# Cap your cloud spend.

## What are the potential benefits?

- Eliminate disastrous surprises in the cloud bill at the end of month
- Always hold your exact budget with our hard spend limits
- Enjoy 5-30% cost savings through cost showback and avoided costs
- Monitor cloud costs in real-time (1 minute delay)
- Check the burn rate of the newly started resources right away
- Set up automatic downsizing or shutdown actions for idle resources
- Make the most significant contributors to cost transparent to leadership with ease
- Outsource DevOps tasks to any developer without the risk of runaway instance costs

## How does it work?

- We query MSFT's resource metering API-s every minute and match the usage data with the resources' prices thus generating real time spend data
- Based on that we enable the user to set up hard spend limits that shut down resources automatically
- We can develop custom actions downsizing the resource based on the set limit
- The real time cost monitoring capability also enables the user to see the real burn rate (EUR/hour) of the resource that has just been turned on
- The UI is simple and quick

## Is it safe?

- Yes, we use Microsoft's SSO login and onboard through Microsoft's connectors, don't handle passwords
- We operate based on the principle of least privilege

## How long does it take to deploy?

- Practically 5 clicks, and some typing
- CostCommander runs in Azure therefore deployment is instantaneous
- We can also provide training for users, the UI is so simple it would take 60 minutes

## What is the status of the development?

- MVP (minimum viable product) is scheduled for completion in Q4/2023

## What are we looking for?

- Users
- User problems that are most urgent in the field of cloud cost management
- Feedback on the product
- Challenge and requests
- 55 minutes of your time, online if you are interested
