Azure Data Platform Assessment

Using our extensive Data Platform experience, Expert Thinking provide a 10-day assessment of your Data Platform, from architecture through to data governance and management.

It is crucial to ensure the scalability, security and extensibility of data workloads. Data is very much a product. As part of this assessment, we will:

- **Analyse the Data Platform architecture, to ensure governance and security is top notch**
- **Review Azure resource utilisation to ensure you are leveraging the most cost optimal and scalable services for your needs both now and in future**
- **Review any ETL processes including Azure resource suitability, data storage and retention, and associated access to data**

Outputs:

- Full architecture review, with architecture designs and recommendations as required in line with Microsoft frameworks and our own industry knowledge of Data Platforms
- Detailed security report covering any resource and data vulnerabilities, including access and identity
- Data governance review and report, covering policies, storage and retention across resources
- Data Resource utilisation analysis and report, with cost optimisation recommendations
- Roadmap of next steps, options and accompanying estimation of work if required
