Let us keep you safe

While your company may observe standard business hours, there is no guarantee that attackers will do the same. Byte's Security Operation Center (SOC) monitors, prevents, detects, investigates and responds to cyber threats around the clock.

We've got you covered

We employ people, processes and technology to continuously monitor and improve your business's security while detecting, preventing, analysing, responding and defending against any cybersecurity attack.

Continuous monitoring

Our SOC team works to minimise cybersecurity risks by monitoring networks 24/7, detecting malicious activities and preventing them before they can cause any damage.

Centralised visibility

Our team provides an integrated network visibility solution, allowing you to achieve full visibility into your network infrastructure and potential attack vectors.

Incident Management

Our SOC not only identifies threats, our experts remediate and manage any incidents or cyber threats that may arise. Byte will also define your security roadmap, improving your security posture, services, platform and devices.
