# Unleash the power of low code, the right way with Ergo.

With Ergo's Power Platform Governance Service, organisations can reap low-code benefits while minimising exposure to any of the risks, so that you can innovate with the assurance of governance and data compliance.

## Challenges

Keeping a control on low-code platforms can be challenging. Business teams or individuals may develop silo-based solutions that exist outside the remit of IT operations, causing application sprawl. The biggest risk of unmanaged workflows and self-service Power BI dashboards is that data use falls foul of regulatory requirements and security policies. With different departments running disconnected solutions, it becomes hard to monitor their effectiveness, calling for expertise and oversight.

## Ideal Solution

With Ergo's Power Platform Governance Service, organisations can reap low-code benefits with additional layers of governance, data compliance and continuous insights. This encourages business innovation while mitigating business risk.

## Desired Outcomes

As a trusted advisor, we will deploy the Power Platform Centre of Excellence tool to review your Power Platform environment and make recommendations to ensure good governance and regulatory compliance.

# Why Power Platform Governance Service

The popularity of low-code platforms speaks volumes about the value businesses see in decoupling software development from technology and putting it in the hands of the people who use the applications. But keeping a control on it can be challenging.

## Application sprawl

Business teams or individuals can develop silo-based solutions that exist outside the remit of IT operations. Poorly built solutions can go against the grain of an organisation's carefully curated IT strategy and undermine long-term business goals.

## Data loss

The biggest risk of unmanaged workflows and self-service Power BI dashboards is that data use falls foul of regulatory requirements and security policies. Worse, data can actually go missing. Low-code development is easy; data protection calls for expertise and experience.

## Lack of visibility

With different departments running disconnected solutions, it becomes hard to monitor their effectiveness. Autonomy is fine for sorting out line-of-business solutions, but oversight is needed to squeeze out efficiencies and drive productivity.

# Achieve Low-Code Benefits with Enhanced Governance

With Ergo's Power Platform Governance Service, organisations can reap low-code benefits while minimising exposure to any of the risks.

## Governance

Enable your teams to innovate in a carefully monitored environment, as the low-code platform is wrapped in good governance and best-practice to reinforce business/IT alignment and prevent application sprawl.

## Data Compliance

You don't need software engineering skills to build a low-code solution, but you will need our expertise to fill skills gaps in data management and to execute projects in a compliant manner.

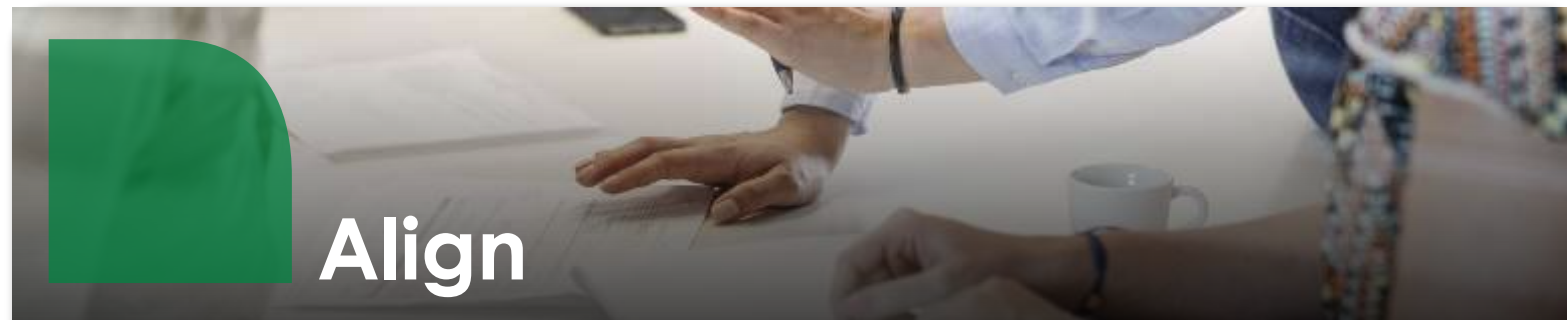

## Continuous Insights

We will set up data collection and analysis tools to provide continuous monitoring of apps, flows, environments, connectors, and 'bots', benchmarking areas for improvement.

# Centre of Excellence Service Pillars

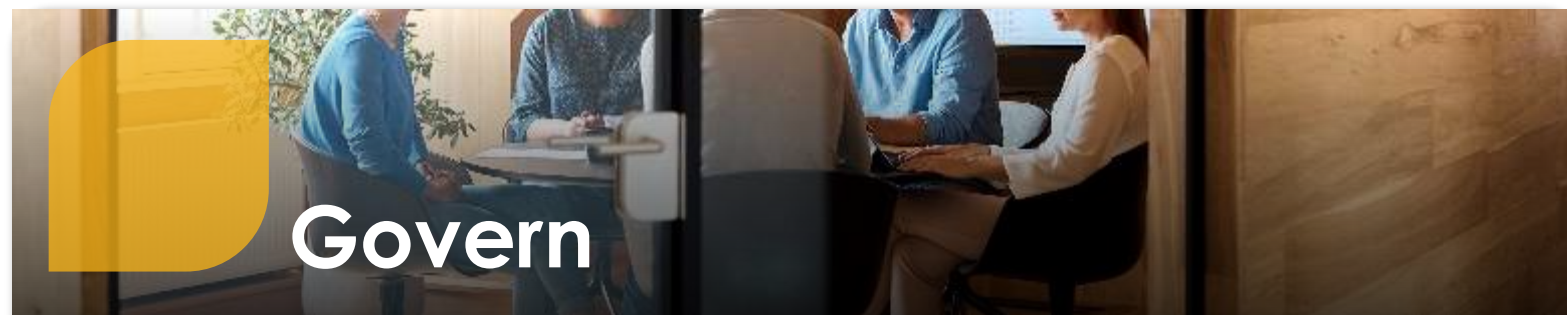

As well as accelerating application development and adoption, we use the CoE Starter Kit to establish audit and compliance processes, encouraging business innovation while mitigating business risk. To get to the point where IT has the oversight and governance it needs, Ergo deploys four service pillars in the CoE.

We define objectives and expected outcomes of your Power Platform from both business and IT perspectives, ensuring they are aligned. We analyse your current application dependencies, identify gaps that Power Apps could fill, and draw on Ergo's expertise in Microsoft technologies to devise a plan that integrates with other solutions, such as Dynamics 365 and Microsoft 365.

We set the IT department up with insights into users and usage across different departments and locations, providing reports that benchmark against best practice. Data collection and analytic tools are deployed for continuous monitoring and tracking.

We establish audit and compliance processes around who is creating apps, the connections that come with them and the data they access. We set rules that allow employees the autonomy, while ensuring they are aligned to security and governance policies.

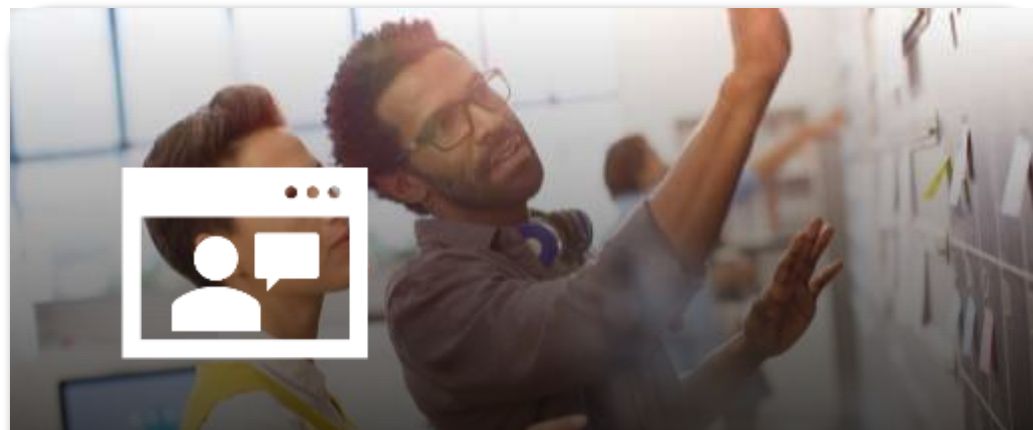

We accelerate adoption and set about creating a community of app makers. We help foster an innovation culture fuelled by new ideas and platform updates. Processes are revisited to ensure continuous improvement, ensuring your CoE is always facilitating the leading edge of low-code development.

# Why Choose Power Platform Governance Service from Ergo?

With almost 30-year history in software development, Ergo has the expertise and experience, not just to deploy Power Platform, but to make it integral to a wider digital transformation strategy, integrated and aligned to other IT investments, including Dynamics 365 and Microsoft 365.

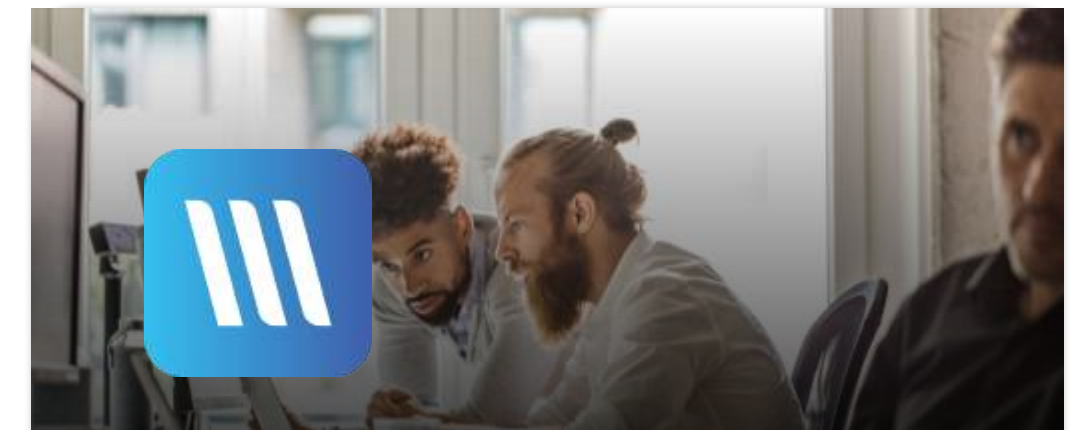

## Expertise to fill skill gaps

With almost 30-year history in software development and a team of professionals with rich experience in Power Platforms, Ergo has the expertise to fill skill gaps through training and workshops to interpret the dashboards, to interpret the results from the platform review and assessment, and app development.

## Adoption & Change Management practice

Our methodology drives usage and improves productivity, ensuring a faster return on investment and averting the risk of IT project failure caused by low user adoption.

## Licensing that delivers long-term value

With guidance from Micromail – part of the Ergo Group and one of Microsoft's leading Licensing Solutions Partners – we will devise a license agreement that delivers the best long-term value and avoids overpaying for Power Platform services.

# Unleash the power of low code, the right way. Get started with Power Platform Governance Service.
