## ADVANCED TOOLS

We have developed unique tools that using AI and automation speed up the software development process and eliminate repetitive tasks.

# GENERATING FRONTEND CODE FROM DESIGN

## PANORAMA

Panorama is the first intelligent design-to-app converter in the market. It can convert your designs into fully functional responsive mobile or web apps. In contrast to other competing tools, Panorama generates code that cannot be distinguished from the code written by humans.

## GENERATING BACKEND CODE

### Welcome to AUTOMATA

Let's generate your backend codes in minutes without a team of developers!

Generate now

Automata has dozens of templates to help you achieve your backend codes. Navigate through the categories below to find the template that will move the needle for your site. If you need it, we've got it.

## BUILD APPS USING AI

# GAMMA WILL HEAR YOU

Just Talk!  
and gamma will lead you  
to make the app you desire!

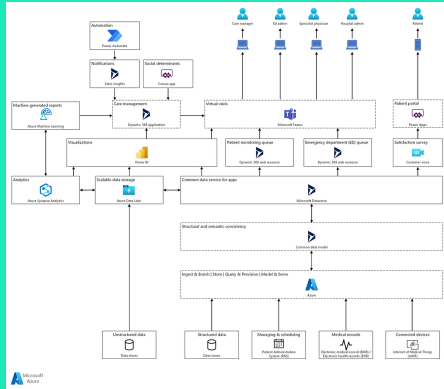

Make an app!

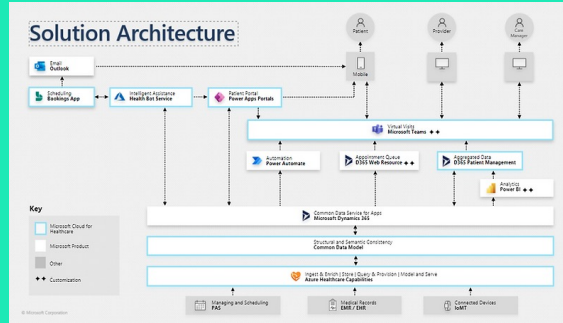

# Sample Solutions

## Clinical insights

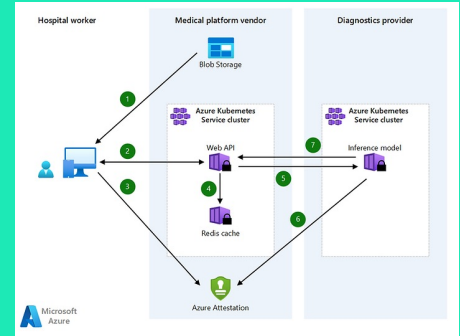

The healthcare industry has traditionally struggled to effectively use the vast amount of data it creates. Most of the medical data is unstructured and inaccessible for data driven decisions. This solution uses data lake to store the large amounts of data required for reporting and analytics. This data is analyzed by using Azure Synapse, for use by the machine learning module and Power BI visualizations

## Virtual health

Since the pandemic, many patients prefer to visit their medical providers virtually rather than in person, whenever possible. Improving clinical and operational insights in healthcare becomes important in such a virtual world. This includes connecting data from across systems, creating insights to predict risk and help improve patient care, quality assurance, and operational efficiencies.

## Confidential computing

When organizations collaborate, they share information. But most parties don't want to give other parties access to all parts of the data. By using confidential computing and containers, the solution provides a way for a provider-hosted application to securely collaborate with a hospital and a third-party diagnostic provider.
