

Intelligent Automation with Power Automate

Streamline process and increase efficiencies with Robotic Process Automation

Enable automation with RPA in Power Automate

Many organizations are exploring RPA solutions to gain operating efficiencies, improve worker satisfaction, reduce error, and adopt ecosystems like the Power Platform.

Whether you want to migrate from an existing RPA solution into Power Automate or start the RPA journey, AIS can help. Our Intelligent Automation services help your enterprise through the crucial first steps in RPA adoption and develop a roadmap that meets both business objectives and your appetite for platform adoption. We also have the experience to help you with the governance, infrastructure, and support needed to succeed.

AIS is your co-pilot in cloud transformation, providing the guidance, resources, and expertise to develop a modernization plan tailored to your enterprise requirements.

Bring legacy applications into your modern workflow with RPA

Many organizations have legacy applications that serve vital roles in their workflows, and these applications can help a multitude of functions and business needs. Since many of these applications were created before modern API extensibility, there is a need to utilize these apps inside modern workflows without the extensive costs of rewriting these applications.

RPA in Power Automate provides tools to help your organization realize the value of intelligent automation. These impacts can be felt across any area of your business: contract processing, document automation, interfacing with legacy apps and modern APIs in a single workflow, and more. AIS can also help your organization how best navigate the implementation to maximize the platform investment and the staff who will benefit from these increased efficiencies.

Goals of this engagement

While RPA's potential is significant, it requires proper planning, guidance, and nurturing to ensure successful outcomes. AIS has years of experience in governing, developing, and optimizing solutions in Azure and the Power Platform. We can help you realize the value of this combined ecosystem through intelligent automation and provide measurable and repeatable impact to your business in many different forms. The following goals are intended for this service offering:

					
Provide governance and infrastructure guidance to support RPA solutions	Provide discovery services on your RPA use cases and give guidance on the best path to success	Understand the whole picture of how RPA can drive business outcomes through automation	Install the Automation CoE Starter Kit from Microsoft to gain reporting on RPA	Create a proof of concept to validate an outcome or move from an existing RPA tool	If necessary, plan for additional development and guidance

Real outcomes for your enterprise

For most organizations, knowing where to start is the hardest part. That analysis paralysis kicks in if you're here, and prioritization is near impossible. We remove the guesswork and help you confidently build a roadmap and execution strategy to achieve your most important business goals.

You'll have the necessary technical foundations to ensure initial and ongoing success from this initial project. You will have validation that RPA can provide the dynamic gains in efficiency to develop your intelligent automation capability further.

As your partner, your success is our success. That starts with better visibility into your IT environment and a clear path forward. You'll come away from this engagement with a better picture of RPA adoption through the Automation Starter Kit and can decide how to proceed in automating your legacy applications. AIS can support you through advisory or implementation every step of the way.

Case Study: Automotive retailer improves IT efficiency with RPA

An automotive retailer created a new legacy tool to provision user accounts, but it was a highly manual and repetitive process that involved significant amounts of time for their IT staff to work with. AIS created a RPA solution that significantly reduced the amount of manual time to interface between different systems that terminally provisioned accounts with this legacy tool. Not only were the IT staff freed to do other work, but errors were greatly reduced due to the automated solution built for them. As a result, the organization saw significantly reduced operating cost and a key process was streamlined.

Case Study: Insurance company improves SOX compliance processes with RPA

A major insurance company has a legacy tool that monitors database access and must record that information through screenshots for SOX compliance. The process was very time intensive and very manual. AIS built an intelligent, attended automation in Power Automate RPA to take the screenshots and store them in SharePoint for their compliance needs. Now their time is reduced, errors reduced, and a key component of their compliance journey is now automated inside of Power Automate building on their already extensive Power Platform investments.
