Microsoft Windows 365 Cloud PC

A modern Enterprise needs choice and flexibility to reflect the new working reality.

Over the last two years, Modern enterprises have faced the challenge of increased remote working demand along with global chip shortages causing longer times for both procuring and provisioning physical endpoints.

As a result, we are seeing clients starting to move away from the limitations of traditional physical PCs and legacy VDI services in favor of Cloud PCs to allow more flexible working styles.

Challenges

- Delivering and supporting secure, remote work at scale can be difficult.

- Global chip shortages and supply line issues are delaying endpoint procurement: with no end in sight.

- Issuing Contractors with corporate laptops can bring about IR35 considerations so providing a secure means for them to work via BYOD needs careful consideration to ensure compliance.

- 3rd party supplier management logistics needs to be simpler in providing them with a secure way to connect and access services while removing the need to ship out corporate hardware and also then collect that hardware when the contract ends.

- Complexity in ensuring the latest and up to date Windows experience is deployed is causing a high overhead for over-burdened IT support staff.

- Organisations are unsure of the correct solution or approach for deploying virtual desktop services.

- Supporting specific teams or individual users with expensive, dedicated PC hardware for high compute workloads adds to the overall run costs.

- Understanding device usage trends and working on those insights effectively.

If you believe that any of these challenges are applicable to your organisation, then we can help you.

Windows 365 is a subscription-based cloud PC service providing end users with a rich Windows desktop experience while working from any location in a safe and secure manner. The Cloud PCs are highly available, optimised, and scalable as per your business needs at any given time.
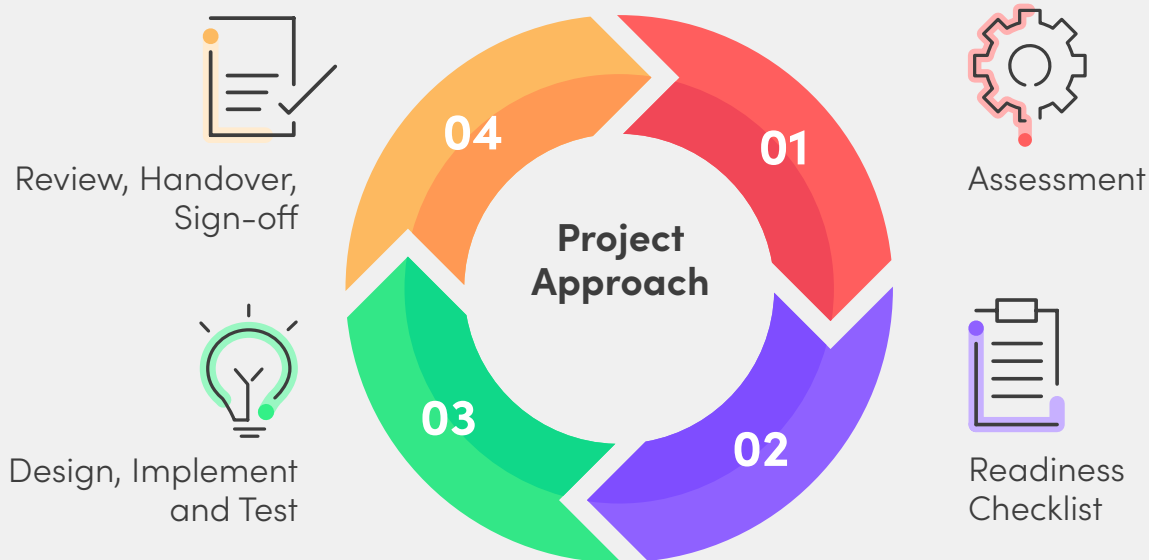

Cloud PCs are easy to create, assign, and manage through traditional services like Microsoft Endpoint Manager and the value with this type of solution is that businesses can ensure that their applications are running on a standardised, managed desktop environment.

Remote employees don't have to worry about connecting to a VPN to manage corporate resources, installing work applications on their personal PCs, or uploading large files to the corporate network - they just have to access the remote desktop environment. Corporate security is maintained with an always up to date environment and sensitive business documents need never be downloaded to an employee's personal device.

**Agilisys**

What can Agilisys do?

We will work closely with you and ensure that your Microsoft Windows 365 journey is designed effectively from the start. We have 15+ years of working with various virtualisation technologies including Azure Virtual Desktop and solid expertise in delivering complex applications and content from the cloud within these virtual platforms.

We provide a full-scale engagement service for assessing, planning, design, setup, customisation, and migration to Microsoft Windows 365, along with what will be required for supporting local IT teams in permitting end users to remotely access their persistent virtual desktop from anywhere, on any device.
