

●● Modernize Endpoints (Microsoft Intune)

The Endpoint Management Workshop is a one-day engagement that will help you showcase the value of Microsoft Endpoint Manager and how to manage users' devices and apps from anywhere.

Microsoft Intune is a cloud service whose main purpose is to manage mobile devices and applications. It allows you to control how these devices are used within your organization, as well as allowing you to configure specific policies to control your applications. Intune allows employees to use personal devices for business purposes, ensuring that the organization's data is protected and isolated from personal data. It integrates with Azure Active Directory (Azure AD) and Azure Information Protection to ensure data protection. It is part of Microsoft's Enterprise Mobility + Security (EMS) suite.

Workshop deliverables include:

- Configuring Microsoft Intune
- Syncing with Microsoft Store for business
- Syncing with Google Play
- Dynamic groups in Azure Active Directory
- Windows Autopilot
- Android and device management scenarios
- Apple Automated Device Enrollment in Intune
- Compliance Policies
- Conditional Access Policies
