

SECURITY & PRIVACY BRIEF
FN FIRST HOLDINGS LLC · JULY 2026

Zero Content Retention, stated honestly

specgit is a visual editor and review layer on top of a GitHub repository your team already controls. GitHub remains the source of truth. Written for the reviewer who has to approve the tool.

We never keep a copy of your docs

Fine-grained GitHub App, repo-by-repo

Hosted on Microsoft Azure

01 Zero Content Retention — and its exact limits

specgit runs no document database. Documents, comments, and review history live in your repository; specgit reads what someone opens, writes their edits back as commits, and keeps **no copy**. Revoke the App and specgit has nothing left to hold.

THE THREE TEMPORARY EXCEPTIONS — ALL DISCLOSED

- ✓ **Live-collaboration state** while people edit together — deleted after publish or direct commit, and after at most 7 inactive days.
- ✓ **AI processing you invoke** — sent only for the action a person starts, and not kept in AI usage records.
- ✓ **Feedback explicitly shared** — a transcript someone opts to share when rating an AI response is kept up to 90 days.

Publish is a merge. The durable record — document, review threads, approvals, history — is the pull request in your repository.

02 Authentication: one fine-grained GitHub App

Sign-in is the specgit GitHub App and nothing else — no separate password, no broad OAuth grant. An admin installs the App once and picks the repositories; teammates sign in with their own GitHub accounts, so every commit and comment is attributed to the person who made it.

Permission	Access	Why specgit needs it
Contents	Read & write	Read the files people open; save edits back as git commits on review branches.
Pull requests	Read & write	Open a pull request per draft, post review comments, merge on publish.
Issues	Read & write	Post and read PR discussion comments (GitHub serves these via its issues API).
Metadata	Read-only	List the repositories the installation grants — mandatory for any GitHub App.

03 What the installation cannot do

- ✓ Change repository settings, branch protections, or webhooks.
- ✓ Manage collaborators, teams, deploy keys, or invitations.
- ✓ Reach any repository outside the ones the installation grants.
- ✓ Move the durable document or review record out of GitHub.

The same posture, in the product. specgit.com publishes the identical claims and qualifiers — this brief neither softens nor extends them.

04 Analytics, AI, tokens, and logs

Content-free analytics

Allowlisted events only — never documents, comments, prompts, selections, chat, audio, repository names, filenames, paths, raw URLs, or input text. Restricted or unknown regions send nothing before separate, revocable opt-in; elsewhere public measurement is cookieless and signed-in events pseudonymous with opt-out. **No ad tech, sale, or retargeting.**

AI is optional, invoke-only

specgit AI (Agent chat, Review, Triage, voice) runs only when a person starts it, and every AI-proposed change or comment **requires human approval** before it is applied or posted. Content never trains models. AI records keep usage metadata only — tokens, model, cost, timestamps.

Tokens, logs, hosting

GitHub tokens are short-lived, encrypted at rest (AES-256-GCM), held for active sessions only, and revoked at GitHub on sign-out. Operational logs are metadata only — never document content — and are kept up to 30 days. Raw analytics events are kept no longer than 12 months. The production service runs on **Microsoft Azure**.

05 · AI MODEL PROVIDER

The AI model provider is **xAI**. specgit's xAI account has **Zero Data Retention enabled: API inputs and outputs are processed to generate the response and are not persisted by xAI** — the default 30-day abuse-monitoring retention does not apply and voice history is not retained. Inputs and outputs never train xAI's models. This is scoped to the AI API path; the product-wide claim is Zero Content Retention (\$01).

06 · COMPLIANCE STATUS, STATED PLAINLY

specgit does not hold a SOC 2 report, ISO 27001 certification, or any GDPR certification, and does not claim one. It is a recently launched product (Fn First Holdings LLC, July 2026). What it offers a reviewer instead is a narrow architecture: no document store, no content in analytics or logs, no AI processing without an explicit request, and repository access an admin grants and revokes in GitHub.
