

Cario Frontend

 API Calls – Data coming from Cario

 API Calls – Data going to Cario

 FTP or Webhooks

1 If the order details have been added to your ERP or WMS, then you can enter the Order Number (or some other unique identifier) into Cario to retrieve the order details and populate Cario's fields. You can choose which data sets are retrieved and then add any missing information directly into Cario.

2 If the customer's platform does not have an API or have some other security policies that prevent external data retrieval, then FTP can be used instead to push the order information to Cario on a predetermined schedule. This information would be stored within Cario allowing it to be retrieved and processed when needed.

3 All the quoting and consignment processes are then completed in Cario. If required, a postback process can be enabled to push consignment status and PODs back into the WMS for reporting and analysis. If an API is not available, this can also be done via a webhook.
