Software Development

Developing digital products is what we've done **for over 20 years.**

Having delivered **over 700 projects** and boasting **a team of more than 1000 professionals**, we possess all the expertise and knowledge to support your technological and business goals.

If you value true expertise in custom-made software delivery – we're the right people.

Get an **agile team and agile partner**

We believe that agility and close collaboration between the Product Owner and the development team are key to creating amazing software.

We are flexible and adaptable – to your specific requirements in terms of team size, skill sets, collaboration and pricing models, and methodology.

We keep you updated, guarantee full transparency during the development process and provide you with solutions to any encountered business problem.

We create for you and with you.

Dedicated Team

Compose an agile team of tech experts to support you in shaping your tech strategy and designing and developing your digital product.

What you get

- A dedicated, agile team of software delivery experts with the right type of skills at the right time

- True business and technical expertise in custom software development across multiple programming languages and frameworks

- Knowledge and experience of not only our software engineers, but also Solution Architects, Quality Assurance Engineers, Business Analysts, Security, Cloud, DevOps specialists and many others

- A broad look at your technology problem at any stage of software delivery from multidisciplinary teams equipped to handle any of your tech challenges comprehensively

as a result you can

- Deliver any of your digital products, from entire systems to new features in apps, in a predictable and high-quality way

- Become operationally agile with an ability to scale up and down and a collaboration model that works for you

- Benefit from having all the specialists you may need under one roof

- Work in a collaborative atmosphere of mutual respect and transparency

What are the benefits

- A technology partner committed to addressing all your tech challenges and software development needs over the long term

- By entrusting us with PM, QA, and value delivery, you get time and freedom to concentrate on your core business

- Consistent, high-quality results, without the inconvenience of having to recruit, train, and develop your team.

- Scalability with a team of experts mixed and matched to to create your perfect team

Software Development – what you need to know

- Since 2000, we have engineered, tested and delivered over 600 software projects – from mission-critical enterprise-wide systems to more modest applications.

- We have mechanisms in place that support predictable and high quality delivery, including Delivery Success Indicators (DSIs), Best Practices of Software Development.

- Our delivery teams are supported by the Technical Expertise (TE) unit – the go-to people for the most complex technical problems

Project Manager

Our Project Manager is your single point of contact for any questions about your project(s) or team(s).

They understand your business, help you identify its problems and are responsible for ensuring we solve them. Their primary responsibility is to plan, execute, and deliver projects on time, within budget, and according to your expectations.

They work closely with other key roles in the project, such as Business Analysts (BA), Solution Architects (SA), and Team Leads (TL)/Scrum Masters and Engagement Managers (EM), to ensure:

- the project team works collaboratively and efficiently to meet the level of quality that you anticipate
- the project is progressing as planned and that any issues are tackled promptly.

To lead the project effectively, a Project Manager follows the Future Processing Way and established project management practices.

Technologies

We have expertise in developing software across various technologies. Here are just some of the main technologies we can help you with.

Backend Technologies

The backend technologies we work in include the majority of mainstream technologies, in particular:

- .NET
- Java
- Node.js

Frontend Technologies

Apart from web development, we develop mobile and desktop apps using both native and cross-platform approaches. Some of the technologies we use include:

- React JS
- Angular JS

Cloud Technologies

In our cloud services, from CloudOps, to cloud modernisation and migration, we're focused on the two main players on the cloud scene, namely:

- Azure
- AWS

Competencies

We have all the competencies you need under one roof.

Here's a snapshot of a few:

- Business Analysis
- Security
- AI & ML
- Software Architecture
- Cloud
- DevOps

- Software Engineering
- UX Design
- Data Solutions
- Blockchain
- Project Management

Delivery Success Indicators

We evaluate our projects based on facts, not gut feelings. And Delivery Success Indicators (DSIs) are one of the mechanisms supporting us in smooth project delivery. In DSI assessments, we look at the following areas:

- project delivery according to client expectations,
- the Best Practices of Software Development,
- best practices of project management,
- the team and team leader,
- client relationships.

Each area contains several indicators which combined flag our projects as red, amber or green allowing us to monitor the delivery.

Best Practices of Software Development (BPSD)

BPSD is a standard that guides us in our projects. It defines quality requirements in 7 areas:
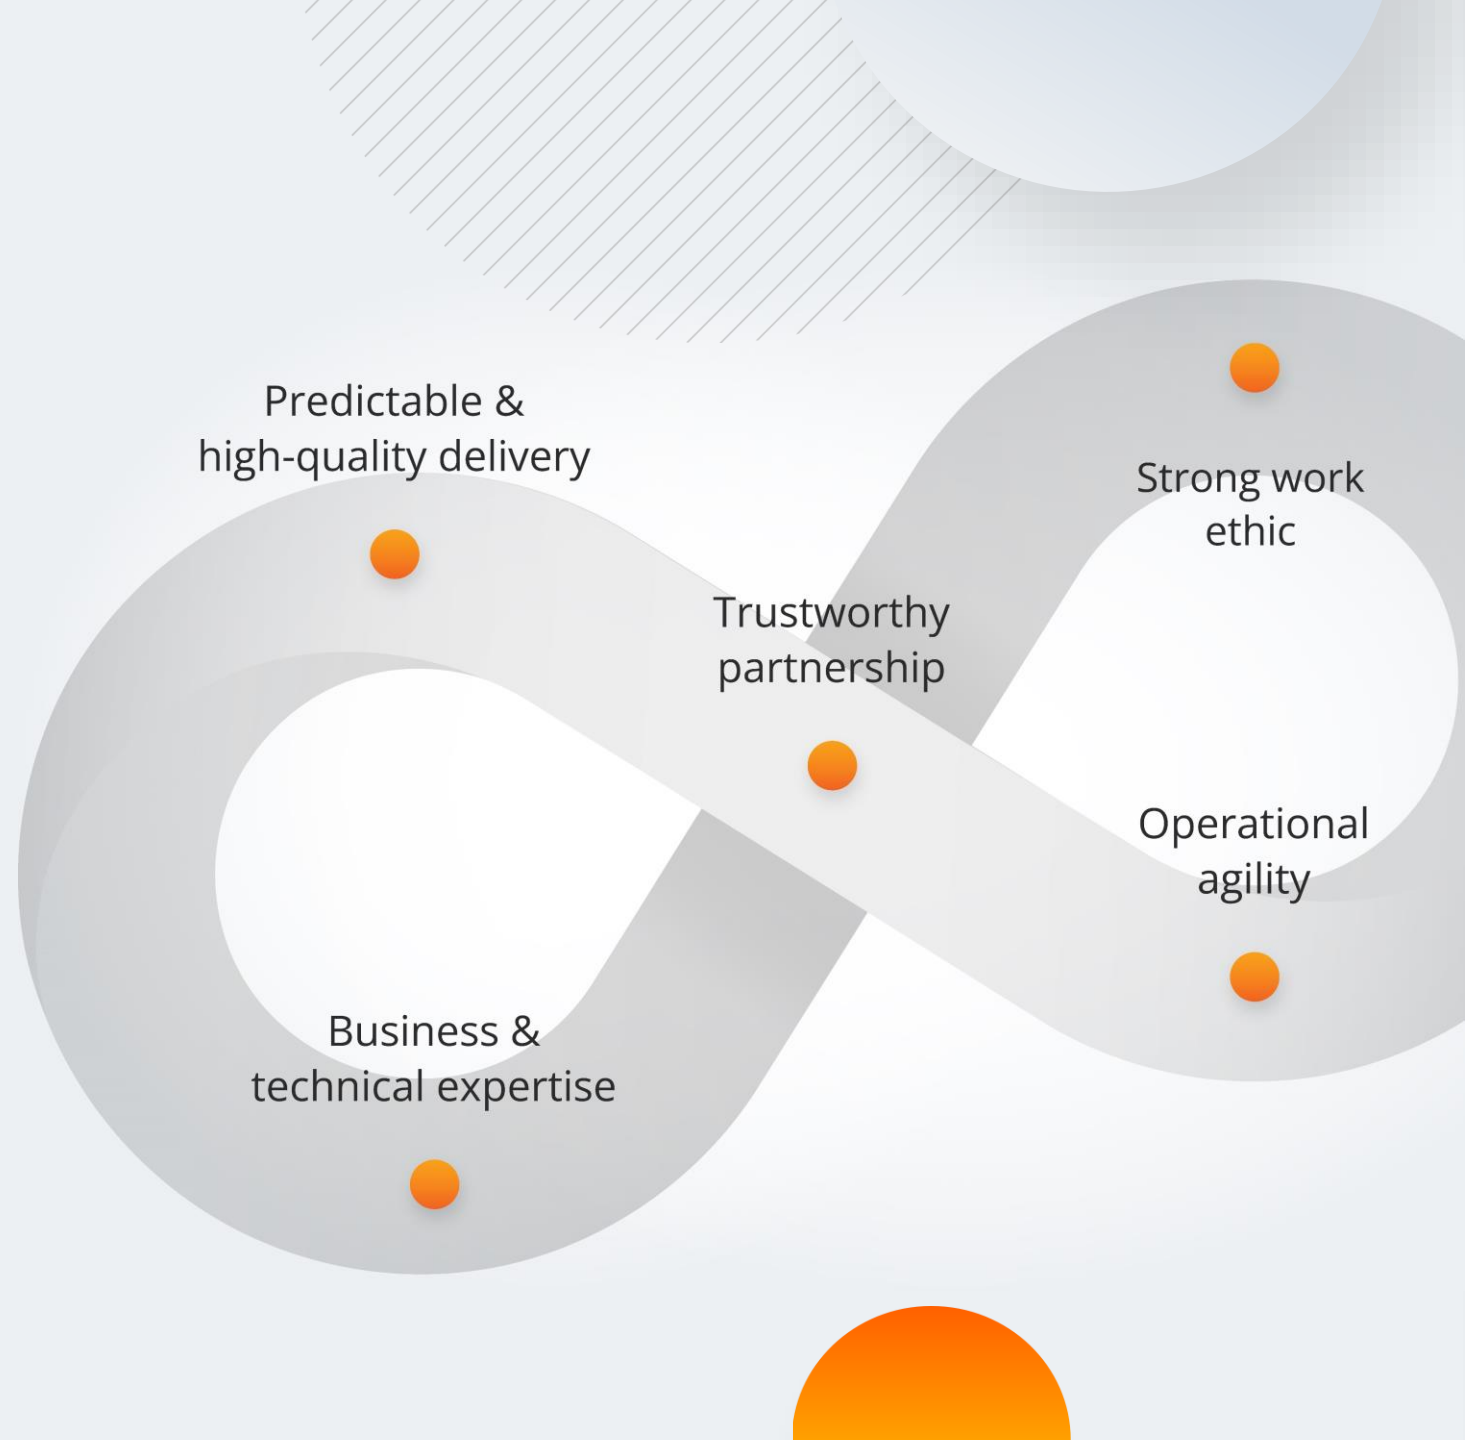

- Architecture

- Code

- Development Environment

- Development Process

- DevOps

- Quality Assurance

- Quality Attributes

The Future Processing Way

The Future Processing Way is our unique approach to delivering the best software for our clients which we have evolved since 2000.

It is our own distinct way of working, a combination of methods, tools and behaviours which helps you achieve great results through our partnership.

Predictable & high-quality delivery

Trustworthy partnership

Strong work ethic

Operational agility

Business & technical expertise
