IOT in Azure

Deploy IOT In Azure

The Internet of Things is much discussed – but how do you take it from a concept to something that is
a tangible benefit to your business in the here and now?

The S3 IoT offering removes barriers - taking you from plan, to proof of concept, to real working solution in an easy three step process, opening tremendous opportunities to improve operations, create new customer experiences and open entirely new lines of revenue for your organisation.

Stage 1 - Consultation and Workshopping

What is your current status and what are the business outcomes that you would like to get to? Our experts will show you the possibilities for you what you can achieve with an IoT solution in Microsoft Azure, and start building a roadmap that will get you there. From the in-depth technical detail to the wider business impacts and indicative costs, your journey starts here.

Stage 2 - Proof of Concept and Testing

This stage is all about seeing your potential solution in action. Our team will work with you to build a working example of your IoT vision. We will look after all components and can even source bespoke hardware and sensors to match your requirements. The data will be hosted and visualised in Azure, giving you the chance to glimpse the data insightthat a full deployment would offer to your business.

Stage 3 - Full Implementation and Deployment

The final stage sees your IoT solution completing its journey from concept to reality. We will help you stage your roll-out with minimal disruption. As your IoT deployment matures into a key part of your business, we will remain on hand to provide technical support, optimisation and maintenance that will keep you ahead of the curve.
