

IQ Messenger: The standard in vendor-neutral critical alarms

IQ Messenger improves alarm processes for healthcare, industry and government based on its powerful vendor-independent message broker. IQ Messenger is used by leading organisations around the world.

The apps and integrations of IQ Messenger aim to bring the right information to the right person, at the right time and to the right device. This is based on a large software development team and years of experience in the world of critical alarms. Our software is medical class II certified, completely vendor-neutral and device-neutral.

All conceivable systems in and around a building that give an alarm or can receive an alarm output can be integrated with the IQ Messenger platform where we send the messages to any desired (smart) device (any-to-any).

Professionals work more effectively with our software without the risk of vendor lock-in and alarm fatigue.

The result? Better care for clients or patients, and higher productivity and safety for professionals in the industry.

Vendor-neutral

No sales of equipment, but a software-only platform that combines existing and new systems independently of vendor. This means you no longer need unnecessary investments in hardware.

Efficient workflow

The alarm system can be fully configured to the workflow. All systems are combined on a single any-to-any alarm platform developed by a software-only message broker.

Fully certified

Fully certified for ISO 27001, ISO 13485 and CE Medical Class IIb. With maximum uptime, ensuring alarm follow-up so that safety is guaranteed.
