

# One-Click Cloud SFTP

Fully hosted, scalable, redundant and built with security in mind. Couchdrop handles the heavy lifting and maintenance for you, so you can spend less time on server management and more time on other important tasks. Setup takes five minutes and no server provisioning, Couchdrop has you covered.

## Connect Storage

Couchdrop supports bringing your own storage as a core function. With this you can bring Dropbox, SharePoint, S3 or anything else for your data at rest. Best of all, Couchdrop doesn't store any of your data.

## Create SFTP Users

Create additional SFTP users and isolate them to specific directories in your cloud storage platform, then control access further by disabling insecure or unwanted protocols, whitelist IP addresses, or restrict file operations.

## Start Transferring

Once you've got your storage and user setup, your external party can now SFTP using a hostname specific to your organisation. Static IPs are also available on request.
