

DC Automate – GitHub

Automated repo sharing and analytics for GitHub

Measurable Results

- Automate on-boarding and off-boarding of vendor and contract developers
- Track and analyze activity across individual repositories or your entire organization
- Plan and control your costs before a project begins

Key Benefits

- Repeatable, documented, and transparent repository sharing practices
- Your development partners can hit the ground running with faster and safer access to your repositories. Get your projects started immediately, remove the wait time and costs.

Flusso's DC Automate is a GitHub app that empowers your organization to collaborate with its development partners, key suppliers, and independent contractors in new and powerful ways

DC Automate takes away the pain of sharing your valuable intellectual property. Stop carrying the risk of cumbersome, time-consuming, sometimes uncertain security and maintenance processes

Trustworthy Collaboration with your Development Partners

DC Automate embeds safe and transparent sharing practices for your repositories across GitHub organization boundaries

Evolve your internal development standards by using the same tool to create shares between internal teams

Fast, Simple and Safe Sharing

DC Automate removes the administrative overhead of managing outside collaborators, simply nominate the organization you want to share your repos with and the maximum number of users and let DC Automate handle the rest.

Create Great Experiences for your Development Team

Developers never need to log a support request again, the target organization just needs to choose the GitHub Teams that require access. On-boarding a new dev is as easy as adding or removing them from the Team, which is automatically reflected in the source organization.

Engagement, Activity and Audits

Technical and business leaders can view activity logs, track development engagement and measure effectiveness of active shares using DC Automates dashboards and audit logs
