- Effortless Projects
- Flexible Scope
- Secure Virtual Environments
- Flat Monthly Rate
- Architects & Senior Engineering

What Is Copilot Readiness?

Copilot Readiness is a comprehensive two-part process that involves assessment and implementation & training. The primary objective of this service is to ensure that both your tenant and your users are fully prepared to embrace the new era of AI conversations.

Assessment

We assess all content locations within your organization, such as SharePoint, Teams, and OneDrive, to gain a complete understanding of where your data resides.

Microsoft's Semantic Index maps all the data in your tenant and illustrates how it's interconnected, providing a holistic view of your organization's data landscape. This information is invaluable in assessing your readiness for Copilot and identifying areas that may require additional attention or resources.

Implementation and Training

After configuring and enabling specific features within your tenant to optimize it for Copilot readiness, we prepare your users and admins to interact effectively with Bing Chat Enterprise and Copilot. We familiarize users with AI conversations, using tools like the large language model and prompt engineering. The ultimate goal is to seamlessly integrate Copilot into your organization, transforming the way you interact with technology.
