Assessment

Azure Web App Migration: 3 Week Assessment

Objective

Let our Azure Subject Matter Experts assess your on-premises or private cloud environment(s) and make it easy to transition your organization's web application workloads into the Cloud.

All Covered's Azure Web App Migration Assessment will streamline understanding how to get your organization's server workloads into Azure efficiently and effectively. Senior level engineers, Solutions Architects will touch all relevant components and segments of your web application infrastructure and design to identify the necessary steps to transition to Azure. This would involve timeline, upfront and ongoing costs, opportunities to modernize your web application infrastructure, and what savings can be taken advantage of through Azure solutions and eliminating or significantly reducing the need to invest in any ongoing capital expenditures.

Process

- Kickoff meeting to gather details of critical web application components of the business, understanding pain points, and defining that the goals are of transitioning to Azure.
- Discovery of your existing environment by experts on our team to capture network topology, database-driven web application dependencies, storage consumption, and existing governance design and access requirements.
- An Azure Migrate project will be leveraged to capture important metrics, which will detail options for modernizing web application workloads to Platform-as-a-Service and estimating what ongoing costs can be expected after your web apps are running in Azure.
- A fully comprehensive report will be reviewed with you to discuss all findings, any concerns to initially address, and recommendations on how to successfully transition to the cloud.

Based on the outcome of the report review, whether it is making a full jump to the cloud, or just a partial transition, a scope of work will be created to get the next steps in motion to begin your journey to Azure.
