

Ensure reliable and trusted APIs that perform and conform.

APIs need to be reliable and trusted in order to enable your digital products.

APIContext monitors your APIs across development and production environments, to alert you to performance issues; find SLA/SLO violations; and ensure conformance against your architected specification.

## Key Benefits

Monitor every API that makes your product work

- Import existing APIs automatically or configure individual calls
- Proactive, outside-in monitoring
- Advanced configuration for critical workflows

Ensure your APIs are fast and resilient

- Global monitoring from 125+ points of presence
- Set SLA/SLO parameters across the entire call and response chain
- Send alerts, logs, and traces to any other system

Manage API governance and compliance

- Flag deviations from your architected spec, or open standards like FAPI and FHIR
- Create compliance evidence and regulatory reporting automatically
- Monitor for API drift with remediation tracking

## Technical Details

- All call telemetry available via OpenTelemetry for consumption and analysis in the tools you already use.
- Simple to configure: import OpenAPI specifications, Postman collections, and curl commands; manage config in code; or set up individual calls in under a minute.
- Configure sequences of calls with dependencies like authentication state
- Triage issues quickly, with dashboards that highlight intermittent issues without digging through logs
- Role-based access to share visibility
- OAuth and JWT token handlers included

APIs that Perform and Conform.
