ENDPOINT CLOUD

Cibecs Endpoint Cloud:
Full Remote Migration

Cibecs Endpoint Cloud is a powerful data management platform that gives IT a single tool to seamlessly **manage, backup, protect & migrate** all your endpoint data & devices.

The Problem

The way most businesses migrate devices feels like it's stuck in the past. Device migration is a complex, time consuming and frustrating process that's less than ideal for everyone.

It takes critical time away from users.

It requires a great deal of overhead from the project team, IT engineers, the service desk, and end users.

Dealing with remote users is a nightmare

Planning and managing a large hardware refresh with a remote workforce that uses a variety of hardware devices is frustrating.

Critical business data can get lost.

Manual device migration can result in data being missed, profiles and settings not being transferred, and misconfiguration of the new device.

It's a tedious manual process.

IT has to ensure that all the business data is located on the machine, migrated and back in the original location.

Confidential and sensitive data.

Users are worried about who has access to their confidential and sensitive data.

Migration with Endpoint Cloud

Remotely Migrate data in minutes, while your users work.

We've built a better, faster, and simpler way to migrate user data to a new device.

Our full remote endpoint migration solution transfers all the user's data and their profile settings to the new machine, while the user works. Data transfer is completely secure, and you don't run the risk of losing any user files.

IT staff can manage it remotely, and users can simply start using the new machine with all their settings and files exactly as they were on their old computer.

Here's a brief overview of our main features:

Remotely trigger and monitor device migration

Migrations can be centrally triggered from Cloud Management and the migration status and progress can be monitored. Trigger multiple migrations simultaneously.

Live Migration

Migrations happen while users continue to work and when you are ready to hand over the device, simply do an update migration to bring across any new work or changes.
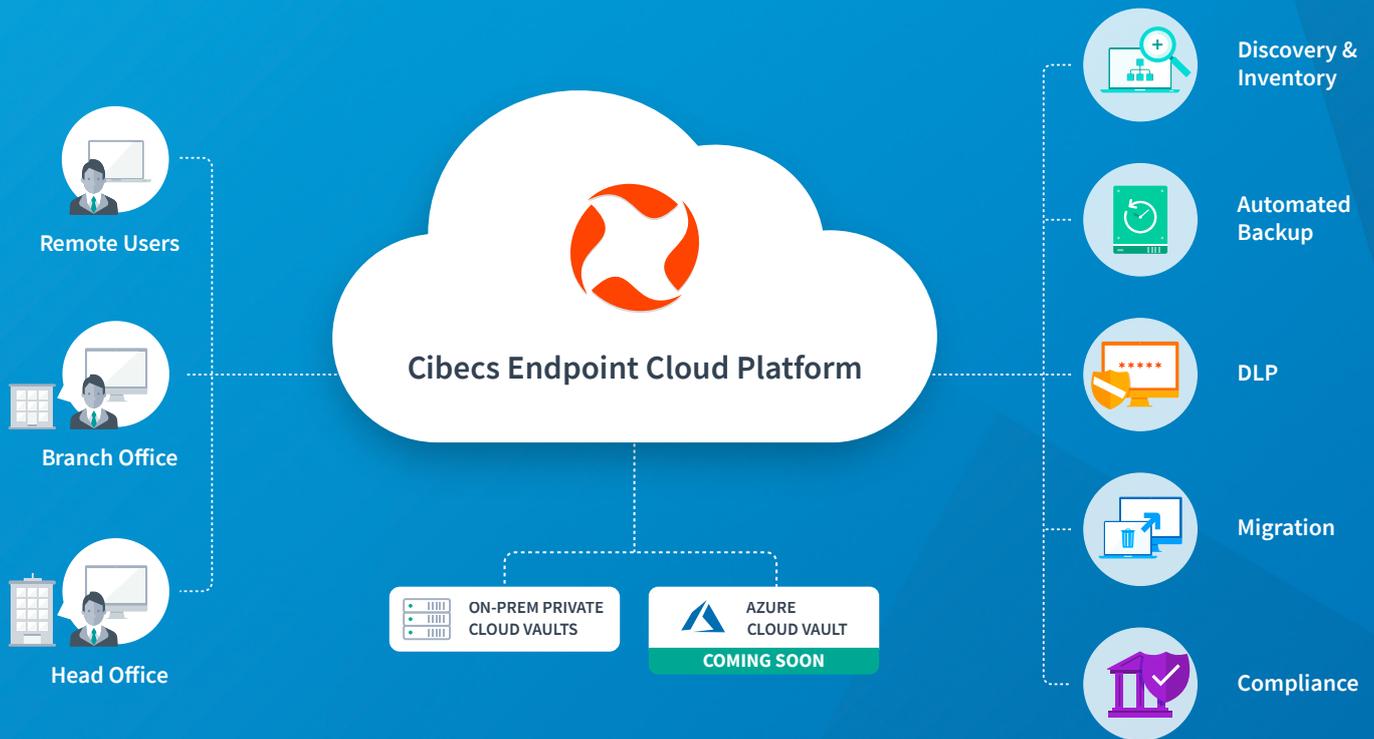

Full device-to-device migration

Device-to-device migration reduces the requirement for additional storage and migrates all files (including business and personal) directly between the two devices. The migration is encrypted as well as compressed to optimize the process and reduce impact.

Migrate all files and profile settings

All business and personal files for the user will be identified and seamlessly migrated to the new device. The user's computer profile including system and application settings are included in the migration.

Cibecs Endpoint Cloud Platform

Remote Users

Branch Office

Head Office

ON-PREM PRIVATE CLOUD VAULTS

AZURE CLOUD VAULT
COMING SOON

Discovery & Inventory

Automated Backup

DLP

Migration

Compliance

The most powerful endpoint data protection & management tool for IT.

Discovery & Inventory

Reporting on your entire endpoint network with a detailed Hardware & Software Inventory.

Automated Backup

High-performance, near CDP backups on-prem, according to your centrally set policies.

DLP

Multi-layered Data Protection with encryption, remote wipe, remote revoke & geo-locate.

Migration

Remotely migrate user data & profile settings to a new machine or OS in minutes.

Compliance

Ensure Governance & Compliance to global Information Security standards such as GDPR, PoPI and ISO 27001.

Cloud Managed

Centralized, intuitive cloud management of all connected devices.
