For third-party applications, the name appears as configured by your administrator.

Personalize sound notification settings

Article • 05/31/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

You can personalize sound notification settings for incoming conversation requests using the personalization menu available on the application tab panel. The sound notifications are available across all channels and can also be set for messages for ongoing conversations.

Prerequisites

- You can personalize the sound notifications only when your administrator has enabled the corresponding setting. More information: Enable sound notifications
- Your browser should allow sounds to be played. In Microsoft Edge, sound is allowed by default. However, if for some reason, sound settings are turned off, you can enable them by going to the media autoplay setting in Microsoft Edge. For information on how to enable sound notifications for other browsers, see the browser-specific documentation.

Personalize sound notifications

The personalized settings have precedence over the administrator settings. You can enable notifications at each channel level for all the channels that are provisioned and available for you.

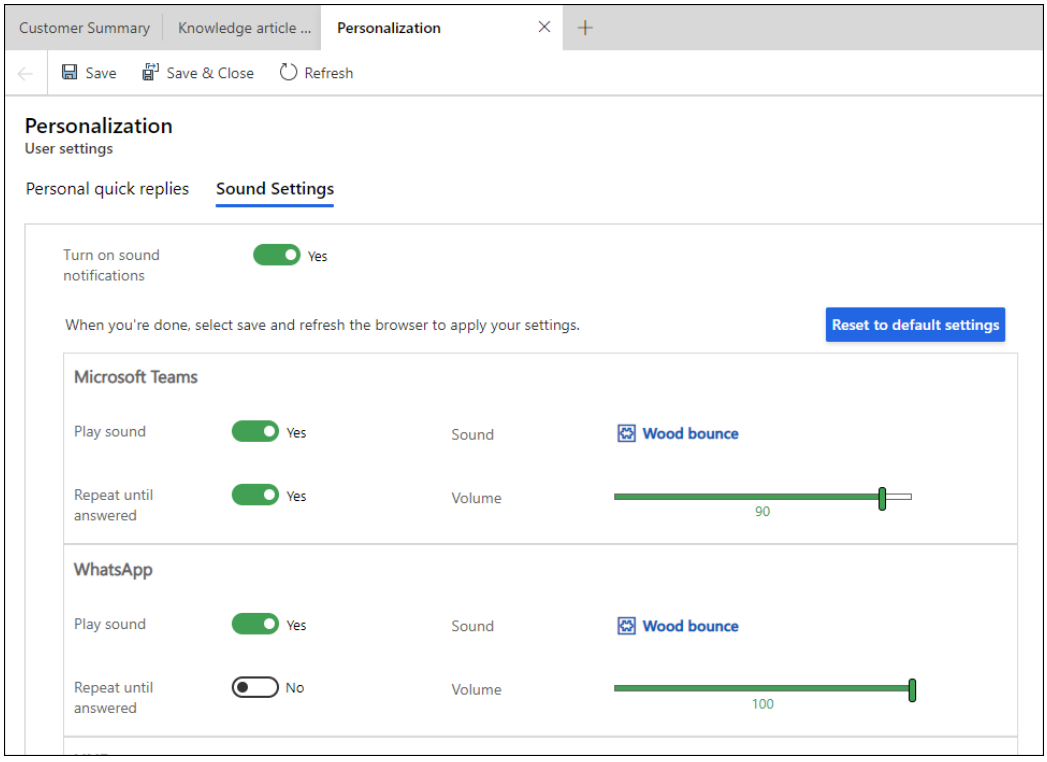
1. On the application tab panel, select the plus icon, and then select **Personalization**. The **Personalization User settings** page appears.

2. Select **Sound Settings**.

3. Personalize the following settings for the channels:

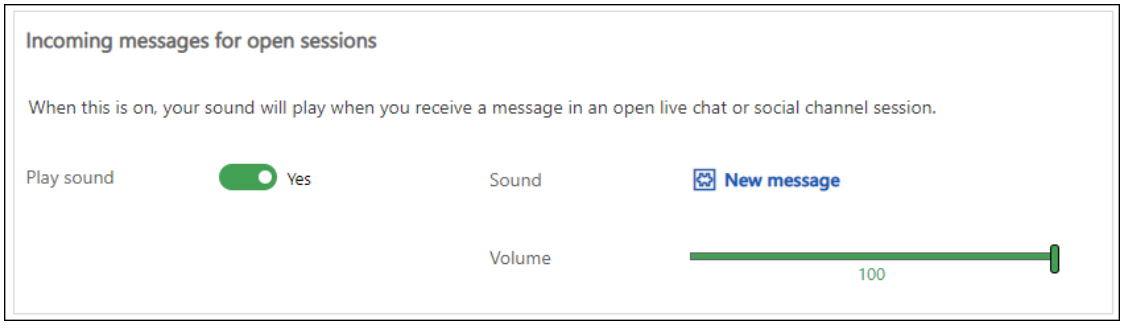
    - **Play Sound:** Set the toggle to **Yes**.

- **Repeat until answered:** Set the toggle to **Yes** if you want the sound to be played until you respond.
- **Sound:** Accept the default setting or search and select a different audio file. You can use the **New Audio File** option to upload and use an audio file of your choice. You also have the option to preview the audio.
- **Volume:** Accept the default setting or use the slider to adjust the volume.



- **Reset to default settings:** When you customize any setting, the button is enabled for you to reset to the out-of-the-box settings.

4. In the **Incoming messages for open sessions** section, customize the options for sound notifications for messages in open sessions, such as live chat or a social channel.



5. Select **Save**.

Create personal quick replies

Article • 11/17/2021

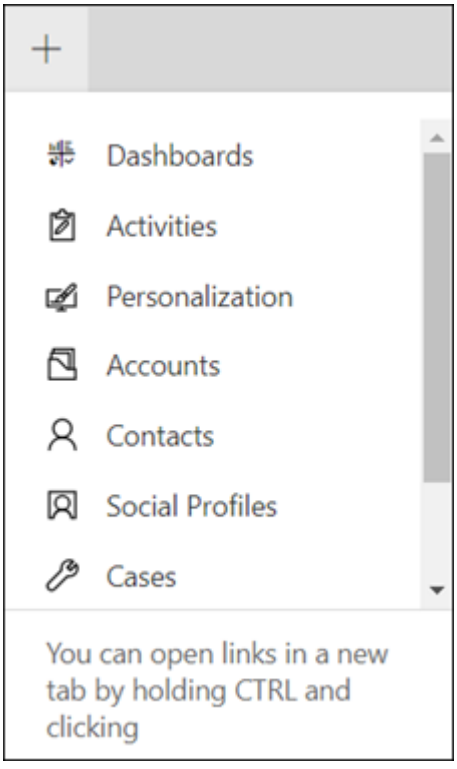
Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

You can use the personalization menu that's accessible through the application tab to add *personal quick replies*, also called *predefined messages*. You can create quick replies for the common questions and scenarios that you need to address in your role. You can tag the replies with keywords that help you invoke the quick replies when you're interacting with customers.

Create personal quick replies

You can create, edit, and delete the personal quick replies you own. The quick replies that you create are available on the **Personal** tab in the **Quick replies** panel of the conversation window.

1. Sign in to Omnichannel for Customer Service, and on the home page, select the plus sign + on the application tab.

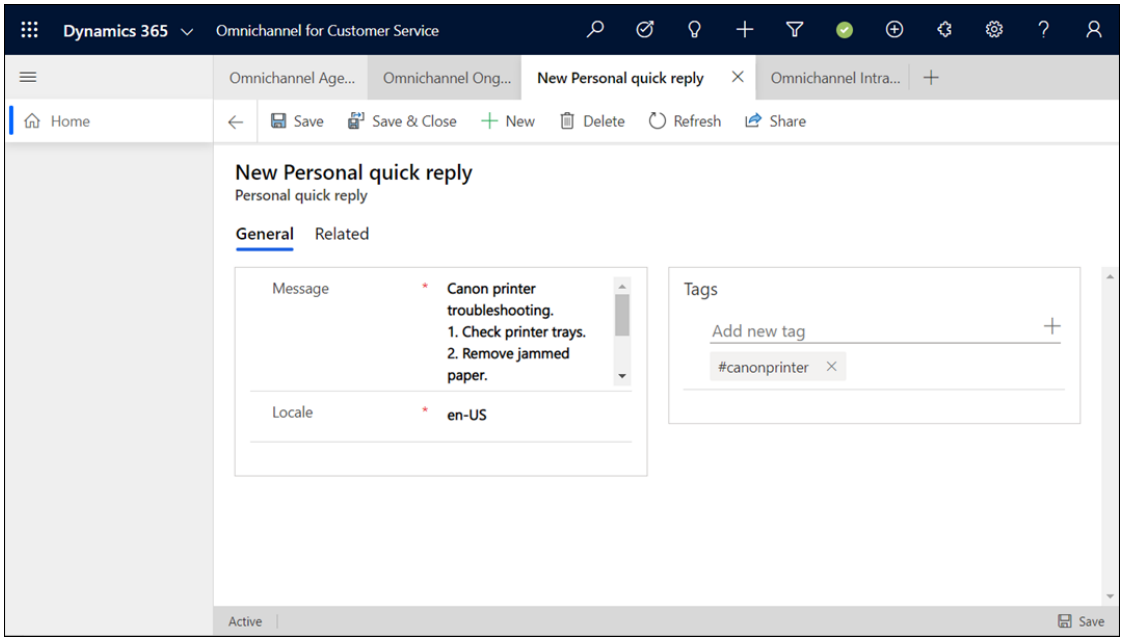


2. Select **Personalization**.

3. On the **Personal quick replies** tab, select **New Personal quick reply**, and do the following:

   - **Message:** Enter the text you want to use for your reply.
   - **Locale:** Select the language in which you want to create the quick reply.

   > **Note**
   > - To avoid duplicating quick replies, check the predefined messages before creating a personal quick reply.
   > - Personal quick replies aren't localized in Omnichannel for Customer Service. To provide quick responses in multiple languages, create a separate quick response record for each language and select its corresponding locale.



4. In the **Tags** area, enter the keyword you want to associate with the quick reply, and then select +. If you want to use the number sign (#), don't use it anywhere else in the keyword except at the beginning.

5. Select **Save**.

It can take up to 15 minutes for the quick replies to be available for your use.

For more information on personal quick replies, see Send quick replies.

Manage presence status

Article • 07/12/2023

Omnichannel for Customer Service offers a suite of capabilities that extend the power of Dynamics 365 Customer Service Enterprise to enable organizations to instantly connect and engage with their customers across digital messaging channels. An additional license is required to access Omnichannel for Customer Service. For more information, see the Dynamics 365 Customer Service pricing overview and Dynamics 365 Customer Service pricing plan pages.

Presence is an indication of your availability or status in the application.

Prerequisites

For the presence status or presence icon to display correctly, enable in your browser for all modes.

View your presence status

You can view your presence status on the navigation bar. You can select the presence icon to launch the presence dialog and update your presence.

- Offline
- Appear away
- Do not disturb
- Busy
- Available

- Inactive

Update your presence status

You can update the presence status in the following two ways:

- **Manually**: To view and set the presence manually based on your availability, select the presence icon on the navigation bar. In the **Set Your Presence Status** dialog, select a status from the list. The list shows the following standard presence statuses:
  - Offline
  - Appear away
  - Do not disturb
  - Busy
  - Available

  You might also see other presence statuses that your administrator configured for you.
