

Azure Government Migration Assessment

Create a cloud migration roadmap that meets your mission needs

AIS' Azure Government Migration Assessment helps you assess the dependencies and cloud readiness of on-prem apps and workloads to inform your migration roadmap and prioritization.

Many of the assessments and resulting migration projects happening in organizations today take too long, cost too much, and aren't delivering business value. Business leaders and IT teams are faced with Data Center evacuations, a need to modernize Mainframes, and aging or unsupported technology without a clear path to cloud, or worse, are stuck in a dead-end, expensive migration project.

Our approach to assessments result in recommendations and next steps for migration. Following the assessment, AIS' application migration expert resources and implementation enables teams to reduce cycle times, leverage proven processes, and scale up talent to deliver better migration outcomes at scale. Our cloud transformation methodology stands on the foundation of our Cloud Delivery Framework (CDF), a repository that provides guidance and backlog documentation for base migration tasks and best practices. Together, our IP and experience helps enterprises realize the cloud outcomes that drive business value and faster time to market.

Our Approach to Application Assessments

 PHASE ONE Workload Discovery	 PHASE TWO Mapping	 PHASE THREE Present Findings
<p>Client work sessions to define strategy and conduct an initial inventory of workloads and applications to create a prioritized migration and modernization backlog. We work with the key system owners and SMEs for each workload or application to assess each application.</p>	<p>Analysis of the systems and source code of custom applications to determine system interdependencies, cloud readiness, application scope, and approach for migration or modernization of your applications to be moved to the cloud, implemented using an agile approach.</p>	<p>Analyze data, documentation, systems and code to compile findings and recommendations and plan for progressing with cloud migration and modernization efforts.</p>

What Happens After the Assessment?

Prior to migrating the first workload, a cloud platform needs to be selected and established, along with meeting requirements for Authority to Operate (ATO). We'll help you with the ATO process, determine the right cloud platform, and create a plan for a landing zone. A proof of concept migration to the designated cloud environment is then followed by a phased migration plan for remaining workloads, prioritized for analysis and rationalization based on business goals, complexities, and dependencies.

Tools for Success
