We deliver a best-in-class application by superseding all the business and technical challenges of the customer with a deep understanding of the customer's business to provide the right solution.

Our technical professionals have substantial expertise across various development models. We take ownership to deliver a best-in-class application by superseding all the business and technical challenges of the customer with a deep understanding of the customer's business to provide the right solution at a quick turnaround time.

• Application Development • Application Engineering • Application Modernization • Application Migration • Application Re-engineering
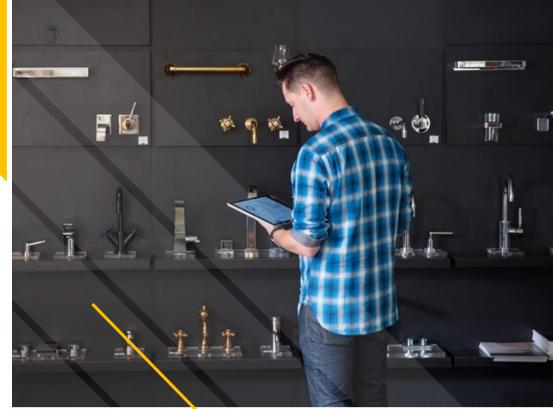

What we offer

1. Discovery Phase: During this preliminary phase, our dedicated team of experts will find out the details necessary to determine the scope of work and time frames and prepare a plan for the end-to-end project execution to deliver a quality product/application as per our customer's needs.

2. UI/UX Design Phase: With our creative designers, we will bring our customer's design virtual thoughts to reality and match them with the customer's expectations.

3. Development / Migration / Modernization / Coding & Build: Our specialized technology developers will create a successful application that End-Users will need. Based on the analysis, our team of experts will recommend the best-in-class solutions and develop a user-friendly solution with an attentive approach. Building sustainable applications, API integration services, Payment gateway integration, Azure Services, Progressive web/mobile app solutions, web/mobile development, legacy system modernization and digital transformation, platform and application Migration, frontend and backend development, IoT development, AI and ML development are the key strength of our robust technical team.

4. Testing Phase: Our certified testing professionals perform all the relevant testing based on the application and users' needs. Generally focusing on Cross-Platform testing, Browser compatible testing, Features & Functionality testing, Front-end & backend testing, Regression, Stress, Load, and Performance Testing, with an Automated Test Suite in Azure DevOps wherever applicable, developed by our testing professionals.

5. Deployment Phase: Based on the customer's business goals, our DevOps experts recommend the best deployment model, which is considered successful, say, with downtime, without downtime, roll-out changes to an environment, environment separation, backward compatibility, and more.

What our customers are saying

- Thanks to the efforts of the Ansi Bytecode team, the company was able to deliver the project just in time for the next cricketing season. the company was most impressed by how well the team adhered to the strict timelines they had without sacrificing the quality of their work.
