

Microsoft Power Platform gives organizations the flexibility to meet the demands of their users, but with those demands and growth comes questions of how to govern at scale. What sets Microsoft Power Platform apart from other low-code options or other shadow IT point-solution providers is that everything is governed and authenticated through a single platform. This means that as an admin, you have full visibility of everything your makers and users do—it's governable, automatable, auditable, and manageable by default.

Organizations today face significant governance challenges. According to IDC, there will be one billion new logical applications by 2028 – scaling the need for development and leading to 72% of IT executives feeling unaware of the number of 'Shadow IT' apps in their organization.

The **Low-code Governance Strategy** engagement is a first step in the definition and design of your governance, security, and operations plan for a successful adoption at scale of the Power Platform.

Low-code Governance Strategy

A three-phase engagement providing an overview of the best practices for governance and scale with the **Power Platform**, designed to prepare you for effective governance, security, and operations of their low-code platform.
