Designing and deploying AI agents that automate work and scale with confidence

Many organisations see the potential of Copilot Studio but struggle to move beyond experimentation into real, production-ready automation. Manual, repetitive and error-prone processes continue to absorb time and effort, while early agent builds often lack governance or a clear path to scale.

Arinco's Copilot Studio Agent Builder Accelerator helps organisations streamline and automate business processes by designing and deploying AI-driven Copilot agents that deliver real value. Through expert-led workshops, structured agent design sessions and hands-on build support, we work alongside your teams to identify high-impact use cases and deliver production ready patterns. The result is not just a working solution, but a scalable, governed foundation for adopting agentic AI across the business.

Why organisations use Arinco's Copilot Studio Agent Builder Accelerator

Reduce manual effort by automating repetitive, time-intensive tasks with reliable Copilot agents.

Improve quality and consistency through a standardised approach to agent design and delivery.

Enable future expansion with a modular agent architecture that supports new use cases.

Build internal capability by equipping teams to confidently use, maintain and extend Copilot agents.

Customer success story

Arinco partnered with a logistics company to redesign and pilot Copilot Studio agents for contract review. This included a contract checklist automation agent and a clause extraction and comparison agent. The engagement resolved reliability issues, improved document interrogation accuracy and equipped the contracts team to automate compliance checks and clause analysis across multiple documents.

Our process

Assess
Collaborate with stakeholders to identify and prioritise high-value processes suitable for agent-based automation.

Design
Define agent behaviour, conversation flows, integrations and governance requirements using proven design patterns.

Build
Configure and deploy Copilot agents in Copilot Studio, integrating with systems, data and workflows as required.

Enable
Transfer knowledge, patterns and documentation to ensure teams can confidently operate and extend agents.
