Our approach for Microsoft 365 Copilot success

Discover & Validate

CloudCan AI experts assess your environment to identify your business requirements, tenant readiness, data mapping needs and more.

Plan & Design

We create an implementation plan to reach your desired state, including plans for environment readiness/remediation and Microsoft 365 Copilot implementation.

Implement & Test

Based on your business needs and engagement choices, we assist with readiness implementation activities, tenant configuration, user onboarding and testing of the environment.

Knowledge Transfer

To prepare you for continued operations at scale, we conduct operational advisory sessions with your team and can provide post-implementation guidance.

How will you drive productivity and efficiency to new heights with Microsoft 365 Copilot and CloudCan Services?

1

Equip your team with a guided pilot of Microsoft 365 Copilot, a platform and experience readiness plan, limited data discovery and governance policy analysis, and the knowledge to operationalize.

2

Extend your pilot to include additional SharePoint sites, data governance policies and pilot users, plus adoption and change management planning to ensure end user readiness.

3

Equip your business with a production implementation, even more SharePoint sites and data governance policy analysis, plus extended adoption and change management planning.
