

Conditional Access

Implementing a secure access strategy for your identities

Implementation | 9.000€*

To ensure that only valid users can access your resources, it is important to design and implement a strong authentication to your infrastructure.

Why?

Since 2020 digital transformation is one of the most important topics worldwide. Companies are facing a change, from classic work to a distributed hybrid workplace. Employees are no longer in the immediate vicinity of a location but are distributed throughout the country or worldwide. Azure AD Conditional Access is part of the Zero Trust strategy and secures the access to company resources.

What do you get?

We will introduce you to Azure AD Conditional Access and develop an access strategy which provides the optimal balance between security and productivity. We will analyze your processes and infrastructure and provide a report with our recommendations.

This includes:

- A general Conditional Access design – which fits to your situation and needs and is in line with our project experience as well as Microsoft's best practises.
- A Proof-of-Concept to implement Conditional Access with a pilot group first.
We will provide the whole setup – groups, policies & monitoring and an evaluation of the results.
- Support during the full roll-out process which includes training for your IT and a full documentation of the whole architecture.
