Enterprise Data Platform Managed Support.

Contents

Azure App Service (URL)

**Step 1:** Log in to the Azure portal

Step 2: From the blade, select **App Services** then select the web app that was deployed from Azure Marketplace
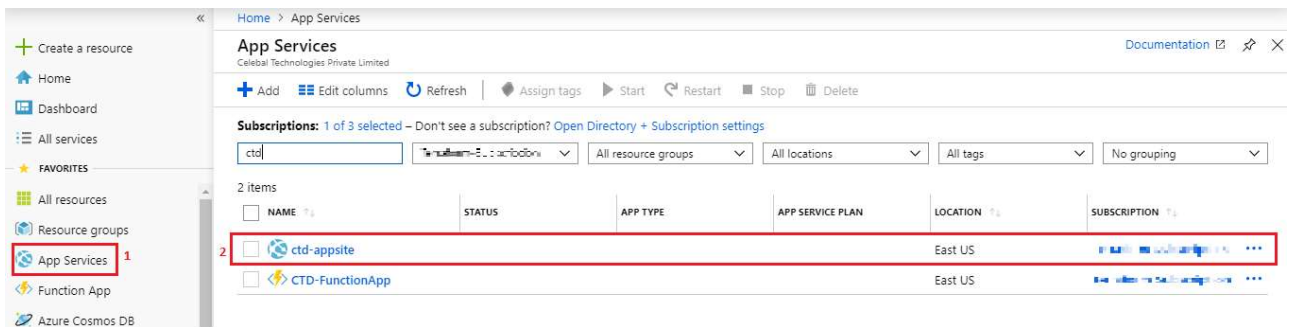

**Step 3:** Select the web app and copy the URL

Azure Data Factory

Step 1: Select **Data factories** option

Step 2: Select Data Factory and click on 'Author and Monitor'
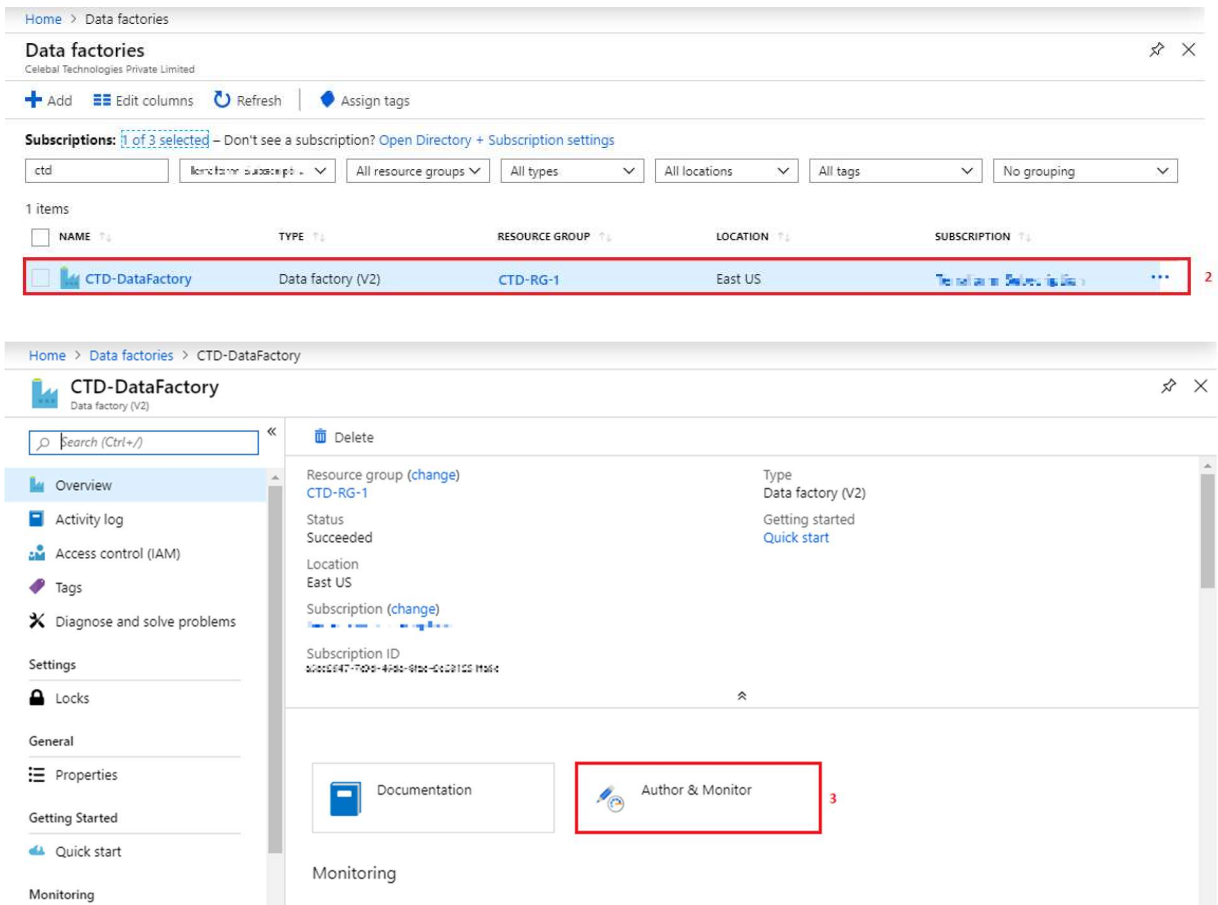

Step 3: Another blade will open, click on the pipeline symbol
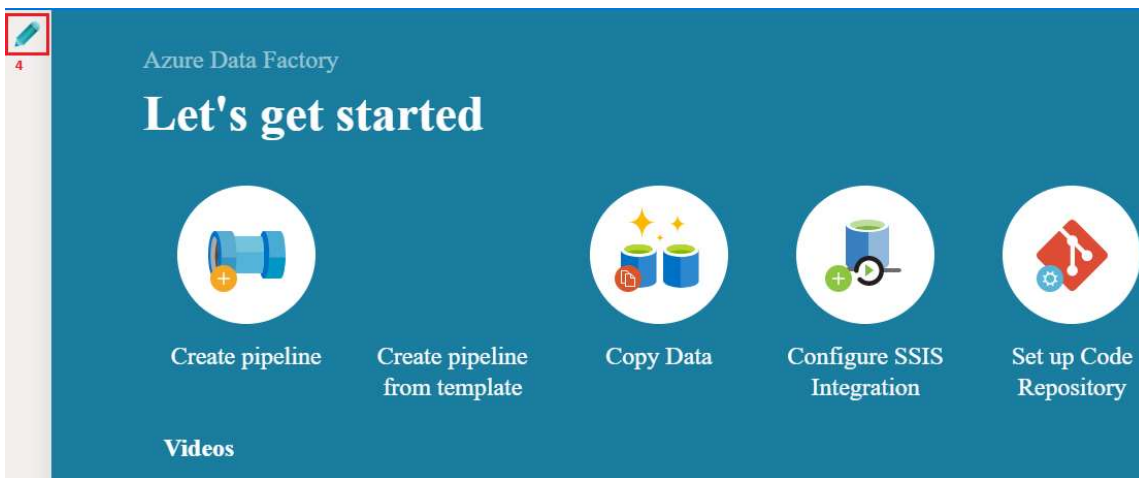

How to download and install Integration Runtimes for Data Factory (For SAP and Oracle)

Step 1: Select Connections option from the Factory Resources blade

Step 2: Select Integration Runtimes, edit the one which is unavailable

Step 3: Click on 'Download and install integration runtime' option

Step 4: Click on Download

Azure Data Factory Integration Runtime

_Important!_ Selecting a language below will dynamically change the complete page content to that language.

Select Language: English ▼   **5** **Download**

The Integration Runtime is a customer managed data integration infrastructure used by Azure Data Factory to provide data integration capabilities across different network environments. It was formerly called as Data Management Gateway.

Step 5: Once it gets download, open the setup and install Integration Runtime

Microsoft Integration Runtime Setup   — ☐ ✕

Welcome to the Microsoft Integration Runtime Setup Wizard

Please select the language/culture to be used by the Microsoft Integration Runtime. Note that this installer will continue to use culture/language of the machine.

English (United States) ⌄

6
Back   Next   Cancel

Microsoft Integration Runtime Setup   — ☐ ✕

Ready to install Microsoft Integration Runtime

Click Install to begin the installation. Click Back to review or change any of your installation settings. Click Cancel to exit the wizard.

7
Back   🛡Install   Cancel

Step 6: Once setup gets installed, copy the 'Authentication Key' from Integration Runtime wizard shown above

Integration Runtime: SelfHostedIntegratnRuntime   ⟩

| Settings | Nodes | Auto Update | Sharing |

Install integration runtime on Windows machine or add further nodes using the Authentication Key.

Name   ⓘ

SelfHostedIntegratrRuntime

Description

Option 1: Express setup

Click here to launch the express setup for this computer

Option 2: Manual setup

Step 1: Download and install integration runtime

Step 2: Use this key to register your integration runtime

Name	Authentication Key
	✅ Key1 Copied to your Clipboard **8**
Key1	IR@6a709224-5d20-4992-8a85-347c564701af@CTD-DataFactory@eu@7A 🗐 🔁
Key2	IR@6a709224-5d20-4992-8a85-347c564701af@CTD-DataFactory@eu@fel 🗐 🔁

Cancel   **Finish**

Step 7: Paste the key and click on Register

Microsoft Integration Runtime Configuration Manager   ✕

Register Integration Runtime (Self-hosted)

Welcome to Microsoft Integration Runtime Configuration Manager. Before you start, register your Integration Runtime (Self-hosted) node using a valid Authentication Key.
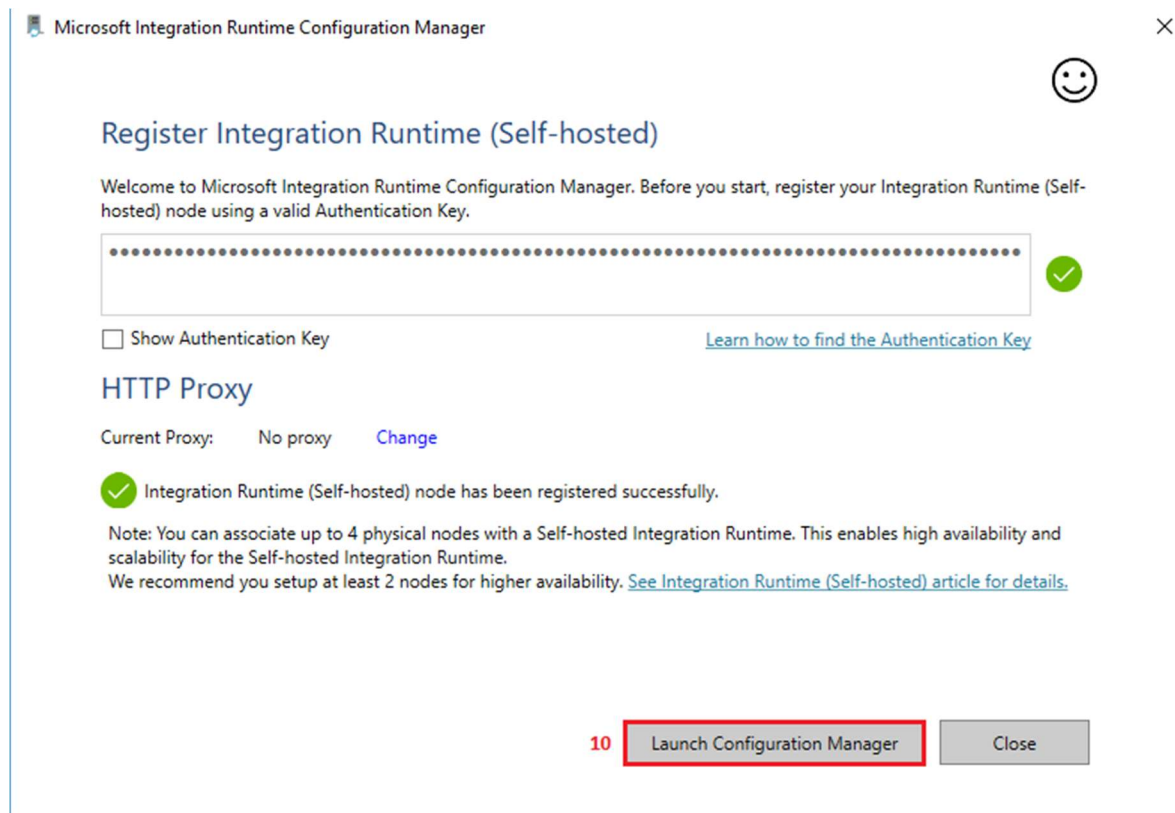

●●   ✅

☐ Show Authentication Key   Learn how to find the Authentication Key

HTTP Proxy

Current Proxy: No proxy   Change

**9** [Register]   [Cancel]

Step 8: It will detect the Integration Runtime environment, click on 'launch configuration manager'

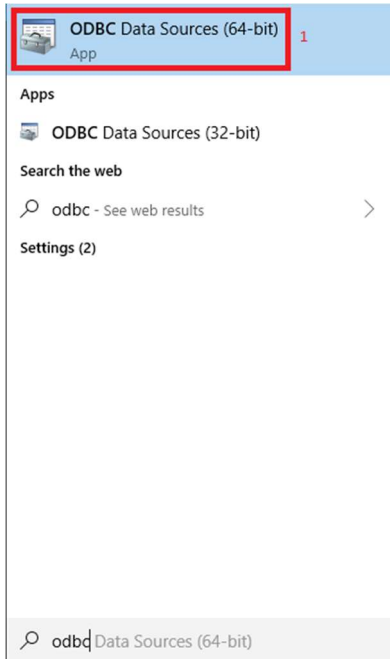

Step 9: You have successfully installed Integration Runtime for Data Factory, visit the Integration Runtimes wizard and check that the status is now running
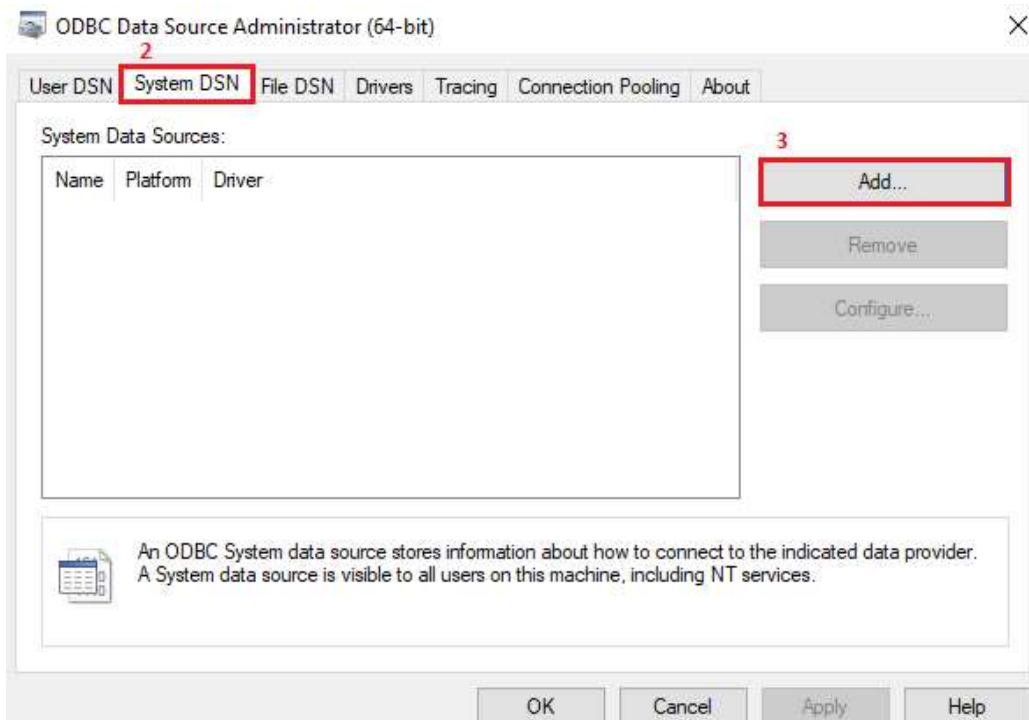

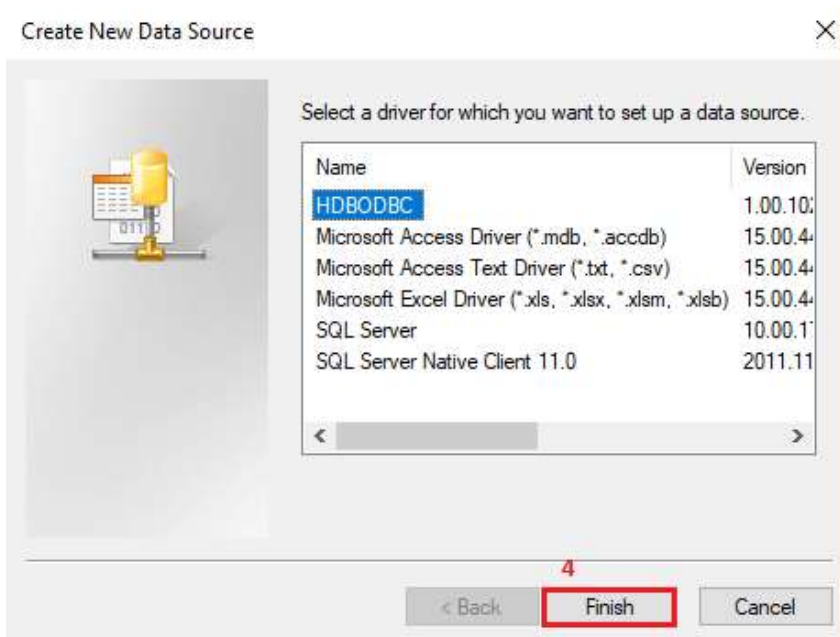

How to add HDBODBC Driver for SAP HANA

**Step 1:** Install SAP Client for HDBODBC Driver, open the ODBC Data Sources

Step 2: Select 'System DSN' then click on Add

Step 3: Select HDBODBC and hit Finish

Step 4: Provide the Data Source Name and Server: port then click on connect

After this step another prompt will open, provide user and password then click on OK this will add HDBODBC Driver.

Azure Storage Account (Access Keys) and (Connection Strings)

Step 1: Log in to the Azure portal

Step 2: Select **Storage Accounts** from Blade, then select the Deployed Storage Account
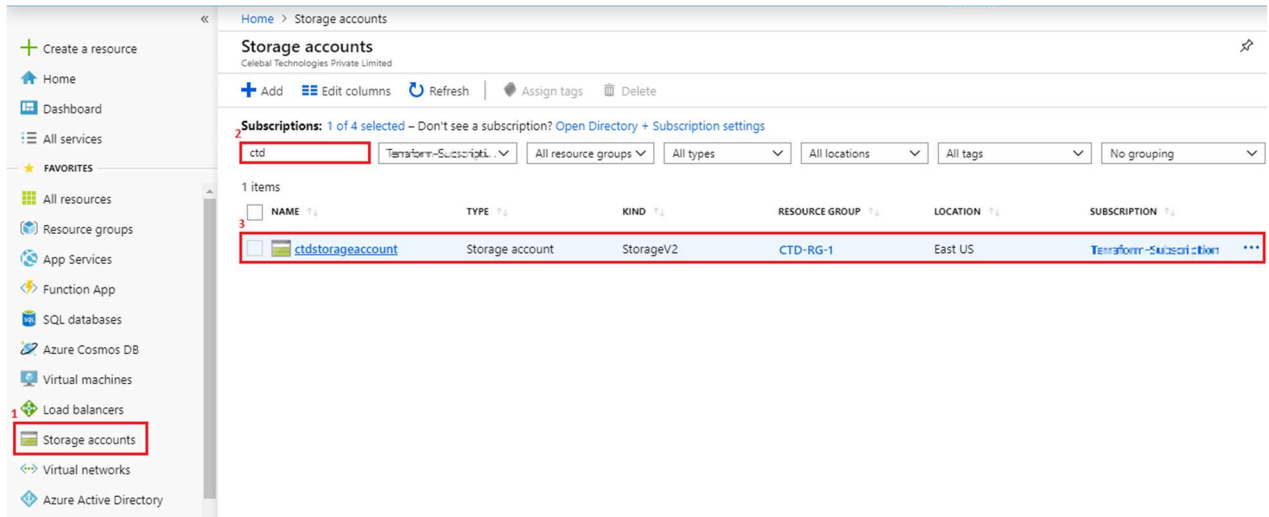

Step 3: Select **Access Keys** from blade then copy the Storage Account Name, Keys and Connection String for future reference
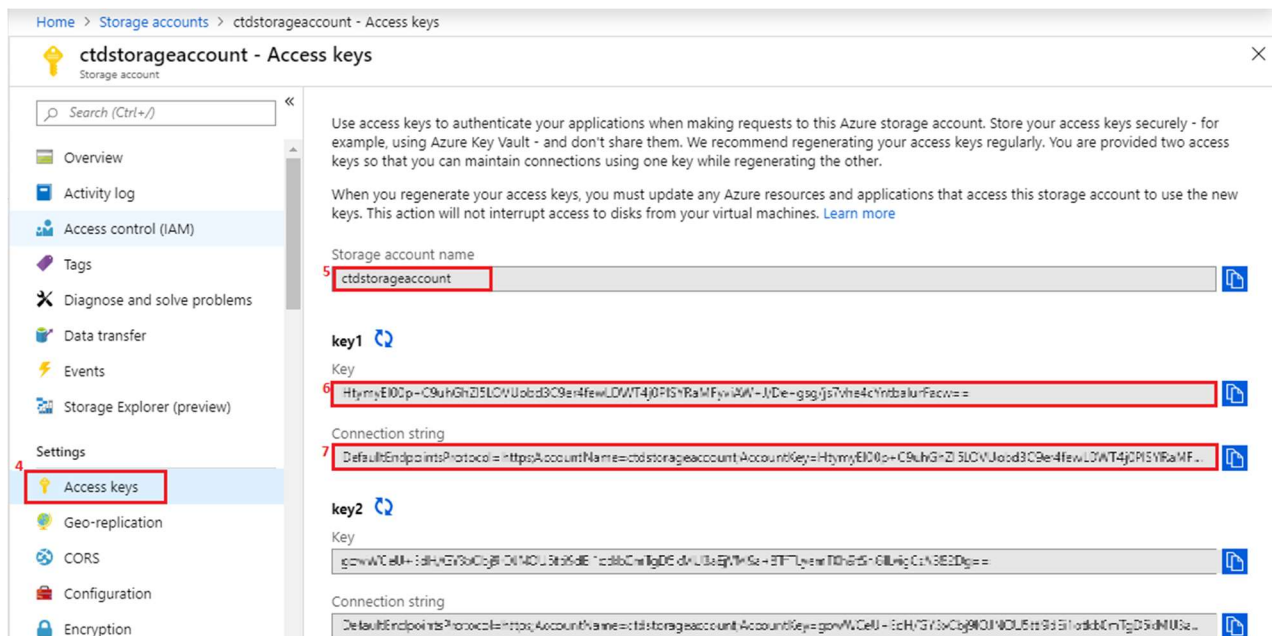

Azure SQL Server and Database (Connection Strings)

Step 1: Log in to the Azure portal

Step 2: Select **SQL Servers** from search tab
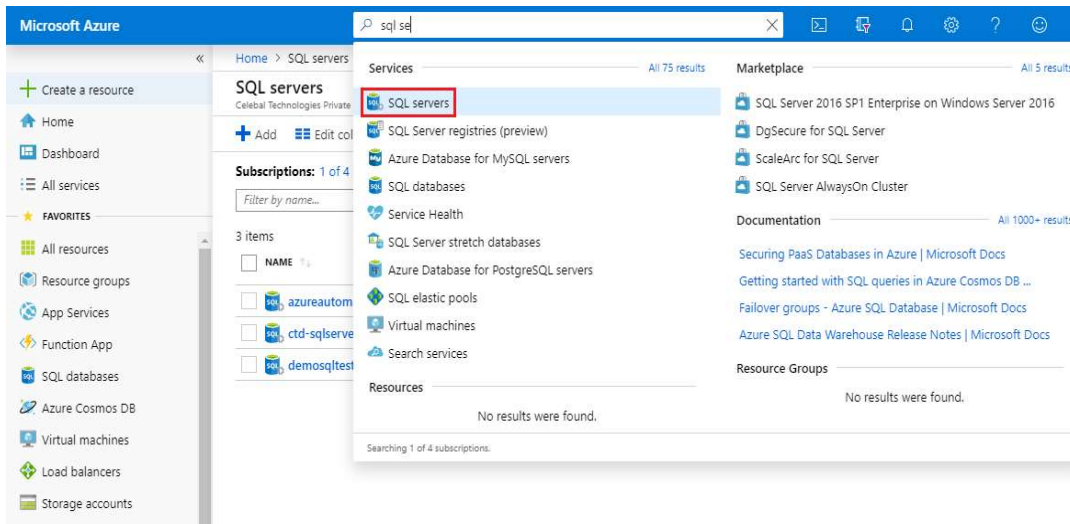

Step 3: Select the **SQL Server**
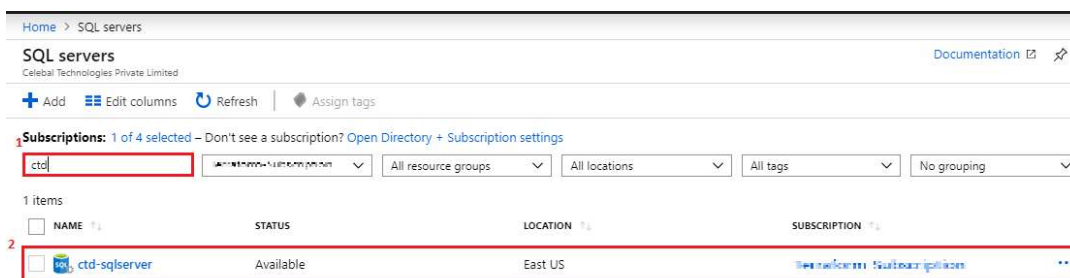

Step 4: Select **SQL Database** from the blade
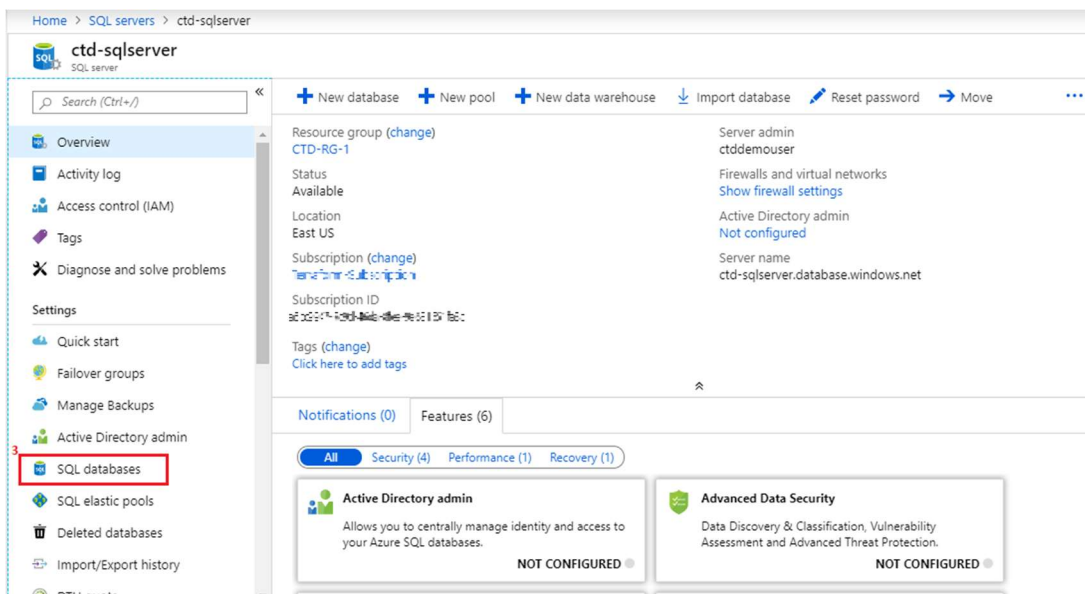

Step 5: Copy **Database Name**
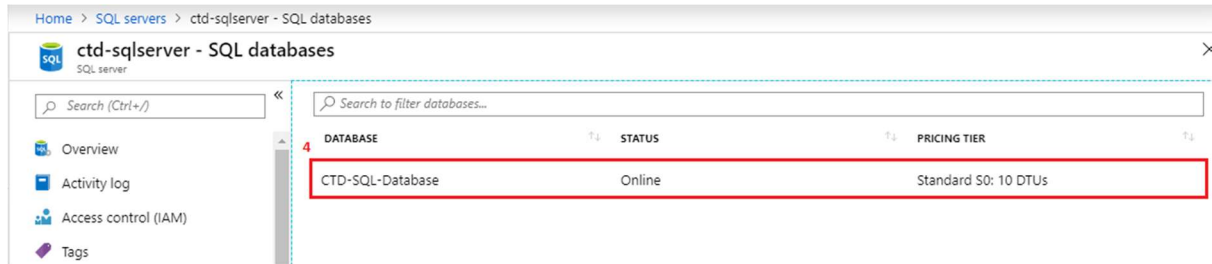

**Step 6**: Copy Server name for future reference then Select **Connection Strings** s
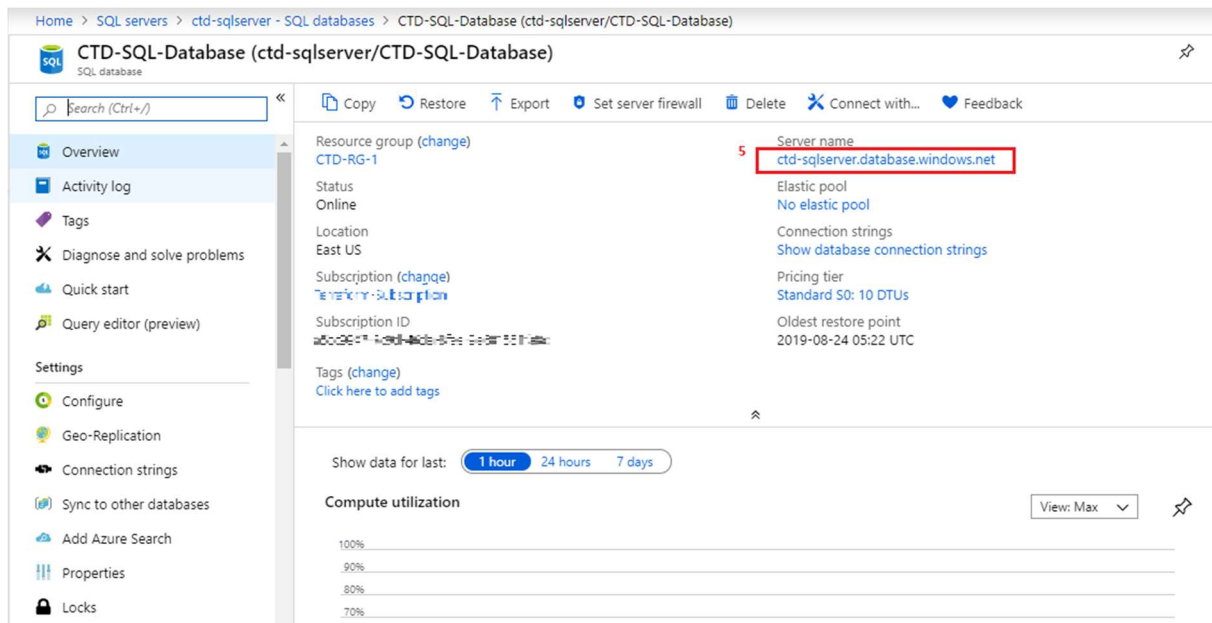

**Step 7**: Copy Connection String, then provide username in place of {your username} and password in place of {your password}
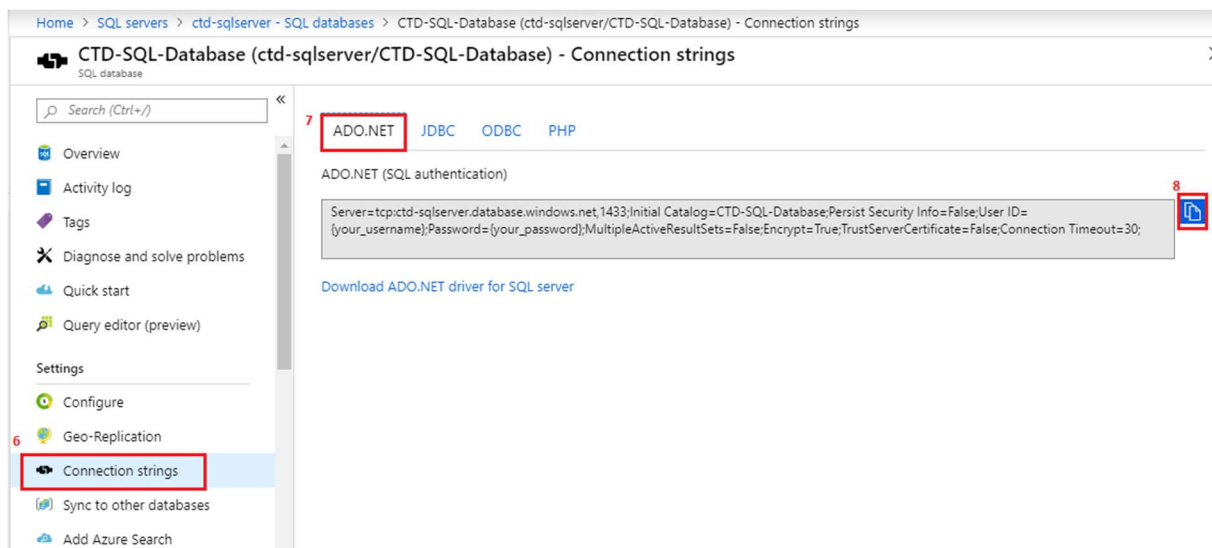

App Registrations (Azure Active Directory)
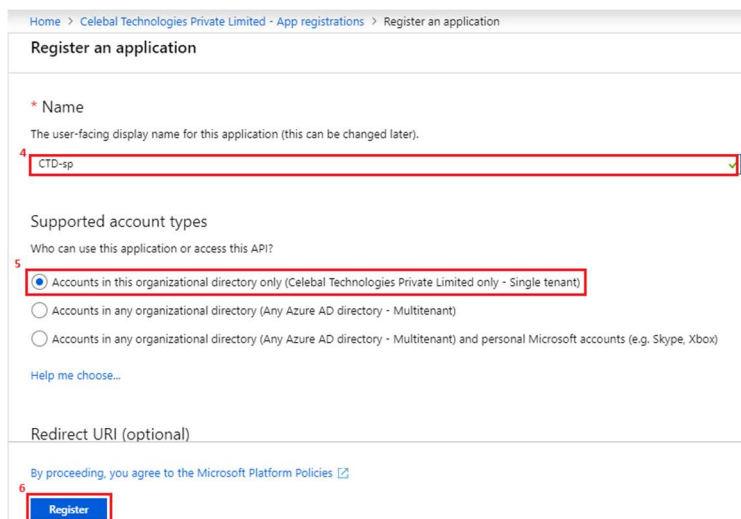

Step 1: Log in to the Azure portal.

Step 2: Select **Azure Active Directory** then select 'App registrations'

Step 3: Register a new Application by clicking on **New Registration**

Step 4: Enter Application Name and **register** the Application.

Step 5: New application is registered successfully, copy **Client ID** and **Tenant ID**.

Step 6: To fetch client secret Select **Certificates & Secrets**

Step 7: Select New client secret option

Step 8: Copy the client secret for future reference

Note -: This client secret can only be seen for once so copy it for future reference or else you will have to regenerate it

Step 9: To fetch Subscription ID, select the **Subscriptions** from Search tab

**Step 10**: Copy **Subscription Id** of your subscription

Step 11: Select **Access Control (IAM)** from the blade
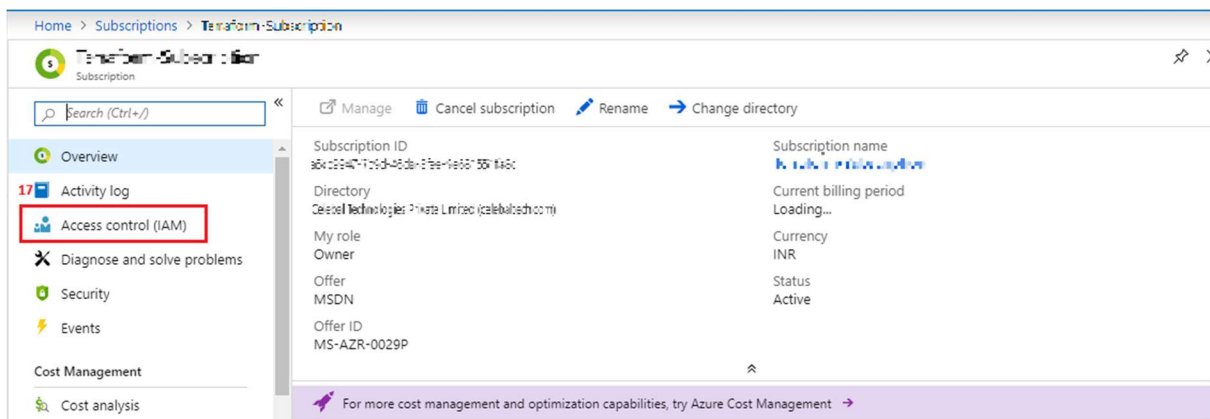

Step 12: Select Add Button then choose 'Add role assignment' option
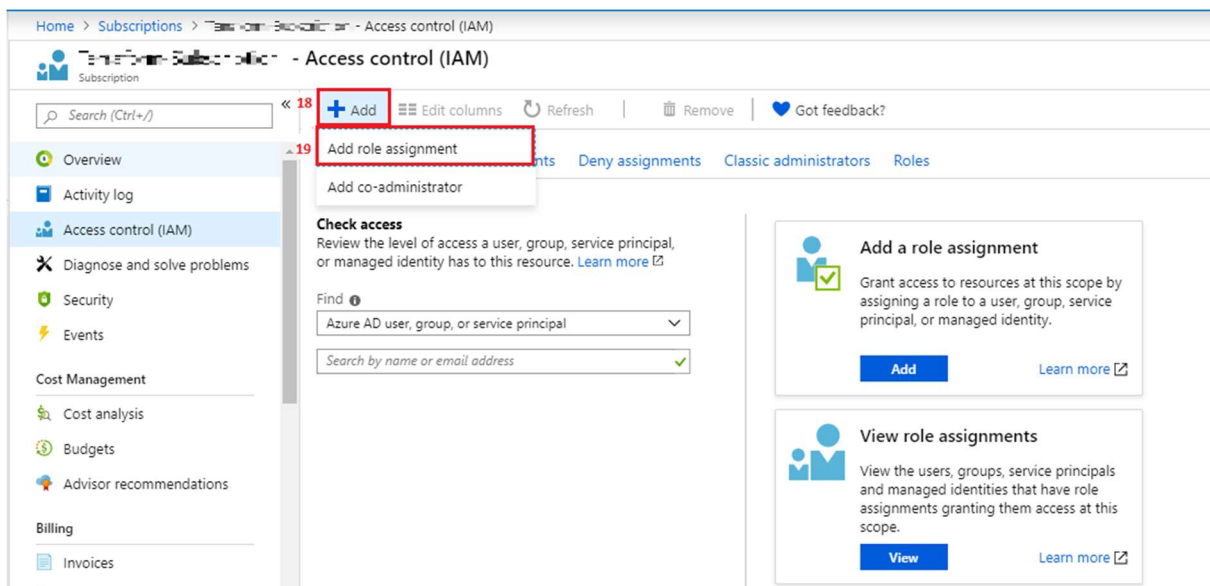

Step 13: Assign 'Contributor' role and select the registered app then click save
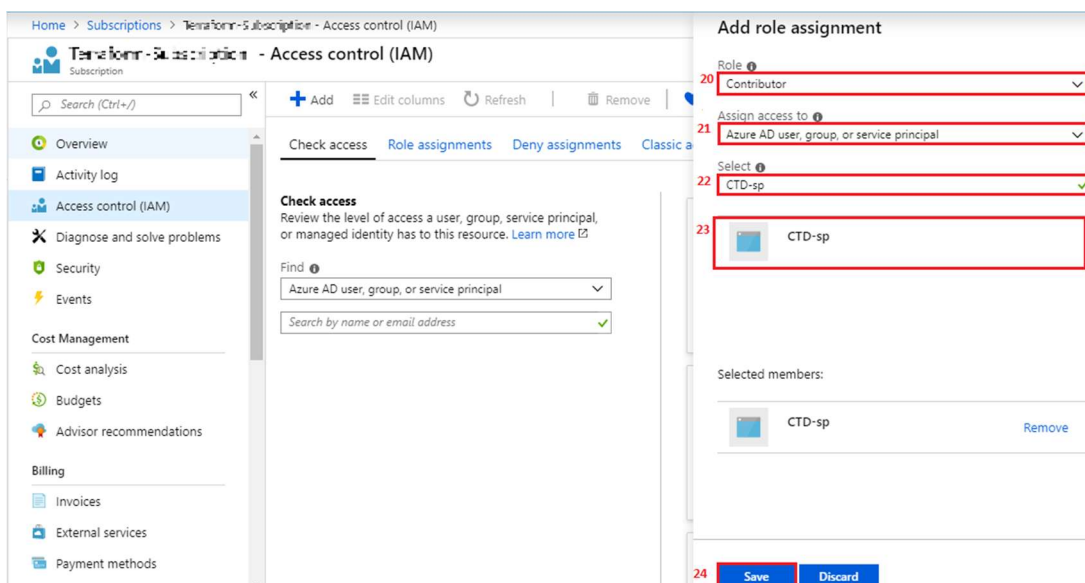

Steps for generating Databricks Access Token

Step 1: Log in to the Azure portal

Step 2: Select **Resource groups** from Blade then select your Resource group
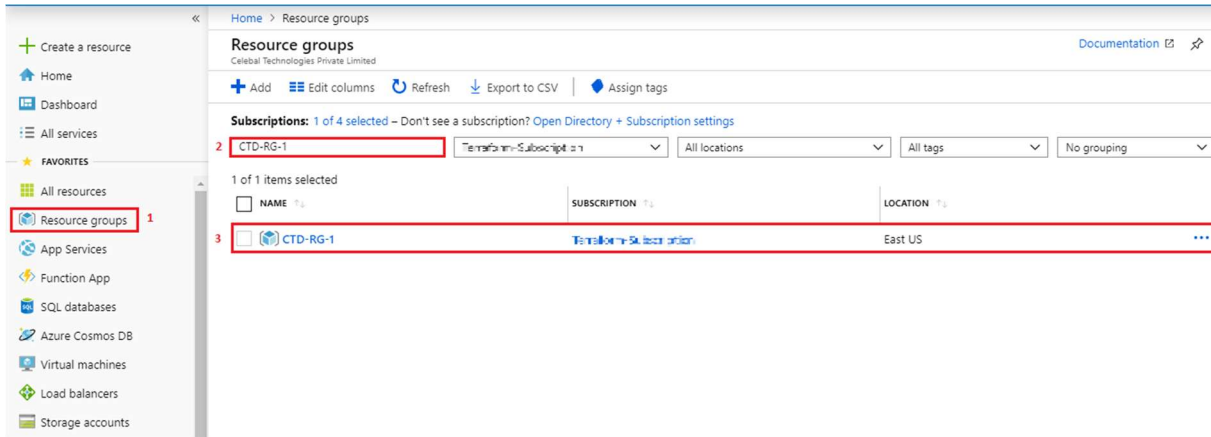

Step 3: In your Resource Group panel, select Databricks service
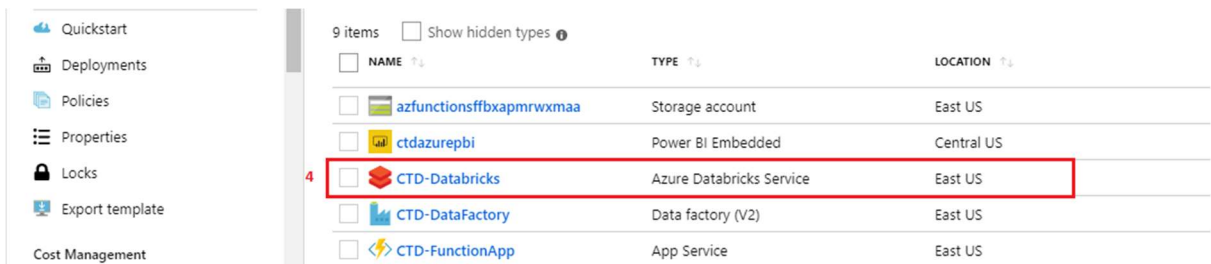

Step 4: Copy the workspace URL for future Reference then Launch Workspace
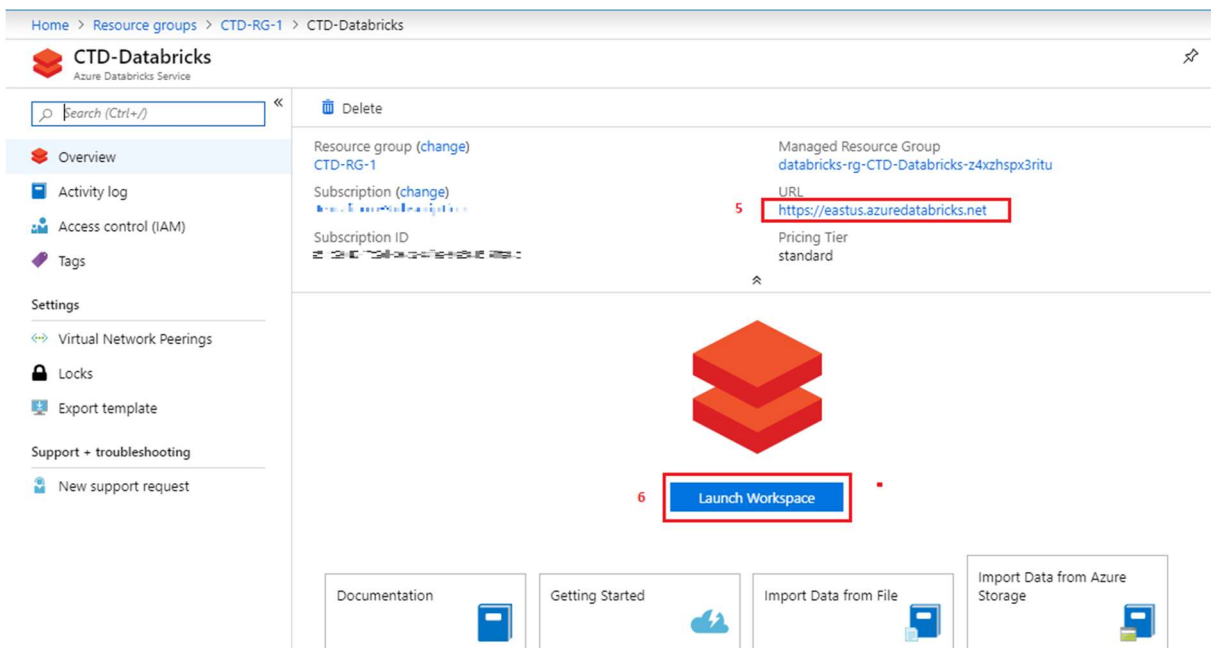

Step 5: In the top right corner, click on the **User** icon

Step 6: Select **User Settings**
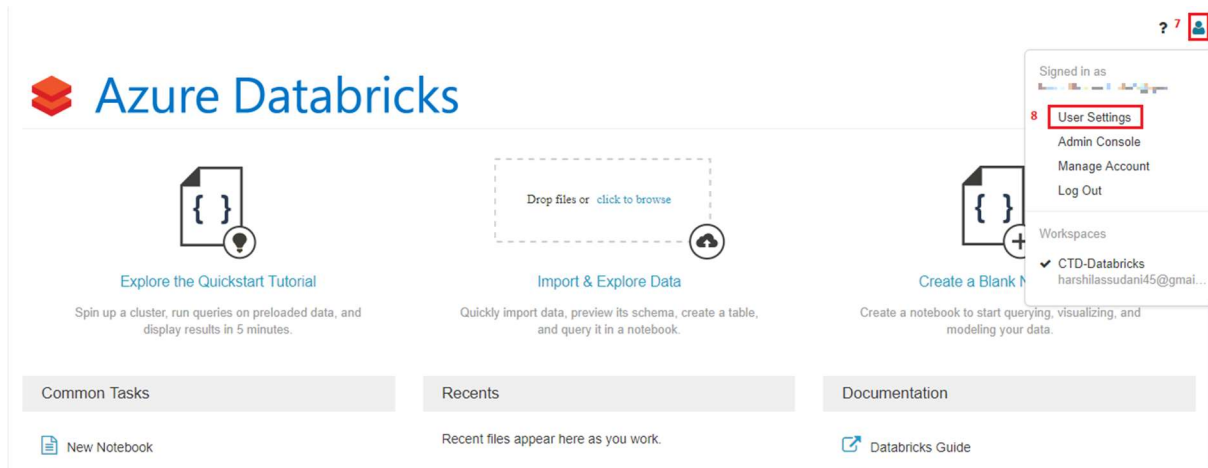

Step 7: Click on 'Generate New Token'
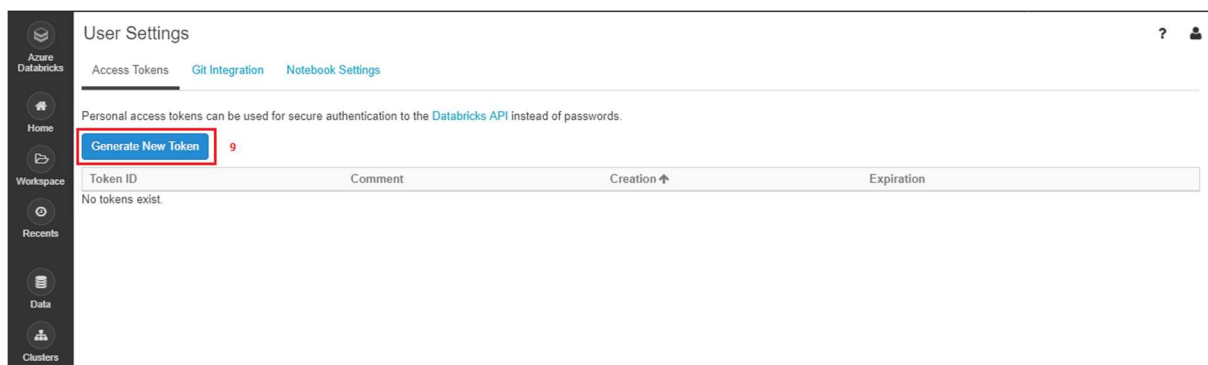

Step 8: This will prompt a window, add a comment and click 'Generate'
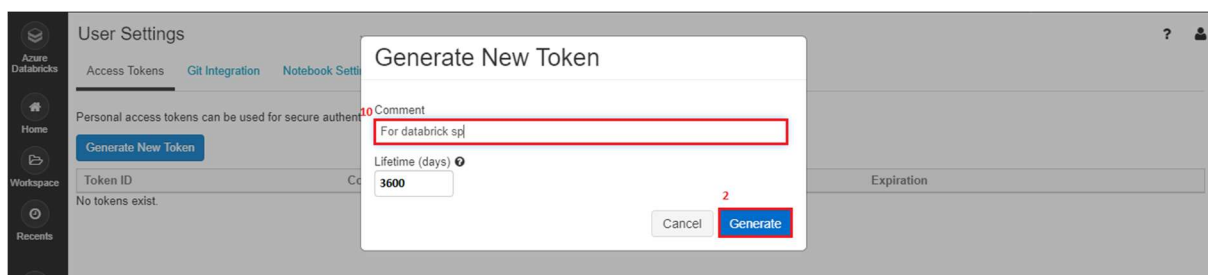

Note-: This token will be generated only once, so copy this token for future reference

Power BI Embedded

Step1: Select **Power BI Embedded** from Azure Portal
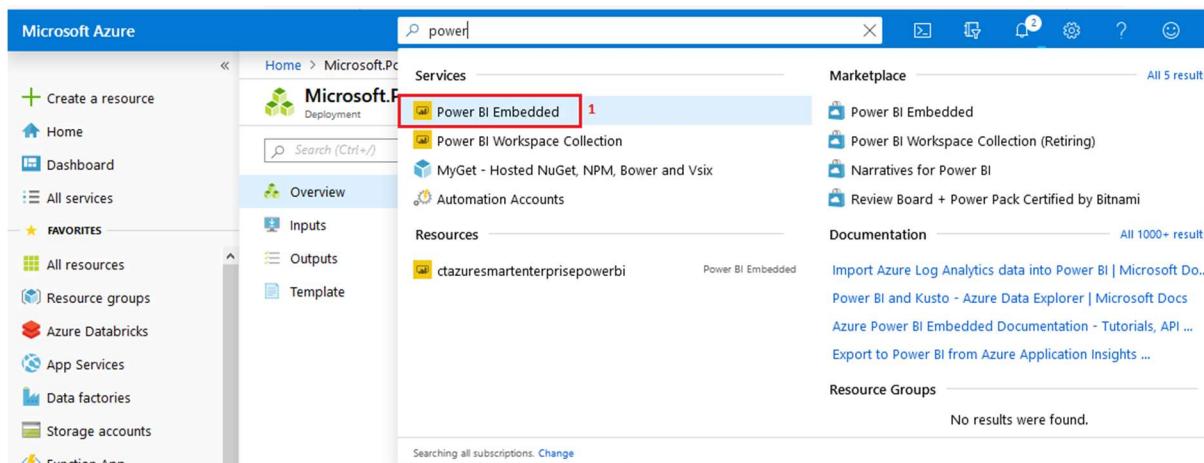

Step 2: Select your Power BI Embedded service
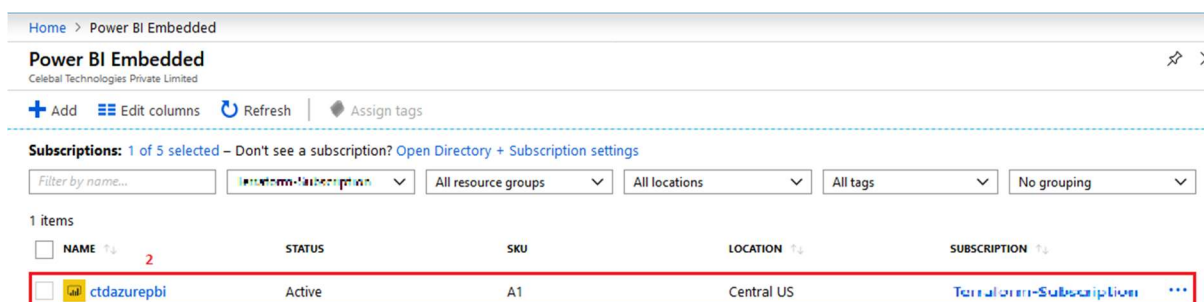

Step 3: Copy Power BI Embedded name, copy Power BI Admin name which is your Azure Portal Id for future reference
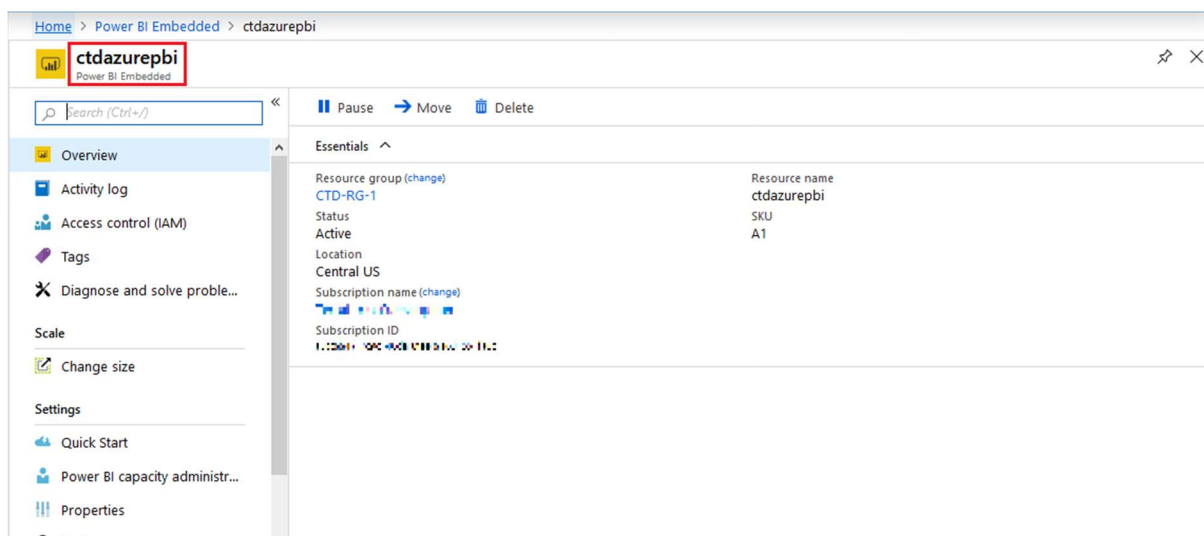

Azure Function App (URL)

Step 1: Log in to the Azure portal

Step 2: Select **Function App** from the blade then select the deployed function app from the list
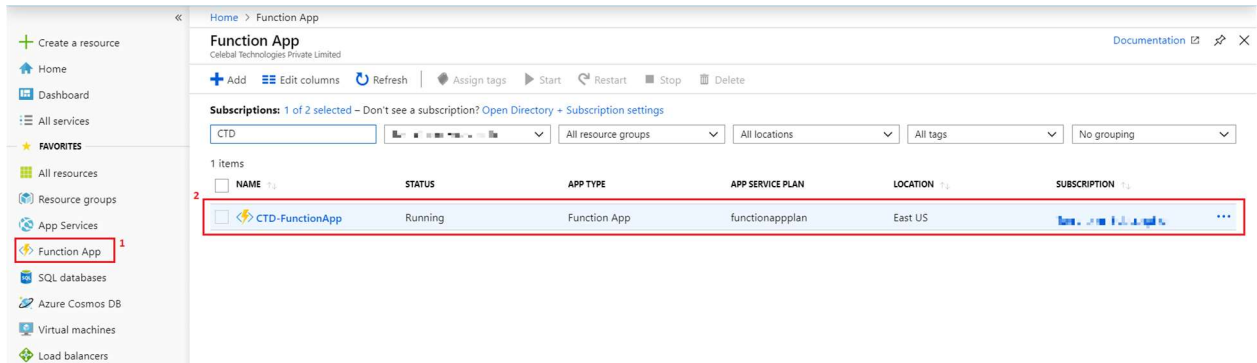

Step 3: Select the Functions from function apps blade and then select the deployed function
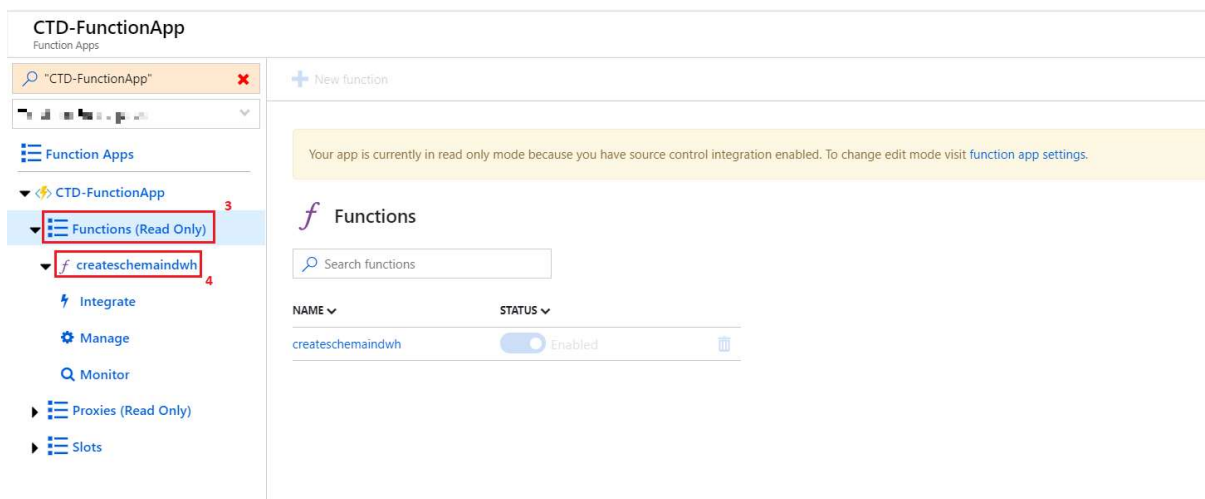

Step 4: Click on 'Get Function URL'

Step 5: Copy the function URL for future reference
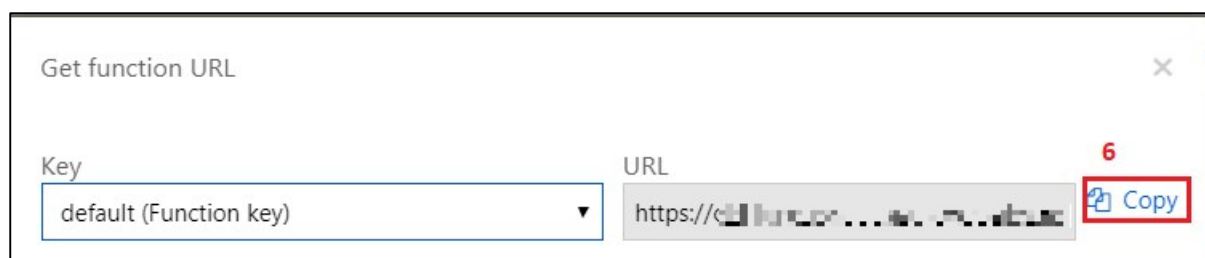

Key Vault Access Policy to see your Secrets in Key vault

Step 1: From the Azure portal, select your **Key Vault**
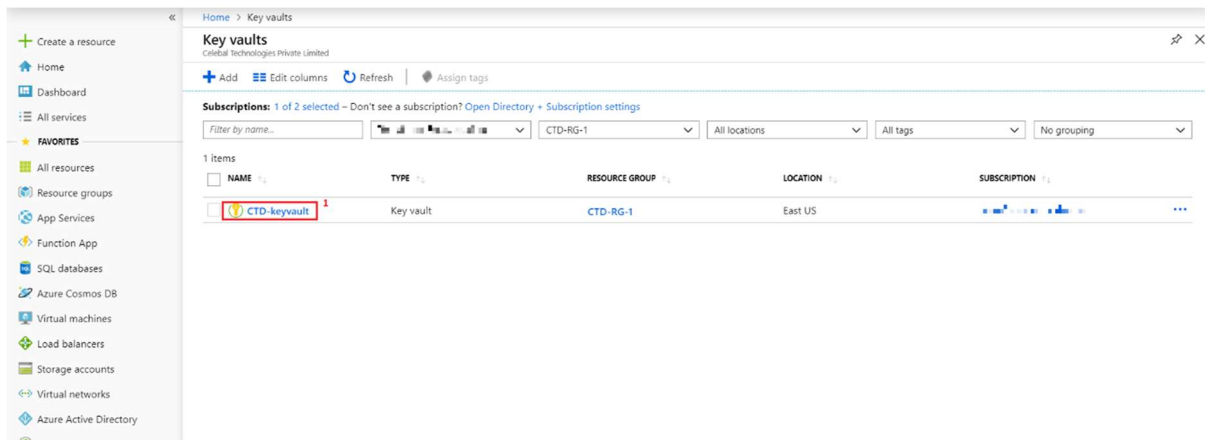

Step 2: Click on the 'Access policies' in the key vault blade
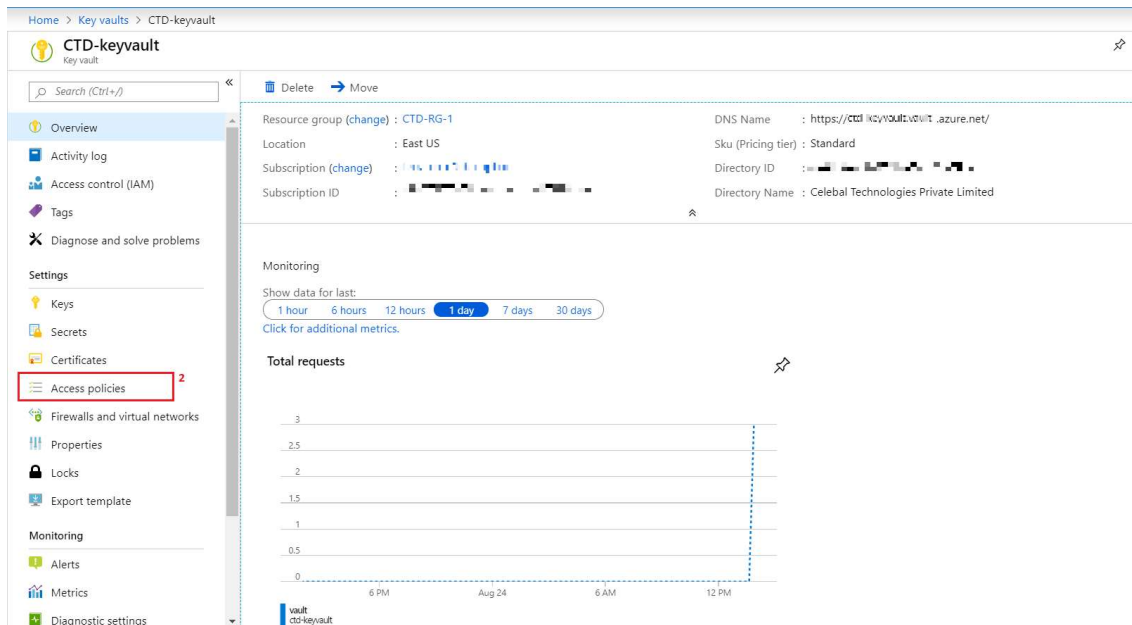

Step 3: Select Add Access Policy
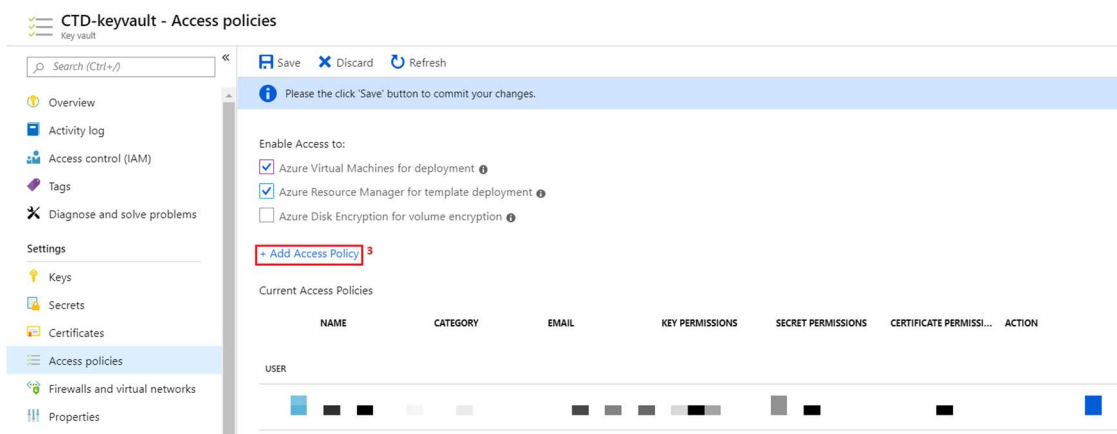

Step 4: After selecting the Add Access Policy, select the Key permissions, Secret permissions and Certificate permissions

Step 5: After selecting all 3 permissions, now select Principal. A blade will open, write your name as given in image and click on 'Select'

Step 6: Now click on 'ADD'

Note: Now you can see your name listed in the users

Step 8: Select **Secrets** in the blade and you can see all the credentials in stored in the Key Vault

Create an Azure Key Vault-backed secret scope

Step 1: Verify whether you have Owner permission on the Azure Key Vault instance that you want to use to back the secret scope.

Step 2: Go to https://<your_azure_databricks_url>#secrets/createScope (for example, *https://westus.azuredatabricks.net#secrets/createScope).*

Step 3: Enter the name of the secret scope.
Step 4: Use the *Manage Principal* drop-down to specify whether 'All *Users'* have MANAGE permission for this secret scope or only the 'Creator' of the secret scope

- Your account must have the Azure Databricks Premium Plan for you to be able to select '*Creator*'.
- If your account has the Standard Plan, you must set the MANAGE permission to the 'All Users' group. If you select Creator here, you will see an error message when you try to save the scope.

Step 5: Enter the DNS Name and Resource Id and click on create

Note-: Example https://databrickskv.vault.azure.net/ --DNS Name

     Example
/subscriptions/xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx/resourcegroups/databricksrg/providers/Micro
soft.KeyVault/vaults/databricksKV –Resource Id

App Service Authentication & Authorization

I.   Azure Active Directory

Step 1: Log in to the Azure portal

Step 2: Select **Azure Active Directory** from the blade then select **App registrations**

Step 3: Select the registered app
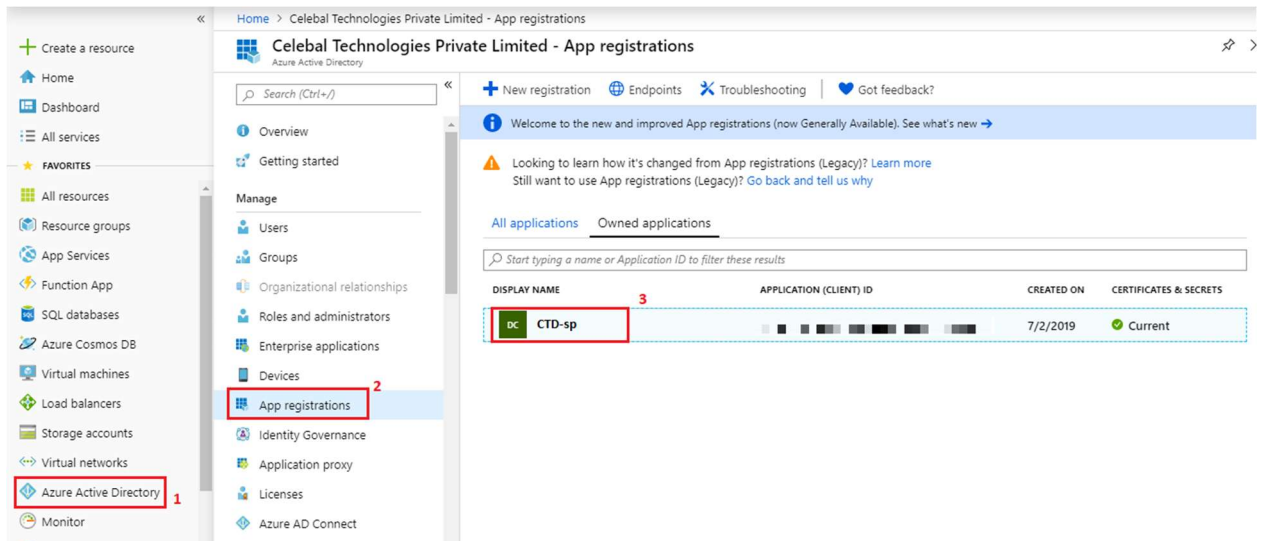

Step 4: Select **Branding** and enter the value of 'Home Page URL' and then save it
 Note-: Enter {your App Service URL}/signin-oidc to the URL.

Step 5: Select **Authentication** then enter the URL then check the 'ID Token' checkbox and save it.
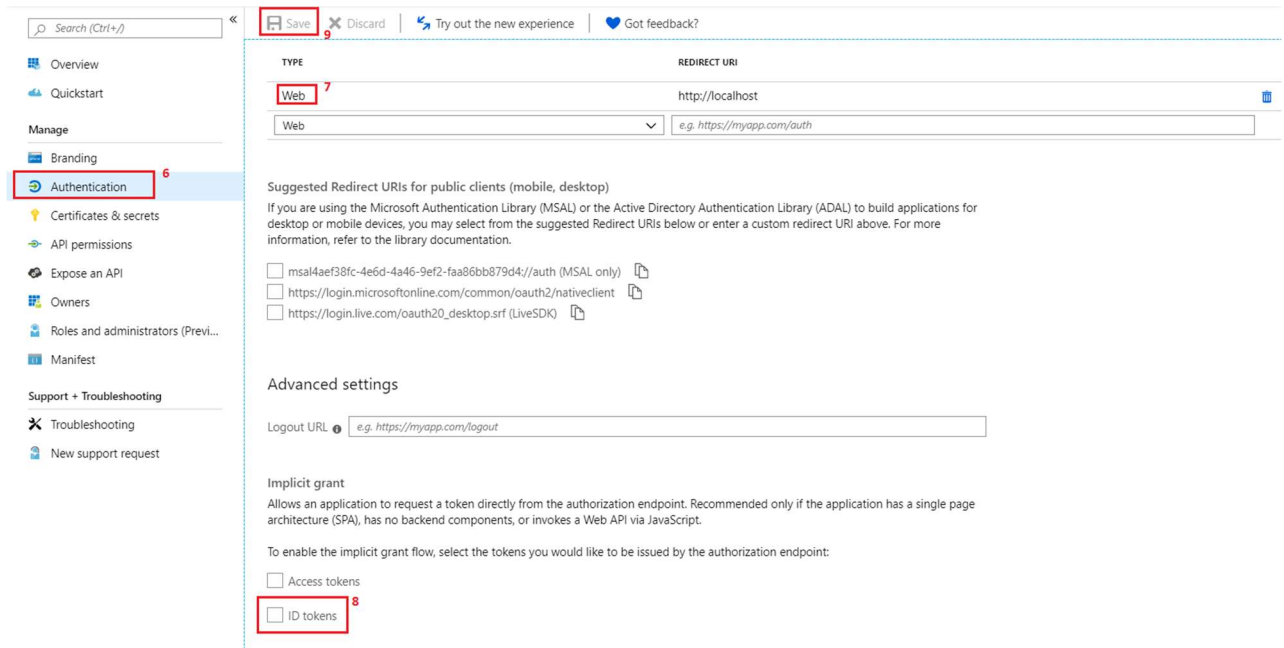

Note-: In URL mention {your App Service URL} /.auth/login/aad/callback

II.   APP SERVICE

Step 1: Select **App Services** from the blade then select the Authentication/Authorization option
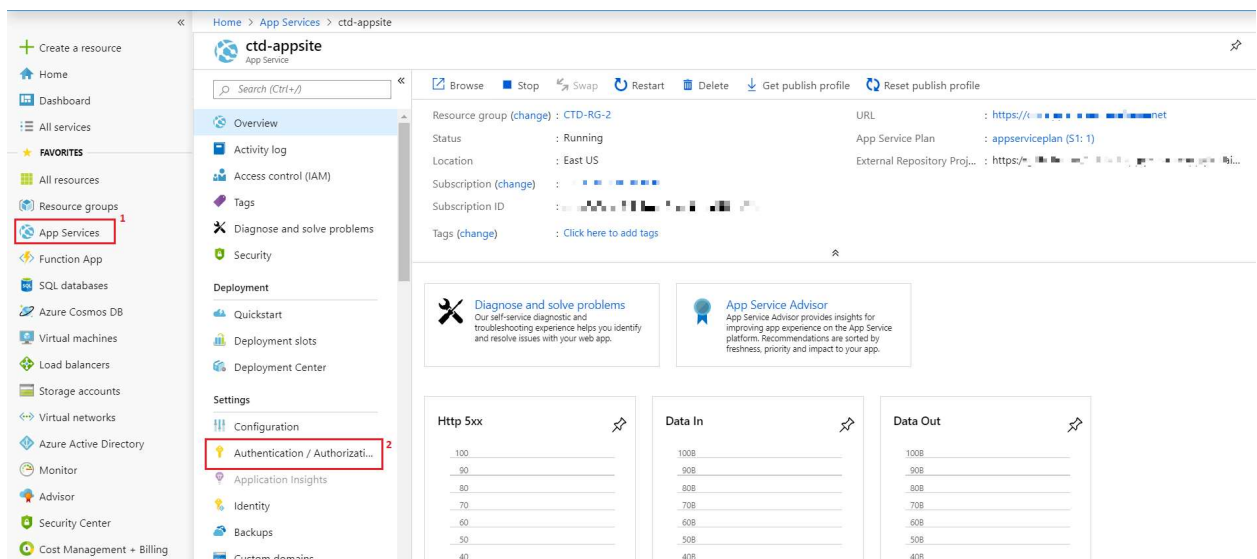

Step 2: Select the 'Log in with Azure Active Directory' option from the list box then configure Azure Active Directory as an Authentication Provider
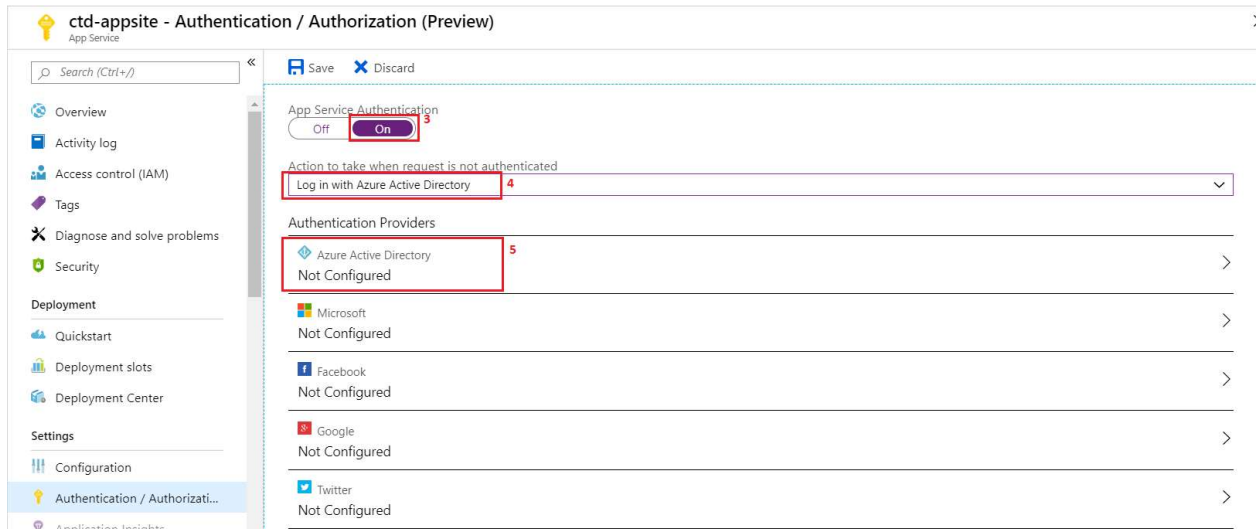

Step 3: Select the Management mode as 'Advanced', enter the Client ID and Tenant ID in Issuer URL as shown below
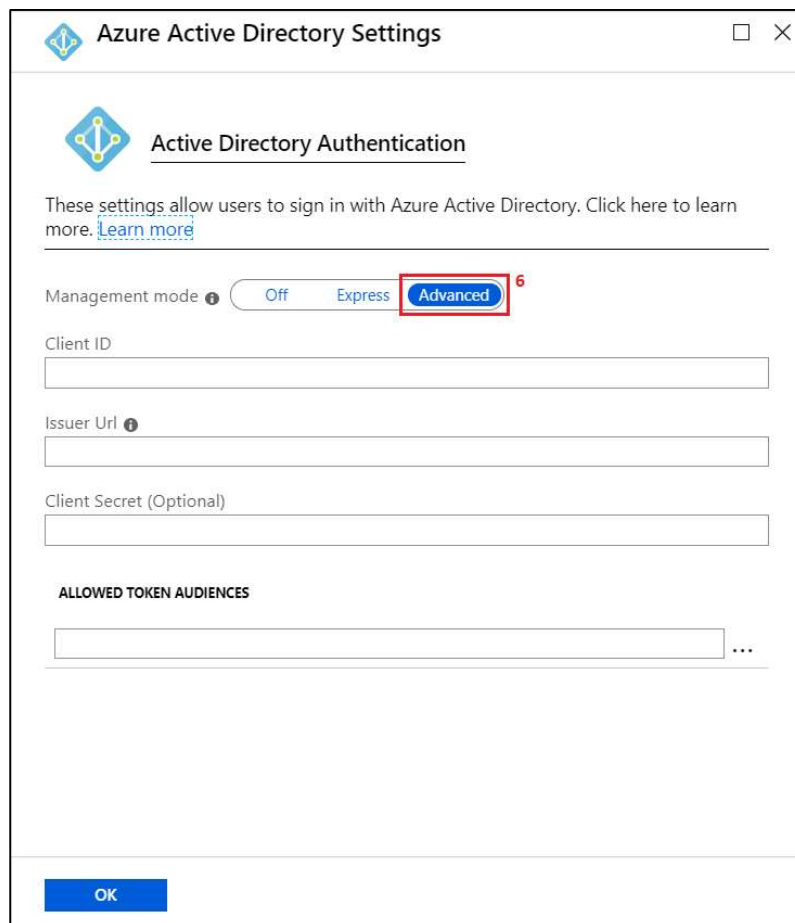

Note-: Add Tenant ID after the Issuer URL https://sts.windows.net/{your Tenant Id}

Solution Architecture
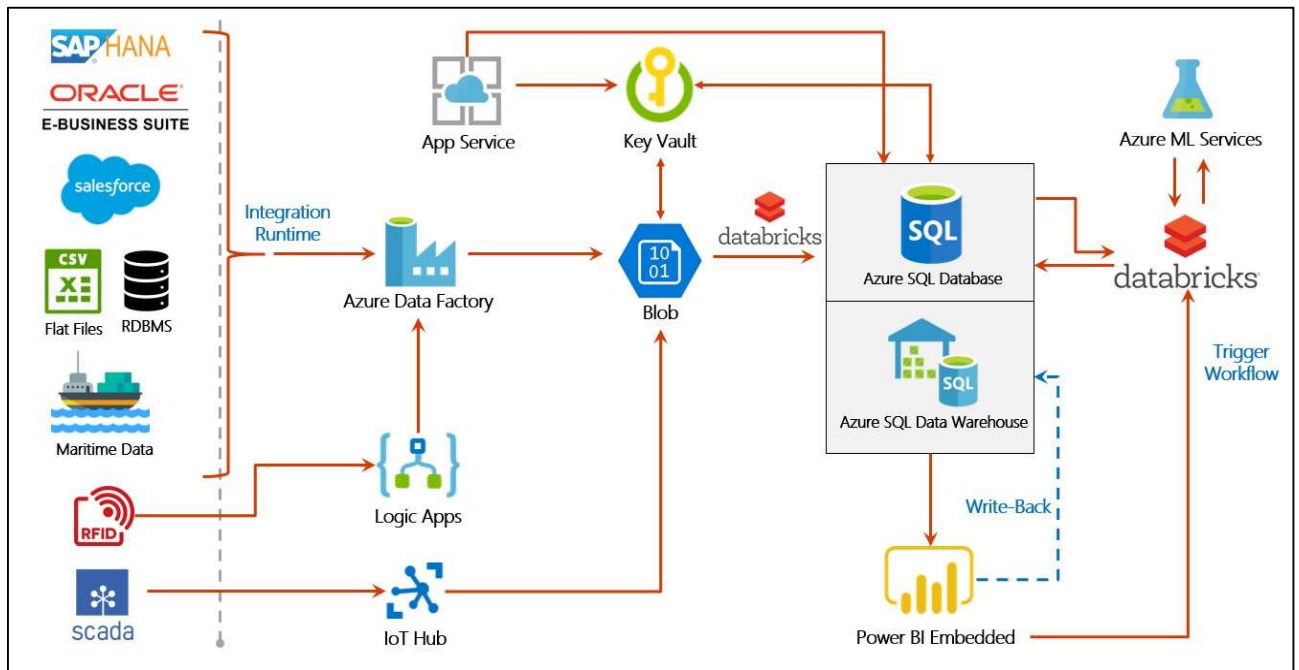

Architecture Description

Components Deployed-:

Azure Data Factory

- Form pipelines to ingest data from various sources

Azure Databricks

- It provides a series of performance enhancements on top of regular Apache Spark which include caching, indexing and advanced query optimizations.
- Runs simulations to identify right inventory levels & demand pricing
- Simulator for optimization and analysing different scenarios during planning.
- Run predictive models for demand and supply forecasts. The planning of different domestic sources (notification, planning documents) and demand on macro / micro level can be captured and analysed to predict the supply and helping sourcing strategy.
- Analytics Engine should support multiple Data Sources. Min below standard data sources should be supported from day 1 – CSV, TSV, MS Excel, SQL and RDBMS

- Analytics engine should provide capability to check analysis with multiple predictive & optimization algorithms
- It should have central data lake concept to manage different data sources in single platform.

Logic Apps

- It helps to schedule, automate, and orchestrate tasks, business processes, and workflows when there is a need to integrate apps, data, systems, and services across enterprises or organizations.
- It enables to design and build scalable solutions for app integration, data integration, system integration, enterprise application integration (EAI), and business-to-business (B2B) communication, whether in the cloud, on premises, or both.

- The Logic apps make use of typical VETER pipeline which involves AS2 connector, X12 connector, Transformation, Encoding and HTTP connectors

IoT Hub

- Acts as a central message hub for bi-directional communication between IoT application and the devices it manages.
- It can be leveraged to collect data from multiple sensors installed on vehicles for scheduling and tracking.

App Service

- Platform-as-a-service that runs web, mobile, API and business logic applications and automatically manages the resources required by those apps.

Key Vault

- Secret management: Securely store and tightly control access to tokens, passwords, certificates, API keys, and other secrets.
- Key management: Create and control encryption keys that encrypt your data.
- Certificate management: Provision, manage, and deploy public and private Secure Sockets Layer/Transport Layer Security (SSL/TLS) certificates for use with Azure and your internal connected resources.
- Store secrets backed by HSMs: Use either software or FIPS 140-2 Level 2 validated HSMs to help protect secrets and keys

Azure Blob Storage

- Store large amounts of unstructured object data, such as text or binary data

Azure SQL Database

- SQL Database is a high-performance, reliable, and secure cloud database that you can use to build data-driven applications and websites in the programming language of your choice, without needing to manage infrastructure

Azure SQL Data Warehouse

- Combines SQL relational databases with massively parallel processing to design, load, manage, and analyse data

Azure ML Services

- Provides SDKs and services to quickly prep data, train, and deploy machine learning models.

- Improve productivity and costs with auto scaling compute & pipelines

Power BI Embedded

- Provide interactive visualizations and business intelligence capabilities with an interface simple enough for end users to create their own reports and dashboards

- Helps create efficient supply chain operations environment, with real-time insights on Temperature threshold, Driver performance & Customer behaviour; thereby maximizing operational efficiency.

- Enables intelligent decision making; by utilizing the power of intuitive rich visuals and reports generated from staggering number of customers, inventory and workforce data.

- Provides consolidated view of the data fetched from multiple sources; in the form of interactive dashboards.

- Delivers critical insights into various activities, to determine the areas of improvement and boost their efficiency.
