

# Cloud Networking Health Check (5-day Assessment)

CloudNation

Identify Cloud misconfigurations and reduce risks around Azure networking. Utilize CloudNation's Advanced Networking practice for optimizing Cloud network architectures or have a trusted advisor assess your overall network strategy.

Cloud networking is different from traditional on-premises networking. New skills are required and other decisions need to be made. For example, Virtual WAN is a great solution but often we see customers struggling with the optimal design and deployment. Misconfigurations happen regularly and might expose workloads to unnecessary risks, performance or redundancy might be suboptimal.

The Cloud Networking Health Check is an assessment that helps organizations using Azure infrastructure get clarity of potential networking issues and configure their infrastructure according to industry-leading best practices.

## Benefits

- Insights from cloud networking professionals
- Visibility into connectivity optimizations
- Results presented thru a report and closing interview
- A set of prioritized actionable recommendations
- Possible remediations thru our Cloud engineers

## Assessment

Our solution is a setup around interviews along read-only access to a customer's environment within Microsoft Azure. This leads to a report with findings and a prioritized set of actionable recommendations. The solution provides executives and stakeholders an overview on the performance of their Cloud Network architecture. The report includes the following elements:

- A high-level executive summary of the most important findings
- A grouping of all our findings, including prioritization
- List of proposed remediations

## Getting started

To get started, CloudNation needs read-only access to the agreed Microsoft Azure networking environment including any repositories which store network configurations. After a kick-off interview and an initial assessment, a follow-up interview is planned which lead to the final report and closing interview.
