Application Modernization Assessment

Protect the investment in your current application portfolio

Your existing application portfolio represents a huge investment in your organisation. Too often these so-called legacy applications are seen as a hold-up for new business and technology initiatives.

Application modernisation is the practice of updating existing software to newer computing approaches, like cloud computing. It realigns your application portfolio with contemporary business and technology initiatives. In doing so, you protect the initial investment in your application portfolio.

Our solution

Devoteam offers key insights on your application portfolio. We zoom in on your application's business impact, cloud readiness, software health and dependencies.

- To decide where to start, we group and rank your applications.
- We have a look at the best possible application modernisation strategy for each application.
- In order to maximise your success rate, we make observations and recommendations about People, Processes and Platforms.
- Devoteam performs a profound analysis for one or two applications, including an actionable roadmap and an ROI & risk-to-benefit ratio calculation.
