# Zero Trust Security Assessment

*A New Paradigm for a changing world.*

# Current Situation

The rise of cloud applications and the increase in the use of mobile devices has redefined the limits of the security perimeter within organizations.

Remote work and the use of personal devices modify the security perimeter of organizations.

External collaboration increases the volume of information that leaves the organization.

Increase in the use of hybrid environments.

# What is Zero Trust?

**Zero Trust** model assumes that there can be attackers both within our network and outside it, so no user or device should be trusted by default.

Within the Zero Trust model, each access request is explicitly verified, which requires that all elements of the organization (identities, devices, networks and applications) be validated and provide trust.
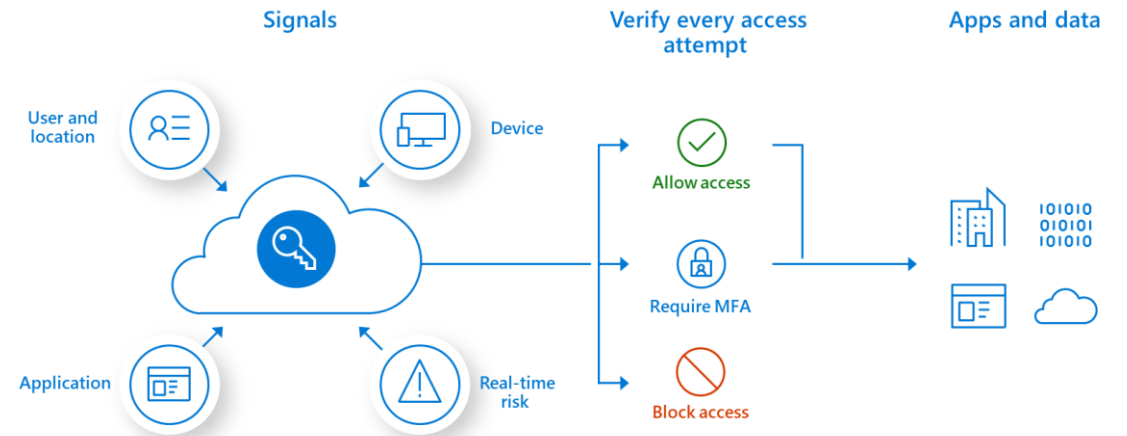

# Zero Trust Security Assessment

**1.** We hold an initial meeting with the customer to find out the current situation in their environment.

**2.** We make a small assessment and contrast it with the security of the environment.

**3.** We identify the degree maduration of the security environment.

# Zero Trust Security Assessment

4. We prepare a report about the current situation of the environment with Power BI.

5. We recommend Best Practices.
