The Problem Businesses Face Today

Most enterprises are still running on legacy platforms — InfoPath forms, Nintex workflows, SharePoint-based processes, and fragile Excel-driven operations. These systems were built years ago to solve real problems, and they still do. But they come at a growing cost.

Here's what keeps IT leaders up at night:

- Critical business logic is undocumented — locked inside aging tools only a few people understand
- Manual rebuilds are slow, expensive, and high-risk — teams spend months recreating what already exists
- Compliance and governance gaps widen as legacy systems drift further from modern standards
- User frustration grows as employees struggle with outdated, inflexible interfaces

Introducing the Modernization Accelerator

Evoke Technologies built this accelerator after observing the same painful pattern across dozens of enterprise modernization engagements. We asked a simple question: what if the hardest parts — discovery, logic extraction, and app generation — could be systematized?

The result is a structured, repeatable accelerator that doesn't just migrate your apps — it intelligently transforms them into scalable, governed, future-ready Power Platform solutions.

What makes this different:

- Structured discovery surfaces hidden logic before a single line of code is written
- AI-assisted prototyping using Microsoft Copilot and Power Apps Vibe accelerates early cycles
- Reusable templates reduce build time without sacrificing quality
- Built-in governance dashboards ensure compliance from day one
- Data model redesign for Dataverse, SharePoint, and ERP systems included

How It Works: A 4-Phase Delivery Model

Every engagement follows a proven path — no surprises, no wasted effort.

Phase 1 Assess & Discover	Phase 2 Design & Transform	Phase 3 Build & Validate	Phase 4 Deploy & Scale
• Inventory legacy apps • Surface undocumented logic • Map data flows & integrations	• Architect new data models • Define app structure • Plan governance framework	• Generate apps from templates • Automate workflows • Business user validation	• Phased production rollout • Training & adoption • Monitoring dashboards live

Where Legacy Breaks, We Modernize.

The accelerator has been battle-tested across complex enterprise scenarios:

 CostEngine Approval Workflows Replace fragile Excel-based capital approval chains with governed, auditable Power Apps flows.	 Product Master Data Modernize product master data workflows with Dataverse-backed forms and automated validation.	 Cost Estimation & Planning Transform planning and approval spreadsheets into real-time, role-based Power Platform apps.
 Enterprise Approval Systems Unify multi-level approval workflows across departments with full audit trails and SLA tracking.	 Legacy App Modernization Migrate any InfoPath, Nintex, or SharePoint-based process to Power Platform — without losing logic.	 Custom Line-of-Business Apps Build net-new business applications faster using AI-assisted generation and reusable templates.

AI That Works with Your Teams

This isn't AI for the sake of AI. The accelerator uses Microsoft Copilot and Power Apps Vibe at strategic points in the delivery lifecycle to compress timelines where it matters most.

- ▶ Prompt-driven app generation shortens prototyping from weeks to days
- ▶ UI automation suggestions reduce UI build time and improve accessibility
- ▶ Workflow recommendations surface automation opportunities your team may not have considered

Ready to Modernize Your Legacy Apps?

Start with a free modernization assessment. Evoke Technologies will map your legacy landscape, identify quick wins, and deliver a roadmap tailored to your business.
