

Cybersecurity Services

Looking to mitigate threats and protect your assets and reputation?

Employee Awareness

The weakest link in cybersecurity and therefore the easiest to target remains the human being, which is why the ransomware attack is one of the first attempts used by hackers to paralyze companies and negotiate a ransom. A phishing test followed by an employee awareness session is a good practice to apply in your company and this, on a recurring basis, to remind your users of the importance of vigilance in order to avoid impacts on the company's operations and reputation.

Penetration Tests

The vulnerabilities of your internal and external perimeters or your websites, whether transactional or not, are important sources of intrusion into your environment without your knowledge. Penetration testing is an effective way to assess your vulnerabilities and apply expert recommendations to mitigate them.

Cybercrime Exposure Analysis

The «Dark Web» is 500 times larger than the traditional web and contains information leaks. The Dark/Deep Web analysis allows you to know if information about your company is leaking out and if hacker groups could be planning attacks against your systems or the types of systems your company uses so you can better protect against them.

CyberSecure Canada Certification

This new Canadian certification includes 13 security control points. ESI offers you a support service in the form of a gap analysis of your company's compliance with these control points and then assists you in implementing them in order to obtain your certification from an independent authority. This certification guarantees the quality of your cybersecurity posture and offers peace of mind to your customers, business partners and shareholders.

“

Our portfolio of cybersecurity services allows you to remain proactive and fix your vulnerabilities before they become the target of attacks.
