

## Product sheet CAS Classification

### Confidently classify your goods with AI

Reduce the time you spend on manually classifying your products. Let Artificial Intelligence (AI) do the work for you, diving into the maze of classification codes.

Simply review the suggested classifications and you're ready to go. Get assurance on the application of the correct duty rates and reduce the risk of big fines from the authorities.

Our AI-powered CAS Classification solution finds the best product classification code or verifies your current classifications based on the information you provide, and it motivates why a particular code is being suggested, giving you the confidence you need.

The screenshot displays the CAS Classification web application interface. On the left is a dark blue sidebar with navigation options: Home, Items, Classification (selected), and Bulk Classification. The main content area is a form for inputting product details. The form includes fields for Description, Item ID (with an 'Autogenerated' option), Jurisdiction (set to EU), Country of origin, and Classification code to verify. A 'Classify' button is at the bottom of the form. Below the form, the results page shows a 'Confidence score' of 88, a classification code of 4202929890, and a duty rate of 2.70%. A detailed explanation of the classification is provided, along with a list of similar items and their classification codes.

## Product sheet CAS Classification

### How it works

As the selected classification codes determine the applicable duty rates, excise rates, and measures (such as import restrictions), it can have a ripple effect on your customs operations. It's thus not unexpected that classification is considered one of the cornerstones of customs. Organisations with a lot of (new) items spend a lot of time and money to find the correct classification code for each item. With CAS Classification, this manual task is taken out of your hands. Powered by artificial intelligence, it suggests classification codes based on the SKU description and/or images, and optionally the country of origin you provide.

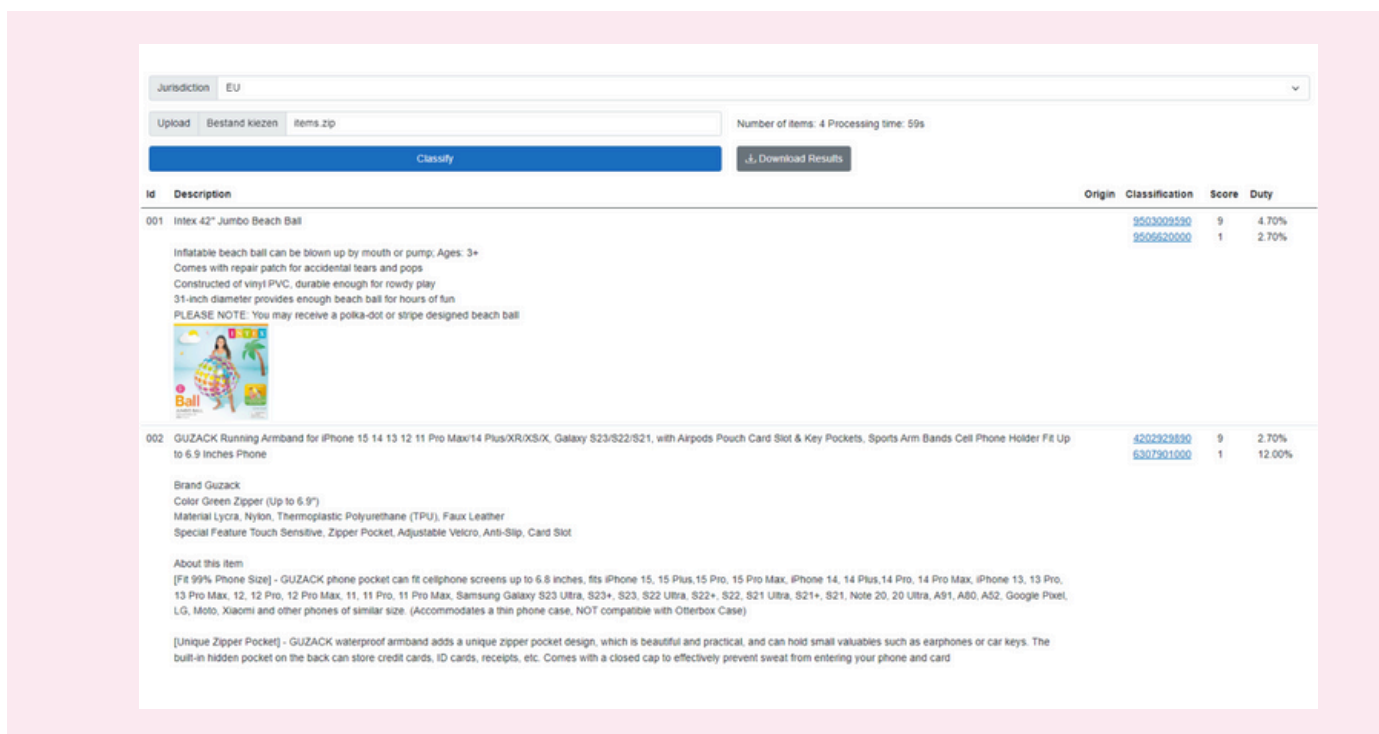

The more information you enter and the more extensive the description, the more accurate the result will be. In return, you get the suggested classification code and the applicable duty rate, measures and rulings. An explanation of the motivation for the chosen classification code and a confidence score help to decide about the correctness of the results.

Next to generating classification codes, the platform can also perform a health check on your existing classifications to check whether these are still the correct codes to be used for your products, verify that the codes are still valid, or find relevant rulings. Simply upload a document including the current classification code, descriptions, images, and country of origin, and these get validated. Changes to classification codes are suggested where applicable as the solution immediately shows those classifications that require your attention.

Item management allows you to keep track of all products you classified. You can select the preferred classification code and add comments to why you selected this code, classify your products again and download your items with their respective classifications.

# Key benefits

- Automation.** Replace a time-consuming and error-prone process with an automated solution. Let it do the background work, one by one or in bulk, to define the correct code and you make the final call.
- Compliance.** Apply the correct duty rates and measures and make sure to verify your classifications from time to time, double-checking whether you are still using valid classification codes. Lift compliance to the next level by combining classification with automated filing in CAS.
- Validation.** Provided reasoning and confidence levels on suggested commodity code options give you the assurance you need to decide on the right classification code for your goods.
