

# Computas Automation Discovery Workshop

## Why Automation?

In today's business the expectations of more efficient and smart use of human resources are ever increasing. Automation allows routine tasks to be handled by computers so that employees can focus on the more complicated tasks.

The opportunities that arise from the use of cloud technology and modern computing, combined with artificial intelligence and new, more collaboration oriented ways of organising businesses, enable more intelligent and efficient organisations and processes.

### Some of the advantages of automation are

1. Improved task flow, overview and collaboration
2. Improved end user experience
3. Faster and more efficient processes, e.g. case management
4. Consistent application of rules, i.e. similar cases are handled alike
5. Verifiable decisions based on data

## Why Computas?

Computas develops efficient and automated solutions for large enterprises and public organisations, and have for many years been solving such challenges for clients like The Norwegian Directorate of Health and The Norwegian Directorate of Immigration. These are solutions that contribute to improved workflow, as well as quicker and more accurate decisions! Computas have strong skills and experiences in developing tailored solutions for automation of processes, focusing on data quality, security and user experience. Our goal is to develop future proof, cost efficient and flexible solutions that create value for our customers. Computas have experienced and skilled experts within both the processes and technology related to automation and modernisation.

In this one-day Automation Discovery Workshop we will focus on how your organisation can utilise automation to improve and streamline your processes. We will go into your goals and needs, as well as which of the organisation's processes have a potential for streamlining and automation. How can the employees, customers and users of your organisation have a better workday and solve their tasks more efficiently? Which data does the organisation have, that can be the source of automating processes and where are they stored? How can cloud technologies like Azure and it's platform services be utilised in implementing automation and modernising and optimising your business?

**Duration:** one day

**Deliverables:** After the workshop you will receive a report containing our recommendations for steps toward a more automated business - short and longer term.
