

## Cloud Essentials

### Microsoft 365 Security Design and Deployment

Secure your Microsoft environment by deploying advanced security features, customised to meet your specific business requirements

Microsoft's comprehensive approach to security means you have access to powerful capability to safeguard your organisation through integrated security, compliance, and identity solutions.

Once you have set your direction, we can help you move rapidly to design and deploy configuration changes and controls that will improve your security stance.

We'd love to discuss your security maturity and journey. Contact us for a no obligation discussion about your requirements.

### Realise the benefits of Microsoft's comprehensive security technology

Designing how to implement advanced security features requires **in-depth Microsoft 365 product knowledge**. Our Cloud Architects are expert at **bringing together technology and business stakeholders** to design security solutions that meet your organisation's needs.

### A flexible, consultative approach to achieve rapid results

We start by hosting a design workshop with relevant cross-functional teams to:

- **Align business requirements** and security compliance standards with product capability
- **Build awareness of implications** of certain controls (like Privileged Identity Management, Microsoft Defender for Cloud Apps or Endpoint Management)
- **Facilitate discussion** and **informed decision-making** about how controls will be implemented
- **Document decisions** that form the basis of the design documentation

Our experienced technical team will then produce **detailed design and configuration documentation** about the changes, as well as documenting your current position regarding each setting.

We will work **alongside your in-house technical team to deploy the changes**.

We ensure changes are **well-documented** and **well-understood** so that in-house teams can manage and maintain the new security features in the future.
