# AZURE CLOUD FOUNDATION

With this program we define the base 'landing zone' and build application architectures on top of that landing zone. Based on the definition made during these workshops an implementation of the landing zone can be performed.

Get knowledge transfer from our experts and hands-on experience with running Azure workloads using Cloud Adoption Framework, incl. cost insights, operational excellence, reliability & security.

Our experts organize workshops with you to define standards for subscriptions, rights management, naming conventions, network connectivity on Azure, security and management services (includes monitoring, backup, …). Through automation we make sure that the implementation of the cloud environment is done in a controlled way which makes each item compliant and secure by design.

Cloud blue-print architecture based on reference architectures and best practices

Tailored to customer definitions

Interactive workshops with technical knowledge transfer
