

Fact Sheet

CS Connect.

Automated data exchange between different systems.

CS Connect integrates Microsoft with ERP systems (e.g. SAP) and automates bidirectional data exchange. In this way, data that is relevant to decision-making is always up to date and available to all participating users in the familiar Microsoft or SAP work environment. The result: precise business decisions with consistent and up-to-date data.

CS Connect can be used both for on-premises as well as Cloud scenarios. Integrations involving Cloud solutions, such as Microsoft Project Online, offer flexible and scalable solutions with a high level of user acceptance and reasonable costs on a subscription basis. CS Connect also supports the integration of hybrid scenarios that use one application in the Cloud, while the other application is available on-premises.

CS Connect is a web-based server application; therefore it does not require the roll-out of client components. The web front-end for configuration and monitoring is presented in the modern style of the familiar Microsoft SharePoint.

CS Connect is versatily applicable and certified by SAP and Microsoft.

“Not only is Campana & Schott one of Microsoft’s principal European partners in these technologies, but they also specialize in integrating Microsoft solutions with SAP. They offer an off-the-shelf integration solution that ensures the integrated system’s longevity.”

Christian Borel
