AUTONOMY WITHOUT LOSING CONTROL

A Copilot-authored migration, blocked by your own ruleset until a human approves it. Illustrative example.

WHAT CHANGES

- Give it a goal, not a line**
Copilot decides which files to change, runs commands and iterates until the task is done.
- Assign it an issue**
It works in a secure Actions environment, writes code, runs tests and raises a PR.
- Your rules still win**
Branch protections, required reviews and security checks apply to every agent action.
- Your code stays where it is**
Local files, GitHub Enterprise Server, GitLab, Bitbucket or Azure DevOps. No migration needed.

Context, not your repository. The extension sends the file being edited and its surrounding context. It does not crawl, clone or download your repositories.

WHERE IT PAYS FOR ITSELF

Framework upgrades

One bank moved 200+ services off an end-of-life framework in weeks, not quarters.

Test data, not real data

Realistic records generated on demand, so production customer data leaves your UAT environments.

Regulatory change

Describe the rule once. Every affected service arrives as a reviewed pull request.

Code you did not write

One mandatory standard applied to vendor deliverables before a human opens the PR.

SECURITY BUILT INTO THE WORKFLOW

Secrets never reach the branch

Scanning across full git history, push protection that blocks a secret before the commit lands, and custom patterns for your own token formats.

Vulnerabilities arrive with the fix

CodeQL semantic analysis across 166+ CWE categories, Copilot Autofix in the pull request, plus dependency review and Dependabot.

Rulesets turn intent into enforcement. Block merges when scanning finds an alert above a chosen severity, mandate reviewers and signed commits, start in alert mode and switch to blocking — defined once at org level, applied to every repository.

CLOUDGATE DEPLOYS IT GOVERNED

One identity

Microsoft Entra ID as the single provider, SSO with Conditional Access and MFA, managed accounts, automatic joiner-mover-leaver.

One policy

Least-privilege scopes from enterprise down to repository, teams synced from Entra, Copilot access and model choice set centrally.

One invoice

Copilot, GitHub Enterprise and Advanced Security billed through your Azure subscription, with cost centres for chargeback.

Let's build your AI-native engineering org.

Book a discovery workshop · run a 30-day pilot · get a cost model.
