✓ Centralized application management

✓ Security and scalability

✓ Modern and innovative corporate image

✓ Based on the zero trust architecture

✓ Based on well known security frameworks (NIST, CIS)

Infrastructure services

Data protection

Identity & Access management

Endpoint & messaging security

Execution

Implementation of the project based on the roadmap document where stakeholders are kept up to date and recurring meetings are hold to make sure that the project is still on track. Through the project, a phased approach will be used to validate new or changing features to safeguard production.

Training

Whenever the project is being implemented, Orlox provides detailed as-built documentation on the configuration. Admin or end-user training can be provided whenever the customer thinks this is necessary. Beside that, potential issues during or after the implementation can be taken care of our support team.

Assessment

With a thorough functional and technical intake on the environment, Orlox can create a simplified overview of the as-is environment.

Roadmap

Together with our intake documentation and the customer's needs, Orlox creates an in-depth roadmap were every technical decision point is being documented. Potential quick wins or important prerequisites will be listed down to be handled first. The roadmap document will then be used as the baseline implementation document for the entire project.
