

Microsoft 365 Health Check

Microsoft 365 is becoming a central point of data and work within businesses. We are seeing users becoming more comfortable with using applications such as Teams. And files are moving from on-premises locations to the cloud. So businesses need to seriously consider how they are securing and adopting Microsoft 365.

Luckily, Microsoft offers a number of inbuilt tools and complementary products that are able to help organisations. ComputerWorld are offering a complimentary review of your Microsoft 365 environment. In this, we will help you prioritise the changes that will make the most significant difference to productivity and security within your Microsoft 365 tenant.

What will we look at during the health check?

As part of this service, we will investigate and document the following critical areas of security and control within your organisation. Our specialist will focus on the three key areas below and discuss with you how your environment is configured and being used in your organisation.

Security

Adoption & user productivity

Recommended practices

The outcome

Upon completion, the ComputerWorld specialists will provide you with a prioritised list of recommendations. This will help you implement the right actions to deliver additional benefits to the use of Microsoft 365 within your organisation. Where relevant, ComputerWorld will also make recommendations on additional products and services that can help you get the most out of Microsoft 365.

Security

With an ever-increasing amount of business data moving to Microsoft 365, we must ensure that security standards are met, and your business's data is secure from exploitation and leakage. Microsoft understands these risks and provides a robust set of tools. These are either available within Microsoft 365, or as complementary products.

During the health check, we will first start by understanding your organisation, and its approach to security. Once we understand the appropriate levels of security required for your business, we can make recommendations as to where improvements could be made. Importantly, many of these recommendations are easily implemented by our customers without additional cost. During the health check we will demonstrate key areas you can regularly review to keep on top of any security concerns within your Microsoft 365 environment.

Adoption & User Productivity

Microsoft 365 is designed to improve productivity, communication and collaboration across the users within your organisation. However, without a cohesive adoption plan, you risk users either not getting the full value from the Microsoft suite, or adopting their own "shadow IT" services that are not within your control.

Within this health check, we will review strategic statistics. These will help us identify the areas of Microsoft 365 that are being adopted by the users. And it will highlight the areas that could be improved with a greater focus on adoption and training. Importantly, we will also briefly discuss your business's needs and challenges to enable us to make informed recommendations.

Recommended Practices

As an IT administrator, much has changed in managing Microsoft 365 compared with managing an on-premises infrastructure. And critically Microsoft 365 is continuously evolving their recommendations and releasing new features and functionality.

During our health check, we will review your current configuration at a high-level. This will help you to understand where changes would be suggested to meet the latest guidance and recommended.

IT could take more than 200 days to detect a security breach within your environment
