# COUCHDROP

File Automation Platform

Fully hosted, scalable, redundant and built with security in mind. Couchdrop's file automation handles the critical, time sensitive and heavy lifting and maintenance for you. From automatically exchanging files between remote systems, to decrypting PGP, Couchdrop's Automate has you covered.

Connect Storage

Couchdrop supports bringing your own storage as a core function. With this you can bring SharePoint, S3, a file server or anything else for your data at rest. Best of all, Couchdrop doesn't store any of your data.

Configure Automation

Set up your automation, whether it is based on an upload event, or if it is set to occur at a regular timeframe. Route files based on file names and other conditions, or have files be sent to a third party in near real-time.

Start Transferring

Once you've got your automation configured, you can sit back and leave it with Couchdrop to handle your data transfer without any human involvement, after all it's automated isn't?
