

Continuous Delivery Pipeline Assessment

Define your continuous delivery vision, and devise a strategy to achieve it.

Continuous delivery aspirations

Embracing continuous delivery allows software development teams to operate with speed and stability, but it rarely comes easy. Technical debt and deeply embedded practices that have evolved without strategic direction introduce barriers to operability. If you want to unpick constraints that are hindering development, but don't know where to start, DevOpsGroup can help.

- Deep-dive assessment of current situation.
- Define what good looks like for your business.

Holistic and thorough

Our Pipeline Assessment is geared towards customers looking to streamline the end-to-end software development process or launch a new CD capability. The goal is to shorten release cycles, automate manual tasks and reduce hand-offs. Consultant-led interactive workshops identify blockers. And we work with in-house teams to co-create a roadmap of improvements.

- Highlight constraints and operational risks.
- Create a targeted backlog to operationalise the pipeline.

Analyse

Structured workshops build a deep understanding of current practice

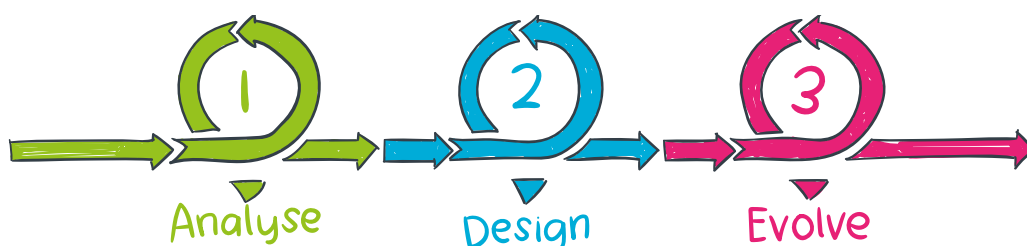

Design

Recommendations focus on driving efficient and effective progress.

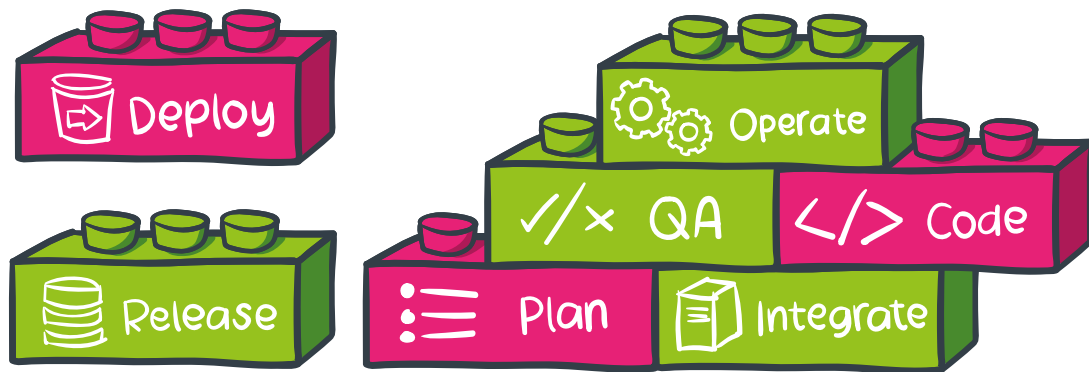

Evolve

Our experienced CI/CD engineers are on-hand to implement if needed.

From vision to reality

DevOpsGroup consultants join your in-house team onsite for two days, running collaborative workshops to understand the root causes of CI/CD issues. The goal is to identify specific constraints that are holding you back, so we can develop bespoke recommendations to address them. These sessions often reveal 'quick wins' that can be implemented immediately to relieve pain points.

First, we meet with you to hold an inception workshop. This enables us to build an understanding of the current situation and find out where constraints and frustrations lie.

Next, we define the vision: an achievable pipeline target-state, fully optimised for your needs.

Then we help you make it a reality, with a prioritised backlog of customised recommendations. You can implement these in-house, or outsource to our engineers if you don't have the required capabilities or bandwidth.

The outcome is an improved pipeline, with fewer manual tasks and handoffs. It clears the way for more agile and adaptive ways of working, so that software developments can be deployed at speed without compromising stability and reliability.
