

# Cloud Services

Cloud is not a destination, but an operating model change. ESI can help you succeed in this change in complete security, according to the specifics of your business model and technological environment, so that your company can fully reap the cloud's many benefits.

## Cloud Operating Model Design

Cloud promises are only achieved by operating IT differently. ESI will design your new operating model to unlock the promises of lower cost, agile enablement, and ability to access a broader range of services without compromising integrity or significantly exceed budget expectations.

## Cloud Infrastructure Design

Cloud infrastructure has the same enterprise class application level requirements as your current environment. Our cloud infrastructure design service will help you meet your enterprise requirements for security, resilience, responsiveness, and cost control.

## Cloud Destination Selection

The cloud is not a destination, however it needs to run somewhere. ESI provides you with services to determine the best destination for your cloud infrastructure (public, private, hybrid or multi-cloud) based on your business and technical requirements.

## Managed Cloud Services

ESI provides services to operate and manage your virtual cloud infrastructure, to monitor and track consumption of the cloud resources and recommendations to ensure your business applications maintain the balance between resilience needs and performance and cost optimization.
