

AI and Advanced Analytics

Your guides to applied AI

We'll take care of everything from data collection and coding to training and evaluation. We combine the best of traditional analytics and data science with business-driven development.

- Machine Learning
- Image and Signal processing
- Network Analysis
- Text Analytics
- Operational Research

Machine Learning

we can build services to enrich your insight and operation using wide range of classification, recommendation and prediction models using whitebox solutions with explanations.

Text Analytics

we can help you to apply text mining techniques to get additional business insights from complex multi-lingual documents. This enables you to summarize the text, identify entities etc.

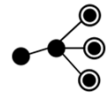

Image and Signal Processing

we can help you to select a proper toolkit or develop an AI-based software to process images or sound, detect patterns or identify objects, structures and text.

Operational Research

we have as well experience with OR tasks like shifts optimization, linear programming, route optimizations etc. This makes analytics practical and operational directly at the critical spots.

Network Analysis

we have an extended expertise of graph data analysis. (e.g. CDRs, social networks, transactions etc). We can build a very complex solutions that would fulfil almost every business requirement.

Model Governance

we understand the whole lifecycle of every AI solution and we know how to make it production ready. This includes containerization and model management.
