

Microsoft Information Protection check-up and deployment

What is Microsoft Purview?

Microsoft Purview provides data policy and risk management solutions for your organization. An important part of Microsoft Purview is information protection.

Why is Information Protection important?

The amount of data in your organization is growing rapidly. Connectivity with external users is increasing. Data is no longer in one place but is spread out and accessible in different ways. This requires an information policy that:

- You know where (sensitive) organizational data is located;
- Data is secured in the cloud, apps and devices;
- You actively identify risks and manage data;
- You are continuously working on compliance with (changed) laws and regulations.

Configuration of Information Protection |
Deployment to a group of employees

3

Testing & Evaluate

Testing | Valuation for scaling to the entire
organization | implementation proposal

The 4-day Microsoft check-up and deployment approach

1

Discover & Design

Insight into your data landscape and the possibilities based on an E3 or E5 license. Based on an interview, we will make a proposal for the implementation of information protection.

2

Configure

Your Microsoft 365 environment can make use of information protection. Information from the previous phase is translated into a technical implementation. From the point of view of knowledge sharing, this is done together with administrators of the internal organization.

3

Testing & Evaluation

After the implementation, several stakeholders from the business are involved in testing this new functionality. After this phase, the results will be shared and discussed with you. After this, information protection can be rolled out organization-wide. Focus: Adoption
